International Handbook of Self-Study of Teaching and Teacher Education Practices

Second Edition

Springer

Springer International Handbooks of Education

The Springer International Handbooks of Education series aims to provide easily accessible, practical, yet scholarly, sources of information about a broad range of topics and issues in education. Each Handbook follows the same pattern of examining in depth a field of educational theory, practice and applied scholarship, its scale and scope for its substantive contribution to our understanding of education and, in so doing, indicating the direction of future developments. The volumes in this series form a coherent whole due to an insistence on the synthesis of theory and good practice. The accessible style and the consistent illumination of theory by practice make the series very valuable to a broad spectrum of users. The volume editors represent the world's leading educationalists. Their task has been to identify the key areas in their field that are internationally generalizable and, in times of rapid change, of permanent interest to the scholar and practitioner.

Foreword

The editors of the *International Handbook of Self-Study of Teaching and Teacher Education Practices* should rightly be proud of their achievement. There is little doubt that assembling a team of well credentialed authors, managing the timelines, schedules, drafts, reviews, refinements, proofs, and final publication is demanding. However, when considering the quality of the editorial team (Kitchen, Berry, Bullock, Crowe, Taylor, Guðjónsdóttir, and Thomas) that has worked so well together on this task, it is not surprising that they have expertly managed the process and now delivered a most impressive International Handbook. I have been privileged to have had the opportunity to read this tome in advance of publication and to offer the following remarks in response.

Although the process of creating an International Handbook is indeed challenging, the strength of this work is immediately clear through the way in which the volume builds on the foundations of the *International Handbook of Self-Study of Teaching and Teacher Education* (Loughran et al. 2004) published a decade and half earlier. The editors have not simply updated the field, they have carefully and thoughtfully recast it in order to capture the changes and developments that have occurred over the intervening years. Together, they have reframed the field to illustrate the opportunities for research and practice that are available to be taken up and expanded upon.

The Handbook comprises six parts: (1) Foundations of Self-Study, (2) Self-Study Methods and Methodologies, (3) Self-Study and Teaching and Teacher Education for Social Justice, (4) Self-Study Across Subject Disciplines, (5) Self-Study in Teaching, Teacher Education, and Beyond, and (6) Self-Study across Cultures and Languages. Together the titles of these parts, and the high quality chapters within each, illustrate the conceptual, theoretical, and practical strength brought to the writing combined with a depth of understanding that extends well beyond the initial foundations of the field. In many ways, it is this growth of understanding and application of self-study that is the measure of the expertise the editors and authors have brought to bear on this work. They have framed the field and developed not only a response to that development but also offered new opportunities for the pursuit of knowledge and insights for the future – the epitome of scholarship.

In part one, Amanda Berry leads a very experienced team of authors that capture the essence of the Foundations of Self-Study. It is interesting – and important – to be reminded of the work that established the field (almost 30 years ago) and this part

highlights that work exceptionally well. The chapters combine to outline the processes, practices, and purposes that drove the development of self-study of teacher education practices (S-STEP) and the ways in which theoretical and practical knowledge have been developed. A major insight from this part of the Handbook relates to the value of knowledge, of and for, teaching and learning about teaching. This part makes clear why research in the field matters to teacher education policy, practice, and theory.

It could well be argued that Whitehead's (1993) articulation of being a "living contradiction" catalyzed many to look more deeply into their own teaching of teaching and, combined with the enthusiasm and desire for teacher education to be taken more seriously within the academy, some (for example Cole and Knowles 1995; Guilfoyle et al. 1995; Northfield 1996; Russell 1995) set in train the ideas and practices that fuelled the research imagination of those who followed for a considerable period of time. Therefore, the foundations of self-study could well be encapsulated by the notion of teacher educators genuinely seeking to better align their pedagogical intents and actions in order to lead to more thoughtful and informed teaching and learning about teaching.

These chapters illustrate the dynamic nature of self-study, the serious desire of teacher educators to develop their scholarship, and the breakthroughs in thinking and practice that have shaped the development of the field over time. As the authors make clear, the *raison d'être* of self-study continues to be seductive and enticing and creates an invitation that is taken up by concerned and committed teacher educators (as exemplified by the contributors to this Handbook).

In the second part, Shawn Bullock works with some exceptionally well regarded self-study scholars to not only lay out pathways for understanding self-study as a methodology, but to also offer insight and critique that guide the thinking and practices of the research enterprise. This part offers an important reminder that research in teacher education matters; particularly so when it is conducted by teacher educators as major players in the field.

In order to gain insights into the teaching and learning of teaching, self-study has – and continues – to push the methodological boundaries. This is not an attempt to "buck" academic conventions but, rather, an attempt to pursue knowledge in new, more meaningful, and applicable ways. Trustworthiness of self-study research, reasons for pursuing such work combined with methodological advancement, constraints, and opportunities are deeply enmeshed in the ethical considerations that must be entertained when doing self-study. This part of the Handbook offers an opportunity to not only grasp the magnitude of self-study as a methodology but to also see into method, again, with an eye for more seriously seeking to align action and intent.

There is no prescribed self-study protocol or doctrine, and this part highlights ways in which the field can be considered in order to explore serious questions about teaching and teacher education research; it is not a field with a prescribed method in search of a question. Rather it is inquiry driven.

The third part of the Handbook (Self-Study and Teaching and Teacher Education for Social Justice) is edited by Monica Taylor. Monica has assembled a diverse team that has conceptualized and presented work in self-study based on a social justice imperative and drawn from a diversity of related fields and programs of work. Through this part, Monica and her team make clear the importance of equity, of framing and reframing perspectives, and of looking carefully into the work of others in thoughtful, respectful, and professional ways.

In many ways, this part takes the challenges and promises of the previous two parts and brings them to life in new and different ways by applying ideas, hopes, and intentions to self-study through the lens of social justice. As is made clear across all of these chapters, it is crucial that teaching for social justice goes beyond rhetoric and becomes reality. As these authors consistently reinforce, it is essential that prospective teachers (and teacher educators too) be sensitized to, and challenged by, the demands of teaching for social justice if the hope for schooling as truly educative experience for all is to be seriously pursued. This part is a prescient reminder of the place of the principle of social justice as a foundation to teaching and learning about teaching.

The fourth part of the Handbook is edited by Alicia Crowe. Her team of subject experts offer in-depth analysis of self-study research across a range of disciplines. This part highlights the long standing and highly regarded ability of many self-study researchers in fields such as Social Studies, Language Arts, Mathematics, Science, Physical Education, and Information Technology. Not surprisingly, each of these authors demonstrates a desire to ensure that the teaching of their specialist discipline is understood and portrayed as richly embedded in particular ways of knowing and doing teaching. They highlight that knowledge and practice are inextricably linked to the subject itself. It is for this reason that the teaching of the disciplines in teacher education continually draws such focused attention.

This part of the Handbook further highlights the importance in teacher education of being able to see beyond teaching as a generic skill base and into the specialist knowledge, skills, and abilities of the subject expert. Through the self-study research documented, analyzed, and portrayed across all of these chapters, Alicia and the team have expertly managed to remind us all that teaching is a complex and sophisticated business. In so doing, the nature of teaching and learning about teaching in the disciplines is brought to the fore in a positive and productive manner. Combined, these chapters show how crucial it is that subject expertise is recognized, understood, and valued, not for the subject alone, but for the pedagogical knowledge and sophistication that underpins that teaching. In so doing, teaching for understanding in a subject is more likely to occur and student learning can go beyond the "what" of the subject and into the "how" and "why." Thus, defining the disciplines and highlighting the pedagogical skills germane to so doing.

The next part of the Handbook (Self-Study in Teacher Education and Beyond) is edited by Julian Kitchen who brings together a group of experienced self-study researchers with deep theoretical and practical roots in the field. In this part Julian

specifically takes up the challenge of pushing the field beyond small scale, individual studies of practice and pursuing bigger picture methodological, theoretical, and practical issues that self-study should rightly embrace. Building on the strong foundations of the past, this part acknowledges the work of those who have come before but ensures that the field does not rest on its laurels.

In 2004 when the first *International Handbook of Self-Study of Teaching and Teacher Education Practices* was officially launched, Stanford University philosopher Denis Phillips in his address to the self-study community challenged the audience to look to the future and not to become comfortable and complacent with the achievements to date. Kitchen and his authors not only remind us of that challenge, but whole-heartedly take it up and show the promise for a future in which the philosophical roots of self-study are able to be seen as applicable and useful to fields beyond teacher education alone.

One element of this part, amongst many, is the value of examining more closely the experience of students of teaching and beginning to conceptualize and conduct studies that illustrate how demanding the task really is of learning to teach. In many ways, this part offers opportunities to begin to dispel the oft' held public view of "telling as teaching" and "learning as listening" (Loughran 2014). The authors evoke an image of the teacher educator as a scholar with a focus on professional development and growth with much to offer others.

As Julian noted himself, "I became increasingly aware of the limited impact of improved courses in the absence of program vision and coherence." Hence, this part of the Handbook can also be seen as ensuring that the notion of self-satisfaction with work at an individual level is not sufficient for productive change and development across a field. This part of the Handbook does not balk at the desire to encourage a move beyond the self and to pushing beyond that which is comfortable (and comforting) because it is necessary for genuine development, growth, and ultimately meaningful educational change.

The final part of the Handbook (Self-Study across Cultures and Languages) is edited by Hafdís Guðjónsdóttir and Lynn Thomas. Together they shine a bright light on the influence and implications of self-study through their careful selection of authors and topics that reflect well the international reach of the field. These chapters embrace all that internationalization entails for self-study. This part of the Handbook offers insights into the experiences of conducting research in self-study in a variety of locations, cultures, and languages. To whet the appetite, their contexts include: Europe, Iceland, Israel, Quebec (Canada), Chile, South Africa, Japan, and South Korea.

This part of the Handbook specifically aims to "turn the focus toward an exploration of the experience of translating and transforming self-study to fit with local contexts, languages, and cultures." International representation has always been a strong and abiding feature of S-STEP. As the authors of this part illustrate, despite S-STEP's initial formation as a Special Interest Group (SIG) of the American Education Research Association (AERA), the work has not been limited to the

usual suspects. In fact, it is perhaps not too much to suggest that the very nature of the S-STEP bi-ennial Castle Conference (see Garbett, Fitzgerald & Thomas' chapter in part 1) in Herstmonceux, through which the work of the community is able to be presented and professionally critiqued in a safe and supportive environment, is the conduit for such strong international participation and involvement.

As the authors of this final part demonstrate, self-study as a field is not always easy to simply translate or adjust in order to adopt in a different language or culture. The problematic nature of self-study itself is a concept that needs to be grasped in order to see the value and promise of researching teaching and teacher education in any culture. Like these authors, those that have accepted the challenge of so doing in languages and cultures other than the more typical "English speaking cultures" of, for example, North America, UK, Australia, and New Zealand, are pioneers of self-study – but perhaps in ways that they might not have imagined when they embarked on their journey.

As many in the S-STEP community have discovered, self-study can be difficult to explain in English in a research culture deeply embedded in Western traditions. However, to purposefully choose to take on those difficulties and carry them into different cultures and languages rightly deserves the acknowledgment, respect, and gratitude that this part represents. It is through the work of authors such as those represented in this part that the self-study community continues to be nurtured and strengthened across a diversity of cultures, languages, and contexts.

Back when S-STEP was finding its collective voice, Guilfoyle, Hamilton, and Pinnegar (1997) wrote about our "obligations to unseen children" (p. 183). In their writing, they captured one of the essential elements as to why S-STEP matters and its alluring to teachers and teacher educators. Self-study is a field in which the core commitment to developing knowledge and practice of teaching and teacher education has been recognized and acknowledged because of what it can mean to education for the learners of the future.

From its humble beginnings as a SIG at AERA, through to the flourishing of the bi-ennial Castle Conference, the production of the *International Handbook of Teaching and Teacher Education Practices* in 2004, and the establishment of the journal *Studying Teacher Education* in 2005, S-STEP's insights into the field have benefitted many. Across the years many have benefitted from the work of those involved who shared their ideas, practices, and research.

An enduring feature of self-study has always been that with the passing of each generation, those that have followed have enthusiastically taken up the baton and actively supported the further development the S-STEP community. With the publication of this *International Handbook of Self-Study of Teaching and Teacher Education Practices*, that tradition continues.

Preface

The *International Handbook of Self-Study of Teaching and Teacher Education Practices* provides current and authoritative insights into important issues in the self-study of practice around the world. This international handbook is a sophisticated re-examination of the self-study of teacher education practices 16 years after the publication of the first edition by Springer in 2004. The first edition remains an important and relevant work that framed the field of self-study, explored its theoretical foundations, unpacked its methodology and methods, reviewed the self-study literature, and offered insights that have guided the growth of the self-study of practice as a scholarly examination of practice, a practical approach to scholarship. The 54 chapters in the second edition consolidate the understandings presented in 2004, review the field as it has developed subsequently, and offer insights for the consolidation and expansion of self-study in the years to come.

The editors and contributors in the first edition of the handbook were deeply concerned with the nature and development of self-study as a new and promising field of study. As "a coming together of like-minded people with similar interests, issues and concerns" (Loughran 2004, p. 13) only occurred in 1992 and the Self-Study of Teacher Education Practices Special Interest Group of the American Educational Research Association only began offering sessions in 1994, the main preoccupations of the two-volume handbook were legitimizing self-study by tracing its lineage, demonstrating that its professional knowledge base was built on a legitimate foundation, and its methods and methodology rigorous and sound. The first edition, along with the launch of *Studying Teacher Education: A Journal of Self-Study of Teacher Education Practices* in 2005, marked a coming of age for the self-study community.

This second edition marks a more mature stage in the field's development. More mature in the sense that it reflects different preoccupations at a later stage of life, one in which self-study seems more rooted and secure. Taking the place of the vigorous and passionate chapters in the first edition justifying our existence are new chapters explaining where we are and what we are doing now as a scholarly community of practice. The sense of opportunity and optimism of a relatively young field is balanced with a longer résumé of achievements. Also, there is a growing recognition of the challenges associated with moving forward. Some promising strands from the first edition are not picked up in the second (e.g., action research), some are reframed

based on the authority of more recent experience (e.g., field experiences), and others take on a new sense of purpose (e.g., a whole part on social justice). We imagine that a third edition in 15 or 20 years will reflect both a further stage in self-study's development and a changing world.

As in the first edition, the foundations of self-study are considered first, with an emphasis on self-study as a major field of study and practice with a rich base of literature. Methods and methodologies are again considered in depth, with more emphasis on concrete examples in the literature and a focus on approaches that have emerged or grown in the last 16 years. In these parts, guidance is offered to both the novice seeking entry and the expert expecting enrichment. The third part significantly expands self-study's work on social justice, both conceptually and in practice. The fourth part concentrates on the increasingly rich literature on applying self-study to practice across subject disciplines, while the fifth part widens the focus to wider issues within teacher education practice and programs, as well as beyond teacher education. The final part considers self-study across languages and cultures; it both captures the richness of self-studies around the world and offers possibilities for growing self-study as an international movement. Each part was coordinated by a leading international scholar who accepted responsibility for the organization of authors, reviews, and editing within the conceptual framework of the handbook as a whole. The editors worked collaboratively to define the margins of each part and to decide where to situate topics that could easily be placed in more than one part.

Each part has been designed to stand as a coherent entity while contributing to the large endeavor. A short paragraph at the beginning of each part provides a brief overview. The first chapter in each part, written by the section editor, serves as big picture introduction to the part's theme and the subsequent chapters. In addition to framing thinking and discussion, the introductory chapter highlights the specific contributions of the chapters in the part.

We thank the many contributors to this handbook, which include many contributors to the first handbook and many who were not yet familiar with self-study. We thank them for taking up the challenge of identifying and critiquing important work, making sense of the field, and pushing the field forward. We appreciate their commitment, determination, and responsiveness to feedback from their editors.

We thank the editors of the first handbook for their remarkable achievement, one we appreciate more deeply having followed in their footsteps. We thank them for passing the torch to us. John Loughran, thank you for embracing the idea and writing the foreword. Mary-Lynn Hamilton and Tom Russell, both former section editors, thank you for contributing chapters to the second edition.

As lead editor, I am particularly grateful to my six colleagues for joining me on this long and, at times, arduous journey. Together we shaped the structure of the handbook. Individually, each masterfully steered their parts to completion. I also thank the team assembled by Nick Melchior at Springer for their trust and patience as they kept us on task and diligently attended to the text and the organization of this handbook.

Finally, the editing of the *International Handbook of Self-Study of Teaching and Teacher Education Practices* is an act of hope. The team of editors hopes that this

edition serves as both a useful introduction to self-study and a source of rich information for established members of the self-study community. We hope that it both serves readers in 2020 and continues to support and inspire them 15 years later. It is our hope that the chapters in this two-volume set clearly and accurately capture the richness of self-study as an established research and practice discourse while pushing the community to move forward, particularly in social justice and across languages and cultures. Finally, it is our hope that this international handbook will play a role in fostering teaching and teacher education for a better world.

May 2020   Julian Kitchen

About the Editors

Dr. Julian Kitchen is a professor in the faculty of education at Brock University. He is the lead editor of *Mindful and Relational Approaches to Social Justice, Equity and Diversity in Teacher Education*, *Narrative Inquiries into Curriculum-making in Teacher Education*, *Self-Study and Diversity II*, and *Canadian Perspectives on the Self-Study of Teacher Education Practices*. In addition, he is the author of *Relational Teacher Education* and lead author of *Professionalism, Law and the Ontario Educator*. Professor Kitchen is co-editor of *Studying Teacher Education* journal and editor for Springer's Self-Study of Teaching and Teacher Education Practices series.

Professor Amanda Berry's work focuses on the development of teachers' knowledge and the ways in which that knowledge is shaped and articulated through teacher preparation, beginning teaching, and in-service learning. A key interest in Amanda's research is the question of educator professionalism, its content, as well as its conceptualization. In line with the international movement of the Self-Study of Teacher Educator Practices (S-STEP), Amanda's research concerns the ways in which teachers' learning can be studied from an insider perspective, as a means of enabling and empowering teachers and developing collectively understood knowledge of practice. Amanda has published extensively in the above areas, including books, handbook chapters, international journals, and academic texts. She is current editor of the journal *Studying Teacher Education*, an international journal

of self-study; former Chair of the American Education Special Interest Group in Self-Study of Teacher Education Practices; and Associate Editor of the journal, *Research in Science Education*.

Dr. Shawn Michael Bullock is a Reader in the History of Science, Technology and Education at the University of Cambridge, UK, and a Bye-Fellow at Emmanuel College, also at the University of Cambridge. He first became interested in self-study methodology in his doctoral work with Professor Tom Russell at Queen's University, Canada, and has developed his understanding of self-study methodology through active participation in the community and via academic appointments at the University of Ontario Institute of Technology and Simon Fraser University, Canada, before taking up his current positions at Cambridge. Shawn is particularly interested in the ways in which self-study methodology sheds light on the relationship between disciplinary knowledge and knowledge of teaching, the ways in which knowledge is constructed via experiences of learning and teaching, and the role of personal history in developing a pedagogy of teacher education. Outside of self-study, he uses the lenses offered by the history and philosophy of science and technology to examine issues in education. Shawn's diverse academic interests are partly reflected by his elected Fellowships to the Royal Astronomical Society, the Royal Geographical Society, and the Royal Society for the encouragement of Arts, Manufactures and Commerce.

Alicia R. Crowe is currently Associate Dean of Undergraduate Education and Student Services and Professor of Social Studies Education and Teacher Education at Kent State University. She has been at Kent State for 19 years. Her current areas of interest are on supporting student success through various initiatives including student success workshops, partnerships to support internships and practical experiences, and supports for students who are struggling to succeed in school. Alicia previously conducted research in teacher education, social studies education, teacher learning, and

technology in teaching. She continues to be passionate about teaching and strengthening the study of one's own practice through self-study. Alicia's edited book, *Advancing Social Studies Education through Self-Study Methodology*, was designed to introduce more social studies educators to self-study methodology and challenge them to use the methodology to better understand and enhance social studies teacher education.

Monica Taylor is a feminist teacher educator, social justice advocate, and parent activist. She has numerous publications on feminist pedagogy and self-study, teaching for social justice, use of Theatre of the Oppressed, teacher leadership, and urban teacher education. She is co-PI of the Wipro Science Education Fellows grant which supports science teacher leaders in five districts in New Jersey. Her most recent book, *Playhouse: Optimistic stories of real hope for families with little children*, describes a progressive parent cooperative school through the interwoven narratives of her own children and those of families for the last 60 years. Currently, Monica serves on the Board of Planned Parenthood of Metro NJ and has been volunteering with Team Brownsville in Texas to support and advocate for asylum seekers. Her commitments to fighting sexism, heteronormativity, and racism manifest in all aspects of her life.

Hafdís Guðjónsdóttir is a professor at University of Iceland, School of Education. She was a general classroom teacher in grade schools for 26 years, an experience that has affected her academic focus. From the perspective of constant changes, she researches critical theory and pedagogy with teachers, their students and families, and school personnel. Her research interests are in the area of inclusion and multicultural education, pedagogy and educational practices, teacher development and professionalism, and teacher education. Her research methodology is mainly qualitative, practitioner research, and self-study of teacher education practices. Hafdís has collaborated with colleagues from Europe, Australia, and North America on research and

professional projects focusing on topics considering her
interest area. She was one of the three editors of the
book *Taking a Fresh Look at Education: Framing Pro-
fessional Learning in Education through Self-Study*
published 2017 and also, along with Françoise Bodone
and Mary Dalmau, one of the authors of the chapter
Revisioning and Recreating Practice: Collaboration in
Self-Study published in the *International handbook of
self-study of teaching and teacher education practices* in
2004. Since 2010, Hafdís has published 30 articles and
27 book chapters. From the beginning of 2019, Hafdís is
the co-editor of *Teaching and Teacher Education*.

Lynn Thomas is a full professor and co-chair of the
department of pedagogy at the Université de Sherbrooke
in Sherbrooke, Quebec, where she teaches in the under-
graduate and graduate programs in TESL. As well as
being an active member of the Self-Study community,
Lynn is a member of the *Collectif CLÉ*, an international
research group that studies literacy across the curricu-
lum, in one or more languages and at all stages of
schooling. She is currently researching the literacy expe-
riences of students in intensive language learning pro-
grams. She is also researching the practicum experience
in teacher education and influences of program require-
ments on the development of reflective practice in stu-
dent teachers. Lynn is currently president of the
Canadian Society for Studies in Education.

The first part of the *International Handbook of Self-Study of Teaching and Teacher Education Practices* focuses on the foundations and development of the self-study of teaching and teacher education practices as a unique form of knowledge-making in educational research. The first segment of this part comprises chapters that invite readers to revisit the roots of self-study through its historical, genealogical, and theoretical origins and surfaces both new and enduring challenges associated with the ways in which self-study is understood, conducted, and communicated. The second segment of this part shifts the focus to an investigation of the ways in which the self-study of teaching and teacher education practices research is positioned within the broader landscape of educational research and its potential for meaningful contribution to other audiences, including the community of teacher educators, the education research community, and policy-makers. Overall, this part positions self-study at an important threshold in terms of its presence and contribution within educational research and invites self-study scholars to critically reconsider the particular character and unique form of self-study of teaching and teacher education practices scholarship, and what that means in terms of the way we both conceptualize and "gate keep" self-study.

S-STTEP: Standing on a Threshold of Opportunity

---

Since its formal establishment as a Special Interest Group of the American Educational Research Association in 1993 and the publication of the *International Handbook of Self-Study of Teaching and Teacher Education Practices* in 2004, *Self-Study of Teaching and Teacher Education Practices* (S-STTEP) has grown rapidly, bringing together the worlds of educational research and practice through the insider perspective of those simultaneously engaged in both. Now 15 years later, on the brink of publishing the Second International Handbook, it is timely to examine the accumulation of S-STTEP research produced since the previous Handbook, to identify directions taken, and to draw out issues and questions of significance that can shape future directions for the field. The authors of the chapters in this section do this through examining the foundations of S-STTEP and its development via several lines of inquiry including a historical perspective via the biennial "Castle" meetings of the S-STTEP community of scholars (Garbett, Fitzgerald, and Thomas); its genealogical-theoretical heritage (Craig and Curtis); its

positioning, stance, and identity within educational research (Pinnegar, Hutchinson, and Hamilton); the establishment of its ways of knowing and claims to know (Vanassche and Berry); and its presence within the broader landscape of insider practitioner research (Butler and Branyon) and in teacher education policy and research (Clift and Liaupsin). While each chapter examines self-study practice and research through a particular lens, when brought together these chapters locate self-study very much at a threshold moment in terms of its development. In its literal meaning, a threshold marks a boundary between one place and another. Figuratively, a threshold also signifies a place of transition or a turning point. It can be a productive space, a space of tension and also of potential and opportunity. For the work of S-STTEP, this threshold moment represents both enduring and new challenges. As S-STTEP scholars, we recognize that as form of scholarship, S-STTEP is well-established. The accumulation of work over decades clearly signals that we are no longer beginning. Yet, as these chapters reveal, the extent to which our work extends beyond our local communities remains limited. Such limitations may keep us lingering on the threshold of potential for the growth and impact of our work. Reminiscent of Zeichner's (2007) critique of self-study in terms of its limited contributions to "discussions and debates about issues of importance" (p. 44) in education, the current pressing issue for the S-STTEP community – and what may be seen as its threshold of opportunity – is in realizing its powerful potential for speaking and contributing to different communities and audiences. While the benefit of self-study in supporting teacher educators to recognize and value their own professional knowledge continues to serve a vital purpose, there are others external to the self-study community who can profit from the knowledge and understandings developed through self-studies of practice. Such a contribution is also consistent with the aim of self-study "to provoke, challenge, and illuminate" (Bullough and Pinnegar 2001) taken-for-granted ways of being in, and thinking about, education. Realizing the potential of this threshold moment for S-STTEP to expand its reach and influence is an issue explored by the authors of each of the chapters in this section. Their explorations also raise a central and enduring tension for the community of S-STTEP scholars – How to maintain the particular character and unique form of S-STTEP scholarship while at the same time aiming to contribute to the mainstream of educational research?

An Overview of the Chapters in This Section

In ▶ Chap. 2, "Tracing Self-Study Research Through Biennial Castle Conferences at Herstmonceux," Dawn Garbett, Linda May Fitzgerald, and Lynn Thomas explore the development of S-STTEP research through the lens of the biennial "Castle Conference." Since 1996, this unique 4-day residential conference, located in a fifteenth-century Elizabethan Castle in Herstmonceux, England, has been the gathering place of self-study of teaching and teacher education practice scholars from across the world. The authors have been involved in numerous roles in many of the Castle Conferences: as editors, authors, reviewers, collaborators, presenters, and participants. They draw on their collective personal experiences, together with the

careful scrutiny of (more than) 700 papers from 12 conference proceedings (1996–2018) as a novel approach to elucidating and reflecting on what they see as "the essence of self-study" as revealed by these documents and experiences. Describing their approach as an "eclectic drawing together of threads," these authors identify their chapter as, "[n]either a history nor a systematic review" but instead invite the reader "to come to know the self-study of teacher education practices better … through the lens of Herstmonceux." The authors look back on the conferences, "to turn the proceedings over and over again – to examine, diffract, and re-think events in order to see our past anew and to imagine what our future may hold" (Garbett, Fitzgerald, and Thomas). In so doing, they offer us insights that embody the spirit of self-study scholarship as both embracing the personal, insider perspective and drawing out the collective experiences of the S-STTEP community.

Garbett, Fitzgerald, and Thomas identify three main "threads" that weave through the development of their chapter. The first thread draws out the image of the Castle as a "home" – a unique physical space where the community of self-study scholars can come together to live and work; the second thread draws out the notion of diversity, among the group of self-study scholars themselves, the diversity of learners with whom they work, and the wide range of approaches taken to support these learners, while the third thread takes up the notion of legitimacy in self-study, looking at this issue both outward from and then inward to the work of the Castle Conferences. The authors elaborate each of these threads as commentaries on the processes and practices of S-SSTEP using examples from their personal experiences and from the conference artifacts and documents.

In taking up the thread of legitimacy, Garbett, Fitzgerald, and Thomas identify two different "faces" of self-study: "facing outward as a discipline to be taken seriously among other disciplines" and "facing inward as individuals strive to have their self-study work taken seriously in their careers." In terms of its inward face, the authors reflect on the various ways in which issues of legitimacy have impacted the organization of the Castle Conference over time so as to meet the requirements of academic life, for example, through the introduction of double-blind peer review processes and the production of conference proceedings using specific formats. The increasing popularity of the Castle Conference within its limited physical space also raises a significant inward issue: How to decide what counts as self-study that is worthy to take up competitive slots in a limited program? Here, Garbett, Fitzgerald, and Thomas foreshadow a threshold moment for S-STTEP as they raise concerns about implicit pressures for participants to conform to particular forms of scholarly legitimacy that may work against the more risky, experimental approaches that have always characterized the spirit of the Castle.

In terms of its outward face, Garbett, Fitzgerald, and Thomas remind us that for many academics, S-STTEP research still sits in a precarious position in terms of its institutional acceptability in matters of hiring, tenure, and promotion. While the previous generation of self-study scholars who have gone on to take up senior positions within their institutions have paved a way for those coming after them, there are still many contexts where self-study remains unacknowledged as a legitimate form of research. This point connects well with Butler and Branyon's chapter

that identifies a growing production of self-study scholarship, yet that is limited in reach, typically confined to a relatively small number of institutions in a few countries. Garbett, Fitzgerald, and Thomas identify a central dilemma of legitimacy for the S-STTEP community to try to balance "the need for criteria that claim legitimacy in such a way that individuals are supported to develop as self-study scholars, but without constraining what counts as self-study so much that it prevents the expansion and development of self-study itself."

Running through all of their chapter threads is the metaphorical notion of the Castle as a safe space – where safety is understood both in terms of participants feeling *safe from* the kinds of oppressions that they may experience as part of their academic work or daily life and as a place where they may feel *safe to* explore their learning with colleagues in ways that they may be unable to experience within their usual institutional frameworks. However, in a somewhat contradictory twist, Garbett, Fitzgerald, and Thomas emphasize that self-study is not (and should not be) a safe and comfortable activity – to learn is to commit oneself to a degree of unsafety, to be willing to feel unsettled and vulnerable, to dare to depart from cherished beliefs, and to try to see the world from different perspectives. It is here that the essence of S-STTEP is foregrounded. Self-study is a risky and uncertain enterprise, and that risky uncertainty mirrors the processes that we engage in as educators every time we interact with our colleagues and our students in educative work. And it is here that a significant challenge, and threshold opportunity, for the S-STTEP community is raised. The Castle Conference should offer a space that is safe – preserving the dignity of participants – yet at the same time challenging, to provoke and extend the learning of all participants.

Garbett, Fitzgerald, and Thomas take an intriguing pathway through the corridors of S-STTEP, viewing the Castle Conference as both a physical and symbolic home for self-study researchers. With this chapter focusing on the community roots of self-study, the next chapter by Cheryl Craig and Gayle Curtis opens up an examination of the conceptual roots of self-study and its emergence within the development of teacher education and education research, more broadly.

In ▶ Chap. 3, "Theoretical Roots of Self-Study Research," Cheryl Craig and Gayle Curtis trace the conceptual underpinnings of S-STTEP research and set out the ways in which particular theoretical "turns" that have shaped the field of teaching and teacher education connect with the development of S-STTEP as a research approach. Similar to the authors of the previous chapter, Craig and Curtis present their chapter both through the lens of published research and through bringing in the personal perspectives of selected, active S-STTEP researchers as they elaborate "a family tree of international researchers in self-study."

Their chapter opens with the enduring problem of the theory-practice divide that the field of teaching and teacher education has continually encountered. This divide produces a dilemma for teachers and teacher educators who both enact practice and produce scholarship, as "theory is forced to confront the complexities of actual teaching and learning, and practice is forced to justify its intentions" (McDonald 1996, p. 3 as cited in Craig and Curtis). For S-STTEP researchers, this dilemma is typically described as viewing oneself as a "living contradiction" (Whitehead 1989,

p. 41). Craig and Curtis go on to present a condensed version of the history of teacher education research focusing first on American philosopher John Dewey, "whose theory of experience—more than any other philosophy—metaphorically formed the 'banks of [S-STTEP's] river.'" Moving from Dewey to Schwab and his contemporaries, Craig and Curtis describe how various conceptions of knowledge emerged and proliferated on the teacher education landscape and how these conceptions variously position both the work of teaching (from simplistic to complex) and the status of teachers (from recipients of others' knowledge to knowers themselves). Craig and Curtis's careful chronicling of the history of the changing times and the influences of various figures in the field offers a very helpful backdrop to understand the context for the emergence of S-STTEP. In particular, they identify Gary Fenstermacher's (1994) review chapter, "The Knower and the Known: The Nature of Knowledge in Research on Teaching," that examines conceptions of knowledge as related to research on teaching, as pivotal to the beginnings of S-STTEP. Based on the research included in Fenstermacher's review, Craig and Curtis trace the various theoretical-genealogical lines to elaborate an international S-STTEP family tree of researchers and research clusters.

As noted by Craig and Curtis, the field of education is characterized by particular "turns" or shifts in thinking about the nature of knowledge and its production. They identify one of the most significant "turns" for the emergence of S-STTEP as the increasing acceptance of qualitative research methods, together with "the constructivist turn (Schwandt 1998), the interpretative turn (Clifford & Marcus 1986), the reflective turn (Schön 1991), the action turn (Reason & Torbert 2001), and the narrative turn (Lyons 2006), which also contributed to self-study's theoretical and methodological acceptance as a legitimate field of inquiry." They go on to identify further "turns" that have been influential in the recent development of S-STTEP, as a consequence of the evolving membership of its community and research developments in other fields.

Ultimately, Craig and Curtis identify the origins of S-STTEP as associated with the turn from formal knowledge and its claims to verification, to practical knowledge and its verification claims which represents "in Aristotelian terms . . .a turn from episteme (formal knowledge) to phronesis (practical knowledge)." This focus on the nature of knowledge in self-study as practical wisdom, that is, perceptual more than conceptual, shifts the focus of S-STTEP from epistemology toward ontology and from modernism to postmodernism. (The issue of positioning and stance in self-study is taken up extensively in the next chapter by Pinnegar, Hutchinson, and Hamilton.)

The chapter concludes by outlining a set of ongoing challenges – and threshold opportunities – for S-STTEP researchers emerging through its various "turns." One challenge relates to the extent of theoretical coherence among the S-STTEP community if some members hold a modernist perspective, while others support a postmodernist perspective. Is it possible and/or desirable to hold these different perspectives together? This issue was also raised by Garbett, Fitzgerald, and Thomas in the previous chapter through the ways in which the S-STTEP community is able to manage pressures from both within and outside to conform to certain kinds of

approaches and ways of knowing that may conflict with its intended purposes and goals. A second challenge identified by Craig and Curtis concerns the ways in which certain constructs are used unproblematically within the S-STTEP community. For example, constructs such as "self," "practice," "pedagogy," "story," "reflection," and "knowledge" are the lingua franca of S-STTEP, and yet each of these terms has its own theoretical basis that is not typically acknowledged by S-STTEP researchers. A third challenge concerns the importance for the community of engaging with mainstream teacher education research. Herein lies a two-pronged risk – if S-STTEP researchers do not contribute their voices to the mainstream of education research, then their unique contribution will be lost, yet at the same time, certain research expectations associated with the mainstream may not align with the ways in which self-study is understood and conducted.

The shift from epistemology toward ontology in S-STTEP is taken up as a central focus of ▶ Chap. 4, "Role of Positioning, Identity, and Stance in Becoming S-STTEP Researchers," by Stefinee Pinnegar, Derek Hutchinson, and Mary Lynn Hamilton. These authors state their position clearly from the outset that, "S-STTEP researchers take an ontological stance" and, in particular, a relational ontology (Slife 2004). Through their chapter they explore how they have come to take up this position and its implications through all elements of the research process, from the purpose and design of a study through data collection and analysis to publication. Their explorations take the form of a series of self-posed questions and responses related to their own positioning and identities within the S-STTEP community and more broadly within the teacher education research community. Underpinning their chapter is a view of "S-STTEP researcher identity as ever emergent—always *becoming*." Drawing from the work of Deleuze and Guattari (1987), the metaphor of *becoming* connects their ontological standpoint to the acknowledgment that each of us represents multiple and constantly emerging selves, located within complex, ever-changing contexts.

Pinnegar, Hutchinson, and Hamilton provide an account of their developing understanding of engaging in research from an initially modernist perspective through the struggles they experienced as they sought to follow the conventions of this research tradition that prioritizes the separation of self and research. As they explain, "we experienced uncertainty but lacked the language to articulate . . .or understand that uncertainty" (Arizona Group 2004, p. 1136). They identify Munby and Russell (1994) work describing "the authority of experience" as influential in affirming the legitimacy of knowledge developed through teaching by those engaged in it and offering a language to name their struggles. Interactions with the growing community of S-STTEP scholars further helped to affirm the importance and power of their shift in stance from seeing knowledge produced by researchers for teachers as the only valid source of knowledge about teaching to recognizing the specialized and unique forms of knowledge about teaching produced by those thoughtfully engage in its practice.

Pinnegar, Hutchinson, and Hamilton identify that the act of naming oneself an S-STTEP researcher entails taking up an ontological orientation that embraces the relational (Slife 2004), recognizing the significance of contextuality, holism, and the

multiplicity of connections among people and situations. They explain that S-STTEP researchers create accounts of their practice in ways that bring to life the particulars and complexities of their "becoming" that do not shy away from the difficulties, challenges, and deeply problematic nature of their work. It is in fact the deep, personal, and often unsettling explorations of practice that they claim constitute the unique contribution of this form of scholarship to the ongoing development of the researcher herself, as well as the larger community of teachers and teacher educators. As a cautionary note, Pinnegar, Hutchinson, and Hamilton advise the S-STTEP community to guard against this form of scholarship becoming overly disciplined, normalized, and conventional. Their insights on S-STTEP as always partial and emerging, rather than settled and confirming, suggest that to engage in S-STTEP itself is to engage in a search for pedagogic turning points, or threshold opportunities, that can enrich personal understanding of practice though raising "new perspectives, new discourses, and new possibilities." Their chapter presents a compelling argument for the importance of the S-STTEP community recognizing the power and potential of this form of radical scholarship in bringing forward the actual, lived experiences of teacher educators in ways that can productively challenge and inform the dominant narratives of educational practice and research.

In ▶ Chap. 5, "Who Does Self-Study and Why?," Brandon M. Butler and Angela Branyon tackle this seemingly self-evident question. Surely the answer is in the name: self-study of teaching and teacher education practices – the study by teachers and teacher educators of their own educational practices? However, since its inception, S-STTEP has grown to address a broadening agenda that includes academics working outside of teacher preparation, for example, educational administrators and leaders (see, e.g., Clift et al. 2015), and even those working outside of the field of education, for example, engineering (Nilsson 2010) and arts, humanities, and sciences (Samaras et al. 2014). Butler and Branyon construct their chapter, firstly, around a systematic investigation of the "who" focusing their attention on authors who have published in the dedicated self-study journal, *Studying Teacher Education.* Then, to analyze the "why," they draw on Kelchtermans's (2009) personal interpretive framework of narrative-biographical scholarship, in particular the component of professional self-understanding, applying this framework to articles published in *Studying Teacher Education.* Finally, they look beyond the existing "who" and "why" to consider "others" whose work falls outside of S-SSTEP, yet aligns with the "insider" practitioner orientation and "practices of care" (Polkinghorne 1988) perspective that is characteristic of S-SSTEP. In so doing, Butler and Branyon unpack important questions about how the S-STTEP community may see the future of this form of scholarship and its potential contribution to a genuinely international agenda for the transformation of professional practice.

Through their systematic review of 228 articles published in *Studying Teacher Education* between 2005 (first year of the journal) and 2017, Butler and Branyon identify a largely Anglocentric authorship dominated by five nations (Australia, Canada, New Zealand, the United Kingdom, and the United States). Looking within countries, Butler and Branyon found very limited institutional representation, suggesting the scope of self-study, at least for those publishing in *Studying Teacher*

Education, is restricted to a small group of higher education institutions and, in many cases, only a small number of individuals located within these institutions. Consequent to their findings, they warn that, "the centralization of self-study scholarship to a limited few faculty and institutions endangers self-study institutionally and suggests that it is still something of an unknown presence in university settings." Of course, as these authors acknowledge, self-studies are published in many other outlets beyond *Studying Teacher Education* and in languages beyond the scope of the review for this chapter; however, it is telling that the flagship journal for the S-STTEP community is authored within such a limited group. One approach to broadening the scope of readership and potential contributors has been the publication of *Studying Teacher Education* abstracts in both Spanish and English language, since 2015. At this stage, it is not possible to determine the impact of this initiative and due to limited resourcing will not continue past 2019.

Turning to the "why" of S-SSTEP, Butler and Branyon draw on Kelchtermans's (2009) five components of professional self-understanding – self-image, self-esteem, job motivation, task perception, and future perspective – to analyze the articles they reviewed from *Studying Teacher Education*. They note that among these different components, identity development ("who am I?") receives substantial attention within the articles. Questions concerning identity development continue through the educator life-span and different roles of educators, from novice teacher-educators through to senior administrators. Self-studies that focus on the identity component reflect the idea that through investigating "who we are in how we teach," we open opportunities for reframing understandings of self and practice and that by articulating and sharing insights with others, collective knowledge about educator learning and development can be promoted. Another component that figures prominently within the reviewed articles is that of "future perspectives." While self-studies typically examine educators' prior and current experiences, the impetus for doing so often comes from a future orientation, that is, to understand and transform personal practice and to improve future educational opportunities for others – students, colleagues, and community.

In the final section of their chapter, Butler and Branyon turn to the "others" of self-study. They draw on Polkinghorne's (2004) concept of "practices of care" to explore possible opportunities to extend the reach of S-STTEP scholarship beyond education while staying consistent with its aims. According to Polkinghorne, "practices of care" are typically enacted in fields such as teaching, nursing, social work, and psychotherapy, whereby the "aim . . .is the betterment of the individuals served, and the means for achieving this aim includes a caring relationship and skilled and knowledgeable actions" (Polkinghorne 2004, p. 1). Butler and Branyon note that while research approaches used by those engaged in "practices of care" to inquire into and develop their understandings of practice and personal professional growth are highly aligned with S-SSTEP, they do not specifically name or draw on S-SSTEP methodology. Butler and Branyon make a strong case that connecting with research involving "practices of care" may offer opportunities for extending S-STTEP scholarship given the "many overlapping questions related to identity, preparation and teaching." They conclude their chapter with a caution that suggests a threshold

moment: by limiting the scope of S-STTEP research to a small number of countries, individuals, and fields, we run the risk of reducing both the "potency" and "pace" of self-study as a viable methodology.

The importance of more fully realizing the powerful potential of S-STTEP is further taken up by Eline Vanassche and Amanda Berry in ▶ Chap. 6, "Teacher Educator Knowledge, Practice, and S-STTEP Research." Vanassche and Berry argue that as a methodology, S-STTEP is well-established. What is not yet established, however, and that constitutes S-STTEP's most current pressing issue is how knowledge developed through self-studies of practice can meaningfully contribute to other audiences, including the broad community of teacher educators, the education research community, and policy-makers. An important challenge to achieve this goal will be to understand the kind of knowledge claims that will most convincingly speak to these different audiences while staying true to the nature of S-STTEP. It is through these themes of S-STTEP's claims to know and its potential for wider influence that Vanassche and Berry unfold their chapter and where parallels with previous chapters – and the threshold potential of S-STTEP – become clearly apparent.

Vanassche and Berry begin by reviewing the ways in which teacher educator knowledge is defined in, and through, the process of S-STTEP and how this knowledge is justified. They position their work through the lens of understanding teacher educator knowledge as "that which manifests itself and constantly develops in and through practice." They draw on and analyze an extended example from Berry's own longitudinal self-study as a window into how her knowledge is conceptualized and practiced in self-study research, including her claims to know. Through this exemplar, they highlight the particular nature and shape of this knowledge as "tacit, complex, often contradictory, situated, relational, and moral." Positioning teacher educators as holders, makers, and users of their own knowledge, Vanassche and Berry aim to challenge a technical-instrumentalist view of practice, whereby knowledge is something to be acquired, possessed, and performed, as manifest in many contemporary professional standards documents and evidence-based research agendas.

Vanassche and Berry go on to discuss five characteristics of S-STTEP methodology that enable its particular form of knowledge making:

- S-STTEP starts and ends with teacher education practice.
- S-STTEP speaks to a broad understanding of "improvement" in teacher education.
- S-STTEP is situated inquiry.
- S-STTEP is intentional and reflective.
- S-STTEP is interactive.

These characteristics are informed by, and build upon, foundational characteristics of S-STTEP research design identified by LaBoskey (2004) in the first *International Handbook of Self-Study of Teaching and Teacher Education Practices*, together with other sources including Vanassche and Kelchtermans' (2015) systematic review of S-STTEP research.

Vanassche and Berry make a case that the complex, personal, and situated nature of knowledge developed through self-study should not be interpreted as a sign that such knowledge is so localized that it cannot be communicated in ways that may be useful, more generally. Drawing on various examples of S-STTEP research, they discuss how different forms of knowledge representation developed through self-study capture and make explicit the complex professional know-how, understandings, and professionalism of teaching about teaching in ways that encompass the perceptual as well as the conceptual, the local, and the general theory and practice. Importantly, such representations are not to be considered as blueprints for practice or to be upheld as absolute knowledge claims. Rather, they represent teacher educator knowing at a particular place and time; their usefulness lies in how they can open up and effectively communicate the complexities of what happens as theories and policies become enacted in the real world of practice.

Throughout their chapter, Vanassche and Berry emphasize that S-STTEP scholarship needs to stay true to its broad research agenda, focusing on understanding, not falling prey to a technicist, improvement agenda. "Without this critical character, S-STTEP research risks becoming one of many strategies to simply become more skilful through experience, confirming the status quo, furthering a rather narrow, instrumentalist and accountability-driven research agenda, and unintentionally supporting the further de-professionalization of teaching and teacher education."

Understanding the important and unique contribution that self-studies of practice can make to the field of teaching and teacher education more broadly aligns with the intentions of the final chapter of this part, ▶ Chap. 7, "Self-Study and Education Policy." In their chapter, Renée T. Clift and Carl Liaupsin examine the ways in which the work of S-STTEP has, or has not yet, as their chapter title suggests, influenced educational policy. Clift and Liaupsin identified self-studies published between 2005 and 2017 that reference and/or discuss policy to examine what these studies say about the relationship between S-STTEP research and education policies. From their investigations, they speculate on finding "the presence of absences," consider why this might be so, and offer guidance as to how the relationship between self-study research and education policy might productively develop into the future.

Clift and Liaupsin draw on the work of Taylor et al. (1997) to inform their analysis of articles in terms of three aspects: the nature of policy affecting teacher education, different levels of policy (national, state, and local), and the effects of policy (direct or indirect) on educational practice. They identify self-studies of policy as:

> the nexus between what was transmitted concerning desirable practice, how that transmission was understood, accepted, rejected or modified, the actions and reactions that preceded, accompanied, or followed, and any change that occurred either to those affected by the policy or any modification, revision, or abandonment of the policy itself.

Searching literature relevant to S-STTEP and policy across an extensive range of sources, they found this a rich topic of focus, although dominated by studies from the United States, with a few studies from Australia, Canada, New Zealand, and

the United Kingdom – a pattern of countries reminiscent of that identified by Butler and Branyon in their chapter investigating who does self-study and why. Out of these self-study and policy-related articles, Clift and Liaupsin identified that most studies described the impact of policy on the work of teachers and teacher educators, but did not engage in critique of the policies themselves, nor report on ways in which S-STTEP researchers use their expertise to affect policy. Echoing Zeichner's (2007) critique of self-studies mentioned earlier in this foreword, Clift and Liaupsin found "no evidence that policy studies are aggregated . . .nor. . . connected to the world, or to contexts that cross borders." Clift and Liaupsin call for greater attention by those engaged in S-SSTEP scholarship to realize its full value in policy studies – moving beyond descriptive accounts of practice to engage with its powerful potential for shaping educational policy and practice.

Arising from their investigations, Clift and Liaupsin pose a series of key questions for the S-STTEP community: "Is it possible that the personal, localized nature of current self-study research discourages examinations of policy? Does policy only enter one's frame of reference when the policy becomes intrusive? Is it possible that engaging with policy can be dangerous, such that policy research might open not only self to scrutiny but also one's institution?" Such questions open up important turning points for S-STTEP research that can provide valuable insights to better understand the implications of policy on educators. Given that all teaching and teacher education is situated within a policy context and that at least in some ways policy drives educational practice, then more efforts to include policy issues in S-STTEP research, or at least become explicit in studies about the policy context, should be a community priority. As Clift and Liaupsin point out, the *International Handbook of Self-study of Teaching and Teacher Education Practices* (Loughran et al. 2004) did not contain a chapter on policy, so the inclusion of a dedicated chapter to policy in this Second International Handbook marks an important recognition of the growing body of work in this area. The issue for the S-STTEP community now and for the future is how to consciously integrate and grow this work.

Abstract

Neither a history nor a systematic review, this chapter illuminates 3 threads that emerged in rereading some 700 papers in the proceedings of 12 biennial Castle Conferences. After an introduction to the Herstmonceux Castle Conference venue, the first theme uses the image of a home as a setting for the community of self-study scholars. Pursuing the social justice mission set by the donor of the Castle's Bader International Study Centre venue, the second theme describes the diversity that characterizes the research papers found in the proceedings, both among the researchers themselves and in the teaching practices they use for and with diverse learners. The third theme, facing outward from, and then inward to, the Castle Conferences, examines issues of the legitimacy of self-study as a research method. The chapter ends with an invitation to self-study researchers to push beyond current boundaries to keep self-study growing into the future.

Introduction

This chapter traces the development of self-study of teacher education practices through the lens of the biennial Self-Study of Teacher Education Practices Castle Conferences. It is an eclectic drawing together of threads that have resonated with us as we read and reread the 12 conference proceedings and reflected on the essential nature of a 4-day residential conference in a fifteenth-century castle in southern England. Writing this chapter has been an opportunity to return to the Castle, not to document a history of self-study or to write a systematic review of the conference papers but rather to turn the proceedings over and over again – to examine, diffract, and rethink events in order to see our past anew and to imagine what our future may hold. The collective Castle Conference proceedings are a rich repository of self-study of teacher education practices in and of themselves. The analysis of these papers, along with our memories of editing the proceedings and attending the Castle, captures some of the nuanced experiences, diversity, hidden gems, and forgotten stories that have been shared at the Castle. These are the stories told by teacher educators about their practice as they communicate their commitment to creating knowledge and understandings that can contribute to a better education. We retell these stories drawing on the Castle papers as much as possible to capture the essence of self-study.

The authors of this chapter have been involved in numerous roles in many of the Castle Conferences: editing, authoring, reviewing, collaborating, presenting, and participating. The task of reviewing the proceedings and writing this chapter was both daunting and engrossing. Reviewing the proceedings brought back memories of

how papers were presented and received, but this record is obviously incomplete because there are always presentations that one cannot attend at a conference. Reading the papers, even at a superficial level, revealed too many treasures to catalogue, and doing so might have meant presenting the work in some linear static form. In our culling, we know too well that many people and papers have been omitted. We were mindful that other authors would take specific foci of self-study of teacher education practices as the basis of their contribution to this Handbook. Our remit was to consider the Castle Conferences from within and to give a personalized reading of these multifarious biennial events.

This chapter begins with a history of Herstmonceux Castle and segues to how it became a home to the self-study of teacher education practices research community on a biennial basis. Traces of the Baders' commitment to social justice and thirst for knowledge are echoed in the bricks and mortar of this grand building. The Castle, with its gracious formal gardens and woodland park, provides the physical context for delegates to come together for a 4-day residential conference that is unlike any other. We also acknowledge the benefactor's story. Alfred Bader gifted the Castle to his alma mater, Queen's University in Kingston, Ontario, Canada, in recognition of the education he received there as a refugee.

The method used to parse some 700 papers over 12 conferences is described in the next section. A spreadsheet of titles and authors of papers provided a backbone for the structuring of this chapter. Many ideas and trends emerged from inputting data into this spreadsheet. Worrying about them, playing with them, and sharing them with others, these ideas began to coalesce around three themes. These themes are named and then detailed. As far as is practical, we have used text from the Castle conference proceedings to illustrate and add substance to these themes.

Our Castle, our home. The first theme addresses the role of the Castle Conference as a physical context that affords and nurtures an enduring community, which every 2 years reassembles and reinvigorates itself. The Castle is likened to the home of self-study research for a purpose. For self-study researchers, it has become a safe haven where they are invited to listen, argue, debate, challenge, and reassure in-house in order to go forth into the wider academic community with confidence. As is the case with any home, there are certain characters who have been instrumental in setting the tone at these gatherings. Their influence is considered through the lens of their participation at the Castle Conferences although it extends well beyond this in the self-study literature. There are threads that hold the community together at a very personal level, for example, the camaraderie and commitment to teaching that ensure the Castle Conference is a vibrant and engaging opportunity to share experiences and learn from one another.

The second theme captures the diversity that struck us, both as we turned over and returned to the papers in the proceedings and as we remembered our experiences there. In another theme we explore the wide ranging backgrounds of participants, the variety of methods and pedagogies they have used, and their often inventive options for presenting self-studies. However, in this theme we have drawn on the proceedings themselves as a means to convey the diversity thread that runs from the Baders' commitment to social justice in their original intention for the use of the Castle, into

a future in which we hope to welcome even more international representation. Making sense of the diversity, particularly as representative of socially just practice, led us to select some exemplar papers that galvanized our collective desire to do better, to be better, and to transform education for the better. At the Castle Conference, the authors are supported, questioned, acknowledged, and affirmed in their respective quests to address these issues. In the presentations the participants respond to the multiple challenges that are laid bare.

The third theme considers legitimacy, which emerged more from the processes surrounding the papers than from the papers themselves. Self-Study of Teacher Education Practices (S-STEP) emerged as a Special Interest Group (SIG) in the American Educational Research Association (AERA) at a time when the research establishment was being challenged to accept qualitative methods as worthy, if not preferable, for driving improvement in teaching and learning. This theme considers two faces of legitimacy – facing outward as a discipline to be taken seriously among other disciplines, not just education as a field of, say, psychology, and facing inward as individuals strive to have their self-study work taken seriously in their academic careers. The Castle provides a safe space to develop the theory and methods proper to education as a discipline in its own right. It is a place where academics can share, innovate, and experiment with ideas while also meeting their institutions' demands.

A Short History of Herstmonceux Castle

Herstmonceux Castle was a product of Norman England. Sir Roger Fiennes, Treasurer of King Henry the VI's Household, was granted the license to build in 1441 for his services. Herstmonceux Castle was constructed over the next century of brick (and is now the oldest such building in Britain). A moat, 4 central courtyards, and 140 rooms completed its medieval splendor. In 1776, having fallen into debt, Fiennes' descendants reduced the Castle to a picturesque ruin by demolishing and repurposing the interior. It remained uninhabited until the early twentieth century when it was restored and made fit for habitation by private owners. From 1946 until 1989, the grounds were home to the British government's Royal Observatory. Light pollution from the nearby towns put an end to this being a premiere location for astronomical purposes, but an interactive science center and several small telescopes are reminders of a previous purpose (Fig. 1).

Herstmonceux Castle is now modernized and functions as an international study center for many different groups of students from Queen's University and around the world. Every 2 years, up to 150 self-study delegates drive through English countryside, take up residence, and self-study research rules for 4 days. There is something that is both comforting and challenging about being admitted to this particular bastion. Outward appearances are imposing. Delegates see the Castle reflected in a moat. There is a narrow bridge leading to a grand door. However, this is a faux entrance rarely opened to admit visitors. Access is gained through a smaller door to the left of the Castle. Once admitted to the inner sanctum, there is scope to explore the gardens and rooms, to relax, and talk candidly about self-study research's trials

Fig. 1 Herstmonceux Castle

and tribulations. Every 2 years, the Castle serves its purpose to enfold and nurture self-study researchers from around the world.

The serendipitous course of events that led to the Castle being donated to Queen's University, Canada, in 1992 by a self-made millionaire and philanthropist Alfred Bader and his wife Isabel is also worthy of mention in this review of self-study through the lens of the Castle Conferences. Alfred Bader, a Czech Jew, was sent as a teenager from Austria to England to escape Nazi persecution in 1938. Two years later, he was sent to a Canadian internment camp for European refugees as a possible fifth columnist (Garbett and Ovens 2018). While in the camp, Alfred sat matriculation exams and applied for entry to three Canadian Universities. McGill rejected him because their Jewish "quota" was filled. The University of Toronto rejected him because the chemistry department was doing sensitive war work. Queen's University accepted Bader, and it was here that he completed undergraduate studies in science and art and a Master's degree in science. He then moved to Harvard for his doctoral studies in organic chemistry. Bader met Isabel, the love of his life, on board a ship in 1949 when they were travelling back to England. A 9-day whirlwind courtship resulted in a marriage proposal, which Isabel regretfully declined because of religious differences. Her book, *A Canadian in Love*, was based on the 80 letters she wrote to Alfred between 1949 and 1950. Alfred went on to meet and marry his first wife, and together they had two sons. Nearly 30 years later, Alfred reconnected with Isabel, who had never married. She had worked as a teacher close to Herstmonceux at Bexhill in Sussex since their parting. Alfred's first marriage broke down, and he married Isabel in 1982. Isabel and Alfred have since dedicated themselves to investing in research and scholarship and supporting the arts. The vision that underlies the Bader International

Study Centre (BISC) reflects the Baders' "commitment to offering students a challenging global education infused with social justice, a thirst for knowledge, and civic responsibility" (https://www.queensu.ca/bisc/about-us/heritage/). It is a vision that informs the ethos inherent at the Castle Conferences.

The inception of Self-Study of Teacher Education Practices (S-STEP) predates the first Castle Conference by several years. A Special Interest Group was first mooted by Beth Herrmann, an American academic, at the 1992 American Educational Research Association (AERA) Conference in response to papers presented by teacher educators Tom Russell, Stefinee Pinnegar, Mary Lynn Hamilton, Peggy Placier, and Karen Guilfoyle. Their papers "pricked the consciousness of many teacher educators as the right issues were being raised at the right time and in the right place" (Loughran 2004, p. 15). Identifying, naming, and acting upon the issues of concern for teacher educators (e.g., learning to teach about teaching, teaching in meaningful ways, and ensuring practitioner research was accepted by the academy) became touchpoints. In this rich, fertile ground, the seeds took root and, given the conditions of the Castle Conference, began to flourish (see Loughran 2004, pp. 13–17 for detail).

How the conversation from AERA was translocated to a Castle in the UK to become a biennial conference was something of lucky happenstance. In July 1994, Tom Russell, a professor of education at Queen's, had visited Herstmonceux to see the new offshore campus for himself. He showed photos of the Castle to Stefinee Pinnegar and Mary Lynn Hamilton when they met shortly after at an action research conference hosted by an academic, Jack Whitehead, in England. Unsurprisingly, the thought of having a conference in a castle caused a great deal of excitement. According to folklore and Janet Richards, co-editor of the first Castle proceedings in 1996, they declared, "We have to have a conference there," and so it came to pass. Since the first Castle Conference in 1996, scholars from around the world have come together for the common cause of enhancing teacher education practices, for sharing knowledge, and promoting teaching ideals. If the original intent of the Bader International Study Centre was to broaden the views of the students who attended extramural courses, that vision has been enacted through the sharing of ideas internationally about self-study of teacher education ever since.

Method of Writing the Chapter and Parsing the Data

Writing about the history and development of self-study through the particular lens of the Castle Conferences has been an absorbing endeavor for us, as authors of this chapter. Fossicking through more than 700 papers in 12 conference proceedings (1996–2018) revealed too many treasures to catalogue, and doing so might have meant presenting the work in some moribund form. The breadth captured in the written artifacts is in itself overwhelming. Wanting to acknowledge and respect the contributions of so many authors is daunting. Coupled with intimate knowledge of the multifaceted nature of each Castle Conference – including the participatory collage workshops, embodiment and dance performances, readers' theater, and poetry recitals – the task of representing this work is truly mind-boggling.

The first step in organizing the papers for analysis was to render 12 conference proceedings, capturing snapshots of self-study's development over 22 years into a spreadsheet detailing dates, people, topics, and a numerical count of the number of references in each paper. Initial themes emerged through an exploratory phase of skimming the titles, authors, and content. These themes were further revised and refined, induced from the data set and from our own values, theoretical orientations, and personal experiences of the Castle Conference. Some themes resonated more strongly with us than others and became the mainstays of this chapter. These themes are by no means all-encompassing, but we are confident they draw attention to the unique contribution that the Castle Conferences have played in the history of self-study as a research movement.

After consolidating the themes, each of us skimmed the proceedings, inserted tabs (physically or electronically) to mark important passages or appropriate contributions related to a theme. We then re-reviewed the proceedings for text that spoke to the themes. This aggregated data was then shared among the authors of this chapter and, along with the spreadsheet, became the basis for the first draft of this chapter.

Three main themes emerged that we explore in this chapter. The first is the development of a community that nurtured self-study researchers within the Castle's walls. There have been many academics who have presented at Castle Conferences and who, by their scholarship and determination to keep teaching at the forefront of their purpose, have strengthened a flourishing community. In a sense, they have created a home at the Castle. The second theme illuminates diversity within the self-study community and speaks to understanding the role of teacher educators as critically reflective practitioners working with diverse learners and preparing new teachers to work with diverse learners and in diverse settings. These self-study contributions simultaneously illuminate the differences between – people, settings, and topics – so that the similarities can be appreciated. The third theme is the legitimation of self-study as research methodology that draws on a variety of methods depending on the purpose. This theme speaks to the crusade that is waged internally and externally to claim rigor and scholarship. There have been founding, tentative principles of self-study as methodology, succeeded by a second generation of principles, which has provided stability for the research methodology. A further generation of principles is now emerging in the richness of the community. We now explore each of these themes in more detail.

Theme 1: Castle Conference as Context – Creating a Home at the Castle

A Place Apart

Creating a community where teacher educators can meet to discuss ideas and explore their understanding of teacher education and its practices has been a mainstay of the biennial Castle Conference. The editors of the first conference proceedings (Richards

and Russell 1996) wrote that this was "the first publication originating from a conference devoted entirely to self-study research," and they invited the reader to "imagine the luxury of residing in this castle and spending four wonderful days sharing ideas and initiatives with colleagues who work in varying educational roles and contexts worldwide?" (p. vi). A residential conference in a Castle certainly is a unique and fanciful setting, but it is the structure and format of the conference that stands it apart from most others. The early organizers had met informally to discuss what they liked most and least about other conferences they had attended. One result of that conversation was that there have never been keynote speakers. Everyone, luminaries and neophytes alike, are allotted 1 h to share their research in a way that engages the audience as co-learners. There has always been an understanding that the audience will be ready and willing to interact with presenters and their ideas. In order to support a meaningful discussion, the papers are made available before the conference so that the delegates can read them and come prepared to ask questions and participate in discussion and exchange.

The thought that this might descend into a conference where the audience was talked to for an hour at a time was an anathema to the community, professing as it did that there was more to teaching than telling. A further feature of the conference organization has been that only four or five sessions run parallel. Because the number of conference delegates is restricted to no more than 150, the audience for each session typically numbers between 20 and 35 people. There is an understanding among participants that they will distribute themselves equitably among presentations. This idea is reinforced by Tom Russell's note on the Castle Conference website for first-timers:

> If a room is full because we did not guess which authors or titles would attract the greatest numbers, remember there are other sessions that would be thrilled to have you join in and increase their audience size. Even if there is space to sit, if you can see that a room already has a large audience, go looking for a room that needs a bigger audience. (https://sites.google.com/site/castleconference2010/Home/thoughts-for-first-timers)

Audiences are also naturally constrained by the size of the rooms, several of which have a capacity of 35–40.

Physical constraints aside, another important difference between this and other education research conferences is the luxury of time – flexible, unrushed, and indulgent time. Teacher educators gather from all corners of the world to discuss challenges, share successes, and celebrate teaching in presentations. The Castle provides a physical space for creating a learning community of self-study researchers who are willing to question, clarify, take risks experimenting with innovative approaches, and examine and reframe their views about teaching and teacher education practices.

The early Castle Conferences welcomed a wide variety of presentations – dance, readers' theaters, plays, poems with trumpet accompaniment, half-baked ideas, collage workshops – and a variety of participants. Some participants were not clear about what self-study was but were willing to give it a try in exchange for an

exotic teachers' "summer camp" in a castle. For example, Joe Senese had a chance encounter with the call for proposals for the second conference in 1998 and was intrigued by the setting. Enlisting three fellow practitioners from his Midwestern USA high school, they submitted a proposal not only to the conference program committee but also to their high school for funding, to share their Action Research Laboratory as a model for professional development that could be extended to preservice teacher education (Senese et al. 1998). They were somewhat surprised that they were both accepted and funded and had no idea what to expect. The overwhelmingly higher education participants, however, were delighted to have secondary school teachers, and the welcome given to their presentation began a run of return trips for Joe for all but one of the following Castle Conferences.

For each of the conferences, specific instructions are given to presenters encouraging them to interact with their audience – to use them as sounding boards for ideas, converse, discuss, suggest, and challenge. As Rachel Forgasz and John Loughran (2018) noted:

> We consider the Castle conference as an invitation to do more than simply present a self-study paper; we aim to create a pedagogic experience that will engage participants in the study, both cognitively and emotionally. . . we draw attention to how pedagogic intent, practice and interpretation interact to create outcomes not always envisaged. (p. 370)

Conversations continue past the scheduled hour of presentation time, over coffee or tea, daily meals, and evenings in the Castle's pub. The sense of collegiality supports the development of deeper understanding and respect for what we profess to know and do. It is this combination of time, space, place, and ethos that ensures that the Castle Conference participants enrich their professional work and nurture the collective community.

Indeed, the papers in the Conference Proceedings were always intended to be "the first part of a two-part communication, the second part of which [was] the 50-minute presentation each presenting author [made] at the Castle Conference itself" (Lighthall 2004, p. 199). Explicitly seeking engagement and participation from the audience is evident in many papers. For example, Donna and Jerry Allender's paper (2008) ends, "In the session . . . the participants in pairs will role-play . . . Afterwards, let's talk about what we're learning from all this talk" (p. 16). Susan Constable and colleagues (Constable et al. 2008) "call upon our colleagues to build on our insights as we improve teacher education by improving teacher educators" at a personal and professional level (p. 76).

Jean McNiff (1996) prefaced her paper presented at the first Castle Conference with:

> This is not a well-formed paper. It is a way into an area that I would like to develop. I have offered opinions about why I think the area is important, and how its importance might be justified, but I am only now beginning to research it seriously. I would therefore like to take the opportunity of our conversations at the Castle Conference to share ideas with you and invite you to give me feedback on the work so far, as well as suggestions as to how it might be taken forward. (McNiff 1996, p. 1)

She concluded:

> I would be grateful to you if you could give some thought to what you do when you are listening, so that we may share our ideas at the Conference. I would be grateful for your insights to help me move forward. (p. 4)

Twenty years after Jean's comments, the dialogue among participants across space and time is as strong as ever. In their 2016 contribution to the Castle, Anastasia Samaras and her colleagues thanked 21 conference participants who had enhanced their conversation through found poems written at the previous S-STEP conference (Samaras et al. 2016). One such poem entitled "The Self-Study Movement" captures the essence of the Castle Conferences for many delegates. We come together to discuss and share the challenges and trials of teaching and researching our teaching in order to improve it. This is fundamental to inhabiting the space where our research and teaching are inextricably combined.

> One life changed
> What can it do?
> To make a difference?
> To impact and inspire?
>
> We tell stories
> To develop an ethical position
> To produce our best true selves
> Not just our intellectual selves
> A whole body experience
> That feels real
>
> Adding to each others' learning
> Breaking down the status quo
> Living in a world where our research is
>
> Being creators of social change
> For the future university
> For the public good (p. 167)

It is often difficult to convey that which "feels real" in the written work. Juanjo Mena and Tom Russell reviewed all 65 papers in the 2014 conference and presented their preliminary findings at the final session. They later published their work (Mena and Russell 2017) stating that all papers were improvement aimed, generated knowledge, and were self-initiated as have come to be recognized as hallmarks of self-study research according to LaBoskey's (2004) much referenced chapter. Three-quarters of the papers reviewed were collaborative in some way or another. However, Juanjo and Tom wrote that even though all papers mentioned trustworthiness, "about 40% failed to explain how it was achieved. Simply mentioning trustworthiness does not ensure credibility to those who do not attend a study's presentation" (p. 115). Therein lies the rub. Those who do attend presentations can attest to the considerable richness and nuanced exposition that is not easily captured in the written artifacts. The knowing laughter of being able to identify with the

presenter's conundrum, nods of agreement when a particular finding rings true, and tears of compassion when empathy abounds – these sentiments are difficult to transpose to the written word. Katharine Childs (2006) wrote:

> I believe storying to be a form of meta-communication because it aids in communicating experience – and because of that, it creates community. A story is not simply words, but the relationship between words and our experience. Community and caring grow when people share experiences. Stories create bridges between people's experiences. When someone tells us a story, even though the actual details of the experience it talks about are different from ours, there are times when we feel a certain resonance between the experiences. It is this resonance that helps us connect and relate to them as being similar to our own. (p. 53)

Many conference delegates return to the Castle numerous times and reaffirm their commitment to the community through sharing their stories of trials and tribulations. Self-study research is a way for teacher educators to ensure that learning about teaching teaching in all its complexity and confoundedness is kept to the fore. This is not to suggest that self-study is a matter of telling stories. Self-study must be more than this. As John Loughran (2008) explained, telling stories is a first step toward constructing knowledge. At the Castle Conference, teacher educators hone their story telling capabilities in order to articulate their growing understanding to a wider audience. Participating and contributing at the Castle is a means for self-study researchers to rehearse arguments and forge new understanding so that they can carry on the crusade, often in what can seem to be uncharted and/or unsupportive territory.

One such well-rehearsed argument is the transition from teacher to teacher educator or nontenured to tenure-track positions. Within the Castle's confines, delegates seek counsel from those who have already accomplished such feats. Over meals and breaks, there are colleagues ready to share their expertise as members of doctoral advisory committees, senior academics who play a part on promotion and selection panels, and others who have refined their skills in crafting funding proposals, vitae, and research proposals. Reading self-study accounts of how such deeds were accomplished by peers and colleagues enables others. In the foreword to William and Hayler's edited book *Professional Learning Through Transitions and Transformations*, Robert Bullough (2016) wrote that:

> hero narratives hold the potential for inspiring readers and listeners to recall lost commitment and faded ambitions and to reclaim themselves as authors of their own destinies... to reimagine themselves as better than they are or thought they might be and thereby suggest that they too can act heroically. (p. v)

Supporting and championing others is par for the course, and with the support of the community, self-studiers forge ahead. An example of the importance of community support is evident in Dawn Garbett's (2012) self-study. Dawn sought promotion based on research-informed and evidence-based teaching and staked "a claim for self-study research to be recognized as more than reflective practice and for theorized teaching to be accorded status" (p. 124). She borrowed the image of Crusader

Rabbit from Stefinee Pinnegar's collaborative work (Arizona Group et al. 1994) and spoke with senior academics at the conference about how best to mount her campaign. Although unsuccessful in her first two attempts, she persevered and was ultimately successful. Her self-study emphasized that being able to combine teaching about teaching and researching teaching together in a cohesive whole was a worthy pursuit in and of itself. Self-studies are typically driven by the desire to improve one's teaching or understanding of an issue rather than the imperative to publish or perish. If recognition in the academy is also forthcoming, it can be considered a bonus rather than the raison d'être. Undertaking a self-study as part of academic gamesmanship and churning out publications lest one perish is not sufficient motivation for the authenticity demanded by a self-study and the demand that transformation of one's practice be a, if not the, goal.

Others use self-study to respond to and understand their dynamic workplaces. For example, Laura Haniford and Penny Pence (2016) engaged in a self-study to reconcile their differences in an institution that was undergoing organizational change:

> [T]heorizing how this happened is important for us in understanding our own frustrations, feelings of disempowerment, and times of profound disengagement. Teacher education programs are always fraught with outside exigencies and our schools with ever changing contexts. We must develop theories to guide us, but these theories must be in a state of constant evolution and address both personal and collective issues, honoring all those involved. We believe that self-study can be an ethic for program participation. We have come to value disagreement as a way into clarifying our work, rather than as something to be stifled or avoided. (p. 178)

There are so many examples of self-study scholars who use this conference to work with and through managing the challenges of institutions' demands and personal motivations and who are willing to rehearse and articulate their learning to enhance our collective ability to understand commonalities in our practices. As was foretold in the early conference proceedings, there has always been a connection through our work that underpins the conferences:

> Learning through self-study is a process with no real end-point. For each of us the journey is different and, although our paths continue to cross in many ways, they are also divergent as issues and experiences influence our understanding of teaching and learning about teaching differently. (Hamilton et al. 1998, p. 1)

Fundamental to self-study's aim is to improve pedagogical practice and to add to not only our own but also others' understanding of this complex task. Five teacher educators (Constable et al. 2008) have captured how powerful studying one's own practice in concert with others can be. Striving to become adaptive experts, they wrote:

> Routine experts learn to do something well and continue to use the same approach with greater efficiency over time. Adaptive experts, in contrast, are willing to change their core competencies. Change, while beneficial in the long run, can be emotionally as well as

practically disruptive in the short run. Our self-study unveils efforts to move beyond the stance of routine experts who develop an approach to teacher education that works and stick with it, in order to become adaptive experts who continually reshape their expertise. (p. 75)

They wrote that the experience of being part of a self-study group was:

valuable and satisfying. Conversations were dynamic and allowed members to express frustrations and to celebrate successes . . . Self-study within a group context provides the right level of challenge and support, promoting professional growth while cushioning the emotional blows that are a natural by-product of moving into uncharted territory. (p. 76)

For those who attend the Castle Conferences and join the community of self-study scholars committed to teaching, this support and challenge is magnified exponentially.

Scholars at the Castle

Coming together as a community of scholars on an equal footing to share and discuss ideas and experiences requires openness and authenticity. Full professors, deans of faculty, program leaders, doctoral students, school-based teachers, and teacher educators mix with ease. Pivotal in nurturing this open-minded stance and willingness to learn from one another have been certain key players. These scholars have been instrumental in setting the direction and tone of the Castle Conference. Tracing the influence and impact they have had on the conferences through each iteration has been beneficial to understanding how the conference has remained vibrant. Tom Russell, John Loughran, Stefinee Pinnegar, and Deb Tidwell are four such notable scholars who have contributed at least one presentation to each of the conferences (1996–2018). Their influence has seeped into the foundations of the Castle Conference. There have been many scholars who have shone at the Castle Conference, but we acknowledge these four as guiding lights from the very first Castle Conference. As we now explain, each has had a different influence on the proceedings and essence of the conference.

Tom Russell, as a full professor at Queen's University, liaised with the proprietors to convene and host the first 11 conferences. He co-edited the Castle proceedings in 1996 and 2000 and authored or co-authored 21 presentations at the Castle Conference between 1996 and 2018. Tom has co-authored with more different colleagues from within his institution, Canada, and internationally than any other presenter at the Castle Conferences. For example, he has written with his department chair, school teachers, college professors, former students, colleagues from Queen's and other Canadian universities, as well as colleagues in Australia, the USA, Spain, and Chile.

Tom's research is grounded in his wealth of practical experience. Tom has always been focused on making a positive difference to his students' learning journey in the long term although, as he, and many other self-study researchers, have realized, "teaching's greatest mystery is the fact that we have no control over what our

students make of what we say and do as we teach" (Russell 1997, p. 41), much less what they are going to remember about the teaching in years to come. Some of his student teachers have gone on to complete their doctoral studies and become teacher educators and leading self-study scholars themselves. Shawn Bullock is one such former student-cum-colleague. Tom first presented with Shawn in 2006 about the assumptions they both had as they continued to learn about teaching (Bullock and Russell 2006). Shawn has since co-authored 13 papers with 10 different collaborators and has 17 papers published in the conference proceedings.

Tom's teaching must be replete with treasured moments as student teachers have responded to his pedagogical turns. He wrote about one such moment thus:

> Learning from time to time, usually in unexpected ways at unexpected moments, that some new teachers did "catch the message in my teaching" and express it in their own teaching sustains my conviction that how I teach *should be* the message that teacher candidates take from my classroom. If they also remember how much teacher education consumes me as it also fascinates and puzzles me, then I have successfully shared my professional passion for teacher education. (Russell 1997, p. 46)

The self-study community has been privileged to witness this unfailing passion for teacher education through his presentations and participation in every Castle Conference.

Special acknowledgment must also be made of Tom's approach to fostering the collaborative and supportive Castle Conference ethos. His has been an unassuming hand at the helm, but his warmth and attention to detail has ensured the smooth running of all of the conferences. In conference organization, Tom has been supported by his wife LaVerne who has specialized in planning excursions to places of historical interest in the English countryside. These bus trips, organized for the day of the opening of the conference and for an afternoon during the conference, afford an opportunity to reconnect informally with previous participants and to make new acquaintances. These, and other aspects of the social program, help to foster a self-study camaraderie.

Equally influential and prolific in the wider teacher education community is John Loughran. He is a longtime champion and advocate of self-study research. John and Tom Russell's connection extends to the time when John was on sabbatical in the fall term of 1995 at Queen's University and observed every class that Tom taught. Their discussions centered on how they could help beginning teachers learn to teach. John and Tom were the founding co-editors of the self-study journal *Studying Teacher Education*. John was also an executive editor of *Teachers and Teaching: Theory and Practice* for many years. He has published and initiated much self-study work with Routledge and Sense Publishers and is the editor for the Springer published book series, *Self-study of teaching and teacher education practices*. It is through these outlets with John's endorsement that many self-study research projects have achieved wider dissemination. John has supervised numerous doctoral students and encouraged them to attend the Castle Conferences to share their work. Like Tom's doctoral student, several of John's former doctoral students, for example,

Amanda Berry, Robyn Brandenburg, and Dawn Garbett, are now regular conference contributors, collaborators, self-study researchers, and editors themselves. John and Tom Russell co-edited the conference proceedings in 2000.

John's contribution to Castle Conference presentations is characterized by the insightful and astute questions he poses to challenge and provoke an audience, a presenter, and/or himself. John's insistence nudges self-study researchers to move beyond telling stories to answer the "so what?" question and encourages them to act and transform their practice. For many, this has become a litmus test to measure the worth of a self-study. Does it have catalytic validity (Lather 1986) in as much as it re-energizes and refocuses attention on teaching? Does this research project make a difference – for the teacher educator, for the students, or for the institution? Most importantly, does the self-study add to the development of knowledge about practice (Loughran 2008)? In this paper John wrote:

> The point of this argument then is that the stories of these teacher educators' work are helpful, and readily identifiable by others, as ways of doing teaching teaching.
> However, it is the learning derived of researching their practice that leads to the production of new knowledge of teacher education practices. This knowledge is not so much propositional by nature, rather it is such that it helps to frame understandings of practice as problematic and dynamic. In so doing, they build on the work of others (both within and outside the field of self-study in productive ways). Therefore, the knowledge developed, offers real possibilities to others because it does not define outcomes as being right or wrong, or the best way to approach a given situation, rather the knowledge is framed such that it informs themselves and other teacher educators about ways of considering what they do, how and why, so that they might bring their own professional judgment to bear on their practice in their context. (p. 220)

John went on to ask the conference delegates:

> So as members of the self-study community, how do we continue to challenge our work in relation to views about the nature of the knowledge we produce from both a personal and collective perspective? How do we intend to push the boundaries of what we have learnt from self-study so that it can be structured and shared in ways that will invite further interrogation and development? It is crucial that we do not stop questioning the *so what* of self-study. (p. 220)

Stefinee Pinnegar is another example of a generous scholar who has collaborated with numerous people over the course of the conferences to push self-study research, methodology, and thinking in multiple different directions. Since 2014, emerging self-study researchers have had the opportunity to attend a preconference workshop, which has been orchestrated and organized by Stefinee. Together with a team of experienced colleagues, they have mentored other scholars and supported them to finesse their self-studies. Stefinee has also brought former students into the self-study fold – scholars who have gone on to contribute to the community such as Mary Rice, Shaun Murphy, and Ramona Cutri. Stefinee has also co-edited two volumes of the proceedings (2010 and 2012). Her work outside of the conference proceedings, through journals, books, and chapters, is prolific. Stefinee and her longtime

self-study colleague, Mary Lynn Hamilton, have collaborated numerous times on conference presentations that have challenged self-study methodology. Many of their contributions have been creative and participatory such as at the 2016 conference where they presented what could be framed as a retrospective catalogue of their work together in an installation that spanned three "Deleuzinal moments." They invited conference delegates to view and engage with their art installation during the conference and to share their own experiences at an afternoon session on the last day. Their work was announced in the program but was not published in the proceedings:

> In this work we excavate our experiences nested within our many contexts (universities-teacher education-life) and explore our catalogue of experiences in relation to our practice across our careers. Our purpose is to unravel tensions among theoretical perspectives, personal experiences and academic choices using visual representations of our maps of destiny. We anchor our work in three identity sites along our landscape: a) experiences in our academic homes, b) collaboration among critical friends, and c) interactions between the academy and our desires for BECOMING strong teacher educators. Our particular experiences reveal the vicissitudes of academic life and our understandings of BECOMING. (Hamilton and Pinnegar 2016, conference programme)

Deborah Tidwell's development as a self-study scholar is an example of the trajectory followed by many committed to self-study research. She began as a reflective practitioner, applying action research methods in single-authored studies. Deb faithfully attended annual AERA SIG sessions and biennial Castle sessions and stepped into service and then leadership positions in both overlapping groups. In so doing, she moved from the periphery to inhabit the center of self-study. Deb has co-edited three Castle Conference Proceedings (2004, 2006, and 2008). She has worked with doctoral students, practicing teachers, graduate students, and colleagues in other universities. Identifying self-study scholars whose AERA or Castle papers fit themes of diversity or methodology, she invited them to contribute to books she co-edited, with particular attention to giving junior scholars a wider opportunity to become established in self-study publications. A particularly poignant collaboration with Hafdis Guðjónsdóttir gave a lasting voice to their dear friend, Mary Dalmau, helping Hafdis to edit the latter's final book (Dalmau et al. 2017). One of Deb's many strengths is her empathy and support of newcomers to self-study. She is very talented in helping novice researchers identify what is important in their work and how to keep moving it forward. Deb is a doyenne held in high esteem by the community.

The influence of these key scholars has extended across conferences, continents, and contexts. Such generosity and genuine interest in one another's research has set an example that others follow. Many repay their gratitude or express their willingness to contribute through mentoring others and collaborating in an ever-widening network. Opportunities to collaborate are often initiated at the Castle Conference but extend well beyond the Castle walls. Spin-off edited books around themes that are first talked about around the dining hall table are a testament to the generative and productive nature of the conferences. At the fore is the abiding drive

to enhance teacher education practices and contribute to our knowledge about teaching teaching.

Holding the Castle Community Together

What are the threads that have held the self-study community together? One of the most endearing traits of self-study researchers is their ability, if not their compunction, to be authentic about their travails. As Donna and Jerry Allender commented in the first conference proceedings:

> The space between comfortable and uncomfortable is where significant learning occurs. This is especially true for self-study. For this reason, we have spent substantial energy over the years on creating and finding the kinds of community that support our efforts. (Allender and Allender 1996, p. 14)

At the Castle Conference, the Allenders found a place where they could share ideas and deepen their understanding of their life's work. Anyone dipping into the conference proceedings finds many examples of teachers who share moments of retrospection, such as something a student or colleague has said that makes a profound difference to the way they view their work, and importantly their priorities. In the retelling, their learning also has the ability to teach us. One such example is a contribution by Allan Feldman (2000). His study was sparked by a doctoral student who asked to discuss her proposal with him at a conference. He said he could spare 25 min. Her poem in response to this chunk of time compares the value of 10 min more. The poem concludes with the line "Take care...It is not the amount of time my friend, it is the quality of time" (p. 64). Allan's ensuing self-study considered his experience of time. He acknowledged his lack thereof stating:

> I had reached a new level of being busy – I now know that there were things that I just would not get done. Why is that true and what does that mean? Why is it that my life as a teacher educator feels like it is slipping into the future? Why does it feel like time's arrow has become a rocket? (Feldman 2000, p. 62)

Many in the audience would have nodded their heads in agreement. Allan claimed there is a time crisis in teacher education:

> because there is not enough time to do what is being asked of us and what we feel responsible for or obligated to do. Teacher education is a caring profession. To do it right means to have enough time to work directly with students and teachers, to listen to what they say, and to use our expertise to give reasonable advice. But teacher education has entered the mainstream of the university, and we, as teacher educators are required to "produce knowledge" through research and other scholarly activities... for many of us... engaged in self-study of our teacher education practices, our desire to engage in these activities has a moral basis. We want to inquire into our practices to learn more about the nature of teaching, teachers and teacher education because we believe this will lead to better lives for students, teachers and the others engaged in schooling. (p. 63)

He offered no suggestions to ameliorate the crisis. We suspect that little has changed in the intervening years; if anything there are even more pressures on our collective energy and resources. Perhaps, encouraged by Feldman's research, the delegates may have taken a moment to consider their own responses to the demands of academic life and slowed time down – however briefly – to gain a new perspective. It seems that such is the lot of an academic and scholar but – even more so – a committed teacher educator.

The notion of teaching as a caring profession echoes throughout the proceedings. As Jean McNiff (1996) wrote: "listening to the message in the spoken words but also the message in the unspoken values. And the actions in which the words are offered speak louder than the words themselves" (p. 4). Jean also wrote that "the literature of self-reflective practice is rooted in the idea of care, that practitioners make a moral commitment to improving their work, which itself arises from a commitment to act in the other's best interest, to care" (p. 4).

In the first conference, there was a large contingent from Queen's University. In fact, 8 of the 43 papers were linked to Queen's University. Tom Russell and Rena Upitis, the newly appointed Dean of Education, co-authored a paper that detailed how a community had been fostered through an honest and frank exchange of emails. This reflection from Tom about one exchange between himself and Rena is underpinned by the sense that we are all positioned in different ways in any community:

> In a university community, it is easy to identify "the new and the vulnerable" in the form of those who are working for tenure. Often these people are young, but this is not necessarily the case. Having been awarded tenure after six years some 13 years ago, I have to accept the fact that I am not new here. Yet I remember those early years very clearly, and felt "new here" far longer than most people seemed to credit me with being new. We who are "older" are easily painted with a single brush, when in fact we vary enormously in our relationships to whatever community exists around us. We who are "older" are not a homogeneous community in any sense beyond mere "been around a long time." Although much has changed in Rena's first year on the job, we are still a community with disparate views about the relevance of research in a Faculty of Education that, some say, should first and foremost be known for good teaching. We have still not resolved the "common sense notion" that doing research means neglecting one's teaching. (Russell and Upitis 1996, p. 140)

Perhaps more than anything else, self-study of teacher education practices research has given Castle Conference delegates wherewithal to combat the prevailing idea that doing research means that teaching should be relegated to lesser importance. For self-study researchers, the Castle Conference is a haven where we can luxuriate and let our passion for teaching in concert with research run amok. Thus, the Castle Conference has become a communal space where researchers in teacher education can gather to take risks, reveal vulnerabilities, and speak honest truths about researching and practicing teaching without fear of judgment or reprisal. The building itself contributes to this sense of safety and openness, as its distinctive castle properties lend an "otherworldly" atmosphere to the conference, far removed from the stresses of daily academia. Clearly, however, it is the participants

themselves, supported by the conference programmers, who have nurtured this community and created this open and supportive space. Just as the Castle has seen many changes, so too has the community changed and developed. As Rachel Forgasz and John Loughran (2018) pointed out:

> the Castle Conference creates opportunities for self-study researchers to be safe *from*: personal criticism; marginalisation; rigid pre-ordained structures; and, the pressure of conformity. Perhaps more significantly, an environment that offers safety *from* all of these oppressions then simultaneously creates possibilities in terms of safety *to*: take risks; innovate; be vulnerable; and experience learning through uncertainty. (p. 372)

A thirst for new knowledge and an openness to learn from multiple others remain at the heart of the self-study community. There are many who interrogate and worry at the challenges and issues that are constant in teaching teaching in dynamic and diverse contexts.

Theme 2: Celebrating Diversity at the Hearth of Self-Study Practice

The theme of diversity in the Castle Conference papers emerged from an initial review of the proceedings. In concert with the original commitment of the Baders, offering all students an educative experience infused with social justice and civic responsibility aligns with the desire to teach in ways that make a difference for all. At every Castle Conference, there has been an eclectic mix of delegates who share a passion for improving teaching, but this common disposition aside, the contexts, challenges, and characters are diverse. The contributions differ enormously in scope and intent. For example, one may celebrate a student teacher's response to a child, unable to use spoken language, who eye-points her preference for which hat to wear in a play (Johnson 1998). In another, as a result of their research, teacher educators may make the statement that Whiteness is an issue for their teaching because it is both figuratively and literally in their face (Griggs and Tidwell 2012). A multicultural research group from a politically fraught country reiterates the message that teaching is always relational (Barak et al. 2016). In 2014, a group of 16 researchers produced a collective self-study on gender, feminism, and queer theory in education (Abi-Hanna et al. 2014). Supporting teachers to adopt frameworks that challenge heteronormativity in schools and embrace LGBTQ youth was the focus of a workshop (Taylor et al. 2018). Even though the stories that self-study researchers tell are specific to themselves and their contexts, what other self-study researchers take away from the stories is germane to their own practice. This is a case of "I tell my story for me, you hear my story for you" (East et al. 2009, p. 61). In this section, we return to the "so what?" question that self-study researchers ask of themselves and their colleagues. As Tom Russell (1997) has stated, *How I teach is the message*. That is, students take a great deal more from who we are and how we interact with them rather than what we may present as content knowledge. Self-study researchers'

understanding of this powerful and enduring message underlies the following section where we discuss the importance of self-study for improving teaching for all students.

The Importance of Self-Study for Socially Just Practice

Self-study researchers are intent on improving their practice, and a focal point often is finding their way to integrate social justice into their courses. Enabling preservice teachers to interact with pupils of diverse cultural, ethnic, or racial backgrounds in respectful and supportive ways is a recurrent issue in Castle contributions. Acknowledging personal trials and challenges at the Castle Conference is a way for delegates to expose their vulnerability and discover innate strengths. As Vicki LaBoskey (2004) wrote:

> We all have issues to overcome, "isms" to undo, strengths to enhance, limitations to minimize in our ongoing efforts to construct and reconstruct our identities as teachers and teacher educators for social justice. Thus, this research stands to benefit all of us concerned about teacher identity formation and transformation. (p. 175)

Ensuring that "education contributes to the promotion of equity, peace, social justice and the universal realization of human rights" (Tudball 2004, p. 251) is a project important to many people. Libby Tudball's study was set in the context of internationalizing a teacher education course to support Australian teachers to be active in socially just ways in a diverse world. Preparing teachers to take their place on a world stage takes on particularly complex dimensions in some contexts. One such context was explored by Israeli colleagues (Barak et al. 2016). This collaborative group studied how they could create a respectful and safe multicultural learning environment for themselves and their Arab and Jewish students. Through their self-study and ongoing research, they exposed blind spots within their professional space that led toward testing and modification of their assumptions, understandings, and ways of being and becoming as educators. As part of this ongoing collaboration, Bobbie Turniasky, Smadar Tuval, and Dina Friling (2018) discussed the tensions inherent in working together:

> Exploring and addressing [cultural identity] is crucial for personal and professional development but is dependent on trust between the participants. Trust is difficult to build and easy to destroy. As teacher educators, we walk the fine line between the costs and benefits of encouraging authenticity and a connection to our surroundings, and building a temporary, semi-insulated learning environment. (p. 226)

Walking this fine line and juggling the need to be authentic with students alongside the need to maintain a sense of professional self-preservation is one thing; being willing to critically focus attention on the issues that self-study research surfaces makes articulating findings even more challenging. For example, Linda

Fitzgerald (2004) acknowledged the inconsistencies in her teaching about diversity and examined possible reasons for them. Taking Russell's *How I teach is the message* to heart, she wrote:

> I tell my students that still, all these years later, I am a racist in many ways, but I am committed to being aware of and to working against my racism consciously and conscientiously to the best of my ability. . .. Although I have worked hard to cultivate an awareness of my defensiveness about race, my reflections and other data about my teaching lead me away from seeing this as the major explanatory factor for the times that I avoid directly addressing racial diversity. In particular, on the rare occasions in which I have students who are members of racial minorities, I find it easy to address racial issues with them directly (they nod approvingly at my "I'm a racist" story.) However it is in those very semesters that I am most likely to avoid addressing publicly race in the class. (p. 109)

In exploring the reasons why she felt reluctant to address these issues, Linda talked honestly about her "lack of knowledge and skill in preventing color-evasion and power-evasion" (p. 111). She urged other participants at the conference to develop plans of action in order to address issues raised through diversity in their practice as teacher educators. In doing so, she highlighted how difficult it is to walk our talk but also how important it is that we continue to try to do so.

Such honest appraisal and insight is a hallmark of self-study. Self-study research enables teacher educators to examine their practice and to support one another to take steps to transform it. This is typified by Anne Freese and Amber Makaiau's (2012) self-study. As they wrote:

> Sharing our challenges and breakthroughs gave us confidence to keep trying. We shared our beliefs, personal experiences, and biases. We did not always agree, but we had one another to use as a mirror to challenge our assumptions about Hawaii as a racial paradise. . . . As we immersed ourselves in our ongoing study of our practice, we learned more about ourselves as well as new ways to encourage a "personal, constructivist and collaborative" approach with our students. This approach helped the students frame and reframe their assumptions about "the others" by realizing that issues of drugs, racial biases, violence, disability, and marginalization are not somewhere else, but are right in our own classrooms. Such insights broadened their thinking in terms of how we need to confront our biases and help our students better understand themselves and others. We learned how aspects and characteristics of self-study can have a significant place in our teaching about multiculturalism, particularly because it creates a direct, personal connection to us and the students. Most importantly, we learned that self-study is not an additive to our teaching, but rather it is an integral part of what we believe and how we teach. Through our increased awareness we can be better positioned to assist our preservice teachers to meet the needs of their students. (p. 116)

And so, we turn to discuss some of the challenges that self-study research has wrestled with through the Castle Conferences. As Vicki LaBoskey noted, we all have our own "isms" to undo in our own contexts, but underneath this is a common desire to improve education and educational practices.

Telling Our Diverse Stories: Large and Small, but Never Insignificant

Issues that self-study researchers have presented over the course of the conferences range from institutional and programmatic dilemmas to those that are more personal in nature. For example, addressing the challenge of enacting change at a personal and institutional level was the focus of Morwenna Griffiths' (2000) longitudinal study. She noted how slowly change happened and, indeed, how little changed in her own project to integrate a social justice approach to teacher education – for her colleagues and, on reflection, for herself. She followed up her colleagues after 3 years and found:

> Sometimes they re-told incidents and sometimes they repeated intentions about what they might do now. Most of them had the same kinds of concerns and focus of interest that they had had previously. Those who began by being most interested in race, gender, class, special needs or sexuality remained focused on that. So at the level of the personal (the small tale) and at the level of the larger political structure (the tall tale), had much changed? I thought I, myself, had changed my own mind as a result of the project. I could even think of examples. And yet I can see plenty of instances where what I have done could equally be said to be 'the same old story', even if with a new twist. (p. 97)

Change is invariably slow and painstaking. It is also often very elusive. Even though on the face of it one might think that changes are being wrought, this can be little more than a facade. Mary Lynn Hamilton's (1998) contribution to the second Castle Conference drew from the literature on culture and difference, beliefs, and autobiography to explore how teachers from the dominant culture might learn to better communicate with ethnically diverse students in schools. As a result of the work with her colleagues, Hamilton put forth the idea that many students operate under the "Tinkerbell tenet" of teaching, that is:

> a strongly held belief that something will occur solely on the strength of that belief, like the saving of Tinkerbell in the 1950s version of Peter Pan. In this play . . ., Peter plaintively invites the audience to "help save" Tinkerbell with the words—"If you believe, if you really believe. . ."—as if the simple act of believing might save this dying sprite. (p. 119–120)

Mary Lynn admitted that her self-study informed her that she too suffers from the Tinkerbell tenet of teaching and that she had made assumptions about her students based on her belief that "things would 'just work out'" (p. 120). She became frustrated because her hopes for her students' greater understanding of diversity and racism in schools did not match her lack of ability to provide opportunities for them to learn about these issues due to institutional constraints. She continued to explore this mismatch in the third Castle Conference. There were many factors involved in the reform of a program, which Mary Lynn Hamilton (2000) acknowledged could be both overwhelming and intimidating. Although she had a mandate to enact change at her institution, her colleagues' responses to calls to support social justice were lukewarm: "'I don't want you to think that I don't support social justice . . .' or 'maybe if we just use other terms. . .'" (p. 111). Their responses suggested that

racism played a part in thwarting her attempts. Mary Lynn challenged other white scholars to confront privilege and injustice wherever possible in their practices and their workplaces because these matters don't "just work out" by themselves. It takes fortitude and perseverance to keep moving forward, whether this is at an institutional level or on a personal level with ones' students.

Various self-study researchers have challenged their audiences, through their presentations and writing, to "walk our talk" with regard to anti-racist teaching and to encourage students to critically reflect on their own biases and assumptions. Just as there are lukewarm responses from colleagues, students can also push back and argue from a privileged position. Michael Vavrus (2004) explained that despite having 80% of the teacher candidates in his course comment that they had become more aware of their "racialized perspectives" (p. 252), there were students who could not, or would not, see the world around them in all its rich diversity, nor how they themselves were positioned with respect to others:

> Six percent, all white women, expressed abstract colorblind concepts that helped them to avoid questioning their own social positions. The other 14% of the sample did not address any issues related to their racial identity as related to their teacher identity formation. The primary reason was an overt denial of the relevancy of the relationship between one's identity formation as a teacher and one's racial identity. Two of those students, both white males, eventually left the program by the end of the second quarter. (p. 256)

Despite this frustration, the overall tenor of this paper (and many others) is that teaching that explicitly addresses issues such as racism can have a profound impact. It can facilitate an awareness of professional identity and reinforce the importance of knowing yourself, as one of Vavrus's student teachers wrote:

> I failed to realize that individuals have to look inside themselves to find their own racial identity and where they are positioned in society before they can take the responsibility of nurturing another human being. [I cringe] at the dominant Anglo practices that I embraced as normal, just, and accepted throughout the years. (Vavrus 2004, p. 256)

If this is the transformation in our students' professional identity that we hope to get them to work on, then we must continue to push them, as well as ourselves, to become more self-aware.

Self-study is so often a driver to understand and act upon our own biases. For example, Timothy Spraggins (2004), an African-American male educator, pondered his choices for dealing with minority students. He asked whether his method of interaction with them reproduced subconscious and internalized prejudices:

> Does this mean that I just might also regard black men students as more likely to create trouble for themselves and less likely to accept responsibility for doing so? Was this subtly communicated to me during and internalized from my early teachings? I have functioned under the premise that my educational and professional experiences, along with my personal reflections on both fronts, push me to seek, to stand with, and to purge my own flaws as best I can. This journey, however, has pressed me to accept a new possibility: not only have I not purged myself of certain prejudices but I cannot see the very ones that inform important

aspects of my personal and professional identities. There is a possibility that deeply buried yet audible voices whisper to me that these black men are pre-disposed to trouble and that the only way to reach them is to yell and show them who is in charge. While I must sit with and seriously deconstruct this possibility, I remain disturbed and embarrassed by its possible influence on my practice. (p. 227)

Spraggin's paper provoked self-study researchers to consider the question, "What if we can't change the way we respond because we are so deeply entrenched in repeating the lessons [learnt in our own childhood]?" It is a question that gnaws away at other self-study researchers. For example, Valerie Mulholland (2006), from a lineage of Canadian settlers, wrote, "I can forgive myself for being emotionally affected by sentimental pioneer stories, but I cannot excuse my complicity in reproducing the discourse that continues to oppress and restrict the lives of others [First Nation people whose land they occupy]" (p. 196). Despite these challenges, the conference proceedings reveal that self-study researchers frequently seize the opportunity to examine such issues of importance in their own practice and disseminate their findings because they view these issues as critically important to good teaching.

Cynthia Nicol and Lisa Korteweg (2010) described their attempts to integrate indigenous perspectives in their respective institutions. They both prepared non-Aboriginal teachers to teach in Canadian schools through culturally responsive approaches to educating Aboriginal students. Cynthia and Lisa shared their vulnerabilities and concerns about their legitimacy in the process and invited others to consider their positionings and stances in terms of taking responsibility for sharing knowledge of the history of Aboriginal issues in Canadian education. They concluded their paper with insights about how the process of self-study helped them to come to the conclusion that they were on the right track for moving forward toward culturally responsive pedagogy, despite the fact that this idea is neither linear nor well-defined:

We, as teacher-educators and teacher-researchers, must take seriously the critical need for the development of courses and professional development that integrate respectfully Indigenous epistemologies as well as develop activities/assignments that prompt decolonizing reflexivity by the teachers. It is a difficult task for which many of us as teacher-educators are not manifestly ready. Yet our results indicate that teacher professional development programs can open up participation by non-Aboriginal teachers in cultural experiences so that participation might strive to be more culturally responsive. We present these research projects and our own critically reflexive dialogues in the hopes of offering some sort of educational direction and teacher education responsibility, one that could contribute to the larger and deeper project of humanizing curriculum across cultural differences. Our journey taken is not a linear path of steps. It instead provides a set of dilemmas, insights and possibilities for both living with and teaching culturally responsive pedagogy. (p. 186)

Writing Our Wrongs: A Safe Place to Be Vulnerable?

Yet the question remains: Why is diversity such a difficult theme to work with? We know that teacher educators find it challenging because they have repeatedly said so when presenting studies on this theme. The wide variety of possible student and contextual diversities, the delicate task of representing everyone's point of view,

and the fears of misrepresenting groups or individuals all add layers of stress associated with focusing on multiple variants of diversity in teacher education. And yet, self-study researchers continue to do this work because they support the critical importance of acknowledging diversity in education and of teaching their students to be mindful of diversity in their own teaching. What makes the Castle Conference special for those who are passionate about teaching in ways that acknowledge and nurture diversity is that it provides a safe place to test ideas and gauge audience responses, including reflections and research on diversity in education. Participants can learn from one another about what has been possible, fruitful, problematic, and productive. Acknowledging personal trials and challenges at the Castle Conference is a way for delegates to expose their vulnerability and discover innate strengths, allowing them to push beyond the individual diversities and focus on what is important to teacher education: humanity, relationships, and caring about each other.

Self-study demands a level of self-awareness and criticality that is rarely experienced in other research methods, perhaps because the self-study community encourages and supports willingness for researchers to expose their vulnerabilities. In her study with Jan Guidry (Guidry and Corbett-Whittier 2000), Connie Corbett-Whittier's example, quoted below, invited the reader to empathize with the sense of frustration and exhaustion she felt:

> In Kansas, education faces many challenges. The most controversial are those that question the division of Church and State. Several groups are involved in attempts to influence legislation and regulations in ways that would weaken this separation; collectively, these groups are referred to as the Religious Right. . .. I had a student last semester who is an active member of the Religious Right. I was exhausted after each class. For the first two weeks he followed me to my car after class believing that if he just kept talking I would see that he is correct in his views. . .

> The negative experiences cited lead to the positive outcomes. For me, I realized the importance of knowledge and my personal relationship to it. I want to learn everything and I want my students to share my passion. To teach is to be passionate about learning. . . my purpose is not to change others' beliefs, but to provide ways for them to ensure that the beliefs they espouse are truly their own. (p. 102)

Jan and Connie concluded with a vision statement:

> To better teach children and adults in this new century, we must no longer be afraid to address bias and stereotypes directly. We need to be explorers of a new, exciting diverse global community. Confronting our stereotypes will not only aid us in challenging students, but it will aid us in becoming better learners, teachers, and better people in general for the millennium and beyond. (p. 103)

We can only hope, given the current state of world affairs, that self-study strengthens our conviction that teachers can and do make a difference in the lives of their students. In the next example, to illustrate the point that teacher educators can and do make a difference, we consider Deb Tidwell's (2000) contribution to the third

Castle Conference. Through journaling and reflections, Deb looked at different ways of valuing students in her courses and how this approach affected her understanding of their learning. By doing so she was able to closely examine her expectations of three students in particular in order to better understand what she believed was effective teaching. Particularly powerful was her critique of her attempts to reach Martin, an undergraduate student who could be profiled as at-risk. Martin arrived for the first class late; he was the only African-American in the class; he was largely ignored by his peers; he had difficulty being punctual or handing in assignments on time; he started to miss lectures and one-on-one meetings that had been arranged in an effort to halt his failing trajectory. Martin, in response to an initial survey of interests, had stated:

> that he had experience working with preschool children for three summers, and wanted to teach in Florida or Texas working with kindergarten through third grade levels. Under the category "something unique about you," he stated "I never give up on any one." He explained that in his life experiences, people had given up on him when he knew he could do things. He had trouble following directions, but if people took the time to explain things to him, he did "alright." (p. 238)

Deb tried to support his academic journey and chronicled her work through journaling and instructional documentation. Despite her best efforts, "by the middle of the semester, Martin had missed 5 out of 16 class meetings, and 4 out of 7 personal meetings with me. Martin withdrew from class at midterm" (p. 239).

Deb voiced fundamental questions germane to all teacher educators about the "purpose of higher education: Is it an environment that should be shaped for all students, or is it a unique environment for students possessing institutionally preferred knowledge? Is this a cultural issue or a quality issue?" (p. 241). In her presentation, Deb shared her frustration with not being able to articulate a meaningful way to value this student in her course and her lack of success in understanding his learning. Bringing this story to the Castle Conference allowed Deb to see the situation as one of many possible outcomes of her study and an opportunity for her learning more about her students generally and acknowledging her efforts at valuing their perspectives, rather than seeing herself as a failed teacher educator.

Researchers exploring their own experiences with diversity have also found a space at the Castle to dialogue with others about their challenges of fitting into White-majority university settings. Barbara McNeil (2010) described her journey of resistance to historical discourses that labelled her racially while she worked as a school librarian and then as a teacher educator. She explored the difficulties of integrating social justice perspectives in her teaching and the open resistance some students have to a nonwhite professor who insists on engaging students in anti-oppressive dialogues about White privilege and racial discrimination in schools and society. She wrote:

> This paper grows out of a self-study that explores my public and private worlds as a racialized Other. It traverses my lived experience as an African-Canadian teacher-educator and how I represent myself in a faculty of education in Western Canada where the space is mapped and produced as white. (p. 160)

Barbara's study led her to more fully understand the many complex issues facing professors who do not fit the stereotypes that students may expect to see. She also found a way forward to reimagine how to interact with students who questioned her authority and place in the academy.

> The dialectical nature of the interpretive frames used in my self-study suggests that charting an anti-oppressive course forward implicates individuals (professor and students) and the institution. As I examine the experiences I shared earlier, I see that I did not take the time to sufficiently understand my teaching context and map a course of how to operate strategically and effectively within it. I did not see that, unlike my white colleagues who generally fit the students' image of who can be a professor, I would need to act with more caution in introducing and undertaking issues related to race, social justice, and equity. (pp. 160–161)

Once she felt ready to share her findings, Barbara discovered supportive colleagues who gave her confidence to work toward building better relationships with her students.

Lis Bass (2002) posed thought-provoking questions at the beginning of her chapter:

> I wanted to do a workshop on race and self-study with a colleague who is multi-racial, but ultimately he felt it was important to focus his work, to develop his scholarship in a "safer" environment. Most of us would be upset by the idea that the castle is not a safe place for working with issues of race; but then again, most of us don't understand why self-study is white. Given our goals for better classrooms, our diverse students, and the diverse situations that they are going to teach in, how can we make self-study a better place for people of color? (p. 20)

Lis described her own life experiences where she tried to live her beliefs and values as a person who supports diversity and equity and the difficult consequences that ensued for her. Her auto-ethnography permitted her to reach out and examine the academic experience of herself and others through a critical lens. Lis wrote, "The power of writing a narrative, using it to do self-study, is that it is a process and a pathway towards change" (p. 20). Has the Castle been a safe place for teacher educators such as Lis to interrupt their narratives and to teach and learn from one another? Lis wrote that she was afraid that she had so many experiences outside the norm that others would discount her and not see their own stories as empowering them to do diversity work. While her experiences were not similar to most self-study researchers, the climate of the Castle Conference permitted a frank discussion about how each individual needs to find his or her own way into exploring diversity.

It was evident to the authors of this chapter and we anticipate will be clear to the reader also that diversity within the context of self-study research contains a broad range of meanings that is difficult to contain within clearly defined parameters. Self-study researchers are focused on many aspects of diversity because understanding our students and the students they will eventually teach is crucial to building the positive relationships necessary for optimal learning. What emerges from all of the papers discussed in the above section is that the self-study research that has been presented at the Castle Conference over the years has been focused on understanding teacher education practice, including all of the people involved in that practice, in order to improve it.

Theme 3: The Legitimation of Self-Study – Raising the Self-Study Child

In this theme we make explicit the struggle to ensure that self-study can take its rightful place in the research arena. It must be noted that we are now welcoming self-study researchers who have been taught by second-generation self-study researchers, who themselves have been influenced and taught by the earliest proponents of self-study. Hence, there is an implicit legitimacy inherent in this longevity. Many self-study researchers are proud to trace their research lineage through their Castle Conference associations. We now have third-generation members of the self-study of teaching and teacher education practices community, perhaps doctoral students doing self-study dissertations with professors who had done self-study dissertations. For them, the issue of whether or not self-study was a legitimate form of research that could be accepted for a peer-reviewed publication might be hard to understand. However, before there was a handbook for qualitative research, or a Carnegie Project for the Educational Doctorate, the goal of legitimacy for self-study research and its practitioners was not guaranteed.

In the proceedings of the first Castle Conference, Ardra Cole and Gary Knowles (1996) pointed to the challenge of legitimacy for self-study:

> How do we, as a community of researchers committed to self-study both in theory and in practice, create a legitimate space for ourselves and our work both within our own institutions and within the broader teacher education and academic communities? (p. 68)

Their question also sets up the two faces of legitimacy of self-study: one facing outward as an academic discipline to be taken seriously among other disciplines and facing inward as individuals who strive to have their self-study work taken seriously in their careers. Ardra and Gary captured well the struggles to be taken seriously in those early years:

> How is the status quo challenged by self-study? Those of us who have had our self-study work (or other reflexive accounts) reviewed for publication by unsympathetic contemporaries can attest to the conserving nature of the review and publication process. Collectively, we are all too familiar with having our work characterized as "narcissistic", "self-indulgent", "egocentric", "solipsistic", and so on ….The reward structure of the academy is straightforward and, for the most part, universal. Publications are most meritorious; the more the better, of a particular perspective, style, or genre, and in prestigious refereed journals. ... Research, by extension, should follow the scientific doctrines of positivism and meet criteria of objectivity, measurement and quantification, predictability, and generalizability, and be presented in relatively detached, impersonal ways. Self-study research is antithetical to all of these principles…. … Publicized research that is both personal and practical in its orientation not only endangers the reputation of the academy but also is, by virtue of its very nature, part of a political agenda to challenge traditional conceptions of what counts as knowledge and research. (pp. 70–71)

Eleven conferences later, the sense that self-study researchers are crusaders, intent on politicizing teacher education and positioning self-study as a scholarly endeavor,

has lessened, for the most part. At each Castle Conference, we celebrate more and more publications, doctoral students defending self-study dissertations and getting jobs as assistant professors, successful bids for tenure and/or promotion, and moves into administrative roles – department head, dean, director of teacher education, and more. One might be tempted to think that legitimacy is no longer an issue. There are, however, counter stories, such as Dawn Garbett's (2012) multiple bids for promotion detailed in the Community theme above. And it continues, for example, in Brandon Butler's (2016) documentation of his institution's reluctance to acknowledge self-study research as scholarly work. Brandon was advised to use more rigorous qualitative methods in his work as he pursued tenure. In a personal communication serving as an epilogue to this story, he reported:

> In response to the feedback received from review committees, I completed several articles that used more "traditional" qualitative methods deemed appropriate by senior faculty. However, I ignored the feedback for the most part. Having "proven" that I could conduct a wide array of qualitative studies, I returned to research largely dominated by self-study. And for good reason. I had already built a research trajectory with self-study and an increasing presence within the field and positive relationships with those who conducted self-study. As a result, I received highly positive external review letters and easily achieved promotion and tenure – even though two years before I was told by an administrator that I would never achieve tenure as a self-study scholar.

Nevertheless, in over two decades of Castle Conferences, the striving for legitimacy has had enough successes that in a follow-up to the call for papers for the twelfth biennial conference, the program chairs felt compelled to remind authors that "we are committed to pushing the boundaries through fresh thinking. The conference organizers wanted to emphasize that the community is never settling for ordinary and is always challenging ourselves to exceed expectations," explaining that "The theme *Pushing boundaries and crossing borders: Self-study as a means for knowing pedagogy* encourages delegates to explore how the methodology of self-study can be challenged, enriched, and/or extended by new theories and ways of thinking" (https://mailchi.mp/22b81683e709/castle-conference-newsletter?e=4918ed6663). Is self-study in danger of becoming too comfortable or even complacent in its current level of legitimacy in teaching and teacher education practices? Is there a new generation of self-study beginning to form under the radar that will need to engage its own fight for legitimacy? Perhaps a closer look at the ways legitimation played out in Castle Conferences and beyond will help us to be alert to answers to these questions.

Legitimacy: Facing Outward

Departing for the moment from the grounds of Herstmonceux, a brief look at the matrix from which self-study arose might give the issue of legitimacy a broader context. One ancient form of establishing legitimacy is, as it is called in India, the *guru parampara*, the lineage from teacher to student, who then becomes teacher to

more students, through the ages. One mimeographed template for the dissertation of education doctoral students used to require a historical section in the first chapter of the dissertation, and many such documents a half century or more ago located the topic of research in a line starting with the pre-Socratics, or even with Confucius, or at least with Rousseau or Dewey. While no longer quite so ritualized, historical contexts still are found in many descriptions of self-study theory and methods. Indeed, we started this chapter with the history of the Castle, and in this section of the Handbook, Cheryl Craig and Gayle Curtis (▶ Chap. 3, "Theoretical Roots of Self-Study Research") trace the theoretical roots of self-study, historically. Therefore, a brief history of struggles for legitimacy for education research might be useful in understanding some of our current practices and in preparing for continued relevance in the future.

The concept of legitimacy is one that involves power; it is a political issue. Who has the power to decide legitimacy is a question that has never been answered for long without a challenge. In *An Elusive Science: The Troubling History of Education Research*, Ellen Lagemann (2000) provided more than a century of background that might serve as a context for self-study's quest for legitimacy. In the early years of the twentieth century, John Dewey's laboratory-school-based approach to education research was more complex than the behaviorism of educationists, like Edward Thorndike, who used quantitative methods and looked for lawlike regularities. The latter sought:

> to be just as scientific as their university peers, while also gaining the status and authoritativeness of established professionals, especially doctors …. what is best described as Thorndike's triumph and Dewey's defeat was an important event in the molding of educational scholarship. (Lagemann 2000, pp. 21–22)

Practitioners of education – teachers at all levels – were subjects of researchers, not researchers themselves, and the questions driving the studies came from the disciplines, not from teachers' interests or needs. However, even so, in the "contested terrain" of the disciplines versus education not being seen as a discipline, "when educational scholarship was professionalized, it was viewed with contempt by noneducationists; when it was discipline-based, it was shunned by students, who wanted 'recipes for practice'" (Lagemann 2000, p. 179).

This situation started to change in the last quarter of the twentieth century when the hegemony of a narrow positivist psychology began to be challenged for its inability to go beyond the individual as unit of analysis and explain the complexity of educational systems, of teacher-student relationships, and of social and cultural forces. In 1982, Ray C. Rist, in the Institute for Program Evaluation of the US General Accounting Office, famously took to task "the limitations in the view that 'what cannot be measured cannot be important'" (p. 439). He pointed to the dissolution through the 1970s of the scientific method of experimentation as the only legitimate method for educational research and the rise of the application of qualitative methods to educational questions and processes. The Qualitative Research Special Interest Group of AERA was established several years after Rist's statement. *Qualitative Inquiry in Education: The Continuing Debate* (Eisner

and Peshkin 1990) was the result of a conference at Stanford University in 1988. In the introduction to their book, the editors described the lingering power of quantitative methods in education:

> Notwithstanding noteworthy progress in the development and reception of qualitative research, the tradition has denigrators who remain uncomfortable with a nonquantitative approach to research. At best, they are uneasy with what they view as a rival paradigm: They are reacting to the fact of competition. At worst, they dismiss it as unworthy of the name of scholarship: They are reacting to the perception that science is _____. They fill the blank, and it happens to contain what they do. . . .In the encounter between quantitative and qualitative researchers, albeit a lopsided one favoring the former, the politics of method emerged . . . . It involved, as politics always does, power, resources, control, policy making, and personnel. (p. 2)

Continuing this rise of qualitative methods from the 1980s into the early 1990s, educationists with roots in disciplines outside of psychology began to reconceptualize education. For some the work was primarily theoretical, applying critical theories influenced by Marxism and the Frankfurt School. For others, the models for new ways of framing questions and for carrying out research came from participatory action research in labor and from other movements where the practitioners were respected and enlisted as co-researchers. Together with a flurry of new AERA special interest groups, including no less than four with "critical" in their names, which both used qualitative research methods and stated social justice aims for improving education, self-study took its place in the academy.

Publications of handbooks not only witnessed but further conferred methodological, if not disciplinary, legitimacy to methods used in self-study – first the *Handbook of Qualitative Research* (Denzin and Lincoln 1994) and a decade later, the first handbook of self-study, *International Handbook of Self-Study of Teaching and Teacher Education Practices* (Loughran et al. 2004). Peer-reviewed journals began to accept and publish self-studies, and in 2005, self-study's own journal, *Studying Teacher Education*, issued its first volume. Despite these bulwarks to protect the growth of legitimacy for self-study, individual tales like Dawn Garbett's (2012) and Brandon Butler's (2016) make clear that the job is not done. They attest to a continuing need to make the case to powerful decision-makers at individual institutions that self-study is an accepted and acceptable method of research, worthy of reward with hiring, tenure, promotion, and gradually taking on those positions of power by scholars of self-study themselves. Thus, we return to the Castle to trace the ways in which legitimacy has been addressed internally in the Castle Conference community.

Legitimacy: Facing Inward

While the second theme of diversity emerged as a distinguishable theme in titles of papers across the proceedings, only one title directly addressed legitimacy: "Legitimising living standards of practice and judgment: How do I know that

I have influenced you for good?" (Whitehead 2000). Reporting on his progress since the 1998 conference, Jack Whitehead described the long process of getting acceptance for his action research as a dissertation, having "learnt about creative compliance in meeting standards of originality of mind and critical judgment in graduating with his Ph.D. from the University of Bath in June 2000" (p. 252). Even looking for synonyms of legitimacy in titles – authorization, authority, regulation, and so on – failed to surface other papers along those lines.

Given the autobiographical nature of self-study, however, a number of papers have included as content, if not as focus, data about opposition encountered in career development as a self-study researcher. The examples of Dawn Garbett (2012) and more recently of Brandon Butler (2016) provide data about continuing issues of legitimacy of self-study in bids for tenure and/or promotion in the academy, particularly in research-oriented rather than primarily teaching-oriented institutions. In response to the needs of participants to have more than "just" a conference presentation to count as scholarly work to show to their employers, a number of changes have occurred over time in Castle Conference procedures.

The first few conference proceedings primarily were means for participants to share papers with each other, available when they arrived at the Castle, assisting in making decisions about sessions to attend and encouraging the audience to come prepared with questions or comments. But they became a springboard for wider distribution. Informally, proceedings editors would identify contributors who adhered to the conference theme and then invite them to expand their papers to chapter length for inclusion in a series of books that arose from the conferences. However, with the fourth conference, in 2002, requests from members for a more prestigious entry on their curriculum vitae led to securing an ISBN number, which has continued for all subsequent Castle Conference volumes. And, with the fifth conference, in 2004, to accommodate the needs of an increasing number of participants whose home institutions would not reimburse their travel otherwise, a double-masked peer review process was instituted for both the proposals and the resulting papers. While continuing the masked peer review, the next step in increasing prestige for conference papers (as far as institutions define it) began in 2016 with the papers appearing as chapters in a bound book published in advance of the meeting. However, from 2018, the book of Castle papers will only be available in electronic form, with no hard copy format at all, with open access on a website. The decision to shift to an open access web repository was made in order to maximize exposure of the work to an outside audience. Given the importance at some institutions of citations to one's publications as a factor in bids for tenure and promotion, chapters that can be downloaded are more available to a wider audience. Earlier proceedings that were only in paper form have been digitized, so that all proceedings are now accessible on the Castle website (https://www.castleconference.com/conference-history.html).

One Castle Conference tradition is that on the last morning of the conference, a plenary session is held in which all participants engage in debriefing the conference highlights, pinpointing areas for improvement, brainstorming themes for the next conference, and other activities for the general welfare of the

community. In 2004, at the close of the fifth conference, the editors asked for feedback on the new double-masked review process. A concern was raised about the wording of questions for reviewers to answer about the proposal or paper being reviewed: Might they constrain the process so much that nontraditional papers would be eliminated? Three people who in the past had been among the more creative presenters – having used art, music, and video – volunteered to join the questioner in coming up with a better form for reviewers to use. In 2006, the sixth conference did include nontraditional papers or presentations at the end of the proceedings as had been done in 2004 to accommodate participants who did not have a standard research paper (e.g., an invitation to a visual presentation of a photo inquiry, works in progress to which participants were invited to give feedback). However, starting in 2008, the proceedings only included full papers, virtually all with a standard research paper format. As the Castle Conference procedures for accepting contributions from delegates evolved to ensure that they are rigorously reviewed by peers and that the work is of a high scholarly standard, might some of the support for research in progress and for nontraditional formats have been muted, if not lost?

One of the contributing factors to a more rigorous review process is the physical limitations of the Castle venue. The conference has continued to grow in its popularity, but the number of attendees is restricted by the Castle site to 150. In 2018, there were 125 proposals submitted – a similar number to 2016 when there were 120. This was a considerable increase from 2014 when 93 proposals were submitted. The authors of 70 proposals were invited to submit full papers – with a final acceptance rate in 2016 and 2018 of around 50%. This acceptance rate compares with 73% in 2014, 77% in 2010, and 66% in 2008. The average number of accepted papers across the years is 58 papers, always constrained, in addition to the quality assurance of the review process, by the accommodation limit of 150 (see Table 1 below).

One of the results of the tighter review process seems to be an increase in citations in the reference list. Once self-study researchers no longer needed to look outward at critics and be apologetic for using qualitative rather than quantitative methods, the guru parampara, the list of "begats" in which an author positioned herself or himself by using citations, spoke to a more internal audience. The literature review that establishes a conceptual framework as well as empirical precedents for the research question and the methods used to answer it now is scrutinized by reviewers whose judgments determine what counts as self-study research worthy of competitive slots on a limited program. And at least some reviewers recommend that the writer add self-study citations if they are notably lacking in the conceptual framework or methods. Although each of the first four proceedings had at least one paper, if not a mode, with no reference list, after the masked peer review began, all papers had at least a minimum of two references cited and a mode of ten or more (see Table 1). Over time, while there were fluctuations depending on the measure of central tendency, numbers of references cited have risen, even as they began to be counted against the total word limit (see Fig. 2). The first editors asked for minimal references in their call for papers for the proceedings:

Table 1 Castle Proceedings descriptive statistics

Year	Number of papers	Mean number of references	Mode of references	Maximum number of references	Instructions/word limit	Acceptance rate	Co-editors
1996	41	8.3	0	23	Minimize references (Trumbull 1996, p. 143)	n/a	Richards & Russell
1998	57	8	0	36	2500 + 100-word abstract	n/a	Cole & Finley
2000	55	11	11	44	2500 + up to 200-word abstract (or up to 3000 in small font)	n/a	Loughran & Russell
2002	47	11.5	0	93	3000 words	n/a	Kosnik, Freese & Samaras
2004	59	10.6	11	40		n/a	Tidwell, Fitzgerald & Heston
2006	58	15	10	32		79%	Fitzgerald, Heston &Tidwell
2008	65	18	13	37		64 %	Heston, Tidwell, East & Fitzgerald
2010	69	15.5	13	40		66 %	Erickson, Young & Pinnegar
2012	70	19.5	16	39	3000 exc. references	77% 71/92	Young, Erickson & Pinnegar
2014	66	19	18	45	3000 exc. references	73% 68/93	Garbett & Ovens
2016	61	20	12	41	4000 inc. references	50%	Garbett & Ovens
2018	62	21	22	47	4000 inc. references	50%	Garbett & Ovens
average	58						

Average Number of References
Fig. 2 Average number of references in papers by Castle Conference year

> In light of the editor's request to minimize references in order to make easier her task of collecting papers via e-mail, I will merely cite the names of various writers whose work has strongly influenced this piece. (Trumbull 1996, p. 143)

In an email about the second conference, sent out by Tom Russell in February 1998, the editors set a word limit of 2500 plus a 100-word abstract, with no specifics about references. They explained:

> This limit is necessary given the large number of presentation papers and our attempt to keep the printing costs down. The papers are more likely to be summaries than fully elaborated papers. The abstracts will facilitate thematic organization. Presenters are free to bring longer copies of their papers to Herstmonceux for distribution at their session.

From 2002 until 2016, the 3000-word limit excluded references; in 2016, the word limit rose to 4000 but now included references (see Table 1). When citations continue to rise even when the trade-off is to have fewer words in text, is this evidence that expectations about the nature of the contribution have become more traditional? Or perhaps are reviewers encouraging more conservative or traditional approaches? On the other hand, may it just be a function of the success of self-study, that more and more publications offer more and more connections for a researcher to make to work that has gone before? In that case, self-study could be following the recommendations that Kenneth Zeichner (2007) made for ways "to accumulate knowledge across these individual studies in a way that will influence policy makers and other teacher education practitioners" (p. 43).

As self-study scholars and practitioners continue their work into the future, there is a danger that the review process could reproduce the politics of method such that, to paraphrase Elliott Eisner and Alan Peshkin (1990), "They are reacting to the perception that [self-study] is _____. They fill the blank, and it happens to contain

what they do" (p. 2). Instead we need to keep questing for "how the methodology of self-study can be challenged, enriched, and/or extended by new theories and ways of thinking" (Castle 12 call for proposals as quoted above). While facing outward, self-study seems to have found a legitimate place within qualitative research methodologies and among those who acknowledge that education is a discipline with theory and methods proper to itself, not just a field in which other disciplines apply their theories and methods. But at any institution in which teachers and teacher educators conduct self-study research, individuals may yet find people in power who question their claims to have self-study count in the advancement of their careers. One challenge for self-study as it moves forward is to balance the need for criteria that claim legitimacy in such a way that individuals are supported to develop as self-study scholars but without constraining what counts as self-study so much that it prevents the expansion and development of self-study itself.

Conclusion

In discussing what stood these conferences apart from the others, one of the authors recounted her first experience of attending a Castle Conference – one that is no doubt shared by others. The excitement of seeing the Castle was quickly followed by disappointment that the actual accommodation was in the "rather dumpy" Bader International Study Centre halls of residence set a 5-min walk away through the woods. Walking alone to the Castle for the first shared meal was pleasant, but entering the dining hall was daunting. Everybody seemed to know everyone else. People were talking and laughing like long-lost friends as they queued for the buffet-style meal. And then, right behind our neophyte delegate – a friendly face, a warm smile, and sincere greeting. "Is this your first conference? Will you join me? I want to hear all about you!" This was a genuine invitation to share self, to engage in conversation, and to discuss teacher education. In that exchange, our first-time Castle Conference attendee was welcomed to the community and was no longer alone. This camaraderie and sense of being at home is an abiding memory for many delegates.

The tranche of self-study of teacher education practices research gathered together in the conference proceedings represents the work of a community that seeks to understand the knowledge created on a day-to-day basis at the microlevel of education as individuals grapple with the complex nature of practice. Every self-study has at its core an imperative to improve practice and to enhance learning opportunities for teacher educators, student teachers, and, in turn, the students with whom these professionals interact and for the institutions and systems in which they work. Self-study researchers are inquiring professionals, deeply committed to understanding themselves and their practices for the purposes of the improvement of education. Focusing on one's self is perhaps the hardest transition to make as a practitioner-researcher. It can seem far less demanding to research someone else's practice and to measure their effectiveness or impact rather than holding oneself to account.

As we look toward future conferences, we are mindful of where we have come from. In the beginning, pioneers innovated and adapted qualitative methods such as action research and reflective practices. This was a time of dynamism and flexibility. As noted, many so-called self-studies in the conferences prior to the 2004 Handbook (Loughran et al. 2004) would not have made the cut in later proceedings. They did not adhere to Vicki LaBoskey's (2004) criteria. The second phase of the Castle Conference era, spanning the middle decade, saw a consolidation around, and fidelity to, a standard fare. Both stages are vital to establish a robust community. In the latter stages, through the editorship of Dawn Garbett and Alan Ovens (2014–2018), there has been a conscious effort on their part to encourage self-study researchers to return to more innovative approaches and a willingness to push the boundaries of what is and isn't considered acceptable to the community. In this "coming of age," self-study researchers are now positioned to extend, challenge, communicate, and promote their own blend of practitioner research. They are also in a position to give voice to others and to acknowledge, respect, and respond to voices different from their own.

In this chapter, the authors have highlighted events, papers, and people to give a reader a sense of the vibrancy of Castle Conference. Self-study has evolved and flourished within this enclave. Self-study researchers have picked up the rallying cry that teaching about teaching is a scholarly endeavor. They have gone forth to spread the word as though their professional lives depended upon it.

Theoretical Roots of Self-Study Research

3

Cheryl J. Craig and Gayle A. Curtis

Contents

Abstract

This chapter broadly traces the theoretical roots of the Self-Study of Teaching and Teacher Education Practices (S-STEP) group, a Special Interest Group (SIG) established in 1993 as part of the American Educational Research Association (AERA). Beginning with the perennial problem of the theory-practice split in the field of teaching and teacher education, a condensed version of the history of teacher education situates ongoing issues in context. Deep roots of self-study research are elucidated, and Fenstermacher's (The knower and the known: the nature of knowledge in research on teaching. In: Darling-Hammond L (ed) Review of research in education, vol 20. American Educational Research Association, Washington, DC, pp 3–56, 1994) review chapter of practical knowledge

C. J. Craig (✉) · G. A. Curtis
Department of Teaching, Learning and Culture, Texas A&M University, College Station, TX, USA
e-mail: cheryljcraig@gmail.com; gayle.curtis@att.net

is used to capture the theoretical lines of S-STEP's initial and ongoing membership. The work chronicles the paradigmatic changes that have shaped the field of teaching and teacher education and brought S-STEP to its current state of being. The chapter closes with a theoretical perspective of S-STEP's contemporary literature, anticipated issues on the horizon, and possible pathways to the future.

Introduction

This handbook chapter takes a wide-angle lens to tracing the theoretical roots of the Self-Study of Teaching and Teacher Education Practices (S-STEP) group, a Special Interest Group (SIG) of the American Educational Research Association (AERA). In 1993, S-STEP members birthed a new genre of research commonly referred to as "self-study." The "watershed event" for its inception happened in 1990 with members of the Arizona Group (Stefinee Pinnegar [Brigham Young University, USA], Mary Lynn Hamilton [University of Kansas, USA], Peggie Placier [University of Missouri, USA], Karen Guilfoyle [University of Idaho, USA]) trying to understand their teaching of prospective teachers. That study was presented at AERA in 1991 and again in 1992, with Tom Russell [Queen's University, Canada] joining the panel and underscoring the need for "qualitative researchers...to study their own practices" (Pinnegar, personal communication, 2018). Having heard about the sessions from others, Anastasia Samaras (George Mason University, USA) and Anne Freese (University of Hawaii at Mānoa, USA) were some audience members who themselves were interested in reflective practice in teaching and teacher education who later became S-STEP members (Samaras, personal communication, 2018). It should be noted here that, in addition to examining the extant literature related to "self-study" research, individual interviews (shown as personal communications in this chapter) were conducted with selected researchers active in the field to clarify and augment the tracing of the theoretical roots of 'self-study' research.

This chapter on S-STEP's theoretical underpinnings begins with the perennial problem of the theory-practice split that the field of teaching and teacher education has repeatedly encountered. It then presents a condensed version of the history of teacher education to situate ongoing issues in context. After that, the deep roots of self-study research are elucidated, followed by the presentation of the significant theoretical and methodological changes the field has experienced in the meantime. In this section, the review chapter on practical knowledge authored by Gary Fenstermacher (University of Arizona, USA) is revisited and retold with the benefit of hindsight. The recapitulation captures in broad brushstrokes the theoretical lines of S-STEP's initial and ongoing membership. Some members naturally transitioned into "self-study" as a new genre of research while maintaining their other research interests. Integration, to borrow Boyer's concept, describes research conducted "at

the boundaries where fields converge" (Boyer 1990, p. 19). Other members abandoned their past research agendas and made "self-study" their sole focus of inquiry, which is an example of disruption in Husu and Clandinin's (2017) language. Disruption, as conceptualized by Husu and Clandinin, happens when the field pays attention to "unheard voices and open[s] up what counts as research in teacher education..." (p. 1169). Then, there was Jerome "Jerry" Allender (Temple University, USA) who had been studying practice in general since 1983 but had not found others with whom his research resonated until S-STEP began. After webs of connection resembling these ones above are elucidated, the chapter chronicles the many paradigmatic changes that have shaped the field of teaching and teacher education and brought S-STEP to its current state of being. To close, S-STEP's contemporary literature is summarized from a theoretical point of view and emergent and anticipated issues on S-STEP's horizon are pinpointed, along with possible pathways to the future.

Conceptualizing the Theory-Practice Relationship

> ...the Greek word for spectators, *theatai* [theoretical], until a hundred years ago meant contemplating, looking... from the outside, from a position implying a view that is hidden from those who take part in the spectacle and actualize it. As a spectator, you may understand the truth of what the spectacle is about; but the price you have to pay is withdrawal from action. (Arendt 1981, p. 93)

The original definition of *theoretical* presents a stark contrast between theory and practice (spectator and spectacle), capturing how estranged those who propagate theory can be from those animating practice. This has become a conundrum (Pinnegar 2017) for teachers and teacher educators. Their work – by necessity (not design) – is situated at the interface between theory and practice. Teacher educators must enact practice (and teach others how to enact practice) while producing rigorous research (Korthagen et al. 2006). Universally, their "Janus-faced" work must address "relevance, practicality, competence and technique," on one hand, and produce "scholarship, theoretical fruitfulness and disciplinary rigor," on the other hand (Taylor 1983, p. 4). It is little wonder that teacher educators view themselves as "living contradictions" (Whitehead 1989, p. 41). They recognize the importance of "walk[ing] [their] talk" and "practic[ing] what [they] preach" in their scholarship (Arizona Group 1996). They know that "teacher education is a uniquely perilous enterprise....in teacher education, what and how you teach are interactive, and you ignore this interaction at your peril" (Russell 1998, p. 5).

Latta and Buck (2008) assert that "[t]he gaps persistently wrestled with between theory and practice are only embraced through embodied knowledge" (p. 323) that teachers and teacher educators hold and express. Bresler (2006) similarly has stated that disjunctures between theory and practice can only be overcome by positioning the thinking-feeling-doing-being teacher/teacher educator at the experiential core. As McDonald (1996) explained, the practices of teachers/teacher educators

necessarily unfurl on the "faultline" between theory and practice where "theory is forced to confront the complexities of actual teaching and learning, and practice is forced to justify its intentions" (p. 3). Bullough and Pinnegar (2001) furthermore maintain that "only when theory [has] efficacy in a practice arena will that theory have a life" (p. 15).

John Dewey was the first North American to view educators as actively "moved by their own intelligences and ideas" (Dewey 1908, p. 16). The agency and mindedness he afforded teachers/ teacher educators, did much to mend the divide between "the knower and the known" (Dewey and Bentley 1949). For Dewey, knowledge "arise[s] from experience and return[s] to experience for validation" (Clandinin and Rosiek 2007, p. 39). In his ontological view, "...life...[does] not...explain how thought or experience initiate action, but how action generates thought in the midst of [living]" (Tomlinson 1997, p. 374). For him, knowledge was a process of knowing forged from experience that is in a constant state of flux. To his way of understanding, knowledge could be both personal and practical with it also being public and open to criticism. Dewey explained, in his own words:

> If we suppose the traditions of philosophic discussion [were] wiped out and philosophy starting afresh from the most active tendencies of today—those striving in social life, in science, in literature, and in art—one can hardly imagine any philosophic view springing up and gaining credence, which did not give large place... to the practical and the personal, and to them without employing disparaging terms, such as phenomenal, merely subjective, and so on. Why...should what gives tragedy, comedy, and poignance to life, be excluded from things? (Dewey 1908, p. 125)

But Dewey was not the only philosopher focusing on practical knowledge. Part of his philosophy built on the European tradition, which could be traced to the roots of Western civilization. Also, Dewey was not the sole philosopher argued for experience-based, nonpropositional knowledge. Confucius, Eraut, Freire, Gauthier, MacMurray, Polanyi, Reason and Rowan, and many others expressed similar views at several junctures of time. Later, women (Gilligan et al. 1990), indigenous people (Weenie 2010), and those in the LGBTQ community (Kitchen and Bellini 2012) would take similar views of knowledge.

Dewey's colleague, Richard McKeon, mapped different relationships between theory and practice in the Western research tradition (i.e., Plato, Hegel, Marx, etc.). He did so because "the problems of the relation of philosophy to action and of theory to practice are encountered in practical activity as well as in theoretical discussion" (McKeon 1952, p. 79). According to McKeon, four theory-practice interactions exist: operational, logistic, problematic, and dialectic. In the *operational* theory-practice relationship, practice leads the way. "Naïve realism" (MacKinnon et al. 2013) or a street-corner practical can occur where it does not consider what is happening beyond one's own practice. In the *logistic* theory-practice relationship, both theory and practice are approached through a theoretical lens. In this scenario, theory dictates practice and logical positivism can happen. The logistic theory-practice arrangement continues to dominate the field of education despite Kuhn's (1970) assertion that scientific truth does not exist independent of the paradigm in

which it was produced. In the third theory-practice relationship, the *problematic*, education research is driven by problems, dilemmas, and tensions (Loughran and Northfield 1998). As for the final relationship, the *dialectic*, a mutual exchange occurs whereby theory informs practice and practice informs theory. In short, "a reflexive relationship [is] established in which research becomes part of the situation, thus reflexively altering its character as the inquiry proceeds" (Connelly and Clandinin 1985, p. 194). The latter two relationships have done much to shift the teacher preparation paradigm from a teacher training mindset to a teacher education focus. Questions of "whether theory precedes or follows practice, whether practice (re)constructs theory, or whether theory and practice exist in dialectic relationship" (Orland-Barak and Craig 2014, p. 4) largely sum up the history of teaching and teacher education, which will now be briefly sketched.

A Brief History of Teacher Education

Internationally, teacher education patterns countries' developments toward nation-hood and reflects whether colonization and/or takeovers happened. For example, the United States (USA) was originally a British colony that obtained independent status through revolution and eventually rose to be an international superpower. Regardless of countries' social narrative histories, teacher education is largely viewed as necessary, driven by supply-and-demand and shaped by societal issues.

In the 1800s, normal schools where elementary teachers were prepared in the USA were the first entities to offer formal teacher education programs. These normal schools became supplanted by non-degree granting independent colleges, which eventually lost out to teacher education programs lodged in comprehensive universities. Other academics took a superior stance towards teacher education when teacher educators in colleges of education reached out to them for assistance, even though their existence as an institution was owed to the teacher educators in normal schools that they had taken over (Clifford and Guthrie 1990). Teacher education's late arrival to academia has been likened to a stroke of "bad luck" (Labaree 2005, p. 187). This hard luck, combined with teaching's status as a semiprofession (Etzioni 1969), has historically marginalized it from other fields, placing it "on the periphery" (Davey 2013, p. 1) of the academy. Of course, this is not the case for Finland, South Korea, and certain other countries. A further exception is China, which never abandoned the normal school (curriculum and teaching) tradition and instead created normal universities during its modernization period (Hayhoe and Li 2010).

During the nineteenth century, teacher certification was introduced in the Western world. Colleges of education were also established. Somewhat later, teaching became an increasingly female profession as males were recruited to higher status professions and fought in wars. In addition to more women teachers, emergency teaching credentials became necessary to meet societal demands. In the USA, temporary permit programs prefigured the post-degree alternate certification routes that currently exist in high needs areas such as urban centers serving mostly students

of color. Alternate certification teacher pathways also were introduced in parts of Australia, England, Estonia, and India, among other countries globally.

Another major juncture emerged during the Sputnik era in the 1960s. The former Soviet Union beat the USA in the race to space during the cold war, a historical event that sent shock waves throughout the world. This development turned international attention to how teachers are prepared, eventually leading to a profession of teaching arising from what previously had been a world of practice. It also solidified the institutionalization of teacher education within university settings, increased the theoretical knowledge base of teaching, and led to the professionalization of teachers in the USA and elsewhere. However, most international teachers and teacher educators were never afforded the status of doctors, lawyers, or dentists. Teaching remained "a minor profession" (Glazer 1974, p. 8), a profession existing in rhetoric only (Runté 1995).

A Nation at Risk (US NCEE 1983), the National Commission on Excellence in Education report on the state of education in the USA, ushered in the crisis of the professions (Schön 1983), which was experienced to varying degrees in the US other industrialized countries. At that time, respect accorded professionals seriously declined. The teaching and teacher education field particularly bore the brunt of the attacks, most likely because of the feminization of the profession, but also due to teachers' increasingly challenging face-to-face work with students.

In the 2000s, accountability demands in the USA, or performativity sanctions as they were called in Europe and elsewhere, increased. Benchmarks were set by policymakers because business leaders equated "competition in the international marketplace [with]. . .the 'battle of the classrooms'" (Augustin cited in Strauss 2001, p. 31). No longer were students in China competing with one another, they were also competing with youths in their cohorts in the West and elsewhere in Asia. In these situations, only cursory attention was paid to the comparative nature of the units of analysis; little-to-no consideration was accorded the complexities of culture, context, and personal and collective meaning-making (Blömeke and Paine 2008).

Unlike other countries like England, Israel, and New Zealand, it is not possible to speak of the American teacher education landscape as if it is governed by a common set of rules because education in the USA is a states' rights issue. In some US states, teacher education programs are offered exclusively by universities. In other states, such as Texas, teacher education takes many forms, ranging from teacher preparation in public/private universities and colleges, to teacher education in one of Texas's regional educational offices, to teacher education programs offered by school districts, to teacher education provided by private consultants, reform movements, and through internet companies. The bottom line is that all these teacher preparation programs are state-authorized. Along with these programs, any individual with a previous degree is permitted to teach in Texas schools, providing they have passed the requisite criminal background check and are working towards receiving their teaching credential by completing a handful of courses.

As this survey of the history of education suggests, the field of teaching and teacher education faces serious challenges, many stemming from the fact that Dewey's theory of experiential education lost, and the behaviorism perpetuated by

Thorndike and others won the right to control the field of education (Lagemann 2002). Every solution that has been proffered in the meantime, however, paradoxically calls for stronger teacher education. This trend began with the introduction of teacher certification in the nineteenth century and has continued since then. As noted, economic commoditization, academization, and fiscal restraint and entrenchment have predominantly shaped teacher education in the Western world (Davey 2013). While teachers internationally are understood to be keys to national prosperity, how they are best prepared remains in limbo, with some of England's universities ceding responsibility for teacher education to the schools (McNamara et al. 2014), Europe abiding by the Bologna Agreement (Fernandes et al. 2012) and the USA and Australia, among other countries, devolving into "what the market will bear" (Ravitch 2016).

Deep Theoretical Root System of Self-Study Research

S-STEP has theoretical underpinnings and research roots that trace through the generations. We begin in the 1950s because Dewey's philosophy of education – his belief that education, experience and life are inextricably linked – had shaped teaching and learning by that decade (Allender and Allender 2016/2008). According to Cremin (1961), progressive education had comfortably – perhaps too comfortably – morphed into "the conventional wisdom of the fifties" (p. 352). It was not long, however, before behaviorism, primarily based on experiments involving animal conditioning, was introduced in Germany by Wilhelm Wundt, founder of experimental psychology. As a learning theory, behaviorism focused on objectively observable behaviors to the exclusion of independent activities of the mind. The work of Skinner and others in the US and elsewhere accelerated the technical rationalist worldview that everything that can be planned can be realized, producing additional theory-practice divides in all professions whose "schools" had become "colleges" at universities – teaching being one of them (Schön 1983). As international teaching and teacher education became more formalized, standardized, and quantified, theoretical gains were made at practical losses. The teacher increasingly became a "technician, consumer, receiver, transmitter, and implementer of other people's knowledge" (Cochran-Smith and Lytle 1999, p. 16) while focus was placed on students' learning and acquiring new behaviors in tightly controlled environments. This spread of psychology into the field of education occurred despite positivist approaches not producing useful and applicable knowledge in its own field of study (i.e., clinical therapy) (Polkinghorne 1988).

Beginning in the late 1960s, Joseph Schwab, whose mentor was Richard McKeon, published four practical papers raising grave concerns about the nature and quality of educational experiences and how educators were expected to think and act. Schwab criticized theories drawn from the social sciences that oversimplified the complexities of teaching. This resulted in teachers acting as curriculum implementers and "agents of the state paid to do its biding" (Lent and Pipkin 2003, p. x) as opposed to being curriculum makers (Craig and Ross 2008) who are

"agents of education" (Schwab 1954/1978, p. 128) in its entirety. Schwab stressed that:

> …education is an interdisciplinary field of practice, policy and scholarship, an enterprise that depends on many theories to illuminate the commonplaces [teacher, learner, subject matter, milieu] …the idea that each commonplace can be illuminated by different theories depending on your purpose or question…[affects]…[the] practice[s] and scholarship [of] teacher educator [s]. (Feiman-Nemser, personal communication with Miriam Ben-Peretz, 2009)

"The practical" foundation that Schwab laid affected the direction of future teaching and teacher research as his students Sharon Feiman-Nemser and Jerome "Jerry" Allender (personal communication 2009) pointed out. Schwab's view of teachers as "fountainheads of curriculum" (Schwab 1983) reflected his favoring of Dewey's pragmatic philosophy of education and his Aristotelian leanings. When he presented his first practical paper (Practical 1), Schwab (1969) declared that "the field of curriculum is moribund, unable by its present methods and principles to continue its work and desperately in search of new and more effective principles and methods" (p. 1). The field, in his words, was marked by "flights" to other fields (psychology, testing, achievement), to talking about talk, to uninterpreted states, to ongoing commentaries, to re-statements of statements and to polemic debate that had not brought resolution to longstanding educational problems. Schwab (1959/1978) furthermore asserted that education was being corrupted by psychology, which at that point of time was behaviorist psychology. Schwab's scholarship declared, in the language of a biologist, that "the body [the field] …was sick…the symptoms of the disease [were] flight[s] from the field … [and that] the prescription [was] "The Practical'" (Connelly 2013, p. 626).

It would not only be Schwab and those already mentioned who would begin to turn the field around but also other students who were directly influenced by Schwab such as Michael Connelly (University of Toronto, Canada), Elliot Eisner (Stanford University, USA) and Lee Shulman (originally from Michigan State University, USA). Connelly and his former doctoral students, Freema Elbaz (now Elbaz-Luwisch) (University of Haifa, Israel) and Jean Clandinin (University of Alberta, Canada), founded a new line of research (personal practical knowledge) and a new research method (narrative inquiry). Elliot Eisner brought aesthetic knowing and art-based research to the forefront of inquiry and Lee Shulman introduced his highly influential concept of pedagogical content knowledge to the teaching and teacher education arena. According to John Olson (Olson, personal communication, 2012), "positivism [had] led to critiques of work on teacher thinking as soft. [The scholars above, among many others] helped open the field at AERA for more nuanced studies of teacher thinking that were not positivist" (Kompf and Rust 2013, p. 15).

The opening of an AERA space is evident in Clandinin's 1985 "Personal practical knowledge: A study of teachers' classroom images" article. As a student of, and frequent co-author with, Michael Connelly, she described their research as follows:

> Teachers develop and use a special kind of knowledge...Using. . .classroom episodes. . ., I offer a theoretical outline of the experiential dimensions of an image and, in doing so, present image as a [teacher] knowledge term which resides at the nexus of the theoretical, the practical, the objective and the subjective. (Clandinin 1985, p. 361)

The shift was also present in the scholarship of Sigrun Gudmundsdottir (Norwegian University of Science and Technology, Norway) (deceased) who studied with Lee Shulman. Gudmundsdottir summarized her research in the following abstract:

> This article explains pedagogical content knowledge as a narrative way of knowing. It describes how narratives serve as a means of explaining that understanding to others. It discusses two San Francisco (California) high school teachers' uses of narrative in teaching. It concludes that, because teaching is like writing a story, understanding teaching is like interpreting a story. (Gudmundsdottir 1991, p. 141)

As can be seen, multiple conceptualizations of knowledge were proliferating on the teacher education landscape. Pinnegar and Hamilton (2009) made the following sense of the different terms, which may be of assistance to readers:

> [The conceptualization] of personal practical knowledge contains within it what others label as judgment (i.e., Goodlad 1990) or concepts of pedagogical content knowledge and wisdom of practice (Shulman 1986). Schön's (1983) conception of the kind of knowing-in-action that informs the reflective practitioner provides another partial accounting for this term. (p. 21)

For Michael Connelly, however, the research focus has always been on the next step of the inquiry into personal practical knowledge and not on others' naming of phenomena in the field (Connelly, personal communication, 2018).

Schwab and his academic descendants were not the only ones theoretically influencing the field's direction. Lawrence Stenhouse (University of East Anglia, UK) and his colleagues (John Elliott, Jean Rudduck, Bridget Somekh, etc.) in England were bringing about substantive change as well. Stenhouse (1983) also rejected behaviorist theories. He similarly argued for provisional understandings of knowledge and research. Rather than focusing on behaviors such as the achievement of prescribed objectives, Stenhouse centered on processes, using the action research method (i.e., Altrichter et al. 1993; Elliott and Norris 2012) whose roots trace to sociology. Like Schwab (University of Chicago, USA) who chaired the Committee on Teacher Preparation for the Biological Sciences Curriculum Study and pioneered science as inquiry in the USA, Stenhouse also was a humanist who supported inquiry orientations. As Director of the Humanities Curriculum Project, Stenhouse envisioned a new role for teachers. Rather than facilitating learning to obtain a prescribed outcome, he believed that they should be positioned as coinvestigators of teaching and learning: they should be "teacher researchers." To Robinson (2004), theorizing teachers as researchers became a "professional necessity" because school improvement, teacher professional development and teaching as a profession were all dependent on teachers acting as agents of change. Stenhouse steadfastly

maintained that "authority should rest with teachers" (Stenhouse 1983, p. 211). He furthermore stressed that "if educational practice is not relevant to theory, then that theory is not properly a theory of education" (p. 211). Stenhouse accordingly organized the Humanities Curriculum Project around live educational problems rather than abstract topics, addressing race relations, for example, from an inquiry stance with teachers remaining neutral.

Another influential pacesetter was Donald Schön (Massachusetts Institute of Technology, USA), whose research focused more broadly on professional practices of which teaching was one. Schön's dissertation, *Rationality in the practical decision-process*, was based on Dewey's theory of inquiry (1938). Schön initiated the concept of the reflective practitioner present in Dewey's scholarship and the idea that reflective practitioners think in- and on-practice. According to Richmond (Richmond et al. 1998 [A tribute to Donald Schön]), Schön believed that education's most important lesson was that theory and practice must be "locked in critical combat" (p. 3). Schön (1983) summed up the problems of practice this way:

> In the varied topography of professional practice, there is a high, hard ground where practitioners can make effective use of research-based theory and technique, and there is a swampy lowland where situations are confusing 'messes' incapable of technical solution... Shall the practitioner stay on the high, hard ground where he can practice rigorously, as he understands rigor, but where he is constrained to deal with problems of relatively little social importance? Or shall he descend to the swamp where he can engage the most important and challenging problems if he is willing to forsake technical rigor? (p. 42)

The mismatch between the "high ground" of academe and the "swampy lowland" of practice (p. 24) prompted Schön (1983) to conclude, along with a chorus of others (i.e., Lyons and LaBoskey 2002), that a different kind of epistemology needed to be envisioned, an epistemology with different claims to knowledge than conventional epistemology whose roots are based in positivist science. This is because

> ...the concepts of a knowledge base for teaching and evidence-based education [are untenable], if and when these terms are understood to be grounded in scientific (scientistic) research on education practice carried out solely by those outside the contexts of schools and other sites of practice...with the intention of discovering universally applicable practice that will inform the work within them. (Cochran-Smith and Lytle 2009, p. ix)

Agreement on a new epistemology would attend to the "puzzling anomaly" (Schön 1983, p. 33) of practice and the development of said practice and necessarily account for reflection and knowing-in-action. Furthermore, by conceiving of knowledge in teachers' terms and demonstrating its complexity, "it [would be] possible to deny outsiders—university-based researchers or government policymakers—access to a simplistic 'knowledge base' for controlling teaching" (Carter and Doyle 1995, p. 123).

According to Walter Doyle (University of Arizona, USA) (Doyle, personal communication, 2018), "the 1970s divide in teaching research was essentially between followers of Nathaniel 'Nate' L. Gage [Stanford University, USA] and

followers of Philip W. Jackson [University of Chicago, USA]." Nathaniel L. Gage was an educational psychologist who had worked in the laboratory of B. F. Skinner. Gage (1962) promoted research on teaching as a science and vigorously spread its influence in the field. A giant in the world of education, he edited the 1962 *Handbook of Research on Teaching* and originated the journal, *Teaching and Teacher Education* in 1985. On the other side of the debate was Philip Jackson (1992), another titan, who also had been prepared in statistical measurement and would also edit a handbook, the 1992 *Handbook of Research on Curriculum*. However, unlike Gage, Jackson had experienced a paradigm shift while working at the Center for Advanced Study in the Behavioral Sciences at Stanford University in 1962–1963. There, he met a primate researcher who used behaviorist techniques to test and train baboons. Philip Jackson concluded that he was doing the same thing with children; that is, "treating them like animals in a behaviorist paradigm." Jackson immediately realized there must be "a better way to understand children, a better way than poking them with sticks" (Hansen in Aboud 2015). Upon returning to Chicago, Jackson (1968) wrote *Life in classrooms* from an anthropological point of view. In it, he argued that classrooms are "too complex an affair to be viewed or talked about from one single perspective. . .all of the means of knowing at our disposal [should be used]" (p. vii). This declaration, along with his advice that researchers "face [their] ignorance" (Jackson 1987), "[became] the standard inspiration for alternate inquiry approaches into what went on in teachers' minds and spirits, as they prepared for, engaged with and reflected on events in and around their classroom practices" (Kompf and Rust 2013, p. 9).

Members of the Invisible College for Research on Teaching (IC) also contributed theories that helped set the stage for the emergence of self-study research. IC was first organized by the US Department of Education, Office of Educational Research and Improvement when Virginia Richardson was Deputy Director and was believed to have authorized its funding. IC grew out of a meeting in which 100 researchers were invited to discuss the field of teacher education (Pinnegar, personal communication, 2018). Feeling the meetings were valuable to their work, they formally organized IC and named Lee Shulman (Michigan State University→ Stanford University→ Carnegie Foundation for the Advancement of Teaching, USA) as its first dean (Jere Brophy [Michigan State University, USA] and Stefinee Pinnegar have been IC's subsequent deans). IC was named by Shulman, who "drew on Robert Merton's observation that in academia the local "college" was often less important than the larger network of personal connections among a group of scholars around the world, i.e., the Invisible Colleges" (Doyle, personal communication, 2018). Merton was a leading sociologist who had pioneered focus groups as a qualitative research tool and introduced *unanticipated consequences* and *self-fulfilling prophesies* to the education vernacular.

IC began with a small circle of invited members and their doctoral students and eventually international researchers from The Netherlands and Germany, for example, were admitted to the group (Wubbels, personal communication, 2018). The main reason for the group's formation was shared disappointment over the results of the Coleman Report (Coleman et al. 1966), the most important policy-influencing

document of the American Civil Rights era. The report revealed that the research topics and instruments used at that time were neither nuanced nor robust enough to capture teachers' influences on student achievement. The absence of clear research outcomes, together with behaviorism being "the dominant psychological paradigm" (Lowyck 2013, p. 40), created the need to study observable teacher behaviors correlated with learning outcomes (Brophy and Good 1986). This research period became widely known as the process-product research era, which eventually became replaced by the teacher thinking era and currently, "the study of teachers and teaching in all of its complexities" (Craig et al. 2013, p. xv), using a plurality of mostly qualitative methods in a multitude of research genres, of which self-study is one.

Among the attendees at the early IC meetings was Virginia Richardson, a powerful leader (Doyle, personal communication, 2018) at the US National Institute of Education (NIE), who previously funded a plethora of ground-breaking research projects, including the Institute for Research on Teaching (IRT) at Michigan State University co-led by Lee Shulman and Judith Lanier. Richardson was originally from Canada (Clandinin, personal communication, 2018), had served in the American Peace Corps (as did Tom Russell who was mentioned earlier), and had attended Syracuse University at the same time as Ken Zeichner (Hamilton, personal communication, 2018). Richardson was vitally important because she was dedicated to improving classroom teaching and to studying teacher education from more of an anthropological point of view (Doyle, personal communication, 2018). As for IC's international attendees (e.g., Michael J. Dunkin [University of New South Wales, Australia], Frank Achtenhagen [University of Göttingen, Germany]), they were desirous of sharing their preliminary research findings in a more harmonious academic community outside of the "intellectual blood-letting" behaviorist-dominated AERA meetings (Kompf and Rust 2013, p. 14).

The paradigm shift became evident in other newly formed organizations as well. In 1983, the International Study Association of Teacher Thinking (ISATT), like IC, became a forum in which groundbreaking changes were made sense of. Among ISATT's initial members were Rob Halkes (University of Tilburg, Netherlands), Joost Lowyck (University of Leuven, Belgium), John Olson (Queen's University, Canada), Christopher Clark (Michigan State University, USA), Jean Clandinin, Freema Elbaz, and Christopher Day (University of Nottingham, UK), along with many others. ISATT was renamed the International Study Association of Teachers and Teaching in 2003 to reflect is mission of studying teaching and teacher education from the "inside out" through primarily qualitative means. This transformation meant it was no longer sufficient to capture teachers' knowledge solely in statistics and in other people's terms. It became widely agreed that knowledge culled from experience was not able to be "tested, packaged, imparted and sent like bricks across countr[ies] to build knowledge structures that are said to accumulate" (Eisner 1997, p. 7). This is because the teacher and the teacher educator as the knower, like the student as a knower, is indispensable to the body of knowledge that exists – in effect – *The knower and the known* as Dewey and Bentley (1949) earlier phrased it. For example, in 2003, Franciscus "Fred"

Korthagen (Utrecht University, Netherlands), whose dissertation, *Promoting reflection as a basis for teacher education*, years earlier built on Dewey's notion of reflection and had attracted the attention of Ken Zeichner (Korthagen interview conducted by Z. Šalamounová and R. Švaříček), delivered an ISATT keynote address on the topic of knowledge as phronesis and knowledge as episteme. Barica Marentič Požarnik (University of Ljubljana, Slovenia) specifically recalled Korthagen's careful delineation of these theoretical terms and emphasized the importance of his "onion model" of teacher professionalism. The latter model facilitated her understanding of the highly debated topic of teacher competencies that others wanted to "instrumentalize" in the knowledge base of teaching in the Bologna reforms introduced post-1999 in Europe (Marentič Požarnik and Šteh 2013, p. 54).

Interim Analysis

The 1960s, 1970s, and 1980s were marked by social change that took place in many spheres: politics, war, art, music, personal values, social issues, and technology, among other areas of significance. The generation of teacher educators entering the academy from the end of the 1980s to the 1990s onward had been.

> . . .raised on a social diet of paradigm shift as modernity gave way to post-modernity, feminism raised questions about fundamental assumptions in theory, practice and representativeness and the Civil Rights Movement brought matters of race and equality to the forefront of both social and educational agendas. [Furthermore], geopolitical shifts had caused walls to crumble, nation states to emerge from deserts and the dawning of a new sense of social justice that laid bare generations of unthinking assumptions marked by the multi-national global footprints of imperialism. (Kompf and Rust 2013, p. 7)

In addition, race, class, gender, religion and special learning needs added further complexities also needing to be contended with by faculties and schools/colleges of education internationally. In a nutshell,

> . . .as society shifted in response to growth and diversity, a concomitant shift occurred in the culture of teacher educators and in that teaching culture as a whole. The movement from practice to inquiry elevated teaching from simple practice to theorizing about practice regarding teaching and associated underlying activities in ways that legitimized teachers as producers of research and knowledge rather than mere recipients of information generated elsewhere. (p. 7)

Undergirding the shift that necessarily occurred was a self-evident truth with which the research community needed to grapple. Process-product research had produced results that were "at best, inconclusive, at worst, barren" (Tom 1984, p. 2) about how "teachers [and teacher educators] should proceed in the classroom" (Barrow 1984, p. 213). Kliebard (1993) further elaborated the problem in his critique of Wang et al.'s (1993) review of 91 meta-analyses, 179 chapters, and 61 experts in the area of teacher knowledge:

> The failure of research to affect practice is not a matter of obstinacy, ignorance, or malfeasance on the part of teachers [or teacher educators], or for that matter a failure on the part of researchers to employ sophisticated research techniques, or to amass large enough data bases. It is failure on the part of the research establishment generally to take seriously enough the conditions of teaching as well as the perspective of teaching professionals. (Kliebard 1993, p. 301)

Teaching and Teacher Education: A Field in Theoretical and Methodological Transition

Tom's, Barrow's, and Kliebard's critiques, along with the research shared later in this chapter, helped to theoretically open a space, albeit a small sliver (given the more conservative educational climate since the 1970s), for different research emphases and alternate genres of inquiry such as S-STEP. The most pivotal review chapter capturing the changes underway when self-study emerged was Gary Fenstermacher's (1994) "The knower and the known: The nature of knowledge in research on teaching." Fenstermacher's 1994 title patterned Dewey and Bentley's 1949 "The knower and the known," but featured a fitting intergenerational subtitle: "the nature of knowledge in research on teaching."

A quarter-century (1994–2019) has passed since Fenstermacher's chapter appeared in AERA's flagship publication, *Review of Research in Education* (RRE). The 25th anniversary of his RRE chapter in 2019 is an appropriate occasion to elucidate the research programs of those featured in the chapter and to show how various elements arising from different internationally recognized scholarship fused in ways that made it possible for an eclectic (Cole and Knowles 2004; Loughran and Northfield 1998; Schwab 1971) and highly promising (Clandinin and Connelly 2004; Russell 2004) new research genre to emerge and flourish on the teaching and teacher education landscape. This was especially the case for the Arizona Group because they were "influenced profoundly by Fenstermacher" (Pinnegar, personal communication, 2018). S-STEP constituted a new form of more "practitioner-owned" research (Vanassche and Kelchtermans 2015, p. 508), joining (1) action research (Whitehead and McNiff 2006), (2) case study research (Carr and Kemmis 2003; Goldblatt and Smith 2005), (3) reflective practice (Mueller 2003), (4) life history (Erickson and Young 2011), (5) narrative inquiry (Clandinin et al. 2016; Estola and Elbaz-Luwisch 2003), (6) autoethnography (Bochner 2012; Pinnegar and Hamilton 2009), (7) teacher research (Shagoury and Power 2012) (8) practitioner inquiry (Dana and Yendol-Hoppey 2014), and (9) the use of practice as a site for research (Wilson 2001). S-STEP would be followed by the scholarship of teaching and learning (i.e., Hatch and Pointer Mace 2007), which appeared afterwards on the Shulman branch of the teacher research tree.

The next part of our chapter will capture how the different lines went forward with others (newcomers and latecomers) joining the self-study research enterprise, spreading it to a multitude of subject matters and interest areas and increasing its theoretical roots while expanding its global reach. It will end with a summary of the research developments that occurred over time that contributed to its theoretical

foundation and facilitated its presence as a premier way to bring understandings of theory, practice, and policy to bear in the study of teaching and teacher education.

Fenstermacher Review Chapter: A Behind the Scenes Retelling

In a video interview published on the *Inside the Academy* website (Arizona State University n.d.a, http://insidetheacademy.asu.edu/lee-shulman), Gary Fenstermacher recalled how Lee Shulman, a former AERA president and then-editor of AERA's *Review of Research in Education* (RRE), invited him – an "unknown in educational research" (Fenstermacher's description) – to write a chapter on the status of research on teaching. Humility aside, Fenstermacher was eminently qualified to take on Shulman's task. Lee Shulman, David Berliner, Richard Shavelson, and Gary Fenstermacher jokingly called themselves the "mafia of research on teaching," a phrase repeated in website tributes (i.e., Shulman, n/d) and in interviews we conducted as chapter authors. Gary Fenstermacher held a Ph.D. from Cornell University in the philosophy of education and was interested in the politics of teaching and the education of teachers. In his early years, he was hired to a tenured faculty position at the University of California, Los Angeles (UCLA), by John Goodlad, then-Dean of the Graduate School of Education and previous Director of the UCLA lab school. A graduate of the University of Chicago and mentored by Ralph Tyler, one of education's most preeminent figures, Goodlad's theoretical roots included John Dewey from whom he came to know "the concepts of progressive education, what might [currently] be called constructivism, and the practice of applying theory with seriousness of purpose and intellectual power" (Goldberg 1995, p. 82). Goodlad's and Fenstermacher's paths would continue to cross when Fenstermacher was invited to serve as Senior Associate to the Center for Education Renewal at the University of Washington and the Institute of Educational Inquiry in Seattle, Washington, both organizations Goodlad later led. In short, Gary Fenstermacher's mentor was John Goodlad. In Fenstermacher's words, Goodlad "served as a model for educational policy and reform that [was] evidentially grounded, morally robust, and democratically compelling." (Arizona State University n.d.b, http://www.leeshulman.net/domains/) Consistent with Dewey, he modelled how "the researcher in education must. . .get immersed in complex phenomena, then withdraw and think about the issues" (Goldberg 1995, p. 82).

Gary Fenstermacher began researching and writing the status of teaching chapter with Lee Shulman and Peter Grimmett (Simon Fraser University, Canada) as editorial consultants. He had just completed his term as Dean of the University of Arizona College of Education in 1991 and his appointment as President of the American Association of Colleges for Teacher Education (AACTE) in 1990, two experiences that had further prepared him, particularly since AACTE was immersed in the Knowledge Base Project. What Fenstermacher produced was a significantly revised version of a presentation that his spouse Virginia Richardson (University of Arizona) and he had previously made at a conference in Tel Aviv, Israel, in 1993, a conference that was initially meant to be a closed conference where the following

scholars, among others, also presented: Lee Shulman, Judith Shulman, David Berliner, Christopher Clark, and Sigrun Gudmundsdottir (Elbaz-Luwisch, personal communication, 2018). The newly refined review chapter, also significantly influenced by his long-term collaboration with Richardson, drew on his philosophical background and his career-long interest in how ideas about knowledge are used and analyzed in several ground-breaking research programs studying teachers and their teaching. Fenstermacher knew his review was vitally important because governments characteristically privilege formal forms of knowledge in the "much vaunted knowledge base of teaching" (Fenstermacher 1994, p. 4). He further recognized that if educational policies were supported by science and that science turned to epistemology to justify its knowledge claims, then epistemology was critically important as well. Concurrently, he left the door open for the prevailing epistemology to be "the wrong epistemology. . .among a number of possible epistemologies" (p. 4). In the chapter's opening, he did not mention that the conventional epistemology he had in mind was grounded in positivist science, which itself had experienced/was continuing to experience a paradigm shift (Kuhn 1970). He did mention Bruner (1986) who had already championed two complementary modes of thought: logico-scientific (paradigmatic/propositional) and narrative (non-paradigmatic/non-propositional) and his belief that "efforts to reduce one mode to the other or to ignore one at the expense of the other inevitably fails to capture rich diversity of thought" (Bruner 1986, p. 11). But he did not include discussion of Schön (1995) who asserted that "the new scholarship requires a new epistemology." Neither did he acknowledge Ernest Boyer's (1990) "scholarship reconsidered," which argued for four scholarships: discovery, integration, application, and teaching and learning. In all fairness, though, Fenstermacher left a crack open where the light could shine in (Leonard Cohen cited in Clandinin and Husu 2017). His review (Fenstermacher 1994) was guided by four questions, all related to self-study's theoretical roots:

1. What is known about effective teaching [teacher education]?
2. What do teachers [teacher educators] know?
3. What knowledge is essential for teaching [teacher education]?
4. Who produces knowledge of teaching [teacher education]? (p. 5)

Where question 1 was concerned, Fenstermacher named the process-product era of research that preceded self-study and showcased N. L. Gage and how Gage believed "the basis for teaching [is] psychology. . .particularly as practiced by university-trained research psychologists" (Fenstermacher 1994, p. 7). Fenstermacher hinted that some researchers "do not see themselves as studying teacher knowledge as much as they perceive themselves as producing knowledge about teaching" – a distinction he later attributed to Pamela Grossman (1994) (International Encyclopedia of Education [2nd Edition]), a prominent former doctoral student of Shulman. Both the Gage and Grossman examples suggest a logistic theory-practice relationship, in McKeon's (1952) vernacular. However, Fenstermacher later indicated that the Shulman research program blurs the lines between formal knowledge and practical knowledge because Shulman used cases and case knowledge as "knowledge of specific, well-documented,

and richly described events" (Shulman 1986). The latter is more suggestive of the practical knowledge domain and possibly a problematic theory-practice dynamic where both theory and practice are brought to bear on practical problems. Like the others mentioned thus far, Shulman's theoretical foundation also threaded to Dewey, most specifically *The Child and the Curriculum,* where Dewey expounded on the difference between logical understanding (the knowledge of the "scientist") and psychological understanding (the knowledge necessary for teachers).

Shulman was also significantly influenced in his work on teacher knowledge by Schwab's work on the structure of the disciplines. In his review chapter, Fenstermacher detected "confusion" in Shulman's writings. This "confusion" may have been attributable to Lee Shulman also being influenced by Benjamin Bloom (the universal [Bloom] versus the particular [Schwab]) (Westbury, personal communication, 2018). Bloom, Schwab, and Philip Jackson were all faculty members at the University of Chicago when Shulman earned his doctorate there in 1962. Shulman taught at universities and led organizations in which funding for sponsored research depended on proposing studies that promise to advance the knowledge base for teaching and teacher education. Shulman transformed a report of clinical studies of diagnostic decision-making by medical doctors into a successful proposal to establish the IRT at the Michigan State University College of Education, which began operating in 1976. The IRT and its large and diverse program of research on teacher thinking hosted the founding meetings of IC and served as greenhouse for early qualitative and ethnographic studies of teaching during the "paradigm wars" of the 1970s and 1980s.

We now move on to Fenstermacher's second review question: "What do teachers know?" Here, Gary Fenstermacher mostly referred to Freema Elbaz, Michael Connelly, and Jean Clandinin as one group, and Hugh Munby, Tom Russell, and other Canadians (i.e., Erickson, MacKinnon; Grimmett) and Americans (i.e., Clift, Houston, Pugach) as another group. Fenstermacher especially noted that Canadians excelled where this question was concerned. Galeen Erickson supplied one possible reason why. Erickson attributed the success to Canada's science groups and the family resemblances between their research programs that continued even after Connelly and Clandinin broadened the scope of their inquiry to teachers' personal practical knowledge (MacKinnon et al. 2013), which, in turn, attracted attention from the USA's NIE (from whom they received funding for the 1980 proposal, *A conceptualization of the interface between teachers' practical knowledge and theoretical knowledge in effecting board policy* (Connelly, personal communication, 2018) and the National Society for the Study of Education (NSSE) (which invited a chapter for the 1985 NSSE Yearbook). As supporting evidence, Erickson noted that Donald Schön invited chapters from all three veins of Canadian research (Clandinin & Connelly; Erickson & MacKinnon; Russell & Munby) to include in his case studies of educational practices volume (Schön 1991). In an email exchange, Tom Russell (Russell, personal communication, 2018) added two supplemental reasons. First, the named researchers created "good teams." Second, Canada does not have "straitjacket pressures in teaching and teacher education [like] the US, so it may have been easier [for Canadians] to ask deeper questions." Freema Elbaz-Luwisch, who studied with Connelly at the University of Toronto, also offered an explanation,

Because education in Canada is the responsibility of the individual provinces, federal funding of academic research in education has not worked to constrain the direction of such research. [Furthermore]... a focus on bi-cultural and eventually multicultural issues [has] led, directly and indirectly, to educational efforts that acknowledge and value cultural and other forms of diversity, and likely also provided background support for research on what teachers, themselves representatives of varied groups within society, hold as knowledge and bring to the practice of teaching. (Elbaz-Luwisch, personal communication, 2018)

Unlike Russell, Munby, Erickson, McKinnon (question 2), and Shulman (question 1), Connelly and Clandinin, while similarly drawing on Dewey (especially his qualities of experience), built on Schwab's (1973) commonplaces of curriculum and the importance of teachers being curriculum-makers (Craig and Ross 2008) rather than curriculum-implementers. The University of British Columbia (UBC) research team noted that this family difference did not present a problem because "Schön's ideas fit [well] with Schwab's (1969) *A language for curriculum*" (MacKinnon et al. 2013). Also, both Schön and Schwab drew their theoretical inspirations from Dewey, and the UBC research team did, too. However, Fenstermacher (1994) noted that despite Connelly and Clandinin using "conceptions and methods that tapped [into] an important and frequently ignored type of knowledge" (p.12), their efforts not to "distort, destroy, or reconstruct this knowledge" (p. 11) resulted in their research program being highly theoretical and conceptual. On the whole, Clandinin and Connelly outright rejected the "imposition of academic theory and research on teachers" (Fenstermacher 1994, p. 10), declaring that "what is at stake is less of a matter of working theories and ideologies and more a question of the place of research in the improvement of practice and of how researchers and practitioners may productively relate to one another" (Connelly and Clandinin 1990, p. 12). Concomitantly, Clandinin and Connelly unveiled narrative inquiry as a relational form of inquiry involving relational ethics and relational ontology. Where Munby and Russell (1992) were concerned, Fenstermacher said he previously had reservations about their favoring of Schön's "an epistemology of practice," but since had warmed up to the idea. Ultimately, Fenstermacher (1994) stated that how the teacher [knower] knows and how it is known that the teacher knows remained a challenge for both Canadian research strands, given both were concerned with practical knowledge (pp. 13–14).

We now move on to Fenstermacher's question 3: "What knowledge is essential for teaching?" To Gary Fenstermacher, the research program developed by Shulman and his doctoral students at Stanford University best addressed this query through the pedagogical content knowledge (PCK) conceptualization. While Shulman's concept has proven to be one of the most frequently cited in the field, Fenstermacher was once again unable to distinguish whether it constituted practical knowledge or formal knowledge or a "blend of the two" (Fenstermacher 1994, p. 14). In a nutshell, despite Shulman and his associates "deepen[ing] understandings of the interconnections between content knowledge and pedagogical knowledge," their epistemological framing was "difficult to isolate and analyze" – something which Fenstermacher attributed to the different worlds of philosophers and psychologists. As an aside, Fenstermacher and Richardson (1994) elsewhere expressed reservations about

practices being dictated by others for practitioners: "the educational psychologist, as psychologist, is hardly ever (indeed, we think virtually never) in a position to make recommendations about practice. The disciplinary perspective of psychology simply encompasses too little of all that constitutes the universe of practice for the psychologist to assume sufficient warrant to recommend practices for teaching." (p. 54).

Fenstermacher's (and Richardson's) reservations serve as an apt transition to question 4, the final question Fenstermacher raised: "Who produces knowledge about teachers and teaching?" Cochran-Smith and Lytle's scholarship arose from the action research/teacher research genre of educational research. Cochran-Smith and Lytle also traced their research program to Schön, who, like Dewey, was foundational to their research program. To Fenstermacher, this author team was most concerned with teachers being recognized as generators of knowledge, a point with which Clandinin and Connelly agreed. Cochran-Smith and Lytle declared that they had had enough of "the. . .regime of scientifically based research and evidence-based education [which] positions practitioners as the recipients of other people's knowledge" (Cochran and Lytle 2009, p. 11). On a different note, their distinction between formal and practical knowledge, on the one hand, and formal and practical inquiry, on the other hand, resembled Richardson's scholarship, with which Fenstermacher was familiar. However, he was unable to conclusively determine which version of knowledge Cochran-Smith and Lytle defended. One thing, though, was for certain: Cochran-Smith and Lytle were bent on relocating the source of teacher knowledge. But the question of whether what was being discussed was formal or practical knowledge, or formal or practical inquiry remained unresolved for Fenstermacher, despite Cochran-Smith and Lytle's (1999) review chapter that appeared in the next *RRE* volume that directly addressed Fenstermacher's lingering query (Cochran-Smith, personal communication, 2018).

Gary Fenstermacher concluded his article entitled "The knower and the known: The nature of knowledge in research on teaching." by reiterating his overarching issues about "the problem of knowledge" (Ayer 1956). His concerns included the challenge of defining knowledge, differentiating knowledge from belief, distinguishing formal knowledge from practical knowledge and determining how one type of practical knowledge differs from another. Then, there was the need to justify knowledge claims and to avoid using terms like knowledge as feel-good "purr" words (Fenstermacher 1994, p. 33). To end, Gary Fenstermacher acknowledged the possible existence of two sciences for the study of education, stating that Cronbach and Bruner in psychology, Geertz in anthropology and Feyerabend in the philosophy of science, among others, had been challenging science's restrictive boundaries for over two decades. He furthermore admitted that a "softening of standards for truth and justification" had resulted and that "teaching is a practice informed and helped by conventional science; it is not based on conventional science" (Fenstermacher 1994, p. 43). Fenstermacher finished by saying that his comprehensive review revealed that "there are different knowers and different knowns" and that "researchers and teachers are different knowers, and the knowledge they generate as they go about their work also differs" (Fenstermacher 1994, p. 47). He further added that research professors

also can cultivate understandings of their teaching in much the same way that teachers do, which segues directly into a discussion of S-STEP's contemporary theoretical roots.

Interim Analysis

The re-construction of Fenstermacher's review of "The knower and the known: The nature of knowledge in research on teaching" theoretically locates the teaching and teacher education field at the time of S-STEP's inception. Not only that, the brief overview traces the different theoretical lines from which S-STEP attracted its membership. To begin, it is important to note that while Shulman's, Connelly's, Clandinin's, Cochran-Smith's, and Lytle's lines of inquiry continue independently in the field, Tom Russell's research program became intimately intertwined with self-study and does not exist outside of it. The same is true for others as well (e.g., Mary Lynn Hamilton, John Loughran [Monash University, Australia]). Around Tom Russell are a cluster of people including Fred Korthagen (Russell and Korthagen 2013), Sandra Schuck (University of Technology, Australia), among others, with connections to British Columbia (Anthony Clarke, via Shawn Bullock) still existing. Also, Tom Russell was instrumental in forming relationships with Australians Jeff Northfield (Monash University, Australia), John Baird (University of Melbourne, Australia), and John Loughran, with John Loughran, in turn, mentoring Amanda Berry (Monash University, Australia), Robyn Brandenburg (Federation University, Australia), Dawn Garbett (University of Auckland, NZ), and several others from Australia and New Zealand. As for the Shulman group, Alan Feldman (University of South Florida, USA), and Anna Richert (Mills College, USA) study their teacher education practices. Vicki LaBoskey (Miles College, USA), Linda Fitzgerald (Northern Iowa University, USA), and Renée Clift (University of Arizona, USA) also came from Stanford University, with Renée having been Shulman's research assistant and Gage's one-time doctoral advisee. However, she clearly traces her theoretical roots to Dewey and Schön, which the re-telling of Fenstermacher's review made evident (Clift, personal communication, 2018). As for Vicki LaBoskey, she was a graduate student of Nel Noddings and had directed Stanford University's teacher education program. She works with many self-study researchers at Mills College (Linda Kroll among others) and has coauthored with Nona Lyons (University College Cork, Ireland), Helen Freidus (Bank Street College, USA) and Mary Lynn Hamilton (University of Kansas, USA). Linda Fitzgerald works at Northern Iowa University with Deborah Tidwell, who was Virginia Richardson's research assistant, and Melissa Heston. Moving on to the University of Arizona, we find – in addition to Deborah Tidwell – the Arizona Group (Stefinee Pinnegar, Peggie Placier, Mary Lynn Hamilton, Karen Guilfoyle), who were also S-STEP pioneers taught by Virginia Richardson, Walter "Walt" Doyle and Gary Fenstermacher, all of whom have been frequently mentioned in this work. As for the two other research lines, Clandinin and Connelly and Cochran-Smith and Lytle contributed key chapters to S-STEP's first handbook. Cochran-Smith additionally conducted a group self-study

(Cochran-Smith et al. 1999). Nancy Brown (Brown et al. 2008) (State University of New York at Old Westbury, USA), who studied with Marilyn Cochran-Smith, is active in S-STEP. Where the former research team was concerned, Connelly's students' Carola Conle (University of Toronto, Canada), Darlene Cuiffitelli-Parker (Brock University, Canada), and Julian Kitchen (Brock University, Canada), among others, participate in self-study with Kitchen making it his sole focus of inquiry and serving as co-editor for this edition of the handbook. On Jean Clandinin's line, Margaret Olson (St. Francis Xavier University, Canada) served as the editor of the S-STEP section of *Teaching Education* when it was the SIG's unofficial journal. Cheryl Craig has written about her experiences amid teacher education and curriculum reforms and Shaun Murphy (University of Saskatchewan, Canada) has copresented and coauthored with Stefinee Pinnegar and Eliza Pinnegar. Cochran-Smith and Lytle's connections to action research, teacher research, and practitioner inquiry broadly conceived bring in Europeans who study their practices – including Jack Whitehead (University of Cumbria, UK) who often tells the story of having only one person turn up at an early presentation: Lawrence Stenhouse (Whitehead, personal communication, 2008). Here, we could also position Fred Korthagen, however, his grounding in reflection may align him more directly with Dewey or perhaps even with Schön, given his coauthorship of foundational pieces in the field of teaching and teacher education with John Loughran and Tom Russell (Korthagen et al. 2006). In addition to having those coming off the Schwab line through Michael Connelly and Lee Shulman, self-study has members who were Joseph Schwab's students and colleagues. Here, Jerry Allender (student) (dialectic teaching/learning, humanistic education), Peter Pereira (De Paul University, USA) (student) (dialectic teaching/learning, deliberation), and Fred Lighthall (University of Chicago, USA) (colleague) come to mind. Aspects of Schwab's theorizing have also been used in the scholarship of Bullock (substantive and syntactical structures of teaching), Clarke and Erickson (commonplaces of curriculum), Craig (commonplaces of curriculum, deliberation, flights from the field), and North, Clelland, and Lindsay (deliberation). Additionally, Deborah Trumbull (Cornell University, USA) who writes in the science area was the doctoral student of Robert "Bob" Stake (University of Illinois, USA), a leading figure in case study research. Further to this, Monica Taylor (Montclair State University, USA) is directly connected to John Goodlad's center work. Her teaching, scholarship and service have been situated within the Montclair State University Network for Renewal, a school-university reciprocal partnership dedicated to the simultaneous renewal of schools and teacher education (Taylor, personal communication, 2018). Additionally, Nathan Brubaker (Montclair State University, USA) grew up in Dewey's home state and sat in some of the same university classrooms as those in which Dewey had sat. Brubaker studied with Matthew Lipman (Montclair State University, USA) who worked with Dewey and who helped fashion Brubaker's doctoral program around Dewey's theoretical ideas (Brubaker, personal communication, 2018). Most of the researchers we have selectively spotlighted found links to what they were already doing in somewhat different fields of inquiry. However, some undoubtedly entered self-study research and aborted the plans others had in mind for their scholarship and careers. Together,

these individuals representing several theoretical lines founded S-STEP. Having painted this overall sketch of self-study's deep roots, our focus will now turn to the specificities of the genre's theoretical foundations.

Specific Theoretical Foundations in Self-Study Research

The field of education is marked by "turns," with the turn to self-study being a monumental shift. These changes occurred when the field appeared to be unfurling in one direction and then forked off in a somewhat different direction either due to discoveries and/or tensions (human or otherwise) – perhaps even unanticipated events – on the educational landscape. Kuhn (1970) explained that "...the world does not change with a change of paradigm, [but] the [researcher] afterward works in a different world" (p. 121). These shifts in attention produced new forms of knowledge and new ways of thinking in and about one's educational environment and how one responds to it. A sub-literature review yielded an abundance of "turns" across the disciplines: for example, the communicative turn, the cultural turn, the quality turn, and so forth. Cumulatively, these shifts served to shape worldviews in previously unacknowledged ways.

Many philosophical, methodological, and theoretical "turns" set the stage for S-STEP's birth as a research genre. One of the most significant ones was the shift from predominantly quantitative research to the acceptance of qualitative research methods. This change occurred when the positivist paradigm "ceased to function adequately in [research on teaching,] an aspect [in] which the paradigm...had previously led the way" (Kuhn 1970, p. 91). To this turn, we add the constructivist turn (Schwandt 1994), the interpretative turn (Clifford and Marcus 1986), the reflective turn (Schön 1983), the action turn (Reason and Torbert 2001), and the narrative turn (Lyons 2006), which also contributed to self-study's theoretical and methodological acceptance as a legitimate field of inquiry. For Pagano (1991), acts of interpreting, narrating, reflecting, teaching, and so forth are all theoretical. To Pagano, "to act is to theorize" (p. 194).

Tom Russell (1997) appropriately likened the study of teaching and teacher education practices to a "pedagogical turn" in the field of education. He explained:

> ...becoming a teacher educator (or teacher of teachers) has the potential (not always realized) to generate a second level of thought about teaching, one that focuses not on content but on *how* we teach...This new perspective constitutes making the 'pedagogical turn', a thinking long and hard about how to teach and the messages conveyed by how we teach... learning to teach is far more complex than we have ever acknowledged. (p. 44, italics in original)

This turn is evident in a wide range of self-study publications (i.e., Samaras 2002) and has more recently been elaborated in *Enacting a pedagogy of teacher education: Values, relationships and practices* (Russell and Loughran 2007), *Powerful pedagogy: Self-study of a teacher educator's practice* (Brandenburg 2008), and

Developing a pedagogy of teacher education: Understanding teaching and learning about teaching (Loughran 2013).

Korthagen and Lunenberg (2004) also have captured changes – turns – that made self-study possible. First, they named a change in focus from expert knowledge to an emphasis on the authority of practice. Munby and Russell (1994) captured this shift in their "authority of experience" conceptualization; Olson (1995) referred to it as teachers' "narrative authority." Berry (2007) explained that the authority of experience captures "the status of knowledge derived through personal experience, compared with other, traditional forms of authority such as the 'authority of position' or the 'authority of scholarly argument'" (p. 12). This change is consistent with self-study's Deweyan, Schönian, and Schwabian roots. However, the authority of experience, like the other authorities Berry mentions, comes with limitations. Brandenburg (2008) recognized this when she wrote that experiences can be interpreted in maligned as well as instructive ways. Hence, researchers like Brubaker (2015) have guarded against the underbelly of experience in their self-studies. Brubaker, for example, jointly established authority in his teacher education classroom. His interactions with preservice teacher candidates informed and extended his authority of experience through carefully-negotiated democratic processes.

Korthagen and Lunenberg's (2004) second turn was from academic theorizing to an emphasis on theories related to personal practical knowing. In this review chapter, many different conceptualizations signaled this shift: practical wisdom/wisdom of practice (Shulman 2004), practical argument (Fenstermacher and Richardson 1994), judgment (Goodlad 1990), pedagogical content knowledge (Shulman 1986), practical knowledge (Dewey 1938; Elbaz 1983), personal practical knowledge (Clandinin 1985; Connelly and Clandinin 1985), and so on, all of which contributed to self-study's theoretical root system. Where personal practical knowing is concerned, we agree with Fenstermacher's (1994) advice that the field would benefit from more communication between those championing the named theoretical constructs, given that all of them have Deweyan theory and practical knowledge at their cores.

The third shift that Korthagen and Lunenberg (2004) pinpointed was the turn from generalizations to a focus on unique situations. Unpacking individual circumstances is where the plurality of self-study's research methods – action research, case study research, auto-ethnography, life history, narrative inquiry, to name but a few – come into play. One can find individual scenarios animated in Feldman's (1996) action research, Freese's (2006) case studies, Hamilton et al.'s (2008) distinctions between narrative inquiry and auto-ethnography, and Mitchell et al.'s (2013) autobiographical self-studies, each informed by literatures specific to their methodologies. Relationships outlining the commonalities and differences among methodologies used in the self-study genre of research have been mapped by Pinnegar and Hamilton.

Korthagen and Lunenberg's (2004) fourth turn involved a change in focus from individual learning to an emphasis on both individual and collaborative learning, and their inter-relatedness. One prime example is their exploration of "remaining aware" conducted alongside Geursen, de Heer and Zwart (Geursen et al. 2010). Another noteworthy exemplar comes from the research collaborative of Davey et al. (2011), a

group of self-study researchers who investigated privatization, illumination, and validation in identity-making. Yet another outstanding example is the self-study of Tuval et al. (2011) who examined their identity as a research team composed of individual scholars. These exemplars and others show how the shift from individual learning to group learning makes self-study somewhat of a misnomer. Most often, the self in self-study is an "assisted self" (Day, personal communication, 2018). Reduced to its essence, the self-study conundrum is this: despite being personal, practical, and individual, self-study is also social, practice-oriented, and community-focused (Williams et al. 2012). Self-study's intent to build knowledge for the profession necessarily cultivates relationships between members of the teaching and teacher education community. The dialectic between the individual and other members of the self-study community is ever present.

Pinnegar and Daynes (2007) also have described how the academy opened up and made a space for alternate genres of research. The four turns they explicated apply to self-study and most other qualitative methods. The first turn they noted was heightened attention paid to relationships between the researcher and the researched *and* the knower and the known (Dewey and Bentley 1949), a topic around which others (i.e., Kessels and Korthagen 1996; Tirri et al. 1999) have continued to build. This turn is especially evident in Julian Kitchen's (2005) theoretical underpinnings, but also in research conducted by Tidwell (2002) and Murphy et al. (2011). Hamilton conceptualized this shift as a turn to "intimate scholarship," which Hamilton and Pinnegar (2015) describe as follows:

> [Intimate scholarship] inquiries explore the particular—our particular experiences, practices, lives, and learning. Intimate scholarship embraces subjectivity and vulnerability. Interpretation in inquiries conducted within the space of the intimate are always open—in the doing, in the living, in the reporting, and in the research conversation of the community. Knowledge in intimate scholarship is developed in dialogue with ourselves, with the research literature, with our past experiences, and with colleagues and participants. Since intimate scholarship is conducted in an uncertain space and is fundamentally relational it is oriented to ontology. (p. 185)

Pinnegar and Daynes' (2007) second turn had to do with the turn from numeric data to written or spoken word. The recognition of the flatness of numbers led to the acceptance of text as data, a phenomenon that distinguishes the field of self-study and is addressed in robust ways in the theorizing of Coia and Taylor (2005), LaBoskey (2012), and Garbett and Ovens (2012). Readers will furthermore recall that the Arizona Group and the self-study researchers from Northern Iowa University (East et al. 2009) have employed dialogue longitudinally as a way of knowing, as have Gudjónsdóttir and Dalmau (2002).

Because Pinnegar and Daynes' third turn mirrored Korthagen and Lunenberg's turn from generalizations to "the power of the particular" (Pinnegar and Daynes 2007, p. 21), we move on to the fourth turn that Pinnegar and Daynes proposed: blurred knowing. Blurred knowing has to do with the move away from accepting the one-view-fits-all approach to interpreting the world (scientific paradigm as conventionally conceived) and the move toward accepting multiple ways of capturing and

making sense of human experience. We will elaborate this turn more fully because it was essentially what our retelling of Fenstermacher's (1994) review chapter was all about. Different international research teams – not only in North America (as Fenstermacher implied) – were wrestling with profound societal changes that raised fundamental questions about what constituted reality, whose reality was being constituted, and for whose purposes was that reality – and not another version of reality or another or another – being showcased. As our chapter's opening section indicated, many changes (women's rights movement, Civil Rights Movement, indigenous people's movement, LGBTQ movement, globalism, etc.) had occurred and/or were unfurling – all of which set the stage for practical knowledge claims being verified within communities of knowing as argued by the research programs of Clandinin and Connelly (with Elbaz, among others), Cochran-Smith and Lytle, (among others), and Russell and Munby (with Erickson & McKinnon, Clift, Houston & Pugach, among others). This disruption happened in the field of education, but also in other fields like law (Amsterdam and Bruner 2000) and medicine (Charon 2008) where attention to the personal and "the particular" also received keen attention. Writing on ethics, American philosopher Hilary Putnam (2004/2005) further reinforced the need to attend to "the particular."

> The primary aim of the ethicist, in Dewey's view and in the view I defend, should be not be to produce a "system," but to contribute to the solution of practical problems...few real problems can be solved by treating them as mere instances of universal generalization, and few practical problems are such that when we *have* resolved them...we are rarely able to express what we learned in the course of our encounter with a "problematic situation" in the form of a universal generalization than can be unproblematically applied to other situations. (italics in original, p. 4)

To the turns already discussed, we add the shift from understanding self in context to understanding how experiences of self-in-context give rise to shifts in identity, as post-structuralists (Zembylas 2005; Sfard and Prusak 2005) and self-study researchers (i.e., Beauchamp and Thomas 2011) have noted. This movement was ushered in by Bullough, Jr's (1989) book, *First-Year teacher: A case study.* This theme has more recently been taken up in collaborative inquiries undertaken by Murray and Kosnik (2011), Williams et al. (2012), and the Portfolio Group (Curtis et al. 2013, 2018).

A further turn has to do with the introduction of other theories as self-study researchers bring new research and philosophies to the field. For example, Allender and Scarlow Allender and Korthagen have merged Gestalt theory with their self-study scholarship. The same can be said for Samaras who based her early research on Vygotsky's theories of learning (e.g., zone of proximal development) and for Whitehead and McNiff who repeatedly draw on the dialectical logic of living contradictions based on the work of the Russian philosopher, Ilyenkov. The Arizona Group's use of Bakhtin's theory of the zone of maximum contact – the zone of inconclusivity – is a further example of theoretical integration (Husu and Clandinin 2017) as is their more recent adoption of Deluzian philosophy (Pinnegar and Hamilton 2015). Other prime examples are Davey's (2013) use of Bourdieu

(1985) scholarship and the work of Curtis et al. (2018), whose theoretical framework draws on Freire. Given self-study's wide-ranging roots, this turn will continue as the field matures and as S-STEP inducts new members.

Additionally, there has been a turn to embodied knowledge, which is subsumed in some conceptualizations of practical knowledge/personal practical knowledge but is not universally acknowledged. Geert Kelchtermans (2009) has especially broken ground in this area through his theorizing on self, emotions, and vulnerability. Where embodiment self-studies are concerned, Forgasz (2015) has advanced the field both as an individual and as a member of a self-study collaborative (McDonough et al. 2016). We predict attention given this theme will increase as the field moves forward.

Recently, metaphors also have been afforded additional theoretical attention. This is evidenced in Thomas and Beauchamp's (2011) use of preservice teachers' metaphors, in East's et al. (2009) use of metaphor as tool for understanding multiple "selves" in practice, in Garbett's (2011) "horse-riding 101" metaphor and in Tidwell and Manke's (2009) use of visual metaphors. Bleakley's (2000) likening of postmodernism to "being adrift without a lifebelt" (p. 405) provides yet another vivid example as does Kornfeld et al. (2007) "caught in the current," which metaphorically captures educational policy's effects on teacher educational programs. This S-STEP trend is expected to continue, given metaphorical thinking, speaking, and theorizing is the highest form of human intelligence (Bruner 1986).

At the same time, self-studies nested in particular disciplines and interdisciplinarity will extend into the future because teaching in the subject areas is foundational to teaching and teacher education's existence. While some teacher educators center on reflective practice (i.e., Aubusson et al. 2010; Schulte 2008) and others teach pedagogies (i.e., Kane 2007; Vanassche and Kelchtermans 2015), still others are positioned as subject matter specialists (Vanassche and Kelchtermans 2014). For example, current literacy self-studies have been undertaken by Freidus et al. (2005); Kosnik et al. (2015) and Peercy (2015). Other recent self-studies have focused on foreign language (Thomas and Geursen 2013), science (Nilsson and Loughran 2012), mathematics (Schuck and Pereira 2011), and physical education (Fletcher and Ovens 2015). To this, we can add the significant body of recent literature that has accumulated around social justice (Cooper et al. 2018; Han et al. 2014; Kroll et al. 2005; Sandretto et al. 2009) and diversity (Tidwell and Fitzgerald 2006). These exemplars' theoretical roots trace to specific areas of inquiry as well as to the roots of self-study research.

Pinnegar and Hamilton's (2009) identification of Stern's (2004) notion of implicit knowledge as being "nonsymbolic, nonverbal, procedural and unconscious (unknown)" (p. 113) suggests the development of an entirely new research vein – that is, what the self does not know within self-study, which also needs to be examined holistically, alongside the known and within the knower. In this way, explorations and theories about "the particular" will become increasingly fine-grained – even as the field broadens and becomes increasingly international and cross cultural.

Furthermore, self-study's roots in liberal/humanistic education (Allender and Allender 2008/2016) has already spawned – and will continue to spawn – transnational/transcultural humanism (Leininger 1997). This is evident in many border-crossing/culture-crossing investigations (i.e., Gudjónsdóttir and Dalmau 2002), which, to this point in time, have been the zenith of the self-study of teaching and teacher education community (Heston et al. 2008). Further to this, InFo-TED (Vanassche et al. 2015) is a new and expanding international teacher educator network appearing on the self-study scene (Rust, personal communication, 2018). This multinational research team may also promote transnational/transcultural humanism in their self-study research activities. These multiple border-and-boundary crossing teams may catapult S-STEP scholarship into the future depending on how far the reach of postmodernism in the field of self-study stretches. These international endeavors may in part find ways to address Zeichner's (2007) call for accumulating self-studies, which is a challenging but not insurmountable proposition for those engaged in intimate scholarship. Clift (2009), Williams et al. (2012), and Kastberg et al. (2012) have made great strides in this direction. Also, the 14 years of self-study research conducted at Northern Iowa University (2010) provides a groundbreaking example of how those engaged in self-study can fruitfully employ serial interpretation (Schwab 1954/1978) and find "encompassing ideas[s]" to "look across" (Clandinin et al. 2016, p. 131) in accumulated bodies of research over time. It is anticipated that additional S-STEP exemplars of this nature will be produced in the near future, some crossing institutional, cultural, national, and international borders.

The field of self-study was borne of the shift from a focus on formal knowledge verification to practical knowledge verification, which, in Aristotelian terms, represents a turn from episteme (formal knowledge) to phronesis (practical knowledge) (Kessels and Korthagen 1996). Bullough and Pinnegar (2004) were among the first to mark this shift. The focus on phronesis opened the floodgates for increased attention paid to ontology. Pinnegar and Hamilton (2009) captured S-STEP's stance in the following passage:

> . . .ontology (the study of what is real) implies epistemology (the study of how we know what is real) and epistemology implies ontology. We can know what is only in so far as our epistemological stance tells us. However, . . .the basic question has always been more about *what is* than about claims to know." (pp. 7-8)

In other words, the self-study community places more emphasis on practice and its improvement than on claims to knowledge according to the field's gold standard epitomized in Fenstermacher's review chapter. Correspondingly, research methodologies address issues of epistemology, it is "the researcher's ontology that drives the epistemological bus" (Pinnegar and Hamilton 2009, p. 77). Loughran (1996) is hopeful that:

> . . .phronesis [will be used as] a conduit to episteme for as the knowledge of practice develops through phronesis, it is almost inevitable that similarities and differences between

situations will encourage thoughts about generalizations and abstractions of practice such that "big ideas" of teaching and teaching about teaching begin to emerge in ways that are able to be tested, refined and verified. Thus, rather than the difference between theory and practice appearing as a chasm, approaching the development of knowledge as learning through experience [will] bridge the two in a meaningful way. (p. 10)

What Loughran foreshadowed could be the "radical middle" that Bullock and Christou (2009) explored or the intersection between practice and scholarship that Fletcher and Ovens (2015) examined. One thing is given: ontology and epistemology are deeply intertwined. In the future, we imagine a similar review to Fenstermacher's being authored for a self-study handbook or a *RRE* volume detailing the ontological and epistemic connections inherent in the self-study research genre.

The shift of attention from epistemology to ontology, along with other identified turns, are part and parcel of a much larger movement – the turn from modernism to postmodernism. As Sarup (1993) explained: "...the postmodern sensibility [has] involve[d] a shift of emphasis from epistemology to ontology...a shift from knowledge to experience, from theory to practice, from mind to body" (p. 172). Experiential encounters with repeated anomalies (Kuhn 1970) in research in teaching, a field previously privileging a single way of knowing, led to the academy's acceptance of practical knowledge research through multiple "streams of influence" (Sadler 1900/1979, p. 49) that congealed to produce S-STEP. S-STEP has continued to evolve and refine itself in aggregate ways through the turns outlined in this section of our review chapter.

Ongoing Theoretical Tensions

As indicated, postmodern "sensibilities" afforded many theoretical advances in S-STEP in addition to catalyzing the group's existence. However, at its outer limits, postmodernism not only questions universal truth, but is skeptical about almost everything, particularly accounts of practice and how they shape readers' interpretations. Potentially this could create issues for S-STEP members and affect the research topics pursued in the future. The following question arises: How do members of S-STEP continue to cohere theoretically when some members have modernist tendencies and others advance postmodernism? For example, Jerry Allender and Donna Scarlow Allender (2008/Allender and Allender 2016) described the post-process-product era when it appeared that qualitative research methods would replace quantitative research approaches. They then went on to describe how the field seemed to correct itself with those championing positivist research agendas reinventing themselves as post-positivists, while continuing to exercise the lion's share of the academy's power. The task of centrists in the self-study community will be one of holding the theoretical and methodological extremities together. However, this will become more challenging and increasingly complex both in S-STEP and in the education field broadly conceived. This tension especially surfaces

on the macro-level when the scholarship of teaching and learning (Boyer 1990) goes unacknowledged in the evaluation of teacher education programs and when decisions on tenure and promotion files are rendered. It also appears at the micro-level in the S-STEP SIG when proposals for AERA and the Castle Conference and manuscripts for S-STEP's journal, *Studying Teacher Education*, are reviewed.

Having touched on the potential impact of postmodernism, we now discuss another of self-study's challenges: its theoretical constructs and their ordinariness. Bruner (2004), for example, spoke of self as a "quirky idea"; Pinnegar and Hamilton (2009) called practice a "slippery term" (p. 16); and Loughran (2013) recognized that pedagogy is a "catch-all phrase" (p. 2). Self, practice, and pedagogy are some of the most foundational coins of the realm of the self-study research genre. Despite all three being problematic, self-study researchers tend to embrace and use these theoretical terms in nonproblematic ways. Bruner (2004) struck at the heart of the issue, when he noted that theoretical constructs such as these are "intuitively obvious to common sense [,] yet notoriously evasive to definition by the fastidious philosopher" (p. 3). Hence, it is imperative that self-study researchers probe the theoretical bases of the taken-for-granted terms they employ.

The same goes for the conceptualizations of reflection and story, concepts that also tend to be used unquestionably. Donald Schön set off a near-cottage industry concerning reflectivity in the professions when he released his series of reflective practitioner books. The emergent challenge, however, is that reflection entered the life-blood of everyday conversation as well as academic life, and nearly everyone is loosely tossing the word around, many in colonized and/or essentialist ways. It is therefore important that self-study researchers not unwittingly participate in the bastardization of reflection's theoretical roots.

One might say "ditto" for story; however, different issues revolve around it, one of which is high stakes. Everyone from babies to theoretical mathematicians and physicists use stories to convey lived phenomena. Additionally, all qualitative research methods employ story – at the very least – as a representational form. Unfortunately, there are at least two major problems with how story or narrative is used in self-study. Zeichner detected both. First, he (Zeichner 1995) chastened self-study researchers about storying their work in ways that make it appear to others as not being as "complex" as it really is (p. 21). Unidimensional storytelling typically happens when broadening, burrowing and storying, and restorying (Connelly and Clandinin 1990) have not taken place in a three-dimensional inquiry space, keeping Dewey's qualities of experience (time, place, and interactions) in mind. The acts of looking forward, backward, inside, and out do not fully take place. Hence, the social, narrative history of the phenomenon under study, its policy backdrop, and multiple accounts of the same experience seem shallow or omitted possibly due to word and page length restraints. The problem with story in self-study research became even more contentious when Zeichner (2007) called upon the self-study community "to get beyond the story" (p. 36). One way to interpret this challenge is to broaden and deepen how individual teacher educator accounts are interpreted and how they become connected to other narratives at both the micro- and macro-levels. This seemed to be what Zeichner was pushing the self-study community to do, given that

self-study research, lives of teachers research, portfolio and reflection research, narrative research, case study research, etc. – indeed all qualitative research methods and most international research (and researchers) – were left out of *Studying teacher education: The report of the AERA panel on research and teacher education* (Cochran-Smith and Zeichner 2005).

Laying aside the politics of AERA and American teacher education, there is a grain of truth to Zeichner's (2007) criticism. Those engaged in self-study research, along with their other qualitative counterparts, *do* need to engage with "the mainstream of teacher education research" so that "the voices of practicing teacher educators are incorporated into syntheses of research" (Zeichner 2007, p. 36). As Davey (2013) noted, there is "still little that goes beyond the individual story" (p. 24). But if we thread back to the beginning of this review chapter, we encounter an intractable roadblock: the mainstream of American teacher education research is dominated by those concerned with formal conceptions of knowledge and a codified knowledge base determined by outsiders to the profession, some being positivist and post-positivist researchers. The bottom line, according to Clandinin and Husu (2017), editors of the most recent *Sage Handbook of Teacher Education,* is that "research in teacher education will not be able to offer explanatory and predictive theories that are the ideal for, and hallmark of, research in the natural sciences. . .." (Husu and Clandinin 2017, p. 1170). The truth of the matter is that "research in teacher education is not done. . .to build and develop theories but to contribute shared understandings that will help in elucidating where we are, where we want to go, and what is desirable, according to diverse sets of values and interests" (Flyvbjerg 2001, p. 167). Once again, we find everything returning to the epistemological-ontological battle captured in our retelling of Fenstermacher's review chapter – the age-old struggle that Schön (1995) termed the "battle of snails" and what Grant and Murray (1999) called "the slow revolution" – toward "the legitimization of the right of teachers [and teacher educators] to carry out investigations into their own practices" (Lyons and Freidus 2004, p. 1079). The situation that has transpired presents those in self-study with an interesting challenge. One way to theoretically address it would be to conduct a mass international self-study around a research puzzle steeped in Dewey's theory of experiential education and break the monopoly that others have on the research on teaching and teacher education field. Another way is to wait for the tipping point that inevitably will occur, as the history of research on teaching and education strongly suggests.

Having taken up some of the issues with stories, we would now like to return the discussion to Fenstermacher's (1994) review of practical knowledge research programs and agree with another of his criticisms: the "purr words" that practical knowledge researchers (ourselves included) are inclined to use. Thus far, we have named five such theoretical constructs: self, practice, pedagogy, reflection, and story. However, many more exist – with knowledge being a prime suspect. In review, "purr" words are words people feel good about using. However, such words are meaningless to philosophers because no justification accompanies their usage. While we are not recommending that self-study researchers make formal knowledge claims in the practical knowledge domain, self-study scholarship would be more rigorous

from a theoretical point of view if how terms were made sense of within practice communities of knowing was included and, where possible, terms were traced to their original sources. This recommendation weaves back to Aristotle and continues to be an Achilles' heel we noted as we have scoured this chapter's literature base.

Conclusion

To conclude this genealogical-theoretical roots chapter of S-STEP research, we return to to John Dewey whose theory of experience – more than any other philosophy – metaphorically formed the "banks of [S-STEP's] river" (Rodgers 2014, p. 89), bounding its multiple and differing streams of inquiry. It was Dewey who inspired others (Schön, Schwab, Goodlad, Jackson, etc.) who influenced still others who spearheaded S-STEP's existence. "Doing Dewey" is how Rodgers (2014) refers to those who live Deweyan philosophy because "a theory of teaching cannot be separated from the self who practices it" (p. 77). To do Dewey, "experience is the starting point... [and]...reflection... is the golden thread" (p. 79) ensuring what is learned is both rigorous and relevant (p. 77). This uncannily echoes how one of Davey's (2013) research participants captured his/her experience of being and becoming a teacher educator. "The real induction," the participant intuited, "happened in the 'doing', *as it must*" (p. 65, italics in original). On this practical note, we dialectically end this theory of self-study review chapter.

Role of Positioning, Identity, and Stance in Becoming S-STTEP Researchers

4

Contents

Abstract

This chapter explores and articulates S-STTEP research identity as ever emergent – always becoming. S-STTEP researchers take an ontological stance. Here, we consider how this positions us as researchers and practitioners as we seek to keep present multiplicities of experience and becoming in every aspect of our research: the focus of the inquiry, design of the study, data collection and analysis, as well as the reporting of the study. Our exploration is organized through a series

of questions: Why do we use the metaphor of *becoming* to make sense of our positioning/stance/identity? What does the action of naming ourselves as S-STTEP researchers mean? How does an S-STTEP identity locate and position us within the educational research community? The teaching and teacher education research community? Within our research? What is the research stance we take up? What is our identity as teacher educator/researchers in our inquiries? In responding to these questions, we assert that engagement in S-STTEP research positions S-STTEP researchers uniquely within the academic community and allows us to contribute new knowledge in new ways particularly around teaching and teacher education.

Keywords

Positioning · Identity · S-STEP · Researchers · Ontology · Stance · Teacher knowledge

Introduction

The primary purpose of this chapter is to inquire into and articulate a view of self-study of teaching and teacher education practices (S-STTEP) researcher identity as ever emergent – always *becoming*. In doing so, we consider how this ontological stance positions us as S-STTEP researchers and practitioners; furthermore, we thoughtfully consider the contribution and impact such a stance has on teacher education research and practice within the educational research conversation, the community of S-STTEP researchers, and for us as S-STTEP researchers. In meeting this purpose, we attend to the complexities of positionality, stance, and identity for S-STTEP research(ers) within S-STTEP research practice and in the larger conversation on educational research more generally. We argue that the ways we (the authors) engage in S-STTEP research uniquely position us (and those who take up identity as S-STTEP researchers) within the academic community to develop new knowledge in new ways (Pinnegar and Hamilton 2009; St. Pierre 2013) around teaching and teacher education. We make clear the power of orienting our work from the basis of an ontological stance for conceptualizing and engaging in practices of S-STTEP research.

As S-STTEP researchers, we simultaneously position ourselves within the research (and in the broader teacher education/education research community) as researchers and as the researched. We embrace these multiple experiences, stances, and identities, including that of teacher and teacher educator, within the meaning-making process of research. Thus as Deleuze and Guattari (1987) argued in any research in any writing we are bring into the inquiry the multiple selves that form a part of us. We assert that this is even more fundamentally so because as S-STTEP researchers, we seek to keep all of these multiplicities present in every aspect of conducting such research. This ontological perspective undergirds and animates the identification of the focus of the inquiry; articulation of the puzzle, phenomenon, or

question; design of the study; accounts of the thinking; and action. It informs the response of ourselves (and the others in our practice), the interpretation and analysis of the accounts, and the reporting of the study.

Viewing experience from a unique perspective, we stand in the space of teacher education researcher. We represent multiple and emerging selves through which we (the authors) conceptualize and engage in the practice of S-STTEP research. It is from this perspective that we attempt to clarify how our positioning, identity, and stance – and the ongoing evolution of identities as S-STTEP researchers – influence the knowledge we create and the understandings we develop in S-STTEP; further, we posit that the learnings teacher educators uncover through S-STTEP research contribute greatly to the research conversation in teacher education (see the Zeichner paradox represented in Hamilton and Pinnegar 2015). We fundamentally embrace the metaphor of *becoming* (Deleuze and Guattari 1987) to conceptualize S-STTEP researcher identity(ies) in ways that are open to complexities around research for ourselves and readers in the inquiry process, in our development as teacher educators, and in our sharing of our knowing about *becoming*.

We acknowledge and embrace the ways that ontological understandings position our work and shape the value, ethics, and insight offered by our stance. To do this, we recount the turns the Arizona Group (2004) experienced (see also Bullough and Pinnegar 2004; Pinnegar and Hamilton 2009, 2015) that reverberate in our (the authors) ever-unfolding understandings of experience, research, and knowing. We draw on our own experience to consider the stories of research that S-STTEP researchers live, tell, retell, and relive (Clandinin 2013) and the stories that others within the broader teaching and teacher education research community tell about S-STTEP research(ers) (Clandinin and Connelly 1995; Connelly and Clandinin 1999). We do so as a way to understand better what such positioning means to S-STTEP research and to S-STTEP researchers and to what this work can contribute. Essentially, we make more explicit our thinking about what it means to be positioned (or take up the position) as an S-STTEP researcher in educational and academic contexts. The community of S-STTEP teachers, teacher educators, and researchers through and with which we become underpins this work. This is an acknowledgment of the ways each of us is many and always in the process of becoming (Deleuze and Guattari 1980/1987). We also acknowledge that the S-STTEP relationships, conversations, and work in which we engage provoke thinking and add depth and nuance to our understandings (individually and collectively).

Our exploration of S-STTEP researcher positioning, stance, and identity is rooted in our (the authors) understandings and theoretical framing of S-STTEP work. We organize this exploration through a series of questions that have emerged through conversation and reflection among the authors and research colleagues:

- As experienced S-STTEP researchers, why do we use the metaphor of *becoming* to make sense of our positioning/stance/identity?
- What does the action of naming ourselves as S-STTEP researchers mean?
- How does an S-STTEP identity locate and position us within the educational research community? The teaching and teacher education research community? Within our research?

- What is the research stance we take up?
- What is our identity as teacher educator/researchers in our inquiries?

Why Do We (S-STTEP Researchers) Use the Metaphor of *Becoming* to Make Sense of Our Positioning/Stance/Identity?

When we name ourselves as self-study of teaching and teacher education practices (S-STTEP) researchers and engage in inquiries from this position, we take up a particular perspective about the nature of reality and research – one of *becoming* teacher, teacher educator, and researcher. The Arizona Group (2004) has articulated an account of our move from a conception of teacher education research within a modernist epistemology to our understanding of S-STTEP research being founded in ontology, in particular, a relational ontology rather than an abstractionist one (see Slife 2004).

A watershed moment in Stefinee and Mary Lynn's understandings of engaging in research from the perspective of S-STTEP occurred at the 1991 American Educational Research Association Annual Conference. Prior to the conference, the Arizona Group had written letters to each other; in these letters, each of us developed understandings around our respective experiences as beginning teacher educators within the context of teacher education, colleges of education, and the university. Separately, each of us looked across the letters as we prepared papers for our conference presentation. We were startled; our papers were completely different from each other: our focus, our interpretation, and our purposes all varied, yet we mostly quoted the same fragments from the letters as exemplars (Mishler 1990). Whereas Stefinee used the entries to demonstrate evidence of our expert voices in our novice experiences, Mary Lynn focused on what our passages revealed about the cultural models we recognized and responded to in our individual contexts. In contrast, Peggy provided an examination of policy, and Karen explored development of voice. Elsewhere, in our handbook chapter we wrote: "How could this be, we wondered. How could responsible researchers vary in their understandings of the same texts? What did this tell us about the research process? Our research processes?" (Arizona Group 2004, p. 1135).

In unpacking this experience, we (the Arizona Group) articulated how it propelled us forward in our epistemological understanding of S-STTEP research and our identity, stance, and positioning as S-STTEP researchers. We accounted for how we moved from a modernist epistemological understanding of being researcher and researched and how we shifted toward embracing ontology to ground our work.

In the first handbook on S-STTEP research, we began by reviewing our movement through a series of discourses on research. In our (Arizona Group 2004) *First Discourse*, we accepted the role of researcher as defined in modernist terms: based on the epistemology of the scientific method. We believed we could be bounded, atemporal, and static. We could distance ourselves from the researched (persons, events, and topics). We could exist as "things" and interact with and treat our participants as "things." We naively sought to use a modernist epistemology to

turn *true beliefs* into knowledge. We desired the ability to make truth claims and assert generalizability for the things we explored. Ironically, we came from other epistemological traditions (literary critics, historians, anthropology, and teachers), and we accepted the findings of (Belenky et al. 1986) concerning women's ways of knowing. In other words, we knew and used other epistemologies. However, modernist epistemologies with their foundational criteria for claims of knowing were seductive and constraining. In that 1991 AERA moment, "…we experienced uncertainty but lacked the language to articulate…or understand that uncertainty" (Arizona Group 2004, p. 1136).

We (Arizona Group 2004) then moved to a *Second Discourse*. From our experience as researchers, we began to understand that as we engaged with participants and explored our knowing of phenomenon, our strategies and perspectives evolved and changed as we studied, since we gained understanding that knowledge could be seen as "contextual and dynamic" (p. 1136). However, "…we continued to act in our role as researchers as if we were capable of remaining in some way intellectually and objectively separate from what we were studying" (p. 1136). Even though we held to this belief, in our actual practice as S-STTEP researchers, we struggled with keeping our self-as-researcher separate from our self-as-researched. Eventually, we recognized the futility of insisting on this separation.

We connected ourselves and our work to Munby and Russell's (1994) argument about authority of experience entering our *Third Discourse*. Thus, how could we maintain separable selves when we used the authority of our self-as-researched as a basis for claiming our knowing? As to the self-as-researcher, we determined that "…as researchers, we saw the self as dynamic and unique, existing in time and context, and a part of an unfolding process…we recognized that we were not all knowing or fully objective" (Arizona Group 2004, p. 1136). This move allowed us to begin to reconcile more fully our 1991 AERA experience, since we now understood that others might interpret our records of our experiences in ways unlike our interpretations. We recognized that both researcher and researched could grow and develop understandings within the research process and project. However, in at least one way, we continued to embrace what Slife (2004) would label as an abstractionist ontology and modernist epistemology. Using our records and interpretations, we felt obligated to convince those with alternative viewpoints about the verity of our assertions.

In our (Arizona Group 2004) *Fourth Discourse*, we argued:

> We come to see that just as what is being researched can change as we study it, the researcher may change in the research process in interaction with and response to [ourselves and others as well as the phenomenon] being studied. (p. 1137)

We recognized that our stance within the research process – as researcher and researched – contexts, and situations always fluctuated and could call forth multiple understandings. From the beginning of its development, other scholars also demonstrated this aspect of S-STTEP research. For example, Bass et al. (2002) recounted three different interpretations of the same set of experiences. They presented

alternative accounts of the learning that took place among themselves and their students. Their study provided clear evidence of the multiple voices and interpretations that result not merely because of the collaboration of three scholars on a research project but because the study was taken up as a collaborative S-STTEP inquiry, each participant standing in the place of their research as researcher/ researched/teacher educator/teacher. They also made visible the ways viable alternative interpretations of shared experiences deepen understandings of teacher education practices and that all three accounts could be creditable.

Furthermore, in Hamilton and Pinnegar (2014), Mary Lynn and Stefinee provided multiple and revised interpretations of our records of *becoming* teacher educators. We represented earlier interpretations of our experience and juxtaposed them against each other followed by the use of alternative theories (feminist, positioning, and then queer theory) to provide additional interpretations. We argued that each of the interpretations we provided of the same records was trustworthy, contained important insights into teacher educator development, and stood as separate viable interpretations of these experiences. In placing these examples side by side, we demonstrate the power of producing multiple interpretations emerging from individual perspectives of a set of events (as in Bass et al. 2002). We also revealed the power of the multiple voices and roles that S-STTEP researchers bring to their work allow for repeated interpretations and reinterpretations from the same researchers (as in Hamilton and Pinnegar 2014). Such multiple interpretations contribute to the understandings that emerge to inform the conversation concerning research on teacher education. The work by Jackson and Mazzei (2012) made clear that thinking with different theoretical lenses results in contrasting interpretations of research records. Further, thinking from within the practical from differing orientations to the practical also results in contrasting interpretations of research records (▸ Chap. 10, "Quality, Trustworthiness, and S-STTEP Research" by Hamiltion et al.).

Interactions with other S-STTEP scholars inform our work and influence our conceptions of the impact of enacting our simultaneously occurring multiple roles within our research and our movement away from modernist epistemologies as the foundation for research on teacher education taken up from our stance as S-STTEP scholars. One contribution that participation in the S-STTEP community provides is our interaction with scholars who represent the range of disciplines that inform teacher education. Like us, Knowles and Cole (1996) used letters as documentation. They wrote to each other during their initial year as teacher educators noting the relationship between the research literature on learning to teach and their own experience as teacher educators. As they developed, they engaged in life history work within the framework of S-STTEP. Ultimately, they embraced arts-based research strategies including dance and visual arts as ways to capture their knowing as teacher educators.

The works of Weber and Mitchell (e.g., Mitchell et al. 2005), another research partnership, pushed our thinking. Their production of enacted S-STTEP studies as readers' theaters at early Castle Conferences (for reference, https://www.castleconference.com) made visible their thinking of the value of performances and visual representations to deepen understandings of teacher educators and teacher

education practices. In a similar way, multimedia performance productions and arts installations (see Finley et al. 1994; Finley and Finley 1998; Finley 1999) freed our thinking about the ways to interpret and share information.

As the S-STTEP community developed and continues to develop, researchers who became part of the community included participants from all disciplines involved in teacher education (see, e.g., Beck and Kosnik 2002 [early childhood]; Bullock and Russell 2012 [science education]; Berry and Loughran 2002 [science education]; Freidus 2005 [early literacy development]; LaBoskey 2009 [educational psychology]; McNeil 2011 [multicultural education]; Ovens and Tinning 2009 [physical education]; Schuck 2002 [mathematics education]; Tidwell and Fitzgerald 2004 [literacy and early childhood]; and Trumbull 2012 [science education]). Further, the community included those who represented the constellation of programs involved in teacher education; there were elementary teacher educators, early childhood teacher educators, special teacher educators, and secondary teacher educators. Conversations about knowing within S-STTEP among a variety of participants brought a breadth to the understandings of epistemology and how knowledge claims could be established.

Conversations about the breadth of ways of knowing, strategies, and methodologies for developing understandings (Pinnegar and Hamilton 2009) and our commitments in teacher education led us and others to shift as we realized that, as a community, our research was based in a desire to understand and make meaning of our work. This led us to shift our orientation toward ontology as the basis of our research. We began to understand that we wanted to represent our experience and understanding of our practice as teacher educators as completely, complexly, and succinctly as possible. Here we turned our orientation away from making modernist epistemologically based claims to know to ontological claims for understanding our context, our practice, our particular work, and our knowing within teacher education. We resonated with Putnam's (2004) assertion that the third enlightenment in research focuses on knowing and communicating the particular.

As our history clearly indicates, we developed and embraced an identity as S-STTEP researchers with inquiries undertaken from an ontological stance (Pinnegar and Hamilton 2015). Clandinin and Rosiek (2007) asserted this orientation toward ontology as the basis for knowing in narrative as a shared boundary of their work. In support of this positioning, Bullough and Pinnegar (2004) asserted:

> Explorations of process and agreement over [strategies] will not lead to stable truth claims. An essential quality of all self-study [of teaching and teacher education practices as well as other qualitative methodologies] points toward a specific ontology, which includes a commitment to a quest for understanding and to a way of being with and for children, colleagues, and our students. (p. 340)

We position ourselves ontologically because of our commitment to research and practice as the foundation for our knowing. The reason we so strongly assert this position is the fundamental nature of S-STTEP research which continually and clearly focuses on our personal understandings of our practice: the practical. Thus, as Bullough and Pinnegar (2001) argued, S-STTEP exists and is enacted in the space

between self and others, history and biography, and strategies and methodologies. Further, S-STTEP scholars continually work to create a living educational theory. That is to say, we (Pinnegar and Hamilton 2009) recognize that the theories we develop are in flux and constantly emerging, being transformed, and deepening. As Deleuze and Guattari (1987) would assert, they are constantly in a state of *becoming* in the same ways we are *becoming* as S-STTEP researchers. In addition, S-STTEP researchers (see, e.g., Loughran 2004) have consistently asserted that in doing this work, we seek to enact what we learn in our practices; thus, our theory is living because it lives in our teaching, research, and teacher education practices. Indeed, as S-STTEP researchers oriented to understanding, changing, and exploring our practice, we focus on the creation of living educational theory – theory that constantly grows and changes and lives in our practice. Our work, like other intimate scholarship (see Hamilton et al. 2016), and our identity as researchers are always in a place of *becoming*, never static. We assert here that S-STTEP work, engaged in from an ontological stance, conducted in uncertain and inconclusive spaces, and taken up in the space of *becoming*, contributes to understandings of teaching and teacher education practices and the research conversations in teacher education.

Leitch (1986) reminded us that we live our lives in middles. Beginnings and endings emerge as we create accounts of our experiences as we story it in particular ways (Clandinin 2013). Modernist researchers conceive of identity as stable, rational, and individual. From this perspective, people experience change but conceive of themselves as principally the same person (Stagoll 2010). In contrast, Deleuze and Guattari (1980/1987) argue that our understanding of self-changes shifts as our understandings of the world change and shift with particular attention to chance confluences of language, societies, relationships, expectations, and so on. As we construct accounts of our knowing in experience, the mere reporting, interrogating, and interpreting of our experience – our representation of the ontology of our practice, move us forward in our knowing as researchers/researched/teachers/teacher educators. We continually move forward in our *becoming* in each of these positions.

Knowing ourselves in practice or in relation to our practice materializes as we engage in and inquire into our knowing in particular contexts. These explorations allow us to uncover, unpack, scrutinize, and make meaning from our non-propositional, experiential knowing in our practice. Such knowledge reveals itself in the rules we have, ways we organize our days and our classrooms, and our interactions with colleagues, students, and others. Often, we are even unaware of this knowing since it is just how we do things. We think of this as embodied knowledge. As Johnson (1989) argued:

> The relevant knowledge here is thus knowledge that grows out of one's personal experience and is the very means of transformation of that experience. It both emerges from and restructures our world, and it has meaning and value only within the context of that experiential process of growth and change. (p. 364)

As Johnson identified what he labels as relevant knowledge, he asserted that such knowledge has meaning within the contexts of our practice. The knowledge we draw

on in our practice grows within it, emerges out of it, and is usually resident in our bodies – our bodies act on what we know. Polanyi (1966) labeled this kind of knowledge tacit. Johnson argued further: ". . .we ought rather to conceive of knowledge as the means by which an organism (here, a human being) adapts itself to its ever-changing environment and effects changes in that environment as the organism clarifies and pursues its ends" (p. 365).

We argue that inquiry into this kind of knowledge and the understandings and assertions for action based on it (Berry and Loughran 2002) allows S-STTEP researchers to make important contributions to research in teaching and teacher education. Uncovering our embodied knowing as teachers, teacher educators, and researchers can potentially contribute much to discourses and research about teacher education.

Johnson (1989) characterized personal practical knowledge (Clandinin 1985) as embodied knowledge that involves habitual structures and patterns. He labeled these as syntax (the routines, patterns, and structures revealed in our experience), semantics (the meaningful conscious and nonconscious implications and influences of our actions within our experience), and the pragmatic dimensions of our actions (our purposes). Johnson asserted (as would we) these are, in fact, "three interdependent aspects of any experience or action" (p. 366). They exist as characterized in Polanyi's (1966) explanation of tacit knowledge as holistic and tangled. Johnson further used the metaphor of "a language of practice," which "stresses the central importance of our embodiment in the meaning, conduct, and understanding of that practice" (p. 366). He explained that practice (the focus of research of S-STTEP researchers) involves ". . .bodily perception, motor skills, action patterns, and spatio-temporal orientation. It is these dimensions that attention to [teachers' and teacher educators'] personal practical knowledge focuses on in ways that have hitherto been ignored" (p. 366). This knowing in practice is a stance in and orientation toward an uncovering of the practical in relation to rather than opposition to the theoretical.

Further, S-STTEP researchers are rooted in the experience of teachers' and teacher educators' practice. This perspective allows for a more conscious knowledge of our action as we observe people's practice and their commentary on it, analyze, and interpret such texts. We argue that observation of a teacher's or teacher educator's practice from the outside does not necessarily allow for such conscious and connected knowing. Just as Johnson (1989) characterized this knowing as a language of practice, Polanyi (1966) argued the holistic, tangled quality of this knowing is fundamental to us. As we attend carefully to our embodied knowing, uncovering elements and aspects of it through analysis of our experience and our reflection on it, there is always more to reveal. In addition, as we come to an understanding of our embodied knowing and act upon it, because of its fundamentally holistic, embodied, and tangled nature, our knowing of practice is partial and emerging rather than settled.

Manke's (2006) photo essay on reflection allowed opportunity to make visible how explorations of embodied knowledge can reveal ourselves to ourselves and make clear our understanding. For her photo essay, Manke took photographs within

the city where she lived, working to capture context-based images that represent the variety of her understandings of reflection. One of Stefinee's favorites is one in which a puddle in the front of the photo captures the entirety of the building in the background. The puddle represented for Stefinee the ways in which in reflection we can take vast, complex landscapes like the slightly distorted image in the puddle and encapsulate them in full detail in our thinking. For Stefinee, the photo captures her tacit understanding of reflection evidenced in the tension between the photo and the puddle. At the end of the photo essay, participants gained new understandings of reflection. Indeed, we no longer understood reflection in the way we did when we began our experience.

We became new in our understanding of reflection as researchers, as teachers, and as teacher educators. Regardless of who we were, implicitly or explicitly, the ways we enacted reflection in our work and in our practice shifted and transformed – sometimes slightly, sometimes completely. The photo essay captured, through Manke's eyes, the concept of reflection – in other words the ontology Manke would identify as reflection. Through her visual accounting of reflection and our experience of it, we stood not in the space of being but in the space of *becoming*; the ground of our understanding shifted. Further, our embodied knowing of reflection shifted as well. Our new understanding and enactment of reflection as a process encapsulates this new knowledge. As Polanyi (1966) explained, our embodied knowledge was again holistic, entangled, and guided our experiences with reflection. Any new examination of our practices of reflection or reinterpretations of accounts from earlier experiences potentially reveals new understandings, characteristics, processes, and connections.

A powerful aspect of studies focused on uncovering our tacit (Polanyi 1966), embodied (Johnson 1989), personal practical knowledge (Clandinin 1985) is that we can create various kinds of accounts and representations of our knowing. But, as we make visible and articulate carefully what we know, it disrupts our tacit and embodied knowing. As we act on that knowing in practice, our embodied, tacit knowledge shifts – perhaps only slightly but nonetheless becomes new. When we reveal something to ourselves that emerges from our tacit knowledge, we embody it and act on it. As this knowing reintegrates itself in our tacit knowledge, it alters.

For S-STTEP researchers, this suggests that our work has no static finality but continuous opportunities to learn and relearn what we know and what is embodied in our actions in our practice, since our embodied and tacit knowing is always emerging, being uncovered, examined and explored, and then altered by our knowing of it. We are not only continuously in a state of *becoming* teacher educators, researchers, researched, and teachers, but we also have an ever-renewing source from which we can examine knowing in teacher education, *becoming* teachers and *becoming* teacher educators. Our thinking can deepen, our focus can sharpen, and our research conversations can open as we reembody and re-examine our knowing in our practice. Our knowing as researchers lives in possibility, not stasis. Thus, even if we return time and again to explore and uncover our knowing, it shifts and opens toward new spaces for learning, developing understanding, and contributing to

research on teacher education. We remain in this state of *becoming* as our knowledge shifts and offers new opportunity to learn from our practice.

Stern's (2004) assertions along with our examination of Polanyi's (1966) conception of tacit knowledge and our quote from Johnson (1989) make clear such knowing grows moment to moment as we act, change, and reflect on, and in, our action. Clandinin (1985) asserted that such knowing of our practice can be characterized as personal, practical knowledge because our beliefs, our experience, our history, our thinking about, and our doing and being are present in our knowing as we plan for, think about, and act in the arenas of our practice. Thus, as we plan for teaching and as we enact teaching, nothing exists as mere repetition of what we have done before. Milan Kundera (1981) in *The Book of Laughter and Forgetting* argued that our routines and our practice are the second infinity. He used practicing a composition on the piano as an example. Each time we perform or practice a musical number, it is not a repetition; it is a new version. This second infinity is representative of Deleuze's (1994) *difference.*

Moreover, Clandinin's (1985) understanding of personal, practical knowledge drew our attention to the ways that our knowing is situated in particular contexts and relationships. As S-STTEP researchers, inquiry into our action reveals the uncertain spaces in which we act and the ways our embodied knowing depends on the context, the humans, our intentions, and purposes. We can articulate a plan for action, and we can capture, conceptualize, and produce a coherent account of the experience in which we are engaging, but as we act in practice in relationship to context, humans, and knowledge, this knowing always depends and is contingent. In this way, our knowing of ourselves and our practice is always partial, inconclusive, incomplete, and emergent. The partial nature of our knowing and curiosity about our knowing in our practice propels us forward in our inquiries in terms of our development of knowledge of our practice, our practice as representative of our knowing, as well as in knowledge of ourselves in relation to or in terms of practice.

What Does It Mean that We Name Ourselves as S-STTEP Researchers?

Often, within the educational research community, the research we do is labeled as self-study. While the term self-study is convenient, easily recognized, and simple shorthand for our longer name (self-study of teaching and teacher education practice), self-study can miscommunicate who we are, what we are about, and how we conduct our scholarship. Naming ourselves as self-study of teaching and teacher education practice (S-STTEP) researchers has important implications for our conceptions of ourselves as researchers and the kind of scholarship with which we engage (Pinnegar and Hamilton 2015). To begin to understand the power and importance as well as the difficulties of naming and being named, we begin with a story from Stefinee:

My great niece has Native American heritage. One day when we were at the park, a group of children attempted to taunt her. They asserted she couldn't play with them because she was an Indian. She simply laughed, skipped over to join them, and asserted, "I'm not an Indian; I'm an Indian Princess." (Stefinee's Memory Reconstruction, Spring 2018)

In examining this story, we note the way in which the children attempted to label Stefinee's great-niece as other, as less than. S-STTEP research has gained increasing status within the research on teaching and teacher education communities, for example, witness its representation in recent handbooks on teacher education (e.g., Clandinin and Husu 2017; Loughran and Hamilton 2016). However, those of us who engage regularly in S-STTEP research have had our work devalued when other researchers labeled it as practitioner research (as if that made it a lesser form). We can be catechized regarding issues of bias or subjectivity in attempts to characterize S-STTEP work as something other than scholarship. Similarly, in the incident involving Stefinee's great-niece, researchers use a name to sort, categorize, subjugate, and dismiss. Indeed, in our experiences names are often used to parse the landscape of research and relegate people into categories which are labeled as having greater or lesser status. Thus, people can use names as tools of marginalization.

One strategy traditional researchers have used across the history of the S-STTEP movement is to name the work as "not research." Ham and Kane (2004) investigated the evidence for such labeling. They identify the defining features and characteristics of educational research generally and compare these with the features and characteristics of S-STTEP as a research methodology. They use their investigation to communicate the rigor of S-STTEP scholarship. In fact, in their chapter, they make a clear case for S-STTEP research as research. Yet, at the end of the chapter, Kane asserts that she herself as an S-STTEP researcher is not sure the work she does under this name is research. In other words, as often happens when others label us in particular ways rather than resist as Stefinee's niece does instead like Ham and Kane's analysis above, we acquiesce. In negotiating our identities as S-STTEP researchers, we are cognizant of other stories composed about us within the academic setting.

Like the children in Stefinee's story who sought to limit her great-niece's participation on the playground, the educational research community and individual researchers within it, when left unchallenged, can attempt to use "naming" as a strategy for dismissing S-STTEP work. Their labeling and assertions may be deployed in the ways articulated in the Ham and Kane (2004) chapter as strategies to demean and restrict who can and cannot be considered as legitimate teacher educator researchers. If Stefinee's great-niece had accepted the other children's naming of her, she could have remained isolated on the playground. In the same way, when we do not resist the assertions about the meaning and character of S-STTEP research (its name and the meaning of it), we too may find ourselves isolated and separated from the research community. When researchers apply demeaning labels and make false assertions about our work, we need to resist and recognize these as strategies for othering us, limiting our participation as scholars, and undermining the value, importance, and contribution of our work. We also need

to produce rigorous, scholarly work acting with integrity and thoroughness in our inquiries.

By asserting her identity as an Indian Princess and simply joining in the play, Stefinee's niece revealed the power that comes from naming ourselves. Our exploration here examines and asserts the power and importance of embracing and rigorously enacting our identity as S-STTEP researchers. We can name ourselves as S-STTEP researchers and label our work as self-study of practice research, reviewing for journals, serving in national and international research organizations, and publishing in major educational and teacher education journals. In other words, we must fully participate as scholars in the research communities to which we both belong and wish to belong. Through unpacking the simple story of Stefinee's greatniece, we have explored the power of naming ourselves as S-STTEP researchers rather than allowing others to make assertions about who and what we are. To further develop our understanding of the power of naming ourselves as S-STTEP researchers, we explore the power of naming generally. Then we turn to the meaning of the name we give ourselves in positioning us in the teaching and teacher education scholarship conversations we wish to pursue, the research conversations we wish to enter, and the research communities of which we wish to be part of. Importantly, while we may shortcut the name of our methodology, that action short shifts the work we do – self-study/self-study of teaching and teacher education practices.

Malinowski (1923) asserted that the act of naming brings things into existence. Before 1994, there was not a research methodology named Self-Study of Teaching and Teacher Education Practices research. While the Arizona Group (1994, 1995, 1996, 1997), along with others (see Pinnegar and Russell 1995; Russell 1995), had begun studying their experience as new academics and their practice as teacher educators, the methodology came into being through the act of naming it and exploring the meaning of that name. As a community, in naming ourselves we enacted and brought into being a "deliberately chosen vision of [ourselves] and the related behavior/appearance consistent with this vision" (Ambareva 2006, p. 221). Early in the development of this methodology, members of the research community came together to examine carefully what we meant by the name and how to identify quality in studies researchers chose to label S-STTEP research. We named ourselves, and we explored deeply, frequently, and thoroughly the meaning of the name, the characteristics of and criteria for the scholarship labeled in this way. In the community as a whole, this conversation continues, and new ways of enacting S-STTEP research continue to emerge. For example, Pinnegar and Hamilton (2009, 2015) explored carefully the various strategies used within S-STTEP work. In addition, they examined the boundaries and overlapping between S-STTEP and other methodologies such as autobiography, autoethnography, and action research. Work by Clift and Clift (2017) employed memory work and its theoretical framework within the methodology of S-STTEP. Cutri and Whiting (2017) provided a thorough exploration of the affordances and constraints in studies that utilized design-based research with S-STTEP methodology. In many of her studies, Craig marries S-STTEP methodology with narrative inquiry strategies and methodology. In Craig (2010), she not only uses this approach to explore her learning from

evaluation and being evaluated but also to more clearly articulate the integration of these frames. Furthermore, Taylor and Coia (see Coia and Taylor 2013; Taylor and Coia 2014) coined the term co-autoethnography and explored the relationship between this methodology and the emerging theories inherent in the development and utilization of feminisms and queer theory as a framework in S-STTEP research. In these studies, the researchers named themselves as S-STTEP researchers giving power and authenticity to nuanced explorations of the relationship and interactions among theoretical frames, research methodologies, and the practices that underscore S-STTEP work. In taking a stance as S-STTEP scholars using other methodologies, they extend the power, practicality, and applicability of S-STTEP as a methodology for producing productive scholarship on teaching and teacher education.

Indeed, naming oneself as an S-STTEP scholar is a powerful act. In doing so we assert certain characteristics as foundational to such scholarship and resist the imposition of others. Just as we are always standing in a space of becoming or perhaps because we stand in such a space, we recognize that ideas and assertion about what counts as quality S-STTEP research continue to evolve. Currently, as S-STTEP researchers, we seek to develop understanding of our action, our relationships, and our processes, all of which are resident in our practice as well as the contexts and the ways our practice offers both constraint and opportunity. We seek to contribute to research on teaching and teacher education by providing particular understandings of teacher education that others can use to understand and develop their own practice as teacher educators.

In a recent study, Craig (2017) critiqued her action as a teacher educator attempting to explore where and how she enacts in her research/teaching/teacher education practice her best-loved self. Similarly Clandinin (1996) articulated a sacred story of teacher education as one where teacher educators are experts and impart theory and our students and public-school teachers are to take up and enact the theories and ideas we impart. Clandinin argued for development of new sacred stories and explored how we might live a mundane story (everyday story) of teacher education in our own contexts and in our individual lives. Disrupting a sacred story with mundane stories can cause a sacred story to shift. These studies called out for new ways and new purposes for enacting our stories as teacher educators. As we name ourselves as S-STTEP researchers and our studies as S-STTEP work, we can, as Craig demonstrated, find ways to enact our best-loved selves in our practices. We can collectively live, as Clandinin argued, the mundane stories of teacher education. In doing so, our studies enable us to understand and enact and push toward new stories of teacher education as we contribute to the research conversation about it. This vision has a more nuanced and practical notion of local variation than the "new teacher education" vision that Cochran-Smith (2005b) articulated. Her vision focuses on knowing teacher education by creating studies based on modernist epistemology that attend carefully to objectivity and generalizability, whereas the studies reported here focus on contributing to and creating a new teacher education by uncovering our practical knowing, using it in our practice, and communicating assertions for action and insights about teacher education in our publications.

We draw on these studies to suggest that when we name ourselves as S-STTEP researchers, we take up an orientation toward ontology, and we push forward in reimagining ourselves as teacher educators, reimagining teacher education research, and contributing new knowledge to the conversations around research on teaching and teacher education. In this work we not only stand in a space of ontology, but we embrace a particular ontology, a relational ontology, in contrast with the more traditional abstractionist and modernist one (see Slife 2004; Putnam 2004). As Slife (2004) asserted:

> . . .what is ontologically real and has being *in practice* cannot be understood apart from its relations to other aspects of the context. Indeed, practices do not *exist,* . . . except in relation to the concrete and particular situations and cultures that give rise to them, implying what we might call a *relational ontology.* (p. 158)

The practical significance of grounding our work in a relational ontology is that such ontology values diversity of opinion and understandings wherein we as a community of scholars are bound together through community, not orthodoxy. Orientation toward ontology and studying our own practice seriously constitutes engagement in unique and radical educational research. S-STTEP research is radical because it embraces subjectivity, diversity of interpretation, theory, and research strategy and because this methodology names the person who conducts this research and holds themselves responsible to create living educational theory wherein what they come to learn and value actually exists in their practice. As Johnson (1989) asserted, the knowledge we seek to explore is nonpropositional and experiential. Further, the Arizona Group (2004) and Pinnegar and Hamilton (2009, 2015) provided clear evidence that we develop knowledge in S-STTEP studies through dialogue. These characteristics of S-STTEP work make it radical as a research methodology within teacher education and other studies that focus on teaching and teacher education practice.

Naming our research as S-STTEP means we develop deep understandings of our practice and thinking about it by creating particular, complex accounts of our practice and our personal practical, embodied, and tacit knowledge as we act in our practice. We do this through honest exploration of our difficulties, challenges, and missteps – perhaps more than our successes. The act of naming ourselves as S-STTEP researchers captures our essence as inquirers and represents our way of being in scholarship. Campbell (1972) suggested that when we name ourselves in particular ways, others hearing the name experience a throb of resonance – which can be characterized as a mystical accord between ourselves and those in our community that emerges from this action of naming. As a community, we value and relish our opportunities to come together as S-STTEP researchers. We could articulate the bonds that hold our community together as a throb of resonance.

Names have a narrative quality; they are important because they invoke stories and counterstories. When we name ourselves, like Stefinee's great-niece, we are positioning ourselves within the educational research community. At the same time,

we also understand the stories others tell about us within which the academic community position us as well. We are always *becoming*. While a narrative trajectory can be imagined, we position and reposition ourselves through coming to understand our work; we also navigate the stories told about us in the continual naming of ourselves. These understandings are constantly shifting, transforming, and reforming. Such shifts and repositionings allow us to more deeply interrogate our practices and our understanding of them. These acts of positioning our beliefs, experience, and relationships represent the possibility of assemblages (Deleuze and Guattari 1987) that shift and change as we uncover the meaning behind our naming. According to van Langenhove and Harré (1999), when we assert a position (such as naming ourselves), each position contains a storyline. Implicit in the storylines are orchestrations of life choices and experiences and the integration and interrelationship of people, events, and commitment. The possible assemblages open ways we might think through these stories, with these stories. Thus, a name carries the stories that define and animate it, operating as a narrative frame that integrates and organizes the diverse names with which we label ourselves. As MacIntyre (2001) has asserted about stories, the values and commitments that guide our lives find embodiment in names.

How Does Engaging as an S-STTEP Researcher Position Us?

The positioning of S-STTEP research(ers) within the educational research community. Over time, the diversity and range of worldview, theory, methodology, strategy, and modality used within teacher education research have only gotten both more incongruent and more entangled. As S-STTEP researchers, we position ourselves in a relational ontology (Slife 2004) and thus embrace the entanglement of views and methodologies. We welcome variety and diversity in terms of the issues raised. We assert that this diversity allows for richer understandings and that the community has become more incongruent. Incongruence emerges because some members of the teacher education research community continue to assert their naming of the features as fences of inclusion and/or exclusion. From the perspective of traditional modernist epistemology and an abstractionist ontology, community is held together by agreement and consensus (see Slife 2004). From this perspective, agreement on issues of theory, methodology, and worldview would make a teacher education research community cohesive, coherent, and functional. In this modernist orientation, those who disagree must be either persuaded to agreement or removed from the community. As a result, some researchers hold on to the tenets of labels; they build boundaries, real and/or virtual structures of participation and publication within the community, and conversation of research in teacher education.

Regardless of which fences and boundaries are erected, dichotomies are asserted as landscape divisions: quantitative/qualitative; behaviorist/constructivist/social constructivist; theorists/critical theorists; modernist/post and beyond post; ontology/epistemology; and so on. Researchers may use naming and labeling as a way to enact dominions of power and prestige. They assert particular narrative accounts

of research that declare one side of the dichotomy as dominant, and they eschew the space of others within it. We do not deny the reality that for many educational researchers there are dominant narratives. In the USA and perhaps elsewhere, funding agencies push particular definitions of research as the only viable – legitimate and fundable – ways to investigate issues.

Potentially, this kind of naming and labeling can be harmful. It can limit careers and opportunity. More importantly, it can limit the kinds of understandings that emerge in the conversation of educational research and thus reduce educators' ability to think coherently to address the complexity of the intractable problems of education in the world at large. We see that, as Greene (1999) asserted, embracing the diversity of research on the landscape allows us to release our imagination as we respond through education. Greene articulated that when we bring the insights from seeing small (using quantitative research that enables us to consider the generalizable and captures the horizon of the landscape of particular problems) and seeing large (using insight emerging from studies that allow us to see up close and understand the particular and personal), this releases our imagination. Such seeing opens new avenues for contemplation and response. As Putnam (2004) argued, generalizable knowledge claims have not been effective in resolving the social and educational problems of the world. He asserted that studies that allow us to more clearly see and understand the particulars of an issue and make determinations of whether those particulars apply in our case hold the greatest promise for addressing and ameliorating these problems.

S-STTEP methodology positions us as researchers differently within the landscape of educational research. Since we orient our research toward understanding "what is" from our perspective in practice, we take up a relational ontology. Slife (2004) argued that those who embrace a modernist epistemology (a position that animates much of the dominant narratives of educational research and researchers) insist that membership in a community requires consensus and agreement. While discord can exist, a community thrives only when those who disagree are persuaded to the dominant view of things. Diversity threatens communities of research founded in modernist epistemology and abstractionist ontology. Slife (2004) argued that true community requires variability and some discord. He asserted that the most important task of those who hold an orientation toward relational ontology (like those of us in the S-STTEP community) is to protect difference and otherness. Indeed, he posited that "this task does not mean that common beliefs are unimportant. It just means that these beliefs are secondary to and ultimately should be in the service of facilitating something more basic – complementary and intimate relationships" (p. 168).

The educational research community has a rich and varied landscape. The value of the educational research community is that scholarship from every discipline contributes to research in education. In terms of the social sciences, there are sociologists, anthropologists, philosophers, educational psychologists, developmental psychologists, and historians to list a few that add perspective and nuance to the educational research community. Because of the need for elementary and early childhood teachers to teach content, there are also faculty who have education in all

of the academic disciplines – biologists, physical scientists, mathematicians, literary theorists, language and linguistic scholars, as well as physical education, dance, theater, art, business, home economics, and family sciences researchers.

Potentially, then, when educational scholars consider the intractable problems of education and society (poverty, community, culture, immigration, refugees, literacy, numeracy, etc.), every arena of scholarship could be brought to bear educational issues. The multiplicity of epistemologies and methodologies covers the entire range of scholarship. Such attention can produce multiple perspectives on every problem and careful study of particular ones. The potential for releasing the imagination to guide educators in responding to these issues, as Maxine Greene (1999) argued, is heightened. Within the research community, educational researchers encounter studies that allow us to see the problem across the horizon, characteristics, and features of the landscape of the problem.

As S-STTEP researchers who engage in studying our own practice along with the dilemmas and challenges within it and our thinking about and response to it, we have much to contribute. Qualitative studies of particular intractable problems generally and S-STTEP specifically allow us to articulate the intimate landscape, shape, and features of these problems. One example of this work is the Tidwell and Fitzgerald (2004) account of Tidwell's teaching of disengaged or disengaging students. Her three case studies and the attendant details allow us to see more clearly issues of literacy development, disengagement from learning, and underestimation of student potential in relationship to persistent complexities of learning or cultural difference. Tidwell made evident challenges teachers face in remaining present to students in such circumstances. Cutri et al.'s (2012) exploration of their negotiation of class difference in pursuing advanced education provided particular cases that resonate with and bring tension to studies that look across the landscape of issues of poverty and class in education. In her study, Schlein (2010) also offered valuable insights. She documented her cultural challenges and shifts in understanding as she moved from being prepared as a teacher in Canada to teaching in Japan and then moved from teaching in Japan to graduate work in Canada. Laid alongside historical, anthropological, psychological, and sociological work on cultural competence and learning, Schlein's work resonates with these other studies bringing insight of the personal and relational to studies that see from a distance (small in Greene's words). Insight into the personal and particular bring life to the theories and theorizing that the studies that look across the horizons of such problems usually do not provide.

S-STTEP studies bring insight into particular understandings concerning the intractable issues of education generally and teacher education specifically. This is so because S-STTEP researchers look inside to their own understandings and outside as they excavate such understandings in relationship to the others in their practice and within the contexts of practice. S-STTEP makes public as a researched, knowing based on practice and the practical, which in past research eras would remain implicit and embodied in the knowing of individuals. Our inquiries bring intimate scholarship, personal issues, and knowledge of the individual forward for consideration in relation to other work. In this way, S-STTEP consistently has the potential to push scholars and policy makers into the zone of maximal contact – spaces of uncertainty

where they may need to uncomfortably reconsider and reimagine issues and arguments they thought were settled. Thus, S-STTEP scholarship has the potential to be unsettling and to unsettle the conversations in educational research (Bakhtin 1981). Kuhn (1962) argued that revolutions in paradigms and knowledge emerge when scholars question, take up, and explore ideas based on settled and often ignored assumptions of disciplines. S-STTEP scholarship can bring this challenge to conversations in educational research.

As S-STTEP researchers, we enact a relational ontology which values diversity and difference, accepts incommensurability in the research conversation, and seeks to make space for and welcome this diversity into the community of educational research. Like St. Pierre (2013), we reimagine "*social science inquiry* enabled by postmodernism in spite of the current positivist orthodoxy" (p. 451, emphasis in original). In a research community, animated by a modernist epistemology, researchers assert a single story of the process of educational research and insist on objectivity, validity, and generalizability. They position their subjects within their research as static and knowable, seeing themselves as capable of randomizing and controlling variables that might cloud the findings they produce. This approach does not take seriously the theoretical frames that animate research and through which researchers make meaning of their work. St. Pierre (2016) critiqued this approach as one rooted in practicalism – a view that elevates practice over theory as it resists the notion that rational thought alone can shift practice. St. Pierre noted:

> the effects of that everlasting theory/practice binary that seems to structure not only the applied sciences but also how we teach their methodologies. It demands, whether we are ready or not, that we get data and produce knowledge. In the name of practice, in the *leap to application*. . .we pay short shrift to the theoretical and conceptual systems in which various empiricism are thinkable. (p. 111, emphasis in original)

Research practices rooted in modernist epistemologies have become the privileged approach to research in the academy. However, as we have argued here, S-STTEP research that captures and articulates embodied knowing of our thinking and action within educational practice contributes to and disrupts settled assumptions based on modernist research on education. Through S-STTEP research we offer a different approach, one that embraces theory as a way of thinking differently about our work and ourselves within it.

The positioning of S-STTEP research(ers) within the teaching and teacher education research community. Zeichner (2007) and Cochran-Smith (2005a) have both asserted that S-STTEP research has the greatest potential to contribute new understandings as well as transform teacher education research. Zeichner's comments have both been welcoming and critical – which we label the Zeichner paradox. His main criticism focused on the need for S-STTEP researchers to make clearer the contribution of this work to the larger research conversation within teacher education. He argued that we need to position our work more clearly and carefully in relationship to the discourse about teacher education. He also argued that S-STTEP researchers need to also connect their work to other S-STTEP research to

demonstrate the value of the work for developing critical understandings about features, practices, and theories of teacher education and teaching.

In a 2005 article, Zeichner provided a personal essay in which he articulated his experiences in *becoming* a teacher educator and the learning that emerged. He did this to provide guidance for the education of a new generation of teacher educators. He argued that to learn in *becoming* teacher educators and developing power for teacher education research more generally:

> . . .those who work in teacher education programs need to think consciously about their role as teacher educators and engage in the same sort of self-study and critique of their practice as they ask their students to do in their elementary and secondary school classrooms. (p. 123)

Here, Zeichner continued to assert the power, the need, and the place for S-STTEP research and researchers as participants in the conversation of research on teaching. Thus, while Zeichner acknowledged limitations of S-STTEP in contributing to teacher education as it existed in 2007, he also asserted its necessity in developing deeper understandings of teacher education practice and practices and solidifying its vitality for the research conversation in teacher education and the learning of teachers.

Cochran-Smith and Lytle (2009) asserted, "[S-STTEP] works from the postmodernist assumption that it is never possible to divorce the self from either the research process or the educational practice of teacher education broadly construed" (p. 40). From their perspective, as S-STTEP researchers work inside particular social situations, their insights and understandings develop in the context of their research and living in their practice. As researchers who study and share insider knowledge about teacher education and its practices, S-STTEP researchers have the potential to provide unique and interesting perspectives and knowledge that those using other methodologies may not be able to provide. Cochran-Smith (2005a) recognized the need for large cross-national and cross-institutional studies of teacher education practice and teacher development in relationship to teacher education. LaBoskey (see LaBoskey 2006; Lyons et al. 2004) provided an interesting juxtaposition in two studies. In the first, she and colleagues examined how particular practices and assignments undertaken in her teacher education program moved across programs and contexts. The assignments are amended and adapted and provide interesting results in other contexts of teacher education across the nation. In an additional study, LaBoskey (2006) explored the ways in which the things she taught in teacher education continued to show up in the practices of teachers now years into their own teaching careers. These studies offered evidence for critique and support for the Cochran-Smith (2005b) assertions based mostly on and advocating for quantitative work.

Since we seek to uncover our embodied knowing, our processes in enacting practices, and our personal practical knowledge as teacher educators (Clandinin and Connelly 1995), S-STTEP researchers seek sites for exploring our knowing of and in our practice. We collect and develop records and accounts that unpack and interrogate our embodied knowing. Such work can thus provide multiple

(and perhaps conflicting) views of the phenomenon under consideration. Central features in our own work are the use of dialogue as a process for coming-to-know (see Pinnegar and Hamilton 2009), critical friends (see Schuck and Russell 2006), collaboration (see Gudjonsdottir, et. al. 2014), and interaction (see LaBoskey 2004).

As Cochran-Smith and Lytle (2009) argued, S-STTEP work offers clear evidence that the old-fashioned assumption that "true" knowledge about practice and situations can only be uncovered, produced, and shared with trustworthiness by those who stand outside the situation is no longer a tenable one. Further, since S-STTEP inquiries occur often everyday, the work travels between and holds in tension theory and practice – it is seldom one or the other but frequently represents intersections between the two. Kastberg et al. (2016) examined their use of feedback to their teacher learners. Within their study there is an ongoing movement from their action in practice to their thoughts about their students' learning and their uncovering and acting on their own learning. In one such move, they explore empathy in giving feedback. They move from work by Julian Kitchen on relational teacher education, examination of their feedback, and their understanding of the term *empathy* and articulate the influence of their increased understanding in their practice as teacher educators.

With our obligations to unseen children (Arizona Group 1997) (the students of the preservice teachers we prepare as teachers) and commitment to understanding, S-STTEP researchers embrace uncertainty and vulnerability and enable disruption of assemblages that attempt to capture dominant narratives of teacher education, teacher learning, and teaching. Kastberg et al. (2016) provided a clear example of this in their wonderings about how their teacher learners will be able to provide mathematical explanations that will enrich the understanding of their future students. Thomas (2017) produced a careful exploration and analysis of the ways in which her own location in an Office of Field Experiences reified the theory/practice divide. She explored her own beliefs and actions as she sought to disrupt this divide while her location reinforced it. Martin (2017), through S-STTEP of her course content in relation to practicum experiences, explored first her identification of the barriers brought on by her action, reflection and thinking about these barriers emerged, and the new practice had potential to disrupt those boundaries. All of these studies revealed nuanced understandings of teacher education, research, and practice and a future orientation. They highlighted a desire to meet their obligations as S-STTEP scholars, their practices in relationship to preservice teachers, and their concern that what they do in their practice and interaction with colleagues and students will lead to better outcomes for the children that their students will teach. These works provided a nuanced analysis revealing embodied knowledge, understandings, obligations, and the enactment of practices that can potentially meet obligations held for unseen children their own preservice teachers will teach. These studies disrupt teacher educators' understandings and practices and make visible new knowledge of and in teacher education. This disruption allows insights and understandings that come into the conversation leading to new lines of work and deepened understandings. This is the purview of S-STTEP work, and this is an important contribution to conversations about research on teaching and teacher education.

Because S-STTEP researchers engage in inquiries across all of teacher education, there is the potential to contribute new understandings across the boundaries of teacher education. Kastberg et al. (2016) helped us understand more complexly the nuances and demands of preparing mathematics educators and new ways for teacher educators to enact such education. Beck and Kosnik (2002) gave us new insight into and wisdom about how to enact teacher education for early childhood teacher educators. Berry and Loughran (2002) helped us see better the elements and characteristics of classrooms of science educators. Chróinín et al. (2015) reported a S-STTEP study of physical education teacher education. They explored not just their thinking, belief, embodied knowing of physical education, and the need to enable teachers to enact new practices; but their study also revealed their understanding of enacting innovation and the influence of embodied knowing of past practices, instantiation of belief, and the role of critical friends and frequent dialogue in creating new practices. Lovin et al. (2012) make clear the role of belief and understanding of theory within a particular subject matter (in this instance mathematics) in shaping our subsequent practices. Their study revealed how both insight and blindness can emerge from our beliefs and the power of critical friends in enacting practices more coherent with our beliefs.

As S-STTEP researchers, it is clear that positivistic notions of research persist in shaping understandings of what is and is not research within academic communities (St. Pierre 2013). We echo St. Pierre's critique of qualitative research as "so disciplined, so normalized, so centered. . .*that it has become conventional*, reductionist, hegemonic, and sometimes oppressive and has lost its radical possibilities" (p. 451, emphasis in original). These entrenched understandings of research have taken up the characteristics of what Crites (1971) called a sacred story. Sacred stories form consciousness. They are sacred, "for the people who understand their own stories in relation to them" (p. 295). Clandinin (1993) noted the way that telling stories of experience allows others "to be reflective about their practices and invite them to engage in a restorying of their stories" (p. 13). As S-STTEP researchers, we share our experiences of teacher education practice and research that are not meant to serve as "models or solutions to the problems of teacher education but are stories that highlight the tensions each of us has experienced as we live out our personal stories of teacher education, schools, and universities" (p. 14). Sacred stories of research only shift in the consciousness of researchers as they encounter new experiences – new stories of research. Our research provokes reflection for our readers and allows for new understandings of experience and new conceptions of research to be imagined. We continue to position ourselves within the larger teaching and teacher education research community through insightful, thought-provoking, and meaningful inquiry. The sacred stories of research in response to our work therefore continue to shift and allow for new stories of research. In this way, S-STTEP research does and can continue to make essential contributions to research and inquiry in the teaching and teacher education community, "to produce different knowledge and produce knowledge differently" (St. Pierre 1997, p. 175).

The positioning of S-STTEP research(ers) within our own work as teacher educator researchers. As we have argued earlier in this chapter, *becoming* S-STTEP researchers has consequences in our practice as researchers, teachers,

and teacher educators. Engaging in S-STTEP research and striving to create living educational theory locate us in spaces of vulnerability, disruption, uncertainty, dialogue, and relationship. Two of our early studies provided ample evidence of the tenuous nature of these spaces. An article by the Arizona Group in 1994 represented a collection of the letters we each wrote during our second year as professors. Based on the complete set of letters, we each developed an interpretation that we presented at AERA. As we noted in the handbook chapter that appeared in the first handbook of S-STTEP research (Arizona Group 2004), we were surprised when we realized that not only had we presented drastically different interpretations based on the letters as evidence; but we used similar segments of the letter to ground and represent our interpretation. (We disrupted our understanding of ourselves as researchers as we engaged in research practices).

In 1994 (Arizona Group 1994), we published a piece that presented our experience as new professors in teacher education. To represent our collective interpretation and analysis of the letters and our experiences, fragments from the letters were arranged chronologically and form the major text of the article. However, in our selection of segments and our arrangement of them, our purpose was to engage readers in an act of interpretation. We sought to create a format that would enable other researchers (beginning or experienced teacher educators) to consider their experiences alongside ours. We sought to construct a text that would push them into Bakhtin's (1981) zone of maximal contact – a space of vulnerability and inconclusivity. We hoped that as researchers read the articles, simply by the fragments selected and their juxtaposition, readers would arrive at similar themes to those we reached. In other words, we left interpretation of the letters open. We sought to disrupt researchers' conceptions of research publications, expose our vulnerability in our roles as teacher educators, and draw readers into dialogue with conceptions of being an academic, a teacher educator, and a woman in the academy. We sought to push them to uncover their embodied knowing of action and practices as teacher educators and reconsider them.

In our 1996 work (Arizona Group 1996), we articulated our process and experiences in *becoming* teacher educators. We created and then interrogated our individual accounts of *becoming* teacher educators in order to present our experience in *becoming* at that point in time. We hoped to push other researchers to reconsider their role in the learning-to-teach process by remembering, retelling, and reimagining experiencing *becoming* a teacher in terms of their *becoming* a teacher educator. Similar to the letters, we drew our readers in as interpreters seeking to disrupt stories and understanding of their experiences as teacher educators and academics, pushing them to reimagine how they might study and enact their practice as teacher educators. We made visible the challenges, uncertainty, and interpretation disrupting the landscape of teacher education practices. In this process of constructing both of these research publications, we unhinged our own understandings of what we thought we knew when conducting this work. Taking up S-STTEP research pushes us to reveal assumptions, explore practices, and uncover and capture embodied knowledge. As a result, we never arrive at a settled identity as S-STTEP researcher or as a teacher educator.

Ironically, engaging in this work and recognizing this space of inconclusivity and *becoming* do not, however, completely dislocate our work. We may often feel we are engaged in The Centipede's Dilemma (Craster 1871):

A centipede was happy – quite!
Until a toad in fun
Said, "Pray, which leg comes after which?"
Which threw her mind in such a pitch,
She laid bewildered in the ditch
Considering how to run.

Because we value learning from our practice along with the shifts and alterations we make in it, our work disrupts, disturbs, interrupts, and dislocates our practice and our thinking about it. We stand in a space as teacher educator researchers where we continually seek to understand and improve in the context, processes, and moments of our practice. We document our thinking, record our steps and missteps (our successes but just as importantly our colossal failures), and collect information on our practices, our experiences in practice, and the thinking of our students and others in our practice. We then produce public accounts that represent our understanding and the themes, patterns, and storylines that support and result in the insights we share. Ironically, as Williams et al. (2012) indicated, instead of undermining us as we explore the messiness of practice and confront ourselves with our fiascos and difficulties, *becoming* S-STTEP researchers gives us confidence to act in both new and old ways. Because we conduct our work on shifting ground, we create living educational theory in our research accounts and in our practices, and we speak with the clarity of the moment recognizing that that clarity may shortly disappear. Because we value community and orient to ontology, we seek to make space for diversity of methodology, culture, worldview, and representation within not just the community of educational researchers and teacher educator researchers but also within the community of S-STTEP researchers.

In our work, we constantly seek to see things from another perspective, from a different view, and with a different theory or theoretical frame. We are rooted in the situatedness of our own experiences in our lives. Seeking out multiple perspectives that add complexities to our understandings allows us to see our own experiences in new ways. Like Lugones (1987) we strive to world travel – to understand the experience of future teachers, our colleagues, and others from their perspective. The inquiries of S-STTEP always exist in that space between self and other; biography and history; research and practice; and reflection and action (Bullough and Pinnegar 2001). In taking up S-STTEP research, we attempt to be open, to welcome disruption, critique, insight, and learning. S-STTEP researchers recognize that gaining insight may also result in blindness; thus we seek to see beyond the blindness or insight and our lack of always knowing our embodied knowing. Being open in this way fosters our *becoming* and our scholarship, leaving us always *becoming* teacher educators and researchers – never arriving or existing in a state of knowledge as claimed and settled.

Central in our scholarship is the embrace of dichotomies. Derrida (1987) reminds us that there is never an inside or outside, context or process, and knowing or doing; instead they are all entangled. As we engage in dialogue around the phenomenon we explore, we engage with multiple interpretations to consider how things might be other or how the realness of descriptions we provide or assertions we make push our work and our practice forward.

As scholars, we realize that reaching an insight about particularities in our practice may blind us to other insights we might have developed. This pushes us to continue to question and consider different understandings that might emerge in relationship to accounts of our practice, dialogue with texts and critical friends, and our careful interpretative stance to examining documents or reports of practice. S-STTEP researchers as inquirers and as teachers also take our obligations to unseen children seriously. In other words, in examining our practice and our knowing of it, we seek to embrace understandings that lead us to improve the learning of our students and theirs.

We recognize that this embrace of a stance in a place of *becoming*, where we encourage ideas that may or may not be productive, is a hallmark of our work as S-STTEP researchers. Thus, S-STTEP methodology (in concert with the other methodologies we utilize in this work) allows us to contribute in significant ways to educational research and the research conversations around research on teaching and teacher education. The inconclusivity, disruption, reflection, reflexivity, rethinking, assumption hunting, and interpretation fundamental to this work and our existence in a space of *becoming* are an advantage to our work because this means we are always in flux seeking to improve and seeking to develop deeper understandings. S-STTEP researchers often face the Centipede's Dilemma captured in the poem presented in this chapter; in considering "how to run," we often reveal ourselves to ourselves; our embodied, tacit, and practical knowledge becomes more visible. Thus, S-STTEP researchers are always compelled and propelled to look again, to look deeper, to return to, and to re-examine understandings: this ethos animates us as teachers and teacher educators.

What Is the Research Stance We Take Up?

Much of the research conversation surrounding teacher preparation focuses on best practices. Bullough (2012) argued against best practices asserting with Dewey (1916) that "certainty in a perplexing, contradictory and dangerous world is the worst sort of illusion" (p. 346). He urged educators to embrace the uncertainties and complexities inherent in teaching. Bullough asserted that as understanding of teaching and learning deepens, the situations of education reconfigure, and the contexts of teaching shift, and best practices are frequently no longer viable. Further the things promoted as best practices may fall short, often need adjusting to the students, the teachers, and the circumstances; therefore a unilateral application of a "best practice" across all contexts is seldom productive. Bullough suggested that what we seek are "better" practices and counterstories enabling educators to attend to the learning of

the students they are educating. This is particularly true in teacher education since in educating teachers we cross many institutional boundaries in enacting their teacher education programs. Teacher education must attend to and educate preservice and in-service teachers about "best practices" for teaching every discipline and every student – special education, learners of additional languages, and children with challenges of speech, hearing, and mobility and in different age groups (early childhood, regular elementary, secondary, and even sometimes adult learners). What is "best practice" for one student or in teaching a particular discipline can collide with each other. Thus, as we prepare teachers and as we study teacher education, teacher educators find themselves needing to educate students not so much about a variety of things but instead prepare them to make reasonable and informed decisions and judgments. Our studies as S-STTEP researchers enable such inquiries.

As Bullough (2012), Clandinin (1995), and others have argued, the traditional role of teacher educators is to teach theories of teaching and learning developed through large-scale studies that employ modernist epistemologies and then guide teachers (preservice and in-service) toward the application of theory to their experience in practice. From this perspective, the research of teacher educators, particularly those studying their own practice, should focus on how they apply theory in their practice or how students resist or enact theories taught in teacher education within their practice as teachers. Similar to other S-STTEP researchers, Kastberg et al. (2016) and Chróinín et al. (2015) inquired into their efforts in enacting best teacher education practices. Their studies revealed the complexity and multiple contingencies and vulnerabilities in such efforts. As well, they provided guidance for teacher educators attempting to innovate in their practice or adjust and enact unfamiliar but potentially productive practices. Similarly, Garbett and Ovens (2012) established the necessity for teacher educators to provide a balance of authenticity and safety for the teacher education students they are teaching whenever they enact new practices.

The research stance that animates from a modernist epistemological view is based on a weak relationality. From this perspective, there is no sense that relationships are fundamental to good teaching or that it is vital that the teacher educator understand not only the human relationships but also the context, the grammar of the discipline, and the pedagogy undertaken. This research stance assumes that large-scale, multi-site studies using instruments that produce numeric data can produce findings and identify best practices that can be easily imposed across contexts. From this orientation, theories and principles and best practices are applicable across multiple contexts, contents, or even any teaching experience. Theories of teaching and learning and the best practices that capture them are easily transportable, can be repeatedly applied, and are guaranteed to produce results. When the desired outcome, from applying such practices, is not actualized, then blame is pointed toward the teachers' lack of skill, resistance to fidelity, or incompetence. The conceptions of practice that emerge from such work are not real since they ignore that real practices are part of the larger whole and their properties stem from a strong relationality that pays careful attention to relationships among the parts as well as

the humans involved (see Bullough 2012; Putnam 2004). Kitchen's (2006) S-STTEP study explored his experience in *becoming* a relational teacher educator and the necessity for empathy and respect. His work clearly demonstrates the centrality of relationship as a teacher educator.

When experienced and expert practitioners are asked questions of practice, they do not articulate theories, and principles, or assert the application of a best practice. Instead they respond, "it depends" and identify the relational aspects upon which enacting a practice is contingent. Martin's (2017) S-STTEP research focused on her seeking to support preservice teachers' learning so that they were more capable of enacting the theory she taught in their practicum experiences. She came to see that "best practices" in teacher education that she enacted positioned the preservice teacher in their practicum in ways that reify the theory/practice divide. As she explored her assumptions, her thinking, and her practices more deeply, she came to understand how deeply she needed to listen to the voices of her students in order to help them take up and adjust the theories she taught in the practicum. Martin recognized in her teaching as teacher educator that "it depends." S-STTEP researchers recognize that by taking a relational ontological stance in our practice and in our inquiries as teachers/teacher educators – the researcher and the researched that practices – we seek to understand what exists and what we know in relation to the particular and specific contexts, cultural milieu, and actions we produce. Our studies excavate our practices, our contexts, and our actions to make clear our knowing in our practice. As S-STTEP researchers we position ourselves in this way, because uncovering our embodied knowing and our understanding of our practice behind our expression of "it depends" holds great potential in shaping, contributing to, and forming the research conversation in teacher education.

While we, as S-STTEP researchers, participate in the larger conversation concerning research on teaching and teacher education, our work is oriented to a relational ontology, and we seek to develop understanding of practice from and through our own particularities. We explore, interrogate, and inquire into the particular situations of our practice. We contextualize our work and, like Derrida (1987), recognize there is not an inside and outside, but the whole of our experience is relevant in these explorations. Polkinghorne (1988) charts the failure in psychology of research based on modernist epistemologies to provide any findings that are relevant in real practice. Practices do not emerge from conscious, rational calculations of theory. Instead, practices emerge from non-deliberative, background understandings emerging from our culture, our contexts, and our relationships that are uncovered as we document, reflect on, and examine carefully our actions and thinking. S-STTEP research and researchers seek to contribute knowing of and from practice to the research conversation of teaching and teacher education. In order to do so, we recognize that we stand on uncertain ground in our inquiry projects, our foundation for knowing and orientation in our works is toward a relational ontology, and our knowing is grounded in dialogue (conversation, collaboration, scholarship, critique, and interaction). Our work always stands in that space between self and other. We seek to understand the nuances of practice and the reality of "it depends." Of course, research from a wide range of

methodologies and orientations inform our thinking and our practice; however, in order to contribute the unique insights that can come from excavating embodied knowing and understanding in and of our practice, we, as STTEP researchers, must take up a research stance different from the more traditional one employed in the past.

Our stance as S-STTEP researchers allows us to explore our practice, our understanding of it, and the dynamics and relationships entailed within it. We assert that the research we do, our orientations toward this work, and the assumptions underlying it enable us to develop understandings and viable scholarship that develops knowledge of real and authentic practice. Such work exists in an uncertain and shifting space and is conducted by teacher educator researchers who are always *becoming*.

We conceptualize S-STTEP research as a form of intimate scholarship (Hamilton et al. 2016). Scholars who embrace and enact intimate scholarship are open and allow clear and comprehensive access to their practice and their thinking about it. They seek to be honest in their studies – the accounts they draw forward for exploration, their engagement in acts of interpretation and exploration of meaning, and the communication of the understandings they reach. Like Paul Cezanne, in his still life paintings, S-STTEP researchers attempt to provide a holistic account that simultaneously presents the practice and an understanding of it as experienced by the researcher and others who stand within it.

We take up a stance oriented toward ontology. Engaging in dialogue is fundamental to our process of coming-to-know. Central in our positioning as S-STTEP researchers is the value we attribute to the particular, our recognition that we are always vulnerable in this work and must act in humility. We hold ourselves open to alternative representations and interpretations and are willing to try out new ideas and shift and adjust practices. We recognize that to learn, we must, as Dewey (1916) argued be open, act wholeheartedly and be responsible as we uncover and sharpen out knowing of practice. As we study our practice and develop a deeper understanding of it, we become increasingly responsible for it.

As we have articulated earlier in this chapter, the location and space of S-STTEP research exists in uncertainty and inconclusivity, on a shifting and never completely stable terrain of scholarship. As we engage in research, many of the things we come to know exist on the periphery of our understanding and emerge as we act within our practice. Such knowing becomes available and is revealed as we scrutinize our practice, create accounts of it, and engage in dialogue about it. We seek to observe our actions and thinking carefully in order to reveal the embodied knowledge we act on in our practice. However, embodied knowing is tacit and holistic and resonant in our personal practical knowledge; thus once we act on the knowledge we develop, it entangles in the whole and becomes part of our embodied knowledge again. While this results in our being able to constantly explore our practice, our findings do not operate like theoretical knowledge, stable truth, or assertable claims of best practices that are imposed on the basis of modernist epistemologies and foundational criteria for knowing. Instead, our knowing is always incomplete, emerging, and partial. Because we systematically explore our knowing and doing as we interrogate it to

uncover multiple interpretations and alternative representations, our knowing is always emergent. Through careful research practices articulated in this handbook and through dialogue, we gain confidence in our understandings and see whether they have sufficient strength and viability that we can take up and act upon them in our practice.

Within our inquiries we are always aware, as Barad (1998) argued, of the inseparability of the *objects of observation* and the *agencies of observation.* Just like the contexts in which we work and the relationships in our practice, the strategies, techniques, and modalities we utilize in studying our practice influence the knowledge we develop. In order to engage in inquiries conducted from our perspective, and focused on our knowing in our practice, we seek multiple ways to reveal the knowledge we enact. At the same time, we are aware always that the tools we use to explore may impact what we are able to see. In order to develop insight into our practice and uncover themes, patterns, and narrative lines, we will become blind to other things we might uncover (De Man 1983).

Both critics and even practitioners of S-STTEP may imagine, because of the use of the abbreviated term "self-study" to represent this methodology, that this work is characterized by solipsism or therapy. Neither is the case. Even memory and autobiographical strategies of data collection and interpretation are always excavated in terms of the self in relation to practice. The purpose and intent of the work is to develop understandings of teaching and teacher education practice. A fundamental character of the work is its betweenness. As Bullough and Pinnegar (2001) explained, S-STTEP work and those who conduct it do so from a space between: between self and other, between history and biography, between strategies and even methodologies, and between experience, theory, and practice. As S-STTEP researchers we take up our work as we negotiate unsteady ground and locate ourselves in a space between.

Ethics is central to our ontological orientation and stance in S-STTEP work. In exploring our practice and engaging in dialogue to develop our knowing, we always encounter other people. In acting ethically, we must act with kindness and integrity. While we seek to know our practice, we recognize that people are never completely knowable. We acknowledge that complete understanding of their knowing of practice is beyond us and will remain so.

We must be ethical in our inquiries. This means being honest in our accounts since those accounts often represent our own knowing. We must hold ourselves accountable to enact the things we come to know in our practice. We argued earlier that S-STTEP work stands in ontology and exists in a community that values and seeks diversity and that as S-STTEP researchers, we experience a throb of resonance within the community. Developing this work requires community, and loving relationships are fundamental and necessary to it. Across our experiences as S-STTEP researchers, there has always been a concern that we be successful as researchers not just individually but collectively. This is part of our ethical obligation to the scholarship of S-STTEP research; to those with whom we work – teachers, teacher educators, and students of the teachers we educate – we, together, are *becoming.*

We pay attention to trustworthiness (see Hamilton and Pinnegar 2000). Earlier, we noted the ways that S-STTEP researchers are positioned differently within the

research community. Specifically, we called attention to the ways we connect theory and practice rather than assuming a "positivist orthodoxy" (St. Pierre 2013, p. 451). Making explicit not only our experiences but as well as the theory that shapes our methodological and interpretive perspective is rooted in our commitment to trustworthiness as scholars. Moreover, we resist perspectives of S-STTEP research as merely personal reflections. Jackson and Mazzei (2008) have outlined the limits of experience and narrative voice in qualitative approaches. Their argument rejects the substitution of the subjective authority through the narrative "I" for objective authority through the modern research paradigms, "simply replacing one privileged center with another, making similarly narrow claims to truth, authority, and authenticity as objectivism" (Jackson and Mazzei 2008, p. 299). As S-STTEP researchers we value the use of I, not as a center for asserting privileged knowing but as an act of owning our practices, our understandings, and our representations of them.

Moreover, because we adopt a view of identity as continually *becoming*, in the words of Butler (1992), "I always arrive too late to myself" (p. 79). We argue for a move beyond the notion of perceived transparency because as Jackson and Mazzei (2008) reminded us, there are "the traces of the unaccountable" (p. 313) in the stories we tell. We do not critique the importance of experience – rather we question the notion of an authentic, cohesive, and coherent "I." The sentiments of Jackson and Mazzei echo in our thinking:

> Spivak reminds us, 'Making positions transparent does not make them unproblematic' (p. xxxx). Therefore, we seek a performative "I" that has the potential to produce evocative, ethical, and failed practices that result in a telling with the potential to open the gaps and produce different knowings. The desire is not a truthful story, but a story that confronts the truths and traces that are both possible and impossible. This "I" does not become paralyzed by the impossibility of the limits of knowing but is constructed by an ethics as it uses those limits to present complicated voices and create new ways of understanding for those who read and listen to these performative accounts. (p. 314)

Therefore, S-STTEP research is and should be provocative and disruptive to our own stories of research and experience and to that of the academic contexts in which we live and work. In this work, we position ourselves as vulnerable since we reveal fiascos, unproductive actions, and understanding and we invite others to critique our knowing and our practice. From this perspective, we embrace new perspectives of knowledge and knowing that deconstruct power structures that seek to marginalize and silence difference; and as we do so, we open new perspectives, new discourses, and new possibilities.

What Is Our Identity as Teacher Educator/Researchers in Our Inquiries?

As S-STTEP researchers, we attempt to conduct studies of our practice with openness and honesty in our accounts of our practice; and we often bring a critical, questioning approach to our work. As Placier (1995) did early in S-STTEP research,

we are willing to identify and explore our fiascos and not just recount our hero stories. In Coia and Taylor's (2013) S-STTEP project, they interrogate their teaching practices to see whether they continued to enact the strong beliefs they held about feminism. As we suggested earlier, Tidwell and Fitzgerald (2004) explored Tidwell's attempts to re-engage students. She recounted the humility she experienced as she came to understand issues of engagement, judgment, and teaching in new ways. This openness and honesty in the exploration of our research indicates (we think) that our knowing of ourselves will always be disrupted. Our integrity as S-STTEP scholars means that we act on the things we learn. S-STTEP projects by Kitchen (2006, 2016) revealed the power of uncovering our embodied theory and enacting it in ways that result in living educational theory being clearly visible in our practice. Kitchen's work drew attention to a conundrum that as we create educational theory, seek to enact it, and study our embodied knowing, our knowledge of our living theory shifts. As a result, our identities will shift, and we will continue in our process in *becoming*. S-STTEP researchers and teacher educators continually seek to create living educational theory so that what we come to understand becomes visible in our practice. Ironically, as it becomes visible, we examine our knowing yet again and potentially disrupt the theoretical stances we had been enacting.

As S-STTEP researchers speak of their stance, they often use the language of positioning. Van Langenhove and Harré (1999) explained that our personhood emerges as we position and reposition ourselves. In capturing our understanding, we attend carefully to the ways in which we position ourselves and others. Charting our positioning reveals the potential and possible storylines that underlie our knowing of ourselves as teacher educator researchers. Dewey suggested that we learn from our experiences. We explore our experience to develop knowledge of our practice. Carefully attending to the continuity of these experiences and our interactions within them provide valuable evidence of our knowing in our practice.

In exploring practices and experiences, we often seek to study both the context and the processes embedded in our practices as we enact them. We do this from an orientation to relational ontology. Thus, S-STTEP researchers strive for thickness and depth to their study as they attend carefully to the particular, since we recognize that each particular lived experience is unique. When these unique qualities are captured collectively, the relation of the experience, process, and context to the whole (including the experienced past) has the potential to enrich understanding of teaching and teacher education. We seek out thick descriptions in our renderings of our practices including the intertwined relationship of context and history. In analysis and presentation of our assertions for action and understanding, we make visible the links between our data and the sense we make of it. Positioning ourselves in this way promises to shift our identity and develop knowing of practice that is rooted in lived experience.

As we study our practice and develop deeper understandings of it, we become increasingly responsible for it. We resonate with Barad's (1998) assertion that, "we are responsible for the world in which we live not because it is an arbitrary construction of our choosing but because it is sedimented out of particular practice that we have a role in shaping [it]" (p. 101). The dominant narrative of being an

academic is often characterized as telling. Our preservice teachers are often meant to listen and enact the ideas we tell them in their teaching practice. In teacher education programs, frequently we follow an orientation to knowledge of teaching – demonstrated in the construction of courses and learning experiences – in which we carve up the knowledge of teaching and distribute it as discrete elements across our programs. Crites (1971) might name this as the sacred story of teacher education. Clandinin (1995) asserted that in living different narratives in everyday acts of teaching within teacher education, there is the potential to shift sacred stories of teacher education.

As S-STTEP researchers, we resist and struggle against this older but persistent sacred story of teacher education. In taking up studies of our own practice, we have the potential to shift this story and the identity of teacher educators. Crites argued that the best hope for doing this rests in our enacting mundane stories in opposition to the sacred story. Through living and accounting for these mundane stories as S-STTEP researchers, we can articulate the ways in which we actually engage in the practice of teacher education. In this way, we can form our identities as teacher educators in opposition to the sacred story, contribute to the conversation surrounding researcher in teacher education, and develop new stories of teaching, teacher education, and research.

Who Does Self-Study and Why?

5

Brandon M. Butler and Angela Branyon

Contents

Abstract

In this chapter, the authors consider the question, "Who does self-study and why?" This is a complicated question given the broad base of self-study publications in books, journals, and conference proceedings. To provide focus and to avoid overlap with other chapters in this handbook, this chapter reviews research published in *Studying Teacher Education* to

uncover which educators conduct self-study research and their institutional and national affiliations. Following this consideration of who conducts self-study, Kelchterman's personal interpretive framework is used as an analytic frame to understand why educators use self-study of teacher education practices. After recognizing the "who and why" of self-study research in teacher education, the authors extend the review beyond *Studying Teacher Education* to reveal the extent to which self-study research is present outside education and teacher education. Using Polkinghorne's "practices of care," research in a number of disciplines – medical and nursing education, physical and occupational therapy, and counseling and social work – is reviewed for references to self-study research. Uncovering a limited presence, the authors identify exemplars of autoethnographic and narrative inquiry studies in each discipline and consider the ways in which such research may be adapted to self-study. The chapter concludes with recommendations for how self-study research can be extended beyond its current disciplinary, geographic, and institutional boundaries.

Who does self-study and why? This is seemingly such a simple question. The name alone – self-study of teacher education practices – suggests a form of scholarship conducted *by* teacher educators *of* their practice. Many before us have written about why we as teacher educators should conduct self-study. Loughran and Northfield (1998) noted that self-study had "become an option for all those committed to the improvement of professional practice" (p. 8). In the same year, Cole and Knowles (1998) perceived self-study as "a powerful mechanism for the reform of teacher education" (p. 224). They saw a dual purpose in self-study, in that teacher educators could use it for "their own personal-professional development" as well as for "enhanced understanding of teacher education practices, processes, programs, and contexts" (p. 225). In the first self-study handbook (Loughran et al. 2004), Loughran et al. (2004) wrote, "A common 'big picture' purpose for many self-studies is linked to the desire of the teacher educator to teach in ways commensurate with the hopes for their student-teachers' teaching (i. e., the notion of 'practice what you preach' or modeling)" (p. 10).

Rather than focus on these overarching purposes for the use of self-study, we take a different approach in this chapter, choosing to consider the personal interpretative reasons as to why teacher educators engage in self-study research (Kelchtermans 2009). Kelchtermans defined his personal interpretative framework as "a set of cognitions, of mental representations that operates as a lens through which teachers look at their job, give meaning to it and act in it" (p. 260). His framework consists of two domains: professional self-understanding and subjective educational theory. Kelchtermans also identified "five components that together make

up teachers' self-understanding: self-image, self-esteem, job motivation, task perception and future perspective" (p. 261). We more fully define this framework in the requisite section of this chapter on why researchers use self-study. But before we can address the "why" of our question, we must understand the "who" of self-study. That is what we address first in this chapter, with attention paid to authorship, country of origin, and institutional context.

We would be remiss to conclude the chapter without a consideration of the "others" of self-study. Too often, self-study is considered the domain of teacher-educators. Other chapters in this handbook explore self-study across different subject disciplines, in specific areas such as technology and educational foundations, and in transdisciplinary and international contexts. We did not want to appear repetitive by revisiting such areas. As a result, we look to what Polkinghorne (1988, 2004) considers "practices of care" beyond education (e.g., nursing and medical education, physical and occupational therapy, social work, counseling) to understand to what extent self-study is present or might be extended within these practices. Our exploration serves a particular purpose. Self-study scholars can still struggle with scholarly acceptance of their work, and the field can be perceived as "emerging" after 25 years, even as other areas within qualitative research such as case study and ethnography have become readily accepted and used by researchers. Cole and Knowles (1998) argued that "unless self-study processes are applied more widely [beyond teacher education] . . . chances are that this progression of acceptance will not happen with the same potency nor at the same pace" (p. 229). By reviewing the presence of self-study research in these practice-oriented fields and making the case for its inclusion, we hope to one day have an answer to the question of "Who does self-study and why?" that goes far beyond teacher education.

Uncovering the Who, the Why, and the "Others" of Self-Study

To understand the "who" and "why" of self-study, we reviewed the 228 empirical and conceptual articles published in the journal of self-study, *Studying Teacher Education*, between 2005 and 2017, with 2005 being the first publication year of the journal. We did not include the 16 article commentaries that were part of special issues in our analysis because they were not empirical or conceptual studies but commentaries on other studies published in the journal. We focused solely on *Studying Teacher Education* for specific reasons. First, the question of "Who does self-study and why?" can be considered all-encompassing. In fact, when we were first tasked with this chapter, our feelings were that of apprehension. How could we make sense of all of the self-study research conducted to date or at least since the first self-study handbook was published (Loughran et al. 2004)? Included in this review would be all of the major English-speaking research journals in teacher education and national-level teacher education journals from across the globe. We would also have to review discipline-specific education journals, which are already considered elsewhere in this handbook. Finally, we would have had to include in our initial review all major research journals in disparate fields beyond education (i.e., business, engineering,

the arts, sciences, etc.). Such a review was not practical as the scope of academic scholarship is awe-inspiring and we would inevitably fail to include research from one or more journals or areas of scholarship. Additionally, self-study scholarship can be found in a number of edited books, and the biennial Castle Conference produces conference proceedings, which are considered in another chapter in this handbook (Garbett et al. 2019). As such, we made the decision to focus our attention on one journal, *Studying Teacher Education*, for our review of the who and why of self-study. Journals beyond *Studying Teacher Education* were reviewed for the section on "The Others of Self-Study Scholarship: Looking Beyond Teacher Education" of self-study. As the sole journal dedicated to self-study research, the official journal of the American Educational Research Association's Self-Study of Teacher Education Practices Special Interest Group and a journal with international scope, we felt that a review of all articles published, excluding article commentaries, up to the writing of this chapter, would provide readers with a substantive picture of the who and why of self-study. To undertake this review, we first downloaded all articles published between 2005 and 2017, entered pertinent demographic data into a Microsoft Excel spreadsheet for all pieces (author, title, countries of origin, institutions), and then read each article to determine the authors' personal-interpretative reasons for engaging in self-study (Kelchtermans 2009), which we added to the Excel spreadsheet.

Practicality also served a purpose with our consideration of the "others" of self-study. A review of the two most prominent research journals in each primary discipline (e.g., sciences, humanities, engineering) would necessitate a considerable review of publications. Additionally, academic research is published in innumerable journals devoted to specialties and subspecialties. At what point would our review conclude? Practicality and a need for specificity led us to Polkinghorne's (1988) concept of narrative knowing in the human sciences. He later linked this concept to the "practices of care" (Polkinghorne 2004), in which "the aim of these practices is the betterment of the individuals served, and the means for achieving this aim includes a caring relationship and skilled and knowledgeable actions" (p. 1). Polkinghorne identified a number of practices that include "teaching, nursing, social work, and psychotherapy" (p. 1). Although self-study can and does exist within areas such as business, engineering, and the hard sciences, from our perspective Polkinghorne's notion of practices of care served as a purposeful frame through which we might consider the "others" of self-study. For, if teaching is considered a practice of care, it becomes logical to find current self-study research in other practices of care and to determine the ways in which self-study might be extended to those areas. As such, we focused our attention in the final review section on the areas of nursing education, medical education, social work, counseling, and physical and occupational therapy.

Who Does Self-Study?

In this portion of the chapter, we share the results of the first part of our three-part review. To answer the question of "Who does self-study?" we identified the authorship, countries of origin, and institutional contexts of the 228 empirical and

conceptual articles published in *Studying Teacher Education* between 2005 and 2017. During its history, the editors of the journal have remained firmly international, representing Australia, Canada, and the Netherlands. The editorial board is international in scope with current representation from the Netherlands, New Zealand, Spain, the United Kingdom, and the United States, while the International Advisory Board is just as diverse, with additional members representing Iceland and Israel, in addition to those countries already noted. However, through our review we found that the authorship within the journal represents a less internationally diverse perspective and is dominated by small numbers of individual authors and institutions.

Self-Study Scholarship by Country

Although *Studying Teacher Education* might be perceived as a journal with international scope, its origins in the American Educational Research Association are telling given the prominence of US-based scholars and institutions published in the journal. Of the 394 individual authorships (each author counted once), the United States accounted for 248 (62.9%) authors published and 99 (58.5%) of the institutions published in the journal. International presence narrows when one acknowledges the inclusion of only 15 other nations of author origin, with the journal largely Anglocentric. Five English-speaking nations (Australia, Canada, New Zealand, the United Kingdom, and the United States) account for 88.7% of authors published and 83.1% of institutions published in *Studying Teacher Education*. Table 1 provides an overview of countries represented in the journal and the three institutions with the most publications from each country. Given the focus that the scholarship from these five nations will receive in the remainder of this chapter, we want to pay some attention to the lesser represented nations in this subsection.

Among the remaining nations, inclusion in the journal was often facilitated through research collaborations with scholars in one of the five English-speaking nations. Researchers in four nations (Bangladesh; Barbados, itself English-speaking; Japan; and Spain) were part of research teams made up of one or more scholars from the United States and/or Canada. Spain is represented by one author, Mena, who collaborated with Russell – a long-time editor of the journal – on a study that analyzed the collaboration, methods, and trustworthiness of papers presented at the 2014 Castle Conference (Mena and Russell 2017). The research from the other three nations exemplify the complexity in tying author-ship to specific nations and institutions and the transitory nature of academia. Bangladesh may be represented in the pages of *Studying Teacher Education* (Chang et al. 2016); however, the author in this case (Li) was originally from the United States and had only recently joined her Bangladeshi institution after a period of time where the research was conducted (University of Hawaii). Barba-dos was published in the same issue in a study of linguistic and cultural appro-priations of an immigrant literacy teacher-educator (Smith et al. 2016). Barbados

was represented by the second author, and although the remaining two authors are institutionally located in the United States, both are immigrants with the first author originally from the Caribbean and the third author from Ghana. Scholars from Japan had authorship in two articles (Makaiau et al. 2015; Sakamoto and Chan 2006). Similar to the other articles highlighted here, the two Japan-based scholars collaborated with authors from the United States, at the University of Hawaii (Makaiau et al. 2015) and the University of Nebraska-Lincoln (Sakamoto and Chan 2006). In the case of Sakamoto and Chan (2006), both graduated from the University of Toronto in Canada, where a number of self-study scholars have worked and studied. Makaiau et al. (2015) conducted their self-study at the University of Hawaii in the United States, but each identified from different national origins: the United States, China, and Japan, respectively. Suguru was a doctoral student on a 1-year visit to Hawaii at the time of the study and returned to Japan prior to publication of the research.

The scholars highlighted in the previous paragraph hold strong ties to scholars and institutions in Canada and the United States. As we noted, international research in the journal was often published in collaboration with scholars from Canada and the United States, but there is a direct connection between the increase in a nation's publications and the presence of single-authored articles and collaborative research that extended beyond Canada and the United States. For example, Guðjónsdóttir, from Iceland, collaborated with researchers in Australia and the United States to better understand the S-STEP SIG from the perspective of its membership (Samaras et al. 2012). Additionally, Guðjónsdóttir collaborated with colleagues from the University of Iceland to understand their work as supervisors of master's research projects (Jónsdóttir et al. 2015). Iceland was also represented by two solo-authored studies that explored understanding of literacy through New Literacy Studies (Gísladóttir 2014) and learning to think of teaching as a situated enterprise (Guðjónsson 2007).

China, Ireland, and the Netherlands are the remaining nations outside the top six nations in the journal with international collaborations. In addition to an article conducted in Hong Kong of a teacher-educator's role in a learning study (Walker 2007), a Chinese researcher collaborated with Dutch scholars on intercultural misunderstandings between a doctoral student and supervisor (Hu et al. 2016). There was also a collaboration between Dutch and Canadian scholars who investigated their teaching of a foreign language pedagogical strategies course (Thomas and Geursen 2013). A final piece was authored by two Dutch scholars who explored their professional self-understanding (Koster and ven den Berg 2014). Like many other international collaborations in this section, Irish scholarly collaborations occurred with researchers in Canada and the United States. Researchers from University College Cork collaborated with a researcher from the United States to share three cases of how reflective inquiry facilitated their transformation as educators (Lyons et al. 2013). The final international Irish collaboration was from Fletcher et al. (2016). In their study, Fletcher, a Canadian, collaborated with Ní Chróinín and O'Sullivan, both from Ireland, to investigate how two layers of critical friendship supported their development of a pedagogical innovation in physical education. In addition to the international studies, two studies were conducted solely by Irish scholars (Donnelly 2006; Eberhardt and Heinz 2017). The first study, by Donnelly (2006), considered her use of learning technologies, while in the second study by Eberhardt and Heinz (2017), the authors investigated Eberhardt's teaching of action research to classroom teachers.

There were several nations with no international collaborations: Israel, Malta, Pakistan, and Sweden. Israel, the sixth most published nation, was well-represented in the journal with 11 individual authors and 5 institutions, with much of their research the result of collaborative research communities. We will consider a few here. Following three paper presentations at the 2008 Castle Conference, Turniansky et al. (2010) revisited the research they shared at the conference to uncover the territorial, knowledge-based, and value-based dimensions that existed within their collaboration. Several of these authors continued their collaboration the following year in an article that documented how their community countered a number of tensions that had emerged over their time working together (Tuval et al. 2011). From Sweden, Nilsson (2010) shared her experiences of teaching engineering education, while Fransson and Holmberg (2012) used self-study to better understand technological pedagogical content knowledge from a theoretical and pedagogical perspective so they might better prepare their preservice teachers to teach with technology. Two researchers from Malta shared scholarship on the effectiveness of initial teacher education (Sultana 2005) and a self-study of a teacher-educator returning to the primary classroom to teach (Spiteri 2010). Published in the first year of *Studying Teacher Education*, Sultana's article (2005) consisted of a literature review with no evident connection to self-study concepts or literature. Spiteri (2010), on the other hand, temporarily returned to classroom teaching during a sabbatical and used self-study to counter assumptions she previously held about teaching and to better inform her teaching of preservice teachers. Finally, one article was produced from Pakistan, by Bashiruddin (2006), who investigated her teaching of

self-study to master's degree students, noting that the experience generated interest among her colleagues and other teacher educators in Pakistan to engage in self-study as a way to reflect upon and interpret their practice.

Self-Study Scholarship by Institution

We noted previously that the United States accounts for 99 (58.5%) of institutions published in *Studying Teacher Education*. Five English-speaking nations (Australia, Canada, New Zealand, the United Kingdom, and the United States) account for 83.1% of all institutions published in the journal. The total number of institutions represented in the journal – 169 – are too many to fully consider within the space provided for this chapter. Having considered the 11 nations with the smallest publication count in the previous section, we turn our attention to the three nations with the most publications in the journal. Although we will highlight the range of institutional engagement with self-study, we will pay particular attention to the most represented institutions in each of the three nations.

In the United States, from which the majority of institutions published in the journal originate, there are over 4,000 institutions of higher education. With 8 public high schools included in the journal, that leaves 91 higher education institutions represented in *Studying Teacher Education*. This number alone, approximately 2% of total colleges/universities, suggests the limited scope of self-study within the United States at this time. Three institutions (Brigham Young University, George Mason University, Montclair State University) represent 39 (15.7%) authors from the United States and 22 (9.6%) of all articles published in the journal. The university with the most participation is Brigham Young University, with 16 individual authors and 12 articles from the university. In their narrative self-study published in the journal's first issue, Pinnegar et al. (2005) explored the relationship between mothering and teaching, highlighting feelings of inadequacy, care exhibited toward students, and the value placed on relationships. Among the faculty and doctoral students at Brigham Young University, Pinnegar has contributed the most articles to the journal, with three publications (Hamilton and Pinnegar 2013; Pinnegar et al. 2005; Rice et al. 2015). Pinnegar's interest in identity is threaded through these three self-studies and in the four article commentaries she contributed to a guest edited issue in 2011. Other universities (George Mason University, Montclair State University) in the United States have a similar amount of author representation in the journal, but the number of articles published is less than half those authored by Brigham Young University educators. Whereas the research that comes out of Brigham Young is a mixture of individual and collaborative research, the articles published by educators at George Mason and Montclair State are strictly collaborative in nature.

At first glance, it may appear as if self-study research is widely embraced and enacted by faculty and doctoral students at these institutions. However, a closer look highlights the centrality of individual faculty to the presence of self-study institutionally. Brigham Young University is an outlier in this case, with six authors

having two or more articles published in the journal. But in the next four most represented institutions, there are individual faculty who would seem necessary to the continuation of self-study institutionally: Anastasia Samaras at George Mason University, Monica Taylor at Montclair State University, Brandon Butler at Old Dominion University, and Mary Lynn Hamilton at the University of Kansas. What is evident in the United States is that the centralization of self-study scholarship to a limited few faculty and institutions endangers self-study institutionally and suggests that it is still something of an unknown presence in university settings. Brandon (author) serves as a representative case. Should I transition to another university setting, what self-study presence would remain at my current university? My institutional self-study scholarship has been largely limited to work with doctoral students (Butler et al. 2014; Butler and Diacopoulos 2016; Gregory et al. 2017), with each returning to the classroom or themselves entering the academy. With only one self-study collaboration with an institutional colleague (Grant and Butler 2018), it is possible that Old Dominion – like Montclair State, George Mason, and Kansas – would have its self-study presence disappear or endangered should the principal self-study researcher leave.

After the United States, there is a significant decline in participation from other nations. Canada, with 42 individual authors and 17 institutions represented, is the second most published nation in the journal. Of these 17 institutions, 14 are institutions of higher education. There are 39 articles published in the journal with institutional connections to Canada; this includes international collaborations. Of these articles, 24 (61.5%) are connected to five institutions (the University of Toronto, University of British Columbia, Nipissing University, Queen's University, Brock University). However, this number is somewhat misleading because a number of the self-study researchers from these institutions began their careers at one of two institutions: the University of Toronto and Queen's University. This suggests, similar to the United States, the origins of self-study research at a small number of universities and eventual dispersal to other institutions through doctoral students' transition into the professoriate. The three most published Canadian institutions drew participation from eight authors each, although the University of Toronto can claim seven publications, while the University of British Columbia and Nipissing University each have four. In the case of Nipissing, authorship has centered on Arlene Grierson, who has three published articles in the journal (Grierson 2010; Grierson et al. 2012; Williams and Grierson 2016), with one of those a collaboration with six institutional colleagues. Faculty at the University of Toronto, in particular, Kosnik and Beck (2008; Kosnik et al. 2009), have worked closely with doctoral students such as Kitchen, Fletcher, and McGlynn Stewart who learned self-study during their doctoral studies and continued to enact it at other universities as faculty members. At Queen's University, Tom Russell (Loughran and Russell 2007; Mena and Russell 2017; Russell 2017; Schuck and Russell 2005) introduced self-study to his doctoral students who have since relocated to other institutions (e.g., Bullock, Christou).

Australia exhibited similar production numbers to Canada, with 34 individual authors and 14 institutions represented in the journal. Three universities – Monash University,

the University of Technology Sydney, and Deakin University – were the most prominently published institutions, with Monash University represented by eight authors and ten articles. As with much of the research highlighted by institutions in the United States and Canada, self-study research at Monash is centered largely on two faculty members: Loughran and Williams. Combined, they contributed nine of the ten articles from Monash. We will highlight the work of Williams in the next section, but we will briefly touch on Loughran's research here. In addition to his work with Russell (Loughran and Russell 2007), Loughran also collaborated with Nathan Brubaker on an article about executive coaching within Loughran's role as a dean (Loughran and Brubaker 2015). Brubaker, who is currently employed at Monash, published three articles in *Studying Teacher Education*; however, two of those publications occurred when he was a faculty member in the United States (Brubaker 2010, 2012). Loughran also contributed two individually authored articles, one of which was a literature review on self-study and was the first article published in the journal (Loughran 2005) and another that makes an argument that self-study research must go beyond simply "sharing stories" of practice (Loughran 2010).

In contrast, self-study research at the University of Technology Sydney and Deakin University was dispersed among a number of researchers. Only Sandy Schuck, at the University of Technology Sydney, had more than one publication (Schuck 2009; Schuck and Russell 2005). In her solo-authored self-study, Schuck (2009) examined the results of two research studies she had enacted and used self-study to uncover what she had learned from her research, with particular attention paid to dilemmas experienced by teacher educators navigating the theory-practice divide. Aside from Schuck, research from the University of Technology Sydney was collaborative, with two research teams publishing self-studies of learning through peer observation (Pressick-Kilborn and te Riele 2008) and the development of student teacher reflection (Aubusson et al. 2010). Three articles were published by researchers at Deakin University, using collaborative self-study that explored the use of peer mentoring, including how the process created tensions and dilemmas for teacher educators in enacting a meaningful learning experience for their students (Allard and Gallant 2012). Having presented self-study research at the institutional level, we now turn to individual contributions to the self-study community.

Self-Study Scholarship by Individual

As we explore authorship at the individual level, we will first consider authorship in the journal as a whole. We then consider the individual authors who have most often published in the journal. Between 2005 and 2017, there were 486 total authorships in the journal. This number includes multiple articles by individual authors. With 228 research articles published in *Studying Teacher Education*, the author to article ratio is 2.13 authors to each article published. Given the collaborative nature of self-study (Bodone et al. 2004; LaBoskey 2004), this finding

should come as no surprise. Although a number of articles were single-authored, most had 2 or more authors, with 32 (14%) articles having 4 or more authors. 28 of these articles have been published since 2009. Five articles with four or more authors were published in 2010 and 2012, with at least two articles published each year since 2009. From 2005 to 2008, there were four articles published with four or more authors, with none published in 2008. Although the cause is difficult to ascertain, we see one commonality among much of this research in that the authors extensively make use of communities of practice as a conceptual and/or methodological focus of their self-studies, a concept that has received increased attention since the first self-study handbook was published in 2004 (e.g., Butler et al. 2014; Grierson et al. 2012; Ramirez et al. 2012; Tidwell et al. 2011).

Turning to individual authorship, there is a tension of concentration on a limited number of authors, similar to those highlighted in the previous sections on institutional and national inclusion in the journal. Of the 486 total authorships, 20 authors had 3 or more publications that accounted for 76 articles (15.6% of total count) published in the journal. Forty-two authors published 2 articles that accounted for 82 publications (16.8% of total count). This means that 61 (15.5%) authors out of 394 individual authors who published in the journal accounted for a third of all articles. Accordingly, the remaining 333 authors each contributed once to *Studying Teacher Education*, meaning that a small number of self-study scholars dominate the pages of the journal. Table 2 below provides a list of the most published researchers in the journal. The table shows a mix of scholars who are viewed as originators of self-study research, having been members since its origin or shortly thereafter, and second-generation self-study scholars who have known self-study during their entire time as academics. In the remainder of this section, we will explore the research of the three most published self-study scholars in the journal: Bullock, Ritter, and Williams, who also represent the three most published nations in the journal, Canada, the United States, and Australia, respectively.

Perhaps there is some irony in the fact that the three most published authors in the journal share one of the most cited articles in the journal (Williams et al. 2012). In their literature review on teacher-educator development and the transition from classroom teacher to teacher-educator, they identify three influences on the development of identity: the examination of personal and professional biography, the navigation of institutional contexts, and the development of a pedagogy of

Table 2 *Studying Teacher Education* publications by author, 2005–2017

Number of publications	Authors
7	Shawn Bullock
6	Jason Ritter; Judy Williams
4	Valerie Allison; Brandon Butler; Julian Kitchen; John Loughran; Tom Russell; Monica Taylor
3	Judith Barak; Nathan Brubaker; Cheryl Craig; Kathryn East; Tim Fletcher; Dawn Garbett; Arlene Grierson; Clare Kosnik; Sharon McDonough; Stefinee Pinnegar; Anastasia Samaras

teacher education within a community of practice. So, it may be no surprise that much of their individual scholarship has focused on their personal understanding and growth of a teacher-educator identity. Of the three authors, Bullock has the most publications in *Studying Teacher Education*, with seven articles. His first contribution was a collaboration with Theodore Christou during their doctoral studies at Queen's University (Bullock and Christou 2009). In their study, they explored what they termed the "radical middle between theory and practice … by encouraging [teacher] candidates to enact practice based on theory and to construct theory from personal understanding, by working to show them how we are trying to do the same" (p. 77). Bullock's interest in better understanding the practicum experience, his area of focus in his first self-study article, was revisited in a later article (Bullock 2012, 2017). In Bullock (2012), he returned to data collected as a doctoral student to make sense of how he responded to problems of enactment related to the power differential and complicated relational dynamics that exist between supervisor and teacher candidate. In his most recent self-study, Bullock (2017) extended his consideration of clinical education to include the influence of classroom teachers who host his teacher candidates. In this study, he re-examined his journals from his student teaching experiences 20 years prior, in conjunction with data collected as part of a larger multi-site case study. Through this research, Bullock developed metaphors to understand the effects cooperating teachers have had on his practice as a teacher-educator.

For Bullock, an additional avenue of self-study research has been an exploration of explicit pedagogies of teacher education (Bullock 2014; Fletcher and Bullock 2012). Fletcher and Bullock (2012) conducted an interdisciplinary self-study – physical and science education, respectively – to make sense of their respective disciplinary literacies but found that through self-study they were able to "craft a shared vision for our pedagogies of teacher education with literacy as the central piece of that vision" (p. 19). Several years later, Bullock (2014) explored his personal biography to understand how nonformal education (participation in martial arts) influenced his pedagogy of teacher education. As we transition to the work of Jason Ritter, we highlight research by Bullock and Ritter (2011) in their collaborative self-study of transitioning into the professoriate. In their article, they noted the necessity of "conform[ing] to a new set of institutional demands" (p. 176) related to the value placed on teaching by others, being strategic in meeting research expectations, and the expectation to consistently excel in all areas of faculty work. Ritter's own self-study agenda has been intently focused on his identity as a teacher-educator. In his early research, Ritter (2007, 2009) examined his transition from classroom teaching to teacher education.

Similar to Bullock, Ritter's (2007) initial foray into teacher education was through clinical supervision. Having been certain of his identity as a classroom teacher, Ritter felt comfortable in his initial attempts to replicate his practices in his student teachers. However, he found his experiences as a doctoral student – including coursework, peer relationships, and the work of teacher education itself – created a cognitive dissonance in him that forced changes in how he viewed his teacher identity and his responsibilities as a

teacher-educator. Ritter (2009) later conducted a 3-year self-study to comprehend how his views toward teacher education and his teacher-educator identity had developed during his doctoral studies. He revisited this data in Ritter (2011) to capture the affective challenges he experienced as a doctoral student, including "exhibiting fear of regression in my work, displaying apathy or exhaustion, exhibiting frustration and restlessness, and struggling to navigate interpersonal relationship with my students" (p. 231). Ritter's next publication was a literature review on teacher-educator development (Williams et al. 2012), but it was not until 2017 that he published again in the journal. In that study, Ritter (2017) shifted his attention to his teaching of self-study. He had developed an identity as a self-study researcher but questioned whether he could teach self-study to others. The study reports on his facilitation of a faculty research collective and the instructional, relational, and methodological challenges he experienced.

The final author we discuss here, Judy Williams, shares the second largest number of publications in the journal with Ritter, at six articles. Aside from a collaborative self-study on professional learning through collective digital feedback on student assignments (Auld et al. 2013), Williams' self-study research has centered on her teacher-educator identity. Her first self-study used Korthagen and Vasalos's (2005) concept of core reflection to improve her teacher education practices and to facilitate "learning and identity construction as teacher educators in a collegial context" (Williams and Power 2010, p. 129). The remainder of Williams' self-study research has considered how her identity developed through boundary crossing experiences, the first of which focused on practicum supervision (Williams 2013) and the remaining two on international experiences in teacher education (Williams and Berry 2016; Williams and Grierson 2016). In these final two articles, Williams led an international practicum experience through which she came to terms with the distinct differences between work in the field and at home in terms of relationships, responsibilities, practices, and perceptions. What is evident from these three self-study scholars and a review of the other most published authors is that identity development receives substantive consideration in the pages of *Studying Teacher Education*. From one's status as a novice teacher-educator (Bullock and Christou 2009; Ritter 2007, 2009), a supervisor of practicum/student teachers (Butler and Diacopoulos 2016; Cuenca 2010), or college administrator (Clift 2011; Loughran and Brubaker 2015), self-study scholars continue to ask the question, "Who am I?" To summarize, in this section we explored national and institutional contributions to *Studying Teacher Education* and individual authorship. In the next section, using the lens of a personal interpretative framework (Kelchtermans 2009), we consider why researchers conduct self-study.

Why Conduct Self-Study?

Having addressed the "who" of self-study, we now consider *why* researchers conduct self-study. To answer this question, we turned to Kelchtermans (2009), who derived a personal interpretative conceptual framework of narrative-biographical

scholarship. According to Kelchtermans, when educators discuss their practice and the incidents that have shaped their professional values, they tell stories framed as "anecdotes, metaphors, images and other types of storytelling to recall, share, exchange or account for their experiences in classrooms and schools" (Kelchtermans 2009, p. 260). Each educator's narrative classroom experiences can be understood through individual "experiences from the past and expectations of the future" (p. 260). When these two aspects of reflection are combined, the educator develops a narrative-biographical perspective of how he or she developed both personally and professionally and created meaning out of learning (i.e., sense-making). This framework presents the scholarship of teaching and then invites the "audience to acknowledge, confirm or question and contradict" (p. 263) the choices, emotions, and practices revealed in the act of self-understanding. Kelchtermans (2009) noted that

> Making the implicit educational theory explicit through reflection is of crucial importance if teachers want to develop the validity of their professional knowhow, refine or extend it. Only if its content is made explicit, others can comment, question elaborate, contradict, and thus contribute to furthering its validity. (p. 264)

Because developing an understanding of self as educator involves seeing the self through the eyes of those who observe you in practice (students, parents, administrators, colleagues), education is a profession where personal and professional identities are intricately woven together to form an ethical responsibility with which to respond to both professional and personal situations.

Kelchterman's framework consists of two parts, professional self-understanding and subjective educational theory. We chose to focus our use of the framework on the pursuit of professional self-understanding and its five components, given their clear connection to practice, which we could delineate in our review of articles published in *Studying Teacher Education*. Subjective educational theory reflects educators' "personal system of knowledge and beliefs about education that teachers use when performing their job" (p. 263). Educators' knowledge and beliefs are at the core of self-study research, which complicates our ability to differentiate the two as reasons for why educators use self-study. In the remainder of this section, we first define Kelchterman's notion of professional self-understanding and then use the five components of self-understanding – self-image, self-esteem, job motivation, task perception, and future perspective – to make sense of why educators use self-study.

Who Am I? Seeking Self-Understanding Through Self-Study

Although the question "Who am I?" suggests an inquiry into one's identity – research that is replete within self-study – in this section of the chapter, we use Kelchterman's (2009) term "self-understanding" in place of "identity." He differentiates between the two by explaining that identity is a "static essence" while

self-understanding is an "understanding of one's self at a certain moment in time (*product*) as well as . . . an ongoing *process* of making sense of one's experiences and their impact on self" (p. 261, emphasis in original). Development of self-understanding grows out of educators' telling stories about themselves as teachers. Nias (1989) calls this "persistent referentialism" (p. 5). This sense-making not only involves a change in our professional self-understandings but also involves a change in our emotional understandings, which leads to better understanding of ourselves as our roles, perceptions, and contexts change (Lunenberg et al. 2011).

By examining teachers' lives and practices through the study of biography, autobiography, action research. and self-study, we develop and clarify the connections between who we are as teachers and who we are as learners (Bullough and Pinnegar 2001; Kitchen 2005a; Pinnegar et al. 2005). Kelchtermans (2009) analyzed the narratives told by teachers and determined that five components make up a teacher's self-understanding: self-image, self-esteem, job motivation, task perception, and future perspectives. We consider educators' use of self-study through an exploration of representative literature that reflects these five components.

Discovering Self-Image: Who We Are and Want to Become

Kelchtermans (2009) stated that "self-image is the descriptive component, the way teachers typify themselves as teachers. This image is based on self-perception. . .and is strongly influenced by the way one is perceived by others" (pp. 261–262). Educators' self-image is based on what others (i.e., students, parents, colleagues) think of us as people and professionals, perceptions that can leave one's self-image in a state of flux depending on the context in which we are perceived and the relationships enacted within that context. For example, Kitchen (2005a) analyzed 10 years of personal and professional writings coupled with writings collected from preservice teachers. These writings helped him "understand how the complex interplay among personal practical knowledge, professional practice, the university classroom and the school environment inform my work" (p. 19). Both personal knowledge (through reflection) and professional relationships (through practice) often led him to important sense-making and served as a bridge between theory and practice. Through reflection and practice, Kitchen's (2005a) relational approach to education enabled him to better meet the needs of his students, reflect on his practices, and then develop his self-image within the context of his professional practices in order "to develop teacher education programs that are reciprocal, respectful and authentic" (p. 28).

In a companion article, Kitchen (2005b) continued to study the development of self-image through the perception of others. Kitchen drew on the work of Dewey (1938) stating that "education is development from within" (p. 40). Self-image is not simply a recitation of our credentials but rather a revelation of our understanding of our personal knowledge and our receptivity to develop relationships. In a letter to his preservice teachers, Kitchen explained his identity as an educator and his desire to develop a meaningful relationship with each of them, noting that:

> By sharing my experiences, I illustrated my engagement in reflective practice. By listening authentically to their stories, I modelled respect for teachers as curriculum makers. By providing them with reflective tools, I assisted my preservice teachers as they explored their personal practical knowledge. (p. 200)

Nieto (2010) stated that we each need to "understand and accept [our] own diversity and delve into [our] own identities before [we can] learn about and from [our] students" (p. 157). It is the self-images we explore that enable us to combine our theoretical understandings of teaching with the practical realities of the classroom and its complexities. Although the technicalities of teaching can be taught and practiced, teaching is also about making those split-second decisions in the moment to manage student learning. It is in these moments when the technicalities of teaching meet the teacher's own ideas and practices that the teacher is able to realize how self-understanding stems from his/her life experiences. These moments of self-realization become the anecdotes that are passed on to others within a social context by "conversation, dialogue, and narrative" (Clark 2001, p. 4).

In another example, Hug and Moller (2005) explored the collaborative practices they established in two early childhood courses in language arts and science to examine how using literacy skills affected their teaching and learning of science. Both teacher educators brought a common belief to the study that stemmed from their separate academic disciplines: "Reading and experiencing literature and science are essential ways for us to understand ourselves and our world" (pp. 130–131). Using this common belief, they began to define an approach to best teach these separate subjects collaboratively. Each teacher-educator brought their individual expertise to the teaching of these subjects, but it was in the collaborative lessons when Hug and Moller realized their self-images were changing. Reflection on these changes emerged as questions were asked and "connections were seen between teaching and the larger social, historical, and political world in which [they] and [their] students are situated" (p. 137).

In another example, Nicol (2006) sought self-study to improve her communicative abilities with her preservice teachers. Because her stated purpose was to instruct future mathematics teachers about new ways to engage in mathematics pedagogy, a sense of resistance and discomfort were expressed by students and felt by Nicol. The preservice teachers were uncomfortable being asked to move outside their understandings of how to teach mathematics in traditional ways, while the instructor could not understand why they were so resistant to try new pedagogies. Nicol (2006) acknowledged the pain, confusion, frustration, and discomfort her students experienced and came to understand for herself that those feelings were part of the process of coming to new understandings. Her pedagogical practice shifted from a focus on teaching her students new and innovative ways to teach mathematics to listening to her students as they struggled to decide the best way to teach their students about mathematics.

These studies reflect the idea that when we negotiate our understandings of who we are and who we want to become, we are able to reframe our self-understandings and transform our practices within a social context. As we begin to share our stories

of identity and practice transformation, a sense of trust and a sense of community develop with other teacher educators that increase mutual interest in promoting teacher learning.

Framing Self-Esteem: Coming to Terms with One's Job Performance

The next component of Kelchtermans' (2009) professional self-understanding, self-esteem, "refers to the teacher's appreciation of his/her actual job performance" (p. 262). Because so many teacher educators come into higher education from primary and secondary teaching, the transition from teacher to teacher-educator can create many concerns about one's self as novice and expert (Turniansky et al. 2010). Doctoral students and newly hired faculty in education may find themselves lacking confidence in their new roles, unsure of what their new self-image should be. Yet this lack of confidence is not just seen in doctoral students or new faculty. Hutchins (2015) states that "Imposter tendencies are alive and well among higher education faculty" (p. 10). Feedback from others concerning our job performance is important, but that feedback is filtered through the significance we grant to the person or group giving the feedback. As new teachers, teachers in a new subject area or grade, and newly hired professors navigate their new contexts and seek to define themselves within these new paradigms, self-esteem can suffer as teachers wonder if they are capable of accomplishing the tasks they perceive as essential in assuming the role of teacher or teacher-educator. This transformation from a familiar role into a new role includes a reframing of both personal and professional self-image and self-esteem (Bullock and Ritter 2011; Harrison and McKeon 2010).

Williams and Grierson (2016) studied the dilemmas that arose for them as teacher educators when facilitating professional development in an international context. Cultural tensions arose that not only caused the international teachers to be dissatisfied with the professional development but also caused the teacher educators to realize that their evaluation of job performance as an element of self-esteem was "reflective of their personal pedagogical values and beliefs" (p. 55). Navigating these tensions caused both teacher-educators to question their job performance and the value choices they made when they confronted these issues. Both chose to continue to provide the prescribed professional development and accept the realities in inequity and neocolonialism within the context of the school systems. Yet the prescribed action also caused some discomfort in Williams, who "felt that to some degree I was an 'imposer of knowledge'- not what I teach my students about good teaching" (p. 64). Self-esteem or appreciation of job performance was finally achieved when the teacher educators realized after reflection that not only was it important for the international teachers to understand "their frames of reference and their perspectives of themselves. . .but also to understand the assumptions, values, and beliefs that we ourselves took into these contexts" (p. 67).

Ragoonaden (2015) studied "the space between self and the practice engaged in" by exploring her autobiographical writings (p. 83) and the relationships that can be made by exploring the connections between her teaching and learning. She examined her experiences as a teacher in Canadian public education and how she consistently seemed to be classified by her *otherness* where her *differences* were

more focused on than her *sameness* (p. 86, emphasis in original). From these observations, and how they related to framing her own self-knowledge about her practices, she realized that she was not "incorporating culturally relevant pedagogy in my own practice, particularly representations of indigenous knowledge" (p. 89). Ragoonaden (2015) was able to question her pedagogical decisions in relation to who she was as an immigrant, a woman, and a tenured faculty member and thus bring about new knowledge of her teaching practice and transform her view of self.

Self-study is the search to understand who we are in the context of what we do (Loughran 2004). Self-study can provide a safe space for us to explore our personal and professional contexts, which shape our personal and professional self-understanding. As these new understandings emerge, we explore the defining moments, the critical incidents that triggered the transformations, and how this change was influenced by autobiographical stories that attempted to place our experiences within a narrative framework.

Formulating Task Perception: What and How We Teach

Determining what and how we teach is the aspect of self-understanding that defines the tasks a teacher believes must be accomplished in order to be a good teacher. Educators not only have to decide what they need to do to be a good teacher, but they also have to decide "tactics for negotiating, navigating, influencing, and controlling their working conditions" (Kelchtermans 2009, p. 262). In his self-study of teaching secondary students, Senese (2005) investigated the constructivist idea that making meaning out of knowledge must occur within the context of the relationships we establish with one another. We need to not only look at our students to see how they learn, but we must also look at how we as teacher educators learn. We must not just look at how to teach but look at how our pedagogical practices and choices reveal who we are and what we believe. Through an examination of the relationships he built with his students as he taught them how to learn, Senese was able to "learn more about my own learning processes and, in turn, my own teaching process" (p. 44). By struggling with his role as the authority on the subject matter, he reframed that role and allowed his students to contribute to what needed to be done to study class content. Yet, despite this decision, he discovered that he still exercised the role of expert in the classroom because he was perceived by students as the authority figure. It was not until he realized that having the title of teacher does not make one a teacher, that he could finally allow himself to relinquish control and let students be both teachers and learners. Senese reflected, "I am finally realizing that in order to create the kinds of relationships that foster true, authentic, and real learning, teachers must relinquish control of themselves" (p. 52). What made him a teacher was his ability to create an "optimal state of mind by being both teacher and student" (p. 52). His students taught him that an optimal learning environment is the one in which students teach the instructor about "negotiating, navigating, influencing, and controlling" the classroom context and content (Kelchtermans 2009, p. 262).

Mueller (2006), a teacher-educator, studied the gap between theory and practice in her practice. This gap is what teacher educators struggle to bridge as they examine

the tasks they perform and the best ways to perform those tasks. As she studied her personal experience as a teacher and her professional knowledge as a teacher-educator, she came to the conclusion that her knowledge is a:

> complex fusion of my experience as a classroom teacher, my knowledge of schools and curriculum, my knowledge of children and how they learn, my ability to create meaningful learning environments, my knowledge of educational research and my teaching and learning experiences as a teacher educator. (p. 138)

Teaching preservice teachers how to think about teaching and learning became the task Mueller saw as one of the most important aspects of her practice. As she read her preservice students' reflections about her teaching, she reflected on her early days as a teacher and realized that her past played an important role in formulating who she is in the present and who she would become in the future. Helping students see their uncertainties and then to have the courage to explore those uncertainties allows educators to transform their practices, build relationships with students and challenge students to reflect, and then reflect again on their job as educators.

Loughran and Russell (2007) examined the complexities of the act of teaching. Although teaching is often seen as merely the transmission of information, teaching is a complex activity developed through constant learning and practice. Authentic classroom experiences need to be included in the learning of how to teach in order to make the decisions used in planning and teaching explicit. Once the task perception of teaching is clarified and teaching is no longer seen as merely the passing on of information to pass an arbitrary assessment, teaching can be understood as the complex discipline it truly is. By studying their own practice, opportunities are created for new teachers to recognize and work productively with the complexities and intricacies of teaching.

Discovering Job Motivation: Reinforcing Commitment to Teaching and Place

Task perception is intricately interwoven with job motivation. When educators feel they have completed the necessary tasks to be a good teacher and can balance the working conditions with task achievement, educators tend to remain content and stay in the profession (Sinclair 2008; Inman and Marlow 2004). These career educators see a broader purpose for education, teaching and learning becomes less about knowledge retention and more about making sense of and applying knowledge learned. This is where job motivation develops. Burchell (2008) studied the imaginative aspects of teaching that motivate her when she mentors doctoral students during dissertation writing and supervision. She found that, over the years, her job was more about "willingness and ability to work with the student to imagine an undefined possibility" than it was about strategies in the writing process (p. 80). She explained that each doctoral student must find the approach to researching and writing about a topic that is right for that particular time and place. With this understanding, the dissertation can become a more concrete entity and is no longer an imaginative space, as the student must release some of what they believed to be their topic and allow the dissertation to

evolve. In the same way, preservice teachers must be willing to let go of the "pre-understandings [they] bring to any teaching situation" (p. 90). The imaginative aspect of teaching allows for the possibilities of what teaching has to bring and fosters the creativity that makes teaching unique to each educator (Smith and Cook 1992).

Margolin (2008) explored the collegial relationships she developed at her university and how these relationships affected her as a leader. Part of the elementary education faculty's scheduled weekly time was a 90-minute meeting of the department. After becoming chair of her department, Margolin posited that the social focus of these meetings was a way for faculty to avoid talking about conflicts and pedagogical and philosophical differences. In an attempt to change these dynamics, Margolin made several alternations, including the organization of a learning community to "reframe practice by problematizing teaching and by giving and receiving critical feedback, through inquiry into their practice" (p. 178). Tensions that surrounded many of the changes that grew out of this change almost brought about a department revolt, but it also brought about better understanding and transformation of Margolin's practice. She began to realize that change had to begin with her willingness to share the responsibility of guiding the department with all the members, noting "I understand that we live in a complex and highly interconnected world in which all parts of the context are interdependent and influence one another" (p. 184). When we begin to rely on each other as a professional community, then we begin to reshape our identities to match the reasons why we went into education in the beginning of our careers.

For teacher-educators, motivation can also come from a return to the classroom (McDonough 2017; Spiteri 2010). For McDonough (2017), a 1-year return to teaching provided her the opportunity to explore tensions she experienced related to instruction, the perception of others, and educator identity. The opportunities provided during her return to teaching, along with the associated tensions and her use of self-study, helped McDonough renew her research agenda, reinforce her practice as a teacher-educator, and continuously "examine how the cultural and organizational forces of the university mediate the way that I enact my practice" (p. 249). As an English language educator in Malta, Spiteri (2010) returned to the classroom to "better understand the challenges faced by pre-service teachers in implementing" a specific language learning framework (p. 132). As a consequence of her classroom experiences, Spiteri confirmed that "the language teaching methodology that we promote on our teacher education programme is relevant and achievable" (p. 138), which motivated her continued use of this instructional approach and to find value in the program of which she was a part. As evidenced in the studies highlighted here, job motivation is an important factor in our use of self-study. It can help us better understand how to reframe our teaching practices and find necessity in our work as educators.

Examining Future Perspectives: Completing Professional Self-Understanding

Once educators realize that self-understanding is a fluid concept, self-image can be refined, self-esteem reevaluated, task perception refigured, and job motivation

reframed. The actions performed in the past affect the decisions made in the present and the choices made in the future. Self-study, by its very nature, simultaneously looks at the past in order to affect change in the future. Although many educators reflect on prior experiences and explore current practices in order to grow professionally, the change sought by those engaging in self-study is not just in the practice of teaching but also in knowing their future selves. As such, from the perspective of the authors of this chapter, all of the self-study research we analyzed fell into this final category of examining future perspectives. As the differing views of practice were explored, the self-studies revealed *discomforting dialogues* (Kelchtermans 2009, p. 270) that explored the morality of teaching and the decisions made while teaching and the emotional experiences of teaching and confronting one's practice through someone else's perspective. Kelchtermans argued that:

> By examining and unmasking the moral and political agendas in the work context and their impact on one's self-understanding, one's thinking and actions, reflection can open up perspectives for empowerment and for re-establishing the conditions for teaching and learning that allow for pedagogical processes to take place in which people can regain authorship of their selves. (p. 269)

We assert that self-study conducted within a context of reflection, analysis, and support is a way to extend our "reflection on practice . . . and move to wider communication and consideration of ideas, i.e., the generation and communication of new knowledge and understandings" (Loughran and Northfield 1998, p. 15). The use of collaboration, critical friendships, and reflective inquiry helps build relationships with students and colleagues and enables personal and professional growth (Bodone et al. 2004; Harrison and McKeon 2010; Kitchen and Ciuffetelli Parker 2009).

We, as self-study researchers, are simultaneously supported and challenged by our ongoing dialogue and the access we give one another to our classrooms, students' feedback, and personal reflections. Collaboration also enables identification and refinement of the common threads we share while also challenging each of us within the group to grow and develop in our practices. To illustrate, Kitchen (2005b) explored the shared space created when educators discuss their personal pedagogical practices and invite critical conversations which have the potential to make us vulnerable. Gregory et al. (2017) asserted that this shared space also allows us to be open to the possibilities of transformed understanding and enhanced practice. We are better able to grapple with difficult realities in our pedagogical practice when we share our perspectives with trusted colleagues because (1) self-study not only informs the practices of the participants in the study but also makes the tacit knowledge available to others and allows for a critique of our practices (Loughran 2004); (2) self-study can most effectively reveal the misunderstandings involved in encounters between different power differentials (Hamilton 2006), which are often subtle and easily go unnoticed when rooted in core cultural and educational differences; and (3) self-study adds an alternative, individualized, and in-depth form of understanding to research about teaching and

teacher education (Bastos and Sa 2015; Williams and Berry 2016). Creating and participating in a self-study group provides a forum to explore our personal and professional lives, allows the navigation of emotions, explores the role of intuition into our practices, and creates, at times, uncertainty and instability (Schön 1983). Engaging in self-study with a community of practice, through collaboration or with a critical friend, allows teachers to examine their personal and professional goals of teaching in search of harmony between beliefs (personal) and practices (public/professional) (Tauer and Tate 1998).

The Others of Self-Study Scholarship: Looking Beyond Teacher Education

In this section, we turn to the "others" of self-study. While self-study research originated in teacher education, it has extended beyond those settings into school classrooms and other areas associated with education such as school and university administration. However, self-study has had limited presence in areas of practice beyond education, even among those areas deemed "practices of care" (Polkinghorne 2004) such as nursing, counseling, and physical and occupational therapy. Most of these practices of care are devoid of self-study research, while others, for example, nursing education, have a small presence. As such, it was difficult to provide an expansive consideration of self-study within these fields, which was our original intent. But scholars and practitioners in these areas have engaged in narrative research through methods such as narrative inquiry and autoethnography. Polkinghorne (1988) noted that within the varied areas of human sciences, narrative research provides certain benefits to developing an understanding of practice and personal growth. For him, this form of research was not simply a theoretical notion; rather it came from an "unresolved personal conflict between [his] work as an academic researcher on the one hand and as a practicing psychotherapist on the other" (Polkinghorne 1988, p. ix). His concept of narrative knowing in the human sciences focuses on the meaning we make of practice and self (Polkinghorne 1988, 2004). With the emergence of practitioner-oriented scholarship in these care professions, as chapter authors we saw an opportunity to consider how self-study might be applied more widely beyond education (Cole and Knowles 1998).

To that end, we identified six practices of care that use research methodologies that "privilege self in the research design" (Hamilton et al. 2008, p. 17) which Hamilton and colleagues identified as self-study, narrative inquiry, and autoethnography. We aligned practices of care from related fields that resulted in our areas of consideration below: medical and nursing education, physical and occupational therapy, and social work and counseling. Using the Primo by Ex Libris library search tool provided by Brandon's university library, we conducted individual searches for each practice of care using the terms "autoethnography," "narrative inquiry," "self-study," and "self-study of teacher education practices." Searches for each area of practice using "self-study of teacher

education practices" yielded only four results, in social work. However, these articles were authored by teacher educators and published in teacher education journals, so they did not meet our search criteria. Next, we searched each area of practice using the term "self-study." This yielded more results although these articles reflected an alternative definition of self-study, centered on professional certification, patient self-evaluation, or program review. The only practice of care article we identified in self-study – as conceptualized in teacher education – was in nursing education. Our review did uncover a parallel research methodology to self-study in the area of dance therapy, embodied artistic inquiry (Hervey 2000). In a recently published study, Rot (2018) explored her experiences with dance through the lens of her racial identity and status as a graduate student in dance/movement therapy and how her experiences informed her practice as a future counselor. This study was reminiscent of self-studies by Bullock (2014) investigating martial arts and Garbett (2011) who studied her experiences of horseback riding and how their analysis of their learning within those nonformal educational experiences informed their practice as teacher educators.

We then turned to searches for each practice of care using the terms "narrative inquiry" and "autoethnography." These searches produced numerous results. Although we identified a number of autoethnographic studies for each practice of care, identifying narrative studies from "the position of the 'I'" was more challenging (Hamilton et al. 2008, p. 25). As a result, much of the research we highlight below is autoethnographic in nature. Hamilton et al. (2008) cautioned that, "At first glance, it may appear that narrative inquiry, autoethnography, and self-study are interchangeable methodological approaches focusing on stretching boundaries and contesting realities," but "[t]he differences emerge in seeing how these research practices are enacted and how the thinking underlying the practices is revealed" (p. 25). Because our intent in this section is to highlight the similarities between self-study and the narrative or autoethnographic scholarship already conducted in practices of care beyond education, we must not oversimplify the ways in which that scholarship can be shifted to be considered self-study scholarship. But if we wish to extend self-study to others outside of teaching and teacher education, we must first identify scholarly exemplars within those practices of care so that scholar-practitioners in those areas might see the possibilities of self-study in their scholarly areas. In the remainder of this section, we offer an overview of the use of narrative inquiry, autoethnography, and self-study in each of the practices of care we identified at the outset and identify ways in which self-study might be applied to exemplars of research from those fields.

Medical and Nursing Education: Challenging Positivist Orientations Toward Scholarship

We begin with nursing education, the only practice of care in which we noted the presence of self-study research. Scholars in nursing education were early proponents of self-study research (e.g., Drevdahl et al. 2002; Stolder et al. 2007).

Across two articles (Drevdahl et al. 2002; Louie et al. 2003), the authors made an argument for the use of "reflective self-study," a three-phase process that focused on assessment, implementation, and dissemination. Their model was first concerned with identifying colleagues with whom one could develop an honest, open, critical, and collaborative approach to investigating problems of practice; followed by a careful consideration of appropriate research methods and forms of data collection and analysis; and concluding with the communication of findings to the academic community and an improvement of practice. Their first article, published in the *Journal of Nursing Education*, has been cited by others in nursing education who use self-study research. The second article was written for a broader audience and published in the *Journal of Higher Education*. Stolder et al. (2007) built on the arguments presented by Drevdahl and colleagues, noting that "Examining the self as teacher, perhaps from a border-crossing framework, is foundational to nursing education, nursing practice, and the generation of knowledge providing the evidence in both arenas" (p. 267). Even with the call for increased awareness among nurse educators, particularly through the use of self-study, few have taken up the call. We identified three self-studies in nursing education (Barbour 2016; Ragoonaden et al. 2018; Woods 2017).

Barbour (2016) frames her study explicitly as a self-study, using self-study literature, but the outcome is not consistent with commonly agreed upon characteristics of self-study. For example, key facets of self-study research were missing, such as an improvement-aimed focus (LaBoskey 2004). Findings were simple expressions of the author's experiences with grief and did not explore how, through self-study, she came to better understand and improve how she handled her grief at the passing of patients. From a methodological perspective, the article provided limited detail regarding data collection, but did highlight her attempt at trustworthiness through the use of peer debriefing with a graduate advisor and several nurses and nurse practitioners. Woods's (2017) self-study was developed through her dissertation. Like Barbour (2016), Woods (2017) had a limited focus on the improvement-aimed facets of self-study, instead relying predominately on narrative descriptions of her teaching and learning experiences, only highlighting what was improved toward the end of the dissertation. However, Woods' research was more embedded in the self-study literature, including the first self-study handbook (Loughran et al. 2004). Perhaps one reason why both authors' work shows limited engagement with a self-study approach is because this was their first foray into self-study and both worked alone. As the self-study scholarship in teacher education has shown, learning self-study occurs best through collaboration with others and often more experienced, self-study scholars. Learning and enacting self-study alone can be challenging. But, given the general absence of self-study research and experienced scholars in nursing education, such difficulty is to be expected.

The experiences of Barbour (2016) and Woods (2017) contrast sharply with those of Ragoonaden et al. (2018). In Ragoonaden and colleagues' study, two nurse educators – Morajelo and Kennedy – served as critical friends to one another, with Ragoonaden serving as a meta-critical friend and self-study "insider" to support their researcher collective. These authors noted the positive impact that critical friendship

played in the improvement of Morajelo and Kennedy's instructional practice and highlighted the influence of working with colleagues from other disciplinary areas. Their findings, which we will revisit again toward the end of this chapter, reinforced the influence that interdisciplinary professional learning, or learning across two or more disciplines, particularly through self-study, can have on faculty identity and practice. Although the research itself was aligned effectively with self-study and critical friendship literature and exhibited sufficient methodological detail, the findings were limited in scope, consisting primarily of one quote from each researcher for each of four findings. Given Ragoonaden's self-study background and experience, this limitation in the study may be attributed to the confines of the publication outlet rather than the researchers' abilities as self-study scholars.

Although self-study has not been extensively embraced in nursing education, other forms of personal and practice-based scholarship are more widely used. For instance, narrative inquiry is increasingly used by nursing researchers, although much of that scholarship is focused on others (i.e., students or patients) and not on the self. A vocal proponent in nursing education for the use of narrative inquiry, from the perspective of the narrative "I," is Lindsay (e.g., Lindsay 2006, 2011; Lindsay and Smith 2003). Lindsay (2006) noted early resistance to narrative research among colleagues who see the "separation between daily life experience and theory-based curriculum [as] structured into nursing education" (p. 43). This tension within the field, similar to those expressed in other practices of care like medical education, creates epistemological mindsets that rely heavily on quantitative measures and more traditional qualitative approaches. However, when one reviews the narrative research by Lindsay, there exist possibilities for reconsideration of her work as self-study scholarship. For instance, in Lindsay (2011), she shared her experiences as a caregiver for her father in the last months of his life while teaching a course on working with older persons. The narratives related to her father's hospitalization and eventual death were powerful; however, the moments shared of the nursing education course did not account for how her perspectives and practices were altered because of her personal experiences. Had Lindsay more carefully considered how her experiences as a caregiver for an older person improved her practices and understanding of nursing student needs in the course, this study would have served as a powerful example of narrative self-study in nursing education.

Narrative inquiry is increasingly used in nursing education, but autoethnography has received more consideration as narrative methodology, particularly in the area of mental health nursing (e.g., Foster et al. 2006; Peterson 2015). The use of autoethnography in this area of nursing is due to mental health practitioners' noted stance that "subjectivity and personal experience are seen as valuable to the nurse who is seeking to understand how another – the client – encounters, understands, and makes meaning from, the world" (Foster et al. 2006, p. 44). Peterson (2015) added that "This [form of research] may be challenging for nurses, who have long been instructed to limit self-disclosure in their professional role" (p. 228). Yet many nurses and nurse educators have begun the process of showing vulnerability related to their work, especially through autoethnography. For example, research on the tutor-student relationship by Gardner and Lane (2010) serves as an exemplar of

autoethnographic scholarship that could be reframed as self-study. They share experiences of Gardner's teaching of Lane in a formal course setting and how their relationship, connected largely to Lane's feelings of grief and depression, emerged in the space. Spread throughout the article are moments from the classroom environment and the tensions both experienced in seeking and providing support. But absent from the research is attention to how the relationship improved Gardner's future instructional practices and her understanding of self as instructor, tutor, and counselor, as well as Lane's future practices as a nurse. Given the collaborative nature of their research, an appropriate link to self-study research could be made through the work of Taylor and Coia on co/autoethnographic self-study (e.g., Coia and Taylor 2010; Taylor and Coia 2009). Through co/autoethnographic self-study, Gardner and Lane might better understand how their past and current shared experiences could improve their nurse and nurse educator practices, so they might understand the "impact of [nurses'] personal and professional cultural identity on their practice" (Peterson 2015, p. 231).

Publications from medical education, in contrast, exhibit few examples of scholarship from the narrative "I." That is not to say narrative research is absent, as narrative inquiry has been conducted in small numbers in recent decades, with 34 journal articles published since 1992. But in our search, we did not identify narrative scholarship in medical education that focused on the researchers. Rather, narrative inquiry scholarship in medical education has focused on research participants as others in the research. A search for autoethnography showed four results. Yet there have been considerable efforts by scholars to make the case for narrative inquiry and autoethnographic research in medical education. Jean Clandinin has written extensively about the need for medical students and doctors to study their identities through narrative research (e.g., Clandinin and Cave 2008; Clandinin et al. 2011, 2017). However, these authors noted that a persistent challenge in promoting narrative research is the increasing reliance on medical case studies and case reports to educate medical students, which leaves students with few opportunities to explicitly consider their emerging identities as healthcare practitioners. Monrouxe (2010) noted that "The issue of identity and identification has been a central concern within the social and human sciences for decades, yet it is rarely discussed openly within medical education" (p. 41). Similar arguments have been made for the limited presence of autoethnography in medical education (Farrell 2017; Farrell et al. 2015). Farrell et al. (2015) attributed this to "the fact that the world of medicine is often viewed through a positivist lens and the tenets of evidence-based medicine are ingrained in the culture" (p. 981).

One autoethnographic exemplar in medical education comes from Gallé and Lingard (2010), who explored Galle's experience as a medical student in a field placement. In fact, much of what is shared in the article reflects LaBoskey's (2004) methodological guidelines for self-study research. The research was self-initiated and focused on Galle's learning in an interprofessional setting. It was interactive and sought validity in that Galle shared vignette drafts and early findings with his placement peers. From a methodological perspective, the study was qualitative in nature with detailed context of the author, other participants, and institution

provided. Galle provided sufficient description of data collection and analysis procedures and fully described the vignette writing experience. The one area in which the article did not align with self-study research was its lack of attention to improving practice. Galle and Lingard noted that the intent of the research was to share the experiences of students in a placement, something that was lacking in prior research of interprofessional medical placements. And although they suggested adaptations to future placements based on Galle's experiences, they did not consider how Galle's own conceptions of identity and future medical practice were improved by studying the placement. Additionally, Lingard's voice, presence, and influence were absent from the study. From a self-study perspective, Lingard could have served as a critical friend, or knowledgeable other, for Galle as he investigated his placement learning.

In considering the possible extension of self-study into nursing and medical education, there is greater potential for self-study in nursing scholarship. There already exists a small base of scholarship in that field. It may simply need further support to effectively introduce it, similar to the way in which Ragoonaden served as critical friend to two nursing educators (Ragoonaden et al. 2018). Because narrative inquiry and autoethnography have a strong presence in nursing education, it would not be too great a step to further the use of self-study research. However, unlike nursing education, the immediate challenge in extending self-study into medical education is in generating a collective understanding of the importance of professional identity, the appropriate educational strategies for facilitating identity development among medical students and their educators, and the benefits that narrative research can provide in moving the discipline forward in those areas (Monrouxe 2010; Wilson et al. 2013), although recent scholarship suggests that medical education may be open to embracing these ideas (Molloy and Bearman 2019).

Physical and Occupational Therapy: A Slow and Steady Move to Narrative Methods

Like nurses and doctors, physical and occupational therapists are concerned with patient care. Whereas physical therapists assist clients in treating injury, occupational therapists help clients adapt to changing conditions brought on by medical illness or accidents. Principally, occupational therapists are concerned with helping the client maintain a quality standard of living. Similar to the literature on nursing and medical education, we found a distinct difference between the use of narrative-oriented scholarship in physical and occupational therapy. In our search, we identified 22 results related to narrative inquiry and physical therapy with none from an "I" perspective and 19 results for autoethnography. Many of the results in the two searches overlapped, with few studies actually conducted using auto-ethnography or narrative inquiry.

As a field, physical therapists have only recently considered qualitative research as an alternative to quantitative research (Petty et al. 2012a, b).

Commenting on the challenge presented by qualitative research, Carpenter (1997) noted that, "Physiotherapy has grown – from its roots in massage and remedial exercise – as a practical therapy, and in this sense is empirical in nature. The empiricist's position is that conclusions and beliefs are based on first-hand evidence, observation and experience" (p. 10). Bear-Lehman (2002) added that physical therapists look for "work that is objective and precise, boasts of a large sample size, and has statistically significant findings to share. The implication is that these rigors of strict scientific method are associated with quantitative methods based only on physical properties" (p. 85). However, treatment, especially in physical therapy, is about changing client behaviors as much as it is in treating the injury. Bear-Lehman (2002) noted, "We need to be able to recognize and appreciate why our patients have acted or responded in a certain manner" (p. 85). For her, qualitative research can help physical therapists understand the human impact of the therapies they provide.

As we noted, our search resulted in few narrative inquiry and autoethnographic studies related to physical therapy. Those we did identify were studies conducted by scholars from outside physical therapy. For example, Esposito (2014), who works in educational policy, conducted an autoethnography of living with pain. Zavattaro (2014), in public administration, wrote an autoethnography of almost losing a leg and how it influenced her athletic identity. Walton-Fisette (2017), a professor of physical education teacher preparation, studied her experience of being a runner in pain. Each of these studies was conducted by an academic outside physical therapy but referenced their experiences with physical therapy.

Although a search of occupational therapy showed similar numbers of narrative inquiries compared to physical therapy, we did identify research conducted by occupational therapists from the narrative "I" perspective, particularly through autoethnography. Frank and Polkinghorne (2010) noted that qualitative research emerged in occupational therapy at approximately the same point in time as other areas of human science, although that research was conducted through what they termed the first generation of qualitative research in occupational therapy – ethnography, phenomenology, and grounded theory. A second generation of qualitative research, which includes narrative methods, has begun to take hold in the past decade. Much of this work centers on occupational therapist identity development (Carra et al. 2017).

Carra et al. (2017) conducted a research project with 13 occupational therapist academics drawing from action research, autoethnography, and narrative inquiry. In many ways, their article reflected common themes found among self-study researchers related to the influence that participation in a community of practice has on professional identity. In the study, participants noted that the scholarly community assisted them in constructing and reconstructing identity, helped them develop a more scholarly identity, and informed them of the benefits of collaboration and collegial support in professional development. Had the participants been the authors of the study, the work could have made a substantive self-study contribution to occupational therapy scholarship. Alternatively, the authors, who coordinated the scholarly community, could have conducted self-study research into

their facilitation of the space and how their community leadership and participation informed their practice as occupational therapy scholars.

Finally, we highlight an exemplary autoethnographic study from occupational therapy. Warne and Hoppes (2009) explored Warne's – an occupational therapy student – poignant first experience with a dying patient. They noted that such moments, which Yalom (2008) termed *awakening experiences*, "hold potential to enrich both personal and professional lives" (p. 310). Although the study considered Warne's personal lessons learned from the experience, there were few explicit lessons connected to her practice and identity. And like research previously highlighted in this section, the second author's presence was limited in the study. Authorship was divided, with Warne writing the findings and Hoppes writing the introduction, literature review, methods, discussion, and conclusions. Aside from Hoppes' authorship of these sections, the only mention of him in the study referred to his teaching of a research course in which the study was conducted and the reflection prompted by him and Warne's peers. If this study were to be reframed as self-study, Hoppes' role in the research and interaction with Warne would be enlarged, likely through the use of critical friendship. Additionally, they would have highlighted how the field placement and Warne's interaction with a dying patient helped her reconsider and improve her practice. These authors did note that the experience helped Warne develop "the beginnings of awareness necessary to address the complexities of death and loss" (p. 314). But of particular interest to a self-study scholar would be not only an identification of this awareness but also its translation to occupational therapy practice.

There exist similarities between educators and physical and occupational therapists in that they "usually transition to academia as established practitioners, with strong practitioner identities and limited higher education skills and experience" (Carra et al. 2017, p. 502). For self-study researchers, the common entry points and professional experiences among these fields provide an avenue through which self-study can be introduced as occupational therapists continue to explore their transition into academia and create a more concrete professional identity. Physical therapists likely experience similar dilemmas as educators and occupational therapists in their transition from practitioner to academic; however, until qualitative methods, especially from a narrative perspective, are more widely accepted in the profession, it will be difficult for self-study scholarship to make inroads into physical therapy.

Social Work and Counseling: Exploring Identity and Practice Through Narrative Methods

The final practices of care we consider are social work and counseling. Although there are differences between the two, there do exist some similarities. Both can provide support for individuals, families, and groups, but the counselor focuses more on providing therapy or support to the client, whereas the clinical social worker – who can also provide therapeutic support – is more connected to community

resources, is an advocate for clients, and can pursue social change that can benefit individual clients and broader populations in the longer term. Narrative inquiry has a long history in both fields. In social work, Gorman (1993) argued that emphasizing scientific-oriented scholarship diminished the field, noting, "The process of objectification and abstraction that are required to turn social work into a science have violated social work's philosophical belief in the uniqueness of individuals and have devalued what social work practitioners do" (p. 247). Although narrative inquiry is well-represented in social work scholarship, we found it difficult to identify narrative research from the narrative "I." On the other hand, auto-ethnography has been extensively used, with a range of topics addressed; these include but are not limited to feminist identity (Averett 2009), immigrant identity (Karki 2016), poverty (Krumer-Nevo 2009), and queer studies (Alvarez 2017; Turner et al. 2018).

Before turning to the area of counseling, we highlight one study as an exemplar of autoethnographic social work scholarship and how it might be reconsidered through a self-study lens. Turner et al. (2018) conducted an autoethnography into how microaggressions related to queerness impacted the authors' standing in the academy. In sharing their experiences, Turner and colleagues hoped their scholarship "adds to the discourse on disrupting heteronormative privilege, specifically within schools of social work" (p. 108). Their research effectively highlighted the microaggressions experienced by LGBTQ faculty and doctoral students in social work. From a self-study perspective, their scholarship was self-initiated, qualitative in nature, interactive through the inclusion of three authors, and made visible their methods and data in the pursuit of trustworthiness. However, their work did not have an improvement-aimed focus. Throughout the study, Turner and colleagues identified individual and shared experiences viewed through the lens of micro-aggressions. But they did not consider how their scholarly space helped them make sense of those microaggressions and how their identities and practices were transformed because of these new understandings. Instead, they turned their attention to what social work education and scholarship might accomplish to better support LGBTQ faculty and students and educate heteronormative faculty and students.

Like many other practices of care, narrative inquiry research is present in the counseling literature, though much of it focuses on students or clients. And like other practices of care, autoethnography represents the large majority of narrative "I" scholarship in counseling. As such, we focus on this form of scholarship in our consideration of counseling research. Autoethnography in counseling has addressed a range of topics, including professional moves (Wright 2009), autoethnography as form of therapy (McMillan and Ramirez 2016), teaching counseling (Hargons et al. 2017; McIlveen et al. 2010), and clinical supervision (Borders and Giordano 2016). We focus on one of these studies as an exemplar of autoethnographic scholarship in counseling and how such work might be reframed as self-study research (Wright 2009). In her study, Wright used autoethnography to make sense of her experiences, and the tensions that surrounded those experiences, of moving to a new international context. Her research reflected several concepts used by

self-study researchers, including the notion of a "fragmented self" (Galman 2009), and self-study scholarship on boundary crossing (e.g., Williams 2013; Williams and Berry 2016). However, neither data collection nor its analysis was fully described in the article. As a result, it did not fulfil the criteria of exemplar-based validation (LaBoskey 2004). Additionally, consideration of how the autoethnography helped Wright improve her counseling practice and/or identity as a counseling educator was not addressed. To reframe this research as self-study, further methodological clarity, a search for trustworthiness, for example, through the inclusion of a critical friend or peer feedback, and identifying insights for professional practice, could be made.

As with many of the practices of care highlighted in this section, narrative scholarship is present and increasingly used by social work and counseling scholars to investigate and share their personal and professional experiences. But like many of the practices of care, self-study research is absent in these two areas. However, we see rich opportunities to extend self-study into these areas as there are many overlapping questions related to identity, preparation, and teaching, in both fields. In our concluding section of this chapter, we highlight a number of attempts to introduce self-study into interdisciplinary settings and note other ways in which self-study might be extended into these practices of care.

Moving Forward: How Can We Extend Self-Study Scholarship?

In this chapter, we sought to answer the question of "Who does self-study and why?" As we noted at the outset, the question itself is broad in scope. To provide some boundary to our work, we focused our investigation of the question upon research published in *Studying Teacher Education* and limited our exploration of the self-study "other" to several practices of care (Polkinghorne 1988, 2004). Our intent was not to provide an all-encompassing coverage of the question, but rather to take a careful look at the who, the why, the limitations of, and potential for self-study research in education and other practices of care. In uncovering the "who" of self-study, we found that self-study research in *Studying Teacher Education* is significantly limited by geography and institution and is dominated by a small number of researchers. As we have noted, our review did not take into consideration self-study research published in other teacher education and disciplinary journals as we reserved an exploration of that literature for other chapters in this handbook. What we expressed in the "Who Does Self-Study?" and "Why Conduct Self-Study?" sections of this chapter is limited to *Studying Teacher Education*. Such a review is inherently limiting with research published in a wide range of languages, not just English. Approximately 90% of studies published in the journal are authored by researchers in English-speaking nations, so it may simply be that one's access to and ability to publish in the journal reflects their language of preference. This is not to say that self-study research is not published in other languages, but without an understanding of languages foreign to our own as native-English speakers, it is impossible to fully paint a picture of who conducts self-study and why they do so. But within *Studying Teacher Education* itself,

there have been recent attempts to increase international inclusion in the journal. From 2015 to 2019, articles have been published with English and Spanish titles and abstracts in an attempt to extend readership and authorship into Spanish-speaking nations. In conjunction, Tom Russell, an editor of the self-study journal, led an initiative to compile articles from early issues of the journal, along with new self-study studies conducted by Spanish speakers, into a Spanish-language book (Russell et al. 2016). Ideally, the introduction of Spanish titles and abstracts, publishing a collection of articles in Spanish, and the addition of an editorial review board member from Spain will help extend self-study research into areas of the world where it previously was nonexistent.

We also suggest that self-study scholars seek additional national and international outlets for their work, particularly journals in which self-study has not been previously published. Publishing in these journals can extend the scope of self-study to areas as yet unaware of self-study but can also promote and increase the standing of *Studying Teacher Education*, as noted by journal editor Amanda Berry in the Fall 2018 S-STEP newsletter. To increase the geographic presence of self-study, researchers can continue to present at international conferences outside of the self-study conference, such as the International Study Association on Teachers and Teaching, and organizations affiliated with AERA such as the European Educational Research Association and the World Educational Research Association. Presenting at these conferences and publishing in journals associated with them can extend the presence of self-study far beyond the S-STEP SIG, which can, in turn, encourage self-study researchers not currently publishing in the journal to submit their work for consideration. Such outreach may increase representation beyond the core, five English-speaking nations.

Additionally, if the community of self-study researchers is, in essence, to democratize the self-study scholarship published in the pages of *Studying Teacher Education* and other journals – extending the who of self-study – and shift the use of self-study more widely past education, then the self-study community should consider the responsibility we have as self-study scholars in generating campus-wide, multi-institutional, and transnational spaces for the teaching and learning of self-study (e.g., Pithouse-Morgan and Samaras 2015a; Ritter et al. 2018). We found a wide range of self-study communities of practice in our review of *Studying Teacher Education*; however, they were rather limited to teacher education, though teacher educators like Samaras and Pithouse-Morgan have conducted research with colleagues from noneducation disciplines, and we touch on some of that scholarship below. If we were to extend the presence of self-study beyond education, we would help our colleagues outside education embrace what Sullivan and Rosin (2008) see as a new agenda for higher education. They noted that, "Despite the growing and increasingly consequential 'scholarship of teaching and learning' movement, teaching remains too often a private practice performed by sole academic proprietors, rather than a public and scholarly practice through which insight is developed progressively over time" (pp. 128–129). Their suggestion to address this issue is through the use of cross-discipline faculty development "oriented toward the discovery of common predicaments, common purposes, and new opportunities for

institutional renewal" (p. 128). From their three-person, interdisciplinary community of practice, Ragoonaden et al. (2018) identified potential in broader initiatives. They argued that:

> Campus-wide reflective communities of practice, situated into inquiry-based models, sustained with contributions from interdisciplinary colleagues, can provide spaces where pedagogical practices can be carefully planned, continuously revised, and where curriculum can be re-negotiated according to the plurality of contemporary society. (p. 82)

This form of interdisciplinary professional learning, through the lens of self-study, has been highlighted by self-study scholars in recent years. We briefly identify a few examples. In their work on polyvocal professional learning, Pithouse-Morgan and Samaras (2015b) noted the importance of transdisciplinary learning through self-study. Through a national grant-funded project, Pithouse-Morgan led a group of 40 academics from six South African universities who explored their practice using self-study research. Samaras organized several university-funded initiatives to engage university faculty with self-study, first with 11 university colleagues in learning self-study, next in a 4-person collaborative on self-study and e-learning, and finally a 17-person faculty group on self-study in teaching in digital learning environments. From this work, Samaras published several studies with university colleagues (Samaras et al. 2014a, b). Early in this chapter, we highlighted Ritter's (2017) self-study of teaching self-study to university colleagues. These stories of the teaching and learning of self-study, particularly from transdisciplinary and transnational learning communities, have come together in a recent edited book (Ritter et al. 2018). We encourage those interested in developing their own institutional self-study communities to consider this work. A common thread among these projects and studies is administrative support within a college or institutionally through centers for faculty development (Sullivan and Rosin 2008).

Yet even with administrative and institutional support, the self-study researcher who organizes a self-study learning group must have colleagues in and beyond education that are willing to participate. In recent years, self-study scholars have questioned the appropriateness of the name "Self-Study of Teacher Education Practices" to describe self-study research. As Pithouse-Morgan and Samaras (2015b) asked, "What can other fields learn from a methodology that has been largely used by teachers, for teachers?" (p. 5). With their colleagues, they use the term Self-Study of Professional Practice (SSoPP) to describe self-study as a more inclusive research method. We do not intend to argue for or against a name change in this chapter. That is a more substantive dialogue that must occur among the many who conduct self-study research. However, if we want an answer to the question of "Who does self-study and why?" that more fully encompasses education and those beyond education, we must engage in this difficult discussion and find the ways in which our colleagues and institutions can more fully embrace self-study scholarship as a way to transform professional practice.

in and through the process of S-STTEP. Of particular interest is the shape and form that teacher educator knowledge takes in S-STTEP; how S-STTEP allows us to uncover, articulate, develop, and represent teacher educator knowledge; and how this knowledge is justified. One main distinction guides this review: a view of teacher educator knowledge as a stable quality that individual teacher educators acquire, possess, and perform, in contrast to a view of teacher educator knowledge as that which manifests itself and constantly develops in and through practice. This distinction, as will become apparent, is critical to understanding self-studies of teacher educator knowledge because it represents two different ways of seeing teacher educator knowledge that shape and define who is the "knower" about teacher education and what justifies claims to know something about teacher education (including more conventional conceptions and methods of science and what is often framed as "alternative" research approaches, such as S-STTEP methodology).

Teacher educator · Knowledge · Knowing · Professionalism · Enacted · Practice · Experience

Introduction

This chapter is about what can be known by and about teacher educators and teacher education through *Self-Study of Teaching and Teacher Education Practices* or S-STTEP research. It reviews how teacher educator knowledge is defined in and through the process of S-STTEP. Of particular interest is the shape and form that teacher educator knowledge takes in S-STTEP; how S-STTEP allows us to uncover, articulate, develop, and represent teacher educator knowledge; and how this knowledge is justified. One main distinction guides this review: a view of teacher educator knowledge as a stable quality that individual teacher educators acquire, possess, and perform, in contrast to a view of teacher educator knowledge as that which manifests itself and constantly develops in and through practice. This distinction, as will become apparent, is critical to understanding self-studies of teacher educator knowledge because it represents two different "ways of seeing" (Burke 1935) teacher educator knowledge that shape and define who is the "knower" about teacher education and what justifies claims to know something about teacher education (including more conventional conceptions and methods of science and what is often framed as "alternative" research approaches, such as S-STTEP methodology).

The chapter begins with several excerpts from a self-study of one teacher educator's practice. The excerpts, drawn from the work of Berry (2008), provide a window into conceptions of teacher educator knowledge, practice, and S-STTEP research and also set the scene for what follows in the rest of the chapter. Berry's study analyzes her struggles as a former high school biology teacher transitioning into teacher education. The study not only explores her developing knowledge and

practice as a beginning biology teacher educator but also unravels and documents how S-STTEP methodology allowed her to uncover and build her knowledge of practice as a teacher educator. The excerpts below are taken from Confidence and Uncertainty, where Berry explains explicit modelling as an approach to providing her student teachers with opportunities to learn about teaching practice. Modelling is used here in a double meaning of not only "walking the talk" but also providing a meta-commentary (Wood and Geddes 1999) on practice, opening up the pedagogical reasoning, thoughts, and actions underlying practice as a teacher educator (Loughran 2007; Bullock 2009).

One way that Berry chooses to open up her practice for scrutiny and dialogue with student teachers is through keeping an Open Journal, that is, an electronic journal made available to the student teachers in her class that documented her purposes for each biology method session, her observations of how these purposes actually worked out in class, and how her experiences in turn helped to inform her thinking about purposes, practices, and processes of learning and teaching about teaching biology. Berry starts by sharing with the reader two entries from her Open Journal during the first week of her biology methods class:

> (Entry written prior to method session)
> I have been in two minds about how to proceed this week. First, it would be helpful to continue exploring the idea of living and non-living and to look at how possibilities from last week's session might be followed up in the classroom. In other words, if the teacher has generated confusion and questions (as I did) then how might the teacher move on from that point to help students start to organize their knowledge about that idea? However, on the other hand I feel like it is a bit soon to proceed with resolution of these ideas just yet. Presenting the samples of materials and encouraging question generation is a good teaching approach in itself because it aims at exploring students' knowledge rather than the teacher's knowledge, and that is a message that I wish to encourage in thinking about teaching. I'm also hoping it will provide a model for how the group will go about their 'interview with a student' assignment [Assignment in which prospective biology teachers interviewed middle school students about their understanding of a biological concept]. It is important to gently probe someone's thinking rather than closing in on one right answer, if you want to get an accurate idea about that person's thinking. . . I am aware that I am trying to do this, but how clear is my intention to the group?? I wonder whether anyone has followed up on the idea of living or non-living?? How much does it matter amongst other competing concerns??
> (Entry written after the session)
> It was fantastic today to have spontaneous discussion about whether people had gone off and talked with others outside uni[versity] about the meanings of living and non-living. I was so pleased that this discussion wasn't initiated by me and it was something that provoked a response in a few people e.g., one person consulting a text and another discussing with a friend. It would have been worth pursuing, but I didn't, to find out what motivated some to continue to think about the issue while others forgot it as soon as they left the room. (Berry 2008, p. 72)

Berry unpacks the meaning of these journal entries in the paragraph that follows:

> In the extract (above) I publicly wrestled with the issue of how to deal with the confusion that I had purposefully generated in the previous week from asking students to identify a selection of objects as "living" or not. I could help students resolve some of their ideas

through further discussion and questioning, or I could use these experience as a way of modelling an approach to eliciting learners' different ideas, and not worry about taking it any further. Either way enabled me to model a constructivist approach to learning – although different aspects. In the end, it was the enthusiasm of a few students who sought to resolve their own confusion that led to a whole group discussion about the meaning of the word "living". (Interestingly, I did not use this experience as a means of helping students to consider the process of learning that they had engaged in.) (Berry 2008, p. 73)

Another approach that Berry used to provide student teachers with opportunities to learn about practice through explicit modelling was through "thinking aloud" (Loughran 1996) during her biology method classes:

My decision to make explicit my thinking was based on the idea that the problematic nature of teaching needs to be highlighted in teaching about teaching in order for careful attention to be paid to the pedagogical reasoning which underpins practice. In other words, if teaching is understood as being problematic, then in order for learners of teaching to more fully grasp the nature of the problematic, teacher educators need to articulate and explicate such situations in their own teaching. In that way, prospective teachers might begin to access, and better understand, the ideas and actions that emerge in considering teaching as problematic. This might then be a starting point for prospective teachers to begin to recognize and access the knowledge on which practice is based – but that is not always explicitly seen or understood. However . . . Even though I have identified that articulating my thinking about teaching during the act of teaching is an important goal of my teaching, I have also found that this is not an easy goal to "live" as a teacher educator. I am not always consciously aware of my actions, in action, nor am I able to readily articulate my pedagogical reasoning on the spot. Usually, there is a multitude of thoughts running through my head as I teach. How do I know which of these is useful at any particular time to select to highlight for my students? (Berry 2008, p. 75)

Berry shared her reflections about "thinking out loud" about her teaching with one of her student teachers, Lisa, via email. Lisa responded in the following way:

From: Lisa
    To: amanda.berry@education.monash.edu.au
    I think it was important for us to trust that you would be able to teach us well . . . opening up your vulnerability and uncertainty about things was unsettling for many . . . It was like 'whoah! She doesn't know what she's doing all the time – holy hell! – what hope have we got? (Berry 2008, p. 75)

Further reflecting on this situation led Berry to recognize differences between the teacher educator's perceptions of her role and the student teachers' perceptions of the teacher educator's role:

Lisa helped me to learn that in choosing to make my thinking about my teaching available, some prospective teachers experienced a loss of confidence in my ability to successfully guide their development. Their views of my role were not compatible with the role I was enacting. (Berry 2008, p. 75)

In these excerpts, we see a former high school biology teacher in the first weeks of her biology methods class as a teacher educator. She is exploring different ways to

invite student teachers into her pedagogical reasoning as a teacher educator. We also see a researcher trying to analytically make sense of the tensions and problems she encounters in her practice as a beginning teacher educator. In our analysis, Berry's work shows the potential of S-STTEP methodology to open up and unpack the nature and shape of teacher educator knowledge as tacit, complex, often contradictory, situated, relational, and moral. It is knowledge that has arisen from and is shaped by her present and past circumstances, actions, and experiences in particular contexts which themselves carry meaning for Berry. We only see a glimpse of that broader context in the excerpts above, but the larger book publication, from which these excerpts are taken, includes important elements of Berry's biographical experiences as a former biology teacher, the teacher education curriculum that comprises this biology methods course, the particular student teacher population and where these student teachers are at in their development, etc. Berry's decision to model a socio-constructivist approach to teaching and learning in her practice reveals something of her personal ideas about good teaching and what she stands for as a teacher educator. Her developing teacher educator knowledge can be discovered both in her actions and in conversation and reflection about those actions (i.e., in an Open Journal). The knowledge she uses as a basis for her actions is also continuously shaped by her actions and reflection on those actions. Action here is used a pars pro toto term to refer to all that makes up the practice of teacher education, including its planning, teaching, and evaluation. It shows how her knowledge as a teacher educator is not purely technical or a straightforward application of research-based theory to practice. Rather, it is found in what Schön (1983) labelled the "swampy lowland where situations are confusing 'messes' incapable of technical solutions" (p. 42). It is the capacity to judge when to act and how to act in light of the learning and development of a particular group of student teachers, here and now, while lacking an ultimate ground from which to predict or determine the "rightness" of actions and its effects (see also Kelchtermans 2009).

The excerpts from Berry's (2008) study bring to life just one example of the many possible ways of doing S-STTEP (i.e., through documenting and problematizing practice via reflection and journaling) and doing teacher education (i.e., a socio-constructivist approach to teaching and teacher education). Following Kelchtermans (2015), we do not conceive of Berry's work to serve as an "example of good practice" that sets a normative example of S-STTEP or teacher education practice to be copied or followed. Rather, we envision it to be a "good example of practice" with "good" referring to the way her practice is (re)presented. Berry's study does not just describe what is happening in her practice but also includes tentative explanations of why that might be happening, including her continuing struggles, questions, various attempts and decisions, and her developing learning, understanding, and knowledge as a teacher educator. In so doing, her work entails a call for professional dialogue. She addresses her readers as colleagues and fellow professionals, and invites them to think along (using the understandings and insights offered) and link the presented experiences and knowledge to their own professional context and practice settings, rather than "setting and imposing the norm (dictating what is good or best to do)" (Kelchtermans 2015, p. 364). The excerpts contribute to our

understanding of the nature and form that teacher educator knowledge takes in S-STTEP by unravelling the complex interplay between personal experiences, beliefs, practice, theory, research, and professional context.

In this chapter, we review conceptions of teacher educator knowledge as they are defined in and through the process of S-STTEP. In particular, we are interested in the shape and form that teacher educator knowledge takes in S-STTEP; how S-STTEP allows us to uncover, articulate, develop, and represent teacher educator knowledge; and how this knowledge is justified. We shall return to Berry's study throughout the chapter to illustrate the conceptions and properties of teacher educator knowledge as they appear in and through S-STTEP.

Berry's Study as a Window into Teacher Educator Knowledge, Practice, and S-STTEP Research

Returning to the excerpts from Berry's (2008) work, we are offered insights into one teacher educator's knowing-in-action (Schön 1995). This kind of knowing is "built into and revealed by our performance" (Schön 1992, p. 124). Just as Schön (1992) argued, it is very difficult or nearly impossible to put into words all of one's understandings and knowledge of one's work. As Berry (2008) indicated, "I am not always consciously aware of my actions, in action, nor am I able to readily articulate my pedagogical reasoning on the spot" (p. 75). Yet, her actual actions and decisions in practice manifest and reveal a great of deal of knowledge about teaching and teacher education.

The excerpts reveal a teacher educator who is very much pondering, deliberating about alternatives, doubting about what to do next, and questioning the effectiveness of what has been done. The entries in Berry's journal remind us of the two phases of reflective thinking identified by Dewey (1933): an initial state of doubt, hesitation, or perplexity that originates thinking and the second related phase of searching or inquiring in an effort to manage or settle doubt and uncertainty. This is not a teacher educator who is fully in control of the effects that her actions will take in practice or who works from a clearly defined or research-based plan that is fully laid out in advance and then carried out accordingly, in action. The tentative wording Berry uses in the excerpt supports this assertion: for example, "I think," "I feel," "I struggle," "I did not know." We see a teacher educator who is continuously making decisions about how and when to act in support of the learning and development of her student teachers while lacking an ultimate "high, hard ground" (Schön 1987, p. 187) to base her decisions for action or a definite guarantee of where those decisions might lead, both in the immediacy of this situation and in terms of their effects more broadly (see also Kelchtermans 2009). Put differently, the problems of practice this teacher educator deals with cannot be fully resolved through the application or modelling of research-based theory and interventions ("best practices") in her practice. Returning to Schön's (1987) analogy of the high ground and the swampy lowland, Berry is immersed in "messy confusing problems (that) defy technical solution" (Schön 1987, p. 187), relying on her personal understanding of meaningful teaching and teacher education to respond to the unique and always changing needs of her student teachers.

If we look in more detail at the kind of decisions she makes in her practice, we notice that these are not just technical decisions. Answering the question of how to proceed as a teacher educator implies taking a stance (Kelchtermans 2009), that is, making a choice – albeit often not felt consciously – for a particular set of norms and ideas about good teaching and teacher education and dismissing others for very good reasons (see also Nias 1999). For instance, her decision about whether to resolve student teachers' confusion around defining the concept of "living and nonliving" after the first week of class might seem like a technical decision about what instructional interventions, strategies, or activities to use at first, but actually hides questions of her purposes and goals. Teacher educator knowledge, as revealed in this teacher educator's practice, is "knowing how to act" in the pursuit of educational goals which one finds meaningful and defensible in light of a particular group of student teachers, in particular stages of their learning and development.

It is quite difficult to capture the knowledge involved in this practice in general terms. The knowledge is bounded by the particular situation in which it is enacted and the others – mainly student teachers – present in that situation. If we try to build an understanding of the kind of knowledge implicit or embedded in this teacher educator's actions, it is not enough to just look at the teacher educator by herself. Berry is not the only one in the practice setting giving meaning and purpose to what is happening. The excerpt also entails a view of the teacher educator in a relationship with student teachers, whereby the student teachers are not simply receivers of information about biology teaching but also producers of meaning for themselves and actively making sense of what is happening. The meaning of this teacher educator's actions is not predetermined, and the "success" of the chosen courses of action to support her student teachers' learning about teaching can only be partially anticipated because it depends on what plays out with her students in the context of the moment. She cannot control the meaning that her carefully designed teaching activities will have in the actual classroom situation as teacher education practices by definition involve others – student teachers – who do not passively undergo the experience but actively make sense of the experience. Lortie (1975) referred to this phenomenon using the term "apprenticeship of observation" by which he showed that student teachers have developed their own image of what it means to teach from their long histories as classroom audience which acts as a lens through which they make sense of the experiences offered to them in the teacher education program. Teacher educator knowledge is, as Fenstermacher (1994) argued for teacher knowledge, related to "how to do things, the right place and time to do them, or how to see and interpret events related to one's actions" (p. 20).

The dependence on the relationship with student teachers to achieve results – understood broadly – is what sets the teaching and teacher education profession, and the nature of the knowledge involved, apart from other professions. Drawing on Fenstermacher's (1990) work on the fundamental relational nature of teaching, Labaree (2000) contended that "a surgeon can fix the ailment of a patient who sleeps through the operation, and a lawyer can successfully defend a client who remains mute during the trial, but success for a teacher depends heavily on the active cooperation of the student" (p. 136). A similar contention could be made about a therapist who requires the client's willingness to be successful. The connection between Berry's actions – like any teacher

educator's actions – and student teachers' learning and development is uncertain. The knowledge under study in Berry's work is thus not an individual attribute but a socio-relational accomplishment that is continuously shaped and reshaped through the actions that she takes in response to the needs of the particular practice situation in which she finds herself and the others (her student teachers and the future children in their classrooms but also teacher educator colleagues, etc.) present in that situation.

The shape and form of teacher educator knowledge under study in Berry's work – tacit, contradictory, personal, situated, and relational – also ties into the specific research approach observed in the excerpts. In these excerpts, we see a teacher educator who appears less concerned with building her own technical proficiency or trying out new interventions and monitoring their effect, as a teacher educator taking the freedom to concern herself not only with the questions "How can I make my practice more purposeful and effective?" and "How can I update my knowledge of effective teaching?" but also questions like "What do I actually want?"; "What kind of teachers do I aim to develop?"; and "Why do I believe that is important?" Questions such as these are not mere empirical questions that can be resolved on the basis of strong research evidence or the "knowledge of science" (see also Schön 1983). Rather, these questions of value and purpose require introspection; a search of values, beliefs, and purposes; and inquiry into what one does and why one does it that way, of what one knows and understands, of where and how one acquired that knowledge, and of the level of consistency incorporated into the above.

The excerpts only show us a glimpse of a much more encompassing S-STTEP project, but even in its entirety, the project does not seem to result in clear-cut rules and guidelines for future practice. At the very most, this teacher educator got an indication of the many factors which contribute to the gap between intention and reality in her efforts to educate these future teachers, an awareness of the fact that even the most carefully thought-out practices have a number of unintended side effects and, above all, an awareness of the fact that she actually does not know or cannot explain all that is happening in her practice, because it is the specific circumstances and interactions that shape and determine the outcomes. In our terms, Berry's work opens up an understanding of teacher educator knowledge as messy more than tidy, moral more than technical, situated more than general or context-free, constantly developing more than static, and relational more than individual, which we will explore further in the next section. Again, we are not claiming generalization from this one teacher educator's practice, but we point to a way of thinking or "seeing" teacher educator knowledge and how it is constructed, developed, and represented in and through S-STTEP.

"Ways of Seeing" Teacher Educator Knowledge

Although teacher educators were once recognized as an "ill-defined, under-researched and sometimes beleaguered occupational group within Higher Education" (Menter et al. 2010, p. 124), research focusing directly on teacher educators is proliferating over the past two decades. Agreement is building around the fact that

the work of educating teachers requires "knowledge, skills and beliefs which are qualitatively different from those developed as an experienced classroom teacher" (Vanassche et al. 2015, p. 344; see also Vanassche 2014). Teacher educators' centrality in the pedagogies and practices of initial teacher education is brought into relief yet, at the same time, also brought into question.

Based on the premise that teacher education quality is directly linked to teacher quality, it has been assumed that strengthening the quality and credentials of teacher educators is the path to more effective teacher education programs in order to enhance overall teacher quality. In many countries, this assumption is met with the development of professional standards for teacher educators, following the widespread model of standards for teachers (see a.o. the United States, Turkey, Germany, Flanders, the Netherlands, Ireland, Australia). Koster and Dengerink (2001) summarize the rationale underpinning the adoption of teacher educator standards: a professional standard benchmarks the minimum levels of achievement for teacher educators; it makes clear what they should know and be able to do; it offers an instrument for their professional development; it helps individual teacher educators to analyze their own strengths and weaknesses; and it guarantees a level of quality in teacher education, especially when standards are combined with certification or registration processes, as is the case in the Netherlands. Koster and Dengerink (2001) wrote with the Dutch teacher educator standards as their frame of reference, but their arguments speak to the standards already in place in other teacher education settings or are being used to build a case for the development of standards in settings that do not have these yet. Teacher educator standards serve to "share a knowledge base" (European Commission 2013, p. 16) and are seen as "fulfilling an 'ethical obligation' to be precise about teacher educators' work" (p. 16), an ethical obligation not just to teacher educators themselves but also to student teachers and the children in their future classrooms and government funding invested in the educational enterprise.

The fact that teacher educators have their "own" standards is applauded on many sides. Advocates for the application of a uniform standards framework claim that such standards will improve the standing of the profession particularly in the view of the public and upscale the knowledge invested in the work. However, we argue that professional standards also represent a particular – and one could argue a predominant – "way of seeing" teacher educator knowledge. As Burke (1935) states: "every way of seeing is a way of not seeing" (p. 49). The thrust of Burke's argument is that every understanding also in part relies on a certain degree of blindness or that every reflection of reality by its very nature is also a deflection of reality. In our terms, professional standards attend to particular aspects of teacher educator knowledge and elide other aspects of that knowledge which we explore in more detail below.

Professional standards "see" teacher educator knowledge as an individualist notion or attribute and speak to a more technicist model of teaching and teacher education. The emphasis is on developing and maintaining teacher educators who know "what works" and who know how to reproduce "what works" in their practices and pedagogies with student teachers. According to this line of logic, knowledge is something that individual teacher educators acquire, possess, and then perform with

their student teachers. In this regard, it is a state to be achieved (i.e., a teacher educator who is "knowledgeable" about subject matter, effective instructional and assessment strategies, mentoring, etc.). When knowledge is seen as a quality that an individual teacher educator acquires, possesses, and performs, it can also be mapped or assessed to see how much knowledge one has and how skilled one is at deploying that knowledge in practice. An example can be found in the Netherlands where the Association of Dutch Teacher Educators, with the financial support of educational authorities, derived a certification procedure from the standard contending that "to serve the goals of quality assurance and professional development the standard itself was not enough" (Koster and Dengerink 2008, p. 139). Experienced teacher educators can deliver evidence of how their knowledge and performance "measures up" against the standard in a portfolio and become certified for four years by the professional association; beginning teacher educators can "formulate their intention to acquire the competencies expressed in the standard" (Koster and Dengerink 2001, p. 347).

By selecting the individual teacher educator for attention, this conventional way of seeing also generates an understanding of teacher educator knowledge as untied to time and space. While research warns us against the claim that there is a recipe book to teaching, still the discourse of standards evokes the notion of general, context-free knowledge that can be transferred from one situation to the next. From such a view, knowledge moves with the competent individual from one situation to another. For example, once a teacher educator has successfully acquired the standard of "supporting, using and conducting research that informs the field" (Association of Dutch Teacher Educators 2016) and demonstrates an ability to bring to bear that knowledge into practice, one assumes that the teacher educator has acquired the standard and that the specific knowledge that undergirds it can occur context-free, regardless of the practice setting. In reality, a teacher educator's ability to perform research is shaped by a variety of considerations, including the available resources (in terms of time, funding, and staff) to conduct research, the overall workload, the meaning and appreciation of research in work remit (that might be different in different "types" of higher education institutions), the research culture in the team, and a multitude of other aspects that are tied specifically to the context of the teacher education setting in which a teacher educator lives his/her professional life. The same can be argued about the standards of "daring to take risks and initiatives" and "standing by one's views and argue them convincingly" (Koster and Dengerink 2001). As Vanassche and Kelchtermans (2016) have demonstrated in their narrative analysis of teacher educators' professional development, the ability to develop and sustain one's own pedagogical vision and the professional courage to take risks and initiatives depends on the quality of the collegial relationships in the team and the fit between one's personal value and belief structures and those operating on the program and institutional level. If "standing by one's views and argue them convincingly" (Association of Dutch Teacher Educators 2016) implies a – covert or public – critique of the dominant curriculum policy in the program, this can induce a sense of vulnerability (Kelchtermans 2009) in teacher educators that may deeply affect their opportunities to develop professionally and take risks and initiatives.

A conception of teacher educator knowledge as individualist, technicist, fairly stable, and context-free also shapes and defines who is the "knower" about teaching and teacher education and what justifies claims to know something about teaching and teacher education. According to this line of logic, the "knower" is in essence the author of the professional standards – in most cases a group of researchers, policy-makers, or "expert" teacher educators – and individual teacher educators by virtue of adherence to these standards in their personal pedagogies and practice. Standards list and prescribe the knowledge that individual teacher educators need to master, or at least actively work toward, in order to legitimately consider themselves "professional" teacher educators (Kelchtermans 2013). The claims that justify what teacher educators *should* know and be able to do – the imperative revealing the normative orientation of this way of seeing teacher educator knowledge – come from scientific research programs that seek the determinants (or variables) of effective teaching and teacher education and build a knowledge base for use by teachers and teacher educators.

This ties in with more conventional conceptions and methods of science that clearly distinguish the researcher from the researched, or "the knower" from "the known." The relationship between research and practice, or knower and known, is portrayed as existing in a technical, linear, and fairly direct "cause and effect" relationship: accumulating through scientific study the distinctive knowledge base for teacher education, and then codifying the accumulated knowledge and having teacher educators successfully import these in their day-to-day pedagogies and practices, it is assumed, would be our best indicator of good (effective) teaching and teacher education. In Clandinin and Connelly (2000) terms, this way of seeing teacher educator knowledge concerns knowledge *for* teacher educators as opposed to knowledge that is expressed in and results *from* teacher educators' own experiences and practices. In Schön's (1987) terms, professional standards emphasize technical rationality that views "practitioners as instrumental problem solvers, who select technical means best suited to particular purposes. Rigorous professional practitioners solve well-formed instrumental problems by applying theory and technique derived from systematic preferably scientific knowledge" (pp. 3–4). Rather than giving central stage to the pedagogical tact (Van Manen 1991) and practical wisdom (Furlong 2013) of teacher educators to decide on how to best proceed with a particular situation, this way of seeing contends "there is or should be a best particular way of doing something" (Osburn et al. 2011, p. 213), what Campbell et al. (2004) have referred to as "the pedagogical equivalent of painting by numbers" (p. 13). It is also from this logic that one often discusses the "effectiveness" of teacher education and uses terms as "best practices" and related variants of "evidence-based teacher education" or "research-informed teacher education" as proxies of quality.

Although the standards are intended to support the professionalization of the profession and preserve professionals' control over their own profession, it has been argued that such initiatives have "to all intents and purposes, swept away such conceptions of professionals' autonomy and control over their work-related remits and roles" (Evans 2008, p. 24) because the delineation of the profession, who is

designated as professional, and what is defined as valuable knowledge and practice, comes from elsewhere, that is, the research community, policy-makers, or professional associations (depending on the authorship of the standards). Even standards which are clearly developmental in that they are owned by the profession and aim to serve the profession, in practice, often function as regulatory standards that "remove autonomy and limit diversity of practice . . . and focus on the technical demands of teaching" (Bourke et al. 2018, p. 84). The distinction between "development" and "regulatory" standards is borrowed from Mahony and Hextall (2000) who examined trends of increased control and new managerialism in teacher education and professional development, and explored the impacts of these trends on the shape of the profession.

While S-STTEP research could reflect this way of seeing and studying teacher educator knowledge, we believe the excerpts from Berry (2008) and other work from the S-STTEP research community complicate this way of seeing teacher educator knowledge as individualist, technicist, context-free, and stable. S-STTEP challenges the idea of generic abilities and generically competent teacher educators and the sharp distinction between producers and consumers of knowledge. S-STTEP focuses on conceptualizing what is actually happening in practice and *why* that might be happening, as opposed to normative definitions of what should happen in that practice (e.g., in terms of lists of required competences or standards). As Bullough (1997) noted, answering the question why things happen the way they do "necessitates a two-phased response, beginning with practice and ending with principles, guiding assumptions or fundamental beliefs, which, hopefully, wraparound and inform and sustain [one's] practice" (p. 13). It is our contention that S-STTEP offers both a conception of and a methodology to tap into teacher educator knowledge as that which is enacted in practice, while engaged in one's professional activities, as constantly evolving and developing from experience, and as situated in a particular context (Evans 2008; Vanassche and Kelchtermans 2014; Vanassche et al. 2019). Again, going back to Bullough (1997), "principles emerge from practice; we practice our principles, and in practicing and confronting our limitations often we discover just what those principles are" (p. 13). Or, referring back to the title of Bullough's (1997) chapter, *Practicing Theory and Theorizing Practice in Teacher Education.* Underpinning S-STTEP methodology is a conception of *enacted* teacher educator knowledge, giving center stage to the patterns of knowing revealed in the actions, judgments, and deliberations made in workaday practice, as opposed to a conception of teacher educator knowledge as what is *demanded* from teacher educators by reference to professional standards (Vanassche et al. 2019). Here, knowledge is not a fixed state that can be achieved, but something that constantly develops from and through experience, and that is enacted – and only becomes "real" or "visible" – in practice.

Returning to Berry's (2008) study, we note that it is conceptualized within such a view of teacher educator knowledge as complex, dynamic, personal, situational, and tacit since it is only visible in, and realized in, practice. Her account of practice – we emphasize just one account of practice and not the only account of practice – questions the instrumentalism of technical rationality (Schön 1987) through opening

up the uncertainty, instability, conflict, and uniqueness that characterize teacher education practice. Implicit in Berry's excerpts is a conception of teacher educator knowledge not as "the application of scientific theory and technique to the instrumental problems of practice" (Schön 1987, p. 30), but theoretical knowledge of her work is brought to life through her actions in practice. These actions do not appear to be governed by specific rules, nor does she have a straightforward way to determine which actions are more or less appropriate to pursue in the given circumstances. General descriptions of and for teacher educators' work, for example, in terms of standards, cannot do full justice to the complexity that characterizes this practice. The pondering of this teacher educator appears to show that there is no universally verified set of best practices that could govern her actions in the particular and unique circumstances in which she finds herself. As Evans (2007) argued, the question of what qualifies as best of the best "is specious and in many ways unanswerable: Best at what? Best for whom? Best under what set of circumstances? And so on" (p. 554). The generic term "circumstances" in Evans' argument refers to questions of purposes, goals, relationship, and contexts which very effectively rule this teacher educator's behavior. The S-STTEP community has provided convincing evidence that teacher education should not and cannot be understood as the technical application of knowledge to practice, but pedagogy actually requires improvisation, tact, discretion, and judgment enacted within a specific context (Van Manen 1994). We are reminded of Dewey's (1958) discussion of the artistry of professional practice by which he referred to a professional deeply engaged in his/her job, committed to do well and finding satisfaction in it, and "caring for his materials and tools with genuine affection" (p. 5). "It is knowledge that reflects the individual's prior knowledge and acknowledges the contextual nature of that teacher's knowledge. It is a kind of knowledge carved out of, and shaped by, situations" (Clandinin 1992, p. 125). It is "a dialogue of thinking and doing through which I become … more skillful" (Schön 1987, p. 31).

From this follows that the competence of any teacher educator is likely to vary from time to time and situation to situation, and that mastery of teacher educator standards and the knowledge written into these standards in itself is not enough to predict successful or effective performance. A further example of this contention is found in the self-study research of Bullock (2012a) who studied his developing pedagogy of supervising student teachers undertaking their practicum. Many of the student teachers who were assigned to him were pursuing training in subjects which were outside his areas of expertise (i.e., physics and mathematics). Not having familiarity with the subject matter (which is a key component in most existing teacher educator standards; see, e.g., "demonstrating appropriate subject matter" in the framework from the Association of Teacher Educators in the United States or "teacher educators are able to acquire and maintain knowledge and skills to do with their own discipline" in the standards developed by the Dutch Association of Teacher Educators) led Bullock to question the extent to which he could contribute to the improvement of the quality of these student teachers' practicum learning. Through a content analysis of his journal, however, he found that he shifted focus from his concern with having sufficient subject matter to support student teachers to

recognizing the critical role of the relationship between the student teacher and the supervising school teacher and his understanding of that relationship:

> I failed to account for the influence of power dynamics on the development of teacher candidates' knowledge. I assumed that teacher candidates would be interested in trying new teaching strategies on their first practicum. Instead, teacher candidates used teaching strategies designed to fit in with the perceived expectations of their associate teachers [supervising teachers in schools]. (Bullock 2012a, p. 149)

Bullock (2012a) learned through his self-study of practice that maintaining productive working relationships between the school and the university and the fit between theory espoused in the program and theory used in school is as important – if not more important – in practicum learning than the teacher educator's subject matter knowledge and pedagogy brought to bear on the post-lesson observation debriefs.

Embracing a view of enacted teacher educator knowledge figures into a different conception of science and the relationship between science and practice. One way of considering the difference is in Bruner's (1986) distinction between what he called the paradigmatic, or logico-scientific, mode and the narrative mode. The logico-scientific mode "deals in general causes . . . and makes use of procedures to assure verifiable reference and to test for empirical truth. Its language is regulated by requirements of consistency and noncontradiction" (Bruner 1986, p. 13). The narrative mode, in contrast, leads:

> to good stories, gripping drama, believable (though not necessarily "true") historical accounts. It deals in human or human-like intention and action and the vicissitudes and consequences that mark their course. It strives to put its timeless miracles into the particulars of experience, and to locate the experience in time and place. (Bruner 1986, p. 13)

These two modes of thought capture well what we have called two "ways of seeing" teacher educator knowledge and the relationship between the knower and known that constitute these, as well as the power imbalances between the two logics. The former, logico-scientific mode, underpins what was previously referred to as a conception of demanded knowledge and carries "a stamp of approval" (Osburn et al. 2011, p. 126) that prematurely closes the debate on what teacher education should work toward (i.e., the goals of teacher education and related definitions of "good," "adequate," or "less adequate" teacher education). However, following Osburn et al. (2011):

> we argue that neither the validity, nor effectiveness, nor the 'best-ness' of an action or idea or policy is assured simply because it is purported to be a 'best practice'. Similarly, the potential excellence of an idea or action is not nullified because it has not been endowed with the 'best practice' sobriquet – although lacking the designation may very well cause it to be rendered suspect, accorded lesser status, or go unnoticed or unused by some. (p. 216)

The narrative mode maintains such a view of knowing as personally situated and demands attention to the concrete, particular, and situational aspects of knowing

denied by the logico-scientific mode. It also redefines the relationship between the knower and the known, or more precisely, it redistributes power between different "groups of knowers" in (research on) teacher education (i.e., researchers of teacher education and teacher educator researchers) which has important emancipatory consequences for the teacher education profession. From a conception of enacted teacher educator knowledge, and the associated narrative mode, the critical objective of teacher educator knowledge research is "*not* for researchers to know what teachers [teacher educators] know, but for teachers [teacher educators] to know what they know" (Fenstermacher 1994, p. 50, emphasis in the original). As Elbaz (2018) argued, "knowledge is power, to see oneself as holding knowledge is also to see oneself differently in relation to existing sources of power" (p. 165).

It is our contention that S-STTEP methodology has the capacity to open up the complex, moral, relational, and contextualized knowledge of teacher educators and to share this knowledge with the broader community. In the next section, we consider how the nature and characteristics of S-STTEP as a research methodology and form of knowledge making allow for such a close, interpretative, and contextualized analysis. We draw on examples from recently published S-STTEP research to illustrate our analysis. Again, these examples have not been selected to set or impose the norm for "good S-STTEP" (or "good teacher education"). But by carefully describing what is happening in actual self-studies of teacher educator knowledge and providing insight into the factors and processes that contribute to teacher education practice, we aim to deepen our understanding of practice and, simultaneously, deepen our understanding of the "kinds" of knowledge that are produced through S-STTEP methodology and its supporting grounds.

How Does S-STTEP Methodology Enable the "Making" of Teacher Educator Knowledge?

Given our view of teacher educator knowledge as constantly evolving and developing in and through experience and practice, then how does S-STTEP methodology enable the "opening up" and "making" of that knowledge? Embedded in the phrasing of the question is the claim that S-STTEP is not a methodology to represent or infer knowledge per se, but is primarily concerned with the making of that knowledge. For this reason, S-STTEP is recognized as not only a research approach but also a way for teacher educators to support their own professional learning and development through making explicit and empirically validating their knowledge of practice. In what follows, we identify characteristics of S-STTEP methodology that contribute to this way of seeing teacher educator knowledge and illustrate these characteristics with examples of recent work from the S-STTEP community. These characteristics are informed by and build upon the characteristics of S-STTEP research design identified by LaBoskey (2004) in her foundational contribution to the first *International Handbook of Self-Study of Teaching and Teacher Education Practices* and attempt to reconstruct the methodological nature of the work that followed since then, including the edited volume *Self-Study Research Methodologies*

for Teacher Educators (Lassonde et al. 2009) and Vanassche and Kelchtermans's (2015) systematic review of S-STTEP research. Here, we draw from those characteristics associated with the uncovering and making of teacher educator knowledge. In line with the "good examples of practice" philosophy detailed above, we have selected our examples not because they profile success stories but because they provide rich insights into "what is going on in the practice" and "unveil the why of particular practices" (Kelchtermans 2015, pp. 364–365). In so doing, the characteristics of S-STTEP methodology are brought to life as they are practiced and (re) shaped by teacher educators in their particular settings:

- S-STTEP starts and ends with teacher education practice.
- S-STTEP speaks to a broad understanding of "improvement" in teacher education.
- S-STTEP is situated inquiry.
- S-STTEP is intentional and reflective.
- S-STTEP is interactive.

S-STTEP Starts and Ends with Teacher Education Practice

Typically, S-STTEP research begins with a question, or a concern, about the teacher educator's own practice. It arises out of the specific context and practice of the teacher educator and aims for developing an understanding of practice within its context that ultimately helps to inform the improvement – broadly understood – of "the experience of teacher education" (Berry 2004, p. 1308). As LaBoskey (2004) noted, "we feel responsible for the immediate implementation of any new understandings that result from our research" (p. 818) which also implies that the rationale for S-STTEP research "needs to extend beyond the epistemological into learning theory, beliefs about the nature of teaching, and moral, ethical, and political values regarding the means and ends of education" (p. 818). Knowledge becomes visible as practice (what we do) is studied and unpacked and includes the perceptual elements of that practice (how we feel) as well as the conceptual (how we think). In this way, S-STTEP methodology is about seeking to understand and conceptualize what actually happens in practice and why that might be happening; it's about answering the question of how we think about our practice and why and if that practice should be changed and why that change might be desirable. It includes, but is not limited to, one's goals, aspirations, or ideals for practice as a teacher educator.

Practice, in this sense, encompasses the immediate and present as well as past experiences, including biography (how one learned to teach) as well as understandings about teaching, learning, and "self" that have been derived through practice. For example, Williams and Hayler's (2016) book, *Professional Learning through Transitions and Transformations: Teacher Educators' Journeys of Becoming*, is a collection of contributions from teacher educators investigating their developing understandings of their practice through S-STTEP research over time. It includes Kitchen's (2016) 15-year study of his efforts to improve his use and understanding of

"relational teacher education," a term he coined "to convey my approach, which is informed by Rogers' 'helping relationships' and Hollingsworth, Dybdahl, and Minarik's 'relational knowing'" (p. 195) and how it has informed his ways of being and becoming as a teacher educator. "Throughout my career, I have collected data on teacher candidate learning with a view to improving my responsiveness" (Kitchen 2016, p. 174).

Reflecting on, in, and following action is where knowledge is also shaped and developed. Hence, S-STTEP methodology draws significantly on Donald Schön's (1995) work on professionals' learning in and from their personal experiences of practice which, in turn, builds on and extends Dewey's notion of inquiry:

> In the domains of practice, we see what John Dewey called inquiry: thought intertwined with action – reflection in and on action – which proceeds from doubt to the resolution of doubt, to the generation of new doubt. For Dewey, doubt lies not in the mind but in the situation. Inquiry begins with situations that are problematic – that are confusing, uncertain, or conflicted, and block the free flow of action. (Schön 1995, p. 9)

Along similar lines, North (2017) stated that "it may be that reflection-in-action requires a level of attention which disrupts the teaching act" (p. 392). S-STTEP in the same way is intentionally destabilizing. Drake's (2016) inquiry into his mathematics teacher education practice highlights this issue of deliberating between alternatives that emerge through the practice context and through the S-STTEP process:

> I sometimes found that I was conflicted about which of the multiple possibilities to address, so my problem became "what is the most important issue right now?" – what is stopping this activity from progressing the way it is intended, what actions of the (pre-service teacher) or students may be contributing to this, and are the actions of the (pre-service teacher) leading to high engagement in rich mathematical learning for everyone? (p. 254)

While S-STTEP research often begins with the identification of a problem, problems rarely arrive neatly prepackaged for investigation. Problems typically emerge unexpectedly and often publicly (i.e., in the moment of practice), exposing gaps between espoused beliefs and theories-in-use (Argyris 1980) and instances of being "a living contradiction" (Whitehead 1993). Consider, for example, Fletcher and Bullock's (2015) uncovering of discrepancies between Fletcher's beliefs and practices as a consequence of teaching in an asynchronous online environment: "Tim felt that the way he experienced the relationships with his students online placed him in a position of authority that conflicted with his beliefs and the ways he went about fostering relationships in face-to face teaching environments" (Fletcher and Bullock 2015, p. 702).

The use of critical incidents and critical incident technique plays an important role in S-STTEP research – driven by a sense of emotional disequilibrium – and can capture and bring to life a situation in ways that engage the interest of and are recognizable for the reader. Brubaker's (2015) confrontation with a student suspected of plagiarism in his teacher education class vividly illustrates this point:

... uncovering Franklin's potentially pirated projects proved, for me, thoroughly unplanned and unanticipated. In my mind, it represented a test of my entire approach to grades – revealing potential flaws that would reflect my integrity as a teacher educator. I was suddenly faced with a critical moment in my teaching ... (p. 228)

Brubaker's (2015) experiences also offer the reader insights into his knowledge making-in-action, as he deliberates over the question of how to proceed that goes beyond making a technical decision but that draws on his own stance about good teacher education:

From my view, how I handled this dilemma would set a precedent for my future teaching as well as my students. It would affect how I would treat others in the course and how they would treat me, as well as how our course experience would ultimately be remembered. Ethically, I perceived an obligation to act, though there was no guarantee that doing so would be worthwhile or straightforward. (p. 228)

Williams and Grierson (2016) focused on critical incidents encountered through their experiences of leading international practicum experiences. Each teacher educator was confronted by discomforting situations that challenged her expectations and assumptions of "good teaching and learning practices" (p. 62). Through identification and analysis of particular critical incidents, Williams and Grierson (2016) came to recognize an underlying issue contributing to their sense of disequilibrium that was "responding to the at-times-contradictory demands of supporting teacher candidates, responding to needs of local teachers, and meeting the expectations of our universities and/or local educational authorities to provide new educational ideas to the host community" (p. 64).

Bullough and Pinnegar (2001) claimed that "to study practice is to simultaneously study self: a study of self-in-relation to other" (p. 14). Via practice, the self comes into play, through decisions or actions taken by the teacher educator in order to reach particular goals which she finds educationally meaningful. It is in one's practice as a teacher educator that the particular goals one strives for and one's ideas about meaningful strategies to realize those goals become apparent. Both of the above examples illustrate this point, as each teacher educator grapples with the question of how to proceed based on their norms and ideas about good teaching and teacher education. We agree with Bullough and Pinnegar's (2001) assertion that considerations of the intertwined nature of self and practice are central to S-STTEP methodology, also:

because using one without the other leads to a different methodological perspective. For example, examination of the self when it is removed from practice may be more closely aligned with auto ethnographical approaches, while a focus on practice removed from the self can be viewed as similar to action research. (Fletcher and Bullock 2015, p. 695)

Starting from an assumption that the self and practice are intertwined, S-STTEP methodology "helps teacher educators describe and analyse the self-in-practice, reach conclusions about specific teaching and learning situations, and develop

deeper awareness of how to construct strong pedagogical practice in the future" (Fletcher and Bullock 2015, p. 659). Ovens and Fletcher (2014) suggest that "the purpose of fore-grounding 'self' in self-study is a deliberate act to acknowledge that it is the self who is producing knowledge of practice while simultaneously enacting that practice" (p. 8). Understanding S-STTEP methodology in this way helps to counteract the (often misunderstood) idea of self-study as a study of the self as person, a focus on "who I am" in an almost therapeutic sense (Vanassche and Kelchtermans 2015), rather than who I am in a particular context of practice, at a particular point in time, or as Kelchtermans (2009) suggested, "who I am in how I teach is the message." For this reason, this chapter consistently uses the long clause *Self-Study of Teaching and Teacher Education Practices* or S-STTEP as a central descriptor of the work. While the short clause self-study is easier to work with, it unjustly suggests a focus on uncovering one's true, authentic self (as a form of introspection). The S-STTEP clause includes a focus on the self as implied or enacted in one's practice as a teacher educator, consistent with the view of teacher educator knowledge this methodology promotes. Through the process of engaging in a self-study of practice, we come to see both self and practice differently, often expressed as a process of "reframing" (Schön 1983). Importantly, S-STTEP's explicit intention to be both personal and practical, and public and criticizable, extends Schön's concept of reframing beyond the individual's reinterpretation of personal practice, to include a contribution to the body of research available to teacher educators (see Brown (2004) for a further explanation of this point).

The outcomes of S-STTEP research are thus intended not only to have immediate utility for the individual and her/his practice but also open up new possibilities for ways of thinking about practice, about theory, and about S-STTEP methodology. The risk of self-study research beginning and ending with practice:

> may be that researchers become too focused on their own unique practice and forget to reflect on the significance, or lack of significance, of their work for others, not only in terms of a better mutual understanding, but also in terms of production of knowledge. (Korthagen and Lunenberg 2004, p. 438)

A common misunderstanding about a self-study emphasis on "starting and ending with practice" is that S-STTEP methodology is insular, speaking only to the maker of the knowledge and only to local practice situations. While practice is the context in which knowledge is developed, the development of knowledge through the self-study of practice extends beyond the context of the individual teacher educator. Dilemmas or problems of practice may begin privately, but when they become written, investigated, and published, they become public (Samaras and Freese 2009). Through making the act of deconstructing and reconstructing understandings of practice and experience public, S-STTEP researchers (implicitly or explicitly) invite readers (or listeners) to acknowledge, question, refine, and contradict the understandings shared in dialogue with readers' understandings of their own professional practice situations. Hence, practice encompasses both personal practice and the broader practice of the profession of teacher education, referring to S-STTEP's

"overarching desire to better align theory and practice, to be more fully informed about the nature of a knowledge of practice, and to explore and build on these 'learnings' in public ways" (Loughran 2007, p. 14).

S-STTEP Speaks to a Broad Understanding of "Improvement" in Teacher Education

S-STTEP researchers study their practice in order to shape it in a direction that can benefit their students, the students of their students, and their broader professional and research communities. Change or improvement in this sense has a moral dimension because it focuses on goals and purposes of learning about teaching that go beyond the technical acquisition of knowledge and skills or making teacher education practice more effective or efficient (Vanassche and Kelchtermans 2015). It involves the search for consistency between beliefs and practices (e.g., How do I live my principles more fully in my practice?) or learning how to "walk our talk" as teacher educators. It involves asking difficult questions about self and practice that inevitably open up new ways of thinking and new kinds of knowing. Notable examples of this kind of improvement-aimed S-STTEP research include the excerpts from Berry's (2008) work shared in the opening sections of this chapter but also Brubaker's (2015) efforts to create a more socially just and democratic classroom (described above) and Ritter's (2016) efforts to deconstruct the default assumptions, or folk theories, that guided his practice. Through their self-studies, Berry, Brubaker, and Ritter came to recognize "not what is right and what is wrong" (Ritter 2016, p. 57) in their practice, nor a single desired outcome for improvement, but the importance of questioning more deeply their commitments to particular ideals.

Typically, as a consequence of their self-studies, teacher educators report that their preconceived beliefs have been challenged and that S-STTEP methodology has compelled them to revise their views. Hence, falsification, not verification, characterizes S-STTEP methodology. Mitchell et al.'s (2009) work captures well the potential of S-STTEP to not only reach well beyond its initial intent but also to be transformative:

> Knowing more about ourselves as teachers and learners changes us, provokes growth, jolts us out of complacency – sometimes radically, in ways that can seem transformative. In the course of examining one's practice systematically, a pivotal 'aha' moment can occur, a jolting of the kaleidoscope that shifts our view when we reach one of those precise or fuzzy points at which we are irrevocably changed. (p. 48)

Barnes' (2017) research exemplifies this outcome further as she came to recognize that her carefully designed Community Inquiry Project may have reinforced and perpetuated assumptions about race that she intended to challenge:

> By evading discussions of race, racism, and even white privilege, I was complicit with white educational discourse that reinforced the status quo, even when the stated intention of my teaching was to challenge the status quo and expand students' perspectives. (p. 301)

Contrary to her prior belief, she learned that by disregarding overt considerations of race, she "could have unintentionally modelled a colour-blind approach to teaching, one that is often the result of fear or discomfort around discussing polemical topics with students" (Barnes 2017, p. 301).

While the outcomes of S-STTEP research aim toward improvement of practice and an improved understanding of the contexts in which the practices are immersed, improvement is never guaranteed even when explicitly planned and attempted. Hence S-STTEP methodology is improvement-aimed (LaBoskey 2004), acknowledging that there will always be a disconnect between the ideal and actual, between one's intention and action. Typically, in the quest toward improvement, new questions and dilemmas emerge, and new pathways for study are opened. Therefore, the notion of improvement in S-STTEP is not about solving problems or creating best or most effective practices but about building a careful understanding of the educational setting and the practices conducted within it, in order to contribute to broader, more "pedagogical" understandings of teacher education practices (see Vanassche and Kelchtermans (2015) for a further examination of this point).

Self-Study Is Situated Inquiry

S-STTEP researchers acknowledge that their work is situated within particular biographical, temporal, physical, social, cultural, and political settings, and these settings shape actions, interactions, and understandings of all participants. The inherently situated and context-bound nature of the work invariably shapes the focus of the study as the problems, issues, or questions are defined by the context, and that includes the teacher educator himself or herself, and that must be responded to by the teacher educator himself or herself. As Wilcox (1998) identifies, teacher educators' knowledge is enacted and developed "in the spaces of possibility defined by intentions and constraints in local, specific and immediate situations" (p. 71). Constraints "present problems that must be dealt with and they provide a frame within which development can take place" (Wilcox 1998, p. 71). As a consequence, the teacher educator asks "what learning is possible within a given context?" (Wilcox 1998, p. 71) and is faced with the reality of having to deal with their own level of competence in enacting these possibilities. For example, Freese's (2006) study of her interactions with a student teacher, Ryan, led her to understand how her own biography, prior experiences, and cultural assumptions impacted her interpretations of their interactions, in potentially unhelpful and unrealistic ways:

> My interpretations of Ryan's behaviour, as well as our interactions, were filtered through lenses affected by prior experiences with struggling student teachers, by my beliefs and theories based on working with hundreds of student teachers. I thought I could explain and understand his behaviour because of my prior experiences. But now I realize that my interpretations did not necessarily apply to Ryan's situation and did not have the benefit of his unique perspective on his experiences. (p. 116)

Dinkelman, Margolis, and Sikkenga (2006) combined case-study and self-study methodology to investigate features of the institutional context they encountered, the knowledge they employed in their decision-making, and the merging of their former identities as classroom teachers with their new identities as teacher educators. These examples add heft to the claim made above that the practice under study in S-STTEP is never the practice of the singular self. It also encompasses attention to the biographical, social, cultural, and institutional contexts in which one finds oneself as a teacher educator and how these multiple contexts shape one's understandings of practice, as well as one's understanding of oneself as a teacher educator and others present in practice.

Along similar lines, Pinnegar and Hamilton (2009) highlight context as including the broader cultural milieu in which we exist. "We practice in cultural settings that are part of a larger cultural milieu, have a history, have agreed-upon ways of acting and being, have a future" (Pinnegar and Hamilton 2009, p. 81). However, these cultural contexts may be hidden from us as they form part of the taken-for-granted backdrop of our work. This means that context can also blind us to certain aspects – our assumptions and tacit beliefs can limit what we consider as possibilities for acting. This can create tensions in terms of being "caught" within the context and being able to step outside and imagine differently – yet this is the very opening where learning can take place (Wilcox 1998).

Because the context both shapes and constrains the way we act, S-STTEP researchers need to make the context clear and visible: "the fact of being in this place in time, with these students, in this setting – as part of data collection as well as in our deliberations about data analysis" (Pinnegar and Hamilton 2009, p. 81). This also includes "the uniqueness of each context, the personal involvement, the bias, and the emotional investment" (Loughran and Northfield 1998, p. 3). Making context explicit then allows readers to better understand the social and cultural grounding that informs the claims made and, more appropriately, find value from and apply those claims to their own understandings of practice.

Further to this, some S-STTEP researchers deliberately seek to change context so as to become more conscious of the influences of context on their thinking and practice. For university-based teacher educators, often this involves returning to teach in school settings. For example, Spiteri's (2010) return to classroom teaching to develop a refreshed understanding of the complexity and challenge of teaching, to "challenge [her] knowledge-of-practice and [her] knowledge-in-practice" (p. 132); Peercy's (2014) return to teach Spanish language learners in a secondary school that enabled her to examine the "gaps that existed between my ideals and my actions" (p. 164) from a teacher educator perspective; and McDonough's (2017) return to the classroom to investigate how her "renewed experiences in the first order setting [high school] might impact on my practice and how I might engage in making the tacit elements of this practice explicit in my work as a teacher educator" (p. 244).

The situated nature – broadly defined – of our work as teacher educators means that we are deeply vested and involved in it. At the same time, S-STTEP is not simply about coping with the pressure and constraints of contextual factors (Loughran and Northfield 1998). S-STTEP methodology requires that educators

learn to recognize, reframe, and reconsider understandings of practice within these constraints. That is, "[l]earning to see the current context honestly and making informed choices as to how to adjust one's response that can open up new pathways of agency . . . not previously considered" (Franklin Torrez and Haniford 2018, p. 111). However, learning to work within contextual constraints is far from a straightforward issue. While S-STTEP research focuses on one's own practice, it is never just one's own practice under scrutiny; it inevitably brings into play the institution within which the teacher educator works and develops. The up close and personal nature of S-STTEP means that those who conduct this work and the institutions in which they work are rendered "vulnerable and accountable. S-STTEP researchers lay bare for public scrutiny aspects of themselves, their practices and their institutions" (Cole and Knowles 1998, p. 228). In their study of the professional learning of one teacher educator in a Flemish S-STTEP project, Vanassche and Kelchtermans (2016) found that engaging in the project intensified an already difficult relationship between the teacher educator and his institution. The project outcomes not only gave this teacher educator ammunition that reinforced his personal beliefs about good teaching that conflicted with the dominant institutional policy but also made these two very different agendas of individual and institution visible and public. Ultimately, the teacher educator withdrew from the self-study process:

> . . . he moved back to the position of the distanced researcher, loosely referring to theoretical frameworks and concepts, but without any 'lived' or 'engaged' story as it was related to his own practice. His use of passive verbs and the anonymous plural 'we' instead of 'I' linguistically supported his detachment: 'nowadays, we are all confronted with competencies in one way or another'. (Vanassche and Kelchtermans 2016, p. 8)

Conflicts between one's personal beliefs about teaching and those of the institution such as this example illustrates go beyond issues of technical difference or personal opinion but also inevitably draw upon issues of power and loyalty which can have a very strong impact on the S-STTEP process and the processes of reframing and professional learning it seeks to promote.

S-STTEP Is Intentional and Reflective

In pursuing their educational goals, S-STTEP researchers carefully and systematically examine their educational contexts, beliefs, and relationships. Approaching the study of practice in this way involves the need, ability, and willingness on the part of the teacher educator/S-STTEP researcher to make their decision-making explicit – both in terms of the educational practices engaged in and reasons for them, and the design of the research that makes knowledge and knowledge making processes public. Through a focus on examining and understanding practice in this way, teacher educators become more purposeful and deliberate in what they are doing, so that S-STTEP acts as a means of promoting "more conscious modes of professional activity in its practitioners" (Ritter 2012, p. 152). Intentionality, in this sense,

goes beyond the idea of a commitment to technical proficiency as an educator or researcher (see also the meaning of improvement-aimed implied in the work) but refers to the need and ability of the S-STTEP researcher to an explicit commitment to investigate, uncover, and name the problematics of practice, including those associated with researching practice as well as its enactment.

Intentionality is also manifested through the moral commitment of care of the educator acting in relationship with students and with others (colleagues, collaborators). Trout's (2018) previously described self-study of practice documents the process through which her experiences of working with students of color led her to reframe and pay more explicit attention to her embodiment of care in teacher education. In the following excerpt, we see Trout's (2018) willingness to strive with explicit intentionality to this ideal, while acknowledging, as yet, uncertain outcomes:

> In my teaching I struggle more. I try to create moments to help students embody care in such a way as to understand how race, class, and other forms of difference play out in schools and society. This is challenging work, especially in my classes that have limited racial diversity. But I have begun to talk directly about race and oppression, something I did not do before this class. . . . Although I have added these elements to my courses, I am unsure of their impact on student beliefs. (p. 52)

Seeking to understand practice through purposeful investigation of it also connects with the notion of the teacher educator as a reflective inquirer and learner, "being thoughtful in a Deweyan sense about one's work" (Cole and Knowles 1998, p. 42) and carrying the "the connotation of deliberation, of making choices, about coming to decisions about alternative courses of action" (Van Manen 1991, p. 98). Through making these processes publicly visible to students through explicit modelling, S-STTEP research promotes a dual agenda. It not only informs teacher educators about their practice through systematic reflection but also promotes reflective teaching by the very example it sets (Dinkelman 2003). Leaman and Flanagan (2013) highlight this point as they uncovered new understandings of modelling through their experiences of enacting and researching modelling in their teacher education classes:

> After engaging in an iterative cycle of critical conversations while viewing the videotaped lessons, we now suspect that modelling our expertise did not turn out to be the only reason why modelling worked. Rather, our success in beginning to close the theory-into-practice gap occurs when we *normalize vulnerability* for our preservice teachers – by doing so, we emphasize the ongoing nature of teaching and learning as a never-finished product. (p. 57)

Importantly, S-STTEP methodology requires those who choose to engage with it to go beyond "everyday" or superficial meanings of reflection, to critically and systematically examine their practice, drawing on the perspectives of a range of others, including colleagues, student teachers, and existing educational research (i.e., theoretical frameworks, key concepts, and findings of educational research). The rigorous nature of this process may explain why teacher educators seem to identify readily with the S-STTEP process, immediately seeing benefits for their own

practice, yet why they also find it particularly hard to sustain, given the often-experienced limitations of time and other resources to conduct such work. Vanassche and Kelchtermans (2015) underscore the importance for S-STTEP research of maintaining a rigorous reflective stance:

> In order to stay true to its research agenda to not only optimize practice, but also contribute to a grounded and public knowledge base of teacher education, self-study needs to encompass and demonstrate intentional and systematic actions of data collection and analysis. (p. 13)

S-STTEP Is Interactive

S-STTEP happens in relationships – very similar to the way in which teacher education and teaching happens in relationships. Teacher educators cannot make learning happening on their own. They depend on student teachers. In the same sense, S-STTEP methodology depends on the inclusion of others to carefully and intentionally explore different perspectives on the issues under consideration. LaBoskey (2004) proposes the term *interactivity* to distinguish this aspect of S-STTEP methodology (rather than collaboration) to highlight that the inclusion of others goes beyond simply for the purposes of checking or interacting around external data sets. "Instead, the interactions are the data set, or at least a part of it" (LaBoskey 2004, p. 848). Interactivity can take different forms according to the focus of the study, including interacting with colleagues with the same practice agenda in the same context; colleagues in different contexts – near or far – working on different practice agendas; students as data sources, as interpretation checks, or as co-researchers; and texts of various types (professional literature, alternative media, self-constructed) to inform interpretations of personal experience. The inclusion of multiple perspectives increases opportunities for reframing (Schön 1983) that is fundamental to S-STTEP methodology. A variety of viewpoints must be employed in the reframing process and divergent rather than convergent learning outcomes sought (Loughran 2002). In this way, S-STTEP decenters a view of knowledge as externally derived, certain, and settled and instead emphasizes a view of knowledge as constructed, social, situated, and distributed.

In S-STTEP methodology, the notion of interactivity also implies an ongoing process. Through S-STTEP, knowledge and understanding of self and practice is developed over time, changing and evolving as new insights and information are gained and acted upon. The temporal, unpredictable, and often nonlinear nature of learning not only requires immediate action on the part of the teacher educator but also opens up new developments, new pathways, and new questions to follow. In this way, the teaching and research process are interactively intertwined. Through engaging in such an iterative process, LaBoskey (2004) asserts that we "come to know" our teaching in an ongoing way. Discoveries prompt new research questions, and the process of disseminating results creates a new feedback loop that in turn spurs a new S-STTEP project.

The study by Fletcher et al. (2016) highlights both the ongoing, interactive nature of S-STTEP and unexpected – and perhaps uncomfortable – discoveries that led them not only to reframe their thinking and actions as teacher educators but also to refine the focus of their study:

> Much of the design for our collaborative S-STEP research was guided by an assumption that new understandings of self and practice come from engaging in interactive processes with others (LaBoskey 2004). We assumed the critical friendship process would help us develop insights and understandings of [our] pedagogies. Our analysis showed that while our understanding and development of [our] pedagogies evolved over the course of the two year project, so too did our understanding and enactment of critical friendship. Although our intent at the outset of the project was to provide many opportunities for interaction . . . our analysis shows we had not engaged with this aim in a critical way. (pp. 309–310)

How Is Teacher Educator "Knowing" Documented and Represented in S-STTEP?

The body of S-STTEP work has made clear that acknowledging and accepting the complex, situated, moral, relational nature of knowledge should not be read as a signal to give up on the ambition to develop a public (shared) knowledge base of teacher education; neither should this ambition be reduced to a notion of "knowledge in practice" (Cochran-Smith and Lytle 1999), something so individualized and localized that it cannot be mapped on a more systematic basis. The teacher education profession needs to develop a shared language of teaching about teaching (Loughran 2006), a language which makes explicit the complex professional know-how, understandings, and practices that teacher educator professionalism might comprise so that others also can start to analyze, question, and critique it (Vanassche 2014).

The work of the S-STTEP community has offered interesting exemplars of what a language of teaching about teaching that comprises both the general and the particular might look like. The problematic and dynamic nature of knowledge is reflected in the language of "paradoxes" (Wilkes 1998), "axioms" (Senese 2002), "tensions" (Berry 2004), and "assumptions" (Brandenburg 2008). Other S-STTEP researchers have framed their knowledge representations more in the form of personal theories or understandings about practice, for example, principles of learning to teach teachers (Bullock 2009); assertions for action or understanding (Berry and Loughran 2002); or a theory of relational teacher education (Kitchen 2016). Here, we see that it is not the choice of representation per se that is important, as much as the fit for purpose. Ultimately, the representation should serve as a framework for teacher educators in (better) aligning practice and purpose or understanding and conceptualizing discrepancies between both.

To explain further, Wilkes (1998) identified the "paradoxes" of "content and manner," "autonomy and collaboration," and "silence in the classroom" as ways of articulating the contradictory nature of practice as she experienced it and as an approach to learning more about her own practice. The enactment of these paradoxes

provides the stimulus for further questioning of her practice in continually striving to enhance consistency between actions and beliefs. Similarly, Berry (2004) names the specific "tensions" of "telling and growth," "confidence and uncertainty," "planning and being responsive," "safety and challenge," "action and intent," and "valuing and reconstructing experience" that actively hold contradiction and ambiguity together in her experiencing of, and learning about, teaching. Senese's (2002) beliefs expressed as "axioms" include "go slow to go fast," "be tight to be loose," and "relinquish control in order to gain influence." Senese (2016) explains that:

> [e]ach axiom has a built-in balanced tension and appears to be counterintuitive. None of them are[sic] easy to do, but through a (now) conscious effort to enact them in my practice, I have developed a sense of how to apply them. (p. 142)

Brandenburg (2008) articulated a set of "assumptions" that underpinned her teaching (and her views of her students' learning). For example, student teachers are as motivated to learn about teaching as she is to teach them, reflection is improved using specific tools, and S-STTEP methodology is helpful for learning about teaching teachers. Framing her knowledge through making these and a number of other assumptions explicit helped her to question the taken for granted in her practice, which led her to make real changes in her teaching and subsequently led to improvements in her students' learning about teaching.

Expressions of teacher educator knowledge in the form of tensions, paradoxes, assertions, principles, etc. pertain to the specific, local, and situational but also to the general. They are general in that they capture the bigger picture of teacher educators' work but also specific enough to help explain, analyze, and guide local teacher educator practices, decisions, and actions. For example, knowing about Senese's (2002) axiom of "relinquish control in order to gain influence" may be important in recognizing a problem of practice as being about who directs learning; knowing of the particular is critical in working with that axiom and deciding about how to handle it in the specific situation at hand. As such, these kinds of expressions of knowledge encompass both the perceptual and conceptual, both the local and general, and both theory and practice.

Common to knowledge expressions that stay true to the problematic and dynamic nature of teaching and learning about teaching is that:

- The concept(s) serve as strong reminders about important issues that influence teaching and learning.
- The concept(s) capture and communicate the counterintuitive nature of learning about teaching (Wilkes 1998; Senese 2002).
- The concept(s) are generative in helping to guide, inform, and offer new ways of responding to practice but do not offer answers of how to act in practice.
- The concept(s) help to question the taken for granted in practice.
- The ambiguous/contradictory nature of the concept(s) opens up different kinds of meanings, and hence possible different learning opportunities emerge (Loughran 2006).

- The concept(s) serve a function that allows the teacher educator to abstract from specific situations to apply to "teaching more generally" (Loughran 2010, p. 224).

In terms of their practical use, these forms of knowledge expressions serve several functions. As a form of advance organizer, they can help teacher educators prepare for a learning experience or help make sense of and restructure learning following teaching. They can provide an analytic scheme from which to unpack and interpret local situations in practice, to help teacher educators analytically understand and acknowledge the complexities of practice, and to keep them in an appropriate balance when exercising professional judgment and deciding on action. As Berry (2008) explains about her concept of tensions:

> A series of tensions is not rich or comprehensive enough to provide guidance in all directions – nor would it be expected to. In this case, tensions offer a way of 'reframing' traditional notions of knowledge development in teacher education and so create new and different possibilities for understanding and improving practice. What is helpful (necessary) about the set of tensions is that it captures and holds onto, 'ambivalence and contradiction, rather than reducing or solving it'. (Stronach et al. 2002, p. 121) (p. 167)

One of the reasons why these forms of knowledge representation are so interesting to S-STTEP researchers is because the question of standards or judgment about what constitutes high-quality teacher education practice cannot be sidestepped and has to be faced: What is good teacher education?; What kind of teachers do we aim to develop?; On what goals do we agree?; On what goals don't we agree? – questions central to a conception of enacted teacher educator knowledge as we defined it in research on (the professional development of) teacher educators (Vanassche 2014). Implied in articulating professional knowledge in a series of tensions, axioms, or paradoxes is the expectation that teacher educators continuously position themselves and take a stance toward these tensions or paradoxes in their own practice settings. These discussions form the basis for the further development of teacher educator professionalism:

> . . . we see them as situated accounts of local responses to particularly sited socio-cultural issues in teacher learning. Their aim is to raise questions of social, cultural, and institutional context to a new level in discussions such that these questions may become the focus of understanding rather than simply locations in which an activity takes place. (Freeman and Johnson 1998, p. 404)

As such, these knowledge representations also engage in a fundamentally different relationship with the reader and therefore, one could argue, also in a fundamentally different relationship between research and practice. By keeping the complexity of the work intact, they very effectively position the reader (or listener, observer, etc.) of a self-study of practice as a professional himself/herself who needs to make sense of the portrayed complexities in his/her own practice setting and decide how to expertly act on them. Knowledge claims in S-STTEP are always tentative and uncertain. Claims arising from exemplars do not have to be secured as absolute

knowledge but rather "claims that are useful to others for understanding their practice or action in it at that particular place and moment in time" (Lyons and LaBoskey 2002, p. 54). These accounts of practice are not intended "to become exercises of importation or the basis on which to promulgate techniques" (Freeman and Johnson 1998, p. 404).

Other kinds of knowledge expressions formulated in more static terms (e.g., principles or frames for guiding practice) are similarly not intended as a blueprint for practice but to offer guidance to teacher educators. For example, while Kitchen's (2016) characteristics of relational teacher education are intended to be aspects that can be "intentionally and explicitly addressed in one's professional practice" (p. 180), they are not offered as a formula since "the most important element is a commitment to relationally knowing one's preservice teachers" (p. 180). In this way, Kitchen emphasizes the characteristics of S-STTEP methodology as contextual, moral, and relational that we outlined in the previous sections of this chapter. Similarly, Bullock (2012b) highlights the importance of his self-developed principles for framing his practice, at the same time pointing out their inevitable inadequacy in practice:

> Although these principles were important in that they named my initial assumptions . . . they did not provide a convenient set of answers for the problems of practice I encountered . . . It is one thing to have principles to aspire to, but it is quite another to use these principles to navigate the tumultuous waters of practice. (pp. 117–118)

Representations of knowledge in S-STTEP include more than text-based formats. S-STTEP researchers also use arts-based representations, including creative writing, visual representations, photography, art installations, multimedia, films, drawings, collage, performance, etc., to construct, analyze, represent, and communicate their understandings of self and practice as they make their research public (Samaras 2010). Such representations can be helpful in making explicit both to ourselves and others, the tacit, hard to express, or otherwise hidden aspects of practitioner knowledge. Weber and Mitchell's (2004) chapter in the first *International Handbook of Self-Study of Teaching and Teacher Education* provides a comprehensive account of arts-based self-studies that has been subsequently built upon by S-STTEP researchers such as Samaras (2010); Mitchell, Weber, and Pithouse et al. (2009); and Pithouse-Morgan and van Laren (2012); and in edited collections such as Tidwell et al. (2009) and Pithouse-Morgan and Samaras (2015).

Expressions of knowledge communicated through arts-based representations perhaps even more so than text have the capacity to:

> . . . simultaneously present multiple viewpoints and generate multiple interpretations . . . draw attention to the importance of the everyday by making it strange or casting it in a new light . . . combine cultural and transcultural elements; . . . evoke, but also sometimes transcend the specific context in which they are created, and they can use specific instances to comment on, or illustrate wider generalities (Weber 2008). (Weber 2014, p. 9)

Importantly, across all of these expressions of knowledge is that they are not considered as a blueprint for practice or a normative guide on how to do teacher

education or how to be a teacher educator. These knowledge representations contribute to knowledge for teacher education by teacher educators, through unravelling the complex interplay between biography, beliefs, curriculum, student teachers, school culture, resources, policy frameworks, collective beliefs, and so on. They are representations of knowing in a particular place and time. They exist in the form of personal professional theories or living educational theories (Whitehead 2009) that include "explanatory principles in their embodied knowledge as teacher educators" (Whitehead 2009, p. 108).

Implied in articulating professional knowledge through these different forms of expression is that teacher educators continuously position themselves in relation to and take a stance toward this knowledge within their own teacher education practices. Hence, when we consider the "application" or "usefulness" of any given self-study of teacher educator knowledge, something more is intended than the instrumental-technical sense of "what works." It is in the more fundamental sense of what Schwandt (1997) called "making something relevant to oneself." This calls upon the same sort of knowledge developed and involved in teacher education, that is, "knowing from within or practical-moral knowledge," which "requires not cleverness in application but understanding" (Schwandt 1997, p. 76). According to Schwandt (1997), the aim of practical-moral knowledge is to do more than "simply give them good ideas" but to "actually move people" (p. 81). And, as Stronach et al. (2002) argued, this is "our only hope of a politics that is for professionalism as well as about professionalism" (p. 130).

Conclusion

The Potential for S-STTEP Methodology as Critique of Our Conventional Way of Seeing Teacher Education Knowledge and Practice

It is in reframing traditional notions of knowledge representation in the ways described above that the potential of S-STTEP methodology as a critique of our conventional way of seeing teacher educator knowledge and practice arises. S-STTEP has the potential to open up a different and critical – in the sense of challenging the status quo and allowing for alternative voices to be spoken and heard – understanding of teacher education practice and knowledge that challenges the more technical-instrumentalist view of practice underlying a conception of demanded professionalism (Vanassche and Kelchtermans 2015). From a logic of demanded professionalism, the success of teacher education depends on teacher educators being knowledgeable about and skillful in the application of the theories and principles of effective teaching and teacher education that have been defined elsewhere. S-STTEP troubles such a technicist perspective (i.e., applying the right means to a predefined end) on teacher educator practice by holding onto complexity and contradiction, rather than aiming to control or reduce it (Stronach et al. 2002; Berry 2008); by celebrating and analyzing teacher educators' professional judgment

on how to act in specific situations rather than standardizing this judgment by replacing it with procedural knowledge; by giving central stage to a committed and responsible relationship with student teachers rather than flattening it; and by taking into account and fundamentally questioning the contextualities of the work rather than simply considering these as the site in which practice happens to take place. "Knowing" in S-STTEP accepts the need for normative decisions between different answers to the question of how to do justice to one's students or, more generally, the question of what is good teaching. These dimensions of practice are offered little scope in the dominant research agendas of evidence-based teacher education and effectivity.

In order to realize that potential, S-STTEP research needs to stay true to its broad research agenda, focusing on understanding and not just "fixing" or "improving" teacher education in a technical sense. As argued by Vanassche and Kelchtermans (2015), S-STTEP researchers cannot – and should not – have their research agendas reduced to questions of effectivity (what works?) but should continue to focus on critically analyzing the (normative) beliefs and assumptions about teaching that underpin practice. Opening up and critically challenging the pedagogical reasoning underlying actual practices (what is happening?; how is what happening influenced by the broader institutional, political, societal contexts of the work?; what beliefs underpin practice?; how tenable are these beliefs in practice?; etc.) is a research agenda which does justice to everyday practice but at the same time carries a relevance which extends well beyond the local practice arena in which the research was carried out. In order to fulfil its commitment to a practice-based yet theory-building research agenda, S-STTEP researchers need to explicitly link the close, interpretative analysis of "knowing" enacted in local practices to previous work in the field, both conceptually and theoretically, as well as methodologically.

Without this critical character, S-STTEP research risks becoming one of many strategies to simply become more skillful through experience; confirming the status quo; furthering a rather narrow, instrumentalist, and accountability-driven research agenda; and unintentionally supporting the further de-professionalization of teaching and teacher education:

> This would limit the value of self-study to its functional, self-oriented and problem-solving character and, by doing so, self-study research runs the risk of being cut off from its enormous potential to develop a substantial critical-political, pedagogical and epistemological understanding of the complexities of teacher education. (Vanassche and Kelchtermans 2015, p. 14)

The Challenge of Learning Other People's Languages

Since the previous *International Handbook of Self-Study of Teaching and Teacher Education* was published in 2004, S-STTEP as a field has continued to grow and flourish. As we see it, S-STTEP methodology has now reached an important threshold in terms of its development. It is clear that as a methodology, S-STTEP has become well established. The pressing issue for the S-STTEP community now is

in recognizing its powerful potential for speaking and contributing to a range of different communities and audiences. While S-STTEP continues to serve a vital purpose in supporting teacher educators to recognize, value, and develop their own professional knowledge, and in contributing to the development of the S-STTEP community per se, there are important audiences outside the S-STTEP community, including the broader teacher educator community, education research community, and policy-makers that can benefit from the understandings developed through self-studies of practice. Understanding what kind of knowledge claims will be most useful to effectively speak to these different audiences while staying true to the nature of (the research on) our work will be an important next step. While we agree it is important to perfect "our practice" and become better at what "we," S-STTEP researchers, do, it is also important to learn how to speak other people's languages and to be better communicators of our work to researchers, policy-makers, and practitioners. For instance, Zeichner (2007) critiques S-STTEP research on the basis of limited "discussion within individual studies of how a study builds on the work of others . . . [or] how a set of studies informs the field as a whole on particular substantive issues" (p. 39). Zeichner identifies a lack of S-STTEP work that could be directly contributing to "discussions and debates about issues of importance" (p. 44) in educational research.

Again, this should not be read as a plea to mirror the existing and dominant forms of scholarship and practice. As S-STTEP researchers, we believe it is important and possible to preserve the integrity of knowledge representations as moral, contextual, and relational, but there is also scope for new approaches that serve different purposes – including joining the debates about issues that concern other teacher educator practitioners, teachers, policy-makers, and academics. To do so, requires acceptance of S-STTEP's critical responsibility for opening up and effectively communicating the complexities of what happens to theories or policies on their way to what Schön (1983) called the "swampy lowlands" (p. 43) of educational practice. These complexities depend on the contexts of teacher education, biography, values, resources, school cultures, and the very nature of the profession as a committed and sustained relationship between people.

We also fully recognize that effective communication is a two-way process which carries the expectation that teacher education practitioners, teachers, policy-makers, and academics learn someone else's language by appreciating the particularities of (self-study of) teacher education practice. A variety of attitudes to S-STTEP research are not conducive to this communication. Researchers in teacher education might view S-STTEP as an approach which offers fruitful prospects for individual professional development but lacks the theoretical and methodological rigor to join the ranks of academic research. Policy-makers might see S-STTEP methodology as too "infected" by personal belief and opinion, and lacking clear solutions to "policy problems" (Cochran-Smith 2004), without the need for dialogue. These are over-done stereotypes but clearly serve to highlight the importance of real dialogue, with interest in and respect for the complementary expertise each party holds on the joint commitment to preparing teachers to the highest standards.

Self-Study and Education Policy

7

Toward Understanding the Presence of Absences

Abstract

Self-studies of policy are the nexus between what was transmitted concerning desirable practice; how that transmission was understood, accepted, rejected, or modified; the actions and reactions that preceded, accompanied, or followed; and any change that occurred either to those affected by the policy or any modification, revision, or abandonment of the policy itself. In this chapter, we examined the direct and indirect effects of policy at the national, state, and local levels, based on peer-reviewed articles from 1999 to 2017. We found that the studies documented the way in which policy directly or indirectly affected teaching, but not how self-study researchers affected policy. We also found that policy effects often (and sometimes negatively) engaged teacher educators' emotions. We call for greater attention by self-study researchers to examining the links between teacher education and teacher education policy, particularly the ways in which teacher educators can participate in creating or modifying education policies.

Introduction

> In summary, the field of self-study research has developed an international cadre of proponents who are engaged in serious and important investigations of teacher education, but who have not yet begun to address their connectedness to the county, the state, the nation, or the world. (Clift 2004, p. 1363)

Things have changed and have not changed since the first author (Renée) reviewed teacher education-focused articles published in peer-reviewed journals for the first *International Handbook of Self-Study of Teaching and Teacher Education Practices* (Loughran et al. 2004). Since that chapter, 13 volumes of the self-study journal *Studying Teacher Education* have been published, many of which reference teaching and teacher education in the larger context and that discuss policy explicitly and/or implicitly. Other journals have also begun to publish self-studies, or pieces approaching self-study, with a focus on teacher education, and we have identified several policy-oriented articles not published in *Studying Teacher Education*. As we will discuss in more detail, the majority of these studies are from the United States, and, therefore, this chapter will be limited in international scope. Our title, containing the phrase "presence of absences," signals that we will attend not only to what has been published but also to things that do not yet currently appear. The purposes of our chapter are to discuss the studies that do exist and what those studies say about the relationship between self-study and education policies. We also offer our observations on studies that do not yet exist, speculate on why this is so, and consider how the relationship between the self-study of teacher education (and teaching) might evolve between now and the third handbook.

Issues of Policy

The Nature of Policy

Our understanding of education policy has been influenced strongly by Henry et al.'s (1997) text, *Educational Policy and the Politics of Change*. Although it was first published over 20 years ago, we feel that many of the concepts they defined and explained still hold today. They began their discussion of education policy by noting that as public schools and public education became the purview of the government, the goals of promoting desirable cultural norms and ensuring some form of accountability over teaching and learning were dominant. In the 1960s, however, education became immersed in calls for social change, including assertions that "Educational policy has thus become a bureaucratic instrument with which to administer the expectations that the public has of education" (p. 3). The public, of course, is never a united front. Policies are created by those who hold differing beliefs and ideologies and who are, themselves, influenced by those who hold differing beliefs and ideologies. "[P] policies do not emerge in a vacuum but reflect compromises between competing interests expressed by the dominant interests of capitalism on the one hand and the oppositional interests of various social movements on the other" (p. 4).

Henry et al. (1997) reject what they label as a rational model of policy and change in which policies are developed, polices are implemented, and polices then produce the desired outcomes. In studying policy development and implementation, therefore, it is important to study what was originally desired, the compromises among the actors that affected policy development and implementation, and the consequences of implementation – intended and unintended – as they vary across cultures and contexts. They present evidenced-based arguments for policy as multidimensional, value-laden, contextual, and productive of unintended as well as intended impacts.

Levels of Policy

In this chapter, we also take the position that policy affecting teacher education originates at a broad range of levels. Henry et al. (1997) noted, and we agree that:

> [Policy typically refers to those] produced in schools by school communities, including administrators, teachers and parents. In our discussions of policy and policy making in this book we include all these types of policies. While there are some differences in policy making at these different levels, they also have much in common in terms of the policy processes involved. The traditional political science and public administration literature which deals with policy tends not to take such a broad approach. Rather, that literature focuses mainly on what is referred to as public policy, meaning government generated policies which are developed and implemented through state bureaucracies. (p. 22)

In our view, national- and state-level policies that mandate to teach certain content, use designated assessments, or teach about specific teaching practices are

obvious. While we acknowledge that there may be occasions for looking at the impact of policies at an international level, we found no examples of such self-studies in our review. Less obvious are standards recommended by national organizations, but which have not been officially adopted by a state or a program. In addition, we feel, local policies that affect teacher education are often influenced by local decisions to emphasize a specific social or ideological framework (i.e., social justice) or conform to an accrediting body's standards.

We agree that:

> Policy is more than simply the policy text; it also involves processes prior to the articulation of the text and the processes which continue after the text has been produced, both in modifications to it as a statement of values and desired action, and in actual practice. Furthermore, contestation is involved right from the moment of the appearance of an issue on the policy agenda, through the initiation of action to the inevitable trade-offs involved in formulation and implementation. (Henry et al. 1997, pp. 28–29)

As modified and applied to self-study, self-studies of policy are the nexus between what was transmitted concerning desirable practice; how that transmission was understood, accepted, rejected, or modified; the actions and reactions that preceded, accompanied, or followed; and any change that occurred either to those affected by the policy or any modification, revision, or abandonment of the policy itself.

Direct and Indirect Impact of Policy

Henry et al. (1997) remind us that the impact of policy can never be predicted in advance and that implementation will not be uniform:

> we must remember that, even without any obvious ambiguities in a policy text resulting from competing interests, there will be no single interpretation of a policy document. This means that predicting the effects of policy is never easy.
>
> It is important to recognize that contexts, as well as affecting policy production, also often distort policy goals in various ways and so have a very real impact on policy implementation. (p. 50)

Therefore, it is important to understand how specific individuals in their own contexts experience policy and how the policy does and does not shape their understanding of teaching and teacher education and their perceived abilities or opportunities to practice. It is also important to understand whether policy facilitates learning and practice or if it is debilitating.

Emotional Response to Policy

While seemingly unlikely bedfellows, administrative policy and human emotion are inextricably linked. Policy is usually developed to implement change; human

emotion is inevitably invoked when dealing with change. As Hargreaves (2004) suggests, "There is no human change without emotion and there is no emotion that does not embody a momentary or momentous process of change" (p. 287). It is easy to recall personal and professional changes that have evoked fear, confusion, anxiety, indignation, resignation, demoralization, or disenchantment. "However, while most organizational and personal change involves some measure of pain, poorly conceived and badly managed change can inflict excessive and unnecessary emotional suffering" (Hargreaves 2004, p. 288).

Kelchtermans et al. (2009), in a volume comprised entirely of research on teacher emotions, discussed the links between change (including policy changes that emphasized teachers' performance in terms of students' test scores) and teachers' emotions in relation to feeling vulnerable. They studied teachers in four schools experiencing shifts toward more diverse populations. The authors documented how policy had a differential impact on feelings of vulnerability and emotion depending on the culture and leadership of the school and on teachers' individual differences. This work has implications for the ways in which teacher education administrators might alleviate some of emotional discomfort and debilitating feelings of vulnerability. In the best of all possible worlds, research could suggest how we might craft better current and future policy. In the more likely situation that policy continues to be developed in the manner that it has been, understanding the emotional loading could provide for development of better approaches to the implementation of policy. Finally, in the very likely situation that policy is implemented without thoughtful consideration, we might be better equipped to deal with, or help others prepare for, the inevitable emotional outcomes.

Chapter Organization

In the next section of this chapter, we describe the ways in which we identified and then categorized the self-studies we discovered. This is followed by a discussion of the studies in each category – not to critique the studies' claims, methods, or theoretical foundations but to establish a foundation for the final section of the chapter in which we offer our conclusions on the current landscape (what exists and what does not yet exist), the dilemmas and challenges of conducting self-study policy-oriented research, and some considerations for future research.

Methodology

The two of us, (Renee and Carl), have worked at the same institution for 9 years, negotiated the demands of policy mandates together, planned and designed (and redesigned) teacher education programs, and commiserated over good meals about the impact of policy on teacher education. Until this point, however, we have never talked about our research with one another and have never collaborated on research or writing. Renée is an active member of the self-study community whose recent

research has included the self-study of teacher education administration and collaborative program design among university faculty. Carl is just being introduced to self-study. His research in special education focuses on designing and maintaining environments for children with disabilities that are both safe and supportive. Our two, very different lenses have enabled us to understand the studies we identified from both complementary and contrasting perspectives.

Search Criteria

In order to identify articles for this chapter, Renée skimmed all of the articles in all of the issues of *Studying Teacher Education* (Volumes 1–13), noting any article that mentioned policy as it affected practice. Renee also conducted an EBSCO search using the terms *self-study* and *policy*. In addition, she reviewed several papers presented at a self-study special interest group session (for which Renee was the discussant) at the 2017 annual meeting of the American Educational Research Association. Because we didn't see any evidence of self-study research, in general, in *Studying Teacher Education*, Carl then searched the last 10 years of literature in peer-reviewed, special education-focused journals of policy studies and teacher education (e.g., *Journal of Disability Policy Studies*; *Teacher Education and Special Education*). The absence of self-study in special education is a topic to which we return later in this chapter. We identified a total of 39 studies that seemed relevant to this chapter. Renée then reread the articles, eliminating 13 because, while they may have had the word policy somewhere in the text, they were either not policy oriented or were actually studies of other, not studies of self. We were pleased to have identified so many – and to note that the studies were being published outside of *Studying Teacher Education*.

We then each, separately, reread the remaining articles noting whether they addressed *national*, *state*, or *local* policies. We also categorized the authors' descriptions of the effects of the policy on practice or action as *direct* or *indirect*. We did not include studies of decisions by individuals or small groups of individuals to teach in a certain way (such as using role-playing or teaching certain novels). In other words, when teacher educators perceived that they were being mandated or strongly encouraged to engage in certain practices, meet certain standards, or adopt particular philosophies, we included them in our analysis. We also noted that while most of the authors described and discussed policy using emotion-free, academically oriented language, several of the articles mentioned the emotional impact of policy implementation.

Results

As described in the *Methods* section of this chapter, one categorical approach was to organize articles in our review by whether they addressed *national*, *state*, or *local* policies. In this section, we describe how policies at each level are connected to the studies and further distinguish some categories within our original set.

National-Level Policy

When it comes to high-impact national policy, the US Elementary and Secondary Education Act of 1965 has been a long-running "game changer." With all that has transpired in the years since its passage, it is often forgotten that this law was originally conceived as an integral piece of President Lyndon Johnson's *War on Poverty* (Jeffrey 1978). While the impact of this legislation on improving outcomes for poor children over the last half-century is debatable, the long-reaching impacts (intended and unintended) of the policies it includes are unquestionable. The law has been revised and reauthorized by the US Congress at least every 5 years. The version passed in 2001 that was retitled as the *No Child Left Behind Act* (NCLB) provides the genesis of policy concerns for three of the articles included in our review.

Kosnik's (2005) self-study provided a unique view of the impacts of NCLB on teacher education; the view of a Canadian researcher transplanted to a US context. Kosnik noted the difficulty of understanding national policy impacts unless one is immersed in them:

> In hindsight, I now realize that during this period I did not fully appreciate the trends in US policies and politics. At the annual American Educational Research Association (AERA) conference I would listen attentively to my American colleagues lament the additional program requirements mandated by their state or federal government, the challenge of applying for NCATE approval, the threat of alternative certification programs, and the emerging control of education by the right wing. Although I paid careful attention and offered words of encouragement, the true impact of these initiatives, policy requirements, and changing attitudes towards research eluded me. (p. 212)

Following relocation to Stanford University in California, Kosnik described how certain NCLB requirements, particularly those related to teacher and curriculum standards, became more palpable and impactful in her work. She argues that self-study as a methodology is uniquely positioned to "play a key role in restoring the importance of teacher education" (p. 209).

Scherff and Kaplan (2006) also described policy issues arising from NCLB through a unique and insightful perspective: a university teacher (Scherff) returning to the classroom. The authors explained how policy elements in NCLB, such as requirements for schools to show progress in student test scores, created an environment that altered the nature of teaching:

> Because I had left the secondary classroom before the pressure of *No Child Left Behind* was fully realized, I was not prepared for the overwhelming feelings of fear, stress, and nervousness it brings to schools. In my few months back in the high school there was not a day that I was not reminded in some way about how high the stakes were. The sense of dread that *NCLB* created was not healthy for me, and I know some of my colleagues felt the same way. (p. 163)

The school accountability requirements in NCLB also provide the tangential genesis for issues explored in a self-study by Erickson and Young (2011). In this study, the authors were asked to consult with a school dealing with NCLB's

federal mandates for accountability in areas of literacy and mathematics that were crowding out instruction in the social studies curriculum:

> While only literacy and mathematics test scores were used to determine AYP, the teaching of social studies content was still required by both No Child Left Behind and our state core curriculum. Teachers were left to find innovative ways to teach social studies without impinging on time already allocated to literacy and mathematics instruction. (p. 94)

While the authors went on to describe more localized issues that evolve in negotiating curriculum development with school staff, this article is a good example of the far-reaching impact of national policy on related issues in teacher education.

Professional organizations exist for many reasons, but chief among them is to create policy to promote the profession, support members, and improve outcomes. One study in our review (Thomas and Monroe 2006) explored aligning changes in pedagogy with two policies developed by the National Council of Teachers of Mathematics: the Curriculum and Evaluation Standards for School Mathematics (National Council of Teachers of Mathematics 1989) and the Professional Standards for Teaching Mathematics (National Council of Teachers of Mathematics 1991). The authors describe how a change in pedagogy (i.e., from individual work to rich group-based inquiry) can not only align with standards but improve student learning.

In another study in our review (Craig 2010), the specter of accreditation by a national university board looming over a Department of Curriculum and Instruction provided a broader context for policy implemented at the university, college, and department levels. While the localized issues will be discussed later in this chapter, the study is mentioned here because it is another example of how national or regional policy imperatives can serve as indirect propagators of not only state but also local policies.

As noted in the introduction to this chapter, the majority of the articles in our review discussed policy issues in the United States. However, at least five of the articles identified in this review demonstrate that the pressures of policy on the work of teachers and teacher educators is not limited to the United States.

Both Harris (2010) and Doecke (2004) presented situations that arose from national teaching reforms in Australia. They both illuminated a tension created by national policy implementation that may be common in Australia and elsewhere; to what degree does implementation of policy conflict with professional identity? Harris (2010) wrestled with this existential professional question during the development of teacher education program modules on early literacy in the face of national reading policy in Australia:

> This self-study explores tensions that I experienced amongst messages from literacy research, policy, and practice, and also describes ways I reframed my position as a teacher educator in the literacy nexus to address these tensions while fulfilling my responsibilities in the professional development program with integrity and scholarly care. (p. 75)

In an article influenced by federal (Australia) and state (Victoria) curriculum development requirements, Doecke (2004) situated the article by describing the

tension that arises from maintaining a questioning approach to one's professional practice:

> Above all, this counter narrative has me working with the realization that my professional identity as a teacher educator puts me at odds with the official curriculum and policy context in which I am obliged to operate. (p. 204)

The New Zealand Curriculum (NZC) is the policy that originates the self-study of Major (2011). More specifically, Major's self-study explored how paradigm shifts implied in the NZC with regard to conceptualizations of knowledge and learning. Major illustrated how such national reforms might (a) create epistemological shifts in teacher education students, (b) increase the capacity of teacher education students to effectively implement culturally responsive practices, and (c) align with the author's pedagogical practices.

Chappell (2008) provided an example from the United Kingdom of efforts to work within multiple national educational policies. One set of policies focus on promoting standards-based and performance-based initiatives in schools. The other set of policies focus on creating partnerships between artists and schools to develop student creativity. Amid the desire to work across the tensions inherent in seemingly contradictory expectations (performance/creativity), Chappell examined how to develop/mediate such conflicted policy environments.

National standardization of curriculum provides impetus for another self-study in our review, this time in Korea (Ro 2017). Ro explained how a focus on test preparation is often associated with Asian systems of education. The questions posed for the study, however, seemed to be relevant to practitioners in any national system of test centric reforms; can teachers carry out practitioner inquiry in the face of a focus on standards? If they can, how do they do it? The teachers that Ro studied did find ways to continue a commitment to inquiry, but only by separating test preparation from inquiry; they found practitioner inquiry and test preparation to be wholly incompatible.

State/Regional Policies

Many state policies that impact teacher education actually originate at the federal level. This is true for some of the studies we described in the "National" section of this chapter. For instance, the mandates that Doecke (2004) discussed originated in the Australian federal system and required development of new policy in the state of Victoria. Scherff and Kaplan (2006) focused on mandates of NCLB being implemented through high-stakes assessments in the state of Florida. But we also identified educational policy issues in self-studies that actually originated at the state level, and, in both cases, the state policies under consideration originated in California.

In the United States, 26 states provide a procedure by which state laws can be created or changed by a vote in a public election. These are referred to as

"propositions," and voters/groups in some states take greater advantage of this avenue to lawmaking than in other states; California is a state in which it is common to see "propositions" on the ballot. Prado-Olmos et al. (2007) described how a number of recent propositions passed in California affected people of color:

> In California, communities of colour justifiably feel under attack. Recent political activity has assailed a commitment to diversity and social justice by way of approval of propositions against the provision of social services for immigrants (Proposition 187), affirmative action (Proposition 209), and bilingual education (Proposition 227). These propositions have legalised an ideology that legislates the unequal treatment of students of colour, their families and communities of colour. (p. 89)

In terms of state education policy in the United States, it should be noted that the constitution of the nation leaves much of the practice of education to the states. This includes credentialing of teachers, which invariably involves development and implementation of policy. In the case of California, this task falls to the California Commission on Teacher Credentialing (CCTC). As members of teacher preparation programs in California, Kornfeld et al. (2007) wondered to what degree they have become complicit in policy implementation with which they may not agree:

> Are we serving as cogs in the CCTC's wheel? That is, by participating in the system we deplore – preparing our students for the high-stakes test they need to pass – aren't we helping to support and perpetuate that system? (p. 1908)

Local Policies

In our review, policy emerging locally was noted in 11 articles. These policies were born from a variety of local sources: local funding agencies, university, school, and classroom/individual.

It takes money to conduct school reform and education research and run educator preparation programs. In one article identified in our review, Craig (2006) described working across five school campuses in a school reform effort funded by a local agency. The author describes the difficulties encountered as this collaborative project evolved in light of policies associated with funding, collaboration, and the focus of the reform.

Those who work at universities can certainly attest to the degree to which administrative policy can impact their research and practice. Five articles in our review dealt with policy at the university level. In three of these articles (Cochran-Smith et al. 1999; Monroe 2013; LaBoskey and Richert 2015), teacher education programs are prompted to engage in evaluation and redesign in light of locally held (i.e., college, department, program) beliefs and policies. In another article, Craig (2010) more reluctantly negotiated a range of university requirements that forced challenging changes to courses, materials, and pedagogy. In the fifth article, Gemmell et al. (2010) dealt with the issue of succeeding as teacher educators amid

university policies that appear to value research excellence over teacher educator program outcomes.

Four articles in our review clearly highlighted the influence of school-level policy on teacher practices and teacher education. As described earlier, a national organizational policy effort in mathematics teaching is the origin of the pedagogical reexamination undertaken in the Thomas and Monroe (2006) article. However, the authors noted that it was local school policy to adopt these mathematics standards and it was the school that provided the professional development that spurred further engagement of the authors to examine their pedagogy. Likewise, NCLB and state-level issues are the genesis of policy concerns in the Scherff and Kaplan (2006) article. However, the major focus of Scherff and Kaplan's research illustrated the ways in which policies within the school itself negatively affected a university teacher's return to teach in a public-school classroom. Erickson and Young (2001) described a similar "cascade" of impacts in which federal and state policies drive school-level policies. In turn, the new school policies moderate and mediate new school issues and concerns, such as how student test performance impacts schools' reputations. Finally, the policy changes at the school that Byrd (2015) studied occur as the principal interacts with a broader set of national policies related to college and career readiness:

> It was a principal's interpretation of our charter management organization's focus on college readiness. Making our instruction, expectations, and very *culture* more rigorous would, in theory, make our students better prepared to enter into and graduate from college. (p. 125)

Only one study in our review involved changing pedagogy in relation to policy that was specific to a classroom. Bauman (2015) provided a fascinating piece in which the focus is on how to respond to and support the "toy gun" play of young children in a way that balances developmental needs and a personal commitment to non-violence.

Impact of Policy/Impact on Policy

One well-established feature of self-study is the impact such a study has on one's practice (Pinnegar and Hamilton 2009). In this chapter, we have identified two levels of impact. Direct impact refers to a self-defined change in behavior, perception, or understanding. The impact could be understood by the researcher as positive or negative, as empowering or debilitating. Direct impact and indirect impact are not mutually exclusive, and the distinction, for us, is subtle. Indirect impact is more subtle and doesn't result in a change in practice, but more of a speculation on the connection between policy and practice. In writing this section, however, we found it difficult to articulate the subtleties, and, therefore, we combined the two.

Cochran-Smith et al. (1999) conducted the earliest self-study we found. They conducted a group self-study of their own views of social justice within their university's teacher preparation program. Over time, many members became more

forthcoming and developed a sense of social justice that shifted from the individual to the societal. Their discussions began to affect programs beyond teacher preparation, as well as faculty hiring practices. They also found that not only did they have divergent views but that they were not able to come to agreement on what they meant and how that should pervade their practice and their curriculum. They also found it difficult to know what to reveal and what not to reveal to one another – safety and confidentiality was an issue, "for some individuals, being part of the social justice group exacerbated personal issues with others and fed into tensions about status and role" (p. 245).

In Victoria, Australia, Doecke (2004) studied his own and his student teachers' struggles with implementing a mandated, outcomes driven curriculum while encountering:

> . . .an extraordinary range of abilities and levels of engagement in their secondary English classes. And this is not only a matter of varying degrees of sophistication that students show when achieving the stated outcomes – the students' work sometimes bursts the parameters of the original exercise, opening up possibilities for language and learning that my student teachers simply had not anticipated. (p. 206)

Over the course of the study he realized that he was, in effect, also using language that implied standardization across his own students' experiences and contexts and his preference for those students whose beliefs aligned with his own.

Kosnik (2005) studied the impact of moving from Ontario policies guiding teacher preparation to US/California policies in which teacher preparation programs were expected to align with national and state standards, thus curbing some autonomy for program directors and instructors. At first, she explains, she was against such restrictions, but as time went on, she began to change her opinion and began to more closely connect standards to program development and instruction, "Much to my surprise, I am beginning to understand the place of standards for teachers and for curriculum" (p. 220). Standards, she argued, could more closely integrate research with practice and might address critiques of teacher preparation.

As a newcomer to the United States and to her institution, Craig (2006) found herself involved in a change initiative with local schools. Her self-study revealed a disconnect between her perception of herself and the expectations of the reform effort – one with which she became increasingly uncomfortable. This disconnect led to more self-reflection as she began to grapple with a sense of self as teacher educator and researcher:

> I had to reconcile myself to the fact that I, as an individual, could be real in my face-to-face interactions with the teachers but the entrenched institutional forces encasing our activities would continue to place palpable restraints on both the teachers and me, particularly as our work became more public. I would not and could not identify myself as a reformer attached to the change effort. (p. 110)

In the United States, reform-oriented mathematics instruction has been an agenda for over 15 years, one which may or may not have been official policy in

a given state or institution. Actually, reforming instruction was the focus of Thomas and Monroe's (2006) study as Thomas sought to engage his students in problem-solving, with Monroe acting as a critical friend. Over time he/they found that simply arranging desks to allow for group discussions around problems was insufficient: "without rich tasks, getting the students to participate actively and meaningfully in the discourse was a challenge. Later, as the tasks improved, so did the discussion among the students" (Thomas and Monroe 2006, p. 177). Rich tasks, which he defined as those that were meaningful to the students, allowed their interest in mathematics to surface and reaffirmed the instructional changes Thomas had made.

Returning to secondary school English teaching after obtaining a doctorate, Scherff discovered that state and national policy changes had engendered a test-oriented, student unfriendly climate (Scherff and Kaplan 2006). With Kaplan serving as a critical friend, Scherff documented the ways in which she successfully, but mostly unsuccessfully, taught literature and writing. She did not last the full year; she returned to her university as a different person. Where once she had dismissed prospective teachers' concerns over testing and instructional management, she drew from her brief return to the classroom, "I am different and I do things differently. I am acutely aware of my responsibility to prepare preservice teachers for the realities of the job" (p. 165).

After becoming a new department head, Fayne (2007) began to study the connection between supervisors, the teacher education program, and the student teaching experience. She studied the supervisors' concerns and successes and then used her position to establish reasonable supervisory loads and to work with the faculty. "We identified adjustments and modifications to course design and early field requirements that would address the problems identified by supervisors" (p. 64). This is one of a very few studies in which policies were established by local actors, engaging in local research, to serve local needs.

Prado-Olmos et al. (2007) are another example of local agency and local impact. Based on their own experiences as faculty of color, they collaboratively studied their instruction in multicultural courses and summer institutes. They developed principles for their instruction, added their own stories/experiences, "of racial and ethnic oppression, and encouraged our students to do the same. We were decidedly political" (p. 97). They noted that first students needed to see themselves in courses, reading, and activities before they could go beyond self to appreciate diversity in other forms.

Olafson et al. (2007) sought to create a more collaborative, field-based, and content integrated program for their teachers. Their data indicated several challenges such as:

> striking the appropriate balance between teaching structured teaching strategies, course content, and candidates' experience in the classroom. We had to reframe the meaning of experience in our program to challenge whether our classrooms were valuable places for candidates to begin to talk about methods and techniques of teaching and critically examine their experiences. (p. 162)

While they experienced some progress, the change initiative ultimately failed in the second and third years of the program when collaboration became more difficult. The authors found that adding new participants and closely linking school-based practitioners and university-based practitioners proved impossible, especially when external funds to support the initiative ended.

Chappell (2008) studied eight dance-based partnerships between school teachers and dance artists, resulting from a shift in national policy in England. He found considerable variation in schools' support for working together and considerable tension between an orientation to dance as process and dance as leading to a performance. He also found considerable variation in teachers' and dance artists' willingness to be studied as partnerships were implemented:

> And yet, in the majority of the eight partnerships, teachers were open to letting the challenge in to some degree. Dance artists with more mature or more 'activist' backgrounds, encouraged by the challenges brought in by the research mentor, were able to stretch teachers' perceptions beyond the performativity culture encouraged by their LEA, into a more reflective, deeper, process-focused way of working, which was perhaps also more risky and unknown. Teachers tempered these challenges within their own situations to differing degrees, but were able to do this despite the fact that they did not have a strong local culture of encouraging creativity. (p. 182)

In a study of the tension between formative and summative assessment in the practicum, Parker and Volante (2009) conducted a study of supervisors' and their own experiences. They developed an understanding of how individual bias affected assessment and the strategies they used for balancing conflicting messages from formative and summative feedback. They shared their work with others, external to the university, gaining more feedback. They reported using their study to influence local policy and practice, "Since writing this paper, we have approached the Program Committee and been invited to lead a sub-committee to revise the evaluation form for teacher candidates" (p. 42).

Craig (2010) found herself affected by the external review process necessary for accreditation, both university accreditation and teacher education program accreditation. She described how the hard work of she and others had done was discounted within the college, but that "one of the baseline assumptions of accountability systems is the belief that somebody is doing something wrong for which they should be punished" (p. 67). This feeling was reinforced by her institution when her department chair and her faculty colleagues, who had done most of the work for the accreditation review, were not specifically acknowledged by the administration.

The Australian government's revision of literacy instruction necessitated professional development and curriculum development. Harris (2010) was asked to design a module for the early grades. In so doing she found that reframing certain implications embedded in the policy (such as *Methods that Work for all Children* as *Principled Repertoires of Practice* or *Teachers as Recipients of Research* as *Teachers as Producers and Interrogators of Research*) enabled her to transform top-down mandates into professional development opportunities that "engage preservice and classroom teachers in reflecting and acting on key messages in informed

ways, shaping the spaces and possibilities we create for teachers and students in our teacher education courses" (p. 89).

Collaborating to increase their research orientation and productivity, Gemmell et al. (2010) worked to create an atmosphere that was dialogical and promoted reflection on self as teacher and researcher. Over time they articulated five themes concerning their journey together – collaboration, reassessing the nature of research, creating time for research, embracing new roles, and affirming the importance of the integration of self-study research with practice. They cautioned that:

> This is not a journey that is safely predictable and replicable. The account is more like those travelers' tales that show that there are wonderful new landscapes to be experienced and that there is always something personally and professionally valuable to be found in them. (p. 100)

Erickson and Young (2011) hoped to (and were funded to) work with teachers on developing curriculum/instructional guides for local and widespread dissemination. The project was not successful, in part because, "Prior to our self-study, we were unaware of how deeply the discourse of teacher educators permeated our ways of interacting, believing, and thinking" (p. 100). They were perceived to have become a part of top-down implementation as opposed to collaborators working as a group to make policy mandates locally meaningful.

In New Zealand, a new national curriculum encouraged focusing on learners' needs and relevant curriculum (in contrast to the other reforms referenced by self-study authors). Major (2011) investigated ways this curriculum change might affect preservice teachers, particularly in developing teacher capacity to engage in culturally appropriate practice. In the course of this study, Major reported that:

> Despite my belief that knowledge and knowing are contextualised, contingent, partial and temporary, allowing that to play out in practice still seems incredibly difficult. I feel the pull towards a desire for certainty and stability and away from the messiness and paradoxes inherent in education today. (p. 259)

In other words, the impact of Major's (2011) self-study was the realization that teaching in culturally appropriate ways is more difficult to implement than to promote.

As Monroe (2013) moved from being a mathematics teacher to a mathematics teacher educator, she wondered if her knowledge was transferable or consistent, especially given changes in policy and recommended practice. She reviewed notes on and recollections of her teaching and found that, over time, she had developed a sense of the cultural differences in student populations and how those differences shaped her practice. She also learned that one must structure learning environments to support those differences – and that this was not always possible for her:

> In contexts where I perceived a shared commitment to equitable discourse and learning environments, I could readily adapt my practice to the cultural milieu without a threat to my sense of self as a mathematics educator. In other cases, I experienced internal dissonance,

not readily formulating a response that I considered both equitable and culturally appropriate. (p. 105)

Byrd (2015) used the phrase "rigor revolution" to describe his principal's mandate to focus on college readiness. To address this, while maintaining a commitment to student centeredness, Byrd studied his students' orientations to reading. On a surface level, he found that students were quite able to recite the official school views on reading, but that when he observed them less directly they had their own, distinct views. This knowledge, he felt might enable him to be a better teacher, "it assigns me the task of uncovering students' private reading orientations in order to help them form orientations that are better suited to their strengths and needs" (p. 138).

LaBoskey and Richert (2015) studied their graduates' practice, given that they were engaging in self-study projects. They found that the graduates were able to initiate focused studies geared to improvement. Graduates interacted with others around their study and used multiple, primarily quantitative methods. Only one graduate, however, sought to validate their study using an exemplar-based approach. This information now influences their:

> thinking and practice with regard to our support of such work, not only in terms of the facilitation of self-study, but also in terms of how we prepare credential students in the specific areas of focus for them: academic choice, motivation in reading, and orientation to reading. (p. 170)

LaBoskey and Richert (2015) concluded that they needed to be more explicit about the components of self-study, especially in searching for disconfirming evidence. Overall, they confirmed for themselves that self-study is an appropriate approach to studying one's own teaching and has the potential of transforming teaching practice.

Bauman (2015), a kindergarten teacher, corroborated the findings of LaBoskey and Richert (2015) in her study of her students pretend gunplay. She noted that her students tried to hide what they perceived as illicit activity from her, but that the gunplay was pervasive. She encouraged them to share their play with her and began to see that it facilitated English language learning, developing and maintaining social rules, and distinctions between pretend and real:

> The most rewarding part of this investigation was the chance to see how my students effectively responded to their peers' social-emotional needs and how they practiced self-regulation. I had no idea that there would be so much cooperation demonstrated within this type of play. (p. 208)

She concluded that because guns affect both social justice and safety teachers, it should not suppress the topic but should use it to facilitate critical thinking.

In Korea, there is considerable pressure on students to study hard and pass the state tests. Ro (2017) studied three teachers who had reputations for engaging in practitioner-led inquiry and had published their work in a variety of venues. The teachers felt that the emphasis on test preparation diminished students' inquiry skills

and, furthermore, was seldom related to real-world mathematics and science problems. Despite the teachers' national reputations and their pedagogical convictions, their work had no impact on policy, and they had to segment their curriculum so that test preparation was well covered. Acknowledging work by Hargreaves and Shirley (2012), Ro concluded that:

> A broad and sustainable reform requires collaboration of all entities working toward a better public education system. Instead of treating teachers as the target of reform, policy makers need to shift their mind-set to involve teachers as partners of reform. (p. 40)

Kornfeld, Grady, Marker, and Ruddell (2007) conducted a multi-year study of responding to state-mandated teacher preparation curriculum change, specifically:

> 19 standards, each of which includes a number of specific elements. In order to win the CCTC's approval, institutions must submit lengthy documents detailing how their proposed credential programs will meet each element of each standard – 128 elements in all. (p. 1904)

They felt as though they were being forced into practices that shifted power to the state. Once the program was implemented, however, they found that their students labeled them as being top-down, at least until the changes had been in place for a few years. The authors found that over time a common language evolved and that the authors were adopting that language themselves and began framing curricular decisions around what the state expected and allowed. They concluded that continuous self-study was imperative if they were to maintain their own principled beliefs.

Emotional Impact of Policy

The studies in this section discuss policy implementation and change through the presentation of very personal and often even painful experiences. While Henry et al. (1997) did not discuss emotion, per se, they emphasized the very complex relationship between policy and change. We agree with them that:

> the so-called rational model of educational change separates policy processes into two distinct stages of policy development and policy implementation. This model assumes that, given a set of perfect conditions, policies can produce the desired outcomes. But given human diversity and organizational complexity, this assumption is fundamentally flawed. (p. 7)

We divide this section among three categories of emotional response (high, medium, and low) to demonstrate the range of passions among the authors who chose to elaborate on emotions as they discussed policy impact. Those we labeled as studies with high emotional tones described feelings in detail as a major element of the article. In the more moderate discussions, the emotional effect of the policy or policies was described, but did not color the entire article. The authors of studies with low emotional tone mentioned emotion almost as an afterthought.

High Emotional Response

As recounted earlier in this chapter, Scherff (Scherff and Kaplan 2006) returned to teaching high school English in her original home state after working as a tenure track faculty member. Her coauthor, Kaplan, was a professor who characterized Scherff as, "an accomplished teacher, researcher, and academic" (p. 157). Scherff expected a rather easy reentry into the classroom, but conditions in her state had changed:

> I found myself facing students who did not care about English or reading. Due to the demands of testing and the low achievement levels of my students, I rarely had time to draw on my exciting ideas. Most students did not want to do projects that highlighted their talents. Sadly, they were used to worksheets and seat work. (p. 159)

Kaplan noted that, "Lisa lasted for half a year. She lasted until she was ready to scream and fall on the floor in utter frustration. She lasted until she realized that she was doing more harm than good. She dreaded going to school each day" (p. 160). Both authors discussed the ways in which high-stakes testing in the state had produced physical pain, emotional stress, and an overwhelming sense of failure for Scherff. As we discussed in the previous section, Scherff was able to learn from her disastrous experience and used that understanding to shift from ignoring test preparation and began to discuss with her students/future teachers the reality that teaching would include high-stakes testing and expectations for their students to perform well on tests.

High-stakes testing is also the topic of Craig's (2010) inquiry into the ways policy was affecting her teaching, her research, and her annual reviews:

> The press for accountability is driving me wild... I see it not only paralyzing others but seizing me as well. For the teachers in my research, it is weekly submissions of lesson plans, benchmark tests, achievement exams, practice testing, attendance reports, telephone logs, site visits, quality reviews, training sessions, and meetings, meetings, meetings... (p. 63)

She described in great detail the ways in which her methodology of narrative inquiry was called into question when she attempted to renew her research approval. This led her to cease working with children. Her syllabi were no longer under her control. Not only did she need rubrics for evaluating every assignment, she was also required to use the language of the national accrediting teacher education agency *and* the language of the university's accrediting agency in her syllabus. She was also expected to produce student samples illustrating low-, medium-, and high-quality work and to predict, for the future, what percentage of students would fall into each category. "Faced with impossible deadlines, I missed a student defense and began to uncharacteristically lose things" (p. 67). "I also struggled to control the intense emotions I felt boiling inside of me as I later reported in my journal" (p. 69). While her self-study helped her document and better understand her emotions, it did not enable her to affect her institution's policies.

Erickson and Young (2011) began working with a local school to address the US policy often referred to as *No Child Left Behind* (Public Law No. 107–110, 115, STAT. 1425) – the same policy that caused the state-level changes discussed by Scherff and Kaplan (2006). The researchers were invited to assist teachers in developing higher-quality social studies lessons (an area not tested by the law but mandated by the school). The researchers were very disappointed with the materials that the teachers produced:

> Typically, we found the objectives to be underdeveloped, and clear alignment between lesson components was not always apparent to us. Further, attempts to align instruction with state core curriculum guidelines often appeared inappropriate. (p. 96)

They found themselves caught between valuing the teachers' work and meeting what they perceived to be the higher level of expectations of the agency funding. They opted to revise the teachers' work. "Over time, however, the teachers' disappointment with our changes surfaced. . ... Their comments signaled mounting irritation with the alterations we had made to the original lesson materials they had given us" (pp. 97–98). Only three teachers decided to stick with the project; the others all dropped out. "As we listened to the teachers, we were hurt and disappointed that they felt their participation in the project had been futile" (p. 98). They concluded that:

> We need to recognize multiple ways of knowing that are valued outside the academy. In this case, the discourse of teaching, including a quest for "what works" in teachers' classrooms, represented ways of knowing that merited consideration. Relationships may be at risk when teacher educators inadvertently show partiality towards empirical knowledge and devalue the knowledge privileged in the discourse of teachers. (p. 102)

Without their self-study, they would not have been as attuned to the teachers' feelings of ownership and their own decisions to privilege the funding agency over the teachers' work.

The final study in this section was the group self-study of aligning of a teacher education program with state-mandated teacher education standards conducted by Kornfeld et al. (2007). They identified three levels in which emotions came into play. The first was the struggle to adapt to the new standards and, at the same time, to continue meeting the expectations of the national accrediting body, which "took a tremendous toll on faculty members involved in writing and preparing the program document. Interviews revealed strong reactions of anger, resentment, and fear, as well as feelings of helplessness and inadequacy" (p. 1911). The second lay in the early stages of implementation when students became angry with change in the midst of their program:

> Our students' response to our directives was disturbingly similar to our response to the CCTC. Now we were the entity that was quoting specific standards and citing the TPEs to explain the new requirements: although we had not originated this discourse, in our students' eyes we were the entity mandating changes in a dictatorial, technocratic manner. (p. 1919)

The third level involved their own emotions as they realized that their teaching, their language, and their coursework were all being affected by the changes – that their convictions would be compromised if they did not continue using self-study to monitor themselves and one another.

Moderate Emotional Response

Moving from Canada to the United States brought Kosnik (2005) into close and uncomfortable contact with the policy referenced by Erickson and Young (2011):

> As I become more familiar with the NCLB legislation, I am shocked by the ability of a government to impose practices (which are not universally accepted or based on research) on an entire nation, and to force each state's cooperation in abiding by these policies of practice. (p. 214)

She observed more and more regulations being placed upon teachers who, in her view, were blamed for all students' failures, likely because their teacher education programs were at fault. Over time, and as she studied her own ability to connect the standards to her work with teacher educators, Kosnik came to believe that standards for teachers and for teacher education that:

> if appropriately formulated, can provide a rationale for teacher education and can prescribe appropriate practice. In order to acquire the knowledge, skills, and attitudes of thoughtful and effective practitioners, beginning teachers need specific knowledge; they require time to learn their craft, and they need to be enrolled in substantial (not shortened) programs developed by skilled teacher educators. (p. 220)

Craig (2006) also moved from Canada to the United States, but instead of interacting with federal policy mandates, she became involved with a school-university research project in which she was labeled as an outsider and expected to help implement a more local version of reform. She expressed discomfort with being positioned this way, deciding that she had become hybridized, "deeply connected to the myriad of teachers, principals, university professors, and reform representatives with whom I personally interacted but still detached, to the extent possible, from the status quo agendas of the institutions they represented" (p. 112).

Excited to try multiple approaches to mathematics problem-solving, Thomas and Monroe (2006) reported on Thomas's efforts to improve his teaching effectiveness. Over time, based in part by Monroe's feedback, Thomas began to attend to the emotional climate in the classroom:

> Students were expected to share leadership and all were to participate in the discussion. In a setting where the focus was only on the correct answer, students often feared taking risks. Instead, our classroom environment became a place where mistakes were common but not criticized. (p. 178)

He was amazed at the results, and his efforts to improve his teaching and his students' learning were affirmed.

Uncomfortable with being positioned, and adopting a poststructural approach, Prado-Olmos et al. (2007) (all Chicana/o [their reference to themselves] faculty teaching courses in cultural diversity) adopted a proactive approach to curricular change. They noted that their university held promoting diversity as a core value. Thus, the professors had the opportunity to explicate principles for their own practice while discussing the tensions and the challenges students of color face at the university and in society. As a group they stated, "we believe it is critically important to create a supportive classroom environment. Attending to this in our teaching is essential for facilitating the kind of openness, for both students and faculty, that we feel is evidenced herein" (p. 100).

Harris (2010) was charged with developing curriculum on early literacy in Australia. She felt some discomfort with developing a curriculum in a top-down manner, and so she studied her own practice of teaching the modules she developed to teachers. The article reflected on how the policy guiding the curriculum and her teaching of teachers highlighted the ways that:

> Conflicting messages within and across research, policy, and practice can and do arise, as I found in this self-study. How we respond to and make sense of these conflicts is part and parcel of the choices we make in our mediation as teacher educators, and is shaped by our own professional histories and philosophies. (p. 89)

Gemmell et al. (2010) discussed the uncomfortable pressure that their colleagues experienced as a result of local policies requiring teacher educators to also be researchers, "Most of us were considered by the School of Education, as well as by the university, not to be doing enough research" (p. 162). They formed a research group of nine colleagues and then began to study issues in the own practice – which increased participants' interest in and enthusiasm for research.

Low Emotional Response

Monroe (2013) reflected on her move from mathematics teaching to becoming a mathematics teacher educator. Like Prado-Olmos et al. (2007), she emphasized the importance of creating a supportive learning environment. She wondered what that might mean across cultures. She learned that "reform-based mathematics pedagogy can create dissonance within Native children when it encourages teachers to challenge a student's ideas to help him or her further shape or build a mathematical argument" (p. 98) and that in Hawaii discourse had to be very carefully planned in order to allow participants the opportunity to disagree or question without being perceived as rude.

In South Korea, teachers experienced a tension between what they felt to be meaningful mathematics teaching and test preparation. Ro (2017) reported on teachers who were studying their own practices. While she did not conduct a self-

study of her practice, we included it because of the teachers' work. She found that in all cases, the teachers taught the test at one time and engaged their students in inquiry projects at another. They did not feel safe merging the two:

> A space needs to be created where various practitioners, not only teachers, can share, discuss, and improve their reform ideas freely. It is only when individual teachers' capacities are combined with the collective ideas of other practitioners, and both consistently work together, that a meaningful reform can be achieved. (p. 40)

Conclusion

As we notes earlier, things have and have not changed in the arena of policy since the publication of the first *International Handbook of Self-study of Teaching and Teacher Education Practices*. Those two volumes did not contain a chapter on policy, and now there is a growing body of work relating self-study to policy. From the self-studies presented in this chapter, there is evidence that self-studies are becoming a bit more connected to local, university, regional, state, and national contexts. These studies, however, are limited in scope in that they typically document policy impact, but do not interrogate or critique the policies themselves. There is no evidence that policy studies are aggregated across contexts, nor are they becoming more connected to the world, or to contexts that cross borders. To do so, in our view, would entail establishing a specific subgroup of the Self-Study SIG and to consciously devote cross-national attention toward building a research agenda. Much of the current research concerns the impact of national policy changes in the United States and resultant changes in state and local policies on teaching and teacher education. A few studies explored national- and state-level polices in Australia (Doecke 2004), Korea (Ro 2017), New Zealand (Major 2011), and the United Kingdom (Chappell 2008), but self-study researchers in the United States were the most likely to write about the impact of policies on their work as teacher educators and on teachers with whom they work. What has not changed, as far as we could determine from our searches, are studies that, as Loughran (2010) urged, move beyond stories of the impact of policy to examples of how self-study research might inform or influence state or national policy. We found no evidence that researchers were responding to Zeichner's (2007) recommendation that self-study researchers use their expertise to affect policy. There is one possible exception to this, however. Bedell et al. (2017) presented a paper on the ways in which they were able to affect state-level policy on teacher candidate evaluations in New Hampshire, USA, to the annual meeting of the *American Educational Research Association*. As of now, to our knowledge, that study has not been published, and we did not include it in our review.

Influencing local policy seems much more amenable to self-study research (Parker and Volante 2009; LaBoskey and Richert 2015; Cochran-Smith et al. 1999; Fayne 2007). Parker and Volante (2009) and Fayne (2007) described their attempts to influence policies related to teacher candidate supervision. The other two studies examined assumptions/policies guiding their teacher education

programs and changes or improvements that occurred as a result of their studies. Still, four is a very small number of studies, something to which we return later in this section.

At this point it is clear that the impact of policy and teacher educators' reactions to that impact predominate. How oneself implemented policy-guided instruction (e.g., Thomas and Monroe 2006); how oneself was harmed by policy (e.g., Scherff and Kaplan 2006); or how oneself implemented policy (e.g., Major 2011) constitute the bulk of the studies. There is no indication that such studies are dramatically increasing or decreasing over time; we found nothing published in 2017 and that leads us to speculate that the angst created by US state and national mandates may be diminishing, but it is too early to tell.

The subject matter content of the policy studies included literacy (e.g., Harris 2010) mathematics and science (e.g., Ro 2017), early childhood (e.g., Bauman 2015), social studies (e.g., Erickson and Young 2011), and dance (e.g., Chappell 2008). Absent were policy studies in language acquisition or language policy, special education, physical education, art, and theatre. Because of Carl's background in special education, we were acutely aware that we found no self-studies in that field, although an author of the Cochran-Smith et al. (1999) article, Alec Peck, is a special educator. In addition, Weiss et al. (2015) do implement a design similar to self-study as they discuss collaborative course development in special education. We note, however, that at the 2018 meeting of the American Educational Research Association, presentations in self-study sessions did include special educators, and we look forward to seeing some of these published.

We asked ourselves: Why is it that there are so few policy-related self-studies? Why is it that teacher educators who have become administrators are not, at least, conducting more local policy-related self-study research? Why is it that special education is notably absent from policy self-studies? Why is it that Zeichner's (2007) plea that "self-study researchers become more engaged with the mainstream of research in teacher education and insert the perspectives and voices of practicing teacher educators more centrally into the policy debates that frame teacher education practice at the local level (p. 43)" is generally being ignored? As an administrator (Renée) and a special educator (Carl), we offer the following speculations concerning these questions.

We feel that it is entirely possible that the personal, localized nature of current self-study research often discourages examinations of policy. If one is concerned primarily with one's relationship with and impact on one's students, policy may only enter one's frame of reference when the policy becomes intrusive, renders practice uncomfortable, or opens a window to re-envisioning and improving practice. At this point, we, a subset of the self-study community, have not yet turned our gaze beyond the more immediate to a wider horizon. At the same time, we who have moved into administration may not see our policy-related actions or inactions as a source of interesting data. It is also possible that we are loathe (possibly afraid) to do make or work public because of the potential harm that could come to our college/university/selves from policymakers who also fund our teaching and research.

Professor or administrator, engaging with policy, can be dangerous (or perceived as dangerous) to self and to department. For example, special education, in most schools or colleges of education, is seldom located in the same department or work group as early childhood, elementary, or secondary education. Working across programmatic lines is seldom a norm. Likewise, university faculty in the field of special education often claim ideological roots that reside in a far different place than those of other education faculty. It is possible that by embracing self-study, special educators also embrace new methodologies that are perceived as incompatible with traditional methods and, therefore, might harm the chance for promotion and diminish one's stature in the field. This may be beginning to change – as two self-study sessions at the 2018 meeting of the American Educational Research Association contained presentations by special educators. It should be noted that line of reasoning in the preceding sentences do not explain the apparent dearth of self-study work in ESL/bilingual education that is openly related to policy issues. Due to issues of equity, ESL/bilingual education efforts exist in a space that is both politically charged and highly regulated and deserving of critical exploration, especially by self-study researchers.

Another politically charged teacher education policy, coming from our US home state of Arizona, allows school districts to hire and grant certification to any secondary teacher who has completed 5 years of relevant work experience – nothing more. One could imagine a collaborative self-study in which a school- or university-based teacher educator might work with one of these teachers – both documenting their problems, solutions, dilemmas, successes, and joys. One could image that a result *might* be that lack of prior teacher education meant nothing, that the beginning teacher, with the help from the collaborating teacher educator, had a beginning year that was no worse than the beginning years described in much of the literature. Or, one could imagine that a result *might* be that the beginning teacher quit midyear, emotionally and professionally scarred. In the first possibility, we (as self-study researchers) might be documenting that we should not exist – a clear political threat. In the second possibility, we (as self-study researchers) might be exposing professional misconduct on the part of the teacher educator, district or the beginning teacher. Ethically, therefore, should we be using our research to produce exposés?

In a somewhat related fashion, it is possible that the emotions engendered by some of the researchers described in this chapter are (or are perceived as being) too personal and not sufficiently academic or analytical. It is possible that just as self-study involves opening one's practice to scrutiny and critique, policy research might open not only self to scrutiny but also one's institution. As we mentioned earlier, the latter may be particularly problematic for administrators – who all too often are viewed as institutional representatives and who may be prohibited from speaking out for just that reason.

It is also possible that there is much more work in the self-study literature that is tied to educational policy, but not explicitly. We explored journals beyond *Studying Teacher Education*, but our keyword searches may have left relevant studies out. For this chapter, we selected peer-reviewed self-study articles that evidenced an obvious link to policy at the national, state, or regional/local level. In most cases, the authors made overt references to the manner in which education policies that prompted their exploration of practices (e.g., Kosnik 2005; Prado-Olmos et al. 2007;

Ro 2017). In other instances, direct association to policy was made as the researchers explored the context for the data they had collected (e.g., Craig 2006; Gemmell et al. 2010; Scherff and Kaplan 2006). It could be conceived, however, that many (most?) self-study research in teacher education is situated in policy. The researchers, however, may have been less attuned to the policy (or political) dimensions of their work as opposed to the immediacy of improving classroom (or field-based) practice. Regardless of the topic, all work in teacher education likely can be described as situated in some way in the policies that drive those practices. Efforts by authors to include policy issues in their description of the context milieu of their work would provide valuable insights as we seek to understand the implications of policy on teacher educators.

It is absolutely certain that there will be more national, state, and regional/local policies authored, adopted, and implemented between now and a third edition of this handbook. If this chapter were to be updated for a third edition of this handbook, we would hope to find that self-study researchers were contributing from other fields of education (i.e., special education, the arts, and ESL/bilingual education), considering the context of policy at a global level, and allowing themselves to write confidently about the passions that emerge in their work. As Henry et al. (1997) argued, it is highly probable that a rational model for describing policy development and change does not accurately describe the implicit and explicit values the cultural and contextual variation or the intended and unintended outcomes. As Zeichner (2007) argued, only by deliberately integrating self-study within programs of policy-related research can we use our work to make a difference. For this to happen, a portion of the self-study community must consciously develop related, overlapping, possibly collaborative programs of policy-oriented research.

In closing, we believe that as self-study researchers, we have an obligation to our students and to their students to describe contextually and culturally beneficial instructional practices that have a positive (or a negative) effect on learning, creativity, and skill acquisition. We have an obligation to qualitatively aggregate our results and to explore the ways in which these results can lead to policy changes locally, within our states, nationally, and maybe (at some point) internationally. If we, the community of teacher educators and administrators from all regions of the world who continue to engage in self-study research, do not turn a part of our research agenda to both studying the impact of polices and using our knowledge to inform policymakers, who will? And as we answer that question, there is one more – should they be the ones doing so?

Part II

Self-Study Methods and Methodologies

The second part of the *International Handbook of Self-Study of Teaching and Teacher Education Practices* explores the pressures, constraints, invitations, and opportunities that are a part of self-study methods and methodologies. Early chapters focus on the nature of the methodology, with a particular emphasis on what it means to be a hybrid methodology and how self-study researchers might live their commitments to quality and trustworthiness in the shifting grounds afforded by self-study methodology. Middle chapters explore different opportunities and possibilities for beginning to engage with self-study methodology before moving on to robust considerations and analyses of the methods afforded by self-study and the concept of methodological innovation with our practice as researchers. After a chapter revisiting important questions of ethics in self-study, the part concludes with a newcomer's analysis of self-study methodology through the lenses of experiences in reflexive methodologies grounded in a different academic culture and language. This part challenges all self-study researchers, regardless of experience, to consider carefully how concepts such as collaboration, critical friendship, hybridity, and trustworthiness contribute to the selection of methods and the development of methodological inventiveness in producing ethical, high-quality self-study research.

Navigating the Pressures of Self-Study Methodology

Constraints, Invitations, and Future Directions

Shawn Michael Bullock

Contents

Abstract

In this chapter, I will focus on the concept of pressures in self-study methodology with a view to focusing on the constraints and opportunities around two major considerations in self-study methodology: critical friendship and collaboration. Both are widely used in the extant literature, are ill-defined, and may pose some considerable pause from new and experienced self-study researchers alike. A conceptual metaphor developed from my lifelong experience as a learner and teacher of martial arts will provide an additional lens for examining these pressures. I then suggest a different entry point for thinking about self-study methodology: the freedom to be creative in an environment to do self-study through what I refer to as creatogenic and creatopathic environments. The chapter concludes by using this heuristic to provide a brief analysis of the chapters comprising this section of the handbook, all of which have taken a new approach to considering self-study, methods, and methodologies.

In my 15 years of involvement with self-study methodology, I have noticed a sometimes uncomfortable relationship between the community and its methodology. On the one hand, there were a considerable number of chapters in the first handbook devoted to unpacking the methodological traditions that had developed in the first decade of self-study. Bullough and Pinnegar's (2001) *Guidelines for quality in autobiographical forms of self-study research* continues to serve as a touchstone for many, and there are several books devoted to issues of methodology and methods within self-study (e.g., Pinnegar and Hamilton 2009; Lassonde et al. 2009; Tidwell et al. 2009). On the other hand, I have witnessed many discussions at both the biennial International Conference of Self-Study of Teacher Education Practices ("The Castle Conference") and meetings of the American Educational Research Association (AERA) that have resulted in sometimes uncomfortable disagreements on the nature of methodology and method.

While a certain amount of disagreement is healthy and helpful for any research paradigm, I have noticed that those in disagreement are often those who are more familiar with self-study methodology and those who are new to the field. Those new to self-study, for example, tend to ask questions about why self-study is considered different to, for example, autoethnography or action research and often express frustration at what some consider to be an unclear set of starting points. Those who are more experienced with the field tend to focus on self-study's hybrid, collaborative nature and the importance of starting to *do* self-study to figure out what self-study is and what it can be for a particular researcher. It is understandable for those who have worked in this or any other research methodology to expect that newcomers do a certain amount of reading to familiarize themselves with a tradition, but I can also empathize with a newcomer who might be confused by statements such as "self-study is not a 'recipe' or 'procedure,' rather it is a methodology" (Loughran 2005, p. 6). The name of the methodology, self-study, has been noted as being a confusing starting point as self-study methodology requires some kind of interaction and many researchers use terms such as collaborative self-study and critical friendship routinely in their work.

My intention in this introductory chapter is neither to provide a comprehensive literature review of methods and methodologies in self-study nor to review in detail the chapters that follow. Indeed, I believe that utilizing one or both of these approaches would be counterproductive to a direction that I think might be more useful for those who are both new and experienced in self-study. In this chapter I will focus on the concept of *pressures* in self-study methodology with a view to focussing on the constraints and opportunities around two major considerations in self-study methodology: critical friendship and collaboration. Both are widely used in the extant literature, both are ill-defined, and both may pose some considerable pause from new and experienced self-study researchers alike.

I begin by invoking a conceptual metaphor, derived from my lifelong practice as a learner and teacher of martial arts for thinking about the idea of pressure in self-study methodology and methods. I then explore some of the existing literature on both critical friendship and collaboration in self-study methodology in order to demonstrate the potential value of this metaphor and to complicate further some of the conversations around methodology in self-study. I will then suggest a different entry point for thinking about self-study methodology: the freedom to be creative in an environment to do self-study, what I refer to as *creatogenic* and *creatopathic* environments. Finally, I will use this heuristic to provide a brief analysis of the chapters comprising this section of the handbook, all of which have taken a new approach to considering self-study, methods, and methodologies. Neither this chapter nor any in this section claims to be an exhaustive literature review. Instead, I hope that this and the other chapters in this section provide both a useful jumping-off point for those new to self-study and a helpful tool for reframing existing understandings for those more experienced in self-study methodology.

Pressures in Self-Study Methodology

In Bullock (2014) and Bullock (2016), I explored some of the ways in which a lifelong involvement in teaching and learning martial arts affected how I think about teaching, learning, teacher education, and self-study. In part, I used metaphors crucial to learning martial arts as a catalyst for thinking about some of the unique features of self-study. In so doing, I recognized the effects that my personal history as a learner had on my professional history as a researcher and teacher educator. As I have noted elsewhere, it is difficult for me to separate lessons from martial arts from how I think, as I have engaged with them as a learner for nearly four decades and as a teacher for about half that time. They are, to paraphrase Russell (1997), a part of who I am in how I teach and, necessarily, how I do self-study research. Connecting with, and being open about, my connections between martial arts, learning, teaching, teacher education, and self-study is a part of my moral commitment to self-study research and practice (Pinnegar and Hamilton 2009).

For this section devoted to pressures in conducting self-study research, I will invoke a metaphor from Italian forms of swordplay in an attempt to complicate the English term "pressure." To do so, I entreat the reader to think about a concept known as *stringere*, a term that is often casually translated as pressure but more usefully – at least in swordplay – conceptualized as an interplay between constraint and invitation. Within Italian traditions largely developed in the Renaissance (see Capoferro 1610/1999), *stringere* highlights the placement of one's sword relative to one's opponent's sword. For example, I might position my sword (e.g., a side sword or a rapier) such that the hilt (the part held in one's hand) is aimed slightly toward my hip and the rest of the sword aiming on a diagonal, away from me and toward my opponent. The point of the sword thus appears in my line of vision at about the level of my nose, angled toward the opponent. Italian swordplay would refer to this *stringere* as blocking an inside line while leaving an outside line open. A wise

opponent would not attempt to attack the inside line, through a presented sword. They would instead attack on the outside line, over the hilt, and toward the outside of my body, where there is very little sword. A wise defender would not remain in the existing guard if attacked on the outside line; they would shift their arm 90° to close the outside line with the strongest part of the sword (the *forte*). Of course, in closing the outside line, they open the inside line. And so it goes in swordplay: action and reaction, *risposte alle domande poste*.

If the preceding is difficult to visualize, all one needs to do is realize that any action in swordplay provokes a reaction and that there is a certain logic to the sorts of reactions one might encounter. In fact, many texts are framed as a conversation between attacker and defender or teacher and student. Sometimes, activities for learning swordplay are framed along the lines of questions: "If the attacker asks you a question by moving their sword in a particular way, what is your response?." An attack on an outside line requires one to close the outside line, which in turn opens up one's inside line. And the converse is true. It is obviously outside the scope of this chapter to go into the full range of "questions and answers" posed in swordplay, but the idea is that there is neither a perfect guard nor a perfect attack. There are always openings and closings.

Indulging me for a moment longer, I would like to point out that *stringere* requires a student of swordplay to always be mindful of openings created by closings and, by extension, to employ this knowledge strategically. One possible way of interpreting this concept, which was used extensively during my studies, is that any constraint one places on the motion of one's opponent's sword is an invitation for them to move differently. Thus we say that *stringere* involves both constraint and invitation. A martial artist, skilled with a sword, purposefully constrains, even over-constrains, in order to invite a particular invitation. In other words: I might over-constrain the inside line with an obvious movement because I know that such a movement pro-vokes a response on the outside line, for which I am prepared. Such a strategy is considerably better than choosing a guard position that waits for an unknown response.

In analyzing how the concept of pressure affects the way I think about self-study methodology, I was drawn immediately into thinking about the dynamic nature of how different pressures develop, increase, decrease, and redevelop over the course of any self-study work that I have done. Be it through critical friendship or through some other sort of collaboration, I have never had an experience in self-study that was free of pressure or an experience that was always subject to the same, constant pressure. I am also mindful of the tendency to associate the word *pressure* with negative experiences – we might speak of feeling pressure at work, pressure to meet a deadline, and pressure to move out of our comfort zone. Thinking about my contributions to this handbook, however, made me realize the extent to which I think about pressure from my lifetime of education in the martial arts. For me, pressures in research methodology and in the martial arts can be modelled in similar ways. I would argue strongly that self-study methodology requires a management of pressures that can be productively understood through the lens of *stringere*, the language of constraints and invitations. Each time I invoke the concept of *stringere*

in this chapter, I encourage the reader to remember that this concept is a way of modelling the richness of the pressures we experience as self-study researchers.

I now turn to examples of how *stringere* might apply to both develop and enrich an understanding of two of the key tenants of self-study that are likely to provoke both discussion and disquiet in discussions of both new and experienced self-study researchers. The differences in, and opportunities afforded by, the methodological hallmarks of *critical friendship* and *collaboration* call attention to one seemingly obvious critique of self-study: How can it be *self*-study if you are working with other people? One response is to say that self-study is both self-initiated and self-focused (LaBoskey 2004) or that "self-study must go beyond personal reflections of practice so that the learning about teacher education practices might truly resonate with others" (Loughran 2005, p. 6). Accepting these assertions, however, does not make navigating the vast literature in self-study that uses critical friendship and/or collaboration any simpler – particularly when the precise natures of these concepts are often not made clear. We will now see how *stringere* sheds light on debates, discussions, and questions contained within the tenants of critical friendship and collaboration in self-study by both considering examples from existing self-study research and from chapters in this section of the handbook.

Critical Friendship

Despite the moniker of *self* in self-study, the methodology favors some form of collaboration. A considerable amount of self-study research uses the term *critical friend*, which implies a particular kind of collaboration and an approach to data analysis and interpretation. Problematically, however, it is not always clear what self-study researchers meet by critical friendship and how it intersects with, yet is different from, collaboration. Are collaborators necessarily critical friends? Is it possible to do collaborative self-study without critical friendship? Moreover, is it possible to do self-study without some form of collaboration? The answer to the last of these questions seems to be a resounding "no," from the literature, although one must broaden the concept of collaboration somewhat. The answer to the first two questions is less clear and speaks to the varying understandings of critical friendship implicit in the literature. For example, Mena and Russell (2017) analyzed 65 papers presented at the 10th Castle Conference (held in 2014) and offered the following challenge to self-study researchers:

> A critical friend who already understands the researcher can help to review data, challenge assumptions, and suggest additional perspectives. Thus self-study is a personal analysis of teaching practice by the self but it is not conducted in isolation. *About 25% of the papers presented at the 2014 conference appeared to have been carried out individually and without collaboration. We urge self-study researchers to ensure that their self-studies are collaborative and to give at least some explicit attention to the contribution made by the collaborators*. (p. 116, emphasis original)

In particular, they cited critical friendship as an important way of explaining why a study might be considered trustworthy, stating that "simply mentioning trustworthiness does not ensure credibility to those who do not attend a study's presentation" (p. 115). At the same time, however, one might argue that the concept of critical friendship is understood in different ways across different papers, with varying degrees of explication of the nature of said critical friend.

The concept of critical friendship requires one to both be an advocate for the work and to ask difficult questions that might, in some ways, impede the sense of confidence for the teacher educators involved (Schuck and Russell 2005). It adds the pressure to "regularly test the relationship as it proceeds, checking for clues about the level of critical commentary with which each feels comfortable" (p. 120). The constraint of critical friendship ensures that there is a certain kind of trustworthiness to the work by closing down lines of critique around, say solipsism. Critical friendship also offers the constraint of holding one accountable to one's critical friend, be it through an agreement to meet, to exchange written work, or some combination therein. But it opens up a line in which a self-study researcher is perhaps more vulnerable because the researcher is sharing and interpreting their practice within the context of a relationship, one that might also have other professional and/or personal dimensions and one that may or may not require critical friends to negotiate various sorts of boundary crossings (be they social, conceptual, intersectional, and/or institutional). Similarly engaging in self-study without a critical friend constrains the fear of vulnerability, in some ways, but opens one up to other kinds of questions, such as the ways in which one has attempted to understand their own practice via LaBoskey's (2004) exemplar-based validation and the degree to which it is possible to identify living contradictions (Whitehead 1993) without the aid of another. Finally, one might apply *stringere* to understand the different kinds of pressures invoked by other forms of collaborative self-study methodology, in which researchers work together in various ways but explicitly do not identify as critical friends. It is reasonable to ask not only about the differences between critical friendship and collaborative self-study but also the openings and closings of lines of enquiry afforded by each approach.

Schuck and Russell (2005) is one of the most often-cited papers on critical friendship; it is the most cited article in *Studying Teacher Education* (Kitchen and Berry 2020). In my view, it offers one of the clearest articulations of the nature and complexities associated with critical friendship. The paper reports on the ways in which Schuck and Russell acted as critical friends to each other in two different self-studies: first asynchronously with a focus on Russell's teaching via email and then in person when Russell was a visitor to Schuck's university. This article is significant in many ways, one of which is the candor with which the authors outline their uncertainties around critical friendship. Phase 1 focused on Russell's teaching and revealed that the authors had different conceptualizations of the nature of critical friendship, mediated in particular by differences in academic rank:

> Although participating in the project was a valuable learning experience for Sandy [Schuck], she was unsure as to what she was contributing as critical friend to Tom [Russell]. These

issues, that were quite significant for Sandy, were distant or invisible for Tom, particularly as he was struggling with unexpected challenges in his teaching. Differences in academic rank seem to carry much more significance in Australia (as in the UK) than in Canada; Tom saw Sandy as an academic colleague whose comments would be welcome. (p. 109)

The result in Phase 1 was a somewhat uneven understanding of the roles of critical friendship and the degree to which one might support a critical friend versus the degree to which one might challenge the practice of a critical friend – particularly if one is concerned about the complexities of status differences between the two. Returning to the metaphor of *stringere*, we see that each choice made by a critical friend constrains certain lines of enquiry while opening up others. In Phase 1 of their study, Schuck and Russell remind us that academic rank and related power dynamics might act as a constraint within the dyad and, moreover, that the perceptions of each critical friend might differ in an accounting of the constraints and invitations in a given situation. One of the clear insights from their work together is the parallel between learning to teach and learning to be a critical friend: "ascertaining ways of improving practice for oneself is likely to be more effective in enhancing practice than actually being told what to do" (p. 113). Conducted at a distance, Phase 1 of their critical friendship seemed most useful as a catalyst for Russell to write extensively about his perceptions of his teaching, with Schuck navigating how she might respond to his writings with considerable uncertainty.

Phase 2 of Schuck and Russell's (2005) research was undertaken face-to-face and seemed to feature several moments in which the nature of the critical friendship was negotiated more effectively. Phase 2 also highlighted another type of difficulty in self-study work, namely, the pressures associated with finding ways to both support and challenge the work of a critical friend. Significantly, they were able to speak in person after each of Schuck's classes, which brought a mixture of enthusiasm and disappointment for Schuck:

> Supportive and encouraging comments are more easily received than ones that challenge our thinking and beliefs. We both experienced this in the role of the practitioner, and we both wondered how best to challenge gently as the critical friend. Sandy, while eagerly looking forward to the discussions with Tom after each class, also experienced moments of disappointment when Tom highlighted aspects of her practice that could be improved. While recognizing that a study of the aspects of her teaching that could be improved was a central component of her self-study, accepting these challenges from a critical friend and working on ways to address them was not easy. The temptation to be defensive arose, and it was only through reflection after the conversations that Tom's message could be received in the open way he intended. (p. 117)

This excerpt highlights some key features of critical friendship to which the authors return at the end of their article. Schuck and Russell (2005, pp. 119–120) offer 11 conclusions about critical friendship that I will not repeat verbatim here, although I encourage the reader to consider their conclusions in any critical friendship they might undertake. The 11 conclusions, in my view, might also be understood within the *stringere* metaphor. Possible constraints to critical friendship include, but are not limited to, assumptions made about how personal and/or professional friendship

might translate into critical friendship, assumptions about focusing the results of the critical friendship on the person whose teaching is being studied, underestimating the time involved to develop a shared understanding of critical friendship, and the affordances of critical friendships based solely on asynchronous sharing of data. Possible invitations to critical friendship include, but are not limited to, assumptions about how personal and/or professional friendship might translate into critical friendship, the possibilities of building ways to study the nature of critical friendship itself (see Fletcher et al. 2016 for a helpful framework of analysis), the affordances of lengthy critical friendships spanning multiple self-study projects, and the importance of clarifying assumptions about teacher education. To see how a constraint might work with an invitation, I invite the reader to think about how a new critical friend might be selected from, say, a group of existing professional colleagues with whom one has never had an extended conversation about the nature of teacher education.

It is not difficult to find references to critical friendship in the broad self-study literature; in many cases it has been used as a way to signal the special nature of the collaboration between many self-study researchers. Some self-study researchers have specifically considered how their conceptualizations of critical friendship have changed as a result of engaging in self-study. In their conceptualization of a third, "meta" critical friend, Fletcher et al. (2016) warned of the dangers of not considering the possible negative outcomes of critical friendship and suggested that a meta-critical friend could help self-study researchers from single-loop to double-loop learning (Argyris 1976) by helping critical friends push through familiar territory toward new conceptions of teacher education. Their comments align well with Bullough and Pinnegar's (2004) idea that the very notion of framing and reframing problems of practice via critical friendship needs to be unpacked and interpreted as well. Petrarca and Bullock (2014) suggested that an initial commitment to collaborative work required them to negotiate a critical friendship, to engage in the type of thinking they wished to engage with. Olan and Edge (2018) shared a "collaborative conference protocol" (p. 321) to explain how they generated their critical friendship. Their interesting comments help self-study research to, among other things, understand the ways in which critical friendship may require researchers to cross new boundaries, even when there exists a prior personal and/or professional relationship. Olan and Edge concluded that they "experienced critical friendship and added layers to what critical friendship is—layers of re-imaging, re-inventing, negotiation, accepting, and acknowledging that there are events and incidents that are and will inform our lived experiences, even if our voice was silent when that moment occurred" (p. 324).

Nilsson (2013) demonstrated some of the ways in which self-study researchers might work across disciplines by describing the ways in which she acted as a critical friend to six engineering colleagues from her position at a university center for teaching and learning. Nilsson was cognizant that her positioning relative to engineering colleagues might be at odds with some approaches advocated by Schuck and Russell (2005) and took care to find ways to learn from the existing pedagogical expertise of her colleagues, stating that "it became evident that the role of the critical friend shifted from being perceived as an 'expert on teaching' to a co-producer

of knowledge which, in the end, was as a consequence of building respect and trust" (Nilsson 2013, p. 205). The constraint of being framed as a university-based "expert" on teaching (via her role title), compared to colleagues in another faculty, also opened an invitation for Nilsson to engage in new ways of creating mutual trust across disciplines.

Samaras and Sell (2013) extended the idea of critical friendships to working with graduate students in a teacher research course by using letter writing as a way to support self-study research projects. They argued that critical friends should "provoke new ideas and interpretations, question the researcher's assumptions, and participate in open, honest, and constructive feedback" while acknowledging that "the structure and pedagogy of critical friend work can be problematic" (p. 97). Samaras and Sell observed that the experiences of graduate students using the critical friendship approach varied: one group's experience revealed a commitment to shared responsibility for one another's work and to openly sharing challenges and struggles with self-study research, whereas the other group's letters remained "a tool for private speech on an intrapersonal level," and thus "feedback was minimized because they were not accessible to each other" (pp. 104–105). We see here an important example of the reasons one must make knowledge gained from self-study public; even creating an explicit space for critical friendship does not guarantee that the full benefits of critical friendship will accrue. In their analysis, Samaras and Sell suggested that "there is an in-betweenness of support and critique in peer review" and, citing a student-participant, that students "need to push beyond politeness" (p. 105).

In their unique self-study of the role of executive coaching in learning to be a dean of education, Loughran and Brubaker (2015) used critical friendship to understand both what Loughran learned about university administration via engagement with an executive coach and how Brubaker's role as a "meta" critical friend (c.f. Fletcher et al. 2016) helped to reframe ideas developed between Loughran and his coach. In addition to being a relatively rare insight into the processes of learning to be a university administrator, the study highlights the ways in which Loughran engaged and taught his executive coach about how to be a critical friend, from a self-study perspective, while simultaneously relying on Brubaker to "redirect [Loughran's] focus to the task at hand and unpack the experiences in non-threatening yet constructive ways" (p. 267). This relationship is also notable for acknowledging the power differential between Loughran and Brubaker; the authors go to significant lengths to explain the ways in which they managed issues of unequal status and the requirements of confidentiality in their work. Importantly for the purposes of this chapter, Loughran and Brubaker argued that the primary outcome of their self-study was an enhanced understanding of the power and potential of critical friendship, what they described as the "essence" of critical friendship:

> Purpose is key: constructing purposes to which we are collectively committed and building purposeful partnerships from common goals matters, despite being difficult to achieve. Making both purpose and relationship explicit is central to benefitting from a constructive critical friendship. Nevertheless, the imperative is to offer both: confirming and disconfirming data; on-going and continued challenge and support; and, critique and friendship, in

order for the research enterprise to genuinely be of value. Critical friendship must be rigorous, systematic and based on evidence. It must contain a combination of both support and challenge or else it will, more likely than not, simply bolster that which has always been the case. (p. 268)

Their comments echo those made throughout this section; critical friendship is not merely a convenience nor is it a way to seek out confirmatory support. It is, as I have argued, a space of negotiation subject to constraints and invitations, both of which shape and reshape pressures incumbent on those doing self-study work. One hopeful message from Loughran and Brubaker's (2015) work is the agency embedded in critical friendship and self-study; like partners engaged in swordplay, critical friends must manage the movements of their partner and theirselves, being willing to switch between the figure and the ground. As Loughran and Brubaker suggested, "self-study and critical friendship are two ways of cultivating such assent, ways of doing the difficult inner work of shaping and influencing one's own participation" (p. 268).

Collaboration

In the first edition of this handbook, Lighthall (2004) analyzed a corpus of self-study work comprising 125 writings in order to develop an understanding of the development of the field and to conceptualize its prominent features. Of all of the features of self-study methodology that he coded, collaboration was the most frequent – more so than even the concept of self-study of practices. In other words, one might make a reasonable argument that self-study is grounded in collaboration – be it between authors, between author(s) and others, within the study itself, or within some other form of professional practice. He identified four general patterns to collaboration: between colleagues in face-to-face environments, between a self-study researcher and their students, across disciplines, and collaboration to overcome geographical distance. A consideration of each of these patterns in terms of *stringere*: face-to-face collaborations invite particular conversations, whereas geographical distances constrain other types of conversations, for example. Collaborating across disciplines, as Nilsson (2013) and Fletcher and Bullock (2012) did, offers the interesting constraint of first establishing a shared language across disciplines before exploring the openings created by working with those who approach teaching and learning in slightly different ways. It should also be noted that the voices of preservice teachers have been important ways of enhancing trustworthiness in self-study research, albeit these approaches sometimes require a somewhat different sort of collaboration (Loughran 2004).

Lighthall (2004) also highlighted a somewhat unique feature of collaboration in self-study, namely, the ways in which modes of collaborating support and extent of the development of professional relationships: "creating collegial niches for themselves and in the practical work of educating teachers together" (p. 206). He returned to the importance of collaboration at the end of the chapter, stating "the single most prominent feature of the s-step enterprise is collaboration" before entreating "we can

build on that strength" (p. 231). In particular, he suggested that self-study researchers continue their work to collaborate across disciplines in the academy and with teachers in schools. It would appear that both directions have been soundly taken up by self-study researchers; one might look, for example, at work by Han et al. (2014), Newberry (2014), or Williams and Ritter (2010) for examples of collaborations across disciplines within education and the broader academy and at work by Capitelli (2015), Kitchen and Bellini (2012), or Brown and Russell (2012) for work collaborative self-study with and by teachers in schools. Papers presented at the Castle Conference seem particularly likely to demonstrate the kinds of collaboration that Lighthall called for (e.g., Kosnik et al. 2006; Forgasz and Loughran 2018; Garbett et al. 2016).

Bodone, Guðjónsdóttir, and Dalmau (2004) commented on both the omnipresence of collaboration in self-study of teaching and teacher education practices research and the variety of forms that said collaboration undertook. Helpfully, they introduced three forms of thinking about collaboration in self-study methodology. Listed in order from the form of collaboration most present to least present:

1. Collaboration as "simply there, a pervasive presence, the background to the action, or a way of working (e.g., team teaching)" (p. 745)
2. Collaboration as a critical part of inquiry in self-study
3. Collaboration with "voices in the literature, their life history and the broader discourse" (p. 745) but not directly with other researchers

Bodone et al. argued that there seems to be no clear definition of collaboration in self-study – much like self-study methodology itself, which also resists definition yet operates within a particular coherence (Loughran 2005). They highlighted what they felt were some of the key features of the dialogue around collaboration in self-study, broadly characterized in four themes:

1. Self-study and collaboration have an "intrinsic" relationship (p. 771).
2. The need for some form of collaboration arises in part due to the "ethical and theoretical" location of self-study within traditions of reflective practice and the social construction of knowledge (p. 771).
3. The nature and form of collaboration within self-study has an effect on the nature of the "self" in self-study, the ways in which knowledge is created and disseminated, the relationship between learning and action, and the ways in which changes in knowledge of teaching teachers overlap with changes in teacher education practices.
4. Collaboration in self-study should not be about "consensus, unity, and sameness," in particular because "collaborative agency is always at risk from our (and our colleagues) inability to see beyond our shared comfort zones" (p. 771).

Stringere helps us to understand these features of dialogue in collaborative self-study, particularly when one considers the concept of collaborative agency. Taken lightly, collaborative self-study might be thought of as a way to generate simple

consensus, to enter an echo chamber where one knows one's ideas will be valued in particular ways. The relationship between constraint and invitation, however, reminds us that collaborative consensus always closes down particular lines of enquiry and invites critiques from other points of view. Collaborative self-study, grounded in dialogue conceptualized as an interaction between partners, each moving, framing, and reframing their inquiries, is best understood as a dynamic process in which we invite others to extend themselves beyond a comfort zone.

Hug and Möller (2005) used self-study to examine their collaborative practices within early childhood education as early tenure-track teacher educators teaching courses in literacy, language, science, mathematics, and technology for the first time. They began from the premise that "Collaboration is a key aspect of self-study and a central feature of [their] work" (p. 130) and further specified that collaboration was a form of "intellectual connectedness" which in turn contributed to "community as emotional connectedness" and "integrated disciplines as pedagogical connectedness" (p. 131). They acknowledged both personal and professional dimensions of their development in developing new understandings of their identities and their approaches to teaching teachers. Our metaphor of *stringere* helps us to realize that a collaborative dyad necessarily involves constraints and invitations; the authors themselves comment on the need to constrain certain discussions solely within their collaboration while making other conversations an invitation to the wider discourse:

> Through our work during the semester and through the writing of this paper, both of us developed a deeper understanding of what it means to teach in an integrated manner. In teaching and analyzing, we came to realize that it is important to develop a space in which we can highlight our own stories—those that we can shape for public sharing and those that remain private between two teacher educators struggling to make sense of their teaching. In such a space, we could ask questions about what we were doing and begin to see connections between our teaching and the larger social, historical, and political world in which we and our students are situated. The formation of this space had a direct impact on how we created and told our stories. (p. 137)

Importantly, Hug and Möller (2005) used the word *struggling* to describe their collaboration, a term that in this context reminds us that struggle does not necessarily mean combative. Just like in the martial arts, choosing to engage in study of practice with another requires a constant negotiation of collaboration and the ways in which one might open, close, and reopen lines of enquiry.

Martin and Dismuke (2015) called attention to the relative paucity of self-studies that analyze collaborative approaches to teaching. They focused on both the nature of their collaboration teaching a writing methods course and the ways in which their collaboration changed over time. Crucially, the authors came to their work as teacher educators with considerable experience collaborating with other teachers in their prior roles as elementary school teachers. They argued, in part, that collaborative self-studies between teacher educators teaching the same course tend to adopt a narrow view of practice and encouraged future self-study work that explored the role of collaboration in planning approaches to teaching teachers. Martin and Dismuke

believed focusing on planning to be particularly important in the political, often ends-focussed, teacher education environment in which they worked.

Hamilton and Pinnegar (2013) introduced the metaphor of a *topography* in order to analyze and interpret their understandings of collaboration in self-study methodology, developed over a decades-long series of collaborations dating back to the origins of the methodology itself. They agreed with Bodone et al.'s (2004) assertion that collaboration was essential both to the nature of self-study methodology and to the ways in which self-study research might unfold; they combine these ideas with Clandinin and Connelly's (1995) idea of a professional landscape as a way to think about collaboration as the metaphorical ground of self-study methodology. The use of the term *ground* calls attention to topography, Hamilton and Pinnegar (2013) wrote:

> We recognize that topography includes the physical, natural, and human-made aspects of the land above the surface. In fact, a topographic map appears as land in relief and describes one place in relation to other places in terms of elevation and position, symbolically telling a local story … We used the symbols of topography to guide us as we attempt to map the research land before us, to deepen our understanding of collaboration as a fundamental characteristic of self-study of practice research. However, we also hold in our memory the knowledge that while land surface might remain mostly static, it can shift in ways similar to the surface of research. (p. 76)

Our metaphor of *stringere* reminds us that deciding on a particular trajectory both closes down certain avenues while simultaneously opening up possibilities; a skilled practitioner is conscious of both constraints and invitations and plans accordingly. Hamilton and Pinnegar's topography of collaboration functions in a similar way, in that they acknowledge both the paths taken in their collaboration while acknowledging how the ways in which they think about possibilities change over time (e.g., the shifting surfaces of research). Furthermore, Hamilton and Pinnegar used North American poems that reference geographical concepts as a way of exploring possibilities in their thinking about collaboration, acknowledging that they did not know *a priori* that poetry would push their thinking in particular directions. This approach allowed them to identify standpoints in their collaborative research, which allows them to take seriously the challenge of thinking about how knowledge in self-study might develop over time. Here again, we see an analogy between the preparedness and improvisation of self-study methodology, martial arts, and the ways in which experienced self-study researchers think about collaboration.

Creating Environments for Self-Study: A Look Ahead

At the beginning of this chapter, I acknowledged that engaging with self-study methodology requires attending to multiple pressures, both internal and external, and that the nature of how one perceives and works with the pressures of self-study methodology has much to do with how familiar one is with the methodology. I introduced the concept of *stringere* early on, developed from my experiences

with martial arts, as a way of operationalizing and analyzing the ways in which self-study methodology opens up certain lines of enquiry as it closes down others. I also emphasized that the *stringere* changes as one engages with self-study methodology, as pressures change over time. Having explored the pressures exerted on self-study methodology and on self-study researchers by the interrelated touchstones of critical friendship and collaboration, it is time to look ahead to some of the contributions made by chapters in this volume. I wish here, though, to complicate the *stringere* metaphor introduced earlier. Constraints and invitations may help us consider the reflexive, relational elements of both critical friendships and collaboration, but this metaphor misses a crucial element of both martial arts practice and self-study research: creativity.

One link between the practice of martial arts and the practice of self-study methodology is that it is impossible to memorize and enact a set of steps that will produce meaningful work, in either case. There is a certain improvisation required within the enabling constraints imposed in each, particularly as one collaborates with different partners and forms of partnership, creative and otherwise. To help conceptualize these ideas further, I find it helpful to consider Barron, Montuori, and Barron's (1997) idea of *creatogenic* ecologies and *creatopathic* ecologies. The former support creativity, the latter do not. Barron et al. were quick to point out both that "friendships are an important part of creative human ecologies" and that "almost all creation is a collaboration" (p. 127) before discussing some of the inherent paradoxes of creatogenic ecologies. Writing about how artists and musicians create, Barron et al. argue that creatogenic ecologies have both role models and offer moments of solitude, "for as they internalise the work of others—their mentors, colleagues, friends and enemies—creative persons are also developing their individual view of the world" (p. 128).

Stringere offers a creatogenic ecology because it requires one to understand how constraints and invitations operate in a given situation. As a martial artist or a self-study methodologist, I argue that the strategic deployment of constraints to provoke particular invitations allows for creative work, and it is this kind of creativity that, in part, makes it difficult to clearly define self-study methodology or its components. Here, now, we can begin to see that the pressure of self-study methodology is not something to be avoided; it is to be embraced.

Subsequent chapters in this section offer their own takes on the aforenoted pressures in self-study methodology, alongside many other new ideas. I entreat the reader to spend a moment, however, considering each of the following chapters in terms of the *stringere* that is tacitly and explicitly articulated and the ways in which the questions raised by the authors contribute to creatogenic rather than creatopathic environments.

Fletcher (▶ Chap. 9, "Self-Study as Hybrid Methodology") makes a strong case that hybridity is at the core of self-study of teaching and teacher education practices methodology, perhaps as much as ideas about collaborations. Drawing on Bullough and Pinnegar's (2001) comments about the betweenness of self-study, Fletcher considers the warrants for arguing the inherent hybridity of self-study methodology from empirical research and from definitional, theoretical, and

methodological perspectives. He argues, in part, that various definitions of hybridity have been implicit since the outset of the methodology and that, in many ways, self-study might be considered a methodology-pedagogy. A table referring to examples of hybrid relationships in self-study methodology is sure to provoke considerable thought from both novice and experienced self-study researchers. The hybrid nature of self-study means that teacher educators are uniquely positioned to understand epistemic claims made about and by self-study research and that self-study makes a call to ontological considerations. One of the clearest messages from Fletcher's work is that his status "between two worlds," having worked hard to establish self-study in physical education and to develop an understanding of self-study via his identity as a physical education teacher educator, has offered both constraints and invitations: constraints in the sense that he recognizes the hybridity of self-study allows one to push further into a new disciplinary community while opening up questions about quality, due to a paucity of potential reviewers. Opening up to reviewers in self-study more generally, however, constrains the ways in which the disciplinary has been foregrounded, because relatively few members of the self-study community have expertise in physical education. We thus return to the same potential questions about quality. The invitation, though, to a creatogenic environment in which to consider ideas about hybridity as a researcher who exists at the boundaries of multiple scholarships seems well worthwhile and to be a powerful lesson for newcomers in particular.

Hamilton, Hutchinson, and Pinnegar (▶ Chap. 10, "Quality, Trustworthiness, and S-STTEP Research") consider what it means to embody frequently cited concepts such as quality and trustworthiness in practice as self-study researchers. Such concepts, they argue, require particular attention to the ontological commitment of self-study researchers not only to engage in knowledge grounded in lived experiences but also to recognize the particular commitment to rigor in research that such a commitment entails. Helpfully, Hamilton et al. include perspectives from both experienced and novice self-study researchers while reviewing and situating the concepts of quality and trustworthiness within the broader range of qualitative research paradigms. In this way, one might think of the broader qualitative revolution in social science research as a creatogenic environment that created a set of constraints and invitations for the field of self-study to develop among a group of like-minded researchers and teacher educators. They give us an important insight into the constraints imposed on early self-study work, specifically the temptation to draw equivalencies between qualitative and quantitative research (i.e., that concepts such as "data" always mean the same thing in different contexts), a constraint that invited a certain tendency toward "defensiveness" on the part of self-study researchers. Hamilton et al. use their chapter to call attention to a different sort of invitation, that of seeing the value of studying one's own practice while acknowledging that it can be both "a disruption and disrupting" (▶ Chap. 10, "Quality, Trustworthiness, and S-STTEP Research") given the ontological commitment one needs to make. Throughout their analysis, Hamilton et al. call attention not only to the position of the self-study researcher in their examination of practice but the ways in which said positionality tends to shift in context with respect to

theirselves and the methods employed and as a function of the foundational nature of the collaboration in self-study. This positionality helps self-study researchers to, in their words, "bring provocative, productive yet sometimes hidden perspectives and understanding to research in teacher education" (Hamilton et al., ▶ Chap. 10, "Quality, Trustworthiness, and S-STTEP Research").

Ritter and Quiñones (▶ Chap. 11, "Entry Points for Self-Study") help us to consider a fundamental challenge in self-study methodology: How does one begin? The commitment to research on teaching and teacher education within self-study is indeed appealing to many researchers, but the ways in which the methodology has developed over time can make questions of where to begin in self-study overwhelming. Ritter and Quiñones offer a welcome practicality to the pragmatics of "Where to begin?" for teacher candidates, education doctoral students, practicing teacher educators, and higher education practitioners from other fields grounded in, among other things, an analysis of the purpose statements in 209 articles published in *Studying Teacher Education*. They conclude, in part, that published self-study research tends to be focused on practice while being both interpretive and exploratory. Ritter and Quiñones then offer a series of potential purposes and topics for engaging with self-study for each of the aforementioned four groups. They assert that self-study methodology might be particularly of value for different reasons depending on one's role in education. For teacher candidates, self-study might help one understand the role of one's own personal history in learning to teach, perhaps particularly in relation to the role of clinical (practicum) teaching experiences within a teacher education program. For doctoral students, many of whom are former classroom teachers, self-study might be a useful way of managing and analyzing the transition from teacher to teacher educator while simultaneously navigating the new demands of working within academic structures – particularly structures that require particular kinds of research outputs. For practicing teacher educators, self-study methodology offers a way to bring together the pedagogical and research-based responsibilities of teacher education, particularly with a view to improving their personal practice. Finally, higher education professors from other fields might find self-study methodology to be a particularly useful form of professional development, particularly when faced with challenges of developing an understanding of their vision of teaching and associated practices. Helpfully, the chapter includes four vignettes to help illustrate the ways in which self-study methodology might function as a creatogenic environment, albeit in different ways for different practitioners. The reader is invited to consider these vignettes in light of their own positions as self-study researchers and educators, particularly with respect to the constraints and invitations experienced by each of the authors.

Tidwell and Jónsdóttir (▶ Chap. 12, "Methods and Tools of Self-Study") provide a kind of master class in considering the methods one might use in self-study methodology, arguing in part that methods in self-study offer a particular sort of creatogenic environment that is not readily seen in many other qualitative approaches to research. They argue that self-study methodology also required them to report its methods in a unique way, as they were multilayered and not easily

disposed to a "clear and concise listing" (this volume). Instead, Tidwell and Jónsdóttir (▶ Chap. 12, "Methods and Tools of Self-Study") decided to organize their analysis in terms of narrative-/text-based methods and arts-based/creative methods. Each set offers a distinct sort of creatogenic environment, and each method, or set of methods, invites the self-study research to consider various constraints to their work while simultaneously exploring the multilayered nature of self-study. It is worth noting that Tidwell and Jónsdóttir felt that only certain forms of self-study research lent themselves to an analysis of the methods employed; word limits on Castle Conference papers made their analysis of the sometimes unique and novel methods employed somewhat difficult. Narrative- and text-based representations and methods included narrative inquiry, dialogue, journals, interviews, and critical incidents; each was analyzed within the context of multiple self-study publications before considering lenses afforded by multiple sources of narrative- and text-based data and by a theoretical orientation toward an ethic of care. Arts-based and creative data representations and methods were much more difficult to categorize, according to Tidwell and Jónsdóttir. They chose to present self-studies using visuals, poetry, dance, music, and theater and closed with an example of a polyvocal process drawing from multiple arts-based methods. Tidwell and Jónsdóttir argue, in part, that there are "echoes of a polyvocal approach to research" (▶ Chap. 12, "Methods and Tools of Self-Study") throughout their consideration of arts-based approaches to methods in self-study research before concluding with an appeal to the power of multiple, creative methods in self-study and the concurrent responsibility of self-study researchers to make their approaches, assumptions, and methods of analyses clear.

Pithouse-Morgan and Samaras (▶ Chap. 13, "Methodological Inventiveness in Writing About Self-Study Research") challenge us to consider what sorts of methodological inventiveness we might employ in our work as self-study researchers. The chapter helps us to, among other things, consider the concept of polyvocal approaches in additional detail, which Pithouse-Morgan and Samaras argue is illustrative of "how continuing dialogue with multiple ways of seeing, knowing, and doing can intensify and broaden professional learning in self-study research" (▶ Chap. 13, "Methodological Inventiveness in Writing About Self-Study Research"). Their chapter also provides insight into the processes of a long-term critical friendship and collaboration – an interesting way of considering both the creatogenic environment of their collaboration and the constraints and invitations they seek to support via their commitment to polyvocal professional learning. Pithouse-Morgan and Samaras provide a helpful reminder of the importance of both dynamism and transdisciplinarity in self-study research. Beginning with the premise that self-study methodology's focus on collaboration has lent a particular kind of support to methodological inventiveness since its inception, the authors provide us with specific examples of the sorts of possibilities afforded by polyvocal professional learning within long-standing research teams at their institutions in South Africa and in the United States of America, respectively. In an intriguing example of a way to make their practice explicit, Pithouse-Morgan and Samaras include a narrative dialogue

from participants in Pithouse-Morgan's research group, with comments by Samaras, in an effort to "walk the talk of novel and expressive writing practices" (▶ Chap. 13, "Methodological Inventiveness in Writing About Self-Study Research"). Relatedly, the authors include four examples of research conducted by emerging self-study scholars within graduate student groups, all of whom are school teachers in either South Africa or the United States. In so doing, Pithouse-Morgan and Samaras take seriously Lighthall's (2004) call for increasing the nature and scope of collaboration in self-study methodology and, crucially, frame collaboration as a two-way street between school-based and university-based educators. I encourage readers to think carefully about these exemplars and to, in the words of the authors, consider the ways in which this approach "offers inspiration and permission to other novice self-study researchers who might be intrigued by, but might also feel unsure about, exploring methodological inventiveness" (▶ Chap. 13, "Methodological Inventiveness in Writing About Self-Study Research").

Cuenca (▶ Chap. 14, "Ethics of Self-Study Research as a Legitimate Methodological Tradition") begins with a dual acknowledgement of the conceptual foundations provided by Mitchell (2004) on the ethics of self-study research in the first edition of this handbook and of the ways in which the research landscape has changed in recent years. In particular, Cuenca argues that the constraints and invitations posed by ethical dilemmas in self-study research are, if anything, more exposed in this day and age. He is concerned particularly with the interrelated issues of identity (particularly as conceptualized by Gee 2000), relationships, and public vulnerability – considering each in turn within his chapter. Cuenca reminds us that identity and self-study are at least partially tied up in the ways in which one is recognized as a teacher educator and further complicates the issue by stating that institutional power has a considerable effect on the ways in which a certain kind of institutional identity is often pushed on teacher educators. Cuenca provides examples from self-study literature that explored the ways in which self-study researchers have explored issues of practice as they relate to natural and affinity identities, noting "raising issues of ethical anxieties related to natural and institutional identities is noteworthy as an ethical decision itself" (▶ Chap. 14, "Ethics of Self-Study Research as a Legitimate Methodological Tradition"). The issue of relationships and ethics in self-study is both mediated and complicated by the fundamental role played by collaboration in self-study research. Cuenca recognizes the self and the other in this section of the chapter and provides a helpful analysis of the role of critical friends and collaborations in self-study research. He is quick to point out, however, that critical friendship adds additional ethical tensions to self-study research, particularly when there are perceived differences in power dynamics. Cuenca also points to ethical questions within collaborative self-studies more generally, arguing that ethics need to be considered formally regardless of whether or not ethical questions are at the forefront of a particular study, citing the potential for feelings of disillusionment, disappointment, and disenfranchisement if ethical responsibilities are not made clear. Finally, Cuenca provides powerful examples of not only the ways in which

engaging in self-study makes one vulnerable but the ways in which public reporting of the results of self-study make one publicly vulnerable. Put another way, the creatogenic environment of self-study methodology offers invitations to particular kinds of discomfort, but the constraints of methodological guideposts can "sustain the ethical practices of both the practitioner and researcher" (▶ Chap. 14, "Ethics of Self-Study Research as a Legitimate Methodological Tradition").

Finally, Bullock and Bullock (▶ Chap. 48, "Introducing Self-Study in Quebec: The Challenges of Promoting S-STEP in the French Language") explore the ways in which a cross-disciplinary, cross-cultural, and plurilingual approach to collaborative self-study and critical friendship create a creatogenic environment. Throughout the chapter, they exchange the roles of novice and expert as an experienced scholar in French sociolinguistics (C. Bullock) and an experienced self-study researcher (S. Bullock), who have engaged in collaborative self-study, in part, to understand each other's perspectives on learning to teach and learning to teach teachers. For added complexity, Bullock and Bullock discuss some of the ways in which their discussions are mediated via different academic languages and their personal language of communication (French). Potential linguistic pressures surrounding words that mean very different things in French and English (e.g., didactics, reflection) are touchstones for both a newcomer to self-study methodology (C. Bullock) and a newcomer to French sociolinguistics (S. Bullock). C. Bullock experiences and makes visible some of the pressures she faces as an experienced researcher, used to reflexive approaches, making the transition to self-study. The chapter explores and analyzes the pressures associated with the distance between the researcher and the researched, the requirements to be publicly vulnerable in a professional environment, and the cultural construction of the *self* in self-study. Crucially, the authors then move to consider the challenges that French sociolinguistics pose *to* self-study. This stance relies heavily on both the ways in which they explain concepts to one another from their research traditions and on the understanding that self-study should be exposed to robust outside critique. In this way, the beginning part of the chapter describes the ways in which self-study constrains C. Bullock's understanding of the methodology, while the second part of the chapter explores the ways in which C. Bullock uses her research tradition to invite critique to self-study methodology. In particular, she asserts that self-study methodology requires a didactic stance, understood through the lens of French approaches to didactics, that comes from within the researcher's plural conceptions of the self, applied self-consciously. The chapter concludes with a consideration of power and self-study as viewed through the lens of language, particularly salient considering the majority of published self-study literature is in English. In so doing, Bullock and Bullock assert "we have explored perspectives offered by both power and language in an effort to better understand the perplexing politics of self-study methodology" (▶ Chap. 48, "Introducing Self-Study in Quebec: The Challenges of Promoting S-STEP in the French Language").

Navigating the Pressures of Self-Study Methodology

This chapter has explored the pressures of self-study methodology by invoking a metaphor from martial arts, the Italian swordplay term *stringere* to understand the constraints in opportunities posed by said pressures on self-study methodology and self-study researchers. In so doing, we have considered and complicated the relationship between critical friendship, collaboration, and self-study, at once questioning the degree to which they are fundamental to the methodology and the ways in which they might offer new opportunities to experienced and novice self-study researchers alike. Engaging in swordplay, or in any martial art, has taught me the value of attending to the constantly shifting figure and ground, to the constraints and invitations that are created and destroyed in a moment as I move with a partner in improvised ways. In considering this chapter, I realized that self-study research methodology is quite similar, particularly as self-study work is grounded in collaboration, demands collective improvisation, and exerts multiple pressures – constraints and invitations – on self-study researchers.

Drawing on martial arts to understand self-study methodology is a new way of thinking, one that I believe introduces useful conceptual metaphors. I hope that this framing chapter encourages the reader to live within some of the complexities introduced in self-study methodology, as self-study allows us to "remap what we know and present ourselves back to ourselves in ways we had not thought of, leading us to discover the things we already knew but had not said" (Hamilton and Pinnegar 2013, p. 86). As someone who has engaged with martial arts longer than self-study methodology, or really any other learning experience, the process of editing this section and reflecting on the many contributions my colleagues have made to my own thinking has indeed led me to discover something I knew tacitly; namely, that part of my attraction to and sustained commitment with self-study methodology is because I have operated in dynamic spaces of constraint and invitation, through martial arts, since I was a small child. I now realize that this is part of what I was getting at in some earlier work exploring the intersections between critical friendship, mindfulness, martial arts, and self-study:

> Many people know that *judo* is literally translated as the *way of gentleness*. Fewer are aware that it could be translated as the *art of giving way* ... [The founder of *judo*, Jigaro Kano] argued that "Even if you are stronger than your opponent, it is better to first give way" (Kano, 1937/1994, p. 17) ... [we might also] state that once must move in the direction one is being pushed or pulled, at least initially. Balance is more important than strength ... Some people might be uncomfortable with the combative elements of Kano's remarks, or indeed with the use of martial arts as metaphors for thinking about academic work ... Here I would add that martial arts are less about reacting to conflicts in the outside world than they are about responsible to challenges in our inner lives. (Bullock 2016, p. 121)

These comments resonate strongly with me now, for different reasons, as my position as researcher, teacher educator, practitioner, and martial artist has shifted in the intervening years and my public vulnerability in revealing pressures I

experience as a self-study researcher has invited me to explore a relatively private part of my life, my life as a martial artist, in public ways. I am beginning to realize just how much these experiences have helped me to navigate the complex pressures of self-study methodology and how important it has for me to *give way* to new experiences, new ideas, shifting pressures, and the ontological demands of a robust, reflexive practice.

Self-Study as Hybrid Methodology

9

Tim Fletcher

Contents

Abstract

Throughout this chapter an argument is made that hybridity is a central feature of self-study of teacher education practice (S-STEP) methodology. Attention is given to ways in which S-STEP methodology might be considered hybrid from historical, definitional, methodological, and theoretical perspectives. These considerations are supported by empirical representations of hybridity in S-STEP literature.

T. Fletcher (✉)

In this chapter I argue that one of the defining features of S-STEP is its hybridity, which can be seen from multiple perspectives. In the opening chapter of the first edition of the *International Handbook for Self-study of Teaching and Teacher Education Practices*, Loughran (2004) traces the history and roots of the Self-study of Teacher Education Practices movement, claiming it was formalized in the early 1990s through "a 'coming together' of like-minded people with similar interests, issues and concerns" (p. 13). He also referred to Korthagen (1995), who suggested that teacher educators have their feet in "two worlds" simultaneously – the world of scientific research in education and the world of practice. While I don't imagine Loughran was foreshadowing the writing of this chapter nearly 15 years later, his references to "coming together" and "two worlds" serve to frame much of how this chapter on S-STEP as hybrid methodology was conceptualized and developed. Throughout the chapter I elaborate on reasons why S-STEP researchers must always have their feet in at least two worlds if they are to uphold the traditions while also advancing S-STEP methodology.

One way the *Oxford English Dictionary* defines the term hybrid is "a thing made by combining two different elements" – a coming together, if you will. A hyphen is very helpful to denote hybrid relationships between concepts and I make use of this grammatical tool to demonstrate hybridity throughout the chapter. I might even suggest that S-STEP researchers often occupy a similar space as a hyphen does, residing in a middle ground fraught with tensions in concepts, practices, and understandings (Berry 2007). Indeed, Bullough and Pinnegar (2001) referred to the "betweenness" of S-STEP, identifying the importance of acknowledging and managing the balance between, for example, private experience and public issues, biography and history, and self and practice (in relation to other). Similarly, in exploring how they managed the tension in balancing theory and practice in their respective teacher education courses, Bullock and Christou (2009) referred to the space between these two ideas as the "radical middle." Throughout the chapter, terms and phrases such as betweenness, tensions, or "the radical middle" may be helpful for readers to recall when thinking about how S-STEP is hybrid.

In the chapter I consider the ways in which S-STEP methodology might be considered hybrid in its definitional, methodological, and theoretical backgrounds. Where relevant I provide examples of how ideas about hybridity are represented empirically in the literature. While the chapter may be read as a list of the ways in which S-STEP can be viewed as hybrid, I suggest that the listing should be interpreted or constructed as an integrated set of features that contribute to the hybridity of S-STEP.

Before moving any further ahead, it has been challenging to try to predict or identify the potential audience for this chapter, and so I thought it helpful to disclose my thoughts and intentions and the assumptions I am bringing to the writing of the chapter. I make some assumptions that many readers interested in this chapter are new to S-STEP and may hope to read about some of the methodological and theoretical traditions and assumptions of S-STEP research. In saying that, I also assume that some readers will be experienced S-STEP researchers who are looking for ways in which knowledge of and in S-STEP can be synthesized, perhaps in order to move the field forward.

My assumptions are also grounded in my own personal and professional biographies. Although I have been engaged in contributing to S-STEP work for nearly 10 years, I still feel relatively new to the field. I was not an active participant in the early phases of the S-STEP movement and struggle to reconcile my interpretations of S-STEP with the lived experiences of those who were. Put simply, they were there and I was not. Much like any S-STEP work, my interpretation of that history in this chapter and elsewhere is partial, personal, and provisional and should not replace or substitute a reading of the history of S-STEP that was written as it was happening (e.g., Hamilton 1998; Loughran 2004; Samaras and Freese 2006).

It is also worth mentioning my background in the subject matter of physical education. This is important because it has provided a relatively fertile space to share S-STEP work. In the last 5 years or so, significant interest has been generated in S-STEP in physical education teacher education (e.g., Hordvik et al. 2017; Carse et al. 2018; Lynch et al. 2018; Ovens and Fletcher 2014), and because many contributors to that work share their findings in physical education journals and conferences, it sometimes does not make its way readily into the "mainstream" of the S-STEP community. Moreover, there are fewer gatekeepers of S-STEP in the respective subject matter disciplines, and I think this has both advantages and disadvantages: contributors may be willing and able to push S-STEP into unexplored territory yielding unique, insightful, and perhaps unconventional contributions, but at the same time, standards for quality may be compromised through the review process (due to a smaller number of reviewers in that community having deep background in S-STEP). From time to time, I reference work from physical education teacher education because often it has provided me with a different perspective through which to consider S-STEP and its contributions (such as Tinning 2014); as such, it has provided me with a way to position myself "between two worlds" (Korthagen 1995).

With these assumptions laid out, readers are encouraged to identify the parts of the chapter of most relevance for their purposes. To that end, each section might be considered to stand alone from the others; I do, however, make attempts to connect each to the other.

Definitional Hybridity

At the time of its emergence as a novel educational research methodology, those involved in S-STEP could fairly clearly articulate *why* they were doing the research they were doing – to improve their understanding and enactment of teaching about and learning about teaching – but there was also a corresponding uncertainty in describing exactly *what* was meant by S-STEP research and *how* it would be assessed by others in the academy (Loughran 2004). Members of the Arizona Group (e.g., Guilfoyle et al. 1995) clearly describe the tensions they experienced in seeing the value in S-STEP for their own teaching and their students' learning (and for subsequent insights into teacher education practice) while perceiving that S-STEP would be unacceptable in what I interpret as a conservative climate of

"institutional politics and policies" (p. 38). These tensions were amplified by the virtue of the authors being female, untenured, beginning professors in teacher education whose academic profiles and publishing records were being evaluated by academic gatekeepers for the purposes of tenure and promotion.

In pursuing an agenda for S-STEP, those involved in the early history would have had to consider the extent to which there would be opportunities to publish S-STEP research in order to make their private understandings public, at a time when there were no journals, handbooks, or conferences geared specifically to S-STEP research. And as a corollary, they would have had to ask themselves and each other: would colleagues evaluating their tenure applications judge S-STEP research as and alongside "R-esearch"? If so, how should S-STEP be defined and considerations for quality be established? It would appear that the early members of the S-STEP community had their feet in two worlds: the world where S-STEP research was valued for its impact on self and practice and for self and other(s), and the world where there were unspoken rules about what counted as R-esearch in the academy. At the time, S-STEP did not appear to fit into the latter category, and this may be partially because of uncertainty about how it should be defined and judged.

These concerns led several members present at the genesis of the S-STEP community to seek to clearly define S-STEP – a pursuit many in the S-STEP community are still engaged in. In one of the clearest and earliest attempts at a comprehensive definition of S-STEP, Hamilton and Pinnegar (1998) defined self-study as:

> …the study of one's self, one's actions, one's ideas, as well as the 'not self'. It is autobiographical, historical, cultural, and political and it draws on one's life, but it is more than that. Self-study also involves a thoughtful look at texts read, experiences had, people known, and ideas considered. These are investigated for their connections with and relationships to practice as a teacher educator. (p. 265)

Although the definition offered by Hamilton and Pinnegar (1998) is widely used, there remains uncertainty about defining S-STEP in rigid, narrow ways. Indeed, one of the challenges in learning to do S-STEP research is identifying what it is and what it is not, and newcomers often find it particularly challenging to begin an S-STEP inquiry when they feel they do not have a definitional foundation upon which to begin (Stump et al. 2018). Consensus on a pragmatic, operational definition has been difficult to reach – as it happens, one aspect of consensus concerns the difficulty with which to pin S-STEP down to one definition (Bullough and Pinnegar 2004; Ovens and Fletcher 2014; Pinnegar and Hamilton 2009; Schulte 2009). Some suggest this may be due to the competing interpretations of the term *self-study* historically, where it has been used to refer to a certain type of individual or institutional self-evaluation, typically grounded in psychological conceptualizations of the self (Loughran 2004). As Vanassche and Kelchtermans (2015) suggest, the full term *self-study of teacher education practice* serves to distance the work of those in the S-STEP community from those who have conducted self-studies with broader institutional aims that might be classified as "traditional" in terms of their research agendas and

approaches. The TEP in the acronym is therefore very important. Others argue for the inclusion of *teaching* practices within the acronym (Pinnegar and Hamilton 2009), so it becomes S-STTEP; however, due to my positioning as a teacher educator and my focus on teacher education practice in the chapter, I maintain the use of S-STEP.

Despite some uncertainty about clearly defining S-STEP both from those working in the field and outside it, there is some agreement about several of the defining *features* of S-STEP, each of which contains at least an implicit representation of hybridity. Specifically, there is agreement that S-STEP involves an interrogation of the extent to which a practitioner's beliefs and practices are aligned "and that the self (however that might be described, from the individual through to the institution) carries a major responsibility in establishing this alignment" (Loughran 2004, p. 9). Thus, the hybrid relationship of beliefs-practices may serve as one of the major agreed upon features of S-STEP research that helps define what it is and what it is not. In Bullough and Pinnegar's (2001) seminal work *Guidelines for quality in autobiographical forms of self-study research*, they make reference to another widely agreed upon feature: "Self-study points to a simple truth, that to study a practice is simultaneously to study self: a study of self-in-relation to other" (p. 14). Understanding the ways in which one's self (one's beliefs, values, dispositions) does or does not align with the ways one engages with others *in* practice – self-other-practice – is at the core of the S-STEP enterprise. Thus, in defining S-STEP, its hybrid nature and features serve as foundations upon which the nuances and particularities of S-STEP are built. Specifically, the "coming together" of beliefs and practice *in* practice with others represents the foundational tenets of S-STEP methodology and its community (Loughran and Northfield 1998).

Along with specific definitions of what S-STEP is from an operational perspective (the features that inform how S-STEP research is conducted), it might also be defined from a relational perspective. For example, taking up insights from Hamilton and Pinnegar (1998) at the genesis of the S-STEP movement, Ovens and Fletcher (2014) identified the role of community as an essential element of the S-STEP endeavor. They state "self-study is a wide-ranging professional network of practitioners who share, research, and evolve their own practice as teachers and teacher educators... This professional network has been essential in evolving the self-study concept and for supporting its various practitioners" (p. 5). Acknowledgment of the S-STEP community does not necessarily provide researchers with insights into *how* to conduct S-STEP research; however, it is crucial in providing researchers with ideas and an understanding of *who* S-STEP research is shared with. For example, in their review of the state of the art in S-STEP, Vanassche and Kelchtermans (2015) acknowledge that there remained a clear and explicit purpose on developing and articulating a pedagogy of teacher education (in its various guises). This latter point acknowledges the role of the teacher education research community in providing an audience with whom the work is shared.

That the S-STEP community values the ways in which researchers make their research public to improve the lives of researchers on personal-professional levels also stands it apart from other methodologies. For example, in considering the

potential that S-STEP had to offer physical education teacher education research and teacher education research more broadly, Tinning (2014) suggested the strength of S-STEP lies in its existence as a discourse community and not in its technical features. He asserted that an emphasis on the technical orientation of action research was a main reason for its schisms in the 1990s, which some believe continue today. Thus, a main feature that might distinguish S-STEP from action research is in the role and importance of the community and audience with whom the research is shared. This goes beyond community members being able to lend a sympathetic ear; members of that community are at the forefront of casting provisional judgments on the trust-worthiness of the S-STEP research being shared and deciding on its potential to make important contributions to the field of teacher education research *and* to the lives of teacher educators, their students, and the students they will teach in the future (Craig 2009). When validation of S-STEP research is viewed as a process embedded in the extent to which readers find the work resonant and trustworthy, it becomes clear that consideration of the audience is a vital element in the S-STEP research process. S-STEP as methodology-community thus serves as another way to consider the hybridity of this work and the stance of the teacher educator-researcher.

While there is general agreement regarding S-STEP as methodology, others position S-STEP simultaneously as methodology-pedagogy. In particular, S-STEP has been identified as a powerful tool for the professional learning of teacher educators (Lunenberg et al. 2010; Vanassche and Kelchtermans 2016). The profes-sional learning needs of teacher educators have gained prominent attention recently, particularly in Europe, and the role of S-STEP has gained traction in supporting these needs. Vanassche and Kelchtermans (2016) documented the processes of six experienced teacher educators who engaged in S-STEP research. Importantly, the teacher educators had previously not been expected to conduct "formal" research in their roles and thus had limited experiences as teacher educator-researchers. While the teacher educators found value in S-STEP as a pedagogical approach to their professional learning concerning the *practices* of teacher education, it took consid-erable time, effort, and reconciling tensions to find value as an approach to research. Thus, while many in the S-STEP community continue to find S-STEP a powerful methodological tool (i.e., S-STEP as methodology) that allows them to conduct rigorous research on their practice and meet institutional research expectations (through publications and generation of funding), this does not hold for others in the teacher education community who may not have had research expectations in their role. On the contrary, they may prioritize a conceptualization of S-STEP as pedagogy in relation to their professional learning needs. While creating a hybrid version of S-STEP as methodology-pedagogy may serve as an attractive way to meet the needs of both groups while also adding value, Vanassche and Kelchtermans (2016) suggest this is easier said than done and involves sensitivity to a highly complex set of interactions that will likely follow.

The recognition that teacher educators are uniquely placed to understand the problematic nature of teacher education practice signifies another way that S-STEP can be seen as hybrid. That is, S-STEP has been referred to both as methodology *and* a way of knowing (Kuzmic 2002; Pinnegar and Hamilton 2009). This is because the

research is grounded in practice, and the practice is that of the researcher. This leads to the roles of researcher-teacher educator as being intertwined and "generally inseparable" (Tidwell et al. 2009, p. xiii). When teacher educators (or other practitioners, such as teachers) are conducting the inquiry, there are both implicit and explicit assumptions made and stances taken in terms of epistemology. For example, S-STEP researchers reject aims of seeking objectivity, predictability, and generalizability and therefore do not hold the view that the researcher must be removed from the immediate context being studied (Ham and Kane 2004). The researcher *is* the researched (along with others embedded in the professional contexts of the researcher-researched). In terms of epistemology, the personal practical knowledge and experience of teacher educators in and of their professional context are thus valued and recognized as carrying the potential to make significant contributions to research (Loughran and Northfield 1998; Pinnegar and Hamilton 2009). Cole and Knowles (1998) identified the political stance taken by those in the early S-STEP movement as representing "an epistemological challenge to the traditional and modernist conception of both knowledge and research" (p. 258).

Epistemology and Ontology

The privileging of personal experience in S-STEP research owes much to the work of Schön (1983), Munby and Russell (1994), and Korthagen and Kessels (1999). Specifically, Schön's (1983) theorizing about epistemologies of practice residing in knowing in-action (created from experience) serves to emphasize the fact that professionals – particularly those involved in the many forms of teaching – know more than they are able to articulate and that much their knowing is tacit and situated in the moment-to-moment actions, interactions, and experiences of their work (Polanyi 1967). It is by reframing experiences through reflection in- and on-action that both deeper understandings and improvements in practice are enabled (Schön 1983). This perspective has had strong uptake in teaching and teacher education, serving to draw attention away from teacher training and toward a more holistic, integrated approach focused on the education of teachers as lifelong learners and enquirers into their own practice (Korthagen and Kessels 1999).

Drawing from Schön's (1983) work, particularly concerning reflection in-action, Munby and Russell (1994) introduced the idea of the authority of experience to explain tensions felt by pre-service teachers when encountering the authority of reason (represented by propositional knowledge) or the authority of position (represented by supervising teachers or professors) during their practicum placements. For S-STEP researchers, the idea of the authority of experience is used to support the proposal that by conducting research on one's practice, revising and revisiting problems of practice, and articulating the ways in which personal experiences are reframed, the teacher educator-researcher gains authority of experience that pushes back against the authority of reason, as represented by formal knowledge generated through more traditional types of research. S-STEP researchers thus approach problems of teaching and teacher education practice with an aim to

articulate exemplars that represent contextually bound claims and interpretations about knowledge and understanding *in* practice rather than to seek solutions for practice in ways that are expressed as formal knowledge (Craig 2009; Ham and Kane 2004; Hamilton and Pinnegar 1998; Loughran and Northfield 1998). As Guilfoyle et al. (1995) and others in the early days of S-STEP expressed, it may be easy for the authority of reason to overshadow the authority of experience when S-STEP researchers are seeking avenues and opportunities to conduct research or to develop a research program, where there may be implicit or explicit pressure to clearly delineate teaching and research agendas. As such, some may choose more traditional research designs for their research *alongside* (or as "padding" for) their S-STEP work. It would appear, however, that the trailblazing of early members of the S-STEP community has meant that newer members of the community do not face similar resistance from tenure and promotion committees. Many current members of the S-STEP community would quite likely (and proudly) explain that they have not felt they need to yield to the authority of reason in justifying research programs where S-STEP is the main platform and represents a significant, original, and ongoing contribution to the knowledge base of teacher education.

Kessels and Korthagen (1996) and Korthagen and Kessels (1999) provided two key philosophical arguments that have relevance concerning the relationship between personal knowledge and formal knowledge in teacher education. In an attempt to bridge the gap between theory and practice, they used two concepts, describing the significance each had for framing problems in teaching and learning to teach: (1) knowledge as episteme and (2) knowledge as phronesis. Episteme, which might be described as grand or big T theory, serves to help one "know more about many situations," while phronesis, which might be thought of as personal or situational (little t) theories, helps one to "[perceive] more in a particular situation and find a helpful course of action on the basis of strengthened awareness" (p. 7). Following from Munby and Russell (1994), Korthagen and Kessels (1999) suggest that in order for teacher candidates to engage in appropriate reframing which may enable them coming to richer and deeper understandings of practice, the emphasis for teacher educators should not be on presenting epistemic theories or frameworks but on building the amount and quality of personal or local experiences of and in practice through which teacher candidates can develop knowledge as phronesis. This is not to say epistemic knowledge does not have value: Korthagen and Kessels (1999) believed that phronesis is perhaps used more often and has more value in helping teacher candidates to understand the basis of their decisions. In this way, knowledge as episteme may then stem from knowledge as phronesis. One of the reasons the arguments proposed in these papers have been taken up so strongly in S-STEP may be due to ongoing critique of its perceived atheoretical nature (Zeichner 2007), thus providing S-STEP researchers with an arguably stronger theoretical basis upon which to frame their work – that is, episteme-phronesis represented a "grand theory" that aligned with the worldviews and interests of S-STEP researchers. Moreover, it may have further aided those who were seeking tenure and promotion with solid grounds that, when based upon these theoretical arguments, S-STEP research counts as R-esearch.

Schön's (1983) epistemology of practice rejects positivist epistemologies of practice – which are based on applications of formal, scientific knowledge to professional decisions – and embraces a view that professionals possess and draw from an inner logic (what some might call intuition) to address problems *in* practice. Their thinking and knowing are embedded in their work and are often tacit, which renders it difficult to explain (Polanyi 1967). While much attention has been paid to the role of Schön's epistemology of practice in shaping S-STEP research and its underpinnings, Pinnegar and Hamilton (2009) suggest that questions regarding epistemology automatically bring issues of ontology into question. In a way, they propose a hybrid relationship between epistemology and ontology with each being inextricably linked to the other but with the "researcher's ontology [driving] the epistemological bus" (p. 77). While Pinnegar and Hamilton (2009) acknowledge S-STEP as a way of knowing (epistemology), they suggest that more attention is given to the ways in which S-STEP enables practitioners to inquire into ways of being and becoming (ontology) in terms of practice and its improvement. For this reason, S-STEP has been described as representing a moral stance to the world (Bullough and Pinnegar 2004).

By their very nature, these ontological considerations require S-STEP researchers to contemplate deeply personal beliefs, values, and positions (which shape one's identities) and the ways each informs the teacher educator-researcher's practice. Indeed, the blending rather than the separation of personal-professional (identities, knowledge, values, beliefs, and so on) and teacher educator-researcher has been identified by some as other defining features of S-STEP, particularly in ways that serve to distinguish it from action research (Kosnik et al. 2006; Samaras and Freese 2006). However, it is not enough for S-STEP researchers to engage in "indwelling" for its own sake. While S-STEP research can have important and profound personal value and interest, there is a need for others in the professional community with which the research is being shared to find value and interest. As Pinnegar and Russell (1995) note, S-STEP researchers "investigate question[s] of practice… that are individually important and also of broader interest to the teacher education community" (p. 6).

For the discussion of hybridity in this chapter, it is important to recognize the language used by authors that helps us understand the ways in which important concepts in S-STEP can be used to infer hybrid relationships. For example, in their discussions of epistemology and ontology, Bullough and Pinnegar (2004) and Pinnegar and Hamilton (2009) do not pit each against the other in an argument for "either-or"; they discuss each in terms of "and" and "more-less" with a case being made for ontology as the foundation for the epistemological stance an S-STEP researcher takes. Similarly, Korthagen and Kessels (1999) do not suggest choosing phronesis or episteme; they do, however, suggest prioritizing one over the other in a relationship with each other, not in place of each other. Bullock and Christou (2009) also suggest that the separation of theory and practice is "unhelpful and unproductive for both teacher candidates and teacher educators" (p. 75), and they advocate for occupying a middle ground between the two. In addition, S-STEP research must hold value for the individual conducting the research and for the broader

professional community who engages with the research (Loughran 2004; Pinnegar and Hamilton 2009; Vanassche and Kelchtermans 2015). These types of relationships between concepts, ideas, and positions can be thought of as tensions, involving a push-pull between each without the bond ever breaking. While Berry's (2007) introduction of the notion of tensions has served as a helpful analogy for understanding practice, when thinking about hybridity in S-STEP, tensions might also be a helpful analogy for understanding and interpreting the philosophical underpinnings of the S-STEP field.

Methodological Hybridity

In the previous section, I attempted to identify hybridity in S-STEP methodology by considering several definitional and philosophical perspectives inherent in S-STEP traditions. These philosophical perspectives have strongly informed the ways S-STEP researchers approach their inquiries methodologically, from asking and developing certain types of research questions to favoring certain methodological tools and conducting their analyses in particular ways. In this section I draw from several reviews that explore the traditions and history of S-STEP to consider hybridity in the methods and methodologies used by S-STEP researchers.

Methodological Traditions

In tracing the history and traditions of the S-STEP movement, Samaras and Freese (2009) identify the influence that several methodologies have had on S-STEP research. Importantly, they suggest that Schön's (1983) work on reflective practice has served as a common theoretical framework that informs the methods and methodologies selected by practitioners who study their practice. For example, Samaras and Freese (2009) identify several qualitative approaches including personal histories, life history, narrative inquiry, and action research. Of interest, in the first edition of the *International Handbook for Self-study of Teaching and Teacher Education Practices*, an individual chapter was dedicated to each of the following methodologies:

- Personal histories/life history (Samaras et al. 2004)
- Narrative inquiry (Clandinin and Connelly 2004)
- Action research (Feldman et al. 2004)

Although it was not offered extensive discussion in the original *Handbook*, we might add autoethnography (see Coia and Taylor 2009; Hamilton et al. 2008) to this list of methodological traditions that have influenced and continue to influence S-STEP research.

In keeping with the hybrid nature of S-STEP however, it is interesting that many S-STEP researchers take the position that it is the way researchers use the best or

most appropriate parts of these and other methodologies – a philosophically and methodologically pragmatic approach – in their S-STEP research design. Indeed, Bullough and Pinnegar (2001) stated forthrightly: "Self-study is a mongrel: the study is always of practice, but at the intersection of self and other and its methods are borrowed" (p. 15). Those methods borrowed tend to be qualitative and lend themselves to other methodologies in the list previously described (life history, narrative inquiry, and action research). While drawing from multiple methodological traditions provides S-STEP researchers with flexibility in their research design and data collection and analysis procedures, Bullough and Pinnegar (2001) recognized that this presents particular methodological challenges, notably in the writing, sharing, and potential publication of results. It is worth quoting their argument at length:

> Methods blend, and with blending comes difficulty in establishing authority grounded in methodological traditions. Moreover, what counts as data expands greatly, and researchers face the difficulty of representing, presenting, legitimating, analyzing, and reporting one's own experience as data – and of doing so in honest, not self-serving ways. Seeking to establish authority on the basis of borrowed and mixed methods demands much of the researcher. Thus self-study researchers inevitably face the added burden of establishing the virtuosity of their scholarship within and through the writing itself; lacking established authority each researcher must prove herself as a methodologist and writer. (p. 15)

Bullough and Pinnegar (2001) implicitly make the point that while the inherent blending of methodological traditions in S-STEP scholarship may be read by some as a "mash-up," which signifies that the researcher has failed to align their work with other more recognized forms of inquiry in their purest senses, it was the shortcomings in some of those methodologies that led to the development of S-STEP movement in the first place. S-STEP is not the only form of hybrid methodology. Hybrid methods and methodological designs have a rich tradition in engineering (e.g., Oleskovicz et al. 2009; Zhou et al. 1992). Further, Denzin and Lincoln (2000) and Kincheloe (2001) employ the concept of bricolage, where qualitative researchers embrace a synergy between disciplinarity and interdisciplinarity – recognizing the socially constructed nature of, for example, educational research while embracing traditions from other disciplines (such as anthropology, sociology, and so on). The bricoleur blurs methodological genres as well as theoretical and philosophical traditions (Kincheloe 2001).

In the tradition of bricolage, S-STEP was developed as a form of inquiry (a methodology) that was itself blurred but also enabled or favored the borrowing of data collection methods (e.g., reflective diaries, observations, correspondence) in order to privilege the knowledge of teacher educators *in* practice and provide them with a place and space to use their voices in trustworthy and meaningful ways (Bullough Jr and Pinnegar 2001; Zeichner 1999). To return to a point made earlier, the S-STEP movement not only provided a coherent methodological grounding for a certain type of research in teacher education; it also provided a strong community with whom claims about trustworthiness could be shared, debated, and provisionally verified. Again, if the argument that S-STEP is coherent is accepted, then it follows that the hybridity of S-STEP is foundational in this sense, in that the blurring (or blending) of both methodologies *and* methods is inherent in strong S-STEP design.

Despite the acknowledgment that S-STEP methodology and methods constitute a blended or hybrid approach to scholarship, there remain continued questions about what S-STEP research is and what it is not. In particular, newcomers often wonder what distinguishes S-STEP from action research or autoethnography or narrative inquiry. Such questions might carry with them assumptions that methodological designs should be positioned as "either-or" (i.e., an inquiry should be S-STEP *or* action research) rather than "and" or "more-less" (Pinnegar and Hamilton 2009). It is worth selectively reviewing the literature that has addressed these types of questions and issues in light of the purposes of this chapter.

Action Research, Narrative Inquiry, Autoethnography, or S-STEP?

The apparent dilemma presented by the borrowing and subsequent hybridization of methods that constitutes S-STEP designs has been the subject of some discussion in the literature (Bullough and Pinnegar 2001). In this section I draw from two strong examples where S-STEP researchers have considered *why* S-STEP might be chosen over other similar methodologies for particular research problems and questions. Specifically, I consider essays by Samaras and Freese (2009) who distinguish action research from S-STEP and Hamilton et al. (2008) who compare other methodologies that privilege the self (namely, autoethnography and narrative inquiry). Importantly, in both cases the authors do not attempt to state that one methodology is better than another but argue why researchers would choose one over the other in relation to their research questions.

Like many members of the S-STEP community, Samaras and Freese (2009) acknowledge that their entrance into the field of S-STEP was borne from previous involvement in action research. This experience allowed them to identify commonalities between S-STEP and action research. As they have stated: "In both methodologies, the researcher inquires into problems situated in practice, engages in cycles of research, and systematically collects and analyzes data to improve practice" (p. 5). What seems to stand S-STEP apart from action research is the emphasis on the self (Feldman et al. 2004). While action researchers can implicitly or explicitly draw from their beliefs to inform their understandings of practice, they do not have to – it is not a necessary component of the inquiry. For example, one of the main conflicts in the field of action research came from external authorities (such as school districts) dictating that teachers *will* use action research to examine certain aspects of practice and using it as a means of monitoring teachers' actions, whether the individual teacher deemed those aspects problematic or not (Casey et al. 2018). In contrast, it is the individual or group of individuals conducting the S-STEP research that initiate and select the line of inquiry based on their experiences of practice (LaBoskey 2004). Vanassche and Kelchtermans (2015) remind us that the particular part of practice that is being studied in relation to self is left to the researcher and the problems faced in their context and professional role. By selecting the problem/s of practice to be explored, S-STEP researchers examine practice in a way that explicitly acknowledges or involves their identities in the

inquiry. As Feldman (2009) notes: S-STEP researchers should be self-critical of their roles as researchers and teacher educators. If the S-STEP researcher is not problematizing the ways their sense of self or identity/identities are wrapped up in the problems of practice being described, then the distinction between action research and S-STEP maintains its fuzziness. As Samaras and Freese (2009) suggest: "Action research is more about what the teacher does, and not so much about who the teacher is" (p. 5).

In stating that S-STEP research involves the linking of two key concepts – the self *and* practice (or more specifically, the self-in-practice) – Samaras and Freese (2009) note that this leads to another distinguishing feature of S-STEP: "self-study focuses on improvement on both the personal and professional levels. Self-study builds on the personal processes of reflection and inquiry, and takes these processes and makes them open to public critique" (p. 5). While action research aims to identify potential solutions to problems of practice, the emphasis is on professional improvement for the individual or the community in which the research is conducted (such as a school or group of scholars). S-STEP also aims for this while furthering the scope of improvement to acknowledge the individual in a *personal* way, a way that values the practitioner's emotions, relationships, and ways of being (Kuzmic 2002; Pinnegar and Hamilton 2009).

Hamilton et al. (2008) argue that directing one's research to the community of S-STEP researchers is one way to distinguish the methodological features of S-STEP from other methodologies. They argue that a main focus of S-STEP research is on sharing research so that it contributes to knowledge of teacher education and can be taken up by members of the teacher education research community. This focus serves as one way to identify similarities and differences between S-STEP, narrative inquiry, and autoethnography.

Recognizing some confusion readers have in differentiating work that uses these methodologies, Hamilton et al. (2008) examine a previously published piece of research by Hamilton (2005) to consider the ways methodological choice affects an inquiry that focuses on the self (such as S-STEP, narrative inquiry, and auto-ethnography) and when S-STEP may serve as the best choice for an inquiry into the self. The work by Hamilton (2005) that is critiqued by Hamilton et al. (2008) involved examining her practice in a qualitative research methods class, with the intent of helping her students better understand key concepts. In a novel approach that serves to stand this work apart from most other S-STEP works, Hamilton (2005) used the art of Winslow Homer as a source of interactivity and a reflective tool to help her interrogate her beliefs and practices. Hamilton et al. (2008) then consider the following key conceptual features of narrative inquiry, S-STEP, and auto-ethnography to identify the extent to which the work of Hamilton (2005) aligns with each methodology:

- *Narrative inquiry*: According to Clandinin et al. (2007), the underlying feature of narrative inquiries is the analysis of storied representations of lived experience. Narrative inquiries also involve recognition of three commonplaces: *temporality* (the recognition that experiences are situated in past, present, and future),

sociality (a concern with personal and social conditions, particularly between the participant in the research and the inquirer), and *place* (the physical context and location of the research) (Connelly and Clandinin 2006). Clandinin et al. (2007) further identify a framework for narrative inquiries that consists of the following eight elements: (1) justification for the inquiry, (2) naming the phenomenon under study, (3) a description of methods used, (4) analysis and interpretation processes, (5) positioning of the narrative inquiry in relation to other inquiries (conceptually and/or empirically), (6) identification of the uniqueness of the inquiry, (7) ethical considerations, and (8) the process of representation.

- *S-STEP*: Hamilton et al. (2008) interpret S-STEP according to the definition proposed by Hamilton and Pinnegar (1998) that was described earlier in this chapter. In addition to this definition, they use LaBoskey's (2004) elements of S-STEP research design to understand the extent to which the inquiry by Hamilton (2005) aligned with principles of S-STEP methodology. LaBoskey's (2004) elements of S-STEP are regularly used by researchers to guide their designs and drawn upon by readers to interpret the degree of quality in S-STEP research. LaBoskey (2004) proposes that S-STEP research is self-initiated and self-focused; improvement-aimed; interactive at some point in the inquiry; and characterized through the use of multiple, typically qualitative data gathering methods, and validation is interpreted as a process based in trustworthiness.

- *Autoethnography*: Ellis et al. (2011) describe autoethnography as "an approach to research and writing that seeks to describe and systematically analyze personal experience in order to understand cultural experience" (p. 273). What distinguishes autoethnography from other methodologies that privilege the self therefore is the focus on the self-in-culture. Although written several years after publication of the work by Hamilton et al. (2008), Holman Jones et al. (2016) offer the following points that further make autoethnography unique: it disrupts norms; it represents insider knowledge; it involves moving through difficulties to make life better; it involves breaking silence, claiming voice, and "writing" wrongs; and it is accessible to readers. This list suggests that a socially just conscience is inherent in autoethnographic work.

Hamilton et al. (2008) claim that while there are features of each methodology in the work of Hamilton (2005), the closest alignment is with S-STEP because there is a clear and explicit focus on improving practice and she embodied a desire to share the understanding she had gained about practice through conducting the research with other teacher educator-researchers. In working backward to the research design, the focus and desire she brought to the inquiry helped to shape the research questions she developed at the outset.

With this in mind, Hamilton et al. (2008) also suggest that Hamilton's (2005) research could be described as a narrative inquiry because it is a storied representation of lived experience; she gives attention to the three commonplaces of narrative inquiry and includes most of the eight elements of the narrative framework proposed by Clandinin et al. (2007). Thus, although Hamilton's (2005) research was initially shared as an example of S-STEP work, readers could interpret and justify it as

narrative inquiry. Indeed other S-STEP researchers more intentionally blur the lines between narrative inquiry and S-STEP in much of their work. For example, Kitchen (2005) examined his "story as a teacher educator" while he was engaged in and experiencing relational teacher education. He explicitly draws from Dewey's (1938) theorizing about the role of experience in education and Clandinin and Connelly's (1994) elaboration of personal experience methods. Thus, like Hamilton (2005), it is the focus on practice and the intent to share his understandings with members of the teacher education research community that help to position Kitchen's (2005) work as an exemplar of S-STEP while borrowing from traditions of narrative inquiry. Other similar examples include research by Chiu-Ching and Yim-mei Chan (2009), Craig (2010), Kitchen (2009), and You (2011).

While the overlap between S-STEP and autoethnography was not as clear in Hamilton's (2005) work, Hamilton et al. (2008) argued that her directing the research toward the community of teacher educator-researchers could be interpreted as explicit attention to the experiences of self-in-culture. However, as Hamilton (2005) did not explicitly focus on some of the features of autoethnography as outlined by Holman Jones et al. (2016), for example, they suggest that the lines remained blurred between the place and role of S-STEP and autoethnography in the inquiry. Moreover, the research questions were more focused on practice and its improvement (improvement in understanding and in enactment), which tends to align with S-STEP designs. As with narrative inquiry, other researchers who are committed members of the S-STEP community strongly make use of autoethnography in their S-STEP designs. For example, Lesley Coia and Monica Taylor's development of *co-autoethnography* clearly blends a focus on the self-in-practice with that of the self-in-culture. Much of their work makes use of feminist theory to examine the role of gender in their teacher education practice (Coia and Taylor 2013). They draw heavily from autoethnographic elements such as disrupting norms and moving through difficulties to make life better (Holman Jones et al. 2016) along with features of S-STEP proposed by LaBoskey (2004). Their work has a clear focus on the self and other, including the ways in which their identities are informed by the relationships they have with students and colleagues (Coia and Taylor 2009). Skerrett's (2008) inquiry is a strong example of S-STEP research that rests between biography and history (Bullough and Pinnegar 2001), considering the ways in which her family and school history and cultural background have informed her teaching and teacher education practices. There is clearly a focus on the self-in-culture in Skerrett's (2008) work; however, her turn to practice suggests it might be viewed as both autoethnography and S-STEP. Hayler (2012) has also done this, focusing on the ways that the identities of teacher educators in England are shaped through their relations with others. These authors' choices to position their work in and share that work with members of the S-STEP community suggest it is the attention to how their understanding of the self-in-culture informs their understanding of teacher education that makes their work stand as a strong exemplar that members of the S-STEP community can learn from.

Taken together and to summarize their analysis, Hamilton et al. (2008) contend that on the surface there may appear considerable overlap or interchangeability between the three methodologies, and at times, one could be positioned as another.

To conclude, they state: "Certainly the commitment to self as an element of the work exists in all three approaches. The differences emerge in seeing how these research practices are enacted and how the thinking underlying the practices is revealed" (p. 25).

Through the analysis of the work by Samaras and Freese (2009) and Hamilton et al. (2008), it is apparent that S-STEP *is* a mongrel (Bullough and Pinnegar 2001) and S-STEP researchers make philosophical, moral, and pragmatic choices to position their work as S-STEP. It is clear that the common features inherent in S-STEP research articulated by LaBoskey (2004) have proven extremely helpful in helping researchers design their inquiries and readers make up their own minds about the quality of the research being shared. However, just as importantly it seems that there is an issue that goes beyond design, and that is the role the S-STEP community plays in helping to establish and position a certain type of research on the self as S-STEP.

Critical Friendship

A central methodological or research design characteristic identified by LaBoskey (2004) and acknowledged by others (e.g., Loughran 2010; Pinnegar and Hamilton 2009; Samaras 2010) is the need for interactivity at some stage of the process. In highlighting interactivity in S-STEP, many examples are framed as collaborative self-studies (e.g., Petrarca and Bullock 2014). The role of interactivity in these types of works is such that LaBoskey (1998) claimed:

> 'interactive self-study' may be a more apropos referent for multi-party self-study than 'collaborative', especially because in many cases, the researchers are not just interacting around an external data set, the interactions are the data set, or at least a part of it. (p. 151)

This comment underscores the involvement of others in the S-STEP process: rather than being "simply" convenient collaborators, all are engaged in the process for individual and collective outcomes on personal and professional levels.

The involvement of others is often framed through critical friendship, not only to meet the expectations laid out by the S-STEP research community in trying to establish rigor but also to engage in a collaborative inquiry into the complexity of teacher education practice. Critical friendship is widely used in S-STEP research designs, though not all critical friendships are undertaken in the same way or for the same purposes. Several teacher educators have demonstrated that the hybridity in critical friendship can be difficult to manage. For example, Fletcher et al. (2016), Nilsson (2013), and Peeters and Robinson (2015) each showed the difficulty in balancing supportive feedback that is at the same time critical and identifying how easy it can be to shift too far to one side and the problems that can arise as a result. In the research by Fletcher et al. (2016), it took a third critical friend (who they described as a meta-critical friend) to push the two teacher educators whose practice was being examined to "move beyond the niceties" (p. 313) and the generally convivial nature of the critical friendship in the early parts of the process. Like

Schuck and Russell (2005), Fletcher et al. (2016) and Nilsson (2013) recommend that people entering a critical friendship tread cautiously and consider the respective participants' knowledge of the pedagogical/professional situation at hand and their openness to learn while also reflecting on their trustworthiness, honesty, and sensitivity. In considering hybridity, managing how the teacher educators in the relationship can be critical friends highlights the personal-professional and emotionally detached elements of examining teacher education practice. Indeed, in a review of the term "critical friend" and its framing, Stolle et al. (2018) used a continuum to show several hybrid relationships *within* critical friendship, including close friend-stranger, insider-outsider, expert-nonexpert, and productive-not productive. Along with Fletcher et al. (2016), their research emphasized the often taken-for-granted nature of critical friendship, and they urged S-STEP researchers to more carefully consider the role and nature of critical friendship and other types of collaboration in S-STEP inquiries.

In considering the assumptions underpinning collaborative self-study and critical friendship, it may be that collaborative self-studies arguably embody (at least in name) a more egalitarian process in interactivity, where the participants are collaborating with the assumption that both contribute to and learn from the inquiry. Critical friendships *can* represent a more detached role for the critical friend, particularly when their practice is not being placed under the microscope. This, however, may be warranted depending on the problem of practice being studied. In this way, the framing of critical friendship should be carefully considered because a detached critical friend might be more appropriately referred to as an "external peer debriefer," which may contrast with the very nature of S-STEP, particularly in its privileging of the voices and knowledge teacher educators have of their context, subject matter, pedagogy, and practice.

Hybridity in Analysis

There is a challenge for S-STEP researchers to analyze their data in ways that allow an appropriate and meaningful examination of the self-in-practice. Established frameworks and protocols for qualitative analysis, such as rich and thick description (Geertz 1973), constant comparison (Corbin and Strauss 2008; Glaser 1965), or various versions of thematic analysis (Braun and Clarke 2006; Miles and Huberman 1994; Patton 1990; Silverman 2000), offer some helpful guidelines for identifying salient issues, incidents, and themes within data sets; however, many of these approaches lack the necessary sophistication and nuance to enable researchers to examine the self-in-practice. This is because these forms of analysis often do not give explicit attention to the role of emotion in that they encourage a relatively "detached" (and thus positivistic) account of the data. However, because they offer established systems of analysis, there may be appeal to S-STEP researchers who continue to be faced with doubts raised through institutional politics and policies, a prominent issue in conducting research using a hybrid methodology. This may be one reason why many S-STEP researchers explicitly maintain and use tools from

other closely linked methodologies, such as narrative inquiry and action research, where analytic frameworks are more clearly articulated and have longer histories upon which to base their work.

In response to the challenges of conducting meaningful analysis of the self-in-practice, several authors have embraced the idea of hybridity (albeit implicitly) as an analytic tool in their S-STEP work. For example, Senese's (2000) reference to axioms and Berry's (2007) notion of tensions serve as helpful metaphors that S-STEP researchers can use to analyze and unpack the dilemmas they face in aligning beliefs and actions in teacher education practice and matching those to the needs of the pre-service teachers they teach. In examining the ways his practices as a teacher educator (in his case, a school-based staff developer) informed his practices as a classroom teacher, Senese (2000) identified three axioms that helped him better understand teaching and learning: go slow to go fast; be tight to be loose; and relinquish control in order to gain influence. In outlining these axioms, Senese explained that each was "... counterintuitive. The tension inherent in each rises from the opposing forces at play. Understanding and employing these opposing forces in the proper perspective is key to helping teachers grow professionally and in helping students grow academically" (p. 229). As Senese suggests, finding how to balance the competing perspectives proved challenging, but once he did, he claimed he was better able to articulate his beliefs about teaching in ways that bridged personal and professional.

In a similar approach to Senese's (2000) use of axioms, Berry (2007) employed the term "tensions" to help her articulate and understand her knowledge of teaching about teaching. Berry (2007) describes tensions as capturing:

> ... the feelings of internal turmoil that many teacher educators experience in their teaching about teaching as they find themselves pulled in different directions by competing concerns, and the difficulties for teacher educators in learning to recognize and manage these opposing forces. (p. 32)

Through using the idea of tensions as an analytic frame, Berry (2007) was able to articulate several of the most powerful tensions she experienced in her teacher education practice that were previously tacit and difficult to name. Specifically, she identified tensions in her practice existing between telling and growth, confidence and uncertainty, action and intent, safety and challenge, valuing experience and reconstructing experience, and planning and being responsive. Although teacher educators may at times move from one source of tension to the other (e.g., feeling more uncertain than confident), there may be some comfort in being situated in the middle – in the in-between space. Importantly, acknowledging the axioms and tensions helped Senese (2000) and Berry (2007), respectively, articulate their knowledge of teaching and teacher education practice for others to learn from.

In their notion of "turning points," Bullock and Ritter (2011) provide a helpful analytic framework specifically geared toward S-STEP researchers in that it clearly acknowledges ways to analyze, unpack, and better understand the self-in-practice. Bullock and Ritter outline the following four features of a turning point: (1) there is

an affective element to the data (e.g., emotional, motivational); (2) the data frame a problem of practice; (3) the author of the data is implicitly or explicitly asking for help, advice, or the opinion of a critical friend, student, or other participant; and (4) the data are bound by the action-present. The first two features clearly acknowledge the hybrid nature of the self-in-practice in calling for data that are emotional and grounded in the problematic and complex nature of practice. Moreover, the place of interactivity as a necessary component of S-STEP is embedded in the third feature, while the fourth is grounded theoretically in Schön's theorizing of practice. As many who are new to S-STEP describe challenges in understanding what is involved in S-STEP and how to conduct it (e.g., Stump et al. 2018), these types of analytic frameworks may be helpful because they provide clearly articulated processes or "signposts" that help S-STEP researchers see practice differently as a result of their inquiries and contain several of the hybrid relationships inherent in S-STEP design.

In yet another alternative to more traditional approaches to analysis of qualitative data, Mitchell et al. (2009) argue for the benefits of an arts-based approach to S-STEP inquiries. Specifically, they describe the processes and outcomes from visual methods, using "images [that] connects us to the self, yet distances us from ourselves" (p. 119). Importantly, Mitchell et al. (2009) suggest that when researchers use these approaches with a critical gaze, personal and social change are possible. They used self-study albums to develop insight about working in South African communities where HIV/AIDS is prevalent. In terms of hybridity, the relationship between private and public is brought to the fore in arts-based approaches, where sharing private experience in a public forum is a necessity *and* strength of the work, with an aim that the understanding generated leads to further social action. Mitchell et al. (2009) provide a thorough list of considerations for S-STEP researchers engaging in visual approaches to their work, including the need to look inward and outward, engage in dialogue with participants in the process (e.g., subjects of a photo, an artist), and consider the choice and alternatives in selecting final images for presentation, embodiment, and performance.

Taking inspiration from these and other examples, S-STEP researchers are engaged in new and innovative considerations of the types of data and how they are analyzed to render complex and new understandings of the self-in-practice. For example, Pithouse-Morgan and colleagues (Pithouse-Morgan 2016; Pithouse-Morgan et al. 2012) used poetry and reflective letter writing, respectively, to showcase different ways of engaging in, documenting, and making sense of personal experiences of teaching and teacher education practice, making strong arguments that different representations and interpretations of the self become possible through the use of these innovative approaches to data gathering and analysis. Further, Forgasz et al. (2014) describe the place of embodied approaches to S-STEP to engage with research on emotions in teacher education practice. Taken together, arts-based approaches to gathering and analyzing S-STEP data allow researchers and practitioners to frame and interpret the processes and outcomes of research very differently than is typically done in "traditional" approaches. Given the importance of making public the findings from S-STEP inquiries, the careful consideration of representation and audience that goes into any arts-based pursuit suggests that these

approaches hold particular promise to shed light on both understanding and representing the complex nature of teacher education practice.

In the following section, I continue to explore the hybridity of S-STEP research, turning my attention to theoretical hybridity. I consider the ways in which several important theoretical concepts, such as self and identity, and their various manifestations have helped to shape S-STEP inquiries and the knowledge that can be gained from them.

Theoretical Hybridity

One early critique of the S-STEP movement was that its work was interpreted as being largely atheoretical (Zeichner 2007; Loughran 2010). In particular, there was a lack of theoretical continuity in the body of S-STEP work, especially in the ways individual pieces of S-STEP scholarship connected to others and to the broader teacher education literature and represented growth or deepening of knowledge of teacher education practice. One reason for these critiques may be that the central role of theories of self and/or identity is often masked or implicit. This is not to say that S-STEP researchers have failed to use self or identity theories to frame their scholarship. There are many excellent examples where a diverse range of self/identity theories have been used to inform an understanding of the self-in-practice (see, e.g., the special issue of *Studying Teacher Education* on teacher educator identity, Erickson et al. 2011). However, at times the self in many self-studies could be better grounded in relation to others through a clearer, more considered application of self/identity theories that could help unravel some of the complexity of researching the self-in-practice.

In arguing for the scholarly value of autobiographical accounts of teaching, Kelchtermans (2009) suggests that we not just focus on *how* teaching and teacher education is done but also *who* is doing the teaching. By its very nature, an S-STEP inquiry is focused on the *who* and *how* of teacher education practice, privileging the self-in-practice and making central the interrogation of the complex natures of the self and practice. Importantly for the purposes of this chapter, theories of the self and identity capture the essence of hybridity by working at the intersection of internal-external views of the individual.

The work of many identity theorists can be helpful to S-STEP researchers, particularly if one places importance on how the self negotiates practice *with others* (Hamilton and Pinnegar 1998; Pinnegar and Hamilton 2009). For example, G.H. Mead (1934) offered the relationship between the "I" and the "me" to illuminate the relationship between internal and external ways of seeing the self, where:

> The "I" is the response of the organism to the attitudes of others; the "me" is the organized set of attitudes of others which one himself [*sic.*] assumes. The attitudes of the others constitute the organized "me", and then one reacts toward that as an "I." (pp. 174–175)

When both sets of "attitudes" are internalized, the self is produced, as Woodward (2002) states: "'I' understand myself through imagining how I am understood by

others – as 'me' (p. 9)." Jenkins (2008) provides an extensive discussion of what he terms the internal-external dialectic of identification, drawing historically from the work of Cooley (1902/1964), Mead (1934), Goffman (1959), and, to a lesser extent, Erikson (1968) to frame his arguments. Jenkins (2008) recognizes that individual and collective identities have traditionally been understood as different phenomena; however, like Woodward (2002), he believes that the processes that make individuals unique are similar to those that collectivities share. Indeed, "the individual and the collective are routinely entangled with each other" (Jenkins 2008, p. 37). Wenger (1998) shares this sentiment, claiming:

> Talking about identity in social terms is not denying individuality but viewing the very definition of individuality as something that is part of the practices of specific communities. It is therefore a mistaken dichotomy to wonder whether the unit of analysis of identity should be the community or the person. The focus must be on the process of their mutual constitution. (p. 146)

It is therefore the interplay between these two perspectives that shapes the processes of identification. For example, identifying as a teacher educator – through analyzing one's beliefs, practices, values, experiences, and relationships – takes not only the teacher educator's internalized perspective of the self into account but also the teacher educator's interpretation of others' perspectives (those others might be students, colleagues, administrators, or critical friends). Where these two perspectives intersect is where identification occurs. Thus, internal-external identification of self becomes another way to think about the hybrid nature of S-STEP, and upon inspection exploring the interrelationship of internal-external processes of identification has been central to much S-STEP work.

Gee's (2000) framework extends the way identity is forged at intersections, introducing four ways to view identity for educational research: nature-identity, institutional-identity, discourse-identity, and affinity-identity. As the name suggests, nature-identity is shaped by forces in nature (e.g., through our genes). Institutional-identity is attributed by others in positions of power or authority. Gee (2000) used the example of a professor or teacher as representing institutional-identity. Discourse-identity relates to one's individual traits that are suggested by other people. For example, peers might describe someone as friendly – a trait that is attributed to the person by others. Affinity-identities constitute specific practices an individual engages in, which could be anything from being a fan of a certain type of music to a specific set of pedagogical practices. As can be seen, toward the end of the examples of each of the identities, they are hard to separate, and Gee (2000) recommends they be thought of as integrated rather than as a list. Given the crucial role that the self and identity play in S-STEP, it becomes clearer how identity can serve as one other way to represent hybridity in S-STEP research.

Several strong examples exist of S-STEP research that have clearly been drawn from the identity theories described above and others to develop deep insights into the complex and problematic nature of teacher education practice. For example, Rice et al. (2015) provide an outstanding example of using identity theories to explore

experiences of non-personhood through S-STEP. In particular, the framing of self-person (or non-person in this case) used by Rice et al. (2015) is reflective of Mead's notion of the I-me, which captures the internal-external dialectic of identity processes. The authors used stories to help unpack and examine their teacher educator identity formation, recounting instances where they were being asked implicitly or explicitly to enact shifts in their teacher education practice. In acknowledging the influential role that the perspectives of others play in identity processes and the emotional toll in doing so, Rice et al. (2015) state: "we took student comments to heart and tried to look beyond the [non-personhood experiences] to see what students were saying and determine whether we needed to shift our being and doing as teacher educators" (p. 29). Although individuals can use their agency to push back against the perspectives of others, often that is easier said than done. While people in positions of authority tend to have substantial influence on identity formation (e.g., colleagues and administrators), Rice et al. (2015) demonstrate the very powerful influence students can have on how teacher educators engage in identity processes and the ways those processes shape the pedagogies of teacher education.

Williams and Ritter (2010) used S-STEP to understand the ways their experiences as school teachers informed their ongoing identification as teacher educators. Drawing from social learning theory which highlights the ways professional learning and identities interact (Lave and Wenger 1991; Wenger 1998), Williams and Ritter (2010) demonstrated several tensions they experienced in becoming teacher educators, particularly in terms of being simultaneously expert teachers and novice teacher educators and developing new ways of relating to colleagues and students. In managing the transition from teacher to teacher educator – a frequent and rich source of experiences for S-STEP researchers (e.g., Guilfoyle et al. 1995; Williams et al. 2012) – they found that instead of replacing one way of identifying with another, there could be multiple ways of identifying at the same time. Reconciling this tension was identified as being helpful to others as they made the transition from teacher to teacher educator: "One identity is not discarded in favor of the other. . . but utilized in ways that will help former classroom teachers to 'repackage' who they are as teacher educators" (Williams and Ritter 2010, p. 90).

Identity theories have been used in conjunction with understandings of cultural biography to enable insights into practice. For example, Skerrett (2008) makes interesting links between her biography, socialization, and identity to analyze the ways her family background and racial and immigrant culture shaped the ways she was able to interpret and understand culturally relevant practices in a teacher education program for urban schools in the United States. Skerrett's (2008) enthusiasm for teaching in urban schools was compromised by many factors, including a Eurocentric curriculum that lacked personal relevance for many of her students from radicalized and immigrant backgrounds, and a lack of opportunities to establish professionally rich learning communities with colleagues in her school. When considering identity as hybrid concept, the many layers of how one can identify (personally and professionally) are striking in Skerrett's (2008) research, particularly in the ways that each layer of identity shaped her beliefs and practices as a teacher.

Gregory et al. (2017) demonstrated how S-STEP could be used to help doctoral students develop identities as teacher educators *and* researchers. Several layers of hybridity are evident in the work of Gregory et al. (2017), including doctoral students-teacher educators, teacher educators-researchers, and learners-researchers. The latter layer of learner-researchers is interesting and quite novel to the S-STEP field, because this focus helps unravel some of the complexities of not only learning to become teacher educators but also of learning to become S-STEP researchers. Crucial to this experience was the development of a sense of trust within the group, where they could expose doubts and uncertainties about teacher education practice and about S-STEP itself. This angle of research represents a fairly new direction for S-STEP, and there remains much scope to explore the ways in which S-STEP is not only conducted but is learned.

In the research conducted by Rice et al. (2015), Williams and Ritter (2010), Skerrett (2008), and Gregory et al. (2017), hybridity is not only present in identity theory (particularly in demonstrating the internal-external processes of developing a sense of self and ways of identifying), it is also evident in the *ways* teachers and teacher educators identify. For example, Rice et al. (2015), Skerrett (2008), and Gregory et al. (2017) reveal tensions experienced in their personal-professional identities and the ways others identified the authors as people and professionals. Although many of us may realize the impossibility of separating personal-professional, Rice et al. (2015) showed that their students fell short of acknowledging the people who were their teacher educators, while Skerrett (2008) demonstrated ways in which the people experiencing the curriculum were often shut out by the professionals who designed it. The research by Williams and Ritter (2010) and Gregory et al. (2017) represents several layers of hybridity, particularly those of being hybrid teachers-teacher educators, experts-novices, and learners-researchers.

There is a strong foundation of S-STEP research that is framed by theories of identity and self; however, as a field, S-STEP researchers might do well to make more explicit reference to some of that work, demonstrating clearly how new self-studies use existing theoretical frameworks and build on S-STEP research previously conducted. Although some identity theories have been offered in this section, this list is not exhaustive, and there is a large and diverse body of theoretical work to draw from. This may further enable S-STEP researchers to make convincing arguments regarding the generation of new insights and more complex understandings of the self-in-practice and the development of pedagogies of teacher education.

Conclusions

In this chapter I have tried to represent many of the ways that S-STEP can be considered as hybrid methodology. I considered the hybridity of S-STEP using definitional, methodological, and theoretical lenses. Using hyphens to demonstrate hybrid relationships in S-STEP where the hyphen represents the betweenness of S-STEP work (Bullough and Pinnegar 2001), in the following table, I list ways in

Table 1 Examples of hybrid relationships in S-STEP

Self-practice	Epistemology-ontology	Self-other
Theory-practice	Episteme-phronesis	Teacher-teacher educator
Beliefs-actions	And-more-less	Personal-professional
Who-how	Action research-narrative inquiry-autoethnography	Expert-novice
Methodology-community	Critical friend	Teacher educator-researcher
Methodology-pedagogy	Internal-external identification	Learner-researcher
Methodology-way of knowing	I-me	

which hybridity in S-STEP has been identified throughout the chapter, roughly in order:

To this list in Table 1, I add two other important hybrid relationships that Vanassche and Kelchtermans (2015) identified as central to the S-STEP enterprise and that represents the knife edge upon which S-STEP researchers are always balancing or the ongoing tension that is felt. In their major review of S-STEP literature, Vanassche and Kelchtermans (2015) state:

> [There are] two tensions on which self-study researchers need to consciously position themselves time and time again: the tension between relevance and rigour on one hand, and the tension between effectiveness and understanding on the other hand. The notion of tensions is intended to capture how these issues are part of the ever-present ambiguity of self-study research and cannot be completely reconciled. Designing, conducting and reporting a self-study means managing these opposing demands and, as will become clear, this shapes the collection and analysis of data in self-study research as well as its knowledge outcomes. (p. 518)

In discussing the tensions above, Vanassche and Kelchtermans (2015) state that S-STEP research must balance relevance for the person or people conducting the inquiry (i.e., the self-oriented nature of S-STEP) with the rigor demanded by members of the educational research community. In addition, the contribution to personal and professional understandings of pedagogy (i.e., for the individual and members of the teacher education community) must be balanced with a quest for practices for which there is some evidence that they are effective for those who are learning to teach. As Vanassche and Kelchtermans (2015) suggest, the hybrid relationships of rigor-relevance and effectiveness-understanding are phenomena experienced by all S-STEP researchers and which capture in a holistic way the myriad smaller hybrid relationships identified throughout the chapter. Senese (2000), Berry (2007), and Vanassche and Kelchtermans (2015) help us to see that the management of tensions between both complementary and competing demands is inherent in S-STEP research. Importantly, these tensions do not need to be resolved or reconciled, but they help those engaged in S-STEP research perhaps understand why examining the self-in-practice is such a complex and complicated undertaking

and that occupying the "radical middle" (Bullock and Christou 2009) or the betweenness of S-STEP (Bullough and Pinnegar 2001) is simply part of the process. To this end, it might be suggested that hybridity is a foundational and crucial feature of S-STEP that not only serves to align it with other similar approaches but also helps to stand it apart.

Abstract

In this chapter, we explore quality and trustworthiness in Self-Study of Teaching and Teacher Education Practices (S-STTEP) research as embodied, lived out in practice, rather than solely a conception of research validity. S-STTEP researchers are uniquely positioned as researcher and participant. From this perspective, we privilege practical knowledge that is rooted in the lived experience of teachers and teacher educators and that brings together theory and practice. While understood as a study of personal practice and experience, S-STTEP research also studies contexts and communities in which our life and work is situated. We argue that quality and trustworthiness in S-STTEP research, in part, is a responsibility lived out relationally with those whom we live and work. In this chapter, we trace the thinking around quality and trustworthiness in qualitative research, generally, and S-STTEP research, specifically. We think about the ways S-STTEP researchers attend to quality and trustworthiness through S-STTEP methodological components. At the same time, we acknowledge that methodology alone cannot account for a sense of responsibility researchers have to their communities of practice and for whom our work resonates. In this way, this chapter seeks to shift understandings of (and affirm) the importance of rigor in S-STTEP research.

Keywords

Quality · Trustworthiness · Teacher education · Teacher education research · S-STTEP methodology · Intimate scholarship · Ontology · Teacher knowledge

Introduction

When imagining this chapter, we thought about the ways we live out quality and trustworthiness as an ethic of research – not as a measure of the validity of research. We reflected on our own experiences of engaging in Self-Study of Teaching and Teacher Education Practices (S-STTEP) and other forms of qualitative research. In so doing, we attended to ways that we positioned ourselves, shared (or chose not to share) experiences, positioned other people/places, and the sitz im leben of our own experiences inside and outside classrooms. At the time of inquiries. We begin with a narrative of Derek's sensemaking, the development of his practical knowledge around quality and trustworthiness as a researcher and in research, in order to provoke thinking and contemplate an ethic of quality and trustworthiness embodied in the lives, relationships, and research practice of S-STTEP researchers.

Derek's Sense-Making Around Quality and Trustworthiness in Research
I was running a few minutes late for our first research conversation, as traffic was not ideal on such a rainy day. A few weeks earlier, Mr. CEO had

responded to an advertisement for participants I placed in a community newsletter for gay men. He agreed to participate in an inquiry around the experiences of individuals as they made curriculum and identity around gender and sexuality. Mr. CEO was waiting at the coffee shop when I arrived. Perhaps because of the rain, the shop was crowded and there was no place for us to talk. Mr. CEO suggested that we try the hamburger restaurant next door. I had never been there, but any place seemed good at the time. There were only a few people at the restaurant, and our presence was a bit awkward because neither of us were hungry nor did we want to order anything. The server gave us a strange look as we mentioned that neither of us were hungry.

As we began to chat, I asked Mr. CEO how he came to the city. He responded, "Do you want the long version or the short version?" As Mr. CEO began to tell his experiences—share very personal stories about his family and life—I noticed that he looked around a bit and whispered as he shared. After a few minutes, Mr. CEO stopped and requested that we finish the conversation in my car. We quickly gathered our belongings, handed a few dollars to the server, and were on our way. Lumbering through the pouring rain, we came to my car. We settled ourselves and continued the conversation.

As I reflected on my experience as a new researcher, I began to think about the ways I had imagined the research might unfold. I felt a bit guilty for not attending to Mr. CEO's experience in the conversation–that I had not ensured that we were in a safe and private place for his experiences to be shared. I had detailed the intricacies of the research plan in the methodology chapter of my dissertation proposal but had not considered rainy days or a participant jumping into the depth of his experiences in the first meeting; I was beginning to understand the lived realities of research were more complex than for which I could have planned. This notion brings to my mind what Aoki (1993) called "the landscape that privileges the curriculum-as-plan" (p. 257). Curriculum-as-plan, Aoki suggested, is the goals, methods, resources, and assessments detailed in these plans are meant "for faceless people, students shorn of their uniqueness or for all teachers, who become generalized entities often defined in terms of generalized performance roles" (p. 258). I began to see the ways that my understanding of research-as-plan was limited, not attending to the particularities of lived experience. The lived curriculum, according to Aoki (1993), emerges from the "multiplicity" of particular student personalities and experiences, a uniqueness known "from having lived daily life with…" (p. 258). When Mr. CEO asked me whether I wanted the long version or the short version, I have come to understand that he was inquiring whether or not I was ready to engage in his story. I wondered why he, by attending to my research-as-plan, had not attended to the lived experience of research, the uniqueness of the relationship I was composing with Mr. CEO.

My growing awareness of this experience with Mr. CEO led me to think about the experiences we choose to share in research. This experience was

not part of my dissertation, but certainly something I learned in the practice of research. I wondered, in what ways are we willing, as researchers, to be vulnerable about the tensions and complexities of meaning making as S-STTEP practitioners and researchers? Because the very nature of our work, we are situated within the academic contexts and we carry those contexts with. I recognize our responsibility to rigorous research; at the same time, I wonder about the ways we position ourselves in the research—perhaps similar to what Craig (2013) called the best-loved self in teacher education. Trustworthiness, in part for me, was telling these sometimes tension-filled stories of learning with my participants. Those stories that showed the complexities of learning how to do difficult work and the responsibilities I had to those with whom I work(ed). (Portions of this narrative have been reconstructed from a previous publication; see Clarke and Hutchinson (2018).)

As S-STTEP researchers, we engage in the work as both researcher and participant. To remain present in our research as both a researcher and participant, we attend to the personal and relational connections between and within experiences. Derek made sense of quality and trustworthiness in research as he engaged in and reflected on his research practice. In attending to his relationship with Mr. CEO, Derek began to understand the responsibility he had to the people with whom he worked. Likewise, S-STTEP researchers do research with and among others; we argue that while understood as a study of personal practice and experience, S-STTEP research also studies contexts and communities in which our lives and practice are situated. In S-STTEP research, we compose stories of practice within our communities and contexts of practice. In doing so, we shape the ways that academic communities and communities of practice understand us (as researchers and practitioners) and themselves.

In this chapter, we explore facets of quality and trustworthiness in S-STTEP research. S-STTEP work has a unique perspective because we always stand in the midst of our practice, understanding our position within our practice to make sense of our knowing. We must stand in the space of our practice, acknowledging that we are never alone in that space. Our work is always situated among students, families, colleagues, and communities with whom we share life. Intimate scholarship, like S-STTEP research (Hamilton 1995; Hamilton and Pinnegar 2014a; Hamilton et al. 2016), has a relational nature that includes quality and trustworthiness within that relation. We assert that the situatedness of our work implies a responsibility to the communities of our practice and research beyond traditional notions of academic legitimacy. We argue for a more holistic view of quality and trustworthiness, one we embody and live out in research.

We proceed by developing the authors' understanding(s) of quality and trustworthiness in relationship to S-STTEP educational practice and research. In doing so, we intentionally continue to decenter and complexify traditional notions of quality and trustworthiness in research and open new possibilities for reframing S-STTEP

research and ideas. In the same way that S-STTEP researchers are rooted in practical knowledge – sensemaking around self and practice through experience in our professional knowledge landscapes (Clandinin and Connelly 1995) – we rely on our practical knowledge around quality and trustworthy research to guide our exploration in this chapter. As such, we uncover some of the positionings around the practice-theory conundrum, which shape our understandings of research and knowing. Furthermore, we explore quality and trustworthiness in components of unfolding inquiries – spaces and practices for building trust and demonstrating quality in S-STTEP research. Here, we select aspects of S-STTEP methodology that allow for the creation of quality and trustworthiness while acknowledging that methodology alone cannot account for a sense of responsibility researchers have to their communities of practice for whom our work resonates. We develop connection and trust in every aspect of the study: conceptions of inquiries, questions we ask, literature that roots our studies, theories that animate thinking, ways we contemplate information upon which we draw, conclusions we open, assertions for understanding, and recommendations for practice we offer. Finally, we return to our commitment to rigorous research that offers valuable and valued perspectives to teaching and teacher education research.

Making Sense of Quality and Trustworthiness in Research

Researchers have long been concerned with the quality of research as a means to authenticate generalized truth claims. Nearly four decades ago, Guba (1981) described a new paradigm for research; he wrote that these new writings:

> bear little resemblance to the kinds of articles we have been accustomed to seeing in our leading professional journals. Both the novelty for the paradigm and the strangeness of the reporting format pose special problems for editors and referees of journals, peer review committees, or dissertation committees considering proposals, and naturalistic inquirers themselves as they attempt to design and monitor their inquiries. What precisely are the criteria that ought to be applied to this class of investigations? (p. 75)

Wrestling with these new approaches, Guba and Lincoln (1981) outlined four criteria of trustworthiness for naturalistic research: credibility, transferability, dependability, and confirmability. These perspectives drew from "natural and experimental sciences" (Marshall and Rossman 2016, p. 43) and thus recast traditional notions of research in broader language that presumed to justify qualitative research in similar ways to traditional academic research. In further writings, Lincoln and Guba (1985) moved past justification of qualitative research to a full-throated critique of positivist approaches to research.

In many cases, those qualitative researchers concerned with rigor look to terms like trustworthiness and authenticity (Lincoln and Guba 1986) to describe approaches to their research. This language attempted, to some extent, to disrupt positivist notions of validity and research quality where sterile experiments

supposedly controlled variables in ways to access truth. At the same time, terms such as trustworthiness – along with strategies like crystallization, triangulation, and member-checking – have been used to determine "what really happened" or if someone's experience is verifiable and therefore might be claimed as truth. However, shifting ontological and epistemological perspectives have led to questions about the appropriateness of these perspectives for judging the quality of many expressions of qualitative research; or as Marshall and Rossman (2016) noted, "[w]ith the post-modern turn/s. . .these canonical standards [reliability, validity, and generalizability] have been challenged, as has the very notion of putting forth criteria at all" (p. 43). We offer similar critiques around the notion of trustworthiness; the use of verisimil-itudinous strategies as evidence of reality seems incomplete, to us, as experience is mediated through and situated in the complexities of lives. Therefore, we continue to wonder about the ways we lived out trustworthiness as relational ethic in research among people, rather than a state or measure of research. We cannot deny researchers' relationships with those who take up their work (who, in this western academic context, can deny the importance of academic-peer acceptance and pub-lication for the research/researcher); however, in articulating our view, we extend this notion to the ways researchers embody trustworthiness throughout the research process.

While we look at the methodological nuances of S-STTEP and situate our work along the research-scape in future sections, at this point we want to acknowledge that S-STTEP came alive in the early 1990s where generally the crisis of representation emerged as new ideas in research clashed with new ways of engaging in it and where we, more particularly, questioned what we knew and how we knew it. The tensions with that general reference to qualitative/quantitative seem fraught with modern/postmodern thinking and an aspiration to be on the "right" side. A binary distinction in the research realm existed where researchers were either qualitative or quantitative in methodological approach. Importantly, this is not a reference to mixed method-ologies. Rather, we suggest S-STTEP research and other forms of intimate scholar-ship (Hamilton and Pinnegar 2014a), identified by the levels of vulnerability and depth of revelation as related to practice and experience, move beyond only two methodological research choices that lock us into simple definitions of inquiry (examples of this early work include Arizona Group 1994a, b; Hamilton 1995; Knowles and Cole 1994).

In the turns around the "posts" and this representational crisis, the shifting definitions became more apparent along with a more fluid way of understanding thinking and reality. As we attempted to turn our heads toward the "posts" and to understand what/why we could see the value in doing research differently, many researchers, like Lincoln and Guba (1985) and Bogdan and Biklen (1982), identified perceived equivalencies between qualitative and quantitative. The research of many interested teacher educator/scholars took up the recognition of equivalencies.

In response, St. Pierre (2008) cautioned that creating "a new language may or may not help in such critique, for example, substituting 'trustworthiness' for 'validity,' because both words refer to legitimation or truth" (p. 323). Barad (2003) and St. Pierre (2013) noted that positivist researchers who have not engaged in the

various research turns – the linguistic turn, the historical turn, and so on – confound tensions because they lack currency in ways of thinking and ways of doing in research studies. They see the attention to trustworthiness as a way to satisfy truth demands rather than a letting go of those demands with a personal orientation to integrity of scholarship. Lather (2013), too, struggled with these issues and suggests that we open and "position alternative methodology as non-totalizable..." (p. 635) and wonders whether the, "old chestnut that questions drive (p. 637)," methodology has evolved.

Using language that indicates an attempt at equivalency between qualitative and quantitative, Hamilton and Pinnegar (2000) wrote:

> What kinds of things would our students need to be able to trust us, as teacher educators about? One of the simple things would be the depth and adequacy of our own knowledge. We would have complex and sophisticated knowledge about any subject that we teach future teachers (we would know, understand, and utilize the knowledge base in our teaching). That is not something students would require of us but something that if to be trustworthy, we would demand of ourselves. Another aspect of this knowledge would be a general understanding of schools and teaching. Teacher educators would have a clear understanding of what education is like in the community or communities where their students will teach. (p. 237)

At the time we felt confidence in this assertion. We struggled, like many others, to navigate the posts. Perhaps for too long, S-STTEP researchers have tried to draw equivalencies between qualitative and quantitative research – data = data, analysis = analysis, voice = voice. Certainly, the Arizona Group (1996) appears to have done that as well as our writings in later works (see Pinnegar and Hamilton 2009). Although we, and others, attempted to push beyond the traditional language, there has not been grand success. We continue to return to issues of trustworthiness, quality, and so on; we consider voice and methodology and strategy and analysis, yet our definitions never seemed to stretch beyond traditional concerns.

We, as authors as well as other S-STTEP researchers, have for too long been defensive about the work we do, responding to critique and trying to fit our work within the shell of the modernist works. Using the occasion of the second edition of the S-STTEP handbook, we suggest that we open our pathway and see the work we do as having value unto itself and as the worthy endeavor that it is. We study our practice. We examine our practical knowledge and the ways it contributes to our practice. As scholars we bring a theoretical perspective to our work in the hope that we can reveal our thinking and decisions made to provide the best support for our students (preservice teachers) and the unseen children in schools. Just as other methodologies take up the desire to contribute to the knowledge base of teaching and to students in schools, S-STTEP researchers demonstrate that desire in the work they do. S-STTEP is a post-qualitative methodology whether or not we label it so.

S-STTEP has been a methodology of choice for teacher educators for more than a quarter of a century, so when invited to explore S-STTEP and relations with quality, trustworthiness, and methodological issues, we thought it might be useful to engage in a critical exploration of assumptions at the foundation of S-STTEP and the study

of practice. To best situate ourselves and our work, we must address certain issues – like the tensions between quantitative and qualitative research and the relations between epistemological and ontological stances in research along with tugging at definitions and pushing upon long-held notions.

Having addressed these issues (to some degree) elsewhere (Pinnegar and Hamilton 2009, 2015; ▶ Chap. 4, "Role of Positioning, Identity, and Stance in Becoming S-STTEP Researchers", Pinnegar, Hutchinson, and Hamilton), we will not present an extended discussion, but we do feel it necessary to set the stage for the stated focus of our work – the exploration of the methodological nuances of S-STTEP and how our work (as an academic community) fits into the research-scape – to address quality and trustworthiness and explore how S-STTEP researchers situate themselves along the research landscape.

Guiding our work with a series of queries, we look at S-STTEP methodology to see how we might consider quality and trustworthiness and how we might determine whether a research study has quality and trustworthiness; consider the reasoning used to establish quality and trustworthiness; list possible elements within S-STTEP research; address where S-STTEP researchers situate the analytic process in their work; examine how attention to practice and practical knowledge supports our work; and identify ways that rigorous scholarship emerges through holistic attention to quality and trustworthiness. Importantly, we explicitly assert that no ground upon which we stand remains permanent and our understandings change or shift the ways we perceive the worlds in which we think we live. This means that S-STTEP scholars offer no claim of truth but rather an "in the moment, at the time" sense of a passing reality. At the end of this chapter, we hope to provoke thinking about S-STTEP methodology and demonstrate the importance of embracing the praxis, the practical and theoretical. In our writing, we look less at what S-STTEP is and more at what S-STTEP does and the ways we can consider what quality does and what trustworthiness does to open our thinking.

Continually Shifting Ideas

What prompted our turn to S-STTEP? We resisted modernist thinking. With little philosophy in our background, we only knew that modernist notions didn't help us think about teaching and practice as we thought they should. We knew we wanted to challenge the ways we looked at teaching and practice, and we knew we wanted to honor teachers/teacher educators and acknowledge what they knew and how they knew it. In a time that voices of teachers or teacher educators had little privilege, S-STTEP researchers pulled these voices forward to make clear the strength and importance of the knowledge, experience, and power of those voices. Curiously, these ideas have only more recently appeared more generally in educational research, whereas in the S-STTEP community, they started to appear in the 1990s.

In those early days of S-STTEP, any of our research presented received challenge – about why, how, and so on (e.g., Ham and Kane 2004; Loughran and Northfield 1998; Whitehead 1993). We attempted to provide clarity and detail, but questions came harder and faster. We turned to what we knew – qualitative research – to offer

clarity and foundation. We used terms like trustworthiness and exemplars and validation. While not perfect, we tried to find shared understandings. As a nascent group swimming upstream, what we knew with momentary certainty was that teachers and teacher educators needed voice in the research by and about them.

In writing this chapter, we have less interest in being respectful of S-STTEP research and more interest in pushing the thinking of those people who read this work and think deeply about it. Moreover, we are interested in identifying the tensions between the modernist "science" folks and those who take up post-qualitative research and the shifting natures of that work. We also want to ensure that the language we use around post-qualitative research does not unconsciously fall back into traditional language. We are not suggesting the creation of new words; rather we are suggesting that we may use words – like positionality or trustworthiness – and make clear what we mean, in this moment, by those words. We know very well that we have used these words differently yesterday than we are using these words today. Ideas shift.

In our age of fake news and false truth and shifting perspectives, how might we define any word? We know what we thought about the selected word yesterday is not how we feel about that idea today. Today it seems like a word that "lumps" things together, and we are not sure we like that today. And today we feel that we need to scrutinize everything – like trust. When we meet someone, we have an instant reaction, and that reaction is on an energetic level – unexplainable in the "science" world – but it is there nonetheless, and this indefinable feeling plays into trust. Or, if we find an article we like, we look at the sources used and the ways we perceive the person's grounding in the topic/area and the "feel" we have of that person, and that plays into trust. Then, we begin to listen or read. For example, when we think of a particular scholar although we have never met her, the energy we feel from her text and her careful use of current and varied sources and her interest in a particular topic may lead us to trust her. There is nothing un-subjective about that. This would be true for anyone's work.

S-STTEP in some ways seemed to be a methodology without a place and emerged during a time when challenges to its existence were strong – researchers study self to understand practice and our ways of thinking about practice. How is that useful? Initially we realized that part of the struggle rested in the ontological rather than the epistemological stance we took up. Doing that, we turned away from warrants to a more intimate look at ourselves as a way to understand others. One of the reasons why S-STTEP is difficult to describe is that S-STTEP researchers have different backgrounds and as researchers we fall back on our familiar, epistemic roots. Sometimes, rather than recognize our methodological uniqueness, S-STTEP researchers took an equivalency approach to differentiate between positivism, post-positivism, and postmodernism. For example, LaBoskey (2004) took up the exemplar-based work of Mishler (1990). Craig (2009) recommends that S-STTEP researchers must consider carefully their research processes to ensure trustworthiness as a way to support their claims to knowing and doing. For Pinnegar and Hamilton (2015), "researchers make themselves publicly vulnerable to questions about the viability of the practice, the evidentiary and interpretive basis of the

assertions for action, and the understandings revealed in the study of the selected practice" (p. 182). This struggle added complexity to the ways we situated practice – the focus of a work.

Drawing upon more than 20 years of research exploring S-STTEP research and methodology (e.g., Dinkelman 2003; Hamilton 1998; Holt-Reynolds 1992; Kitchen 2005; Louie et al. 2003; Loughran et al. 2004), Vanassche and Kelchtermans (2015) claimed that S-STTEP "research focuses on one's own practice; for this reason, it privileges the use of qualitative research [strategies]; collaborative interactions play a central role in the research process" (p. 508), and they asserted that S-STTEP researchers utilize trustworthiness to demonstrate the power of their work. Like Lyons and LaBoskey (2002) and LaBoskey (2004) before them, Vanassche and Kelchtermans defined trustworthiness through the work of Mishler (1990) as the response of the academic community to this research. More specifically, Mishler (1990) asserted that:

> the degree to which other practitioners or researchers turn to, or rely on, and use the concepts, methods, and inferences…is high enough for us to act on it, we are granting the findings a sufficient degree of validity to invest our own time and energy, and to put at risk our reputations as competent investigators. (p. 419)

This, Mishler argued, shifted notions of validity in qualitative research to validation that other scholars validate the work being done through their own willingness to engage with and use this research in their own work. Lyons and LaBoskey (2002) suggested that trustworthiness of research lies in the real-world, fully elaborated examples shared by the author(s) so that "a relevant research community can judge for themselves their 'trustworthiness' and the validity of observations, interpretations" (p. 20). In some ways, this echoes the desire to equate qualitative/quantitative terms.

Many S-STTEP studies even today, Mena and Russell (2017), for example, attempt to draw connections between qualitative and quantitative. They state that:

> [T]rustworthiness establishes the difference between search (a personal or collegial account of experiences) and research (the rigorous processing of data). If the discipline of [S-STTEP] is to advance, the quality of S-STTEP research must be demonstrated in ways that permit other researchers to assess its credibility. (p. 117)

While there is nothing "wrong" with this approach, we wonder whether we do justice to the critical examination of these issues. Furthermore, we wonder about the ways we might push past a desire for credibility to confidently accept and make public our work.

From these perspectives, trustworthiness appears focused on the audience of the research community and whether those that encounter the research find it trustworthy. As they engage with the research, can readers determine the trustworthy ways of the researcher? While these concerns are, of course, important, we argue that trustworthiness implies relationship and therefore should be understood through relational ontology (Slife 2004). Moreover, we suggest that the primary research

relationship to which we must be trustworthy in S-STTEP research is not the researcher and the academy but rather the researcher to the world in which their life and practice is embedded and the researcher and those practitioners, students, and communities for whom we write the research. These relationships require levels of trustworthiness that extend far beyond any strategies to ensure authenticity of this work.

We wonder about the ethical responsibilities that S-STTEP researchers have to students and colleagues, in whose lives our stories of practice are embedded, and the school and community contexts in which the knowledge gained from our studies are lived out. Trustworthiness represents, in part, an obligation to the unseen children we serve along with the colleagues and teachers who will read our work and learn from our experience.

Importantly, these shifts in thinking about research allow for multiple theoretical frames and varied research contexts that offer a multiplicity of understandings to emerge. More than one researcher could examine practice in trustworthy ways and come to different understandings about the nature of practice in a particular place among particular people. We acknowledge that trustworthiness, evidence, quality, and rigor are important. But we argue that these criteria are not static but rather lived out in research. For example, by rigor, we mean the demanding work of continually freeing oneself from the constraints of existing structures, what Foucault (1966/1970) called the order of things, so that we can approach practice as situated in particular places and communities and think the unthought. Other researchers (e.g., Lather 2013; St. Pierre 2013) suggested that qualitative inquiry in general comes with so many instructions and limits that rigor seems impossible to attain.

S-STTEP Ontology and Knowing

We return to our assertion that as S-STTEP researchers we acknowledge that we take up an ontological stance. For us, this turns our attention to the foundations of our beliefs – context, history, and conceptions to explore how we make sense of the world, as we are always *becoming*. Moreover, we are *becoming* alongside and together with others in our contexts and communities. This ontological perspective disrupts traditional notions of knowing, trustworthiness, and quality as static understandings of reality to embrace constant moving, shifting, and *becoming*. Ontology "is fluid, it is about 'what is' in the moment…[where] postmodern theories disrupt the distinction between epistemology and ontology…" (St. Pierre 2013, p. 455).

In a post-qualitative new empiricist research world, researchers use methodology and strategies to problematize the forms of their research and avoid slipping into traditional understandings (Taylor 2017). We recognize that even, "key aspects of the research process—the objects of inquiry, methods used to produce 'data', what 'data' is, coding as a practice of meaning-making, and the formal conventions of academic article writing for journal publication" (Taylor 2017, p. 311) open spaces for scholars to move beyond traditional views of research.

A traditional view suggests that images, "…of thought, credited to Descartes…drive much social science research: A researcher (the subject) studies the world (the object) to know it (this is the epistemological project called empiricism)" (St. Pierre et al. 2016, p. 102). When we take up an ontology of *becoming* not being, we live in a space where things shift-connect-reconnect-attach-detach-reattach. There are always traces of what came before, where we look behind us and see the path we followed while recognizing the difference we live now.

In S-STTEP research, we commit to an excavation and examination of practices for both understanding and improvement from the perspective of the person continually constructing self and practice. We attribute the work's value to the potential it provides for improving practice. Moreover, we look to the value it brings to nuanced accounts of practice as lived and understood by the person conducting the study. We take an ontological stance that focuses on providing a resonant account of learning about and understanding our practice while working to shape practice lived out in and among our varied and diverse contexts and communities. In addition, insistence on an ontological stance signals our understanding that we examine our own practice within the sociocultural-historical-linguistic world within which we live.

In this work, the exploration of the self is not as vital as the exploration of the sensemaking in, of, and through practice since the practice belongs to the researcher (the self) engaged in the study. The ontological stance and the commitment to dialogue as a process for coming-to-know for establishing trustworthiness are vital. S-STTEP researchers, after collecting information for their studies, return to unpack the understandings of practice present in those accounts – through a recursive process that includes interpretive and analytic aspects to uncover the knowing that emerges through examining the practices.

S-STTEP Research Methodology, Quality, and Trustworthiness

S-STTEP researchers seek to enact, inquire into, and understand experience, context, and process as they engage in study of practice. Our shared purpose and positionality animate understandings of quality and trustworthiness in S-STTEP research. With a commitment to ethics and acting with integrity, S-STTEP researchers draw upon their relational ontology to engage in dialogue – internal and external – to explore their coming-to-know process where they interrogate ideas, think and act with critical friends (Schuck and Russell 2005), engage in interior questioning and conversations, and juxtapose theories and ponder what they think they see in relation. These researchers seek to present provocative studies (Pinnegar et al. 2019) and communicate emergent understandings in ways that recognize that both the reader and researcher bring lived experience, practical knowing, to research. To establish work as quality work, strong and believable studies communicate their inquiry process and their study of it as a "fertile space" where thinking and "rethinking the body, self, knowing and agency" (Ovens and Fletcher 2014, p. 8) occur continuously.

As S-STTEP researchers, we become curious about the moments of practice where we experience integrity and identity or in spaces where one or both might be absent. We look to our action and thinking to explore our assumptions, beliefs, and embodied knowing and action seeking to uncover what we think we know and its relationship to what we do. Inquirers seek to understand every aspect of their practical knowing of teaching and teacher education in *becoming* learners, teachers, and teacher educators.

Important in the exploration of establishing the quality and trustworthiness of a study is understanding traditional labels in the inquiry process and the ways S-STTEP researchers can embrace openness, act with respect, and establish integrity. Any element of a study has a potential to produce a sense of establishing a momentary truth while maintaining openness. Orientation toward inquiry and quality of inquiry is less prescription and more insight as S-STTEP researchers make sense of practice and thinking within the study and thoughtfully consider what they see/live as they engage in internal/external dialogue.

Engaging in S-STTEP research can be both a disruption and disrupting. First, S-STTEP research disrupts understandings within the larger research community. Second, engagement in S-STTEP research causes researchers themselves to disrupt and provoke their own understandings of inquiry, knowing, embodiment, and practice. Initially, the larger teacher education research community saw S-STTEP researchers as disrupting. As S-STTEP researchers we took up this work, and the larger community felt unsettled by methodological approaches that seemed to challenge understandings surrounding the production of knowledge grounded in modernist epistemology. Their assertions regarding the ephemeral emerging character of knowledge seemed to raise questions for traditional researchers (see Ham and Kane 2004).

S-STTEP became visible as a methodology occurring during the crisis of representation. At that time, Denzin and Lincoln (1994) articulated the movement away from modernist epistemological notions of objectivity, replicability, and generalizability, labeling them as tenuous and flawed. Later, Putnam (2004) argued that modernist ontology died because their epistemology failed to produce knowledge that supports humans in responding to human problems. Additionally, Polkinghorne (1988) and Zeichner (2017) provided clear evidence that studies conducted from a framework of modernist epistemology failed to offer practical guidance that has or even might result in solutions to the difficulties in schools, therapy, families, and communities. Furthermore, Polkinghorne argued that such work offered few theoretical tools to support practitioners in decisions about where to begin and how to act.

S-STTEP research challenges traditional approaches because these researchers embrace a fundamentally subjective stance in their scholarship and are committed to developing understandings of their practice: their thinking, their action, their contexts, and their assumptions about teaching and teacher education. Ovens and Fletcher (2014) recognized that S-STTEP research neither simplifies nor reduces teaching practice to its lowest denominator; moreover, it does not position teaching as a process capable of being understood from the outside by neutral and detached

observers (p. 10). Rather, S-STTEP researchers acknowledge the importance of the embodied individual-in-action that positions teaching as "simultaneously the thing we know about, the thing we do and the thing we research" (Ham and Kane 2004, p. 104). What these researchers articulate here is the way in which S-STTEP researchers position themselves to provoke more complex and more useful understandings of practices in teaching and teacher education.

When we began our S-STTEP work, we had studied qualitative research and had engaged in research from a qualitative perspective. Initially, we failed to recognize our disruptive stance since from our graduate studies, we accepted assertions about avoiding bias encountered in our reading about qualitative research (e.g., Lincoln and Guba 1985; Miles and Huberman 1984). As the Arizona Group (2004) gathered in Kansas to work on our chapter in the first *International Handbook of Self-Study of Teaching and Teacher Education Practices* (Loughran et al. 2004), we recognized the potentially disruptive nature of our work in relation to the modernist epistemological traditions we had encountered as doctoral students. In the process of producing that chapter, we realized that S-STTEP work disrupts traditional approaches to research and recognized that this disruptive capacity is fundamental to the work of S-STTEP research.

Just as engaging in S-STTEP research serves as a disruption to the ways of understanding teacher education, this work also disrupts the ways researchers understand research. This occurs as S-STTEP researchers seek understandings concerning the theoretical and philosophical potential and promise of engaging in this work. We found new, more complex understandings about knowing, practical knowledge, ontology, and epistemology as we looked more deeply and intentionally into the ways these positionalities shape research. In tracing our own path toward increasingly challenging views (see Arizona Group 2004; Hamilton and Pinnegar 2014b), we noticed that early in the work, we came to understand the crises of legitimation and representation. Soon, we found ourselves becoming ever more challenging in our notions about practice, about knowing (particularly practical knowing), and how one could explore it.

In our work together, Mary Lynn and Stefinee constantly sought to explore the process, context, and practice of our work as teacher educators, and we embraced the notions that we studied and our own *becoming* as our coming-to-know kept evolving (see Arizona Group 2004; Pinnegar and Hamilton 2009; Hamilton and Pinnegar 2015). S-STTEP inquiry always stands on uncertain ground. Yet in the midst of the unstable experiential terrain from which we worked, we developed knowledge of practice, created living educational theory, and presented understandings of practical knowing that contributed to and advanced the research conversation on teaching and teacher education practice and research. To create strong work, S-STTEP researchers engage in research (and research communities) with confidence; we seek to be respectful and act with integrity. From this perspective, we wholeheartedly embrace the fact that we create living educational theory – our knowing becomes visible in the action we take in our practice, our reflection on it, and our dialogue around our investigation. Through grounding in the practical and development of theoretical knowing, we contribute to the larger research community.

Fundamental to our work and its contribution is the quality of openness in the accounts we present. Our own inquiries remain open even after publication. For example, as the Arizona Group (1994a, b, 2007), we presented readers with a chronological presentation of letter fragments we exchanged with each other. We never stated the themes we identified but invited the reader to engage and develop their own notions of the themes that resonated within the text and within the experience of the reader. In another example (Hamilton and Pinnegar 2014b), we demonstrated this openness to readers by interrogating and re-interrogating narrative fragments from earlier work coupled with the use of positioning and queer theory to provide a series of experiential observations. In Hamilton's (1998) book, we ended with a critique from Barnes that invited readers to read the collection of chapters again to reconsider and rethink what they read. S-STTEP inquirers always present partial work, as there are always more to ponder and possibilities to explore. This opening process draws attention to the organic nature of truth. In doing research, knowing always emerges throughout the research process, as well as in the representation of the work and the thinking of authors and readers as they consider the work.

Pinnegar et al. (2010) articulated three aspects critical for quality S-STTEP research: establishing authority of experience, answering the "so what question," and including an explicit turn to self (revealing the reframing of our thinking and practice that resulted). Incorporating these aspects strengthens the work and generates quality. Doing that, researchers can feel confident in producing inquiries, establishing ground for and publishing our assertions for action and understanding. We suspect that even as we/researchers complete documents that reveal and provide support for assertions, they are ephemeral. Since revealing our thinking can intensify and deepen it. Demonstrating quality in the work results in the resonance that other researchers experience as they read the work and as they use it to deepen understanding of their own experiences and practice.

When researchers seek to explore spaces that raise our curiosity and recognize experiences of living contradictions or wonder about how a practice works (see Pinnegar and Hamilton 2009) and we powerfully wield our research tools, we have personal surety in the moment and a sense of integrity in the work. We seek out spaces where our integrity and self converge/diverge. Palmer (2004) identified these as places of wholeness in practice. As teachers/teacher educators, we recognize these spaces where we are neither or where we take up ideas that hold promises of wholeness. When we engage in S-STTEP research, we embrace the Dewey (1938/1997) trilogy of openness, wholeheartedness, and responsibility. We are open to the things we might come to understand about ourselves, our practice, others in our practice, their responses, and our own.

We are open to theory and research relevant to our inquiry. We are open to things being different than we originally thought they would be. We are open to disrupting understanding, shifting our knowing and acting, and transforming as we explore the experiences we engage in and the practices we enact. For example, Pinnegar (1995) provided evidence of this stance as she sought to understand how objectives could inform her instruction. Through the inquiry process, she came to new understandings

about the ways student teaching experiences do not necessarily reflect classroom reality. Allison and Ramirez (2016) demonstrated a similar openness as they sought to understand their actions and thinking as non-tenured faculty pushed into positions of leadership.

Undergirding our studies is the belief that research should and will shift practice; and we operate on these new understandings revealed in our studies. We are committed to act differently in our practice and in our relationships with others. For example, Hamilton (2010) provided a careful exploration based in her seeking to understand preservice response to a course she taught and her adjustments to their responses. Brubaker (2009) offered a clear example of his wholehearted attempt to negotiate an assignment. He engaged deeply with the research on negotiation. He sought to act in ways that honored and valued his own and his students' responses and was in concert with the practices he learned about in his study. Tidwell (Tidwell and Fitzgerald 2004) acted wholeheartedly as she sought to understand her course from the perspective of her students who seemed in some way unengaged. S-STTEP researchers demonstrate quality and trustworthiness when we live out our responsibility to shifting practice through our research.

Additionally, we seek to understand courses from our students' perspectives. Tidwell and Fitzgerald (2004) provided evidence of this as Tidwell articulated her misjudgments of students and her adjustments in response to the knowledge she gained. A study by Philips (2013) emerged because his students consistently responded positively to his course in teaching evaluations but contradicted themselves in the response section when they wrote that they did not feel they would actually use what they learned in their teaching. Philips' (2013) careful exploration of his syllabus, student responses, and his own thinking indicated the ways S-STTEP researchers hold themselves accountable for their practice. LaBoskey (2015) sought to determine whether her work showed up in the teaching of her former students. Again, like Philips and Tidwell, her work gives us insight into the ways S-STTEP researchers act responsibly based on their practice as S-STTEP researchers and teacher educators. (For more examples see Berry 2007; Fletcher et al. 2016; McNeil 2011; Ritter 2012.) We become curious about the space of practice where we experience questions or quandaries or in spaces of absence. We look to our action and our thinking to explore our assumptions, our beliefs, our embodied knowing, and our actions to uncover what we know, its relationship to what we do.

Important to the exploration of how we establish the quality and trustworthiness of a study comes understanding that inquiries have a focused yet open holistic countenance. Our orientation toward inquiry and quality in inquiry is less about prescriptive methods and more about the insights and questions used to make sense of empirical materials brought to uncover revelations in our doing of practice, our thinking about it, and reflection on it. Inquirers seek to understand by, from, and in their practical knowing of teaching and teacher education about the processes and practices involved in *becoming* as learners, teachers, and teacher educators.

Positioning

We have talked elsewhere (Arizona Group 1997; Hamilton and Pinnegar 2015; Pinnegar et al. 2019) as have others (e.g., Thomas 2017; Pithouse 2007; Latta and Buck 2007) about tensions inherent in our positioning. Teacher educators must act as the teachers of new teachers while simultaneously standing in the role of teacher and as a researcher of teachers. Thus, teacher educators are always living their teaching action on at least two levels, and in their pedagogic action, they introduce assignments and activities and problems that will both reveal and engage students in learning and developing as teachers (e.g., Dalmau and Gudjónsdóttir 2002; Jónsdóttir et al. 2015).

As teachers and teacher educators, we act in the moment, and in that moment, we reveal who we are as teachers. In this way, teacher and teacher education practice are embodied and always immanent. Exploration of practice allows for the revelation of the practical reasoning and wisdom that lies underneath actions we take in our moments of teaching. As Noel (1993) argued, our practical wisdom guides us as teacher educators to grapple with conflicting as well as harmonious beliefs, desires, and knowledge as we take action in practical situations. Sometimes as we take action because it "works," our action that emerges from personal practical knowledge of teaching (see Clandinin 1985; Connelly and Clandinin 1985) may belie our beliefs. Our practical wisdom and the conflicts inherent in our personal practical knowledge can be uncovered as we articulate the practical reasoning behind our decisions. Our understanding and reconciling of our practical knowing guides us in determining what actions are morally right in that moment.

Use of I

In our work as S-STTEP scholars, we take up Deleuze and Guattari's (1980/1987) assertion that we desire not to arrive at a "point where one no longer says I, but the point where it is no longer of any importance whether one says I" (p. 3). In our *becoming* we resist and question what we are and who we are (St. Pierre 2013; Foucault 1982) and challenge the voices in our work. We attempt to make sense of the complexities of "I" in S-STTEP – accounting for the "I" who inspired the direction of the questioning along with acknowledging the multiplicities and contradictions that exist in our becoming. We acknowledge that it is difficult to disentangle the many who shape and are shaped by our conception of "I."

In some ways, this making sense of "I" sits at the heart of S-STTEP – where the engaged researchers navigate assemblages of lived experience, practice in classrooms. Other researchers might question how this work might be considered research. Questions about identity and thoughtfulness complicate the ways anyone talks about this (see, e.g., Gilligan 2015; Gilligan et al. 2006; Jackson 2017; Lather 2013; Mazzei 2017; St. Pierre 2013). Taking up an ontological stance potentially raises questions that at least cause tremors in the dominant research world – qualitative, quantitative, and everything in between (Slife 2004). This means that

in our work, "we no longer believe in a disentangled humanist self, individual, person, [and in so doing] we have to rethink qualitative methods (interviewing and observation) grounded in that human being as well as humanist presentation" (St. Pierre 2013, p. 466).

As we engage in our research, we hear many voices including Deleuze and Guattari (1987) who remind us that endings can be unpredictable and not always happy; Butler (2002) reminds us to contest and trouble the "I" and the ways this term is and can be understood. Barad (2007) chimes in with a reminder about import of difference and the need to break away from habitual thinking that miss relations with the surrounding world. We are not alone with our "I."

Forming Research Puzzles

Research puzzles for S-STTEP researchers emerge from our focus on practice. Moreover, drawing connections to research on teaching and teacher education as well as research in other academic fields strengthens and develops our work. When S-STTEP researchers consider research puzzles, we pay attention to context – the researcher's practice and the academic research. When reading about developing research projects, methodological texts often communicate a sense of linearity. Traditionally, the authors of these texts suggest that research begins with a research question. S-STTEP researchers often begin with an idea, a practice, an account, and/ or a context that prods their curiosity. As they ponder, they begin to study the chosen context, collect related research studies, and/or explore theoretical representations. However, as Lather (2013) and others have pointed out, as post-qualitative researchers we can challenge this. Generally, though, curiosity takes us over, leaving us wondering or challenging the whys and wherefores.

Sometimes the accounts and materials, collected as part of practice or even in the pursuit of other wonderings, lead to the formation of interesting and productive queries. Olsher and Kantor (2012) started out working to understand reciprocity of learning in a mentoring relationship. However, once they have gathered accounts and reflections, Olsher became deeply curious about the development of the questions they asked each other. In this way, the study shifted and reopened. Allison and Ramirez (2016) were curious about their practices as untenured faculty, asked to take on leadership positions overseeing and evaluating tenured faculty.

In another study, Philips (2013) became curious about the contradictions between the numeric student evaluations and their written critiques about content of his course. Across the study, as he interrogated student evaluations, reflected on them along with his syllabus and assignments to uncover the quandaries presented in dissonant student responses, he shifted the study. While he puzzled about his understandings of course purpose, his questioning opened and reopened. Strong work guides a study in contested spaces including the context of the practice, the understandings and wonderings of the researcher, and the insights from research and theory.

We understand that quality and trustworthiness in S-STTEP research requires attention to traditional issues of power – in the framing of the study, the author focuses on particular issues. In traditional research, researchers are often positioned as authorities. However, we understand that quality and trustworthiness in S-STTEP research requires a willingness to position ourselves as learners – seekers of knowledge. Philip (2013) and Allison and Ramirez (2016) do not begin in spaces of certainty, but the frame of their purpose engages and orients readers to see into their knowing in practice. In framing the study, the authors communicate respect for the importance of the puzzle for practice and the audience being addressed. Finally, in articulating the focus, purpose, and scope of the study, S-STTEP scholars communicate integrity as researchers. Authors establish themselves as someone speaking with the authority of experience and practical knowing. The focus of the work and the practice of the teacher educator shape the research puzzle. The context and the practice within a classroom cannot be separated.

Presentation of the study and the researcher's interpretive process open toward another important feature of S-STTEP, that is, the turn back to self. Strong S-STTEP research always turns back to self, from what is understood in the research process to what the study reveals to the teacher educator. The turn back to self provides space to explicate both personal and further meaning of what has come to be known as we raise questions about navigating and constructing and contributing to the academic politics and pedagogical processes. Thus, the personal questions of practice that guide the study need to have value to the larger community, and the information gathered and the analytic process lead to this turn.

Articulating the Context of the Study

We find addressing contextual issues to be critical in S-STTEP work. To establish quality work, S-STTEP researchers need to clearly and comprehensively articulate two contexts – the context of the practice and the context of the research conversation. Identifying and communicating these contexts enables S-STTEP researchers to demonstrate themselves and their study worthy of trust. In seeking to establish S-STTEP research as trustworthy, researchers recognize that they demonstrate the strength of their trustworthiness in the ways they clearly and deeply describe their study. Still, judgment regarding levels of trust remains with readers. Explaining and examining these two contexts within which the question/puzzle/focus of the study rests becomes a fundamental part of the researcher's demonstration of trustworthiness.

S-STTEP research attends deeply to the particular (see Putnam (2004) for a discussion of the value of the particular) and does not seek to establish generalizability. Rather, we look to readers to consider the ways our views on practice and teacher education can contribute to their own practice. To do so, we must make clear the practice context of our studies. S-STTEP researchers present a written picture with enough detail to inspire readers to read further and to think more deeply about the ideas presented. We weave in our discoveries, our accounts, and our analytic

process that includes our own practice and personal practical knowing. For example, Thomas (2017) provided an illustration of careful articulation of a study's context. She began her article by articulating her position in the context of her practice. She focused on exploring her knowing of student learning leading to and during practicum. Thomas's care in identifying and communicating the aspects relevant to her context serves a critical aspect of her study. She wrote:

> I have been in my present position as a professor in a large research-intensive university in Canada for over twelve years where I coordinate one undergraduate program and also developed and coordinated the practicum component of another graduate program over a three year period. I have also been working with a group of four other teacher educators who have important roles in the practicum components of their respective universities. We all began our professional lives as classroom teachers and we all have a strong interest in learning more about how our students experience the practicum as a place for learning how to teach. (p. 166)

Notice that she used years of experience twice in establishing her experiential base for her practical knowing of *becoming* a teacher and learning from coursework and fieldwork in teacher education. She documented the range of preservice teachers with whom she works (undergraduates and graduates). She noted her role in the practicum component of the work. She also noted that she had practical knowing of *becoming* a teacher and facilitating others in the work. Here, Thomas calls attention to selected contexts to provide grounding for her assertions about action and understanding that emerge from the study. These descriptions foreshadow Thomas's later discussion of the program's theory/practice divide, a conundrum she seeks to unlock. Thus, these descriptions offered a basis for readers to grasp her assertions; they also provided a foundation from which readers could appraise her integrity and understanding of the work. Her contextualization and its use to interrogate her assumptions about the theory/practice divide demonstrated her as open to rethinking and willing to act with wholeheartedness.

In another example, Bullock (2017) provided historical autobiographical context of learning-to-teach juxtaposed with his knowledge of learning to relate with his current context as a teacher educator. He presented both contexts arguing his use of his learning-to-teach context in order to better understand the response of preservice teachers to his guidance as they prepared to teach. A certain openness in contextual understanding emerged in the shifts from past to present as he shifted from learning-to-teach to teaching teachers and positioned the reader as well as the researcher to experience the zone of maximal contact (Bakhtin 1981). This moment in time, this Zone, when past experiences connect with present experiences and reorient to future experiences complicates and reverberates across the study. It imbued the analytic process, discoveries, and openings with strength and revealed the respect Bullock held for his students and their development as teachers. His frankness concerning his positioning as a preservice teacher and his further work as a teacher educator imbued integrity.

In their work, Mansur and Friling (2013) articulated how their context led to their surprise at teacher candidates' responses to a particular assignment. In the

methodology section of their study, they deepen our understanding of the study's context by revealing that educational research informed their assignment and supported their pedagogy. This contextual conceptual framework provided readers with needed information for understanding the assertions for understanding that emerged from the study and the applicability of recommendations for assignments and pedagogy used in their teacher education programs.

When considering the context of a study, S-STTEP researchers and readers must remind themselves that contexts ebb, flow, shift, narrow, and/or expand. Whatever researchers reveal makes visible their understandings, the authority of their experience in learning from the study, and representation of their context, practice, or research. The selection of details reveals the integrity of the scholar and the respect they have for their readers as they contemplate how the study they read relates to the own work and practice. Importantly, a well-crafted contextual statement is always a feature of S-STTEP that resides in openness where researchers invite readers to think about the context as they interrogate and wonder about the relationship of this research to their own practice.

A second context of the study concerns a conceptual framework that introduces, clarifies, organizes, and establishes the purpose and focus of study. This is a hallmark of strong S-STTEP research and helps support a desire for quality. In a post-world we might want to find a less traditional word, but the point of addressing it here is that readers need some frame to follow along in the study. As researchers, we demonstrate our prowess as scholars by the quality, comprehensiveness, and elegance of the conceptual framework that details the study and the clarity with which we communicate the research conversation.

In developing the conceptual framework of a study, S-STTEP researchers demonstrate who they are as scholars. For example, Brubaker's (2009) study of his negotiation of assignments with students offers a clear illustration of the power of the conceptual framework. Not only did he attend to significant research in teacher education concerning assignments, he then drew forward information about negotiation from other academic fields. Through his articulation and juxtaposition of this framework, he established his interpretive skill, his commitment to careful thorough scholarship, and his integrity as a scholar.

Quality S-STTEP research positioned itself within and refers to larger conversations of research on teaching and teacher education. A quality conceptual frame situates readers in a dilemma faced in the research community or a curiosity that might benefit from exploration. We identify issues and relevant research that contribute to understanding aspects of the study presented. In providing a conceptual framework, researchers demonstrate a familiarity with a wider cultural milieu or research conversations about which the study can provide insight. We illustrate our fluency with the issues we take up by identifying classical studies, current studies, and contradictory studies that contribute to the design of our research. In what we label the Zeichner Paradox (Hamilton and Pinnegar 2015), Zeichner identified the power of S-STTEP research but questioned its contribution because S-STTEP authors made no clear connections between their own work and larger research conversations. They also cited few works by other S-STTEP researchers that might

push forward thinking or contribute to ideas addressed in the larger researcher community.

Strong conceptual frameworks attend to both of these issues. In providing robust, comprehensive, and clearly articulated conceptual frameworks, S-STTEP scholars position their work as valuable, trustworthy, and informative. Doing this situates scholars as attentive to relevant issues. As these scholars unpack the research and thinking that informs their scholarship, they establish themselves as capable of thoughtful, insightful work. They establish themselves as capable of engaging in dialogue about their work that, in turn, supports readers as they progress through the study.

Identifying and Collecting Sources for Inquiry

Within S-STTEP methodology we have few requirements for strategy use in research design other than an expectation that the researcher engages the best ways to uncover practical knowing and knowing in practice and articulates those strategies with detail and clarity. We gather information that reveals our assumptions and our actions to ourselves and those who read our work. We want to see what we know, but we also want to provide clear evidence that unveils how we act and think. Moreover, we want to consider whether we engaged in living contradictions – believing we act in one way but realizing we act differently than we believed. Thus, we need to be fulsome but selective in the information we gather and the ways we gather that information. Our ontological stance supports us as we identify research strategies and explore, unpack, and reimagine our knowing with the information collected.

S-STTEP researchers who develop quality studies carefully consider the uncovering process. Here, we might list general terms like journaling, e-mails, meeting records, narratives, drawings, graphic representations, interviewing, and classroom artifacts as examples. However, from within a shifting post-qualitative world, we recognize that how we engage in any activity depends on context and researcher. Perhaps researcher integrity, commitment to ideas, and ethic of care hold the key. When we examine strong studies, we recognize three clear links that establish the strength of work. When we hold the focus of the study against information gathered, we expect to see coherence. We look to see if sources collected hold promise to reveal the practical knowledge or practices studied. We look to see if sources used relate to emerging interpretations. We wonder whether sources open and reopen consideration of accounts and interpretations that emerge. When reading powerful S-STTEP work, we note that collected sources provide evidence comprehensive, thick, and deep enough to allow deep interrogation of issues and practices. Furthermore, they hold promise that researchers can return to sources and accounts multiple times if needed. For example, Philip's (2013) work uses student comments of his teaching, consideration of his syllabus, and accounts of his thinking that allowed him to spiral through several rounds of his analytic process to provide increasingly deeper responses to ideas animating his study.

Analytic Processes

In S-STTEP research, scholars are both the researcher and researched; information gathered and ideas explored come from their teaching and practice. Potentially, this positioning evokes high levels of vulnerability (Kelchtermans and Hamilton 2004). Quality S-STTEP work clearly articulates twists, turns, departures, and arrivals in the analytic process. Since we always live in spaces of *becoming*, we expect to gain knowledge in our process and may well abandon our initial views. We expect disruption, shifting, and transformation. This means we need to support this process and remain vigilant by returning again and again to our sources of information, artifacts, and accounts to see if we might look differently and open new spaces. We look to see whether our discoveries confirm original thinking or demonstrate shallow interpretations or push forward enough to disrupt perspectives.

LaBoskey (2004) argued that fundamentally S-STTEP is interactive. Pinnegar and Hamilton (2009) pushed this point further by arguing that our process for coming-to-know requires dialogue as fundamental in analysis. Ovens and Fletcher (2014) cogently argue the case for the essential need for collaboration and interaction in conducting S-STTEP work:

> [S-STTEP] is never a solitary endeavour since practices are sets of culturally bound activities emerging from the collective actions, culture, and relationships with others also working in the same setting or community of practice. The practice of S-STTEP is always interactive, particularly in the way the researcher sustains a dialogue with others co-participating in the practice, with data sets, with related theoretical and research literature, and with co-researchers and colleagues. (p. 10)

In S-STTEP research we consistently seek ways to consider multiple perspectives around the interpretations we make. We push toward potential contradictions, alternative interpretations, and spots of blindness (which always accompany insight). Thus, in analysis, interaction is imperative. We seek critical friends. We collaborate with colleagues. We consider our findings with others not engaged in our work. We carry in our heads the critique of those who see the work as spurious or who have strong alternative viewpoints. We read deeply about the focus of the study, the elements of the conceptual framework, or theoretical and philosophical texts that raise questions. Engagement in the analytic process more than any other aspect of S-STTEP work requires willingness to open and reopen the work. Although interpretations may express traces of already established patterns of meaning (Deleuze and Guattari 1980/1987), S-STTEP work encourages challenge to ideas related to dominant realities. Doing this offers openings in the ways we perceive our world with few closures or cutoffs. As we proceed in our analytic process, we may reach a dead end, but the ability to turn around and consider other directions remains available. In education and teaching, we know that some researchers seek more static identities and correct strategies to improve education. In S-STTEP research, we remain open to ideas and issues that emerge and the many possibilities for improvement.

Making Thinking Evident in Our Learning/Knowing

When presenting the possibilities discovered in quality S-STTEP studies, researchers demonstrate respect for the evidence that supports (or does not support) their work and communicates integrity in the ways ideas develop and reveal new understandings. Simply stated, readers can trace the path followed and the ideas revealed in the study. Study assertions speak directly to issues that animated the researcher and the research. In the presentation of ideas, researchers make visible the nuances of thinking, practice, and analysis resident in the information gathered clearly indicating connections among the thinking, the queries, and the openings at study's end.

In clarifying learnings from the study, researchers offer cogent, coherent, and straightforward explanations of understandings reached and assertions for actions/ practice. Researchers reveal trustworthiness through careful, nuanced articulation of themes, threads, plotlines, interconnections, process, and/or configurations and then into the identification of evidence – artifacts and accounts. Examples resonate with ideas addressed in the study and connect with reflection and even push against assertions presented to demonstrate ways researchers hope to convey integrity. These selected examples allow readers to interrogate them as they make sense of the work. They open rather than close discourse inviting readers to reconsider, explore, and connect to assertions made. In presenting the examples, researchers demonstrate their own integrity along with the respect they hold for the ideas and participants in the study.

Researchers' abilities to present assertions, provide exemplars, and reveal ways in which these provide clear evidence represent the imperative to establishing trustworthy research. In doing this, the researcher demonstrates insight and strength as a scholar. They show respect to sources of information used in the study and for understandings reached. Most importantly, they provide a link and connection and a nuanced explanation of these interrelationships. Presenting ideas in this way, researchers establish their ability to demonstrate viability to address issues raised in their work. These strong representations provide clear evidence for the momentary truths uncovered.

Developing Conclusions, Attending to Practice, and the Practical

Conclusions are difficult to write because we recognize that a conclusion opens the portal to other possibilities. While they often read more like summaries, a "this is where we are in this moment" sort of statement, S-STTEP researchers link the conceptual framework, the focus, the information sources, and the understandings that shaped and formed the study. Like Barnes' (1998) critique at the first S-STTEP castle conference suggests, good conclusions reopen inquiry. Rather than representing an ending or static conclusion, our final statements communicate a reframing, a turn back to the self, and the significance of the study for the larger research conversation. In this process, readers find themselves rethinking original ideas,

wondering about sources of information, and reflecting on the analytic process. Good concluding remarks push readers to open their thinking toward new ideas and new considerations. In S-STTEP work this is particularly important because of its grounding in practical knowledge. As Polanyi (1967) makes clear, practical knowing is holistic. When we focus on some element of our practical knowing to examine and interrogate our practice and our knowing, what we uncover re-entangles itself holistically with our personal practical knowledge. What we knew has now shifted, transformed, and merged, and we position ourselves to re-examine what we thought we knew.

Attending to the Practical

As teachers and teacher educators, we locate knowledge in the practical (see Clandinin 1985; Connelly and Clandinin 1985; Craig and Orland-Barak 2014; Hamilton and Pinnegar 2015). Schwab (1970) argued (and we agree) that the knowledge teachers (and teacher educators) draw on for teaching is holistic, imagistic, and interconnected – fundamentally practical. We argue for a more holistic orientation focused on enriching and deepening the practical knowledge that actually guides teaching (Schwab 1970, 1978). Our orientation is to the ideas of the practical raised long ago by Schwab (1970) and the conception of teacher knowledge that guides teaching as personal practical knowledge (Clandinin 1985; Connelly and Clandinin 1985).

Connelly and Clandinin (1985) have argued that teachers draw on their personal practical knowledge to guide their teaching. Clandinin provides the following explanation of the term:

> What is meant by "personal" as defining knowledge is that the knowledge so defined participates in, and is imbued with, all that goes to make up a person. It is knowledge which has arisen from circumstances, actions and undertakings which themselves had affective content for the person in question. This use of "personal" draws attention to the individual local factor that helps to constitute the character, the past, and the future of any individual. By personal as defining knowledge, is meant that knowledge which can be discovered in both the actions of the person and, under some circumstances, by discourse or conversation. By "knowledge" in the phrase "personal practical knowledge" is meant that body of convictions, conscious or unconscious, which have arisen from experience, intimate, social, and traditional, and which are expressed in a person's actions. The actions in question are all those acts that make up the practice of teaching including its planning and evaluation. "Personal practical knowledge" is knowledge that is imbued with all the experiences that make up a person's being. Its meaning is derived from, and under-stood in terms of, a person's experiential history, both professional and personal. (Clandinin 1985, p. 362)

Teachers' practice is guided by their personal practical knowledge to support and enliven who they are as teachers. In Clandinin's (1985) study of Stephanie's personal practical knowledge, she articulated how Stephanie's images of classroom as *home* and as *teacher-as-maker* capture holistically Stephanie's identity as a teacher as well as the moral commitments that guide her action as a teacher. These stories shape and

goad Stephanie's practice and the way in which she lives as a teacher. It leads her to sacrifice time and resources and to act in particular ways in her classroom and in her preparation for her teaching as well as her responses to her students.

We see evidence that teacher educators' personal practical knowledge includes the shaping experiences and influences of social and physical contexts that shape our knowing – and the ways we live out that knowing in those contexts. These understandings provide narrative frames that guide practice. This perspective weaves together and makes coherent background knowledge about students, content, classroom rhythm, commitments, and/or sacrifices. In turn, responses to issues and concerns as teacher educators are guided by this embodied knowing; this personal, practical knowledge guides our ability to design and enact classroom curriculum as well as research. Additionally, we situate our understandings of the tensions among university politics, colleges of educations, and public schools as they collide in the practical, tacit, and embodied knowledge we have as teacher educators.

Our personal practical knowledge shifts as we continue to encounter experiences in our contexts. Dewey's (1938/1997) description of learning from experience in *Experience and Education* helps us conceptualize the ways that experiences exist in a continuum of experiences. Our personal practical knowledge as teacher educators grew from our experiences as preservice teachers and teachers; moreover, our experiences in our graduate studies – the practices of research learned as graduate students and in our dissertation studies – shape how we engage in teacher education research through S-STTEP. As we entered teacher education, our experiences positioned us to learn more about teacher education and what it meant to be teacher educators. Since we took up studying our own practice, we learned from our experiences – and we understood in new ways how we are always *becoming*.

The institutions and communities in and among which we work shape our knowing about teacher education and ourselves as teacher educators. We have access to new perspectives/experiences of teaching and teacher education as we engage with new communities of colleagues and their experiences around the world. Studies conducted in different countries or contexts, even focused on similar practice, expand what we can know and understand about teacher education. We recognize that different contexts may bring about different practices and can lead to real differences in the explicit and implicit knowing we develop and enact as teacher educators. Because we are always *becoming*, our knowing and our knowing of our practice resides in this same emergent space and forms a fruitful site for building knowledge for and contributing to the research base of teacher education.

While this knowledge is particular, as teacher educators share experiences and context and practices with colleagues, there is great potential for learning from shared knowledge. The shared personal practical knowledge of teacher educators has potential to contribute much to our understanding of what it means to be a teacher educator and do teacher education. Because our knowing and our *becoming* as teacher educators is always in process, this knowledge is dynamic rather than static, capable of being informed by formal propositional knowledge as well as practical experience. Accordingly, studies into our own practice and our knowing in

that practice represent limitless sources for developing new understandings and knowledge of teaching and teacher education.

Attention to mandated *practices* in teaching without concomitant attention to the whole of a teachers' practice will always be problematic. Teaching is relational, political, moral, and ethical and enacted in particular contexts, with particular students – oriented to engaging students to learn content and/or ethical commitment. Early in the research on teaching movement, Doyle (1986) explored classroom management and described the conflicting and demanding space in which teaching takes place. He recognized teaching as very public (always enacted in the presence of others) and characterized by multidimensionality since many things of different sorts and importance occurred simultaneously. Teachers often act in the moment; the immediacy of learning and interactions with students and colleagues demand attention. At the same time, all that teachers do occurs in a context that has a history; individual and collective histories come together in the immediacy of these interactions. In the midst of these complexities, teachers must attend to educative experience (Dewey 1938/1997) – these realities of experience demand attention to the practical.

Merleau-Ponty (2013) articulated clearly how practical knowledge (note the difference from practices here) exists in the intuitive and unarticulated ways we move in the world and act in relationship to others. He argued that there are ways in which we lean forward into conversation, move about a room, or respond in interaction with students. This knowledge exists in our gestures, like our raise of an eyebrow, and in our decision to speak or remain silent. This kind of knowledge is fundamental to who teachers understand themselves to be.

While categories of knowledge or specific practices can be a *part* of what guides teachers, it never accounts for the whole. Practices in teaching can never be completely extracted from the personal practical knowledge that informs teaching. When we focus on practices, we can indeed "train" teachers to enact those practices, but it is from the basis of their personal practical knowledge that teachers resist, embrace, enrich, or impoverish their enactment.

Studies that unpack teachers' approaches to practice have demonstrated the power of this kind of research for moving teaching practice forward and deepening teacher educators' understandings of the thinking and development of teachers (e.g., Morgan 1993; Tidwell and Heston 1996). In a study of the epistemology that guided practice of teachers, Gholami and Husu (2010) found that teachers based their reasoning about their practice in their context and their understanding of the nuances of obligation, relationship and interaction rather than on specifications about how a practice should proceed or their knowledge of content:

> . . .in each particular situation, the two participating teachers believed in or did something on the basis of the idea that the situation had specific characteristics to which they could not respond using universal or fixed rules. The findings suggested that the two participating teachers used various meanings to represent the contextual or situational emphasis on their work. (p. 1523)

They clearly articulated the ways understanding of context and beliefs guided teachers' reasoning and actions. Furthermore, Gholami and Husu (2010) indicated

that teachers argue for the goodness of their practice in terms of the paraxial (focused on the moral obligation and grounding of their practice – an orientation to the good within this context) and the practicable (an orientation toward what works or can work given the demands and constraints of the context). While either of these might, in part, relate to their content knowledge, they based much of the deliberation around practice teaching on wider concerns – beyond execution of particular practices in limited and pre-specified ways.

Dunne and Pendlebury (2002) explored the ways their understanding of practical reasoning emerged in teachers' enactment of particular practices. Their explanation about the grounding of teachers reasoning about their practice made clear that the practical, as Schwab (1970, 1978) argued, embodied more than practices. Teachers in their present moment utilized their personal, practical knowing to reflect and act. They engaged in practical reasoning that brought to bear past experiences, obligations, and ethical concerns on the contextual constraints of the moment. Teacher education oriented to training preservice teachers to demonstrate particular practices, even when coupled with reflective exercises, will always be rooted in the complexities of the situation. Our point here is that teacher education focused solely on training for particular practices has limited possibility for educating teachers who will live and work in the lived realities of a particular country, state, city, community, school, classroom, self, and student(s).

The personal practical knowledge of teachers can be uncovered through an examination of enactment. Stern (2004) suggested that we might unpack our embodied knowledge by asking ourselves to create careful accounts of a routine event when we come into and out of consciousness. For teacher educators, the beginning of class or observations of a student teacher might be sites for such investigation. A careful analysis of this account would uncover what they attended to and what they thought in that moment of consciousness. With this strategy, teacher educators might attend carefully to responses, triggers for responses, and possible relationships between them. Such work could reveal important insights about how teacher educators enact their embodied knowledge and how that reveals what teacher educators know. These strategies could contribute new understandings about the processes of being and *becoming* teacher educators.

In 1995, we (members of the Arizona Group) used S-STTEP methodology (see Pinnegar and Hamilton 2009) to engage in an explicit study of our processes of *becoming* teacher educators. We identified three salient features in our accounts: (1) questions and biography; (2) memories, images, and metaphors; and (3) processes in our learning. After completing our study, rather than being able to communicate how becoming teacher educators occurred, we realized that we had unveiled aspects of self from which we constructed our identity as teacher educators. We also recognized that these accounts differed according to our own experiences and the understandings we developed. Our discoveries honored our respective understandings of our inquiry as well as our past experiences that shaped our becoming as teachers and teacher educators. We realized that, as Clandinin (1985) demonstrated in her study of Stephanie's image of teacher, our own memories, images, and metaphors served as guides and goals as we negotiated the process of becoming teacher educators.

As we engage in these explorations – our everyday acts as teacher educators – our tacit and explicit knowing grows and shifts. In this process, our understandings around teacher education emerges and can best be studied and accounted for by using S-STTEP methodological design. Doing this allows us to explore our practice from our own perspective through the theoretical lenses we value and develop. Such scholarship is based in a relational ontology and oriented toward the particular. Because of its orientation toward the particular, grounded in our personal practical knowing (e.g., Clandinin 1985; Clandinin and Connelly 1995), it positions us as vulnerable within our practice and within the research community. A quality of intimacy exists here that we label intimate scholarship (Hamilton et al. 2016). Scholarship of this sort demands a vulnerability to uncover and reveal aspects of our actions, learning and thinking as we live our *becoming* as teacher educators. Importantly, we make visible our personal knowing in the particular experience or understanding being studied from our own perspective. Enacting this, we make clear our understandings of our socially constructed fluid *becoming* as teacher educators.

In the current era of teacher education reform, research on teaching and teacher education from a subjective perspective that is focused on developing understandings of the particular continues to hold great research promise. Indeed, preparing new teachers to engage in the complex classrooms of this country – where teachers must juggle meeting the learning needs of all students – represents an ongoing challenge. The study of teaching, learning, and educating teachers to meet these challenges is an exciting adventure for all educational researchers. Intimate scholarship, like S-STTEP research, allows teacher educators (particularly those concerned with the design and enactment of practices that support development of new teachers while simultaneously studying teaching and teacher education) to develop understandings and contribute to the research conversation. Indeed, utilizing these methodologies allows researchers to uncover and excavate their tacit (Polanyi 1967) and practical knowledge (Clandinin 1985) developed in the present moments (Stern 2004) of their practice that may remain hidden through other forms of research. Recently S-STTEP has gained status as genre of educational research (Borko et al. 2007), yet challenges continue to the quality and rigor of this work (Zeichner 2007).

All of our experiences provide opportunities to explore our *becoming* as teacher educators. Ever-emerging experiences continually shift our knowing about self and teaching practice; through these experiences, we continually draw forward new pedagogies and practice as teachers. When studying their beliefs about teaching mathematics – the ways such beliefs emerge in and guide practice – a group of math teacher educators (Lovin et al. 2012) carefully examined their pedagogy and revealed to the readers their *becoming* as teacher educators. Berry and Crowe (2007) uncovered the pedagogy used to support preservice teachers to think like teachers. In doing so, they revealed their own understandings of what it means to be and act like a teacher/teacher educator. Mansur and Friling (2013) explored the theoretical underpinnings of their curriculum-making and the shifts they made in their pedagogy in order to support teacher development. Their work illustrated that the thinking and action behind their pedagogy revealed their own identity and shifts

in it. They explored their shifting pedagogical and theoretical orientations across time as teacher educators (see also Coia and Taylor 2013; Hamilton and Pinnegar 2009). In *becoming* teacher educators, they often found that their research almost always shifted toward pedagogy and a deeper study of practice (see also Arizona Group 1995, 1996; Bullock and Ritter 2011). Teacher educators orient themselves toward being their best-loved selves and support teachers in becoming their own best-loved selves (as explored by Craig 2013).

Teacher educators, acting as intimate scholars (Hamilton and Pinnegar 2015), position themselves to inquire into the practices and processes they use and develop. Shifts in landscape and adjustment of practice develop the character and hone the learning and skills that raise wonderings and open spaces where teacher educators can nourish and refine their understandings of the knowledge they carry. *Becoming* a teacher educator orients us to particular aspects of experience, practice, and life. Therefore, the ebb and flow of relationships are basic to research on experience, thinking, and practice of teacher educators within intimate scholarship. Studying the practical actions we take (individually or institutionally) reveals who we are as teacher educators and propels our *becoming* experience. This scholarship conducted as intimate scholarship in its various forms (see Hamilton and Pinnegar 2015) enables teacher educator researchers to uncover and explore the understandings we develop of our experience, thinking, and practice.

Integrity and Authority of Experience

S-STTEP research grows up in the space where self and integrity come together. These are dangerous places to explore. While potentially the most productive spaces for gaining insight and understanding, they are also the spaces about which we care deeply. Palmer (2004) suggested that to develop deeper understanding of ourselves, we should seek out those points where identity and integrity coalesce. If we embrace these points of insight and attend to them in our practice, we open ourselves to the possibility of revealing our cover stories and our contradictions (Olson and Craig 2005). When we embrace these places as sites for S-STTEP research, the understandings we uncover may be profoundly enlightening yet difficult to share with other researchers. We need to reveal the experiences that resulted in our development of understanding – but not provide an inappropriate confessional. As S-STTEP researchers we seek to understand these moments, but in doing this, we often explore moments where tensions emerge between sense of self and integrity. We must reveal ourselves as honest in our practice, yet not unkind/demeaning to ourselves or those around us.

As Feldman (2003) suggested, we attempt to stand in a place of *being* (how we are) and study ourselves as we *become* different often conducting our final account from a space of having become different (which he labeled "becaming"). Thus, we usually conduct our research in a space that Bakhtin (1981) labels *the zone of maximal contact* – that moment when past, present, and future are in greatest contact with each other. This is a *zone of inconclusivity.* Studies in these uncertain

inconclusive spaces change our understandings and stories of past experiences while altering the trajectory and experiences of the future as well as the present moment in which we think we stand.

S-STTEP researchers understand that our research can be described as highly subjective, since we conduct most of our research in the midst and seek to understand spaces between. We conduct research on our practice in the midst of experience. While we engage in such research, we explore that space between self and others in practice in the midst of our construction of practice in order to understand and/or improve. If we seek to understand, we often look not only to thoughts present in our mind but also the understanding that resides in our actions themselves or our embodied knowledge. If we seek to improve, we also study our practice as we seek to change and alter it. When engaging in S-STTEP, researchers seek to make clear how process and context constrain and open each other and our practices. Dialogue makes visible our knowing about context and process and those with whom we dialogue. Our interactions allow us to make visible hidden elements in our practice as well as connection to and influence on our practice.

Bullough and Pinnegar (2001) argued that S-STTEP is conducted in the space between biography and history; this research attempts to articulate understanding of specific practices in specific contexts in the lives of specific people and link those understandings to the larger research conversations. As this argument implied, S-STTEP researchers make assertions for action and understanding about their practice from a position that traditional research paradigms would marginalize as subjective.

Munby and Russell (1994) identified three concepts of authority upon which practitioners might make claims of knowing as teachers: authority of position, authority of reason, and authority of experience. Then they continued by arguing for the power of the concept of the authority of experience as a position from which teachers actually make claims about practice since it contains the other two. They said:

> In their many years of schooling preservice teachers have seen two basic concepts of authority at work: the authority of reason, and the authority of position. While the goal of education can be cast in terms of establishing knowledge claims on the authority of reason, there are times when claims are seen to rest on the teacher's authority of position (Russell 1983). Preservice teachers are poised to move from being subject to their own teachers' authority of position to taking charge and, as students turned teachers, assuming authority of position over those they teach.
> Unfortunately, preoccupation with the authority of reason and of position can cause teachers and students to ignore a type of authority lying at the heart of action and performance: the authority of experience. Emphasizing the contrast between school knowledge and action knowledge (Barnes 1976) marked how the experience of school can conceal the differences between the authority of reason and other forms of authority. (p. 94)

Munby and Russell (1994) labeled validity practices from more traditional research as the authority of reason that they contrast with the authority of experience. In this discussion, they argued that the authority of experience lies at the heart of the action and performance that constitutes knowing about practice. For them, the authority of reason learned in school interfered with the authority of their experience,

which underlies their knowledge and action in teaching practice. Importantly, hooks (1994) cautions researchers and thinkers against claiming authority of experience until we know whose experiences we explore and how we examine them. S-STTEP research focuses on our own experiences and practices. Doing this gives us the authority of our own experience and underscores the vulnerability of our work.

When we present our inquiries as S-STTEP researchers, we have experienced, examined, and inquired into the pertinent aspects of our practice and experience. These aspects of our practice and experience, as Stern (2004) argued, are not the whole but merely a part of it. Stern further explained that if we extract pieces from our larger experience and practice, we lose nuances, integration, and connectedness and potential authority they share with the whole. Therefore, we do not segment the experience and practice that we study and present but draw from the whole of our authority of experience. This represents a deeper, more integrated, holistic, and powerful source upon which to ground the individual assertions we make about practice within a particular study. We strengthen our *authority of experience* through the rigor of our scholarship evident in a study and based on the strategies we use.

While S-STTEP researchers may use traditional tools shared with other forms of qualitative research to demonstrate coherence, resonance, and trustworthiness, they also understand that establishing their assertions requires that they act with integrity and honor. As S-STTEP researchers, we attempt to create spaces where who we are and our integrity overlap. We act with integrity to create such accounts (see Bullough and Pinnegar 2004) to demonstrate our trustworthiness (see Hamilton and Pinnegar 2000 for further discussion). However, we also recognize that our audience, our community, or readers of a particular study will ultimately judge the trustworthiness and rigor of the research account we present. (See Hughes 2008; Ritter 2012; Samaras 2010; Taylor et al. 2014; Williams et al. 2012 for more examples.)

Commitments of/to the S-STTEP Community

In S-STTEP research, the focus of the research is on exploration of practice from an ontological stance anchored in a commitment to improvement. Researchers conducting their study within this methodology devote careful attention to their ontological stance to represent their work as trustworthy. We label a study as S-STTEP research when the researcher is responsible for the practices being studied and the person doing the research. In addition, the purpose of the project, either explicitly and directly or implicitly and indirectly, must always be improvement of the practice of the researcher – because of new understandings or honing of the practices under study. All aspects of the study – the focus, the information gathered, the analytic process, the understandings presented, and the conclusions drawn – are oriented toward uncovering and revealing about what is and can be known about teacher education practice particularly as it relates to the larger research conversation.

LaBoskey (2004) outlined five elements of S-STTEP: it is self-initiated and self-focused, improvement-aimed, and interactive; includes multiple, mainly qualitative, strategies; and engages in a process based on exemplars. As we articulated earlier, distinct in the work of S-STTEP research is the focus on ontological stance. S-STTEP research explores practice, the self-in-relation-to practice and the self-in-relation-to-other. We listen to and share accounts as we dialogue in our coming-to-know this work. For S-STTEP researchers, the self has a place in the foreground of the study, but it is never the exclusive focus or purpose of the study.

In careful research, S-STTEP scholars contribute "to the professional knowledge base of teaching as well as generat[e] understanding of the world" (Hamilton 2004, p. 402). We have (1998) described the work of S-STTEP research as:

> the study of one's self, one's actions, one's ideas, as well as the 'not self'. It is autobiographical, historical, cultural, and political . . . it draws on one's life, but it is more than that. Self- study also involves a thoughtful look at texts read, experiences had, people known and ideas considered. (Hamilton and Pinnegar 1998, p. 266)

As this quote suggests, it is more about *becoming* and revealing what we know than about generalizing ideas. S-STTEP has a commitment to creating living educational theory – an organic theory that we enliven as we examine our practice. In so doing we reveal our knowledge and sense of the world shifting like organisms exposed to light to make visible our practice (see also Whitehead 2008).

Dialogue, as the coming-to-know process in S-STTEP research, serves as an important tool for establishing trustworthiness. We ask that – across the process of imagining, designing, conducting, and presenting an inquiry – researchers engage in dialogue. Living in a research space of dialogue means that researchers constantly assert and reflect on ideas; we invite alternative interpretations and seek multiple perspectives. We engage in this process continually across an inquiry, not just as a strategy applied to interpretation or only to final considerations. Continued conversations with peers, a skeptical self, research literature, and other participants in our work are vital aspects of S-STTEP research (see Fletcher et al. 2016; Hamilton and Pinnegar 2013; Loughran 2006; Peercy 2014; Ritter 2007 for examples).

S-STTEP researchers assert their obligation to unseen children (Arizona Group 1997). As well, we acknowledge our commitment to improving the understanding and development of educational theory that will lead to better educational experience for teacher educators, the preservice teachers, and their future students. Bullough and Pinnegar (2009) argued that more important than a concern for acceptance into the academy is the development of settings that sustain teachers and teacher educators – the creation of conditions in which they flourish. As this chapter began, we articulated acceptance, support, and kindness as valued within the S-STTEP community. We value this ethic of care as we interrogate, improve, and inquire deeply into our practices with a desire to provide honest, trustworthy rigorous accounts of our work so that our research becomes vital to the community.

As our initial quote from Derek's research reminds us, as S-STTEP researchers we stand in a particular yet encompassing ethical relationship to our practice. We

seek to bring provocative and productive yet sometimes hidden perspectives and understanding to research in teacher education. Our work is always conducted in a shifting uncertain space that we, as Derek's example reveals, embrace with openness, wholeheartedness, and responsibility to attend to its ethical demands to self, others in our practice, and those in the teacher education community while generating trustworthy, quality research. As we addressed earlier, our concluding remarks here open ideas for readers to contemplate rather than draw a static conclusion.

For at least the last 50 years, teachers and teacher education have been subjected to one wave of modernist criticism after another. They have been threatened by wave after wave of assessment specialists, educational researchers, and policy makers who want to control and manipulate educational practice from the sidelines. Such people provide checklists or rubrics for external evaluations of practice with accompanying punishment for those who fall short. As Ball (2003) argued, education generally has a culture of performativity. Often such groups seek to control practice without ever truly embedding themselves enough in the experience to truly understand and innovate. Putnam (2004) argued that we live in a time of intractable problems that are resistant to general solutions. As a result, particular solutions in particular places at particular times are needed since we can take careful accounts of such solutions and use them to consider approaches to resolving these intractable problems in other places, with other people, at other times. As S-STTEP researchers, we do not deny the value or insight that can be gained from the research of others. Like Greene (1995) argued, studies that see small (large, quantitative studies focused on overarching issues) as well as those that see big (studies that attend carefully to the particular and local) can, in concert, lead to promising responses to the difficulties of this time and place. However, as S-STTEP researchers we believe that studies of our own experience and deepened understanding of our own practice – when connected to the wider discourse in research on teaching and teacher education – have the most potential for informing and impacting not only teacher education practice but the practice of our students. In this way, we can meet our obligation to unseen children as well as their teachers with whom we work.

Contents

Abstract

This chapter focuses on contextual issues relevant to the introduction and implementation of self-study with four groups of individuals: teacher candidates, education doctoral students, practicing teacher educators, and higher education practitioners from other fields. This practical chapter identifies possibilities for initial self-studies for each of these groups and explores ways of connecting self-study to one's own familiar research methodologies.

Introduction

The overall purpose of this chapter is to identify possibilities for initial self-studies and ways of connecting self-study to one's own familiar research methodologies. It serves as an invitation for readers who are exploring the possibility of engaging with self-study methodology to establish or enhance a research agenda. For experienced self-study researchers, it serves as an invitation to revisit existing scholarship with the intention of exploring why and how researchers choose to do self-study and to consider how they might purposefully build on such efforts to further advance scholarly understandings. Accordingly, we take a multilayered approach to the writing of this chapter.

The first section provides the reader with a brief overview of self-study as a methodological choice for researchers. It focuses on the nature and purpose of self-study through a discussion of its historical antecedents followed by a consideration of its ongoing applicability, which includes defining features of rigor and quality. Given the inimitable fluidity of self-study methodology, this section serves as an important backdrop for contextualizing what follows later in the chapter in terms of identifying possibilities for initial self-studies and ways of connecting self-study to one's own familiar methodologies.

The second section offers an exploratory analysis of articles published in *Studying Teacher Education: A Journal of Self-Study of Teacher Education*. Specifically, we take a look at the action verbs used in the purpose statements of each of the studies and how these relate to the topic of inquiry. Our analysis of 209 articles suggests that self-study currently represents a methodology that appeals, and perhaps is best suited, to researchers who have an interest in critically exploring and interpreting some aspect of their own practice or pedagogy, broadly conceived. However, this analysis also points to areas of development for researchers to consider in relation to broadening what might be achieved through self-study research.

In the third section, we use the research literature and our own personal experiences to contextualize and discuss certain issues that particular groups of potential self-study practitioners might face in beginning/engaging in self-study. The groups discussed include teacher candidates, education doctoral students, practicing teacher educators, and higher education practitioners from other fields.

After describing the professional contexts and transitions facing each of the four groups of potential self-study practitioners, in the fourth section, we provide illustrative vignettes to highlight how individuals often seem prompted to engage in self-study owing to a need for greater awareness, a sense of loss, and/or a desire for empowerment. Further to portraying how the themes can prompt research-based action, the vignettes highlight how and why self-study represents an appropriate

choice for certain research questions, with attention given to the ways in which self-study connects to the familiar research methodologies the researchers brought with them to their work. The section closes with practical recommendations for getting started in self-study informed by our practices of teaching, learning, and enacting self-study methodology (Ritter et al. 2018b).

On the Nature and Purpose of Self-Study

Self-study represents an increasingly popular and promising methodological choice for researchers who see value in acknowledging the creative and interpretive nature of qualitative inquiry by looking critically at issues of representation, legitimation, and praxis in their work (see, e.g., Denzin and Lincoln 2000; Patton 2002). Russell (2004) argued that self-study, as a research mongrel of sorts, can trace its origins to previous work done in multiple fields, including reflective practice (e.g., Dewey 1933; Schön 1983, 1987), action research (e.g., Kemmis and McTaggart 1988, 2000), and practitioner research (e.g., Cochran-Smith and Lytle 1993). Bullough and Pinnegar (2001) similarly noted how self-study seems to have emerged as a result of the expansion of naturalistic and qualitative research methods, the influence of the reconceptualist movement in curriculum studies, the growing involvement of international researchers who bring with them diverse intellectual traditions (e.g., Clandinin and Connelly 1990, 1996), and the growing acceptance and influence of action research (e.g., Kemmis and McTaggart 1988, 2000; Stringer 2004). Both of these accounts situate self-study as part of a larger "trend away from modernism and its assumptions about legitimate knowledge and knowledge production toward broadening what counts as research" (Bullough and Pinnegar, p. 13).

At its core self-study seeks to increase understanding of "oneself; teaching; learning; and the development of knowledge about these" (Loughran 2004, p. 9). Samaras (2002) offered useful way to think about the nature and purpose of self-study when she described it as a "critical examination of one's actions and the context of those actions in order to achieve a more conscious mode of professional activity, in contrast to action based on habit, tradition, and impulse" (p. xxiv). While other research methodologies similarly may focus on self and/or practice (e.g., autoethnography with its focus on self and action research with its focus on practice), the distinguishing feature of self-study research is that both are considered simultaneously.

Importantly, however, self-study is not synonymous with personal reflection. Bullough and Pinnegar (2001) noted that "to study a practice is simultaneously to study self: a study of self-in-relation to other" (p. 14). A crucial expectation of self-study therefore includes demonstrating "interactions with our colleagues near and far, with our students, with the educational literature, and with our own previous work…to confirm or challenge our developing understandings" (LaBoskey 2004a, p. 859). Owing to this expectation, self-study research tends to facilitate more nuanced kinds of learning that can be in relation to others, with and through critical

friends, by seeing practice from the students' perspective (Loughran 2004), or in collaboration with colleagues (Pithouse-Morgan and Samaras 2015). Louie et al. (2003) noted how this collaborative aspect of self-study has at least three benefits, including its ability to increase social support, to foster a culture of reflectiveness that results in higher-level discourse and critique, and to help researchers avoid solipsism and increase the chances they will create transferable knowledge.

Further to the collaborative aspect of self-study, additional methodological expectations include that it be self-initiated and improvement-aimed. According to LaBoskey (2004a), self-study "looks for and requires evidence of the reframed thinking and transformed practice of the research, which are derived from an evaluation of the impact of those development efforts" (p. 859). It accomplishes this by employing multiple methods to seek out varying perspectives and a plurality of understandings. Even though the specific methods used in self-study may vary, "the common element is the reflective, critical examination of the self's involvement both in aspects of the study and in the phenomenon under study" (Hamilton and Pinnegar 1998, p. 240). According to Wilkes (1998):

> Brookfield (1995) suggests that reflection becomes critical when it has two distinctive purposes: the first is to understand how considerations of power undergird, frame, and distort educational processes and interactions. The second is to question assumptions and practices that seem to make our teaching lives easier but actually work against our own best long-term interests, and I would add those of our students. (p. 206)

As a final methodological consideration, offering further evidence that self-study is more than simple reflection, there is a widely acknowledged need to "formalize our work and make it available to our professional community for deliberation, further testing, and judgment" (LaBoskey 2004a, p. 860). Loughran and Northfield (1998) made it clear that while "reflection is a personal process of thinking, refining, reframing, and developing actions….*self-study takes these processes and makes them public*, thus leading to another series of processes that need to reside outside of the individual" (emphasis added, p. 15).

Interestingly, as part of the trend away from modernism, self-study is not a prescriptive methodology (LaBoskey 2004a; Loughran 2005; Pinnegar and Hamilton 2009). It represents a "messy process" in which researchers across diverse contexts undertake their work with varied motivations (Berry 2004, p. 1312). Some may want to better understand their professional development, identities, or collegial interactions (Louie et al. 2003; Cole and Knowles 1998), while others may focus more narrowly on their teaching by investigating specific aspects of their practice or the relationship between their beliefs and actions (Berry 2004). Often self-study researchers purposefully aim to "provoke, challenge, and illuminate rather than confirm and settle" (Bullough and Pinnegar 2001, p. 20). LaBoskey (2004b) suggested that self-study practitioners seek "to generate local, situated, provisional knowledge of teaching" at the same time as they "trigger further deliberations, explorations, and change by other educators in their contexts" (p. 1170).

All of this makes clear that self-study is a fluid methodology for research that encourages self-discovery and improvement at the same time as it can inform the understandings and actions of others in their own discrete contexts. Along these lines, the next section briefly considers the specific aims and scope of self-study inquiries as manifest over the last 12 years in the official journal of the Self-Study of Teacher Education Practices (S-STEP) Special Interest Group (SIG) of the American Educational Research Association (AERA), *Studying Teacher Education: A Journal of Self-Study of Teacher Education* Practices.

An Exploratory Analysis of Purpose as Entry Points for Self-Study

Studying Teacher Education began publication in 2005 and represents one of the premier journals for dissemination of high-quality self-study work. It offers opportunities for both teachers and teacher educators alike to publish empirical and conceptual research that advances our understanding of the challenges of improving one's own teaching practices and the associated issue of student learning. To gain better insight into what has been driving self-study research in recent years, abstracts were printed off for every article published in *Studying Teacher Education* since its inception in 2005 through 2017, when this chapter was initiated. In total, the contents of 209 records were examined with the objective of identifying the action verbs and topics of inquiry for each study. The reason we decided to isolate the action verbs and topics of inquiry for each study was to discern, across a large number of cases, what self-study practitioners seemed most interested in studying over the last 12 years and how they chose to approach that study.

The results of this exploratory examination are displayed in Table 1. The action verbs are shown on the left side of the table in a column titled "Purpose of the S-STEP Inquiry." The right side of the table lists the topics of the inquiries. Both the verbs and the topics within each category are listed in order of their frequency (i.e., "to explore" and "to examine" were the most commonly used action verbs). It should be noted, however, that some overlap in these terms is inevitable because the analysis was conducted at face value based on the information provided in the abstracts of the articles. No attempt was made to consolidate or collapse the action verbs or topics of inquiry into more nuanced categories. Therefore, Table 1 accounts for an initial analysis rather than a formal and exhaustive analysis.

Although different readers may interpret this table in different ways, at least two features of self-study seem undeniable from what is presented. First, the action verbs most often invoked in self-studies confirm that this is an interpretive and exploratory methodology. For better or worse, the verbs suggest very little interest in positivistic notions of testing or proving. The verbs are similarly light on postmodern and/or poststructural notions of deconstructing or critiquing. Theorizing, or building theory from theory, does not seem to have been a major point of emphasis in self-study to date.

Another feature of self-study that becomes obvious when reviewing this table involves the centrality of practice. Indeed, practice is the only topic for inquiry that

Table 1 S-STEP inquiries published in *Studying Teacher Education* (2005–2017)

Purpose of the S-STEP Inquiry	Topic of the S-STEP Inquiry
To explore...	Developing understandings of identity, learning, and practice
	Collaboration
	Previous experiences

To align...	Identities and practice
To challenge/confront...	Issues of practice

appears alongside every action verb. Sometimes this focus involves how practice is influenced by certain factors (i.e., previous experiences, professional learning, collaboration, perceived disconnects or tensions, and the broader social conditions of schooling); other times the focus involves the influence of practice on some other phenomenon (i.e., professional identity construction, student learning, etc.). What is clear from this analysis of articles is that self-study currently represents a methodology that appeals, and perhaps is best suited, to researchers who have an interest in critically exploring and interpreting some aspect of their own practice or pedagogy, broadly conceived.

In what follows we attempt to use the research literature and our own personal experiences to contextualize and discuss certain issues particular groups of potential self-study practitioners might face in beginning/engaging in self-study. These groups include teacher candidates, education doctoral students, practicing teacher educators, and higher education practitioners from other fields.

Where Do I Begin? Self-Study Entry Points

In addition to contextualizing and identifying some of the more pressing issues certain groups of self-study practitioners might face in getting started with self-study, readers will also find tables in the middle of each of the following four subsections with ideas for self-studies that could appeal to members of that group. Although we attempted to purposefully ground our ideas and questions in their lived realities, the lists are obviously not exclusive to, or exhaustive of, the concerns for any given group.

Entry Points for Teacher Candidates

Although some teacher candidates are made to engage in research prior to graduation as part of capstone assignments for their undergraduate programs or thesis requirements for their graduate programs, this does not necessarily represent the norm. And even when research requirements are the norm, what effect does engaging in that process have on teacher candidates? The point of raising this question is not to argue against the potential utility of research in the professional learning and development of teacher candidates. Rather, the point is to think of how to best achieve a synergy between the research task and methodology incorporated to maximize effect. In the case of self-study for teacher candidates, high-impact entry points might be found via examinations of biography, especially in the early stages of a program, and examinations of practice-related conundrums, in the later stages.

One significant factor influencing the professional learning and development of teacher candidates includes their own biographies as learners. Countless hours are spent in classrooms where candidates come to acquire a wealth of firsthand knowledge regarding how they think schools operate, what they think teachers do, and how they think students should act, something Lortie (1975) famously referred to as an

apprenticeship of observation. Important as these apprenticeships of observation may be, in some ways, Labaree (2004) perceptively observed how they show candidates "a lot about what teachers do but almost nothing about why they do it" (p. 57). This can leave teacher candidates searching for explicit rationales to undergird their decision-making processes as future teachers. Obviously, it is here where university-based teacher education courses and programs can make a difference. This is where candidates are explicitly asked to become students of teaching, to begin forging their professional identities, and hopefully to trouble their previously formed understandings to avoid simply sliding into default modes of teaching. Encouraging teacher candidates to engage in self-study rooted in their life history and experiences may be one way to raise their awareness and empower them to imagine themselves as different sorts of teachers than those they experienced as students (Table 2).

Further to the importance of biography in the professional learning and development of teacher candidates, another common finding in the research on teacher education is that teacher candidates place a high value on their clinical and student teaching experiences. Most regard their clinical experiences as an influential – if not the single most influential – factor in their professional learning and development as preservice teachers (Smith and Lev-Ari 2005; Wilson et al. 2001). While there is certainly something to be said about learning by doing, it does not always lead to powerful understandings of teaching or pedagogy. Indeed, research describes how many teacher candidates tend to simply follow the pedagogical examples set by their cooperating teachers, usually rooted in didactic forms of instruction (e.g., Borko and Mayfield 1995; Samaras and Gismondi 1998). In this way Britzman (1991) suggested that practice does not necessarily make perfect but can instead serve to reinforce traditional practice.

Table 2 Potential purposes and topics for teacher candidates

Potential purposes for S-STEP Inquiry	Potential topics for S-STEP Inquiry
To explore...	*Life history*: How has my life history impacted my conception of what a teacher is and their role in the classroom?
	Vision: How does my vision of good teaching implicitly support some goals over others?
	Alignment: Do my practices align with my teaching intent?
To articulate...	*Teaching philosophies*: What is my philosophy of teaching, and how does it relate to my own schooling experiences?
	Teacher identity: What are some life history factors influencing my developing teacher identity?
To challenge or confront...	*Diversity*: What are the linguistic and cultural backgrounds of my students, and how can I build on their existing assets?
	Vision and practices: To what extent am I enacting my own vision and practices for teaching versus implicitly trying to please the cooperating teacher or students?

None of this is meant to diminish the potential significance of clinical teacher preparation, especially with regard to student teaching. After all, it is here where teacher candidates' understandings of teaching gleaned though their educational biographies can be further augmented, enhanced, or changed by their practical experiences with actually attempting to teach students on a daily basis. But the work of further influencing these understandings in beneficial ways must be undertaken gingerly. Teaching is fraught with cognitive and emotional challenges (Goodlad 1994; Knowles and Cole 1996; Labaree 2004), and many teacher candidates already report feeling unsettled and overwhelmed in their roles as student teachers (Alsup 2006; Bullock 2011; Cole and Knowles 1993; Segall 2002). Still, while uncomfortable, these feelings can produce the sort of dissonance, in the proper context, for candidates to forge new cognitive and emotional connections leading to enhanced understandings of their teaching. We believe self-study can play an important role in this process for teacher candidates.

Entry Points for Education Doctoral Students

In addition to teacher candidates, another group that might benefit from engaging in self-study includes those who are studying education in doctoral programs. A vast majority of these individuals were classroom teachers immediately prior to their university studies or appointments (Ducharme and Kluender 1990; Lanier and Little 1986). For many, this represents the most significant enculturating experience of their professional lives (Ducharme and Agne 1989). But there are obvious differences between the classroom teaching environment and the higher education environment and, by extension, between the roles assumed and played by classroom teachers and teacher educators. Given the common assumption "that a good teacher will also make a good teacher educator" (Korthagen et al. 2005, p. 110), these differences can be quite unsettling.

First, in terms of practice, there is a different emphasis for instruction in teacher education, and the understandings and knowledge of pedagogy acquired through classroom teaching may not be sufficient for the task of teaching about teaching (Bullock 2007; Kosnik 2007; Ritter 2007, 2009, 2010, 2011). While classroom teachers are expected to teach subject matter to their students in existing contexts, teacher education:

> must be concerned with assisting teachers to learn and apply important ideas about teaching and learning….[and] must be presented in ways that achieve some balance between the existing context and role of teaching and the possibilities for improving teaching and learning. (Northfield and Gunstone 1997, p. 48)

The notion that teacher education is not synonymous with teaching directs attention to the role of the teacher educator. Loughran (2005) suggested the distinction between teaching and teaching about teaching can be understood in terms of "the overarching need for teacher educators to pay attention to their own pedagogical

reasoning and reflective practice and to create opportunities for their student teachers to access this thinking about, and practice of, teaching" (p. 9). This distinction is mirrored, but also elaborated, in the work of Koster et al. (2005) who found that teacher educators understand their roles as consisting of the ability to perform various tasks in the following competency areas: content competencies, communicative and reflective competencies, organizational competencies, and pedagogical competencies. Obviously these differences disrupt the notion that teacher education is a "self-evident activity" (Zeichner 2005, p. 118), which opens up a slew of practice-related research possibilities for doctoral students in education (Table 3).

At the same time as doctoral students are learning what it means to teach teachers, they are also frequently expected to begin engaging in educational research. Most teacher educators do not enter into higher education to conduct research. Nonetheless, this becomes one of the most pressing and demanding expectations placed on them at the university level (Ducharme 1993; Goodlad et al. 1990; Labaree 2004). As a pressing aspect of faculty responsibilities, yet a dimension largely absent from public school settings, research expectations uncomfortably figure prominently into how beginning teacher educators perceive of themselves and their work.

The shift that occurs, usually in graduate school, from classroom teacher to teacher educator *and* educational researcher can be difficult because it requires a change in mindset. Joram (2007) showed how the epistemologies of preservice and practicing teachers were considerably different from those of teacher educators. Specifically, while "professors may consider research-based findings and general principles of teaching to be important for their students to learn, many preservice teachers will discount the validity of such material" (p. 133). Joram attributed this to the "case-based" thinking of many teachers or the "cult of the particular." This way of thinking seems to evolve when individuals begin engaging in research and start to trouble the nature of knowledge and knowledge construction.

Table 3 Potential purposes and topics for education doctoral students

Potential purposes for S-STEP Inquiry	Potential topics for S-STEP Inquiry
To explore...	*Evolution of understanding*: How do course readings shape my understanding of teaching and learning?
	Cultural proclivities: How do my cultural proclivities both enhance and constrain certain understandings?
To identify or articulate...	*Funds of knowledge*: What are examples of students' funds of knowledge, and how do these inform how I approach instructional planning?
	Approaches to instruction: What do constructivist approaches to math instruction sound like or look like in a classroom, either out in the preK-12 school systems or at the university?
To challenge/confront...	*Changing roles*: What are obstacles in my changing role as a teacher/teacher educator/educational researcher?
	Equity issues: How do I challenge [blank] disparities in my school/district?

Moreover, the pressure to engage in research as part of some university tenure and promotion guidelines can compel teacher educators to shift their focus away from their teaching. Soder and Sirotnik (1990) described how some former classroom teachers experienced their transitions to higher education, with its emphasis on research instead of teaching:

> That which was honored no longer is, leading to a sense of betrayal and resentment. Faculty feel resentful, too, because the addition of new tasks and responsibilities is not accompanied by a reduction of demands in other areas. Finally-and perhaps most critically-faculty members share, along with others in the teacher preparing enterprise and the larger institution, a sense of loss of identity. It is difficult to define yourself in relationship to your job when the definition of your job appears to be in a constant flux, subject to addenda and qualifying footnotes added by a bewildering array of politicians, education bureaucrats, and academic administrators. (p. 388)

Yet even with the different institutional and instructional expectations for teacher education, no formal or specific training is typically provided to former classroom teachers as they transition into their new roles as beginning teacher educators (Kremer-Hayon and Zuzovsky 1995; Louie et al. 2002). Many supervisory and beginning teacher educator positions are hastily filled by former classroom teachers turned graduate assistants who are unaware of the pedagogical and contextual challenges their new roles will present (Korthagen and Russell 1995; Russell 2002; Zeichner 2002). Self-study represents a way to navigate these new roles and contexts, with the potential to also yield scholarship-based outcomes.

Entry Points for Practicing Teacher Educators

Unlike doctoral students in education, many practicing teacher educators already have solid understandings of their roles as teachers of teachers. Many also already possess expertise in certain research methodologies used to advance lines of inquiry within established research agendas. But comfort and familiarity do not necessarily equate to conscious and conscientious outcomes in their work as teacher educators and educational researchers. Cochran-Smith (2004) draws attention to the almost inevitability of this issue with her conceptualization of teacher education as both a "learning problem" and a "political problem." This conceptualization is based on the fundamental premise that "teaching itself is an intellectual, cultural, and contextually local activity rather than one that is primarily technical, neutral in terms of values and perspectives, and universal in terms of causes and effects" (p. 2). Thinking about teacher education in this way allows for the consideration and nurturance of aspects of a teacher's pedagogy that resist assimilation to a technical model. Such vital aspects of a teacher's pedagogy, largely ignored by technical approaches to teacher preparation, are exemplified in Shulman's (1987) work on "pedagogical content knowledge," Clandinin's (1985) work on teacher "images" and "personal practical knowledge," and Schön's (1983, 1987) work on "reflective practitioners," among others.

More specifically, Cochran-Smith (2004) argued that teacher education as a learning problem rests on the following three main ideas:

> teacher education occurs in the context of inquiry communities wherein everybody is a learner and a researcher; inquiry is an intellectual and political stance rather than a project or time-bounded activity; and, as part of an inquiry stance, teacher research is a way to generate local knowledge of practice that is contextualized, cultural, and critical. (p. 12)

Understood as such, there is not necessarily a single right way to teach that will always lead to desirable outcomes. Instead, educators must decide and act upon their pedagogical decisions within a matrix of competing and constantly changing tensions. This assumes that the role of teacher educator is more of a process of becoming that must regularly be negotiated than a final stage of professional growth achieved as soon as one enters graduate school.

Even for experienced teacher educators who understand their journeys as teacher educators in this way, purposefully developing as teachers of teachers is often left somewhat to chance and not based off data that has been intentionally collected and analyzed for specific purposes. Put another way, there is oftentimes a separation between how teacher educators teach and what teacher educators' research. Self-study represents a potentially powerful way to bring the two together (Table 4).

Moving along, the second part of Cochran-Smith's (2004) conceptualization, recognizing teacher education as a political problem, revolves around the following three main ideas:

> teaching and teacher education are political and collective enterprises, rather than neutral and individual efforts; all teacher education policies, whether local or federal, whether governing

Table 4 Potential purposes and topics for practicing teacher educators

Potential purposes for S-STEP Inquiry	Potential topics for S-STEP Inquiry
To explore...	*Assessment*: How can I assess dispositions of students in my course?
	Tensions: What are some competing and changing tensions in my role as tenure track teacher educator?
To describe...	*Practices*: How does assignment X relate to student understanding of Y?
	Collaboration: How do faculty describe challenges in collaboration among interdisciplinary research projects?
To scrutinize...	*Institutional tensions*: How do changing tenure and promotion guidelines shape how I approach teaching, research, and service?
	Specific interventions: How do increasing enrollment demands influence my role and responsibilities as a teacher educator?
To improve...	*Practices and understanding*: How do I use [blank] to improve my practice in [blank]?
	Program coherence: How are social justice and equity perspectives threaded into my courses?

> practice in one program or influencing a much larger constituency are driven by values and are, at least in part, ideological; and teaching and teacher preparation for social justice are vital elements of an educational system in and for a democratic society. (p. 18)

To appreciate teacher education as a political problem implies recognizing and interrogating the ideology that undergirds common practices associated with teaching and teacher preparation.

Teacher education as a political problem also suggests that an important part of teacher preparation consists of exploring the broader social conditions of schooling with intent to reveal the "politics of policies" from the "lenses of social justice, race, diversity, and equity" (p. 20). Such an emphasis seems to provide an indispensable way to negotiate the matrix of competing and constantly changing tensions that comprise teacher educators' milieu for pedagogical decision-making. This emphasis can also inform how to approach research. As Ginsburg and Lindsay (1995) noted, "The political dimension of teacher education operates in the daily practices (curriculum, pedagogy, evaluation, and formal and informal rewards and sanctions) as well as in the policy-making arena" (p. 8). It is here, couched within the political realm of teacher education, where teacher educators must decide who they are and what they want to be.

Whether to improve teaching, to enhance/enrich an existing research agenda, or to advance some social good through research, one significant challenge facing this group involves the fact that many experienced teacher educators have to disrupt their previous training in graduate school to actually embrace self-study as a legitimate form of research. Another serious challenge concerns how to connect self-study to the research and methodologies already used in their work. To further shed light on these challenges and how they might be negotiated, vignettes are provided later in this chapter. These vignettes are written by colleagues who participated in a self-study learning group that the first author of this chapter facilitated over the last 4 years. In many ways this group and their stories represent an interesting group to showcase because – while all competent and respected teacher educators/educational researchers in their own right – not one of them had any experience with self-study prior to the formation of our group, and several of them had minimal experience with qualitative research (i.e., direct experience beyond qualitative course(s) taken during graduate school).

Entry Points for Higher Education Practitioners from Other Fields

Although most faculty at the college and university level are expected to teach and research, very few professors hail from teaching backgrounds. Thus it seems worth considering how new professors in general develop as teachers of university students. Kugel (1993) proposed a model, derived from informal observations of his own career as well as the careers of his colleagues, in which he argued that the teaching of new college professors seems to advance through incremental stages marked primarily by shifts in the focus of their teaching. These stages include

initially focusing on one's self and one's role in the classroom, then focusing more intently on the content and presentation of the subject matter, and finally focusing on the students and what they actually learn as a result of their teaching. In this final stage of focusing on the students, new professors continue to develop in increasingly nuanced ways according to the views they hold of their students. Kugel suggested that the progression here for new professors seems to consist of initially viewing their students as receptive, then as active, and finally as independent learners.

Kugel (1993) claimed that fear of failure compels new professors to initially focus on their own role in the classroom. According to Kugel, this fear is intensified "for novice professors because they have seldom been taught much about the skill they are about to perform. They have been taught a lot about the subject they are about to teach, but little about how to teach it" (p. 3). Thus, they think mainly about themselves when thinking about their teaching. New professors only transition out of this stage after developing what they feel are good ways to present their material. Effectively tackling this challenge provides new professors with a sense of legitimacy regarding their new role as teachers.

The next stage in Kugel's (1993) model suggests that, after becoming comfortable with their new roles as teachers, professors return their focus to their subject matter. In this stage, new professors "think of the courses they teach much as cooks think about the courses they serve. They lay out the information as attractively and enticingly as they can, hoping that their students will enjoy it and digest it" (p. 5). Unfortunately, "as professors increase the quantity and the quality of what they teach, the quantity and quality of what the students learn seems to decrease" (p. 5). This learning problem causes many new professors to then turn their attention back to their students. As their attention returns to their students, many new professors begin to notice that the learners in their classes "are not an undifferentiated mass of identical people" (Kugel 1993, p. 7). Therefore, as a way to accommodate the diverse learning styles and interests of their students, many new professors incorporate a "buckshot" approach into their teaching in which they purposefully spread their teaching out and "give all their students a bit of telling, a bit of showing and a bit of doing" (p. 7). Despite these efforts to increase student learning, many professors still note that they are unable to actually construct understandings for their students (Table 5).

In all of the stages discussed above, new professors understood or viewed their students as passive recipients of knowledge. However, according to Kugel (1993), this notion can change when professors begin to understand that "perhaps learning is something students do rather than something that is done to them" (p. 9). Such a realization signifies the beginning of the professor coming to view his or her students as active. In this stage professors start to see themselves more as coaches than experts. Along these lines, Kugel claimed:

> As the professors' views of how to teach change, their views of what to teach may also change. They may decide that it is more important that students learn how to think than that they learn what to think. They may worry less about coverage and more about 'uncoverage.' They may respond to student questions with other questions, hoping to encourage their students to figure the answers out for themselves. (p. 11)

Table 5 Potential purposes and topics for higher education faculty/practitioners

Potential purposes for S-STEP Inquiry	Potential topics for S-STEP Inquiry
To explore…	*Student perspectives*: How do student perspectives from previous course evaluations syllabus inform syllabus development?
	Professional development: How has participation in professional development shaped how I approach teaching and learning in my course(s)?
To describe…	*Experiences*: How do I increase student's content knowledge by using [blank] strategy?
	Collaboration with community partners: How do I work with community partners to enhance student understanding of X?
To scrutinize…	*Complexity of practice*: How do workload policies shape my teaching/research practice?
	Specific interventions: How does participation in an online discussion board increase accountability for discussing course readings?
To improve…	*Practices and understanding*: How do I use case studies of X for increasing student learning of Y?
	Writing skills: How can I better support students as developing writers?

This change in thinking regarding both how and what to teach naturally leads into the final developmental stage for new professors of viewing students as independent learners.

Obviously the goal in the final stage is to allow students to learn for themselves. This is a frightening proposition for some new faculty. As Kugel (1993) made clear:

> Turning students into independent learners may call for more patience and sensitivity than some professors have. It may call for a broader understanding of the material than some can develop. If students are allowed to control what they learn, they can try to visit corners of a discipline that their professors have not yet visited. (p. 12)

Facilitating this type of student learning may not be a priority for new faculty members unless they have, or develop, strong personal convictions regarding its importance. This highlights a need to learn more about the induction process for new faculty so that changes might be implemented to improve the general quality of university teaching. Instead faculty are often greeted with an unsupportive university environment content to let new faculty "sink or swim" of their own accord. As Boice (1991) explained, "Less than 5 percent of new faculty in their first semesters at either campus could identify any sort of social network for discussing teaching" (p. 155).

Taken as a whole, the factors identified above suggest that, while most new university faculty face challenges in terms of developing their teaching visions and practices, neither the incentive nor the means to improve upon this area of professorial responsibility are readily facilitated in the university environment. In this respect, it seems quite possible that many new professors content themselves with

their teaching after they become comfortable presenting their content to their students. If true, this means that many new university professors only advance through the first two stages of Kugel's (1993) model and never get to a point where they pay any particular attention to the needs or learning of the students in their classes. Most new faculty understood good teaching as synonymous with having content knowledge. As long as the new professors in this study were knowledgeable about, and up to date, on the subject matter of their discipline, then their teaching was not really considered as a distinct area for improvement. Self-study can trouble this simplistic understanding and lead to more nuanced understandings of teaching for faculty, possibly resulting in more meaningful learning for their students.

Common Themes Across Entry Points

After describing the professional contexts and transitions facing each of the four groups above, we feel three main themes surfaced in relation to what seems to prompt individuals to engage in self-study; that is, there appear to be entry points that stem from a need for greater awareness, a sense of loss, and/or a desire for empowerment. It should be noted that these themes are in no way mutually exclusive, and self-study researchers are commonly moted by more than one theme at the same time. As such, we attempt to provide illustrative vignettes that incorporate each of the themes below. Further to portraying how the themes can prompt research-based action, the vignettes highlight how and why self-study represents an appropriate choice for certain research questions, with attention given to the ways in which self-study connects to the familiar research methodologies the researchers brought with them to their work. The vignettes also illustrate how self-studies might be conceived and then conducted.

One important note about these vignettes concerns the fact that the authors are practicing teacher educators and current colleagues of ours. To provide some context, Jason Ritter has been facilitating a self-study learning group for interested faculty members from the Department of Instruction and Leadership in Education at Duquesne University for the last 4 years. His efforts to "teach" self-study, and his colleagues' experiences "learning" self-study, have already begun to be formally documented and reported in variety of academic outlets (e.g., see Ritter 2017; Ritter et al. 2018a, b). Some noteworthy facts about the faculty participants in the group include that all joined voluntarily, were pre-tenure, and came from a variety of academic disciplines within teacher education (i.e., English Language Arts/Literacy, Mathematics, Early Childhood, Second Language Acquisition) as well as from a variety of research traditions (i.e., quantitative, qualitative, mixed methods). Importantly, no one in the group had any previous experience with self-study research. As an example, consider the case of the second author of this chapter, Sandra Quiñones, who is a junior faculty member who has participated in the self-study group for 3 years. She came to the group with strong qualitative research experiences as a graduate of the University of Rochester but was more familiar with ethnography (see

Quiñones et al. 2011; Hopper and Quiñones 2012) and blended forms of life history and narrative inquiry (see Martínez-Roldán and Quiñones 2016; Quiñones 2014, 2015, 2018). She joined the group to augment her knowledge of research methodologies in teacher education within a collegial community.

While selecting authors for vignettes from this group does represent a convenience sample of sorts, it is also true the experiences of practicing teacher educators getting started in self-study can be instructive to each of the other three groups discussed earlier. After all, teacher educators are in a perpetual state of becoming and must continually learn about teaching *and* teaching about teaching; adjust to new instructional and institutional expectations; and utilize a variety of research methodologies and methods to advance their scholarly agendas. These are concerns that are shared with, and subsequently could appeal to, teacher candidates, education doctoral students, and higher education practitioners from other fields. In what follows each of the four vignettes are briefly introduced, presented, and then discussed.

Vignette #1

Rachel Ayieko came to Duquesne University as an assistant professor in 2014. Hired for her expertise in mathematics education and strong background in quantitative research, she is one of the original members of the self-study learning group at Duquesne University. Her story of learning to use self-study research to reflect and improve her practice is below. The vignette is followed by a brief discussion of how the three themes seemed to appear – and exert influence – across her journey as a novice self-study researcher.

Learning to Use Self-study Research to Reflect and Improve My Practice as a Mathematics Teacher Educator

This vignette describes my path to learning and beginning to use self-study as a research approach and method of improving my practice with the support of a community of practice at Duquesne University. In this vignette, I provide a brief introduction to my path to being a mathematics teacher educator highlighting some of the more significant points in my journey. I also discuss the process of learning self-study research and the challenges I have faced getting started with my own self-study research. Finally, I conclude with a brief discussion about my current self-study project and point out the tensions and successes as I venture into this *new* way of thinking.

I began having a keen interest in mathematics while learning high school mathematics in my home country, Kenya, with a supportive and knowledgeable mathematics teacher. My high school mathematics lessons were always intriguing and exciting. The many times that I was successful doing my math homework and excelling on standardized tests reaffirmed my belief that I could be successful with this subject. I have pleasant memories of times when my fellow students and I worked in groups to solve mathematics problems from different curriculum materials that we had collected and others provided by our math teacher. Many of my classmates frequently sought me out to help them understand a concept in mathematics or review for an upcoming national examination. My successful attempts in

explaining difficult concepts to my fellow classmates contributed to my desire to pursue a teaching degree.

When I enrolled in an education degree in mathematics and chemistry at the end of my high school education, I was without a reasonable doubt convinced that I was taking a path connected to my passion. My 1st years teaching mathematics proved to be very rewarding. For example, I was awarded a certificate for having worked with a class consecutively for 4 years where few students failed the national mathematics examination. My motivation to increase students' success in mathematics led to me pursuing a graduate degree in mathematics education and eventually a doctorate degree in teacher education with a focus on mathematics education. During my high school teaching career, I learned the importance of connecting with my students and creating a classroom environment where all students were appreciated and challenged to work hard toward their learning.

When I moved to the United States to pursue my doctoral degree, I had the privilege of teaching mathematics pedagogy courses to preservice elementary mathematics teachers as a teaching assistant. I realized that I was able to connect with my preservice teachers in ways that I had anticipated would not be possible. I had an African accent, and the classroom culture in the United States was different from what I had experienced as a student and teacher in Kenya. Notwithstanding, my passion for preparing teachers to teach mathematics grew when I realized the anxiety the preservice teachers had about teaching mathematics in a developed nation. I was intrigued that the preservice teachers needed lots of support and nurturing even though there was extensive research that had related to the improvement of learning mathematics and numerous teaching resources that I had never seen in my previous teaching. I had the urge to improve my practice so that I could ensure the preservice teachers graduated with a deeper understanding of how to teach mathematics for conceptual understanding. Therefore, joining a community of practice for the improvement of my practice was important in my teacher educator journey.

Beginning Self-Study Research. I had never known about self-study research until I joined the community of practice group at Duquesne University School of Education during my 1st year as an assistant professor. I hoped that we would engage in discussions that included reflections on our practice and ways of improving our teaching of preservice teachers. I had struggled in the first semester of teaching as an assistant professor, and I needed to collaborate with colleagues to share my experiences and discuss ways that I could do to improve my practice. I shared my thoughts with our department chair during my first annual evaluation. He noted that our department lacked forums for reflections of our practices and promised to look into ways that could encourage faculty to form groups to support their teaching.

The following semester I received an email from our department chair inviting me to join the self-study group. I was excited to learn that the facilitator of this group was a renowned scholar in self-study. I joined the team not knowing what self-study was, but was eager to learn how I could engage with the group. The group included faculty from literacy education, early childhood education, social justice education, social studies education, and TESOL. Because I am a mathematics education specialist, I had hoped to share some insights with a faculty in the same field. The fact that the community of

practice was from different disciplines in teacher education was important for cross-disciplinary discussions but lacked input from a fellow mathematics teacher educator.

In our community of practice, we learned about self-study through discussions and shared readings. Similar to Zeichner (2005) the process of engaging in self-study enabled me to think more deeply about my teaching practice. I tried to follow some of the suggestions for collecting data about my teaching. The data included journal entries (Loughran and Northfield 1998) describing my teaching and reflective accounts on my thoughts as I taught and after teaching. I found journaling quite a tedious process that required discipline. The first time I tried journaling, I missed several entries, and at the end of the semester, I was unable to use the incomplete data for a reasonable study. I needed to look for efficient ways of documenting my work after every lesson taught if I intended to study my teaching.

For my first self-study project, I chose to study my approaches to teaching the Secondary Mathematics methods course. I realized that I had to teach a cross-listed course after I met with the students the 1st day of class. The students enrolled in the course included practicing teachers, preservice teachers, and a doctoral student. At first, I was worried that the syllabus I had initially prepared would not meet the needs of all the students enrolled in the course. My challenge was to revise the syllabus to ensure it served the needs of all the enrolled students. As I thought about reorganizing this course, it dawned on me that this was a worthwhile self-study project. The fact that many teacher preparation programs across the country are struggling with student enrollment (Sawchuk 2015) makes this study important for other teacher educators in similar situations to learn from my experience. Also, through this process, I would have a chance to study how my approaches benefited or hindered student learning. Finally, this was an opportunity to investigate if my teaching approaches were modeling an example of differentiating instruction, which is an area of teaching that is essential but difficult to implement.

Challenges and Benefits of Incorporating Self-Study. When we started the meetings with the self-study group, I realized I was to engage in research that was different to my area of expertise. I use large-scale data sets to research mathematics teaching and learning. For example, I have conducted research using the Trends in International Mathematics and Science Study (TIMSS) and the Teacher Education and Development Study in Mathematics (TEDS-M) large-scale data sets. For my doctoral dissertation, I used the TEDS-M data to investigate the opportunities that preservice experienced to learn how to teach mathematics. My dissertation study expanded my knowledge of mathematics teacher preparation across different countries. The data mainly consisted of survey results in quantitative form.

Self-study adds a different lens to my initial research in teacher education. Instead of gathering information from practicing teachers, I have an opportunity to examine the perspective of a teacher educator and the process and challenges a teacher educator goes through in teaching preservice teachers. All these views are essential in seeking ways to improve the preparation of teachers. To ensure the research includes triangulated data, the perspectives of the preservice teachers, teacher educators, and self-reflection and perspectives from critical friends contribute to understanding the practices in teacher preparation.

So far, I have learned about the types of data that constitutes self-study research. Self-study data includes data drawn from oral inquiries, reflective journals, and critical friends (Cochran-Smith and Lytle 1993; Loughran and Northfield 1998). Indeed, transitioning from using large-scale quantitative data to self-study data has proved to be a challenge for me. Collecting the data is different and sometimes creates a sense that the evidence is subjective. I have found that self-study is intriguing and contains a wealth of information that could support other teacher educators to examine their practice and learn different ways that have worked or proved to be a challenge to other teacher educators.

Debrief

It is clear that Rachel has a love of mathematics that can be traced all the way back to her early learning and mentoring of her peers in the subject as a student in Kenya. For Rachel, as a teacher educator, this love of mathematics manifests itself in her practice via her desire to *empower* teacher candidates with deeper understandings of how to teach mathematics for conceptual understanding. Although trained in quantitative research methodology, Rachel was brought to the self-study group owing to a sense of *loss*. She admits in the vignette that she struggled during her first semester of teaching at Duquesne. She had grown accustomed to regular debriefing meetings with other faculty and peers as a graduate teaching assistant at Michigan State University. But that kind of regular support and critique was not a mainstay in the smaller school of education where she currently found herself, where classes are mostly taught by other faculty members who possess different areas of expertise. Once comfortable within the self-study group and familiar with the methodology, Rachel initiated a study prompted by her need for greater *awareness*. The study investigated how well she was modeling differentiation in her own mathematics practice in a cross-listed course, a topic for inquiry that had never occurred to her before as a quantitative researcher. Summarily, a sense of *loss* compelled Rachel to join the self-study group where she eventually initiated a study prompted by her need for greater *awareness* of her practice. The end result was that Rachel felt she had moved closer to her ultimate goal of *empowering* teacher candidates with deeper understandings of how to teach mathematics for conceptual understanding.

Vignette #2

Xia Chao came to Duquesne University as an assistant professor in 2015. Hired for her expertise in English as a Second Language (ESL) education and her research prowess as an ethnographer, she decided to join the self-study group immediately upon her arrival to campus. Her story about coming to understand self-study as a "way of being" is below. Although her journey as a self-study researcher does not seem to explicitly revolve around feelings of loss, there is a brief discussion following the vignette that address how a need for greater awareness and desire for empowerment played a hand in Xia's experiences.

Self-Study as a Way of Thinking, Knowing, Doing, and Being: A Learner's Perspective

The purpose of this vignette is not simply to describe my experience as a teacher educator in participating in the self-study group in my department at Duquesne

University but also to explore self-study as a way of thinking, knowing, doing, and being that advances my academic adaptation. I begin the vignette with a brief introduction of my background and initial experience with self-study. Thereafter, I turn my attention to the grounding notions of self-study that inform my teaching and research. After the contribution of self-study to my teaching and research, I conclude with reflections about self-study.

My lived experience shapes my research interests and passion for teaching for equity. I was born in Beijing during the dark decade for China – Cultural Revolution (1966–1976) – that brought about massive economic and educational disruption. Schools had to shut down during the decade. In spite of social and educational chaos, my parents never gave up their children's education. My mother was well educated. She taught me and my brothers to read, write, and calculate. My father was almost illiterate, and this unique constraint had him face discrimination. His hope was to see his children become literate and educated. My father always looked at us with a big smile when my brothers and I learned. My parents highly valued education. They created a print-rich home for their children. Informed by my lived experience, I learned about how disparities inherently influenced by literacy, education, class, and poverty impact the potential development of me and my community. Subsequently, my doctoral education has enabled me to examine the patterns of educational disparities caused by language, literacy, class, and cultural practices in home, community, and school and propose humanizing pedagogy and curriculum that could empower students at the linguistic, cultural, social, and academic levels. My research is grounded in methods and perspectives from educational and cultural anthropology and critical applied linguistics.

My role as an ethnographer and my evolving role as a teacher educator are built upon my self-reflection. My ethnographic work documents the processes in which I identify both the cultural practices of the researched group and my self-reflections-and-interpretations through intensive participant observations, interviews, and field notes. Likewise, my teaching grows out of self-reflection which in turn helps me integrate my research into pedagogical practice. Self-reflection has become my professional habitus. This habitus got me initially interested in the self-study group because the name, self-study, literally links reflection and self. While self-study was a completely new field to me then, I thought it would share similarity with the nature of my research and teaching. Also, as a new faculty to the university in the summer of 2015, I looked for socialization dynamics for learning about "local knowledge" (Geertz 1983). The group would offer me access to such knowledge. Further, as a newcomer to the department, my engagement in the group would help me negotiate my role from being an outsider to an insider to the community.

At the first two meetings, the self-study group impressed me with the colleague participants' openness and dialogic discussions as well as Dr. Ritter's facilitation on self-study and how it influenced teacher education practice. I noticed there was mutual trust within the group which got discussions dialogic in nature. This sense of trust drove me to socialize in the group. Also, instead of simply lecturing and/or mastering in the group meetings, Dr. Ritter exemplified self-study with his own and other scholars' research, engaged us in learning self-study by sharing and discussing

resources, and contextualized doing self-study in both our own fields and the larger self-study community. As he (2017) describes his stance as a facilitator of the group rather than an expert of self-study, Dr. Ritter's facilitation encouraged me to continually participate in the group.

After the first two meetings, I searched self-study as a methodology in language education and found that it has rarely been tapped for its potential to demystify language/literacy practices in multilingual and multicultural settings. This "aha" moment took me to conclusions that I could do self-study in my field, even though at that time I had no idea about what self-study was, how to do self-study, and in what context. At the same time, I coded the colleagues' talks, comments, and experiences with self-study and tried to identify the patterns of their understanding and doing of self-study. I then used concept maps to demonstrate the emerged patterns and their interactions with my field. I identified the relevance and shared perspectives (e.g., criticality, contextuality, reflexivity, and reflection) in the fields of self-study, critical applied linguistics, and ethnography. At the third meeting, I shared with the group my understanding of self-study by linking to reflexivity in anthropology (Salzman 2002; Strauss 1956) and criticality in applied linguistics (Kubota and Miller 2017; Luke 2012; Pennycook 1990). Dr. Ritter reinforced my perspective and connected my understanding to the conception of "critical friends" (Berry and Russell 2014; Costa and Kallick 1993). His verification and explanation invested in my interest in doing self-study. I spent several weeks on reading the articles on self-study that Dr. Ritter shared with us and those published in *Studying Teacher Education: A Journal of Self-study of Teacher Education Practices, Journal of Teacher Education,* and *Teacher Education Quarterly.*

My intensive reading and increased participation in the self-study group helped me generate ideas about self-study and fully engage in the discussions. As one of the "critical friends," I learned that self-study is actually not "self." It is self-initiated, but it emphasizes interaction and collaboration. The self-study group became one of my comfort zones in which I could interact with "critical friends" at the social, academic, and pedagogical levels. I believe that this is essential for developing open dialogues and discussions. Nevertheless, I engaged in the group discussions with both humility and caution. That is, on the one hand, as a newcomer to the local academic community, I was attentive and valued the points of view of my colleagues. On the other hand, my ethnographic sensitivity reminded me that I might be missing something from what they said, since I had not fully engaged in the local community and situated in their academic discipline.

My experience with self-study informs that successful self-study learning requires "critical friends" and "critical mentors." The former is the product that "critical mentors" built mutual trust and openness within the group. Dr. Ritter is my first and only "critical mentor" so far in self-study. His humility and contextual sensitivity encouraged me to increasingly participate in the interactive and inviting discussions, particularly when the discussions got more focused and theme-based. We commented on, suggested, and shared our ideas with regard to challenges and questions we encountered in teaching and research. These shared conversations and discussions crossed the disciplinary boundaries and became a tool for analyzing

pedagogical practices and helped me be proactive about potential issues and problems which would occur in the classroom. Following Loughran (2007), my experience with self-study indicates that self-study works not only as a methodological tool but also as a tool for meaning.

My participation in the group developed my interest in doing self-study research on teacher educators' self/other positioning. I believed that such positioning would shape class discourse patterns and my facilitation of how discussions take place and in what context. Doing self-study research informed my teaching and helped me translate self-study into my teacher education practices. To open channels of communication between students and students and students and me, I embraced the interactive aspect of self-study in my preservice teacher education practices by using a variety of ethnographic methods. For example, to understand the nuanced meanings of language use in the environment, I let students take pictures of anything that contains languages in public places – commercial stands, street signs, advertisements in a library or a shop, etc. – interview people's ideas on the languages, write reflections on the interview and pictures, and analyze the pictures and interview data in groups. Throughout the process, students got involved in individual and collaborative inquiries as "critical friends." I positioned myself not only as a lecturer to students in dealing with topics such as language ideologies and power relations in languages but also as their facilitator and "critical mentor" to explore broader sociocultural patterns of language use. Through doing self-study in teacher education practices, I recognized that self-study is an interactive dynamic for teaching. It helped me prepare students for proactive, reflective, and critical participation.

For me, the self-study group acted as more than a dynamic for helping me navigate my academic socialization in a new work environment. It offered me an alternative mode of learning, thinking, and understanding of self, teaching, and research. Thus, I argue that self-study is not "self." It is not simply individualistic as its name presents. Actually, self-study is individualistically and collaboratively integrated, process-oriented, and context-embedded. It is not only a methodology but also a way of thinking, knowing, doing, and being.

Debrief

A central theme in Xia's vignette revolves around her easy acknowledgment of the perpetual need for greater *awareness*. She discusses how self-reflection is her professional habitus as an ethnographer, and something she strives to model and encourage in her work as a teacher educator. In her own words, even though she was not familiar with self-study previously, "this habitus got me initially interested in the self-study group because the name, self-study, literally links reflection and self." For Xia, fostering awareness within herself and with her students is important, in part, because of her experiences growing up in China during a particularly tumultuous time. Xia discusses how being made aware of a plethora of educational disparities and their effect on people's lives contributed to her passion for teaching for equity, an outcome that is more likely to come about through increased awareness of the social conditions of schooling. Further to this, it would seem that the goal of becoming more aware, especially for teachers, is to then also become *empowered* to play a hand in mediating challenges for students and contributing to an improved future. Xia's

impressive and active use of self-study with her own students in her ESL classes makes it clear that she subscribes to this line of thinking that *awareness* can equal *empowerment*.

Vignette #3

Dawnmarie Ezzo began her work at Duquesne University in 2017 as a visiting professor. While hired to fill a specific need in the preK-4 program for science teacher education, her background in K-12 teaching is quite broad and spans several content domains, including literacy, mathematics, and science teaching methods at the elementary and secondary level. Her interest in various forms of qualitative research led to her joining the self-study group immediately upon her arrival to campus. Her story of coming to self-study, and attempting to pair it with discourse analysis, is below.

Self-Study as a Means of Realizing the Nuance in My Role as Teacher Educator/ Researcher

As a brand-new scholar at the beginning of my research career, I have grappled with the relationship and tensions between methodology, theory, and the role of the self in my research. This vignette traces the evolution of my understanding of the intersection of these roles and describes how looking at my research work through the lens of self-study enabled me to come to an enriched and more deeply nuanced understanding of my role as a teacher educator in my case study research with preservice science teachers.

How I Came to Self-Study. I began my career in teacher education many years before I made the decision to enter graduate school to pursue my Ph.D. and engage in educational research. As a science teacher educator in a university setting, I was extremely interested in improving my teaching and classroom experiences in order to best support the learning of the preservice teachers in my classes. I could see my preservice teachers struggling to develop critical "high leverage" teaching practices such as eliciting, analyzing, and responding to students' evolving science understanding in ways that further their knowledge, and I had read research that suggests that it can take years for teachers to develop the ability to foreground students ideas and engage in responsive teaching, arguing that novice teachers are limited in their abilities to engage in sophisticated instructional practices (e.g., Berliner 1988; Kagan 1992) by their lack of classroom teaching experience. However, I felt dissatisfied with this trajectory for teacher learning.

The field of education needs new teachers who can enter the classroom ready to elicit, analyze, and respond in the moment to students' evolving science understanding and respond in ways that further their knowledge (Levin et al. 2009; Sherin and Van Es 2008). Teachers who are able to attend to students' ongoing science thinking have students who make greater gains in their science learning over time (Ruiz Primo and Furtak 2006; Grossman et al. 2009; Windschitl et al. 2011; Lampert et al. 2013). My preservice teachers and their young elementary-aged students could not afford to wait several years to establish their professional identities and develop the ability to engage in this type of responsive science teaching. They needed to develop these critical teaching practices much earlier in order to be effective teachers. Hence,

my driving question became: how could I use the research skills I was developing in graduate school to strengthen and further the learning of the preservice teachers I was working with in my courses?

I was familiar with the concept of *action research*, in which classroom teachers collect data to inform and improve their classroom work (Feldman et al. 2004). However, as an emerging teacher education scholar, I was not just interested in impacting the learning of my own immediate students but also on impacting the greater field of science teacher education. What might an approach such as *self-study* that explores improvements in my own teaching for the sake of informing the teacher education broader community (Feldman et al. 2004; Loughran 2007) look like, and how might I employ these methods in my own work?

Tensions Encountered While Planning and Engaging in My Self-Study. I began my study with the need to solve a particular problem of practice encountered both in my own teaching and in the teaching of other teacher educators: What could a targeted approach to effectively preparing new teachers to elicit, analyze, and respond in the moment to students' evolving science understanding and respond in ways that further their knowledge (Levin et al. 2009; Sherin and Van Es 2008) in their own classrooms look like?

I designed an instructional intervention for teaching my preservice teachers strategies for eliciting, analyzing, and responding to students' evolving science understanding in ways that further their knowledge, drawing upon the work of others in the field and my own expertise and experience as a teacher educator. Next, I began the work of designing my self-study to explore what that might look like in practice. The research question focused on teachers eliciting, analyzing, and responding to student ideas in the moment of teaching, so I used transcriptions of interactions with students in my teaching, reflective memos that capture my thinking immediately following the class on the discussions, and discussions/co-analysis of the data and my thinking with a colleague who co-taught the course with me and was familiar with the students and my work as part of my data collection and analysis.

Methodological Tensions. After careful consideration of my data and research questions, I decided upon discourse analysis as my secondary methodology, after self-study. As I thought through the lens of each methodology, tensions between them were immediately apparent. Discourse analysis asks that we privilege analyzing the language choices made by participants in the data (Johnstone 2018), looking for patterns across utterances, and analyzing them from an outside perspective in order to determine the speaker's meaning and thinking at a given moment in time. However, because this was a *self*-study in which I was also one of the participants, the level of accurate insight I had into all the participants in my study was inherently unequal – I had far more insight into the meaning and thought behind my own contributions than I did for the contributions of the preservice teachers. Given that this was a study that focused on teaching the preservice teachers how to elicit ideas and responses from students, how to analyze those responses to determine understanding, and how to respond to those ideas in productive ways, this was particularly problematic. Ensuring sufficient balance of insight into all of the participants in the study such that discourse analysis could be used as a secondary methodology

required that I take extra steps to solicit information to lend insight into the preservice teachers' meaning and intentions behind their contributions to the discussions.

Ultimately, I came to realize that despite the tensions inherent in the conflicts of methodology and the focus of the study, what I learn from this self-study can be used to enrich the exploration and learning of other science teacher educators. Because this study sought to explore the influence of a specific set of classroom practices, engaging the researcher as the course instructor was vitally important for ensuring the utmost fidelity and deepest insight into the noticing of preservice teachers' ideas, the in-the-moment decision-making, and the instructional methods and practices used during the instructional intervention.

Self-study provides researchers with the opportunity to contribute to a growing research program in teacher education (Zeichner 2007). Through the process of carefully planning and examining the implementation and results of an instructional intervention designed to support my PSTs development and examining the impact of that intervention on their approaches to teaching, I also engaged in reframing and expanding my own understanding about how to help them to develop their ability to notice and utilize instructionally productive student ideas in their own instructional planning (Barnes 1998; Loughran and Northfield 1998).

Perhaps most importantly, it was only when looking at my work with my preservice teachers through the lens of self-study I realized that in pre-scripting and planning my instructional intervention strategies for teaching the preservice teachers to engage in "of the moment responsive teaching" so that I could effectively model for them how teachers elicit, analyze, and respond to students' ideas in the moment, I was not authentically engaging in these practices myself. The act of pre-planning and scripting these exchanges changed the very nature of the exchanges themselves, ensuring that what I was asking my preservice teachers to learn how to do (elicit, analyze, respond in the moment to student ideas) was very different from what I myself was modeling for them (plan, elicit, respond in the moment to student ideas that matched the ideas I anticipated and planned for in advance). As a result, I was not effectively demonstrating for my preservice teachers how master teachers engage in interpersonal responses to authentic student ideas. I do not think that I would have come to this critical and nuanced understanding of the difference between what I was trying to demonstrate and what I was actually demonstrating without having pursued and explored my own role and work in this study through the lens of the self-study methodology.

Taking the role of both the researcher and the course instructor in this study allowed me to explore a means of supporting PST's development of the ability to notice and utilize instructionally productive student ideas in their own instructional planning. Examining and exploring this work through the lens of the self-study methodology not only allow me to more effectively share work that could inform the teacher education community as a whole, but it also deepened my own understanding of the problem I was working to address. By learning from experience that is embedded within the work of my own teaching, I created new experiences and opportunities for learning for both myself and for the preservice teachers I teach (Russell 1998).

Debrief

This vignette makes it quite clear that Dawnmarie is interested in *empowering* her preservice teachers to be able to elicit, analyze, and respond in the moment to students' evolving science understanding and respond in ways that further their knowledge. She also demonstrates an *awareness* that it is her job to facilitate such learning and advance this goal through both her teaching and her research. This is evident in the vignette via the description of her planned pedagogical intervention for her course pairing self-study with discourse analysis. Interestingly, it was the self-study aspect of her research that led her to realize some of the tensions that accompanied her insider status. This is important in thinking through how self-study might work, or be paired with, other methods and methodologies. It was also revealing how self-study served to illuminate for Dawnmarie some of the ways in which her attempts at modeling proved to not be as effective as possible due to their inauthenticity. In these ways, self-study represents a means of realizing nuance in one's role simultaneously as a teacher educator and as an educational researcher.

Vignette #4

Christopher Meidl transitioned to Duquesne University as an advanced assistant professor in 2015. Hired for his expertise in Early Childhood Education, Christopher joined the self-study group shortly after his arrival to campus. His story about the utility of self-study in the process of developing a scholarly identity at a research-intensive institution is grounded in a greater awareness of pragmatic yet ambiguous accountability issues: his role in addressing the need to diversify Early Childhood Education coupled with the desire to establish a research agenda that extends his experience with qualitative methodologies.

Developing Scholarly Identity via *Self-Study: Exploring My Role in the Diversification of Early Childhood Education*

Becoming a teacher educator is something I was drawn into during my development as a teacher and various classroom experiences over time. My teaching career started as a substitute teacher in Beloit, Wisconsin, but I truly found my identity as an educator after joining Teach For America (TFA). I taught high school English in urban New Orleans, with the student population being 80% African-American and 20% Vietnamese-American. While I enjoyed teaching high school, I knew from my days of substitute teaching that early childhood teaching came more naturally. So I earned my master's degree and certification in early childhood education from the University of New Orleans. From there, La Joya Independent School District in Texas, with its 99% Hispanic almost all Mexican-American student body, provided me an opportunity to loop with a class of children teaching prekindergarten and kindergarten. In each of the locations I taught, reflecting on my teaching in each of the communities I taught, recognizing my own positionality in the communities that I served, was a major part of how I self-evaluated what I was doing.

Experiences in an urban high school, with African-American and Vietnamese-American students, and an elementary school within a rural Mexican-American community shaped my belief that real teaching is about the relationship developed between teacher and student. These relationships were fostered by discussions about

race, poverty, and privilege. My pedagogy became culturally responsive, accentuating students' strengths and weaknesses, only after reflecting on positive and negative interactions during class. With that in mind, as a high school and elementary teacher and university instructor, reflection and reflexivity are important for building, maintaining, and overall understanding of how relationships impact learning. For me the real impetus for becoming a researcher/teacher educator was providing voice for educators. I focused my efforts on Curriculum and Instruction in Early Childhood Education at Penn State University.

My coursework during my doctoral program included both qualitative and quantitative methodologies, in a breadth over depth sort of a way. Creswell (1998), Maxwell (2008), Corbin and Strauss (2008), and Stake (1995) were the qualitative researchers I became familiar with during methods courses. In one particular course, I used a case study format to investigate environmental influences for character education at three different schools. This study influenced my methodological approach to my dissertation, designed as grounded theory.

Since receiving my Ph.D., I have experimented with mixed methods and phenomenology. My current research includes White identity theory, critical pedagogy, and Black feminism. I have recently explored Black feminist and Black male identity theory as counter narratives to the dominant White cultural expectations influencing education and educators. The focus of my most recent research was and continues to be increasing the numbers of students of color, Black males right now, in the early childhood education program. The challenge for me is getting a handle on whether this endeavor is: research in the investigation of it, teaching in looking to provide supports for students, or service in knowing I would have to take an active role in recruiting students despite having no experience doing this.

While I would identify myself as a qualitative researcher, I've only recently been exposed to S-STEP as a methodology. It provides a structure for the messiness that came with exploring how I as a faculty member might create change, personally and systematically, in getting more males of color into early childhood education. My focus on increasing the number of Black males into early childhood education left me in an ambiguous space where research, teaching, and service all came together, but none of them prevalent. At the same time, I was invited into a self-study group, which became an opportunity to establish a methodological framework for my focus. This was important as a junior faculty member because there is so much pressure to make sure what you do *counts*: whether as research, teaching, service, or advising. I chose the use of self-study (S-STEP) methodology as qualitative research to guide the project to which I was struggling to find a scholarly framework (Pinnegar and Hamilton 2009). Other theoretical approaches I had considered were reflective practice, action research, and the scholarship of teaching. However, none of them fit because of methodological incongruity, where research fits but teaching does not; they lead to multiple studies rather than one. Although I am still learning how to use this model, it provides a means to link the relationships between teaching, scholarship, and service.

Self-study has allowed me to sequentially assess my identity(ies), past experiences, values, and beliefs, as the focus of my scholarly identity transitioned to

increasing the number of Black males in early childhood education. The current focus emphasizes teacher preparation but has shown opportunities beyond, including working with school districts. Initially, I pondered how I am involved in recruiting preservice teachers of color and supporting them. Data sources in the planning stage included (1) internal grants for this proposal, funded and unfunded, along with comments; (2) qualitative data from a focus group with multiple stakeholders to establish needs for successful implementation, including program type and a plan for longitudinal change in coursework and faculty pedagogy; and (3) data gathered in securing foundation grants for tuition and support.

Data sources have included personal journals reflecting on interactions in multiple community spaces, as well as a personal autoethnography unpacking my experiences with Black male leadership. Grant applications themselves are sources of data along with feedback as well as my own journaling about how I use that feedback. A final component to apply S-STEP methodology includes consistently having a "critical other" or "critical friend" as necessary (Pinnegar and Hamilton 2009). Some research intends to solve various problems by isolating variables either quantitatively or qualitatively. However, for me self-study allows for self-thought, self-inferences, and self-beliefs to influence the outcomes. There is a possible relationship with S-STEP and phenomenology, with the instructor as the phenomena. S-STEP can be both the application of epistemology and ontology. Samaras (2002) provides the definition for self-study that fits my application the best, "critical examination of one's actions and the context of those actions in order to achieve a more conscious mode of professional activity" (p. xxiv).

In the end, self-studies promote work being done to guide individual critical self-analysis while being accountable to the evaluative nature of research becoming public. Publication will always be the standard gold bar of research. Collectively, the knowledge from all the research projects will lead to the development of a handbook for universities, school districts, and communities to use to develop a student-to-teacher pipeline emphasizing local growth. Utility of research often inform the quality of the investigation. Therefore, the utility of using self-study to understand how to get more Black men into early childhood education consists of both strengths and limitations. The strengths within my work of self-study are that it provides an avenue of scholarly articulation of actions, interactions, and thoughts that are anecdotal and at times ambiguous.

S-STEP is becoming and evermore important part of my scholarly identity. It allows me to explore research that is often difficult to situate in other traditions but is nonetheless vital to improving my practice as an educator and guiding my role as a faculty member. There remains uncertainty in using this as a methodology, however, that then becomes the very influential power in this methodology, in balances what is for me and my students as well as the scrutiny and usability of other researchers, teacher educators, and general public.

Debrief

A salient theme in Christopher's vignette is the *awareness* to continually develop his scholarly identity as he engaged with grant writing and community partners to develop a research project aimed at diversification in early childhood education. He

drew from his experiences with grounded theory, mixed methods, and phenomenology as interpretive frameworks in the process of learning about self-study as a research methodology in teacher education. Although Christopher's vignette does not explicitly speak to a sense of loss and empowerment, he navigated grant writing and the development of an equity-minded research agenda within the context of a new institution. One could say that a *sense of loss* (and inversely, a gain in ambiguity) is part of the transition of a junior faculty moving from a teaching-intensive institution to a research-intensive institution. As part of his own ongoing self-study research practices, Christopher reflects on identity issues and is fueled by a desire for community uplift (i.e., a kind of self and collective *empowerment*). From a pragmatic perspective, self-study has served as an appropriate methodology for Christopher to examine scholarly identity as an early childhood education scholar. S-STEP allows Christopher to explore research in particular ways and affords him with a tool for simultaneously exploring his changing and complex role as a faculty member while also improving his practice as a teacher educator at Duquesne University.

Summary

As we close this fourth and final section of our handbook chapter, we remind the reader of our overall aims. The purpose of this chapter was to identify possibilities for initial self-studies and ways of connecting self-study to one's own familiar methodologies. The vignettes above touched on these issues by describing the efforts of our colleagues in getting started in self-study when approaching the methodology from such diverse research traditions as quantitative and mixed methods, ethnography, discourse analysis, phenomenology, and grounded theory. For readers new to self-study, we hope that this chapter provided ideas on how to get started with self-study methodology as part of establishing or enhancing an existing research agenda. For experienced self-study researchers, we hope that this chapter offered a better understanding of why and how researchers choose to do self-study and serves as a catalyst for how you might purposefully build on such efforts to further advance scholarly teacher education understandings. While we are sure the conversation will continue, as it should, we choose to end this chapter with recommendations for getting started in self-study that take into account some of the insight gleaned across the aforementioned sections.

Getting Started in Self-Study: Recommendations

Identify or acknowledge an issue related to your practice in which you are personally invested or that personally motivates you. There is often an affective dimension to these issues, as they tend to stem from a need for greater awareness, a sense of loss, and/or a desire for empowerment. These are often issues that you need, or want, to address in your practice, regardless of whether or not you choose

to engage in self-study. Self-study simply offers a way to purposefully make sense of the process and to share any understandings gleaned with others.

Seek out critical friends or a community of practice for both support and critique, in equal measure. Provided you experience – or can successfully build – trusting relationships, this interpersonal network is where your study can unfold and/or improve in real time. For example, consider establishing a self-study professional development group that can evolve over time. Practical tips, considerations, and descriptive experiences of undertaking such an endeavor can be found more readily now than ever before (see, e.g., Kelchtermans et al. 2018; Lunenberg 2018; Margolis 2018; Pinnegar and Hamilton 2009; Ritter 2017; Ritter et al. 2018b; Samaras and Pithouse-Morgan 2018).

Take stock of your current comfort level and abilities in research. Consider how self-study might fit within, or enhance, your familiar research methodologies. Ask yourself what role you play in the issues you are experiencing. Consider how that dynamic might be explored using your familiar methods and existing data sources or ask yourself how that dynamic could be explored simultaneously with the work you are already engaged with anyway. Strategies used across the vignettes included shared readings, authentic conversations in trusting – yet critical – environments, concept mapping between key ideas in different research methodologies, and collaboratively practicing data collection and analysis techniques.

Practice doing self-study to do self-study. Collect data. Get in the habit of writing reflections that document your thinking or decision-making. Save artifacts of practice that may serve as evidence of your inquiry process and/or artifacts that provoke questions or concern. Think of how your data might look differently depending on epistemological considerations and/or theoretical frameworks applied for the purpose of analysis. Self-study is both a stance and a practice (Dinkelman 2003), but to actively interrogate in different ways and for different purposes is the choice of the self-study practitioner.

Last, but not least, enjoy the process – regardless of how and where you get started. As noted in another chapter in this handbook (▶ Chap. 41, "Challenges in Engaging in Self-Study Within Teacher Education Contexts"), engaging in self-study can be fraught with challenges and opportunities (e.g., personal, professional, messiness of practice, institutional, nature of the academy, and broader educational research community). We encourage you to view the challenges as productive tensions, rather than barriers. That is, the challenges of engagement in self-study often seem to be mitigated by the methodology itself. This is evidenced via common outcomes like contributing to an advanced understanding of identity, exploring and locating the place of scholarship as an important marker of knowledge and skill, and engaging in more conscious and conscientious practice. Self-study contributes to personal professional practice while also informing different types of scholarship, including discipline-based and pedagogical scholarship. Taken as whole, these kinds of outcomes can serve to foster a sense of agency that questions conformity and contribute to positive change in the culture of any given community of practice.

Abstract

This chapter provides an examination of specific methods used in self-study. We begin the chapter with a discussion of key elements that lead to our definition of what we mean by methods. Methods used for self-study build on traditional qualitative research methods, but the flexibility and creativity that emerge from self-study research lend itself to versatile creative approaches. The specific methods used in self-study often emerge as a particular function of the research. Through a process of examining the research literature where self-study is the methodology of choice, we organize the types of methods used into two major areas: (1) narrative/text-based methods and (2) creative/arts-based methods. We distinguish between what we term concrete narrative and text-based data representation and abstract narrative and text-based data representation. Narrative and text-based data representation considered concrete are those written texts that reflect actual life experiences such as the transcribing of the spoken word or written factual stories reflecting personal or professional histories. Abstract narrative and text-based data reflect the creative art of writing that goes beyond concrete representation and expresses meaning through creativity. Such text creation is defined as arts-based and can be seen in such expressions as creative writing narrative, poetry, and written metaphor. Additional creative/arts-based methods include visual representation, object as data, dance, musical representation, and polyvocal research. Within each of these areas of narrative/text-based and creative/arts-based approaches, we provide examples by describing self-studies using these specific methods.

The Journey

Developing a chapter on the methods and tools of self-study research was an interesting journey for both of us as self-study researchers. We have been involved in self-study research for several years. Deb began her work in self-study in the mid-1990s, and throughout most of her career as a professor at the University of Northern Iowa, she has been actively engaged in the self-study research community through the Self-Study of Teacher Education Practice (S-STEP) Special Interest Group (SIG)

of the American Educational Research Association (AERA) and the biennial international conference on the self-study of teacher education practice (often referred to as the Castle Conference). For over 6 years, Svanborg has been involved in self-study research through her work at the University of Iceland, in addition to her involvement in the AERA S-STEP SIG and the Castle Conference. We wrestled with how to address methods of self-study within one chapter. Colleagues who have provided books addressing methods of self-study (e.g., Crowe 2010; Lassonde et al. 2009; Schuck and Pereira 2011; Taylor and Coia 2014; Tidwell et al. 2009) have had the luxury of both breadth and depth afforded in the space of a book. We realized early on that the idea of an individual chapter on methods would need to hone in on specifics that could speak to methods used in self-study.

Self-study as a methodology is overall qualitative in nature (LaBoskey 2004; Pinnegar and Hamilton 2009; Tidwell et al. 2009). It is not surprising to find that methods used for self-study may follow traditional qualitative research methods found in the social sciences, such as narrative inquiry (e.g., Kitchen 2009; Milner 2010). However, the flexibility and creativity that emerge from self-study research lend itself to more creative approaches in methods as well (e.g., Hiralaal et al. 2018). Part of the complexity within this *describing* of self-study methods is that "the particular methods used in self-study emerge as a function of the particular context within which the study is being pursued" (Tidwell et al. 2009, p. xiii). Defining what is meant by self-study methods means to examine more closely the context for the study, the choices for data collection, and the processes used for analysis of data that inform the self-study. As stated by Pithouse-Morgan et al. (2016), "There is no set self-study research method. The appropriate methods are those that facilitate the inquiry" (p. 27). Loughran (2004) concurs in stating, "There is no one way, or correct way, of doing self-study. Rather, how a self-study might be 'done' depends on what is sought to be better understood" (p. 15).

Complexity

Samaras and Freese (2006) suggest the complexity found within self-study research, which "involves study of the self and study by the self" (p. 10), belies the creation of a simple, all-encompassing definition for self-study methodology. They argue that self-study can be defined by the role of "the self," by the "situated practice" being examined, and/or by the "purpose" for the study, which can reflect multiple reasons that are often integrated (p. 10). There are chapters within this section of the handbook that more closely address the methodology of self-study, as well as issues of quality and trustworthiness, and ethical considerations. What we are eliciting from the self-study literature for this chapter are the ways in which researchers have used tools for data collection and have engaged in research methods to analyze that data. Self-study research of teacher education practice often focuses on issues within a particular individual's professional work. Yet, self-study has also been used at the program level as well to examine practice within the function of a larger context (Kosnik et al. 2005; Kosnick and Beck 2009).

The strength and the complexity of self-study research are reflected in the multiple ways in which self-study can be used. These multiple contexts and diverse approaches to self-study can often challenge researchers as they develop and engage in self-study research. Inclusion is fundamentally grounded in the ideologies of social justice, democracy, human rights, and full participation of all (Ainscow and Kaplan 2005; Florian 2008; Guðjónsdóttir and Karlsdóttir 2009; Jónsson 2011). These ideologies are connected and dependent on each other in various ways. A critical social justice perspective emphasizes that people with their different abilities, characteristics, and backgrounds should be valued and celebrated for what they know and who they are, rather than assimilated into the structures of others (Ryan and Rottmann 2007). Critical social justice does not advocate treating everyone the same as that would simply prolong inequalities that are already in place. Rather, through this perspective, individuals and groups should be treated according to their abilities, interests, and experience; that is, they should be treated equitably. Treating individuals equitably rather than equally provides the potential to counteract existing inequalities (Ryan and Rottmann 2007). Those advocating for critical social justice seek a world that is fair and equitable for everyone, where everyone has the chance to reach their own goals.

Frameworks and Guidelines

Within the self-study research community, there have been efforts to provide frameworks and guidelines to support researchers interested in the self-study of their own practice. The following are three examples of frames and guides for developing self-study research: Samaras' (2011) development of a framework for addressing five key elements in self-study, Pinnegar and Hamilton's (2009) creation of a "Framework for Inquiry planner" (p. 39), and Paugh and Robinson's (2009) frame for "Planning an Initial Cycle of Data Collection and Analysis for. . . AR/PAR Self-Study" (p. 92).

Samaras (2011) recommends that five focus areas be addressed when developing an effective self-study of practice: the study should be a "personal situated inquiry," should involve "critical collaborative inquiry," should be designed for "improved learning," should involve a "systematic and transparent research process," and should result in "knowledge generation and presentation" (pp. 10–11).

Pinnegar and Hamilton (2009) introduced their inquiry planner as a framework containing four areas of question prompts designed to make explicit the confluence of practice and theory in the development of self-study research. In three of their prompt areas, they address identifying problems in practice, determining contexts and participants within the research, and identifying works that guide the inquiry (including addressing embedded values, beliefs, and accountability). A fourth prompt area (technically the third prompt area listed in the framework) asks for the methods to be used in the study, specifically "what would count as evidence" (p. 39). They further discuss a framework for "analysis of personal practice and research" where they define methods in terms of "rigorous research practice" and "explicit evidence" (p. 40). In this second and more specific framework, they ask that data

collection and data analysis be made clear and a connection be made evident between data analyzed and insights made from the study.

Paugh and Robinson (2009) provide a framework for planning data collection and analysis within what they term "participatory research methods" (p. 87). They see a clear intersection between action research/participatory action research and self-study, arguing "participatory methods of self-study are well-suited for the complexity found in educational settings" (p. 90). By examining their practice in relation to others, and engaging in collaborative conversations about practice and the data of practice, they provide a five-prong frame for thinking about research design: (1) purposes, (2) question(s), (3) participants, (4) context, and (5) methods. Within methods they ask researchers to determine data sources to be collected and to determine how that data are to "be analyzed and by whom" (p. 92). In all three of these examples of frames for guiding the development of self-study research, there is a focus on the collaborative nature of self-study and the use of others to inform the researcher about data and the understanding of practice.

Informing Through Others: The Critical Friend

The notion of informing the research through others has been a key element of self-study for many researchers, often termed a critical friend (Costa and Kallick 1993) or critical colleague (Henderson and Hyun 2017). It is the operative word *critical* that Schuck and Russell (2005) argue provides constructive criticism in the self-study research process that informs the researcher and impacts the research process. It is through this collaborative work with a critical friend that self-study research can address the concerns found in "the difficulty of assessing one's own practice and reframing it" (p. 108).

Not all self-study research employs the use of a critical friend, but a predominance of the self-study research within the literature does involve some form of collaboration with others. Often these collaborations help to clarify data collection and/or data analysis within the method used.

Defining Method

Across educational literature, the use of the term *method* has varied, from defining a broader methodological approach to describing a particular stance toward an educational theory, to discussing data artifacts, data collection processes, and data analysis within a study. Borrowing from the focus of the frameworks mentioned above for developing self-study research (Pinnegar and Hamilton 2009; Paugh and Robinson 2009; Samaras 2011), we have defined what we mean by methods as those elements made visible through the explicit discussion of data collection and analysis. We have honed our definition of methods to three specific foci: (1) what is being gathered (the data) to answer the research question(s) within the study, (2) how the data are gathered, and (3) the process by which that data are analyzed. We saw the first and second

elements of this methods definition as representing the tools used in research (such as interviews, drawings, or video recordings). We saw the third component as reflecting the process used for making meaning from the data collected (such as narrative analysis, video analysis, or constant comparison). Using this specific three-prong focus on method, we surveyed multiple sources of self-study research publications to seek ways in which self-study methods are realized.

One of the challenges of explicating the methods from self-study research was in finding clear explanations of what data were gathered, how data were gathered, and how data were analyzed. A particularly challenging source was the biennial Castle Conference proceedings. This is an excellent source for timely research in self-study, yet due to word limits set at 3000–4000 words, we were less likely to find clear explanations of methods. Typically, authors discussed the context for studies, followed by general references to methods in order to have room in their writing to expand upon the discussion of data results and the meanings associated with those results. We found what was more helpful as resources for examining methods were journal articles in *Studying Teacher Education* (the international journal for self-study of practice), other journals publishing self-study research (e.g., *Teaching and Teacher Education*), books and book chapters addressing self-study research, research papers made public at the annual meeting of the American Educational Research Association, and available theses and dissertations using self-study methodology. Yet, despite all these sources, we found it compelling that across publications, the process for analyzing data was not always clearly defined.

We confess there was a desire by both of us to organize this chapter on methods in terms of tool types used and the ways in which data from those tools were analyzed. We saw this as creating a clear and concise listing of the methods used in self-study – a satisfying organizational ethos of our writing partnership. But such an organization did not reflect the actual methods in self-study research represented in the literature. Through our three-prong process of examining data, data collection, and data analysis, the complexity in answering researchers' critical questions in their self-study research revealed the multilayered nature of self-study in terms of methods. Multiple tools were often used to gather sources of data to address the research question(s) within a study, and in some studies, data were represented in more than one way (e.g., video as visual representation and as transcribed narrative). We conceptualized the organization of self-study methods into two areas: methods reflecting narrative and text-based data/representation and methods reflecting arts-based data/representation and creative processes. We use the term *data/representation* to reflect the range of data provided, from concrete elements (such as written text or illustrations) to more abstract elements (such as a video or a performance reflected through dance, music, or voice). Video is an interesting source as it can be tangible as a visual (like an illustration) but also can be more abstract as flowing frames of movement over time rather than a specific single moment in time. In the following two sections, we provide specific examples for narrative and text-based data/representation and for arts-based and creative methods for data/representation. While within a single chapter it is not possible to provide an exhaustive comprehensive survey of all methods ever used in self-study, we have made a conscientious effort to reflect the breadth (and in some instances the depth) of methods as represented within self-study research.

Narrative and Text-Based Data/Representation

In self-study research, we found a preponderance of data represented as text. Because of the verbal nature of self-study, it seems virtually impossible to avoid some form of verbal data source, whether it is a verbal dynamic such as discussion, verbal response to nonverbal prompts, or written text. We characterized verbal data sources as a type of narrative where data were reflected through language, whether the verbal response provided the context for a data source, an explanation of a data source, an emerging story prompted by a data source, or other language-based connections to data. We have carefully chosen representation of text-based data reflecting those self-studies that are intentional in the use of text as a data source. In some self-studies, text is used as a secondary source to help inform the initial analysis of audio or video data. While text may be secondary in data gathering through transcription, we see the final analysis using text as placing these studies within text-based criteria. Narrative examples included narrative inquiry and other forms of narrative as language-based data.

We begin this section by discussing five specific tools that are used in self-study research where narrative and text are the data focus. These five tools include narrative inquiry, dialogue, journals, interviews, and critical incidents. In the discussion of each of these methods, we present the actual self-study, where the method is described through data sources, data collection, and data analysis processes. Another tool that some self-study researchers use in their work is the personal or professional history as an autobiographical way to capture their own theoretical grounding and their own thinking about professional practice (Branyon et al. 2016; Beyer and Tidwell 2014; Torrez and Haniford 2018). We chose to highlight two self-studies that use a very specific form of autobiography through the use of autoethnography (Newberry 2014) and co-autoethnography (Coia and Taylor 2014). Following these different examples of tools used in self-study methods, we discuss three additional studies where narrative and text-based data highlight the rich complexities found in self-study research. In the first example, Murphy et al. (2014) use multiple levels of text-based data in uncovering the growth and change that occurred from their role as doctoral students to their first year as teacher educators. In the second example, Bullock and Sator's (2018) self-study uses multiple sources of narrative and text-based data to examine maker phenomenon in science education. We close the section with Trout's (2010) self-study providing an example of using a theoretical lens (ethic of care) to drive the process of selecting, collecting, and analyzing narrative and text-based data.

Narrative Inquiry: Using Story as Data

We were cautious in using the term narrative inquiry (Clandinin and Connelly 2000) to describe text-based data in self-study, as this term reflects a specific type of text-based research where the researchers "immerse themselves in experience as lived and told in stories" (Kitchen 2009, p. 37). This use of narrative inquiry as "the study

of experience as story" (Kitchen 2009, p. 35) can be seen across self-study research (Clift and Clift 2016; Kitchen 2009, 2016; Sowa and Schmidt 2017). Kitchen's use of the narrative inquiry methodology in concert with self-study methodology has been dominant in his self-study research over time and reflects his deep understanding of the use of story as data. In his 2016 publication, entitled "Inside out: My identity as a Queer Teacher Educator," Kitchen uses queer theory as a method of critique across his collections of stories. Rather than stating a formal research question to ground his study, Kitchen provides a purpose statement for his narrative inquiry: "to examine the importance of teacher educators' cultural identifies and, particularly, how being gay informs my identity as a teacher educator" (p. 13). He used *inside out* both as an evocation of images and a frame for his narrative inquiry.

Through his writings of events from 30 years past as a young man struggling with his public and private identity, he engaged in narrative inquiry using the critical lens of queer theory to identify tensions as a teacher educator. Kitchen's (2016) data of narratives recounted key experiences in his journey from a "closeted teacher to an out teacher educator" (p. 20). Two tensions that emerged from his narrative inquiry were "the challenge of coming out and living out in a heteronormative culture" (p. 18) and "needing to be accepted as gay (and accept myself) and wishing to be accepted as a complex, multi-faceted individual" (p. 19).

Through this narrative inquiry process, Kitchen (2016) was able to see heteronormativity prominent in his earlier recollections of his life. Using narrative, both to provide a context for his experiences and to explain his understanding of his change in identity, provided a rich context for examining these narratives through queer theory. Kitchen embeds his narrative data within the unfolding story of his critique of his experiences and his evolving understandings of his identity in both personal and professional contexts.

Using Dialogue in Self-Study

Dialogue used as data in self-study research usually begins as an oral production which is often transcribed or recorded in notes for data analysis, thus becoming text-based data (e.g., East et al. 2009; Hite et al. 2017). But dialogue is also used in self-study research as a method to analyze data (e.g., Cardetti and Orgnero 2013; East et al. 2009; Pithouse-Morgan and Samaras 2014) and as an instructional process (e.g., Hite et al. 2017).

East et al. (2009) describe dialogue as a method used in two ways: (1) to examine their practice for "the purpose of improving...teaching" and (2) to "critically analyze...self-study" through an examination of content and process (p. 57). These two purposes for using dialogue in their self-study research provided the context for the examination of practice over time in their group discussions and reflections of those discussions, creating an implicit guiding query on how to improve their practice in teacher education.

East et al. (2009) examined their dialogue used in a collaborative group setting through weekly meetings guided by three mutually agreed-upon ground rules for

dialogue engagement: "(1) ask only questions about which one is genuinely curious, (2) draw conclusions only about one's own practices and metaphor, and, (3) maintain absolute confidentiality about what others share" (p. 59). Initially, their dialogues were recorded and transcribed and then analyzed through a traditional qualitative process for transcript analysis of codes and themes. However, as the group continued, they moved toward dialogue as the tool for analysis itself. In this process, they focused "upon our insights-in-the-moment as they arise[d] spontaneously in the dialogue process" (p. 58), citing Gordon Wells' *Dialogic Inquiry* (1999) as their rationale for their analysis. They found this collaborative process of dialogue useful in examining their practice. In particular, their in-the-moment analysis of their dialogue as oral narrative led to a phenomena they referred to as *recalibration points*, which they found similar to Tidwell's nodal moments (Tidwell and Manke 2009 – described below in the arts-based section of this chapter). Rather than describing these moments as reframing their thinking or as major transformations, recalibration points were defined as more subtle small-scale forms of fine-tuning of their awareness and understanding of practice. Through this process of dialogue as oral narrative, the impact on their practice included three important insights: (1) using dialogue within teaching as a process for students to interact and engage, (2) realizing the importance of addressing early childhood education preservice teachers' fears of mathematics and science, and (3) engaging in active listening with students to foster a better understanding of student needs and to model active listening for their own use in the field.

As the study progressed, Cardetti and Orgnero (2013) used what they termed as interdisciplinary "cogenerative dialoging" (p. 253) to examine their practice through nontraditional professional development. They refer to their professional development as nontraditional as they met in unstructured informal gatherings that grew out of hallway discussions which then became more organized encounters. In their self-study, they saw the role of dialogue as a "catalyst for. . .change" in their practice where "ideas are cogenerated through collegial dialog" (p. 253). The interdisciplinary aspect of their engagement came from their university work in two diverse disciplines of mathematics and English language teaching. Their self-study work was guided by their research question: What is the nature of our interdisciplinary practice? Their data consisted of the use of "the narrative method of dialog" that took place "at weekly meetings over a period of 18 months" (p. 255). At the close of each meeting, they established a flexible agenda for the next meeting that was developed with guiding questions and included key points or important ideas generated in the dialogue of the recently completed session. They used handwritten notes from their dialogues to document content discussed, as well as insights and plans.

As the study progressed, Cardetti and Orgnero (2013) moved to electronic documents to record their findings. As with East et al. (2009), Cardetti and Orgnero used dialogue as an active in-the-moment narrative along with their text-based data from their notes. They defined their analysis process as "ongoing and cyclical" where they "refined findings that emerged through. . .critical dialog, follow up emails, and the revision of [their] recorded notes" (p. 256). The outcome of this iterative progression resulted in their development of a model for an interdisciplinary

process which embeds dialogue and reflection with each of five stages: creation of a collaborative environment, initial inquiry, shared inquiry, scholarly connection, and in practice and beyond.

Dalmau and Guðjónsdóttir (2017) describe their use of dialogue as a way to discuss and analyze their data sources in a multi-year self-study of the emerging development of their professional working theory. In this context, dialogue is a critical process for unfolding their "experiences at certain turning points" where they described their process of using dialogue to address their data as an "iterative and analytic process" which was "often messy" as they "stepped back, critically reflected" and "peeled the layers" (p. 135) to understand their practice.

Hite et al. (2017) used dialogue as an instructional process during Reading Recovery lessons with a first grader. The self-study examined her (Hite's) use of priming (the act of an utterance influencing another's utterance) during the writing portion of a 30-minute Reading Recovery lesson where both genuine dialogue and direct instruction occur. Hite et al. examined the specific language during one-to-one writing instruction across five specific Reading Recovery lessons spaced over a 20-week period of lessons, using four indicators of genuine dialogue: open-ended questions, expansion prompts/questions, contingent utterances, and clarifying prompts/questions (Boyd and Galda 2011; Johnston 2004; Wasik 2010). This self-study revealed that even while the instructional intention in the lesson was to provide multiple opportunities for the child to be primed for more complex syntactic use and to engage more often in genuine dialogue, results showed that teacher priming happened fewer times with genuine dialogue and was more prevalent during explicit instruction. The child was primed more during genuine dialogue and had many more opportunities to speak during dialogue than during explicit instruction.

What was most important to Hite (Hite et al. 2017) in her teaching was the realization that priming (both what she says as the teacher and the follow-up utterances by the student and her) does make a difference in language use for children. She also found that in her teaching, genuine dialogue does appear to provide a greater opportunity for priming to occur. Most notably for her teaching preference insight, she found that her teacher discourse was more often explicit instruction rather than genuine dialogue, despite her intentions. This has greatly influenced her future teaching, with an intention for greater use of genuine dialogue to provide richer experiences for her students to use language and more complex syntax.

Using Journals in Self-Study

As can be seen in our discussion of self-study examples across this chapter, the use of journals for documenting data is a popular method in self-study research. From the 2016 Castle Conference alone, journals were used for multiple purposes and in multiple formats, such as shared journaling with colleagues (Fletcher et al. 2016; Ramirez and Allison 2016), student journaling to inform practice (Branyon et al. 2016), recording observations and interactions in teacher education

(Nyamupangedengu and Lelliott 2016), or reflecting and retrospection (Craig et al. 2016; Jónsdóttir and Gísladóttir 2016). We chose to highlight an example of reflective journaling from an article in *Studying Teacher Education* where colleagues worked together in an interactive online journal through an international collective (Makaiau et al. 2015).

Makaiau et al. (2015) are three educational researchers based in Hawai'i who are from different countries and who are in different stages of their professional careers. They began working together from their shared interest in the Philosophy for Children Hawai'i (p4cHI) approach to education. They drew upon literature on "reflective teaching, culturally responsive pedagogies, social constructivism and self-study to frame the role of journaling" (p. 66). They systematically wrote in their online journal over a period of 8 months, beginning with five entries per week but moving to one entry per week as the journaling progressed. They were guided by three goals that also became their research questions: (1) "What is the role of an online journal in their international p4cHI research collective?", (2) "Is there evidence that an interactive online journal can support both collaboration and individual research interests/goals?", and (3) "In what ways does journaling with international partners support personal and professional development?". They chose "reflective thinking via journal writing" (p. 66) as their approach to their collaborative journal. Their decision was supported by Spalding and Wilson's (2002) values of journaling as a permanent record of thoughts and experiences, of establishing and maintaining relationships with others, of being a safe haven for expressing concerns and frustration, and of providing an aid to internal dialogue.

They used constant comparison analysis (citing Glaser and Strauss 1967) through three phases. The first phase examined the first 2 months of journal entries, using the findings to inform their further data collection. They separately developed codes for the data and then worked as each other's critical friends to establish consensus on a set of codes and themes. The second phase included an additional 3.5 months of entries. They individually developed their own codes and themes and then met as critical friends, and through dialogue methodology (Lunenberg and Samaras 2011), they determined their final list of analytic themes. Phase three involved the writing of their findings, with revisions of their thinking and refining of their themes. Their three-phase analysis process resulted in three major themes: an international commons (a place for intellectual safety), deepened inquiry in the research process (revelations of confusions and complexities), and culturally responsive practices (situated and purposeful research).

Using Interviews in Self-Study

Kosnick et al. (2009) describe interviewing as "one of the ways we can hear others' stories" (p. 53). It is this desire to understand the stories reflecting a particular event or phenomenon that inspire self-study researchers to use interviews to inform their understanding of practice. Berg (2007), in his sixth edition on qualitative research, defines interviewing as "a conversation with a purpose...to gather

information" (p. 89). From this perspective, the development of the interview questions becomes critical in making possible the researcher's ability to elicit the information desired from the stories that are revealed through interview. The following two examples provide insights into how interview and question development are used within self-study research. In the first example below, Kosnick and Beck (2008) present a self-study of their teacher education program using interviews in two contexts: to interview each other about their response to the teacher education program and to interview participants engaged in the targeted teacher education program as data to support their understanding of their program. Part of the reason we chose this study was the realistic issues that arose with data collection and their discussion of the evolution of their interview question development over time. In the second example, Philip (2013) used self-interviews to research his university teaching of social foundations. We chose Philip's research because he provides a rich description of the process of self-interviewing to capture the story of self in practice.

In their self-study, Kosnick and Beck (2008) report a portion of results from a longitudinal study on their teacher education program where their study included "preservice elementary literacy instruction at three universities and following graduates of the program during their first three years of teaching" (p. 115). Their research was driven by four larger questions addressing the full longitudinal study:

> What impact does a teacher education program have on student teachers' theory and practice of literacy teaching?
>
> Is there a body of knowledge that student teachers need to learn to be effective literacy teachers?
>
> How can universities and school systems provide more adequate support and mentoring for new literacy teachers?
>
> How can teacher preparation programs dovetail with the many large-scale school board initiatives in the literacy area? (Kosnick and Beck 2009, pp. 216–217)

In the 2008 reporting of their study, Kosnik and Beck began by stating they were interested in learning how effective their courses were in preparing beginning literacy teachers. They address data from one university site (Ontario Institute for Studies in Education at the University of Toronto), where they interviewed 10 university instructors and 22 new teachers. In this reporting, they provide a more specific question focused on literacy knowledge and instruction: How can beginning teachers acquire this array of knowledge, consolidate their learning, and develop an appropriate pedagogy or approach that is feasible for the extremely challenging initial years of teaching? In addition to interviewing others to inform them about their program, Kosnick and Beck also interviewed themselves. They developed two unique sets of interview questions, one to be used with the new teachers who had completed their program and one for the university literacy instructors (which they also used to interview each other). The new teachers' interview questions focused on "their approach to literacy instruction, reflections on their preservice program, suggestions

for improving the program, and current challenges" (p. 118). The literacy instructors' interview questions focused on "background, goals, instructional strategies, assessment of student teachers, textbook/readings, involvement in practicum supervision, suggestions for program improvement, and ongoing learning and research" (p. 118). They analyzed their data each year throughout the longitudinal study, which provided information that informed their continued adjustment to their interview question sets. The first year interviews focused on "program planning and links with preservice," while the focus in years two and three were revised to reflect information that emerged from the analysis of their first year data: "program planning, pupil assessment, classroom organization and community, inclusive pedagogy, subject-specific knowledge, vision of teaching and professional identity" (p. 118).

Through their use of the interview prompts to examine their own thinking about their practice, Kosnick and Beck (2008) also read two publications on literacy and discussed those in relation to feasible application of literacy approaches by new teachers and the use of a comprehensive text in their teaching. Their responses from the interview helped them in their discussion of their own strengths and weaknesses in their approaches to teaching, and they used the data gleaned from the instructors' interviews and the students' interviews to inform their discussion about their own practice. In particular, they honed in on their course syllabi and their lecture notes to determine if the topics and content addressed by their fellow instructors were present in their coursework, as well as addressing what emerged as major concerns from the new teachers. From a larger program evaluation stance, their use of interviews of others informed them about their own teaching and organization of program delivery. Results from their interview process revealed that while university instructors believed it was essential for students "to know about the realities of teaching" (p. 122), they approached this in very different ways, including Kosnick (with a focus on a reading program as guide) and Beck (with a focus on care and life balance). Yet the new teachers were "shocked. . .by the demands of teaching" (p. 123).

Kosnick and Beck (2008) found that what was taught was not necessarily what the new teachers learned in their program. A larger issue that emerged was the need by university instructors (including the researchers) to cover a broad range of topics to attempt to address the reality of teaching. Their data showed that new teachers found this created a sense of disconnected content, with an "overabundance of terminology and topic introduced in the courses" (p. 124). Both researchers found this data informed changes they would like to make in their own teaching. Kosnick found she needed to focus on deepening her knowledge of literacy learning through readings and on reorganizing her course content from weekly topics to core concepts (reflecting the seven priorities that emerged from their research) with goals developed for each class meeting. Beck recognized the importance of focusing his social foundations course around key aspects of teaching that reflected the seven priorities as well. More specifically, he saw a need to interconnect the content across the course to enable his students "to develop an integrated approach to teaching" (p. 126). At their program and institutional level, their interview process provided insights into suggested changes in organization and delivery of content. Kosnick and Beck suggest that clearly developed priorities are needed, recommending

instructors work in collaboration toward consistency in course delivery, toward shared expertise, and toward consensus of topics and terminology to be addressed within the teaching program. They suggest that through these efforts in their own teaching and in the program at large, they can help facilitate beginning teachers effective literacy teaching in the field.

Philip (2013) used self-interview adapted from Keightley et al. (2012) in his examination of ways to better articulate the purpose of social foundations both for his students and himself. Philip argues that although self-interviews, like other interviews, are selective and perspectival, they allow for more flexibility in time and space. Philip allocated 3 h a day for 2 weeks to generate and respond to prompts on the focus of the research. Before starting the interview, he gathered data he anticipated he would need: course syllabi, plans, his reflections, course readings, and artifacts from student presentations. Philip was both the interviewer and interviewee, which created both challenges and opportunities. One challenge was being interviewed and at the same time needing to develop follow-up questions as an interviewer. It also offered the opportunities to iterate multiple times and refine prompts after each interview segment. He started the self-interview process with an overarching question: What is the purpose of social foundations and how do you communicate it to your students? All responses were written up as texts in a word processor. Philip kept an interviewer notebook to record follow-up questions as he wrote his responses. With each new prompt, he reimmersed himself in the course materials, artifacts, and earlier responses. Through this process, he questioned the purpose of the course, refined, abandoned, discovered, and generated new elements. When the iterative process had been exhausted, Philip returned to the document to do further analysis. He coded elements and designed a thematic map. The analysis provided five elements of the course purpose: (1) understanding reflexive relationships of power, (2) questioning ideological assumptions, (3) recognizing reproductive and transformative powers of schooling, (4) understanding social constructions, and (5) considering institutional change.

In reexamining his data, Philip (2013) rearticulated the elements of the course purpose with language and ideas that had strongly resonated with his students and added statements about the importance of teacher's work in a democratic society. As a response and a way to present the findings, Philip wrote an end-of-the-quarter letter to his students containing the study results and his rearticulation of the course. He then offered his students a chance to respond to the letter as an optional assignment (27 of 29 responded). From this engagement by the students with his end-of-the-quarter letter, the research became interactive as well as critically collaborative, where Philip saw the students as serving in a modified role as critical friends to his research.

Using Critical Incident in Self-Study

Critical incidents (moments during teaching that represent a critical instance that can be used to inform one's understanding of practice) have been used by self-study

researchers as a way to problem-solve issues and dilemmas (e.g., Brubaker 2014; Cobb 2011). Cobb (2011) used the frame of the critical incident method as defined by Spencer and Spencer (1993) to examine six incidents that she described as "stories involving various participants' investigations of fractional representations" (p. 97). *Participants* were the students engaged in her mathematics course and whose interactions with different assignments in fractional representation provided the stimulus for her teaching stories. Six questions drove her analysis of the six storied incidents: What was the situation? What events led to this situation? Who was involved? What did I think, feel, or want to do in the situation? What did I actually do or say? What was the outcome? Her examination of the stories, and her attempts to answer the six questions for each storied incident, resulted in the emergence of three key issues: (1) student confusion can be heightened by using articles addressing misconceptions, (2) student understanding of the task and its importance is still a challenge, and (3) teacher listening is critical and part of the conundrum in students' understanding.

Cobb (2011) then used these three key issues as a focus for short-term teaching goals to improve her practice. One goal addressed her engagement in a more thoughtful approach toward the selection of useful reading assignments for her students, asking the question: "In what ways will this reading increase student understanding and in what ways will it create more confusion about the mathematics concept or an instructional strategy?" (p. 100). By selecting readings that will increase understanding while eliminating confusion of concepts, Cobb projects this goal will improve her students' engagement in mathematics problem-solving and in application of mathematics in the field. She identified "accurate empathy and intellectual flexibility" as the two competencies that emerged from her six storied incidents, which she sees as serving to "significantly strengthen [her] delivery of instruction" (p. 100). She sees these two competency goals as influencing her development of plans for instruction in future courses and guiding her thinking about engagement with her students during future class sessions.

Brubaker (2014) provided an examination of a single critical incident from within his graduate course on teaching and critical thinking. This self-study came out of his work with ten female graduate students in elementary education who were attending a comprehensive public university located in a region of the United States which he defined as "in the middle of the Bible Belt (the hub of socially conservative evangelical Protestantism in the Southeastern United States)" (p. 111). This self-study had an overall embedded query: How did class interactions with evangelically minded students help shape his pedagogy of teacher education concerning gendered discourses in teacher education? In his discussion of his self-study, Brubaker (2014) provided a description of his stance on gender as a "socially constructed conception of self that situates us relationally (Weiler 2001)," and on the impact of sexism in learning and teaching, where "it is not a matter of whether sexism is a part of who we are, but how broadly and deeply it is ingrained in us (Johnson 1997)" (p. 112). Data were comprised of a transcription of the audio recording of the class discussion, a personal journal, and students' written assignments. The journal and written assignments provided a rich context for describing his thinking about the course and his

students' understandings. The transcribed recording of the class discussion provided the data on the critical incident under discussion. In his analysis of the transcript, Brubaker used a "constant comparative method (Glaser and Strauss 1999)" and "the computer software program QSR Nvivo 8.0, to facilitate the process of constant comparison" (p. 114). He also drew from Lazar's (2007) feminist critical discourse analysis to make visible the "gendered assumptions [that] were discursively produced, negotiated and challenged" (p. 114).

The context of the critical incident occurred during the course when Brubaker (2014) made "efforts to involve students in a process of open inquiry about the topic of religion" (p. 114). Prior to the discussion of religion, the students had been engaged in active class discussions on civil rights, child labor, and critical literacy. With an anticipation that the topic of religion "would be challenging for the group," it had been scheduled for the final week of class, to allow for a "sense of community" to develop over the semester and to have time to develop effective "group dynamics" during discussion (p. 115). Students were given two articles to read, first addressing the notion of Christian privilege in society and second addressing the "unacknowledged norm of Christian beliefs in US public schools" (p. 115). Students developed questions regarding the readings, and two question prompts were chosen by the students to be used in the class discussion: (1) Are the ideas religious-based or society-based? and (2) Why are Christians made to feel guilty? It was during the discussion of "the reasons why Christians were 'made to feel guilty' by the ideas in the readings" (p. 116) that the critical incident occurred. Question prompts provided by Brubaker to students during the discussion created a tension in the class that shifted the dynamic of the discussion. Specifically, students became defensive and strongly questioned the value of his queries, which were seen as personal, confrontational, polarizing, and condescending. The focus on the possible guilt of Christians emerging from the readings was met with hostility, consternation, and confusion by the class.

Brubaker's (2014) analysis of the transcribed data revealed three themes related to how gender was constructed in the discourse: (1) shaping the agenda, (2) distributing participation, and (3) bridging differences. In shaping the agenda, Brubaker saw his selection of articles as a privileged stance of authority, but he saw himself as explicitly involving students in determining what would be discussed (through question development) and positioning his own ideas as proposals that were not to be imposed. His consternation came from some students struggling to move beyond his own proposed ideas, perceiving them as what must be addressed, and thus undermining the "reality [he] was attempting to create" (p. 118). Distributing participation reflected the "use of talk" in this critical incident moment, where the discussion was meant to be "equitable and focused on students' concerns" (p. 119). Brubaker saw the use of talk across the session as being counter to "conventional norms of masculine discourse" (p. 119) in which the male dominates in topic, tone, and length of discussion. The transcript data revealed that Brubaker had a much lower average number of words spoken than the female students in the course, and the content of his language addressed procedural concerns and clarification. Brubaker suggested that they "distributed participation in a manner that contributed

to feminist aims (Sikes Scering 1997)." In bridging differences, he realized the discussion of religion "was more complicated than simply considering religion an interesting source of intellectual inquiry" (p. 120). He saw the importance of understanding this complexity by highlighting the differences in experiences he had when compared to his students. Brubaker's realization of difference in his male role in education came to the fore in this critical incident. "I implicitly embodied the extent to which I had constructed my masculinity in the predominantly female field of elementary education around traditionally male characteristics of willingness to take risks, experience discomfort, and accumulate new experiences (Perra and Ruspini 2013)" (p. 121). Through this analysis of a critical incident that focused on how gender was constructed in a graduate course, Brubaker saw the understandings of gender construction in the class that emerged from the themes (shaping the agenda, distributing participation, and bridging differences) were "contradictory and conflicting" (p. 121). They were "simultaneously upholding and undermining conventional authority relations" (p. 121).

Self-Study Through Autoethnography and Co-autoethnography

"Autoethnography is an approach to research and writing that seeks to describe and systematically analyze (*graphy*) personal experience (*auto*) in order to understand cultural experience (*ethno*)" (Ellis et al. 2011, ¶ 1). Coia and Taylor (2009a) added *co-* to autoethnography in their self-study of their own practice, where they acknowledge that teaching is interpersonal, that self-study is collaborative, and that individuals can research themselves "only within the context of others" (p. 7). In self-study, autoethnography often includes the use of biography and other written and visual data to make meaning of experiences (Bass 2002; Coia 2016; Newberry 2014). Newberry (2014), using autoethnography, provides insights into the process of becoming a teacher educator as someone who was not originally from the teaching field. As a nontraditional teacher educator, Newberry examined the development of her identity as a teacher educator. Coia and Taylor (2014) worked together as researchers using co-autoethnography to "examine the teaching of an upper level course on gender and education" (p. 158).

Newberry (2014) describes herself as a nontraditional teacher educator (someone who comes into the field of teacher education through an avenue other than classroom teaching). She describes her professional setting for this self-study as a faculty member in "the Department of Teacher Education in a large private religious university…[teaching] a course on adolescent development for undergraduates, preservice secondary teachers, and a course on teacher learning and development for in-service teachers" (p. 167). Newberry participated in an assignment in her *Teacher Development and Learning* graduate course, where she asked students to chronicle their journey toward becoming students of teaching through critical incidents, using metaphor, and selecting a series of images and phrases to represent personal history. She and her students shared their personal histories at the beginning of the course and again at the end of the course with revisions. She chose images

representing critical incidents in her journey toward becoming a teacher educator. She then wrote memories about those images, which helped "flesh out the meaning" (p. 168) of those images. This triggered additional memories, which informed her development of her autobiography. It was through this process that she was able to compare her initial story to her revised story, which helped her recognize the complexity of her identity.

Newberry (2014) used her completion of the course assignment as data in her authoethnographic self-study examining her identity as a teacher educator, with an embedded question: How have I developed my teacher educator identity? Her analysis process involved multiple readings of her final autobiographical "story" focusing on critical incidents of "turning points, struggles, and phases of development" (p. 168) across her career. In this process, she identified six recurring themes (avoidance, curiosity, doubt, pretending, doing, and belonging). She then revisited her story and applied the themes as codes across her data. She saw different times and ways in which the themes emerged from the data, as well as the relationship of the themes to each other. From this, she was able to chronicle her phases of development as a teacher educator. She used these phases as the frame to rewrite her narrative, rather than using a chronological timeline. She then provided this updated narrative to two critical friends, who read and provided feedback for clarity and details. She revised her narrative to include the feedback and then "recoded the more complete narrative, selected one critical incident from each phase, and rewrote a shorter narrative of [her] journey with only the selected representative incidents" (p. 168). Newberry used Williams et al.'s (2012) framework ["personal and professional biography, institutional contexts, and a personal pedagogy of teacher education" (p. 164)] to examine her narrative reflecting her journey in developing her identity as a teacher educator. In this final draft, she used one critical friend to review each phase in her narrative. To highlight her experience as a nontraditional from that of a traditional teacher educator, she took her analysis one step further and compared the "influence of biography, institutional context, and personal pedagogy evident in [her] experience" (p. 168) to two traditional teacher educators (Young and Erickson 2011) who also examined their autobiographies using Williams et al.'s frame. For her own journey, she found that she began with resisting the idea of becoming a teacher, followed by investigating (critically examining teaching as a profession), hesitating through questioning her ability, imitating by rehearsing ways of being a teacher, participating through what she termed "performing expected acts" (p. 169), and seeking, where she sought ways to belong. Unlike her traditional teacher educator colleagues Young and Erickson, Newberry struggled with teacher educator identity development, though she sees her personal biography, institutional experiences, and personal pedagogy development as influencing her identity development over time.

Coia and Taylor have been involved in self-study research using co-auto-ethnography for several years (Taylor and Coia 2006; Coia and Taylor 2009a, b, 2014; Taylor et al. 2014). They defined co−/autoethnography as a conscious and explicit collaboration of inquiry, whereby two voices intertwine in an examination of a particular phenomenon or event. The context of their self-study (Coia and Taylor

2014) focused on an upper level course on gender and education at "a small liberal arts college for women in the southeastern United States" (p. 158). The course was taught by Coia, but the self-study involved both Coia and Taylor through their co−/autoethnography process. The study began in the onset of course development, with data involving Coai's "narrative reflections from her teaching, video from her class sessions, emailed dialogue between us, personal narrative from the past and present about our lives as women, quotes, articles, and videos that inspired us, and collaborative writing" (p. 159). Embedded in their study is the overarching question: What have we learned about our practice?

Coia and Taylor (2014) used the term "nomadic inquiry" (p. 160) to describe their analysis and writing process, where they were aware of "points on their path," but their focus was "on the journey" (p. 160). They describe the nomadic inquiry as akin to "shared improvisation and willingness to cross boundaries: . . .boundaries of context, pedagogy, and biography" (p. 160). Their idea of improvisation in their research process related to jamming in music, where improvisation follows the melody of meaning with additional coherent insights and creation that can add to or make the story. They used this musical connection to inform how they framed their results. Through their viewings, readings, and discussions of their data, they wrote about their "teaching lives together and in so doing, develop[ed] a communal practice that yield [ed] new interpretations of our work" (p. 161). Their results became a compilation of vignettes reflected in two music-referenced sections: "Nothing's for certain, it could always go wrong. . ." (Hunter Garcia 1970) and "Wake up to find out that you are the eyes of the world. . ." (Hunter and Garcia 1973). In these sections, they provided specific moments from the course with responses to those moments, reflecting the collaborative engagement between them during the self-study. As self-identified poststructural feminists, their summary discussion, entitled "Goes to show you don't ever know. . ." (Hunter and Garcia 1981), examines more closely the "planned unpredictability" (p. 165) found in the course teaching and the parallel connection between nomadic jamming and the co−/autoethnography process.

Text-Based Data Reflecting Community Growth and Change

In some self-studies, the development of text as initial data leads to an analysis process where the findings reveal the story of a community and of evolving change and growth. An example of this is in the self-study by Murphy et al. (2014). They used text-based data in their self-study research on their experiences that began as doctoral students in a writing support group and extended into their first year as university faculty. The initial context for their study was their work as doctoral students in the dissertation process. They were interested in studying their identity development as researchers and teacher educators through their academic writing journey. Two research questions guided their self-study: How has our understanding of our identities as teacher educator researchers changed since joining the dissertation support group? and How has our experience of acting as critical friends affected our doctoral studies and our work in pre-service education?

In their data gathering, Murphy et al. (2014) held 42 weekly meetings in which a group member's piece of writing (sent via email prior to the meeting) was used as a discussion point for feedback. After the meeting, the author of the writing would send an email to the two other members discussing how the feedback impacted the academic/dissertation writing process. Using Gee's (2000–2001) "theory of identity as an analytical lens" (p. 243), they examined four sources of text-based data to determine their identity development over time: (1) shared electronic discussions gathered over a period of 1 year, (2) post-meeting email reflections on the feedback support, (3) the transcription of the recording of their end-of-year focus group session, and (4) the transcription of the recording of their second focus group session as postdoctorate/beginning faculty at the university, which occurred 1 year after their initial end-of-year meeting. They cited Glaser and Strauss (1967) for their data analysis method of constant comparison. Beyond citing Glaser and Strauss, they also described their process for determining codes and themes through using multiple readings of the texts where they "examined the materials for clarification, continuing to add, delete, modify, and establish themes" (p. 244). In addition to developing themes, they also described how they examined their data for specific moments of confusion and how they followed their data to "trace the a-ha moments" (p. 244) in their growth as academic writers, as researchers, and as teacher educators.

Highlighting their moments of confusion or understanding in their data helped in clarifying their identity development over time. Murphy et al. (2014) used three identity descriptors from Gee (2000–2001) for this process: "discourse identity" examining how people interact and treat an individual, "institution identity" as position recognition accessed through institutional powers, and "affinity identity" through group affiliation (p. 243). As they discussed the findings from their analysis, the key themes that unfolded also unfolded their story of identity development over time. In their discussion of the theme on interconnectedness of their roles and their identity, they revealed the confluence of their data collection with their data analysis process to create an understanding of themselves as writers and researchers. This continued in their discussion of the theme on the reciprocal relationship between being a researcher and being a teacher educator. They made connections across their experiences that unveiled a developing story of who they are in academia that spans both the personal and professional and acknowledges the power of accountability to each other as members of a group that evolved into a collaborative and engaged community of scholars. Their story unfolded through their choice of data and their method for analysis.

Multiple Sources of Narrative and Text-Based Data

Text-based data can be derived from other initial data sources, such as discussion sessions, audio recordings, and video. An example of using narrative and text-based data from across a range of sources can be found in Bullock and Sator's (2018) self-study research focusing on the maker phenomenon, examining the notion of making things as part of classroom pedagogy. They were "particularly interested in the

pedagogical affordances made possible by the interest in the potential of encouraging K-12 students to 'make things' as a part of any number of curricular subjects" (pp. 58–59). Their self-study described the process within their methods where the "emphasis is on collaborative inquiry, through critical friends, and dialogue as a valued component" (p. 61). Their data sources were varied to address the complexity of their research question: How did our understanding of teacher education and self-study change as a result of our exploration of maker pedagogy with teacher candidates? The data consisted of sources addressing their students' engagement in the maker pedagogy lab (MPL) through video, field notes, and surveys by the preservice teacher participants after each session, all of which informed the researchers' thinking about their own practice. Data were also gathered from the researchers' writings and discussions of their practice, as reflected in research journals of their thoughts about their developing maker pedagogies, transcribed recordings of regular meetings on maker culture and movement situated within educational technology, audio-recorded thoughts post MPL meetings, and transcribed discussions that occurred after watching the MPL meeting videos.

Bullock and Sator (2018) describe their analysis methods as coding and thematic analysis. The process included both separate individual coding of transcripts before they got together to discuss the data and discussions when they met to "consolidate" (p. 42) common themes and understandings of data. They saw the "conversations prompted after watching video recordings of each MPL meeting" and their analysis of "post MPL meeting transcripts" as important in revealing evidence of reframing "their understanding of maker pedagogy" (p. 62).

It can be argued that the aural and visual representation in video recordings create their own narrative of actions and engagement. Whitehead (2010) has used video in his action research self-study work as tangible data that imbues and reveals living educational theories. Heath et al. (2010) provide an explanation of video as a meaning-making process, including both the verbal narrative that occurs from social engagement and the *visible conduct* that informs meaning:

> . . .the video record allows the analyst to consider the resources that participants bring to bear in making sense of, and participating in, the conduct of others, to take a particular interest in the real-time production of social order. Video can also enable the analyst to consider the ways in which different aspects of the setting feature in the sequential organisation of conduct. These aspects include not only the talk of participants, but also their visible conduct, whether in terms of gaze, gesture, facial expression, bodily comportment or other forms. Furthermore, video data enable the analyst to consider how the local ecology of objects, artefacts, texts, tools and technologies feature in and impact on the action and activity under scrutiny. (p. 7)

In their analysis of data, Bullock and Sator (2018) viewed the videos of their MPL meetings together and through this process determined the meaning of the narratives of the videos both through the verbal social engagement and the visible conduct observed in the videos. In particular, their viewing honed in on "specific questions, cues, references, and indicators" (p. 62) in teaching moments that reflected reframing. This complexity of text-based data and visual data in video brought to

the fore the value of multiple data sources to explicate change (as in reframing) and process (as in the development of critical friendship). The themes that emerged from their data analysis represented broader understandings of their engagement in this self-study focused on the maker movement in education: the value of self-study, the distinct nature of maker pedagogy, and the deepening of their own teacher education pedagogies.

Ethic of Care as a Lens for Self-Study

Data gathering and data analysis are informed by the theoretical orientation of a study which also informs the type of question(s) guiding research. Ethic of care (Noddings 2003) as a lens for analysis provides an example of how a particular theoretical stance informs the data choice, the gathering of data, and the analysis of data. Trout (2010) developed a self-study of her practice grounded in the theory of ethical care. In her teacher supervisory practice, Trout used ethic of care as a framework for understanding the relationships between people. Her focus was on the relationship of caring that develops between a teacher and students, where "[t]eachers model care, engage in dialogue with their students, create opportunities for students to practice care, and confirm their students' desire to actualize their ethical potentials" (p. 121). The context for her study was in a post-baccalaureate teacher licensing program where 30 student teachers in a social studies education cohort were to participate in a 6-week practicum in middle school or high school settings. The four research questions driving her self-study included the following: (1) "How do I engage in a pedagogy of care with social studies student teachers?", (2) "How do I use pedagogical relationships to engage the student teachers in learning about a pedagogy of care?", (3) "What images of ethical care do I see mirrored in my student teachers?", and (4) "What are the implications of a pedagogy of care for supervising social studies student teachers?"

Data gathered by Trout (2010) were text-based and focused on her interactions with one student in the cohort. Data included email correspondence with the student, her comments on his lesson plans, notes that she took during teaching observations, their recorded post-observation conversations (transcribed), field notes documenting what occurred after site visits, analytic journal entries throughout the time she served as supervisor, and an exit interview with the student (transcribed) after she finished her responsibilities as supervisor. In her discussion of the gathering of data and the analysis of the data, Trout made clear she was borrowing from "case study research methods to explore the data systematically" which arose from "a theoretical proposition. . .of ethical care," where she used "Noddings' (2003) descriptors of ethical care as a heuristic" (p. 124) to explore her work. This lens of ethical care influenced her writing within her reflective journal, using Noddings' descriptors within her journal entries (e.g., *engrossment, commitment, reciprocity*). In addition, the prompts she used for her journal writing were a direct reflection of ethical care issues, such as "contemplate the ways in which I tried to become engrossed in Derrick's ideas" (pp. 124–125). She discussed ethical care as an ontological approach she used when

working with students. And she described her analysis process as "meaning categorization (Kvale 1996)" in concert with "broad-brush (Bazeley 2007) coding strategies to identify subcategories" (p. 125). In addition, she described her organization of her multiple layers of data through the use of Yin's (2003) time-series analysis. Three key themes emerged from her data: (1) care as perspective taking, (2) care as collaboration, and (3) the idea of a caring cycle. She connected her use of self-study with her understanding of the relationship that developed between herself and the student. "The process of self-study shed light on the symbiotic relationship between my care for Derrick, his development as a teacher, and the reactions of his students" (p. 132).

Arts-Based and Creative Data/Representations

Arts-based and creative methods in self-study have been a part of the self-study community from its inception. In the *Handbook of Arts in Qualitative Research* (Knowles and Cole 2008), Eisner (2008) provides a compelling argument for the use of arts in knowledge making. He argues that arts-based research represents Aristotelian knowledge through the theoretical (knowledge of "necessity"), the practical (knowledge of "contingencies" such as local circumstance and contexts), and the productive ("how to make something") (p. 4). Finley (2008) contends that at the very heart of this type of inquiry is "a radical, politically grounded statement about social justice and control over the production and dissemination of knowledge" (p. 71). Weber (2014) concurs, suggesting that the use of arts-based methods enables researchers "to cast a wider net during data collection and offer a panoply of valuable lenses for analysing experience in meaningful ways" (p. 10). Pithouse-Morgan and Samaras (2015) have worked with and facilitated arts-based research within transdisciplinary self-study research communities in their home countries (South Africa and the United States) and have been interested in making "visible the researcher's interaction with others or the reciprocal learning that can occur" (p. 2). They have used the term *polyvocal professional learning* to reflect the multiple contexts, voices, ways of knowing, and methods that emerge within self-study research in the process of making meaning of practice.

Self-studies in arts-based methods reflect a need to further express understanding that represent the social, cultural, and meaning-making contexts from which experience and engagement are derived. This section attempts to present ways in which arts-based methods can be used in self-study. Yet, trying to pigeon-hole self-study arts-based methods into certain categories was challenging, if not impossible. For example, is a photo a visual artifact or an object? Is the brainstorming of ideas shaped into a text-based diagram, map, or cluster a visual, an object, or a text-based source of data? In seeking ways to present methods that can be accessed with relative ease, we decided to capture arts-based methods in ways in which they can be seen as a specific tool or method on its own (such as photo, drawing, or poetry) and as a tool or method within a larger context for labeling (such as visual representation or object as artifact). To that end, in this section are examples of self-studies using data

representation and data analysis processes through visuals (with subgroups of types of visuals used), through poetry, through the use of metaphor, through dance, through music, and through theatrical performances. We close this section with a discussion of an example of the use of the polyvocal professional learning process in self-study that brings together several innovative arts-based methods for research.

Self-Study Through Visual Representation of Meaning

Weber (2008) argues the conceptual value of an image "as part of both external and internal 'realities' reflecting the relationship of image to the dialectics of human perception and sense-making, helping frame the concept more as a dynamic product of our interaction with the world" (p. 50). In self-study, researchers have used visuals as data, as the analysis process, and as representation of meaning through findings. Some examples of visual representation in self-study include the use of photos (e.g., Griffiths et al. 2006; Parker et al. 2016), the use of drawings (e.g., Griffiths et al. 2009; Raphael et al. 2016; Tidwell and Manke 2009), the use of collage (e.g., Jordan-Daus 2016; Magubane 2014), and the use of objects (Dhlula-Moruri et al. 2017).

Photos in Self-Study

In this section, examples of self-studies using photos as visual representations are presented. Mitchell et al. (2009) argue that the use of photo images created by individuals makes "visible their voice around a particular social issue that affects them directly" (p. 122). They contend that the "use of visual approaches in self-study can literally help us to see things differently" by bringing to the fore, both personally and publicly, understandings about practice through methods that allow for "multiple theoretical and practical perspectives on issues of social import" (p. 119). In attempting to categorize photos as artifacts, there is a blurry line between distinguishing photo as visual and photo as object [see the use of photo as object by Kortjass, in Dhlula-Moruri et al. 2017]. It can be argued that a photo is a visual artifact as well as an object. For the purposes of this section, two studies are provided as examples of photo as visual artifact data (Griffiths et al. 2006; Parker et al. 2016).

Griffiths et al. (2006) were novices in their use of photos in this 2006 self-study of power relations in everyday work at their university in England, where they used "visual methods in iterative phases" (p. 226). Griffiths and her colleagues, working in different roles at their university, contended that using photos as an interactive exhibition of their practice confronts the limits of written text and printed visuals in explaining and defining practice. Their self-study examined issues of social justice with a focus "on the importance of action, collaboration and on voice" (p. 229), with an embedded research question focused both on social justice and method: What is revealed in my practice through the use of photo images? Through a three-phase self-study across 8 months, they collected photos of their everyday work and then recorded and transcribed their discussion as they analyzed the photos for context and meaning. At each phase, they developed a visual poster to represent the findings and to present their results. Due to Windle's move to another university at the end of

phase two, Simms stepped in at the beginning of phase three and continued the research with Griffiths. The iterative process of their study enabled them to collaborate and to make adjustments to their method as they progressed through the study. The first analysis in phase one revealed information about the differences they found in their work in terms of variety of work, visual appearance of dress (casual vs. formal), and location of photos (home vs. work). Their initial poster developed at the end of phase one involved a table listing content/actions derived from the photos. Phase two was informed by their first phase, and followed a similar process of photographing work, followed by analysis of photos through discussion. In this second phase, they invited colleagues to collaborate in analyzing photos and making the poster. Three research students joined their work in this phase. The poster was then revised to reflect "the different experiences of work in the two roles" (Griffiths et al. 2006, p. 233). Phase three began with Windle leaving and Simms joining the research team. She took pictures of her own work which were later used in the phase three discussions of data. Photos of Griffiths and Windle during phases one and two and photos from Simms during phase three were used as impetus for continued discussion, which was recorded and later transcribed.

By examining their discussions, Griffiths et al. (2006) recognized the power of visual representation as data, providing rich information about the context of and engagement in their day-to-day work. They discovered a clear difference in how they addressed photos across the three contexts of data collection, analysis, and presentation. During data collection, it was important to be both aware of the data gathering process (be consistent in gathering, be vigilant in taking photos) and to be in the moment (being authentic about the working context rather than making a priori plans for photo shoots). The value of collaboration in photo analysis was critical in making meaning through different points of view, which helped explicate the context and meaning of the photographed moments. Presentation with visuals required a connection across the intent of the data gathering, coupled with the discussion and meaning-making reflected in the visual display of photos within diagram/written text/discourse. They found the use of photo as data beneficial in examining practice, where the process of developing posters to present/represent the data at each phase of the process "produced a critical, reflective dialogue" embedded within an "electric" discussion fused with suggestions, musings, ideas, and questions (p. 234).

Parker et al. (2016) provide an example of the use of photo diary as a reflective process within their self-study research. Their focus was to examine the professional learning of five physical education teacher educators in Ireland who were working within a professional learning community. Two research questions drove their study: (1) What are physical education teacher educator experiences of professional learning within a community focused on communication? and How do physical education teacher educators perceive the influence of this professional learning on their pedagogical approaches with pre-service teachers? They focused on communication in their professional learning as it had been identified as a core competency in teacher education literature, and they were interested in studying how professional learning in communication might impact their pedagogical practice with preservice teachers. Their professional development study involved an initial 3-day outdoor education

camp, followed by a semester of teaching where each chose an aspect of communication as their focus for their self-study of professional practice They used several sources of data: focus group interviews, critical incident reflections, online discussions, classroom observations, and photo reflective diaries. The use of their photo diaries extended across the 6-month study, which began with photos taken during the initial 3-day outdoor education professional learning camp, and continued over 3 months of teaching in their respective preservice teacher education program.

Data collection for the diary during the 3-day outdoor education camp involved selecting "5–6 photos that represented important experiences of the day related to communication" followed by a written reflection of the photo in their photo diary (with the support of specific prompts). They continued photo collection and written reflection of the photos during their teaching. Analysis of their photo diaries involved an inductive approach (Patton 2005), where two of the five researchers coded the data individually and then through discussion reached consensus on coding and evolving themes that emerged. The data were then member checked for confirmation of theme development and meaning-making of the data results. They found their experiences with the professional learning shaped their pedagogy in the classroom. The photo diary in concert with their reflections on critical incidents during teaching helped to document their thinking about practice and their attention to the improvement of communication. The "shared technical language of communication" they developed through the professional learning experience extended into their teaching where they saw communication concepts emerging "through reflections on [their] experiences using photographs and written text" (p. 192). They saw their use of "photovoice reflection" (p. 193) during their professional learning camp and in their teaching "provided a frame that facilitated [their] moving beyond the specific identified problem of practice to 'taking stock' of what was important in [their] teaching" (p. 193).

Drawings as Data in Self-Study

Drawings to create and analyze data have been used in self-study in many different forms, such as visual metaphor, nodal moments, visual design, and diagrams. Three examples in this section highlight the use of drawing in self-study (Griffiths et al. 2009; Raphael et al. 2016; Tidwell and Manke 2009). Tidwell and Manke (2009) used drawings from nodal moments in their work to examine practice as administrators. Both held administrative positions at their respective universities in the Midwest United States. Tidwell was a part-time administrator, serving as coordinator for a literacy education program in her department, and Manke was a full-time administrator, serving as an associate dean in the college of education at her university. They began their self-study with the idea of using nodal moments by highlighting a key moment in their work that meant something, with the directions to "draw a concrete representation of that moment" (p. 136). Their data creation was driven by their research question: How do specific nodal moments in our administrative practice influence our work and our administrative lives? Tidwell had used nodal moments in the previous self-study work and with her students in her teaching and was comfortable with the idea of doodling and drawing and the insights that

emerge from analysis of nodal moments. Manke was less comfortable with drawing and had not experienced working with nodal moments in her self-study research. She was curious, and somewhat cautious, how nodal moments might inform her practice. Because they lived in different states, over 5 h apart, they agreed to meet through video conferencing online, emails, and phone calls to discuss their work. But after their first meeting face-to-face to set parameters for their study, they saw the value of meeting in person for discussion/dialogue and agreed to meet face-to-face every 2 months during their yearlong study. As they progressed through the study, they found they preferred email discussions over virtual meetings or phone calls. Their analysis process evolved into face-to-face meeting every 6–8 weeks, with continuous email discussions over the yearlong study. They kept personal journals of their thinking about the process and wrote synopses of their drawings to explain the context and meanings within their drawn moments. Following their schedule of data collection, they shared their drawings by scanning and sending electronically with the accompanying synopsis. They would then review the data followed by an email discussion of that data.

From the beginning, Tidwell and Manke (2009) recognized that their drawings reflected more than a concrete representation of a moment in time. After their first two drawings were sent and discussed via email, their realized drawings of a moment in time represented more of a meaning in time, where their practice was reflected through a larger metaphorical expression of engagement. As they continued their drawings over time, they saw the metaphorical expression consistently emerging in their nodal moments. While the initial drawings and synopses provided some sense of meaning-making for their practice, it was their dialogic exchanges where they met face-to-face that enabled them to make "connections between ourselves and what is known" (p. 140), creating a deeper understanding of their drawn representation of practice. As they deconstructed the elements within a drawing and the dynamic represented, they would use email exchanges to discuss what they saw and understood from each other's work. The results of their analysis revealed some shared issues in their work, of being overstressed with too much being asked of them, discovering that neither of them functioned well in traditional meeting settings, and discovering their similar desire to help make a difference for others was a critical part of their enjoyment in their work. But the power of using metaphoric drawings to examine their practice was in their deeper understanding of issues and their beliefs that affected their professional work. Tidwell realized her hesitancy to be an administrator was grounded in her belief that such work involved too much being asked of her and took away from her real professional work as a professor. Being able to move forward to appreciate the function and support her administrative work provided to others, and recognizing a need to delegate, helped change her approach and perspective as an administrator. Manke realized the oppression she felt from some of her engagements with aggressive faculty and her sense that her job was too big to be able to be successful in her work. She was surprised by how her use of drawing helped her recognize what was happening in her practice and how she might change, such as making a "conscious effort to feel and act more courageously" (p. 148) with aggressive faculty and focusing on what she enjoys doing rather than being

overwhelmed by an overcrowded schedule. Tidwell and Manke found that drawings as data provided a context for thinking about practice and, through a recursive process of reflection, uncovered multiple layers within practice that helped inform change.

Drawings to Represent Summative Understandings

Griffiths et al. (2009) used drawing to summarize their findings in their self-study examining "everyday social justice in the workplace" in their school of education in Scotland. In their data, they examined diagrams created to represent their research process, word clouds reflecting the dynamics of their engagement, and photos reflecting the place and space of work. Through a dialogic process, they examined the meaning they derived from the data and their understanding of the power of collaboration as researchers. In their summary of findings as a drawing, they depict collaboration as an iceberg constructed of the five researchers floating in the water, facing each other in a circle with their arms supporting each other. Their heads are floating above water, but the bodies (of their research collaboration) are hidden below water. This metaphor of meaning reflected their understanding of the complexity of collaboration, where, as an iceberg, it appears smooth on the surface, but below are the depths that are jagged and unknown.

Raphael et al. (2016) reported on their work from within an interdisciplinary research collaborative at their university in Australia. They continued the work of Griffiths et al. (2009) through examining collaboration in self-study by using drawings as one of their sources of data to reflect issues in practice and as a form of presentation of meaning through a gallery walk. Their study was driven by their research question: (How) can we continue to develop our teaching practice to ensure we are high-quality, contemporary teacher educators and practice-informed researchers? They provided question prompts in their research group that were used to create a drawing or image. They shared their images with each and their interpretations of their own artwork both in writing and conversations. Their initial discussions took place during their monthly meetings as a group, where they kept record of what was discussed. In addition, they made public their efforts by posting scans or photos of their artwork with reflections on a web-based discussion page where they would respond to each other's work with comments and questions. They used a phenomenological approach to analyze the drawings and descriptions in an effort to learn the "deeper symbolic meanings within the artwork" (p. 111). In this process, "they individually and collectively interrogated ideas and issues of concern in [their] teacher education practice" (p. 112). They found that each arts-based activity in which they engaged informed the next arts-based piece. After a year of monthly artwork and meetings, they each created "a summary drawing with reflective comments" demonstrating "how they understood their teaching practice." Following the process they used over the year, they uploaded the drawings for others in their group to respond. Across the summaries, they analyzed for themes that emerged: "experiencing a knot practice," "mapping," and "nautical" (in terms of "navigating through their practice") (pp. 115–116). In their next summer retreat, they used the nautical theme to create "individual collaborative drawings of boats" (p.

117) which they used to interrogate their research work and their teaching practice. They published their findings in a gallery format, where specific examples of artwork were displayed and discussed.

Collage in Self-Study

The use of collage in qualitative research "can mediate understanding in new and interesting ways for both the creator and the viewer because of its partial, embodied, multivocal, and nonlinear representational potential" (Butler-Kisber 2008, p. 265). Jordan-Daus (2016) used collage in her self-study of her new leadership role at a university in England that grew out of a reconstruction of the university infrastructure. Magubane (2014) engaged in self-study as a practicing teacher, where he used collage as data from his grade 9 students to inform his practice and used collage creating as part of his analysis process.

Jordan-Daus (2016) described herself as relatively new to self-study research when she participated in the 2014 Castle Conference. It was from her Castle experiences that she became intrigued with the idea of pursuing self-study of her own practice in a new position as executive head of partnerships and student experience at her university in England. The reorganization of her institution had left her without a clearly defined role (which she had enjoyed in her previous leadership work as department head). She was interested in three major aims which can be seen as embedded questions for her study: (1) to better understand who she was in her newly constructed leadership role, (2) to enhance her effectiveness as a leader, and (3) to add to her knowledge about leadership in teacher education. Using coaching as her methodological tool for her study, she gathered many different sources of data, including documents from her coaching conversations, feedback from others of her work in terms of scorings and free written comments, visual artifacts, blogs, and notes from partnership team meetings and her research triad meetings. She met regularly with two other colleagues, forming the research triad who had been engaged in research work for over 3 years.

For the purposes of this section of the chapter, the focus is on Jordan-Daus's (2016) use of collage as visual artifacts. She used PicCollage™ which is an iPad program that allows for the use of photos, text, and visuals to create collage images. She created her collages across the 9 months of her study, with many of them reflecting specific "moments of critical incidents" (p. 199) in her practice. She positioned her analysis of her data in the context of a five-step model of change originated "as a framework to understand and make sense of bereavement" and found it to be a "powerful theoretical framework to position [her] self-study of leadership in a context of uncertainty, fragility and ambiguity" (p. 200). Analysis included using a constant comparative approach (Corbin and Strauss 2008) across her data, while using the metaphor of "journey and rollercoaster ride" (p. 200) to inform her thinking during analysis. Three themes emerged as identity, team, and authenticity, which were shared with her work-related partnership team and with her research triad who engaged in framing and reframing her understanding of the data

from different perspectives. She found pic collage useful in capturing "some of the uncertainty" in her new role, with "the process of putting together such images" aiding her in "sense making" (p. 200) of the challenges in her work. She found the process of creating and analyzing collage helped her to open her leadership to others, which gave her a safe space to speak out about her practice. This enabled her to "become more authentic as a leader and confident" (p. 204) in understanding and constructing her leadership role.

Collage as an Inclusive Learning Activity

Magubane (2014) engaged in self-study research, *Cultivating Intrinsic Motivation for Learning Technology: A Teacher's Self-Study*, for a Master's of Art in Education degree at the University of KwaZulu-Natal in South Africa. In this multifaceted self-study, Magubane used the symbol of a shield to reflect his heritage and as a lens for his research. "As a Zulu man, the traditional Zulu shield has a particular historical and socio-cultural significance" (p. 8) that Magubane used "as a metaphor to help [him] make sense of the dialectical relationship between SDT [self-determination theory] and Ubuntu [a philosophy and way of life that embodies attributes of being 'generous, hospitable, friendly, caring and compassionate' (p. 6)]" (p. 10). He chose collage as part of his data collection and data analysis process to answer one of the research questions in his study: What can I learn about cultivating intrinsic motivation for learning from my learners' most motivational or demotivational experiences?

Magubane (2014) "saw collage-making as a very inclusive learning activity because each learner in the class had something to do" (p. 132). He asked his grade 9 students to create collages by asking them "to freely and willingly represent on a piece of paper experiences that made them like school and those that made them hate school" (p. 45). He used their collages as data to help inform his practice by reflecting upon specific motivators and demotivators depicted to make sense of his students' reality:

> I consider the following motivators that were highlighted in the learners' collages: feeding; learning computers; sports; and caring teachers. I also engage with the following demotivators: no smile from teachers; corporal punishment; weapons, drugs and teenage pregnancy among learners. I reflect on what the learners' views on school motivators and demotivators mean for me as a teacher in my quest to cultivate intrinsic motivation for learning. (p. 21)

Magubane (2014) used students' oral presentations (recorded) of the collages rather than written descriptions to provide narrative for the collage representation. These were interactive and engaging presentations where class queries and discussions added to the meaning-making of each collage. In his analysis of the students' collages, he used the lenses of motivators and demotivators and, through an inductive approach, noted commonalities across the data. He clipped visuals from the students' collages representing common issues and areas and created his own collage using Shape Collage™, which he then used to discuss his findings with others and

confirm his understanding of the emerging sub-themes within motivators and demotivators. The collage data and analysis experience helped him to realize an overarching understanding related to intrinsic motivation and teaching, which may contradict some of what he sees as traditional teacher-student relationship norms: "providing care and support for learners [as a teacher] is central to intrinsic motivation, especially when learners experience many demotivating factors in their daily lives" (p. vii).

Self-Study Through the Use of Objects as Artifacts

In their work in educational research, Pillay et al. (2017) describe research with object as a partnership between the visual and the written/narrative. As Mitchell (2017) explains, "the analysis of material objects offers the possibility of theorising abstract concepts in a grounded manner and, in so doing, expands the possibilities of what counts as evidence in research" (p. 14). The following self-study example (Dhlula-Moruri et al. 2017) highlights visual-written symbiotic relationship within object research. Dhlula-Moruri et al. used object inquiry around three specific objects (a stove, a flask, and a photograph) to examine their practice as South African teacher educators. They provided a South African context to their teaching and learning as *Ubuntu* [also discussed in the previous South African self-study above using collage (Magubane 2014)]. In this self-study, they define Ubuntu as "the value of communal human characteristics such as caring, reciprocity, and respect for another person's dignity" (p. 83).

Dhlula-Moruri, Kortjass, and Ndaleni (Dhlula-Moruri et al. 2017) each chose an object which reflected an aspect of their educational research. Pithouse-Morgan served as a facilitator, critical friend, and collaborator. Their data sources included "object pieces written independently" by each of the three researchers, audio recordings of their discussions of their objects, and "reflection pieces written independently" by each (p. 82). Pithouse-Morgan then created three "dialogue pieces" (p. 83) from the information shared in the reflections, using WordSift™ to map out initial ideas. From these mappings of their reflective language, three central themes emerged as realizations: "learning through experiencing different conversations," "making educational research personal – making personal research educational," and "understanding the learner...is critical" (p. 83). Pithouse-Morgan then used these realizations to create edited clusters of dialogue from the reflection pieces. These cluster maps were then used in conversations with each other about the meaning and significance of the objects in their research lives, all serving as critical friends in this dialogic endeavor. This notion of bringing in multiple voices and points of view reflected the polyvocal nature (Pithouse-Morgan and Samaras 2015) of their research.

Dhlula-Moruri (Dhlula-Moruri et al. 2017) used the object of stove to address her research question: What can I learn about collaborative learning from my personal history? Using her mother's Kelvinator stove as an educational artifact, she was able to make connections across her life experiences with and around the stove and the

importance of feeling special, of mentoring, of affirmations for personal growth and development, and of the value of collaborating and critiquing as a group.

Ndaleni (Dhlula-Moruri et al. 2017) used the igula (a traditional flask used by amaZulu people) as her research object in addressing her embedded research question: What do I know about teacher learning of isiZulu-speaking English language teachers in the KwaZulu-Natal province of South Africa? She related the making of an igula as representative of her research efforts, as it requires collaboration, diligence, and dedication. She connected her use of this particular igula (which she had used for over a decade) with the cooperation she experienced with participants in her research and saw the makers of the flask (her grandmother and her sister-in-law) as reminiscent of her critical friends in her self-study work. A closer examination of the shape and components of the flask provided insights, such as "the emotions of research participants must be well catered for" [handgrip], or, "the recursive nature of a self-study research process" [sipping from flask and relishing content] (p. 88). Personal experiences evoked by the flask brought her emotional responses, where she saw the close-knit cover of the igula as signifying how "people learn more by cooperating with others" (p. 89) both in personal and professional contexts.

Kortjass (Dhlula-Moruri et al. 2017) used a photograph as her object, showing a group of student teachers who were enrolled in the Bachelor of Education Foundation (BEd) Phase (Grades R-3) program. In the photo, five student teachers are standing in front of an old seminary building that is being used as their student support center. Some students are laughing, others are standing with arms raised above their heads, and all are looking away from the camera to the left in the photo. Kortjass used the contexts within this photo as she described her work with these students, answering her embedded question: How am I cultivating an integrated learning approach to early childhood mathematics? The context of the seminary building evoked a narrative about her students, their lives, and how she works with them through respect and acknowledgment of their challenges. The narrative process led to the emergence of the metaphor "weathering a storm," which, as Kortjass states, "represents and reinforces the significance of this photography for me" (p. 91). A critical outcome for all three researchers was the realization of the importance of "communicating about their selected objects with each other as critical friends" as intensifying and expanding their understanding of "the educative potential of object inquiry" (p. 92). Dhlula-Moruri saw object inquiry as helping her "appreciate the person" she is "still becoming" (p. 94). Once her Kelvinator stove "came to mind in a learning space, it spoke in a different voice" and she reflected upon how it "had influenced [her] life from a collaborative learning perspective" (p. 94). Ndaleni found "that understanding of some hard-to-grasp concepts can be facilitated when objects are used" (p. 94). Kortjass found the process of object inquiry helped her appreciate "interacting with students and connecting with them in a sociocultural way" by "asking students to bring into class objects from their communities that relate to the topics" being taught (p. 95). The objects in their inquiry enabled them to examine both their personal and professional experiences and inform them about practice within their professional lives.

Self-Study Through Poetry

While it can be argued that poetry is a text-based source, it is also an important creative source for examining practice. This section highlights two examples of poetry inquiry in self-study. The first example (Hamilton and Pinnegar 2013) addresses research using others' poetry to inform understanding about collaboration in practice. The second example (Pithouse-Morgan et al. 2015) involves creating poetry by the researchers to inform their understanding of co-flexity in practice.

Hamilton and Pinnegar (2013) used poetry in their self-study of their practice as professors in research institutions in the United States. They were interested in examining their thinking and understanding of collaboration as a "fundamental characteristic of self-study of practice research" (p. 75). They began their study by revisiting their own collaborative self-study of practice research through their own analytic framework focusing on strengths of their methodological descriptions and their depictions of collaboration. They moved beyond their own work to collaborative research in the literature as well. Analysis of their data of earlier work and of the collaboration research in the literature revealed themes that at times meshed and at other times did not. They saw a need to push the boundaries of their data analysis process by using both metaphor and poetry. At this point in their study, their research was driven by the embedded question: How does the use of metaphor and poetry inform our understanding of collaboration? Using the idea of collaboration as the ground for self-study, they employed the metaphors of *mapping* and *topography*. They analyzed their use of topography as a metaphor reflecting the "unsteady land of self-study of practice" by using four poems as markers of the "topography of collaboration in self-study of practice methodology" (p. 78): *Topography* by Ruth Stone (1971) to address the idea of the self in collaboration, *Topography* by Sharon Olds (1987) "to address the idea of the positioning by researchers in collaboration" (p. 78), *Truck Lights* by Rene Fumoleau (1995) to address the relationship of self-study methodology with collaboration, and *The Idea of Order at Key West* by Wallace Stevens (1990) to address the interdependent relationship of community and research presentation in self-study of practice. Their review of their own writings and of the research literature on collaboration informed their dialogue as they read and analyzed the poems. Through this process, topographic moments emerged that connected the meaning within the poetry to the topographical landscape meanings within collaboration.

Pithouse-Morgan et al. (2015) are postgraduate research supervisors from universities in South Africa who contribute to the Transformative Education(al) Studies (TES) project. "TES is a research-intervention project that aims to study and enhance the development of self-study research and supervision capacity within a transdisciplinary, multi-institutional research learning community" (p. 146). In their self-study, they engaged in poetic inquiry and reflexive dialogue. They argued that "collective poetic inquiry is our collective utterance and a knowledge artefact that is crucial for our knowledge building as coresearchers" (p. 149). Their poems were intended to demonstrate their thinking about co-flexity and what they were learning from working together in self-study. Their research was driven by three

questions: "How do we understand our co-flexive experiences and enactments?", "What difference does co-flexivity make to us as transdisciplinary self-study research supervisors?", and "What are we learning about the complexities, challenges, and value of co-flexivity?". They began their poetic inquiry process by engaging in four 1-day workshops and then continued for 10 months working together through email communications. Their first poem came about from their desire to make sense of co-flexivity. Through a collective process, they responded in tweets (limit of 140 characters) to the prompt: "Co-flexivity: What difference does this make?" (p. 150). The tweets were then typed into a word document projected onscreen, and then the words were entered into Wordle™ (a word cloud program that arranges words in different sizes and patterns). This process enabled them to see common patterns across their language and to see the text visual as a single collective piece. Using the collective Wordle™ document, they highlighted key words that were then used to frame a found poem. A few months later, at another workshop, they revisited this found poem with support prompts that helped them think about the poem's content: "What does the poem say? How does it say it? Is it worth saying?" (p. 153). The responses to the prompts were then used to highlight key words and phrases. The highlighted words from each prompt were then used to create a found poem representing that prompt.

At their next workshop, working together Pithouse-Morgan et al. (2015) developed a summative found poem representing their "collective meaning making of co-flexivity" (p. 157). Following their earlier process used for developing found poetry, they projected their previous found poems and emailed responses onscreen and then highlighted key words and phrases which were then used in their development of their summary found poem entitled *Moving, stepping, not up or down*. Their process of highlighting key language helped focus their attention on the meaning of their experience: the coming together, care, safe space, collaboration, scaffolding, research as a lived interactive process, the country's need for indigenous knowledge, Ubuntu, inclusiveness, multiple understandings, and multiple possibilities. They saw the use of found poetry powerful in creating a collective sense of knowledge over time and a sense of community in developing knowledge and understanding about their practice.

Self-Study Through Metaphor

Self-study and the use of qualitative approaches have created a space for many different creative and artistic approaches. Often the uses of metaphor and analogies are original and surprising and add to the understanding and interpretation of data and findings. Many such metaphors are used in self-study research, such as *braided river* as the interconnectedness of professional lives (Curtis et al. 2013); *teacher magic*, where participants explained good teaching as magic (Sowder et al. 2013); *an iceberg* as teachers' practice being the ice visible above water (Kosminsky et al. 2008); or *the airplane* as the whole expertise of a teacher that must be able to build, repair, and fly the plane with her students on board (Magee 2008). In the following

section, two self-studies addressing metaphor are discussed: mind the gap (Perrow 2013) and rhizomatics and rhizoanalysis (Strom and Martin 2013).

Perrow (2013) uses the metaphor *mind the gap* to identify and examine the problem of the difference between best practice and the everyday practice experienced by student teachers. She further expands her use of the metaphor to present and analyze the findings as three phases in her reflective journey in (1) *mind the gap*, where she explains the dilemma she encountered as a student teacher; (2) *mine the gap*, where she describes the process of exploring the nature and extent of this dilemma; and (3) *the gap is mine*, where she analyzes the shift in her understanding of the gap and how it impacts her practice. Perrow illustrates these phases in a series of short vignettes and draws from them conclusions about her own work and broader implications in teacher education indicating the importance of acknowledging the uncomfortable gap and working with it.

One of the many interesting uses of metaphors in self-study is Strom and Martin's (2013) use of the metaphor of *rhizome* to identify problems in practice, to analyze, to understand, and then to present their findings. The rhizome is a plant tubular representing in the research context the interconnectedness of subjects, experiences, life-forms, matter, time, and space. They conducted a co/autoethnographic self-study of their practice applying methods informed by the notion of the rhizome, making use of its multiplistic, nonlinear nature in order to challenge the hierarchical, dichotomous, and process-product rationality of neoliberal logic in education. They wanted to understand their own work in relation to teacher agency and social justice and to gain a greater sense of how neoliberalism is operationalized in their practice. Combining co/autoethnography, rhizomatics, and rhizoanalysis, they displayed connections across teaching practice and understandings of the political nature of teaching, uncovering possibilities for transforming teaching. Strom and Martin used the rhizome concept to help them deterritorialize the neoliberal thinking dominant in schooling and education. Rhizomatics, they claim, emphasizes connections rather than separations, heterogeneity rather than conformity, and fluidity and constant flux rather than a static reality. Rhizomatics helped them to analyze their praxis and connect to larger social influences of classroom events. Thus, the authors shift away from traditional data analysis, highlighting emergent connections as fluctuating, shifting or becoming, assembling, and highlighting multiplicities.

Initially, Strom and Martin (2013) read and reread data, and, rather than applying more known qualitative approaches of axial and open coding, they approached the emerging findings from a nomadic stance using the technique of data walking. As they highlighted sections of interest, they began to connect their entries between personal, professional, and political dimensions. They used the metaphor of the nomad to help them look past traditional stratification of data as they "walked in each other's shoes" (p. 224) reflecting and responding to each other's reflections and considering from multiple angles possibilities of agency and emancipation. To report their findings, they employed cartography as they constructed a visual (pictorial) map of the linkages they identified. The map they drew shows key points and constructs as well as their intricate and complex connections. Its nondirectional appearance reflects the notion of becoming, displaying connections between past

experiences, present practice, future possibilities, and dimensions of their identities. Thus, using the rhizomatic approach, Strom and Martin facilitate acknowledging and thinking about the social complexities related to the individual in the spirit of humanistic reflective thought paradigms.

Self-Study Through the Use of Dance

Early in self-study research through S-STEP at AERA, and more specifically through the biennial international meeting of the self-study research community at the Herstmonceux Castle in England, the use of performing arts included an array of presentation styles to represent self-study. One early example was a dancing performance of experience presented by Cole and McIntyre (1998) at the second International Conference on the Self-Study of Teacher Education Practices. In their presentation of their self-study, they represented their research through dance. In this process, their data were the experiences in teaching, and their analysis was the development of the dance representing both experience and the understanding that grew from that experience. Their publication became the performance of the dance at the second biennial Castle Conference. More recently, researchers have used dance in their self-study of teacher education practice (e.g., Hodson 2016; see Samaras' dance response in Pithouse-Morgan et al. 2016). Hodson (2016) spoke to the role of dance in his self-study of his role as an Aboriginal educator in teacher education contexts.

Hodson (2016) used dance as the foundation for his understanding of who he is as a person and as a professional. He began his self-study by stating that it is a "journey as an indigenous educator and scholar," where he begins his narrative self-study sharing "an account of an incident at the Wiki Pow Wow in 1995" (p. 27). It is at this Pow Wow at the Wikwemikong Unceded Indian Reserve in Ontario that he "began to discard the dominant culture's idea of Indigenous identity" and embraced the understanding that "we are not who *they* say we are, we are who *we* say we are" (p. 27). This profound revelation grounded his understanding of himself and his role as an educator and set the context for his professional work. In his first 10 years in academia in Canada, he describes the complexity of his work, managing Aboriginal research projects, designing and coordinating Aboriginal teacher education programs, and engaging in scholarly publications. During this time, he was active also in Pow Wow dance in Canadian First Nation communities. Because of these experiences, when he participated in a postdoctoral fellowship in 2010 at the University of Waikato in New Zealand, he embraced the opportunity to study the dance and language of the Maori Haka traditions.

This research on his practice as an indigenous educator was his first attempt at self-study. Hodson (2016) has been a dancer for over 20 years, has participated in numerous Pow Wows, and saw the accumulation of his experiences "observed through his eyes, ears, and heart" as constituting "both a narrative self-study and professional development" (p. 29). He recognized the Aboriginal Pow Wow and the Maori Haka as "a powerful process of decolonization for Aboriginal men" as well as

for teachers working with Aboriginal children. In this self-study, he examined the Pow Wow and the Haka in terms of similarities and differences. He identified the powerful similarities of dance, drumming, and music in bringing the knowledge of culture to the soul of the dancer and the observer. He used his experiences in Pow Wow to explain the influences of the "spirit worlds, the family, and tribal tradition" (p. 30) in dance and dress, but also the individualistic nature of the dance and the regalia reflecting the individual. Through his narrative of the history of his Mohawk ancestors and the inequitable treatment of Aboriginal families and children, he provided a rich context for his analysis of the role of Pow Wow on the identify development of himself and the Aboriginal community. He saw a direct connection between his experiences with the Pow Wow dance discipline and his own cultural knowledge base. Hodson saw the evolution of his regalia over time, becoming a "physical manifestation of our expanding knowledge of self, of our traditions, our wellness" (p. 32). Coming from a childhood where *Indian* was a liability in life, the family would hide things considered Indian and children would deny their heritage. Thus, the evolution of his understanding of the Pow Wow becomes even more profound. "In essence, the act of becoming a Dancer and following the Pow Wow trail is an act of self-determination from within an Aboriginal epistemic heritage not from within an epistemic overwrite" (p. 34). Hodson brings what he has learned through dance to his work as a teacher educator. He sees real human change as a process of small increments, where the becoming of an educator involves the same process of learning as becoming a Pow Wow or Haka dancer. The self must come to know who she/he is by "shedding the unconscious self for a consciousness of many possibilities. . .through the dialogic in action" (pp. 36–37). He sees this as a process of critical reflection and argues that all Aboriginal peoples are at the beginning of this long process. He sees "Pow Wow and Haka and the critical reflective process of biographical deconstruction" (p. 37) as providing that place to come to know.

Self-Study Through Musical Representation

As with dance, musical representation appeared early in self-study research, mostly through performances at the biennial Castle Conference (Allender and Manke 2002; Pritchard and Mountain 2006). Allender and Manke (2002) used music to represent the results of their self-study examining artifacts of practice. This piece grew out of their work on examining practice and theoretical understandings through visual and written artifacts, addressing the research question: How do I understand the theoretical grounding of my practice? They used photos, poetry, and jazz as venues to think about their practice and to create their presentation. Allender presented a trumpet solo as representative of their collaboration on practice. In their presentation, they brought six shards (scrolls, books, student writing) representing educational artifacts 500 years in the future, arguing their use of fantasy was relevant in helping to bridge theoretical and practical knowledge. In a recent personal communique with Allender, he shared his reasoning for music as a venue to meaning-making, especially in creating a learning context at the Castle conference. By having participants

listen to his trumpet music, and by providing the fantasy of shards from a future archeological dig, he hoped they "would make a connection that bypasses the normal intellectual channels – you need to translate what you are learning into your own practice." If individuals question "if this is really research – it is, because it is enough to create a reaction and to represent the meaning of the incident or the phenomenon being addressed" (Allender, Personal Communication, 2018).

In a less esoteric study, Pritchard and Mountain (2006) used their experience with hip hop and folk music to engage in self-study of their teaching practice through the creation of verse and through performance. In their 2006 publication, which built off of their 2004 Castle presentation, Pritchard described himself as a White 55-year-old experienced teacher with background as a carpenter and a teacher in special education, and Mountain described himself as a 30-year-old African American classroom teacher with a focus in early childhood education and experience in history and finance. They saw this distinction in their age and their race as critical to researching their professional lives and personal experiences which shaped who they are as teachers. Both men also described themselves as musicians. They had met in a course taught by Pritchard where Mountain was enrolled as an alternative licensure teacher. They connected over interests in education and in music. They began their self-study as a form of identify inquiry to use their art and stories to explore their experiences that informed what they liked and disliked about teaching. They realized their self-study needed to be true to their own teaching lives and in the process to reflect who they are as artists and teachers. They decided their work would be a "dramatic spoken word event with live music and autobiographical vignettes" (p. 2).

Using a story approach to thinking about and documenting their professional lives, Pritchard and Mountain (2006) met regularly for several months "to edit, refine, rehearse, and learn how to tell our stories to each other" (p. 3). Themes that emerged across their collaborative stories were oppression (high stakes testing), bureaucracy, power brokers in education, inequities, tensions of teaching, and hope for their students. Their final piece was a performance rather than an academic paper that resembled readers' theatre with short story vignettes, poetry, and songs. They realized in building their stories through song that the power of language and the rhythm of that language through music helped connect meaning and emotion to larger concepts and issues they addressed. Through their self-study experience, they saw themselves as becoming "ethnographers of their own lives and the subcultures they represented" (p. 17). The experience impacted their teaching and their thinking about teaching. They discovered that "learning to tell our stories in the truest ways has helped us to trust ourselves and not to be intimidated or embarrassed to approach teaching in ways that are counter to the prevailing pedagogical fundamentalism" (p. 17).

Self-Study Through Theatrical Interpretations

"Performative inquiry... is an embodied practice" (Pelias 2008, p. 186), where performance is a way of knowing, where voice and physicality empower that

knowledge, and where the body transforms into the site of knowledge. In this section are two examples of the use of theatrical tools in self-study (Meskin et al. 2017; Weber and Mitchell 2002). Weber and Mitchell (2002) provided a performance at the fourth Castle Conference representing earlier self-study work of Mitchell, entitled *Elsie never wore a prom dress.* What started out as an opportunity to perform the story that emerged from Mitchell's original self-study soon grew into a deeper understanding of the value of performance "to self-study and professional identity" (p. 121). Their embedded research question became: How is my understanding of practice affected by the process of creating a theatrical performance? During the performance of what became Act I of their larger play, Mitchell handed Weber a pair of shoes. This on-stage moment sparked a memory of the significant importance shoes have played in Weber's life, especially in connection to her late father (a shoe salesman). Out of that moment grew the development of a larger piece, entitled *Accessing death: A monologue for two voices.* As Weber explored her memories of her father, she discovered "links, experiences, and themes that underlie her pedagogical practice and beliefs as a teacher educator" (p. 121). They describe their process as an autobiographical inquiry through the use of artistic form, specifically the writing of a play. They contend that through the drafting and redrafting of the play, they engaged in critical, reflective memory work, and in the process moved "back and forth from private spaces to public ones. . .an important component of our methodology" (pp. 121–122). They connected to the research on issues of dress and body both in and out of the classroom, highlighting how clothes can forge professional identities connected to "multiple meanings and social construction of the dressed body" (p. 122). They argue that using theatrical play in self-study provides a place to study one's own embodiment, to suggest theoretical views, is reflexive in nature, and provides "a distancing third eye for self-study, one that reveals aspects of self otherwise hidden" (p. 123).

Meskin et al. (2017) used their writing of a theatrical performance (a play in three acts) to represent the results of their self-study using objects. Defining themselves as artists, researchers, and teachers on an "educational research journey," they chose objects as their "compasses" (p. 175). They contend that "objects operate as talismans, stepping stones that guide us from concrete materiality into self-reflexive abstraction" (p. 176). They used both reflexivity (Kirk 2005) and a/r/tography (Leavy 2009) as critical contexts for their self-study. Kirk's concept of self-reflexivity in educational research was seen by Meskin et al. as the close examination of their lived experiences as educators whose expertise span across diverse arts-based and educational content areas in universities in South Africa. The notion of a/r/tography, where the three roles of artist, researcher, and teacher are integrated, was reflected in what they term their "a/r/tographical writing" which was used as a source to reveal their "artistic, educational and research practices" (p. 176).

Using their objects of choice as a starting point, Meskin et al. (2017) interrogated "their own creative selves and practices, constantly and critically" (p. 177). They initially presented their object inquiry work at a research conference symposium on making meaning of everyday objects. This symposium inspired them to dig deeper in their object inquiry to understand the "significance [that] lies in the empowering

self-awareness harvested from creating, sharing, and relating the story of the object" (p. 177). They "explored poetry writing techniques" to further unpack the meaning within their objects related to their individual practice. Post-conference, they wrote "self-reflexive a/r/tographical arguments about the role of the objects in their educational research journeys" (p. 177). Part of their reflexive process was to read one of their colleagues' original object pieces as well as the additional self-reflexive writing and create an edited version using dramaturgical structure (developing a story into a play form). Pithouse-Morgan served as facilitator in the editing process and, working with two peer reviewers, provided feedback on the edited versions that were then revised again "to form three cohesive acts" (p. 178). Their final three-act play included a tanka poem created by Pithouse-Morgan from the original object pieces (writings) and used as an introduction for each act, along with stage notes and descriptions of actors' actions, the revised texts on their object inquiry, photo visuals of the objects being addressed, and the researchers' explanations of the object inquiry in terms of their individual understandings of the historical/sociocultural dynamics of those objects represented and their impact on their professional work. This process resulted in the development of a fourth act that moved their discussions forward to reveal each researcher's own insights in the use of object inquiry to better understand their "artistic, research and teaching processes" (p. 188). Documenting their findings through the development of a play has created an "improvisational journey..[which] has enabled a vivid dialogue and multi-vocal conversation that engenders an opening up of knowledge, a release from convention. . .that engages with the multi-layered human experience" (p. 194).

Polyvocal Research in Self-Study

The idea of polyvocal research ["multiple views and voices of critical friends" (Hiralaal et al. 2018, p. 297) informing self-study through "dialogic encounters with diverse ways of seeing and knowing" (Pithouse-Morgan et al. 2016, p. 445)] grew out of work from Pithouse-Morgan and her colleagues (Pithouse-Morgan and Samaras 2015). In the use of polyvocal research, participants in self-study use multiple perspectives and multiple voices in making sense of data and processes in research. Across several of the self-study examples provided in this chapter have been the echoes of a polyvocal approach to research. In the following example (Pithouse-Morgan et al. 2016), four experienced self-study researchers engaged in a "collective self-study research process" using "artful research practices" (p. 445). Adapting a poststructural feminist stance, they interrogated their own practices "to consider deeper implications of creative engagement in and through self-study research" (p. 446). Two research questions drove their self-study, their original question, "What has methodological inventiveness in self-study looked like for use individually and collectively?", and a second question that emerged during their self-study: "What is the process of virtual polyvocal research jamming in self-study?"

Over a period of 4 months, Pithouse-Morgan et al. (2016) engaged in online dialogue through email, recorded Skype™ sessions, and Dropbox™ to explore

methodological inventiveness in their research. They chose to begin with the use of rich pictures to capture their practice via "visual brainstorming through drawing detailed pictures" to foster "new ways of looking at an issue from multiple perspectives" (p. 446). They agreed the focus of their initial rich picture would reflect their own experiences in creative engagement in their self-study work. From these drawings, they each cut and pasted pieces from all four initial rich pictures to create a composite rich picture. In examining and discussing their work, they saw the composites as making visible their connections across their individual experiences, reminiscent of the idea of writing into each other's lives as seen in co−/autoethnography. As each worked on their composite rich picture, other methodological inventiveness emerged. Pithouse-Morgan reviewed the Skype™ recording of a conversation, which inspired her to create a found poem using language from both the recorded conversation and the rich pictures to represent their polyvocal dialogue. Taylor was inspired by her composite rich picture and Pithouse-Morgan's found poem to create her own rhythmic found poem that she shared with the group both in written form and as a performance (via Dropbox™). This allowed her colleagues to read and view her performance independently and in multiple viewings, if desired. Taylor engaged in the process of creating a composite rich picture, reading her colleague's found poem derived from language in their work, and creating her own found poem as a reflection of transmediation, where she was translating meaning from one context into another. These shared creations of arts-based data fostered a sense of trust across the researchers that enabled continued innovation in their methodology. Samaras was inspired by the composite rich pictures and found poetry to express her understanding through improvised dance, which she recorded and posted online. Her process was described as moving to "better understand the data" through "expressing her understanding of data by embodying it to build on, and contribute to, [the] collective data" (p. 451).

Collective analysis was conducted through Pithouse-Morgan and her colleagues (Pithouse-Morgan et al. 2016) using recorded Skype™ meetings and typed meeting notes. Through their viewing and reviewing of the data, they identified big ideas that emerged from the composite rich pictures and the alternative data creations, naming their process "virtual polyvocal research jamming" (p. 452). In this analysis of their data and the process they used for data creation, four major elements of virtual polyvocal research jamming emerged: (re)knowing in a trusted community, reciprocal vulnerability, shared improvisation, and methodological innovation as joyful wonder. They saw the use of rich pictures that evolved into composite rich pictures as reflecting the individuated nature of their practice data working in concert with the deep connections they made across practice through their composites. The ability for the researchers to make themselves vulnerable in their data representation came about from their experiences in a larger self-study community that fosters candid discussions, alternative data, and open discussion. In addition, as experienced researchers, there was a level of respect for each other's work that helped to foster openness and creativity. The use of arts-based research methods for expression of meaning nurtured their innovative approaches to thinking about their research practice. All of these dynamics created an environment that supported the emergence of "collective intuition, spontaneity, and improvisation" within their creation of virtual polyvocal

research jamming which, in turn, informed the methods chosen/created for their self-study research.

Conclusion

As this chapter reflects, self-study is a methodology that offers a variety of research designs and methods that often challenge the known and push researchers to think deeper about their own practice, their own context, and their understanding about the complex roles in and purposes of education. To make the wealth of versatile methods and approaches in self-study accessible and comprehensible, we categorized them into two broad areas: (1) narrative/text-based methods and (2) creative/arts-based methods. As the qualitative nature of self-study and its ingrained call for social justice and change often disrupts and deconstructs what is known, pushing further into the unknown, it opens the possibilities and need for more creative and innovative approaches to the study of practice.

In our research on self-study design, we did come across many original and fresh methods for examining practice that explicated not only the rich context and theoretically grounding that framed the study but also unfolded the process of data selection and data analysis that informed the making of meaning within the findings. And it is to this unfolding process of revealing the methods in self-study that we make our final entreaty.

The future of self-study bodes well with the versatile, rich, and compelling research designs and methods represented in this chapter. However, we want to emphasize the power and importance of telling the full story within self-study research. This means providing a complete discussion of the data collection, grounded in the posing of research questions that may move, evolve, and develop across the research process. But the data collection alone is not enough. There were several self-studies found in the literature for which data analysis was minimally addressed. This provides little clarity to the process used to elicit the meaning derived from the data and highlighted in the findings. For a self-study to have truly meaningful, useful results, it is critical that the full data process be made clear.

It is this sharing of the data process that makes transparent the trustworthy nature of the findings. It is critically important for self-study research to include the theoretically grounded research question(s), the data choices and collection process, and the data analyses used to make meaning of the data. It is this full reporting of the data process that enables us to make sense of what we know and that enables us to confirm the efficacy of our research practice.

Abstract

This chapter portrays the rich history of innovation in the self-study research
community by exploring why and how self-study researchers enact methodolog-
ical inventiveness in composing written accounts of their scholarly work and
analysis. Through narrative dialogue, the authors delve into questions of why
many self-study researchers perform methodological inventiveness in writing
about their research. In addition, the chapter offers four detailed exemplars
from South Africa and the USA that demonstrate how emerging self-study
scholars have created various inventive and hybrid approaches to best explore,
represent, and communicate their research questions using various forms and
formats. The chapter closes with a discussion of implications and future possi-
bilities for self-study researchers as they consider their roles and responsibilities
with respect to innovative modes and designs in writing about self-study research.

Transdisciplinarity

Starting with Ourselves

We are teacher educators who facilitate and teach transdisciplinary self-study research
in our respective home countries of South Africa and the USA, often in groups of up to
40 participants (Pithouse-Morgan et al. 2018; Samaras et al. 2014). Working individu-
ally and with other colleagues, we support and guide communities of university
educators and graduate students who are interested in learning about and enacting self-
study research as their shared task, irrespective of their practice. Resonances between
our experiences in South Africa and the USA brought us together with the aim of
learning from each other's experiences in facilitating and teaching self-study research.
Over several years, we have worked together and with others to conceptualize and
portray the transdisciplinary facilitation and growth of self-study methodology in
various contexts, with the aim of communicating its educative value and impact for
others (Pithouse-Morgan and Samaras 2018; Samaras et al. 2015). And in that process,
we too have learnt in the company of fellow teacher educators and faculty and students
from other disciplines. As facilitators and teachers of self-study methodology, we have

grown in our personal and professional understandings through our interactions with each other and with colleagues and students (Pithouse-Morgan and Samaras 2015a).

Working with others as "critical friends" has been identified as a central component of self-study methodology (LaBoskey 2004; Schuck and Russell 2005). Our research has moved us to a deeper level of our understanding of this requirement. We recognize critical friendship as more than collaboration or interaction; critical friendship is brought to life through critical collaborative inquiry with others (Samaras 2011). Cultivating "ongoing, intellectually safe, dialogic collaborative structures for reciprocal mentoring to recognize and value co-flexivity (collective reflexivity) and co-creativity (collective creativity)" (Samaras and Pithouse-Morgan 2018, p. 251) has been vital to critical friendships in our transdisciplinary self-study learning communities.

Our research partnership has blossomed into a network of reciprocal self-study research learning across continents and contexts, which has given rise to ongoing sharing and dialogue (Samaras et al. 2016). We have conceptualized our transdisciplinary, transnational, and transcultural interaction and reciprocal learning through self-study research as *polyvocal professional learning* (Pithouse-Morgan and Samaras 2015a; Samaras and Pithouse-Morgan 2018). Our conceptualization of polyvocality has illustrated how continuing dialogue with multiple ways of seeing, knowing, and doing can intensify and broaden professional learning in self-study research (Pithouse-Morgan and Samaras 2015b). In our conceptualization, openness to and valuing of mutual learning are defining features of taking a polyvocal stance in self-study research.

The transdisciplinarity of our self-study research learning groups has enabled us to be inspired by heterogeneous bodies of knowledge and "patterns of knowing" (Carper 1978, p. 13) and to generate and document a pluralism of knowing, doing, and communicating as self-study researchers and practitioners (Pithouse-Morgan and Samaras 2018; Samaras and Pithouse-Morgan 2018). We have also been inspired by the collective creativity that has animated the learning activities and products of each of our groups, supported by the participation of professional artists and designers, and others who are eager to learn through the arts and digital technologies (Pithouse-Morgan and Samaras 2018; Smith et al. 2018). Our international network of self-study colleagues and students has enacted the disposition of openness in using and generating innovative methods and tools. Similarly, we have embraced this openness and flexibility of how self-study research can be performed through the use of multiple methods and with many voices as we have worked with colleagues and students from different disciplines and contexts (Pithouse-Morgan and Samaras 2018).

As a dynamic element of our transcontinental scholarly collaboration, we have explored and developed innovative modes and designs in writing about self-study research. To illustrate, we have consistently created poetry as a literary arts-informed mode for enriching and expressing our mutual learning (Pithouse-Morgan and Samaras 2017; Samaras et al. 2015). Our poetic self-study research writing has been informed by the creative activity of scholars in diverse fields (e.g., Butler-Kisber 2005; Furman 2014; Short and Grant 2016) who have used poetry to offer evocative, affective, and critical insights into the learning experiences of professionals such as teachers, social workers, and nurses.

In this chapter, we draw on our diverse experiences and mutual learning to document the outgrowth and impact of "methodological inventiveness" (Dadds and Hart 2001, p. 169) in writing about self-study research. As a starting point for exploring and demonstrating *why and how* self-study researchers use and develop innovative approaches and methods in composing written accounts of their scholarly work and analysis, we begin by highlighting a rich history of innovation in the self-study research community. Then, we offer an account of how this methodological inventiveness has been taken up and extended in self-study groups in South Africa and the USA. We go on to present a narrative dialogue that delves into questions of why self-study researchers enact methodological inventiveness in their writing. The dialogue is followed by four detailed exemplars that demonstrate a variety of forms and formats in which emerging self-study researchers in South Africa and the USA are representing and communicating their work. The chapter closes with a discussion of implications and future possibilities for self-study researchers as they consider their roles and responsibilities with respect to methodological inventiveness in writing about self-study research.

A Rich History of Methodological Inventiveness

Self-study methodology emerged from groundbreaking work done in the early 1990s by a group of teacher educators who founded the Self-Study of Teacher Education Practices (S-STEP) special interest group of the American Educational Research Association (AERA). Since then, the field of self-study research and the self-study research community have continued to evolve and grow.

In taking a self-study research stance, teacher educators and other professionals look critically and creatively at themselves with the aim of reimagining their own practice to contribute to the well-being of others. The methodology is characterized by core features such as openness, reflection and reflexivity, critical collaborative inquiry, transparent data analysis and process, and improvement-aimed exemplars that contribute to professional learning, ways of knowing, and knowledge generation (Barnes 1998; LaBoskey 2004; Loughran 2004; Samaras 2011; Samaras and Freese 2009).

Self-study researchers employ diverse, often multiple, methods (LaBoskey 2004; Pinnegar and Hamilton 2009), and, as Loughran (2004) emphasized, "there is no one way, or correct way, of doing self-study. Rather, how a self-study might be 'done' depends on what is sought to be better understood" (p. 15). Self-study researchers have embraced this flexibility of how self-study research can be enacted, inventing new methods to explore their inquiries and re-envision their practice (Tidwell et al. 2009; Whitehead 2004). Their methodological inventiveness has been inspired by a wide range of knowledge fields including, among others, the arts (Galman 2009), popular culture (Weber and Mitchell 1995), digital literacies and digital media (Garbett and Ovens 2017), and transdisciplinary professional learning (Pithouse-Morgan and Samaras 2015a).

From the time of the self-study research community's formation as a special interest group, the dispositions of openness and collaboration have contributed to its growth,

sustainability, and impact (Barnes 1998). Professional support, scholarly partnerships, and critical friendship within the community have contributed significantly to nourishing and expanding methodological inventiveness (Heston et al. 2008; Pithouse-Morgan et al. 2015; Samaras et al. 2012). Self-study scholars have collaborated with others to adapt existing methods, for example, dialogic inquiry (East et al. 2009), narrative inquiry (Freese et al. 2000), and visual methods (Weber and Mitchell 2004). They have also conceived new methods, for instance, co-/autoethnography (Taylor and Coia 2009), embodied approaches (Forgasz and Clemans 2014), polyvocal research jamming (Pithouse-Morgan et al. 2016), and virtual bricolage (Pithouse-Morgan and Samaras 2017).

Significantly, the rich history of methodological inventiveness in self-study research has extended beyond methods of data generation and analysis into innovative modes and designs for writing about self-study research (LaBoskey 2004). Research reports are traditionally constructed using matter-of-fact, propositional written language (Eisner 1997; Richardson 1993). While this more conventional writing continues to serve particular purposes, practices and opportunities for communicating research are rapidly evolving as "scholars invent new ways through new means of representing what matters in human affairs" (Eisner 2008, p. 6). As Badley (2017) argued, "as manifold human creatures who write, we need to fulfil our duty to produce assemblages, bricolages, stories, and texts which reflect the complexities and needs of ourselves and the world we inhabit" (p. 6). Building on pioneering work of qualitative researchers who devised imaginative and evocative approaches in writing about research (for instance, Ellis 1991; Richardson 1993), self-study researchers have found that methodological inventiveness in written research accounts can help to "capture the complexity of the teaching-learning process and to expand and deepen the nature of our knowledge of it" (LaBoskey 2004, p. 854).

Transdisciplinary, Transcontinental Methodological Inventiveness

Over time, the global self-study research community has expanded to offer a wide-ranging inclusiveness of practitioners inside and outside of teacher education, working in and across diverse disciplines and contexts (Harrison et al. 2012; Samaras et al. 2014). The community as a whole is developing and profiting from dialogue between multiple fields of professional expertise and diverse disciplinary and sociocultural settings (Pithouse et al. 2009a; Pithouse-Morgan and Samaras 2015a; Samaras et al. 2015). Notably, this dialogue and diversity have contributed new possibilities for enacting the methodological inventiveness that has come to characterize the self-study research community.

To illustrate, since 2011, Kathleen and her colleagues in the Transformative Education/al Studies (TES) project team in South Africa have worked across different South African universities to study and foster the development of self-study methodology. The project focus is on bringing university educators together to develop educational practice that is creative and responsive to the varied needs

and interests of students and that contributes more broadly to a socially just higher education landscape (Meyiwa et al. 2014; Pithouse-Morgan et al. 2018). TES project participants are university educators engaged in graduate self-study research and their research advisors (termed, research supervisors, in South Africa). More than 40 TES participants teach and research across various academic and professional disciplines, including accounting education, business studies education, clothing and textile design, consumer studies education, drama and theater studies, gender studies, jewelry design, mathematics education, and teacher development. The TES community is also diverse in terms of age, ethnicity, gender, and language and involves both senior and early career academics.

Owing to the contributions of participants who are professional artists and designers, and others who are fascinated by learning from and through the arts, design, and digital technologies, TES group activities have been characterized by co-creativity. This has developed through collective discovery and invention of arts-informed self-study research methods – drawing on literary, performing, and visual arts – and of digital technologies in self-study research, including video making and blogging. TES project research outputs exemplify this co-creativity in the form of published representations of collective self-study research that include drawing (van Laren et al. 2014), poetry and video footage of poetic performances (Pithouse-Morgan et al. 2015; Chisanga et al. 2014), play scripts and dramaturgical analysis (Meskin et al. 2017), dialogue pieces (Dhlula-Moruri et al. 2017), and vignettes (Hiralaal et al. 2018).

Central to the accomplishments of the TES project has been a conscious and sustained effort to learn from and with each other and to build up each other's self-study research facility within a nurturing space and through relationships of mutual trust and care (Harrison et al. 2012; Pithouse-Morgan et al. 2018). Inquiry into the experiences of project participants and leaders has shown how, in the particular context of South Africa with its divisive and damaging apartheid history, this self-study research learning community has contributed to personal and collective resilience and renewal (Pithouse-Morgan et al. 2018).

Across the ocean, in the USA, Anastasia had been working with colleagues at George Mason University (GMU) to introduce self-study research to faculty who could work with others outside of their disciplines and colleges – collectively and innovatively – to reimagine and make public their self-studies of teaching. From 2010 to 2012, participants were competitively selected to participate in Scholars of Studying Teaching Collaborative (SoSTC, see Samaras et al. 2014 for details). In 2012, Anastasia, with co-facilitators Esperanza Román Mendoza from Modern and Classical Languages, Lesley Smith from Higher Education and Digital Literacy, and Ryan Swanson from History and Art History, launched the Scholars of Studying Teaching Collaborative on e-Learning with a focus on the instructor's role in enhancing the *quality* of students' experiences with digital technologies. In 2014–2016, Anastasia, with co-facilitators Lynne Scott Constantine from the School of Art and Lesley Smith from Higher Education and Digital Literacy, launched a third transdisciplinary faculty self-study group: Self-Study Scholars' Collaborative (S^3C) on the Visually Rich Digital Learning Environment. The goals of this initiative were to support faculty development, to expand the scholarship of professional

practice across and within disciplines, and to build research capacity using self-study methodology, tools of visually rich digital environments, and invitations to embrace a beginner's mind for openness and innovation.

Each of the faculty self-study groups at GMU included a dozen faculty – diverse by culture, status, and discipline – with participants from the humanities, social sciences, recreation, education, languages, and the sciences. A key element to success in each of the groups was co-creativity, with a "holistic mutual support . . . supporting intellectual risk, and a Rilkean dwelling in the question" (Smith et al. 2018, p. 292). Participants worked in transdisciplinary critical friend subgroups, within which pedagogies were exchanged and individual projects were invented, discussed, analyzed, and enacted. They created a shared bond in a meta-study (Samaras et al. 2014) extending from the pedagogical to "revelations of self-assessment and what could be learned through interdisciplinary group perspectives" (Samaras et al. 2012, p. 253). Digital technologies and methodological inventiveness were also key elements in the GMU groups, "not merely as a toolbox from which to replace traditional teaching tools with new ones, but as pathways to develop new models of engagement with teaching, learning, and scholarship" (Smith et al. 2018, p. 275). Participants relaxed into "not knowing" and developed a higher tolerance for uncertainty, traits long associated in the literature on creativity with enhanced capacity for inventiveness.

"Why Write About Self-Study Research in Inventive Ways?": A Narrative Dialogue

This section of the chapter offers a "narrative dialogue" (Anderson-Patton and Bass 2002, p. 103) to illustrate how a transdisciplinary group of emerging self-study scholars engaged with the *why* of innovative modes and designs in writing about self-study research. The narrative dialogue consists of a series of short dialogue pieces that Kathleen composed using extracts from a transcript of a face-to-face conversation with a group of her current and former doctoral students who are all university educators participating in the TES project. With permission from the group (Chris de Beer, Mandisa Dhlula-Moruri, Anita Hiralaal, Lungile Masinga, Refilwe Matebane, and Thelma Rosenberg), Kathleen audio-recorded and transcribed the conversation. To enhance narrative flow, coherence, and impact, Kathleen lightly edited the transcript and rearranged extracts into a series of short dialogue pieces to highlight key ideas. Kathleen shared the dialogue pieces with the group and then invited Anastasia to respond via e-mail. In this way, the conversation became transcontinental.

We chose to use a narrative dialogue format to align with "a guiding principle of self-study – walking the talk" (Anderson-Patton and Bass 2002, p. 111). In this case, our aim was to walk the talk of novel and expressive writing practices. The genre of dialogue, which draws on the literary and performing arts, exemplifies how professional learning and growth can happen through conversation among self-study researchers. In the literary arts, dialogue can help readers to come to understand more about the characters in a story and to see how growth happens through interaction between characters (Coulter and Smith 2009). Correspondingly, Pelias

(2008) described how, in a performance, a monologue "comes forward as a 'what is,'" while a dialogue "stages 'what might be'" (pp. 191–192). The dialogue pieces in this chapter illustrate how discussions with trusted peers can deepen and extend individual self-study researchers' thinking. They also reveal different facets of why self-study scholars choose less conventional styles and devices in writing about their research, as well as some concomitant intricacies and responsibilities.

Dialogue Piece 1: Inventiveness Allows You to Show Different Layers, Emotions, and Voices

Refilwe: From the feedback from my critical friends, I realised that when you are writing about yourself and your practice, it's very important that you go into detail on how you did things, because people want to see what you're seeing. So, you can make it visual for them or express it in a creative way so that they can understand what you felt or how you experienced something.

Anita: When you write in a conventional academic style, it's like you become an outsider. It's like you're looking on and reporting on something that happened to somebody else. But, if you use more expressive ways, you are in the process and you can write about your own experiences.

Chris: Did self-study not arise because of the realisation that our lived experience is so complex? With that realisation, probably, comes the responsibility of finding ways of conveying this complexity.

Lungile: Being inventive in your writing allows you to show different layers in your thinking and the emotions that were part of the self-study process and give it life.

Refilwe: Also, creative ways of writing can allow the voices of others to be heard. Self-study is about you, but the voices of others also need to reflect in your conversation.

Dialogue Piece 2: It's Got To Be Inventiveness in Service

Lungile: It's not about being inventive just for the sake of it. You are making conscious decisions about which forms would best work from all the ways of writing that are available.

Mandisa: And you might find that the people who read your work will enjoy different ways of writing.

Thelma: But, there is that question of how far you can go before you've actually lost your reader.

Chris: That's where you need feedback from others—to make sure that there's something that they get from it.

Thelma: Writing about self-study is, in a way, to be of service to those who are going to read it. For myself who was brand new to these inventive methods in writing, I really struggled with them. So, I really appreciate the authors who explain very carefully what they are doing. You can look at their examples and read about how they did it. Then, you think to yourself, "I'm going to try this!" So, it's got to be inventiveness in service.

Dialogue Piece 3: Inventiveness Beyond Writing

Anita: Being creative in writing about my self-study helped me to transform my practice as a university educator. Prior to this, I was rigid in the way I taught. Now, I have found that even my students have noticed I have changed. They say I am more relaxed and not so rigid in the way I approach teaching.

Refilwe: Through what we are learning in our writing, we are teaching our students, without even realising it. Because they are learning by what we are doing.

Thelma: So, the responsibility is to be inventive, to learn, to teach, to communicate, and to be of service.

Response Piece

Anastasia: Our work together has been premised on understanding how professional learning is extended through dialogue and openness to others' points of view. Not only does it offer a democratic means for discovering and exploring, but it consistently leads us to the inventiveness we have discovered occurs in polyvocal learning communities (Pithouse-Morgan and Samaras 2015b) when we bring together "many stories [that] matter" (Adichie, as cited in Pithouse-Morgan and Samaras 2018, p 314). Our transcontinental collaboration has generated multiple stories and new insights and inventiveness that might not have been readily generated by culturally homogeneous research teams or by us as individual researchers (Pithouse-Morgan and Samaras 2018).

The methodology allows us to invent and gives us permission to capture the complexity or our work (LaBoskey 2004). The multiple ways of doing self-study allow us to explore, as Loughran (2004) indicated, "what is sought to be better understood" (p. 15) without being bound by a particular method. We don't invent just to invent but do so with carefully crafted designs to present and re-represent the layers of our developments in understanding. We allow ourselves to be seen in our work and to involve our readers in our work—authentically, without a safety net—as we willing step outside the boundaries of static research methods and write as a service to ourselves and colleagues, and for students.

Nowhere is that more evident than in the research of our students—especially those who are naïve to any known boundaries for exploring and inventing. These emerging self-study scholars remind us of how our self-study community began as innovative researchers, for example, the early work of self-study scholars such as Weber and Mitchell (2002) who performed their research, and Cole who chose to dance hers (Cole and McIntyre 2001), and Knowles who painted his sense of place (Knowles and Thomas 2000). Emerging scholars are a solemn reminder of the importance of staying inventive and not falling back into more traditional forms just to fit in with others.

Showcasing Methodological Inventiveness in Service: Exemplars from Emerging Self-Study Scholars

In addition to facilitating self-study learning communities of university educators, we teach and supervise self-study research with groups of graduate students who are practicing educators in schools in South Africa and the USA. This section showcases four recent exemplars from research conducted by some of these emerging self-study scholars. The next generation of self-study scholars can indeed help all of us reimagine the ways in which we invite others into our self-study research. We have observed the enactment and impact of methodological inventiveness in graduate student writing that portrays how the scholars have demonstrated professional learning by exploring innovative and expressive modes such as metaphor, poetry, collage, and photography. They have invented and interplayed with methods to address the impact, not only for their professional practice but also for others and for a more socially just world.

For instance, Sifiso Magubane (2014) used an indigenous metaphor of a Zulu shield set to conceptualize and represent his theoretical perspectives in a personally and culturally relevant manner in relation to cultivating intrinsic motivation for learning with Grade 9 learners at an under-resourced South African high school. In another exemplar, Arvinder Kaur Johri (2015) composed double-voice poems to express how she influences the learning of her students and her role in the formation of their writing personas in a writing class in an alternative high school with a multicultural student population in the USA. In a third exemplar, Nontuthuko Phewa (2016) used collage as a means of working in a creative and evocative way to produce and communicate new understandings for practice with respect to nurturing supportive teacher–learner relationships with Grade 1 learners in an under-resourced South African primary school. And Delia E. Racines (Racines and Samaras 2015) created photographic self-portraits as a way to artistically inquire into and express significant aspects of her practice as an English learner (EL) instructional coach (iCOACH), coaching teachers in a culturally and linguistically diverse middle school in the USA.

Using a Shield Metaphor to Bring Together Theoretical Perspectives for Understanding Learner Motivation by Sifiso Magubane

Introduction

I am an isiZulu speaker who grew up in a rural area of KwaZulu-Natal, South Africa. In my self-study research (Magubane 2014), I looked at my own practices as a teacher in the context of cultivating intrinsic motivation for learning technology in a township high school. Intrinsic motivation can be viewed as engagement in a task being driven by the feelings of pleasure, delight, and excitement (Lee et al. 2005). I was concerned because learners in my school seemed demotivated. Hence, I explored how I as a teacher could try to ensure that my learners would remain intrinsically motivated so as to make learning about technology more enjoyable and interesting for them.

The school where I was teaching at the time of my study is a "no fee" school, which means that learners do not pay school fees because they come from a community that has been identified as impoverished. A significant number of learners in the school come from single-parent or child-headed families, as well as families where no parent is working. There are various reasons why certain families in South Africa are child-headed. In some families, parents have passed on due to sickness or due to violence. For some, the parents are still alive, but they are working far away, and they only come home once in 2 or 3 months.

The classroom teacher–learner ratio at the school ranges from 1:26 up to 1:50+, and that often forces learners to be seated three at a desk made for two. This is a clear indication of a shortage of resources. In addition, most of the classrooms in the school have no doors, and many windows are broken. Unfortunately, these contextual realities can have a negative impact on learner motivation. For example, three learners sitting at a desk made for two could contribute to learners' restlessness in class.

Methodological Inventiveness

From my reading, I identified self-determination theory as a suitable theoretical perspective for understanding learner motivation in the context of my study. My study was prompted by my concerns about learner behavior and achievement, and, as Demir (2011) suggested, according to self-determination theory, different types of motivation underlie human behavior. In their explanation of self-determination theory, Ryan and Deci (2000) described how motivation can vary in levels and also in orientation. Therefore, this implies that a learner can be pushed to do something because (a) he or she wants to secure the endorsement of a teacher or a parent; (b) the learner knows the value or attainments attached to the completion of that task, such as proceeding to the next grade; or (c) he or she is interested or enjoys the task. The third level indicates a push that comes from within the learner, which is what I regard as fundamental to intrinsic motivation.

From my own experience, I know that learners can be encouraged by affirmation from significant adults in their lives. Mitra and Dangwal (2010) advised that children's self-directed learning can be enhanced by ongoing encouragement from a friendly adult "mediator" who shows an interest in what the children are doing and "[commends] them for their efforts" (p. 680). In my view, to serve as an adult mediator requires you as a teacher to be a warm, caring, sharing, and loving person and to practice what South Africans refer to as *ubuntu*.

Hence, my second theoretical perspective was ubuntu, because it calls for a warm interconnectedness between people, such as a teacher and his learners (Waghid and Smeyers 2011). According to my understanding of the ethical philosophy of ubuntu, we are all expected to be warm and open to each other in the spirit of humanness, irrespective of diverse values, interests, or ideas. Ubuntu is a common concept in much of Africa, and it takes different forms in different African languages (Murithi 2006).

In my view, according to the perspective of ubuntu, learners should be treated in a respectful manner. Ubuntu reminds me that we, as teachers, should at all times regard learners as complete human beings and as such give them the respect they deserve, the love they need, and the care they seek from us. From this perspective, I see that teachers need to maintain caring relationships with their learners at all times to allow for intrinsic motivation to blossom in their learners. As LaBoskey (2004) proposed, I "embrace the notion that all teaching must be grounded in an ethic of caring" (p. 831). Therefore, I believe that it is important for us as teachers to engage in self-study often – to ensure that we do not lose this trait.

In my self-study research, I saw how the spirit of ubuntu in the form of a theoretical perspective could be brought into dialogue with self-determination theory to form a productive foundation to consider the motivation and well-being of learners. I saw a dialectical relationship between self-determination theory and ubuntu. Greene (2007) defined a dialectic approach as a process where researchers engage in a serious discussion of various ways and means of seeing and comprehension. She further pointed out that this "respectful conversation" and intentional juxtaposition results in "enhanced, reframed, or new understandings" (p. 69).

I identified the traditional Zulu shield set as a metaphor to help me make sense of the dialectical relationship between self-determination theory and ubuntu. Moser (2000, para. 6) described "metaphors [as] analogies which allow us to map one experience in the terminology of another experience and thus to acquire an understanding of complex topics or new situations." As Casakin (2011) explained, metaphors can assist us to think about an existing state of affairs from different perspectives, which might lead to the construction of new notions.

As a Zulu man, the shield set has a particular historical and sociocultural significance for me. In the past, Zulu warriors carried shields into battle, and, nowadays, Zulu men still carry shields when attending traditional ceremonies. In traditional Zulu culture, the head of a household (traditionally, a man) must have a shield (*ihawu*) and a spear (*umkhonto*). Thus, the shield and spear form part of my traditional cultural heritage as a Zulu man. My drawing of a traditional Zulu shield (Fig. 1) depicts a shield made from oxhide, which is a single thickness with the hair on the outside, and reinforced with a stout stick laced up the center of the inside with two strips of hide interlaced on each side. At the center of the shield is the strong handle, which lies vertically and is made from interwoven pieces of hide. Because the handle is so strong, the inner surface of the shield is hard. Then a sponge is inserted between the handle and the inner surface of the shield. This helps to make handling the shield more comfortable, and, also, when someone hits it with a stick, it does not hurt your fingers.

In battle, the shield was used to protect a warrior against the enemy, while the spear and knobkerrie were for attacking the enemy. According to Tylden (1946, p. 33), the traditional Zulu shield's "shape and markings provided a valuable means of recognising friend from enemy at a considerable distance." In that instance, a friend

Fig. 1 Sifiso's drawing of a Zulu shield set: Soldiering on with the shield
refers to a warrior who belongs at your side in the battle. According to Zulu tradition, the set consisting of the shield and spear is not normally bought. Instead, a father hands it over to his son when the son is mature enough to start his own family. However, if a father has passed on before the son reaches that stage, the son inherits the set even before he starts his own family, and it symbolizes that the son has assumed the role of leading the father's household. The only instance where the set can be bought is when there is more than one boy in a family. Given that there is only one family set, only the oldest son (of the first wife, if the father has more than one wife) will receive that set from the father, and the other boys will have to buy theirs. However, even when the sets are bought, they still have to be reported to the ancestors by keeping them *kwagogo* [at the grandmother's house], *emsamu* [in the place that is directly opposite the door] of her rondavel. The shield set is highly respected because it symbolizes ancestral protection, and, therefore, it cannot be touched by anyone but the head of the family. The only time when anyone else is allowed to touch it is when there is an ancestral festivity in the family. Then people can take turns exchanging the shield in the kraal and chanting war slogans. In my view, the significance of the shield in my Zulu traditional culture is unquestionable. On a personal level, I remember how, when we were young boys, we used to cut cardboard to make shields and play *induku* [stick fighting]. When I had my shield and a stick, I felt as if I was invincible.

Impact

For me, the shield set symbolizes a Zulu warrior advancing in battle despite the heavy shots that are thrown. That is what I intended to do with my self-study research – to soldier on in spite of the contextual challenges I faced. The use of a shield metaphor helped me to bring my two theoretical perspectives together in a way that made sense for me and in a manner that I could demonstrate to others. From there, I was able to build on and combine principles of self-determination theory and ubuntu to develop alternative teaching strategies for cultivating intrinsic motivation among my learners.

In interpreting the shield metaphor in relation to my study, I related the *protection* offered by the shield set to ubuntu while the *advancement* of the warrior resembled self-determination theory. This means that in order to have a spirit of moving forward, you need first to feel safe. If we teachers show love and care to our learners, they are likely to feel protected – and then they should enjoy learning, and, hence, the internal drive should develop. A lesson that I learned from my self-study research was that the combined qualities of protection and advancement, as symbolized by the shield metaphor, can form the backbone of a teacher–learner relationship to cultivate intrinsic motivation. Engaging in self-study gave me a chance to consider how and why I respond the way I do to certain situations that I face as a teacher. I learned that providing care and support for learners is central to intrinsic motivation, especially when learners experience many demotivating factors in their daily lives.

Double-Voice Poems as a Means for a Teacher to Express Her Learning About Her Students' Learning by Arvinder Kaur Johri (adapted from Johri, 2015)

Introduction

Examining my own practice and the assumptions embedded in my practice as a creative writing teacher in an alternative high school with a multicultural student population in the state of Virginia, USA, I explored my understanding of my students' writing personas and my beliefs, actions, and understandings related to teaching writing (the second exemplar is adapted from a published book chapter (see Johri 2015)). In this self-study (Johri 2011), I harnessed the power of poetic inquiry as a "powerful agent to assist in the revitalization" of the educational profession with the objective of retrieving "the intuitive, an all-too-often ignored sensibility that many years of formal schooling and adult living may have dulled, or even dismissed altogether" (Dobson 2010, p. 132).

Interweaving voices of my students with my own narratives, the focus of my study was to investigate how my practices influence the formation of students' writing personas. The self-study of my writing instructor persona was conducted with the objectives of understanding my writing assumptions and practice and transforming my teaching and writing practices if they were found to be grounded in inequities. The study was also conducted with the objective of understanding how my personal writing identity influenced my pedagogic practices.

My research site was the alternative high school where I teach. Alternative schools are intended to provide supportive learning environments for students who are unsuccessful and at risk in the traditional public school system (Guerin and Denti 1999). My student participants' ages ranged from 16 to 18 years, and they ethnically represented an accurate snapshot of the multicultural population at the research site with 36% African-American, 35% Hispanic, 20% Caucasian, and 9% other racial or ethnic groups.

Classroom teachers possess theoretical orientations that influence and trigger their instructional behaviors (Duffy and Anderson 1984). Since I was in elementary school, I have been an enthusiastic creative writer, maintaining a journal of my original writings and an anthology of inspirational writings. Being bilingual, my language of choice for my writings was English because it was perceived as a "language of the educated" in India during the 1970s. Being a middle, female child in a patriarchal family, I used my writing talent as bait to get attention from my parents. Interestingly, this strategy of mine worked for years, and I enjoyed the status of a poet who was often requested to share her poems in public settings. The public sharing ended, but my passion for writing never abated.

Methodological Inventiveness

I presented my way of knowing and learning using an arts-based self-study methodological process (Samaras and Freese 2006) through which I explored my

teaching practices, assumptions, and beliefs pertaining to the teaching of writing. Samaras (2011) proposed that during the process of conducting a self-study, it is helpful to "design a visual and/or narrative representation of your current classroom situation and your practice capturing the academic, social, and cultural theatre of your classroom, as well as your role within that context" (p. 119). Adopting the format of double poems, derived from the two-voice technique made popular by Paul Fleischman (1988) in his poetry anthology titled *Joyful Noise: Poems for Two Voices*, I deconstructed and reconstructed my class landscape in narratives that reflect on the actions, events, experiences, observations, possibilities, assumptions, perceptions, lenses, voices, and issues being played out within the classroom. In my self-study, I used poetry to tell experiential stories of both my students and myself. These stories were interspersed with autobiographical vignettes, reflective digressions, and points of tension and harmony between the narratives of my students and me, in the role of their writing instructor.

The technique of crafting double-voice poems served to document my progression as a writing instructor including my interactions with my students, my students' reflections on their writing personas, my understanding of their writer's personas, and my beliefs, actions, and understandings related to teaching writing. The double-voice poem is a dialogic exchange between two entities, presenting two different perspectives on a single topic. These poems are composed in two columns and are written to be performed. The discourses threaded across writing genres, purposes, attitudes, and assumptions capture defining moments from the past, the present, and the future. The present moments or "nows" foreground the past leading to reinterpretations and new understandings. Stern (2004) defined these present moments as "a kind of dialogic equilibrium between the past and the future" (p. 28). The reflections in the poem expose my vulnerability as I "self-reflec[t] upon self" to facilitate understanding (Olesen 1992, p. 205). In the role of a writing teacher, I have experienced that my instructional decisions, ontological beliefs, and instructional practices impact the writing outcomes of students, distancing some from realizing their potential as writers and transforming others to embrace writing. These poems explicate how my assumptions, experiences, and beliefs as a writing instructor interplayed with individual students and the collective class.

In this exemplar, I present the poem, "Multiple Narrators." This double-voice poem is written from the omniscient point of view, with multiple narrators describing why they write, where writing takes place, how writing happens, and what are the compelling factors behind the act of writing or not writing. The omniscient point of view is a pedagogical strategy employed within this meta-study of writing personas to deliberate on parallel and counter narratives. The left-aligned text is a mosaic of phrases selected from students' responses to the prompt "Why I write or why I don't write," and the indented text describes my ontological beliefs about writing. Both the columns are interspersed with autobiographical episodes of critical writing moments. The purpose of this poem is to give voice to my students to defend their nonwriter status or to celebrate their writing personas and to acknowledge points of connections and divergences in my trajectory as a writer with the narratives of my students.

Multiple Narrators

On my left there is a pile of crumpled paper balls
Looks like a mini mountain from a distance
     On my desk there is a pile of journals
     Waiting to be judged

On my seventh birthday my grandmother gave me my first diary
     I bought a journal when I was 10 years old
     And wrote about a clown hysterical with the torment
     Of being the face of comic relief

I have to write to make it through a part of life
I just write to make it by when I'm asked to
Whether I want to write or not
Depends on the topic though
     I write to thread my stories
     Into panels of defragmented thoughts
     Retaliating against cohesiveness
     And a logical transmission of facts
     Whether I want to write or not
     Depends on the availability of a blank paper
     Or the Word document on my laptop

Some subjects I just can't connect to or work with
It's hard for me to start an introduction
Writing about what isn't real has absolutely no limits
     Introductions are extensions of closures
     Or are they the core of the middle
     They exist only when a middle and closing is drafted
     Writing fables gives me the liberty to introduce
     The characters at the end

I like writing on my own time
I write better when I want to write
Not when somebody commands me to write
Mostly on Facebook I will write about things that I have thought of
Letters, notes, research papers, essays, important dates
Writing down things for my mom to remind her
Journal writing is what I do the most
I'd rather just be given a scenario to make up myself
Or write about life
     I like writing on my own time
     I recall writing notes to my daughter when she was 10
     Leaving them by her bedside
     To squash any doubts about not being loved
     I write greeting card messages, e-mails,
     A grocery list, a to-do list
     Comments on essays, assignments on the board
     And herald myself a writer

I dislike anyone telling me
I have to write a certain way

Or have limited writing time
There are so many rules
So many grammar conventions in writing
Honestly I don't like to follow them
It's just not fun to be constantly reviewing and revising
> Someday, sometime I will write
> And mull over the sunlight
> Falling on an isolated ringlet
> Of my 10-month-old son
> I will revise and review it
> And rewrite it for an eternity

When I write I like to write with time to think
To write until I think I can bring it to closure
> When I write I like to write with time to think
> To write until I can think

Mistakes are made
But soon they are erased and deleted
When I freewrite there are no errors in my paper
> Mistakes are made
> Myriad in nature
> When I freewrite I loop and reloop my thoughts
> Crossing and recrossing
> Till thoughts grow into apes
> And demand their due

I write for myself because I fight for myself
I also write so I can get over with school
Get all my credits to graduate
> I write for myself
> I write to be published
> I write to teach creative writing

To most reading my writing is a hassle
> I read my writing to any attentive mind
Poems are the best way of showing affection for any person
You might write a simple poem
But it can end up in a published book
> Precision in abundance
> Complex thoughts simply woven
> Poems expose the unsaid
> In dwarfed stanzas of deliberations

There are many reasons I write
But can't think of any right at this moment
> There are many reasons I write
> But they don't count anymore

My writing is powerful and I can control it
There are endless possibilities to what you can create
And how your thoughts come to mind

There are endless possibilities to what one can think
How does one define knowledge?
Is it the intuitive antenna that is triggered at a supernatural level
Is it the systematic accumulation of learned concepts
Is it wisdom accumulated over years of experiential transactions
      Is it the glory that comes with the title of a prodigy.
Is it the survival tactics one needs to master for supremacy in our hierarchical framework
Is it the tranquil state of equilibrium initiated by not wanting to control others
Is it the newborn's eyes ready to seep in the marvel of life

If there were no words in the world it would be a quiet world
    Here I get attached, there I remain detached
    Here I seek the self, there hide others eavesdropping
    If there were no words it would be a quiet world

Writing is another language
Writing has been around since the beginning of time
Whenever I write it changes the way the world sees me
    Writing is another language
    Writing has been around since the beginning of time
    Whenever I write I look at the world from different tangents

Writing to me is like a tornado
It ends either with a lot of damage
Or little damage done
    Writing is the magician's act of hypnotism
    It ends with hypnotising the self
    In believing in the power of writing

We have cell phones, Internet and even chat rooms
Video conferencing too
Then why write anything
    We have cell phones, Internet and even chat rooms
    We write to capture our environment in slow motion

I like to tell myself I hate writing and don't enjoy it but … that's not true
    I like to tell myself that I am a writer and it begins to sound true

Impact

Self-study opened a paradigm of questioning related to the relationship between what is taught and how it is taught and how this teaching influences the learner. The self-study also revealed that my writer's trajectory intersected with my students' writing experiences and that these refrains in our writing persona narratives highlighted that writers are diverse in terms of their writing dispositions, interests, and abilities and, yet, enjoy some common connecting themes. This poetic inquiry gave me a platform to celebrate my students' perspectives and observe myself as another character in the narrative of writers.

Bruning and Horn ([2000](#)) emphasized that promoting students' positive beliefs about writing, establishing a positive emotional classroom culture, and giving students opportunities for authentic writing in a supportive context determine students' motivation to write. The students need to have a voice in drafting the writing protocol of the class because this will give them an opportunity to articulate what they desire to accomplish in a writing class. Taking into account the role that standardized tests play in the instructional approaches, choices, and strategies of the teachers, it is imperative to first know what our students know about writing – not just in terms of their technical skills but also in terms of their macro understandings of the role of writing and its objective. Integrating students' writings into the curriculum can "develop a critically affirmative language that works both with and on the experiences that students bring to the classroom," and this recovery of students' "own voices" (Giroux [1990](#), pp. 16–17) can mobilize a movement toward situated practice.

Creating a Collage to Make Visible a Teacher's Learning from Young Children by Nontuthuko Phewa

Introduction

I am a South African Grade 1 teacher with 5 years of teaching experience in a primary school. The school's medium of instruction is isiZulu, which is the home language of most of the learners and teachers. The learners and teachers are all black African. The school is under-resourced, and most of the children who attend the school come from impoverished family circumstances. Also, many of these children come from families where parents have passed on (often due to the HIV and AIDS pandemic) or where children are left to look after each other because their parents work far from home. Circumstances such as these can result in learners facing a range of social and emotional challenges. Therefore, it is important for us as teachers to engage with learners' social and emotional lives in order to understand their needs and to provide necessary support to help them feel loved, secure, and welcomed in the school environment.

The focus of my self-study research was on supportive teacher–learner relationships. I wanted to learn about how I might improve my practice in order to cultivate supportive teacher–learner relationships. I engaged my class of 37 Grade 1 learners to help me to respond to the following research question: "How I can cultivate supportive teacher–learner relationships?" For the purposes of my research, I planned, taught, and studied three life skills lessons, two mathematics lessons, and four isiZulu lessons. I wanted to learn about cultivating supportive teacher–learner relationships in the context of all three of the learning areas that I teach. All the lessons were conducted in my home language of isiZulu, and the content of all lessons was in line with the prescribed national curriculum.

In this exemplar, I demonstrate how I created a collage to show what I discovered through engaging learners and how I enhanced this learning through conversation with my research supervisor and two fellow master's students (my critical friends). The collage was included in my thesis to visually represent my professional learning (Weber and Mitchell 2004).

Methodological Inventiveness

I created a collage (Fig. 2) to show and reflect on what I had discovered through engaging my learners. Through my self-study research, I learned more about who my learners were, what their expectations were, and what could make them feel happy and comfortable. Creating a collage enabled me to express more than I could have said in words or in writing. Van Schalkwyk (2010) explained that collage making is one way to provide a representation of what "we think and say . . . and do below the level of awareness" (p. 676). This means that a collage can represent

Fig. 2 "What I have learnt from my learners": Nontuthuko's collage

thoughts, feelings, and emotions that we might not have said in words. In looking at the pictures used in a collage, we can "[bring] to light or [disclose], especially by a process of questioning, rich and vivid stories" of lived experiences (van Schalkwyk 2010, p. 677).

In my collage, the image of a child looking at a microscope shows how learners have passion and enthusiasm for learning; they want to learn, but we as teachers sometimes limit learners by thinking that they are not capable. In my self-study, I saw that young children usually try to do their best with every activity. For example, I remember when I gave my learners an activity on coloring pictures of things, people, and places at school. I believe they did their best, and they were happy that I was not fussy about anything and not also trying to point out mistakes they made. I accepted what I got from them, and I was ticking and putting on stars, which motivated other learners to complete the task.

I included a picture of flowers in the collage to show how young children want to please and to be appreciated by teachers. This connects to the word "creative" in the collage and the picture of someone drawing. I learned that young children like to take "pride" in whatever they are doing and they feel disappointed if they are not recognized for their efforts.

Being understood is also very important to learners, as I can see when I at look the picture where the child talks to his father; the child is talking and the father is listening. This shows that children like to be listened to and to be understood, whatever the message they are trying convey. But many times, we as teachers fail to listen to children, and I believe that children share information with adults because they think it is important to them. For instance, in most of my self-study research activities, I encouraged my learners to speak and present their views. I think they all enjoyed getting a chance to express their thoughts and feelings about issues we were discussing, especially because the issues we were discussing concerned them. This connects to the word "intelligence." Children are intelligent, and we should not undermine their reasoning capabilities.

"Let's all respect each other" – I pasted those words in the collage because my learners were willing to work together as a group and to share ideas to accomplish tasks successfully. This is also shown by the images of children working together. I learned that learners can be like a small family when they love and support each other. This is symbolized by the image of a family.

In another picture, a mother is giving her child a flower; this picture demonstrates that children want to receive love from adults. This relates to the word "love" in the collage. We teachers always expect to receive love from our learners, but I have figured out that it is important that we also show love to our learners regardless of their academic performance.

There are pictures showing children looking happy. I think they can become unhappy when they are ill-treated by peers and teachers at school. This connects with the word "emotional." I remember when I asked my learners to list children's rights, and, as we were discussing the right of a child to have parents, one learner explained that she does not have a mother but instead she lives with her granny. Other learners expressed that they also live with grandparents or aunts and uncles. This made me

more aware of how these children need emotional support from significant adults in their lives, such as their teachers.

I presented my collage to my critical friends (Ntokozo and Khulekani) and my research supervisor (Dr. Kathleen). With their permission, I audio-recorded and transcribed our discussion. Dr. Kathleen asked my peers if they had something to add to my collage presentation. Ntokozo replied, "I like the part that children are always happy." She explained further that children love to laugh and share jokes, but we teachers sometimes limit their happiness; for example, we keep on reminding them of classroom rules not to make noise. Ntokozo added that, as teachers, we often expect children to adapt to our moods. For instance, we want learners to be happy when we are happy. Ntokozo also emphasized that children really like to be treated as individuals; she pointed out that in most cases when you as a teacher give a compliment to one learner, others also hope that you will compliment them and recognize their skills or talents.

Khulekani suggested that as teachers, we should be aware that children might want to please us as teachers because they have expectations that they might gain more favor than the other learners. Therefore, he argued, it is important that we teachers make learners know that they are all special and they are all loved.

Dr. Kathleen proposed that the use of flowers in my collage symbolized love and also that children are like flowers; they are beautiful and also delicate, and, thus, they are easily damaged. Children need to be looked after, and we can then get great pleasure and joy from them. She suggested that flowers being placed in the center of the collage symbolized that we teachers need to center our teaching on the learners. From this, I realized that learners are flowers because they are beautiful gifts that we are grooming; we teachers sometimes tend to forget that because of frustrations and being exhausted by the demands of our work.

Impact

As Butler-Kisber (2008) described, "collage can be used as a helpful way of conceptualizing a response to a research question" (p. 270). Creating and reflecting on a collage helped me to respond to my research question: "How I can cultivate supportive teacher–learner relationships?" I created a collage to make visible my learning, and I enriched my learning in discussion with my critical friends and research supervisor. I learned that artistic activities such as collages are useful ways to learn about and reveal feelings and thoughts that might be hard to put into words (Weber 2014). Visual images can help to explain further how one feels.

Through creating and sharing my collage, I learned that learners, especially Grade 1 learners who are still young, are like little plants that need to be nurtured, loved, and cared for. They are so dependent and attached to adults, and they trust them for their safety and protection; they constantly need adult approval. Roorda, Koomen, Spilt, and Oort (Roorda et al. 2011) explained that supportive teachers can serve as a guarantee for learners' safety; when they feel secure, they can explore the school environment and become engaged in learning activities. Trust is important because

children want adults who will be close to them so that they can speak openly about anything that concerns their lives. It is important for learners to trust me as their teacher and that I can always be available to listen attentively to their concerns and to support them. In that way, they are likely to feel loved, happy, and welcome in school.

I also believe that to cultivate supportive relationships between a teacher and learners, the teacher needs to allow learners to feel part of the school by giving them chances to voice their opinions and sometimes to make decisions. As Klem and Connell (2004, p. 262) advised, "students also need to feel they can make important decisions for themselves, and the work they are assigned has relevance to their present or future lives." Through my self-study research, I have learnt that young children are able to make decisions and express views and we should not undercut their capabilities. Learners also need to be given time and space to work and play together. I anticipate that this could make them feel like they are a small family and could strengthen love and care among them. Additionally, I have learnt that learners like to be treated as individuals and to be recognized for their uniqueness and their efforts.

Learning About Duality as an Instructional Coach Through Photographic Self-Portraits by Delia E. Racines (adapted Racines & Samaras, 2015)

Introduction

In this self-study, I examined how my personal experiences as an English learner (EL) and English for speakers of other languages (ESOL) teacher influenced my professional experiences and work with teachers as an instructional coach (iCOACH) in a culturally and linguistically diverse middle school in Northern Virginia, USA. In my role as an onsite teacher educator, I have worked diligently and passionately toward the goal of narrowing the EL achievement gap. This self-study is set within the educational reform context of high-stakes student and teacher accountability and the importance of better addressing the needs of all learners, especially with the growing school population of ELs in the USA (NCES, 2014). While the focus continues to be on the persistent achievement gaps and one-shot professional development solutions for teachers, little emphasis has been on learning *from* teachers or from on-site teacher educators, referred to as iCOACHes, including EL iCOACHes.

As an iCOACH, it was not only important for me to gain insight from the experiences of the teachers I coached but also to gain a better understanding of how such insights from personal experiences influence teaching and coaching. The core research question from this self-study evolved from my personal and educational experiences as an EL. I know firsthand what it is like to live in two worlds, where I spoke only Spanish at home and was surrounded by only English in school. I remember what it was like not being able to understand English and the various

reactions from my teachers and peers as I struggled to learn the dominant language. I remember constantly being told that in order to be successful, I had to learn the English language. As an ESOL teacher and iCOACH, I felt a strong sense of responsibility to debunk myths and advocate on behalf of ELs to give them a voice. However, I also felt a strong need to balance my lens as an iCOACH with my EL experiences to ensure I was effective at supporting teachers, particularly after being introduced to the staff by the principal for my expertise in teaching ELs.

Methodological Inventiveness

The three participants for this study included myself, a Hispanic first-year iCOACH who was an EL and ESOL teacher for 7 years; a white math teacher with 5 years of teaching experience (who also worked in the school where the study took place); and a former iCOACH who was also an EL for 3 years and is Asian American, with 15 years of experience as a teacher in both elementary and middle school.

Personal history (Samaras et al. 2004) was the method primarily used for this self-study to express what I wanted to better understand about myself and yet integrate with other self-study methods. I used a range of strategies for data generation and analysis. In this exemplar, I focus on how, using an alternative arts-based data generation technique, photographs as self-portraits were taken to invoke memory work to uncover how my dual identity was constructed (http://ptaylorimages. zenfolio.com/duality) (Samaras 2011). Using self-portraits in self-study served as a way to inquire artistically into and more deeply examine my practice with a reflexive stance (Hamilton 2005; Kirk 2005). The former iCOACH also looked at the *Duality* self-portraits (Fig. 3) and was asked what connections, if any, she made to the series of photos.

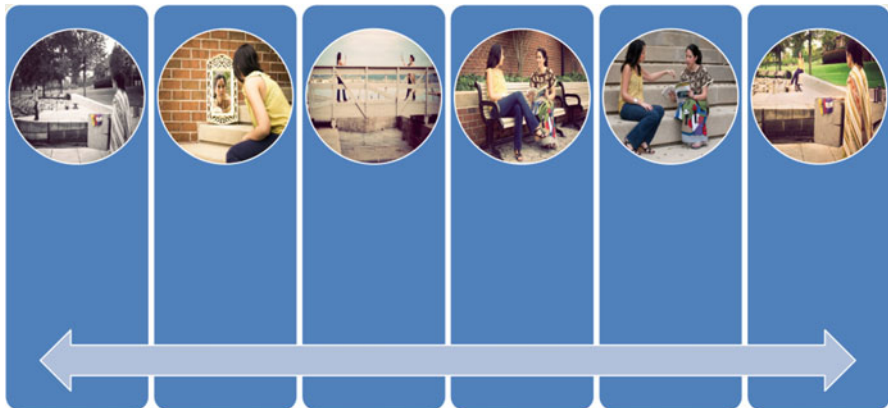
Each of the six self-portraits served as memory-work prompts for my research journal entries. The photos elicited my thinking about my professional identity and


Fig. 3 Delia's duality self-portraits. (Photography by Pete Taylor)

helped to describe my progression as an EL from childhood to today. They also served as a visual reminder to focus on the research question as I moved into the final stages of data analysis.

During this process of coding each self-portrait's journal entry, I kept thinking after writing each memo in my journal, "What does this say about my research question?" "How do these experiences influence my effectiveness as an iCOACH?" "How does my self-study matter to others and to whom?" The overall process of transcribing, analyzing, and theming data was extremely informative. Composing my self-portraits served way beyond a mere data generation tool. Each of my six self-portraits was thought out very carefully to tell a key moment or stage of change of my life story and how I had evolved as once an EL, to an EL iCOACH and then educator. For example, I chose to include the flags from my parents' countries, Ecuador and Guatemala. I also chose a mirror to show my EL self, looking at my American self, wearing a piece of my grandmother's clothing (Fig. 4).

The process of an iterative data analysis allowed me to discover how my multiple selves influenced my effectiveness as an iCOACH and efforts to narrow the EL achievement gap. While seeking to understand how my experiences as an EL influenced my effectiveness as an iCOACH, I became aware of how my experiences, while my greatest strength, were also my greatest weakness and were actually lending to my misassumptions of practice. I realized that while others could not invalidate my experiences as an EL, I could also not invalidate the experiences or lack of experiences of others; meanings in life have no meaning apart from our own interpretations of our own and other people's stereotypes.

However, it was sharing these self-portraits publicly that allowed me to gain various interpretations and encouraged my deeper reflection and meaning making. Essentially, it is what Brandenburg (2008) stated, in that to "see ourselves as agents for our student teachers: motivating them, informing them, guiding them, and preparing them, it ultimately enriches us," that stuck with me the most. It was the

Fig. 4 EL and American selves: Delia's self-portrait. (Photography by Pete Taylor)

self-portraits and insights from participants of the study, classmates, a critical friend, and my critical mentor that allowed this to happen (Brandenburg 2008, p. 196). Self-study calls for collaboration and openness, and both critical friends and mentors are considered critical because they help you gain insight about your research in a trusting and supportive manner (Samaras 2011). Insight also comes from making research public and helps you gain an alternative perspective. One insight, in particular, came from the former EL iCOACH who wrote to me, "your experiences are valuable to share with staff, students, and administrators . . . you have to remain a tenacious advocate."

Impact

The photographic self-portraits enabled me to articulate more crisply how my experiences were actually a strength and a weakness and further see how I could use them to coach more effectively. It was then that the words of the participants answered my research question, and themes emerged clearly with evidence from the data analysis process. Each of these themes played a significant role in not only how my experiences as an EL influenced my role as an iCOACH but also served as recommendations to improve my practice to ultimately contribute in some small, yet very significant, way to narrow the achievement gap for ELs.

Whereas in traditional research, researchers study someone else's practice, in self-study research, the key is that researchers make themselves vulnerable with "the willingness to review existing frames of reference . . . as a criterion of quality in self-study" (Loughran and Northfield 1998, p. 12). Such openness and vulnerability allowed honest critical exchanges to move from learning about the process of self-study to my learning about teaching and coaching; such learning continually moved back and forth throughout my study in a helix fashion. Each critical exchange with my critical mentor encouraged me to become comfortable with the initial discomfort of making my work public, and, although difficult, as Samaras (2011) stated, "it is in making your work public that allows it to be open to review and critique" (p. 77). It is this transparent process that not only allows for the most learning and accumulation of knowledge; it is also this intense and iterative work that builds validation and ensures the integrity of self-study research (Cole and Knowles 1998).

I am aware now how my EL experiences can ultimately help teachers to help ELs achieve. I have more balance and am a better listener. Employing self-study research with other iCOACHes can have a multiplier effect across a school district. After the completion of this self-study research course, I became a mentor alongside Anastasia, co-teaching a self-study research course in an academy course for school district teacher leaders. Traditional professional development assumes that teachers and iCOACHes come in with certain types of knowledge. Self-study breaks down these walls of assumptions and acknowledges that what both teachers and iCOACHes really need depends on the context of their own experiences in schools and classrooms (Hayler 2010; Musanti and Pence 2010).

My study contributes to the literature of bricolage self-study method (Pithouse-Morgan and Samaras 2017), where researchers see their self-study questions as components of their intellectual pursuits and not as bound by traditional or singular self-study methods. My work further highlights how the field of self-study continues to address practical concerns for practitioners and how emerging self-study scholars are opening new vistas for exploring important questions of practice.

Inventiveness in Service: Looking Outward and to the Future

We see a synergetic relationship between the wide inventiveness that characterizes the international self-study community and the creative activity of playing with methodological inventiveness to communicate self-study research and practice. As illustrated by the narrative dialogue and exemplars in this chapter, methodological inventiveness in writing about self-study research is valuable because self-study entails not only studying the impact on self but also on the impact of this work with others and for others. It is vital for self-study researchers to make public their inquiries in engaging and accessible ways so that others will be interested in learning with them and so that the work becomes available for critique and continuing conversations (Samaras 2011).

By presenting exemplars from emerging scholars in South Africa and the USA, this chapter offers inspiration and permission to other novice self-study researchers who might be intrigued by, but might also feel unsure about, exploring methodological inventiveness. Indeed many self-study researchers, both novice and more experienced, might find it challenging to use inventive methods in written research accounts. Through addressing some of these challenges explicitly in the narrative dialogue, self-study researchers might be encouraged to follow the lead of innovators such as Sifiso, Arvinder, Nontuthuko, and Delia. The exemplars also show how creative approaches can work together with, and enhance, more conventional modes of writing.

Our own learning as self-study researchers, facilitators, and teachers has been enriched because of our interactions with our colleagues and graduate students who share our passion for continuous learning and for communicating this learning in engaging ways. Through our work in self-study research learning communities, we have learnt that it is important to try to achieve a balance between challenging and supporting others to be inventive in their writing. Because we are aware that it takes courage and vision to play with imaginative and evocative approaches, we aim to invite others into methodological inventiveness in supportive ways that allow them to experience accomplishment and joy without the constraining fear of failure or negative responses. We are mindful that our students and early career colleagues, in particular, often do feel afraid of pushing against perceived academic boundaries and worry about what others in the academy might think. But, they are encouraged to follow their hearts and take risks through the support of companions in local and global self-study research communities. And, as highlighted by the narrative

dialogue, when they see exemplars of methodological inventiveness to which they can relate, they feel motivated to try it out for themselves.

We have also witnessed how the use of methodological innovation has opened a platform for our students to explore and bring forth to others important social and schooling issues of equity and care – which epitomizes inventiveness in service. The exemplars presented in this chapter demonstrate how, with motivation and support from more experienced self-study scholars, beginners can discover and invent multiple ways to give personal and sociocultural meaning to their work, with generative impact for others. As the exemplars reveal, "the fluidity in the methodology of self-study, combined with the location of inquiry in the self, and with the ability to change aspects of that self in collaboration with others" (Smith et al. 2018, p. 292) can become a potent force for context appropriate, practitioner-led educational and social development (Pithouse et al. 2009b). Through their applications of methodological inventiveness, the emerging scholars who authored the exemplars can teach others about responding to pressing issues of social justice in education. Collectively, the exemplars validate that our work in self-study never stands alone. Instead, it is threaded into a tapestry of related self-studies – in this case a collection of self-studies adding to the knowledge base of studies in diversity, equity, and pedagogic care in education. As Ham and Kane (2004) reminded us, it is not self-study research because it is "by me, for me"; it is self-study research because it is purposefully "by me, for us" (p. 117).

Taken as a whole, this chapter demonstrates how networks and conversations across specializations, contexts, and continents can generate exciting possibilities for self-study researchers reimagining how their research might be represented as outputs of scholarly work and analysis. Collaboration and dialogue can give rise to a seemingly infinite variety of forms that "give us access to expressive possibilities that would not be possible without their presence" (Eisner 2008, p. 5). Co-creativity across the global self-study research community can advance understandings of and opportunities for writing about self-study research in complex, culturally relevant, and pluralistic ways that reflect the increasingly rich diversity of this community. Internationally, self-study methodology is flourishing as it benefits from new learning and inventions generated through networking across diverse fields of professional expertise and diverse disciplinary, sociocultural, and linguistic contexts. Self-study scholars will also continue to play an important role in the broader research community and society as they design new ways of writing about their research and adapting ways of seeing and representing research from multiple lenses.

Ethics of Self-Study Research as a Legitimate Methodological Tradition

14

Alexander Cuenca

Contents

Abstract

In this chapter, I approach the ethics of self-study from the perspective of a legitimate methodological tradition that has a historically situated dialogue with common understandings and practices. From this standpoint, I examine three recursive ethical issues in self-study research: (1) struggles with our multiple identities as researchers; (2) tensions among and between collaborators; and (3) the vulnerability of a public-facing methodology. The stable dialogue within self-study literature of these three ethical issues both inspires confidence in the legitimacy of self-study research and also serves as a reminder to continue to expand the theoretical and methodological contours of self-study. In the final section of this chapter, I explore what ethical questions might emerge as the self-study community begins to navigate more critical theoretical and methodological approaches.

In the first *International Handbook of Self-Study of Teaching and Teacher Education Practices*, Ian Mitchell brilliantly sketched some of the most pressing ethical dilemmas within the self-study research paradigm. Drawing on case studies of teachers and teacher educators conducting practitioner inquiry, Mitchell raised important questions about consent, protection, and risk during the various phases of a research project. Given the relative infancy of self-study research as an empirical genre in 2004, Mitchell's chapter was timely, since there were persistent reports that self-study research proposals were encountering problems when submitted to university ethics committees. At the time, self-study scholars had limited language to describe self-study research, questions of methods, issues of quality, and responses to possible ethical dilemmas. As Pinnegar and Hamilton (2010) forthrightly shared, during the formative years of self-study research, "situating our work within the larger realm of qualitative research seemed less important than doing the work. And doing the work seemed more important than offering details that might have strengthened other scholars' readings of our work" (p. 101).

More than a decade later, this chapter on ethics is situated in a different research landscape. Scholars have openly struggled with ethical dilemmas and methodological questions that have now helped establish the integrity and trustworthiness of self-study research. Dialogues initiated by Mitchell (2004), Hamilton and Pinnegar (2000), LaBoskey (2004), Kosnik and Beck (2000), and Dinkelman (2003), among many others have shaped the conduct of the self-study research. Consequently, these conversations allowed the dissemination of self-study into a broad array of scholarly outlets. Today, with a flagship journal, a handbook, a special interest group, numerous book titles that focus on self-study research, and a biennial conference, self-study is no longer having to battle, as Mitchell assessed in 2004, for our "place in the sunny fields of legitimised research" (p. 1393). It is from this vantage point as a legitimate research field that I enter the conversation about the practice and ethics of self-study research.

With a robust history of yielding important knowledge about teacher education, the ethical tensions of self-study research have become more exposed. Certainly, self-study scholars will continue to face ethical struggles over issues such as public disclosure, researching one's own teaching, and the dynamics of power in the production of data. However, we now have guideposts grounded in literature to help us examine the ethical complexities of those dilemmas. In the sunny fields of legitimate research, common ethical dilemmas are identifiable, claims of empirical illegitimacy are tempered by the warranted assertions produced by the methodology, and conversations within the research genre can move beyond the validity of methods. This stance does not imply that self-study will cease to have its skeptics nor that self-study has no further need to evolve. Instead, what I hope to intimate in this chapter is that by grappling with the ethical tensions of self-study research over

the last decade, we must begin to position ourselves differently within the education research community.

In what follows, I position self-study research as a legitimate research methodology by tracing how the self-study scholarly community has responded to common critiques over the last decade. Then, I use a simple definition of ethics – the moral principles that govern the conduct of an activity – to examine how the robust self-study literature base has approached some common ethical concerns. More specifically, I examine issues of identity, relationships, and public vulnerability in self-study. Although not exhaustive, these major issues capture how the field has confronted ethical issues related to the design, implementation, and production of self-study research. After describing these three major issues, I speculate on some of ethical questions that face the future of self-study research.

Self-Study as a Methodological Tradition

Depending on the proclivities of the researcher, self-study has been called a research design, a research genre, or a methodology. In order to delineate the boundaries of the field and the ethical responsibilities of self-study researchers, I refer to self-study in this chapter as a *methodological tradition.* The label of methodological tradition encapsulates the historically situated, yet dynamic nature of self-study research. According to Moss and Haertel (2016), a methodological tradition is a "sustained, historically situated dialogue and mutual citation among those who locate their work within that tradition and where the participants routinely acknowledge (embrace, revise, or resist) common understandings and practices" (p. 129). As a methodological tradition, the principles of how self-study generates new knowledge have been built over time by people working together to define core concepts and boundaries. Yet, self-study has also been pliant enough to evolve over time and borrow methods, theories, and ideas from other traditions such as action research, narrative inquiry, and autoethnography.

Today, the methodological tradition of self-study research yields nuanced understandings of the content, context, and nature of practice through a range of biographical and autobiographical data sources and analysis methods (Tidwell et al. 2009). With a deep respect for the knowledge embedded in practice, self-study research continues to be animated by the core assumption that it is impossible to extricate the self from practice or the research process. However, by situating inquiry in the local spaces of the inquirer, the self-study community has had to withstand three consistent and interrelated forms of critique that attempt to dismiss self-study research as a methodological tradition: the value-free, quality, and utility critiques.

The value-free critique is grounded in the post-positivist dualism between the observer and the observed. Drawing on the assumption that worthwhile knowledge is only produced by approaches to social inquiry where the researcher is morally and ethically detached from the object of interest, the value-free critique challenges both the processes of self-study research and the value of the knowledge it produces. Efforts by the National Research Council (2004) and the American Educational

Research Association (2006) to establish a "new scientific orthodoxy" (Howe 2009) by creating guidelines for "acceptable" research based on value-free assumptions of collecting and representing data served as a rebuke on the conduct and possible contributions of embodied research to the broader education community. A second common line of critique of self-study research is the quality critique. Because self-study research juxtaposes biography and lived history, questions arise about the quality of the self-study research. Drawing on the metaphor that self-study research is a mirror, Feldman (2003) recognized that self-studies can be questioned, because, "we do not know if what we see in the mirror is accurate or the distorted view provided by a funhouse mirror. Our new knowledge, understanding, or insight may be flawed because it is based on a distortion of the world" (p. 27). The plausibility of Feldman's metaphor rested in the suspicion from the external education research community that self-study research did not have criterion to guide the quality of researching oneself. A final line of critique is the utility critique – whether the professional knowledge generated by self-study research matters to the academy. In higher education, there is an inverse relationship between the proximity of research to the practitioner and the value accorded to that research. The closer the research is to the practitioner, the lesser the value that the research is typically accorded in academia (Lagemann 2002). Since teacher education is a low status professional activity within institutions of higher education (Labaree 2004), an acute critique of self-study research is that producing professional knowledge about a proximal and low status activity holds little utility for the academy and the public at large.

Responses to Criticism: Claiming Legitimacy

Although these three critiques of self-study research continue to pervade the discursive milieu of universities (e.g., dissertation committees; tenure and promotion; institutional review boards) and academic processes (e.g., peer review, grant funding), their dominance has been significantly diminished by the incremental growth of the self-study intellectual community. Steadily, scholars have been building arguments that challenge the assumptions of the critics of self-study research. For example, the value-free critique has been challenged by repeated ontological and epistemological proclamations that if the aim of research is to produce personal practical knowledge, then the necessity of a value-free neutrality is not applicable to self-study research (Berry and Loughran 2002; Munby and Russell 1994; Huber and Clandinin 2005). In short, self-study scholars have collectively rejected the modernist assumptions by which our research methodology is gazed upon by its critics. This rhetorical solidarity proclaims that the validity of self-study research is not found in its objective distance but instead in its transparency about the role of the practitioner/researcher in naturalistic settings.

Likewise, claims of the amorphous quality of self-study research have been successfully questioned. For example, Bullough and Pinnegar (2001) speaking directly to this accusation developed guidelines of self-study research. Similarly,

Lyons and LaBoskey (2002) introduced the notion of exemplar-based validation as a way to discern the quality of self-study research. The articulation of these parameters not only further distinguished self-study from other forms of practitioner research but also provided a litmus test for quality, which allowed scholars to grapple with the tensions, issues, and problems that naturally arise from the conduct of quality research.

Finally, the value of self-study research for academia has been advanced by the presence of the self-study academic community and by the persistence of the inherent rationale found in self-study research – the professionalization of teacher education is a necessary academic pursuit because of the complexity of teacher education and the importance of the preparation of teachers for our society. Arguably, because self-study research enables teacher educators to control their own professional development and share this knowledge with others, each self-study publication affirms the value of the methodology for higher education. Moreover, self-study communities within teacher education have become more ubiquitous (Butler et al. 2014; Dinkelman et al. 2012; Kosnik et al. 2011; Williams et al. 2012), further testifying to the value that institutions are increasingly finding in self-study research.

In the wake of these rejoinders to criticism, the self-study community has grown conceptually, intellectually, and methodologically. Contemporary scholars engaging in self-study research conduct their research with an empirical foundation of ontological, epistemological, and axiological confidence in the methodology. Undoubtedly, like all forms of practitioner research, self-study will continue to have critics. However, as a legitimate methodological tradition, the questions of ethics should no longer respond to external criticism. As an emerging tradition, it was natural that major questions of ethics emerged from skeptical outsiders. The value-free, quality, and utility critiques of self-study were intimately related to an ethical suspicion of the methodology. Not surprisingly then, the focus of Mitchell's chapter centered the discussion of ethics in self-study research as a response to persistent reports that self-study researchers were having difficult encounters with institutional review boards. Certainly, the concern with university oversight boards will continue to be a problem for researchers in institutions where practitioner research is an unfamiliar empirical genre. Yet, as a legitimate field, it is critical to locate our ethical questions, not as responses to external critiques but instead to the evolving contours and directions of the methodological tradition. The following section approaches self-study research as a legitimate methodological tradition by sketching three recursive ethical issues that have emerged within the tradition. In doing so, these recursive issues illustrate not only the relative stability of the methodology but also the ways in which scholars raise distinct ethical questions that help push the boundaries of the methodology.

Three Recursive Ethical Issues for Self-Study Research

Within the self-study methodological tradition, three recursive ethical issues are common: struggles with our multiple identities as researchers; tensions among and between collaborators; and the vulnerability of a public-facing methodology. These

ethical issues are unique to self-study research in part because self-study co-locates the researcher and the researched. Inherent in the design of all self-studies is an individual empirically pursuing knowledge presently not known about oneself. Therefore, if ethics are the moral principles that govern the conduct of an activity, the activity of researching self leaves little distinction between researcher and practitioner. Consequently, discussions about ethics in self-study research move fluidly between the roles of researcher and practitioner, leading to knotty ethical questions intertwined in both the act of conducting research and the practice of being researched.

Yet, regardless of the positioning, ethical issues and questions are intimately related to questions of power. According to Cannella and Lincoln (2011), the ethics of social science research requires the cultivation of a consciousness that is aware of the sociopolitical condition and involves "engaging with the complexities of power and how it operates in the social order" (p. 84). Similarly, for self-study research, questions of ethics are questions about the recognition and deployment of power. Each of the areas below acknowledge that because self-study research is a mechanism of power, ethical concerns must be burdened by both researcher and practitioner.

Ethics and Identity

Self is a social and cultural construction formed through a series of life experiences. The identities that constitute self-manifest themselves as performances in the different contexts where these experiences take place. Because self-study is a research genre that examines the self, the identities of researchers/practitioners often play a significant role in the design and pursuit of inquiries, which raises ethical questions related to identity and power in practice. According to Gee (2001), identity means being recognized as a certain kind of person. In order to examine identity more closely, he offers a useful analytic lens to recognize the formation and workings of identity: nature (who we are in nature), institutional (who we are within institutions), discursive (who we are with rational individuals), and affinity (who we are with shared affinity groups). These four ways to view identities are constantly shaped and reshaped by social, economic, and political means and ends.

As a broad project to advance the professionalization of teacher educators, self-study research tends to focus on the formation and function of being recognized as a certain kind of person – a teacher educator. In order to prepare teachers, teacher educators must unpack their own professional knowledge, skills, and disposition as former classroom teachers and pivot toward preparing future teachers with a corollary set of knowledge, skills, and dispositions. The nature of this pivot is not only contingent on personal values, beliefs, and biographies but also on the ways in which teacher educators work to author the institutional position of teacher educator.

Through self-study research, teacher educators have been able to systematically explore the construction of their institutional identities. For novice teacher educators, they often navigate the formation of an institutional identity by developing

pedagogies in the teacher education classroom that are consistent with personal beliefs and values (Cuenca 2010a; Williams et al. 2012). This early identity formation for teacher educators is most often influenced by learning communities, supportive relationships, and reflective activities (Izadinia 2014). Studies about teacher educators later in their careers feature a more fine-grain exploration of the ways in which they enact practices – become more comfortable teaching teachers – or other institutional responsibilities such as research or leadership (Clift et al. 2015; Crowe and Berry 2007; Dinkelman 2011; Swennen et al. 2010).

The ethical dilemmas that self-study scholars most often encounter related to their institutional identities are about the responsible wielding of the power granted by the institution. The academic institution, with its own landscape of interconnected power relationships, implicitly and explicitly governs the actions of teacher educators and teacher candidates. Without careful attention to the dynamics that exist within the architecture of power in a university classroom, teacher educators can act in ways where power is wielded in ways that can intellectually and/or socially harm candidates.

Rice (2017) offers a good example of the possible dilemmas that arise for teacher educators exerting their institutional identity. In his study, he explored an interaction with a student in an online course concerned about the grade she received for an assignment. Rice responded by indicating his rationale for the grade, and the student once again disagreed with his assertion. He shared in his study not only the frustration with the episode but also a response he wrote, but did not send, that expressed his frustration with the student and the quality of her work. Instead, he resent to the student the original email and the rubric. In exploring his reasons for not sending the email, Rice wrote, "I did not send the email because I did not believe it would support the relationally educative environment I wished to create" (pp. 92–93). Rice recognized that in order to maintain a positive experience, "the teacher forgoes the position of power and takes up the position of more capable other" (p. 96). From this ethical stance, Rice rationalized that with this particular situation:

> Power is not about being in control or having authority over students, something I do not feel I was able to communicate with my disgruntled student. I worried that she saw me as wielding power over her where I was simply attempting to act as the more capable other, helping, and encouraging my online student to successfully complete the assignment.... (p. 96)

For Rice, disrupting the perception of a positive educational experience created an ethical dilemma related to an institutional identity which granted him the unrestrained power to grade and respond to his student as he wished. In aligning the principle of a positive educational experience with his conduct as a teacher educator, Rice was able to resolve this ethical tension. This study is illustrative of how the concern over beliefs and values "alignment" often highlighted in the self-study literature also acts as wonderings about the ethics of deploying an institutional identity that is complex, context-specific, and undefined (Berry 2007; Bullock 2009; McAnulty and Cuenca 2014).

More recently, teacher educators have been exploring how other aspects of their identities operate within the grid of institutional power in higher education. In particular, these studies raise questions about the role of teacher educators' natural identities such as race, gender, ethnicity, and sexual orientation or affinity identities such as social justice. For example, Bair et al. (2010) used self-study to examine their natural identities within the teacher education classroom. This collective of teacher educators consisted of diverse natural identities: men, women, African-American, Indian, White, Christian, Muslim, Baha'i, gay, and heterosexual who explored the struggles of faculty who are substantially demographically different from their students. Their study revealed the tensions that minority faculty across all demographic categories faced when working with students who were not demographically congruent. In particular, the faculty collective found that negotiating students' deficit perspectives of them, while they held power over students, was the most challenging. For this group of teacher educators, not unfairly treating students with deficit perspectives or tempering emotions at students' erasures of their natural identities became the primary ways of resolving this ethical tension.

Similarly, Milner (2010) in a study of how his racialized identity as a Black teacher educator influenced his pre-service teacher candidates noted his worry about the ethics of sharing personal encounters with racism with his students. He recognized that although he clearly had power as professor in the course:

> . . .my students in the class had power (by virtue of their skin tone) that could easily override my power. A simple visit to the dean's office could make the dean skeptical about me or possibly even lead him or her to think I was a racist because I made some of the students feel "intellectually or socially uncomfortable." Moreover, they had the power to drop the course and to give me low teaching evaluations. Also, the students had the power to leave that classroom context and go into society—even the hallway—and regain their power and privilege. They had power because they were White. The students had the power and the privilege to "tune me out" or to counter my every position. (p. 601)

Like Bair and colleagues, Milner recognized how his natural identity complicated the ethics of challenging students' hegemonic perspectives. Ultimately, he overcame this concern, because after sharing his story, some of his students began to share their own stories that pointed to race, racism, and inequity. He saw that his telling "seemed to have broken down some barriers. . .and students became willing to engage in the intellectual work necessary to learn more and to become more knowledgeable" (p. 601).

Kitchen and Bellini (2012) also confronted issues of practice and their natural and affinity identities. In their study, Kitchen and Bellini examined how two teacher educators – one who identified as gay and another who identified as an ally – facilitated a workshop titled "Sexual Diversity in Secondary Schools" and responded to feedback from teacher candidates. Kitchen and Bellini worked to present themselves as models of gay and straight working in alliance, but they also recognized that "teaching about LGBT issues potentially challenges the status quo, which can result in tensions and resistance (McNeil 2011). This is particularly true when one of the presenters is a minority member, gay in our case, whose very presence in the academy may generate hostility" (p. 211). Consequently, they were reluctant to take

a strongly ideological stance and instead "were pragmatically focused on creating a discursive space in which teacher candidates could safely struggle with alternative conceptualizations of sexual identity and the duties of teachers" (p. 211).

What these studies reveal is that the identity of the researcher/practitioner is a critical ethical tension. Seemingly, in studies where the institutional identity is a concern, maintaining a positive educational experience for students seems to be a primary moral principle that defines the ethical decisions of teacher educators. However, for studies where natural or affinity identities are surfaced, the ethical tensions that exist between teacher educators and students are rooted in existing social categories that curtail the ability of teacher educators to properly educate students.

In studies that feature discussions of natural identities, the ways in which power circulates between teacher educator and students are much more visible. As a result, the ethical challenge for the researcher/practitioner is twofold: the traditional institutional power that the teacher educator wields in a teacher education classroom and a responsibility to directly confront the implicit and natural identity of students. Approaches to this twofold challenge varied. Bair and colleagues decided to treat students fairly or temper their emotions when natural identities collided, Milner felt that the benefit of students possibly feeling uncomfortable was ultimately worth the risk, and Kitchen and Bellini focused on creating a pragmatic learning space. Each of these different principles governed practices and ultimately allowed teacher educators to resolve the ethical issues that arose because of the operation of identity in a teacher education classroom.

As self-study researchers, raising issues of ethical anxieties related to natural and institutional identities is noteworthy as an ethical decision itself. All of the studies featured above adhered to a research principle of authentic self-interrogation toward improvement. The worry, concern, and distress exposed in these self-studies about miseducating students or being irresponsible with power reveal not just a commitment as practitioners to pre-service teacher learning but more importantly toward the necessity to publicly unpack implicit and deeply personal categories of self-identification. Although many self-study inquiries focus on the living contradictions of practice – ways in which we may name ourselves one way, but outside observers would name us differently – identity in self-study research operates differently. Questioning how identity operates in practice demands that the researcher value the process of authentically capturing oneself struggling with personally and socially imposed categories constantly in flux. The capacity of these researchers to take such an ethical stand toward practical improvement bolsters both the trustworthiness of these studies and the utility of self-study research for teacher education.

Ethics and Relationships

Despite the focus on exploring *self* in self-study research, all practitioner/researchers are socially located. Therefore, self-study is an exploration of self, and, perhaps as important, the "not self" (Hamilton and Pinnegar 1998) or the various other

individuals that interact with a practitioner/researcher at any given time during a study. Conducting research about the self and interacting with others inevitably lead to ethical questions about issues such as confidentiality and informed consent. Moreover, because researching self *in practice* often leads to greater metacognitive awareness about practice, ethical questions about the responsibilities toward the individuals co-located in self-study research become more acute.

As noted in the previous section, for self-study researchers, the architecture of power within institutions raises ethical dilemmas about studying practice. In most cases, ethical questions emerge when teacher educators exert power with students. However, Clift (2011) in a unique study explored the ethical questions of conducting self-study while deploying power as an administrator. Her self-study described shifting into a new role as an administrator and unpacked how the obligations, responsibilities, and roles of her previous position as a faculty member and self-study scholar do not provide guidance on becoming a teacher education administrator. Clift feared losing her self-study research foci and identified the ethical dilemmas of self-study in this new role:

> I do not know if I will be able to continue self-study in general or the self-study of self as administrator, because of the ethics of confidentiality, the potential harm to interpersonal relationships, and the inherent power relations created by my title and my role. I am grappling with questions such as these: Will I be able to gain ethical approval to include data from others in any self-study? Even if I am, will the acts of documentation and validation inhibit and diminish my relations with others? Is the researcher role compatible with the administrator role? Will I be able to collaborate with others in my professional community without sending signals that I am failing in some way, or that my institution is? Will I be able to publish without harming those whom I have studied and who may read my work? (pp. 168–169)

Each of the questions that Clift identified speaks to ethical challenges that self-study researchers face in traversing the study of self within a power relation with others. What is clear in this example is the conflict between the responsible administration of power and the value of vulnerability and professional development that self-study offers. Moreover, Clift clearly illustrates how self-study is never only about the self but about the dynamics between self and others. In order to explore, learn, and grow in her new role as an administrator through self-study, the interactions with her subordinates must be made visible. The personal unpacking that occurs in self-study research prospectively risked her own standing as an administrator and also relationships with her staff. Although the purpose of the study was to raise, not answer, these ethical tensions, Clift provides important insight into the kinds of ethical dilemmas that arise when accounting for the not self in self-study research.

Another area of human relationships that often raises ethical questions for self-study researchers is working with co-researchers on a project. A common configuration among self-study researchers is critical friends. The use of a "critical friend" is a common practice within the methodological tradition of self-study research that offers both professional and empirical benefits. As Berry and Crowe (2006)

concluded, "when colleagues share critical conversations about practice, new possibilities for practice can emerge, as well as new ways to analyse and respond to problems" (p. 31). Additionally, critical friendships help researchers rethink values, overcome prejudice, and consider the study of practice holistically (Kroll 2005; Loughran and Brubaker 2015; Nilsson 2013). Although critical friendships are additive to self-study research, depending on the nature of the friendship, they also come with a series of ethical tensions that must be navigated between the friends.

In some critical friendship studies, the friends are colleagues who work in different institutional contexts. For example, Schuck and Russell (2005) examined the nature of a critical friendship while working in Canada and Australia, respectively. In their study, they revealed some of the problematic assumptions that existed in the formation of the friendship such as shared expectations for the work of a critical friend and the status differential between the friends. The differential that often exists between friends is often the most complicated ethical terrain to navigate. In the case of Russell and Schuck, the differential was experienced mostly by Schuck who saw herself with relatively lower status because of differences in academic rank between Australian and Canadian institutions. The analysis revealed that these differences were distant or invisible to Russell but were important to Schuck as she questioned the ethical propriety of critique across friends she perceived were of different or unequal status.

Other critical friendships feature efforts to harness the professional development of self-study. However, like Russell and Schuck, status differentials within critical friendships led to some ethical concerns about the circulation of power. One example is McAnulty and Cuenca (2014), who explored the development McAnulty's emerging identity as a novice teacher educator. Cuenca served as his faculty advisor/mentor and critical friend during the study. Although the study led to powerful insights into how McAnulty navigated his first year as a teacher educator, an explicit reality was the status within the relationship that implicitly worked to delimit McAnulty's agency within the relationship. Cuenca identified this as a considerable challenge and ethical tension in maintaining a reciprocal and authentic friendship that was both critical and formative. Similarly, Butler and Diacopoulos (2016) engaged in a joint exploration of student teaching supervision through a critical friendship. Their study featured a similar faculty/graduate student dynamic. They concluded that despite having a good working relationship prior to the collaboration, "that relationship consisted largely of the traditional advisor/advisee and teacher/student roles. If we were to find success within our critical friendship and co/autoethnographic work, we had to learn to navigate the tensions that would inevitably emerge." Ultimately, Butler and Diacopoulos revealed that they had to work slowly and intentionally to overcome the ethical dilemmas of power inherent in an imbalanced critical friendship.

Collaborations are another major strand of self-study research that can sometimes raise complicated ethical questions about interpersonal relationships. Like critical friendships, collaborations abound in the self-study literature and help diversify the kinds of knowledge that self-study research can yield. Collaborations within self-study have generated insights into how teacher educators can better understand their

professional identities, support personal learning, and engage in systematic program reforms (e.g., Martin and Dismuke 2015; Dinkelman et al. 2012; Taylor et al. 2014). Although collaboration studies also feature status differentials, they tend to be characterized by teacher educator/researchers working together toward a common empirical goal. The mutuality among researchers tends to mitigate the ways in which status ethically complicates relationships.

Nevertheless, in collaborative self-studies, ethical issue persists, usually around negotiating relational ethics. For example, Chryst et al. (2008), three untenured professors in the same institution collaborating on developing teacher candidates as reflective practitioners, shared the kinds of tensions that existed when working together. In particular, they noted how initially, each researcher was certain about their perspective on the ethics of classroom conduct and the rigorous classroom "and literally brought to the table a shield of literature to protect her positions." With a similar status position and a common research goal, the ethical questions for this collaboration centered on negotiating trust between the members of the group. As they navigated these differences through dialogue, they began to examine the nature of their own certainties around ethics and rigor and "began to carefully consider the consequences of our students who do not conform or sway toward our particular belief system" (p. 51). Ultimately, the trio found collaboration beneficial and were able to productively work around their ethical differences.

However, even in collaborative studies where ethics are not the central focus of inquiry, questions of ethical behavior abound. Allender and Taylor (2012) detailed incidents within a group of collaborators conducting a self-study focused on exploring the teacher education literature. Because the contributions and responsibilities of each author in the study were not clearly defined from the onset, there was an escalating conflict about what counted as participation in the study and what data could be used without the attribution of the researchers/participants. As a result of this conflict, some of the researcher/participants were bullied, felt hurt, and became disillusioned with the academic enterprise. The authors concluded that the inconsistent perceptions of ethical behavior among this group of academic collaborators fostered not only a breach of academic ethics but also interpersonal ethics. Ultimately then, this study raised important questions for collaborations in self-study regarding the ethical application of academic publishing principles to self-study research, what counts as a substantive contribution within a collaboration, and the ethical response to perceptions of injustice.

To mitigate the ethical challenges in future self-study collaborations, Allender and Taylor suggested following the example of McGinn et al. (2005), who co-created a statement of principles, which helped establish authorship, roles, responsibilities, and mechanisms for group accountability in a practitioner research study. The co-creation of guiding principles led McGuinn and colleagues to enact a "living ethics" that guided their contributions, participation, discussions, and relationships during the study. As such, the living ethics captured in the enactment of the principles led to a healthy, respectful, and ethical collaboration among researcher/practitioners.

Each of the studies in this section recognizes that conducting self-study research influences friendships, collegial relationships, and/or professional responsibilities. Thus, for self-study researchers, the personal and professional transparency that this methodological tradition demands means that interpersonal ethics requires constant monitoring. These studies illustrate what ethical monitoring looks like within a study – raising subjective ethical questions about human relationships. For the researchers highlighted in this section, the ethical questions they raised were not initially anticipated. Russell was unaware of the differential perception by Schuck; Cuenca and McAnulty or Butler and Diacopoulos realized the starkness of their power in the midst of their collaborations; and the collaborative efforts of Allender and Taylor began with the best ethical intentions before unethical behavior began to erode professional and personal relationships. As Brandenburg and Gervasoni (2012) suggested, the ethical implications in self-study research are not always obvious in advance, since "much of what occurs in self-study research is in response to unfolding insights" (p. 164). Yet, the studies in this section provide the self-study community with some important markers for ethical dilemmas.

In essence, relationships where power differentials exist must always be interrogated for possible ethical tensions (Cuenca and Park Rogers 2019). Clift provided an example of this kind of questioning by raising her own struggles with the ethics of confidentiality as a rising administrator in a teacher education program. Similarly, the "shield of literature" that Chryst, Lassonde, and McKay brought to their collaboration helps illuminate the difficulty in negotiating ethical differences among colleagues. Although the context was somewhat different, the deployment of a defensive approach to problematically justify stances and positions was also used by the collaborators in the Allender and Taylor study. Taken together, the studies in this section teach us about the unique ethical complications that emerge during self-study research and the necessity to anticipate how these complications influence not just the empirical product but, perhaps more importantly, our professional and personal relationships.

Ethics and Public Vulnerability

By collapsing the post-positivist divide between the researcher and the researched, self-study research publicly exposes the thoughts, ideas, questions, wonderings, and noticings of practitioner/researchers. This kind of exposure is generally considered a net positive by self-study researchers because implicit practices and processes are made visible. As Hamilton and Pinnegar (2015) noted, self-study research is intimate and vulnerable "because we claim ownership and accept responsibility for our knowing and acting as teacher educators" (p. 121). However, the vulnerability created by researching in proximity to practice often raises ethical questions. Reflecting on her turn toward self-inquiry, Cochran-Smith (2003) recognized that self-study led her to "uncover the underside of my own ethics: both the ethics of practice and the ethics of research and writing about practice..." (pp. 11–12). In

other words, what makes self-study unique is the personal recognition across a study of the vulnerability of studying oneself.

Indeed, self-study scholars often grapple with the discomfort of presenting a vulnerable self to the public. Knowles (2014) offered a forthright assessment of the discomforting nature of self-study research. Investigating her work as a social justice teacher educator, she noted, "the methodology of using my own practice and of choosing which aspects to emphasize for which ends makes me potentially vulnerable to both the scrutiny of my peers and my own self-protection and bias…" (p. 92). The self-initiated scrutiny of practice in public leads to unique ethical questions. What kinds of faults are shared about practice, pedagogy, and beliefs? What are the professional and personal risks associated with disclosure? When (if ever) do methodological ethics supersede personal interest in self-study work? For Knowles, the benefits of conducting a self-study outweighed the risks associated with personal vulnerability:

> One way to ensure that I and my students continue to learn from each other is by opening up my practice…this is a risky process that cannot only destabilize how I know myself, but also disrupt the balance of power inherent in how teaching and learning are framed, and how I relate to other teachers and my students. This vulnerability, I argue, is a powerful possibility for transformation and re-imagining a just pedagogy – not only to the teacher engaged in self-study but also for teachers and students as they navigate the knowledge project of the university. (p. 93)

What Knowles ultimately recognized was that despite the scrutiny or discomfort that might result from disclosing her transformation of thought and practice, the ethical use of the tools of self-study research yielded powerful outcomes for present and future students.

In a similar study on vulnerability, Cutri and Whiting (2015) explored the emotions associated with the discomfort raised by the work of self-study. Drawing on the notion of an "ethic of discomfort" (Zembylas 2010), Cutri and Whiting shared three particular kinds of emotional work that self-study into teacher education practices demands: (1) the management of personal emotional reactions; (2) facing your past in your present practice; and (3) remaining vulnerable and emotionally available for students. Each of these forms of emotional work raises distinct ethical questions for self-study researchers. Naturally, as self-study researchers begin to interrogate their practices, intimate questions about personal beliefs, assumptions, and sensibilities emerge. What emotions get surfaced and the depth of the personal interrogation are ethical decisions left to the practitioner/researcher. As the study by Bair et al. (2010) noted earlier, it is reasonable to experience frustration when students engage in hurtful acts such as erasing personal identities. However, they leveraged self-study research to openly disclose those frustrations and allowed their responses to those emotions to serve as empirical *and* formative knowledge for the teacher education community.

Self-study also provides practitioner/researchers opportunities to revisit and reconsider stances and positions. Quite possibly, the stances or beliefs of teacher educators are troubling when viewed through the lens of a systematic inquiry such as

self-study. Cuenca (2010b), for example, described how he lamented his initial efforts as a novice university supervisor to mentor student teachers. The retrospective stance offered by the tools of self-study research could have easily (and unethically) been muffled. Yet, the ethical boundaries of the methodical tools of the self-study tradition sustained the public disclosure of inward critique. Public-facing admissions of failure such as, "I was unable to make explicit to my student teachers the tacit knowledge that I had developed over time" (p. 39) emboldened the empirical trustworthiness of a study focused on critical reflections about the self in practice. Given the positionality of the self-study researcher as the researched, descriptions of failures and shortcomings are central to the empirical rigor and ethical parameters of the self-study inquiry tradition.

Finally, the vulnerability provoked by self-study also requires researchers to engage in the emotional work of remaining available to students. Because many self-studies originate from particular problems of practice (Vanassche and Kelchtermans 2015), unpacking the situated, relational, and emotional dimensions of practice is revelatory for the practitioner/researcher. It is therefore quite possible that the revelations of an inquiry would inhibit or interrupt exchanges with students. However, the ethical conduct of self-study research demands a balance between the responsibility of being a teacher educator *and* a researcher. Ohito (2016) in a self-study of a social justice-oriented teacher education program recalled the palpability of discomfort when a White student openly read a derogatory term in the classroom:

> The word nigger rolled off Peter's tongue with a smoothness that caused me to visualize it as a slick glob of freshly churned butter bent on oiling the space between two slices of bread…Hearing it fly unencumbered from a white man's mouth, however, stung. I instantly felt trapped among the mostly white bodies that filled the stuffy classroom. My Black skin, of which I was suddenly hyperaware, seemed to be searing from the downward glares of the university's white founders and funders, who were immortalized in large portraits hung high on the classroom walls. The absoluteness of the terror I felt rendered me speechless. (p. 459)

The awareness of conducting self-study research during that particular incident could have led Ohito to engage in a distinctly different pedagogical path or response. Moreover, the unpacking of that incident through self-study tools could have also led Ohito to exclude the offending student. Instead, she prioritized student learning, despite the emotional bruising she experienced in the moment. She responded to the incident later that night in an online class discussion thread and shared her thoughts on how silence sustains White supremacy. Ohito also worked with Peter to address his action and noted that he ultimately prompted the class to assess "how our routinized behaviors in the classroom – specifically silence and politeness – may have been both steeped in White supremacy and barriers to our acquisition of textured knowledge about racism and racial oppression" (p. 461). Certainly, without self-study, the incident with Peter would have been salient moment. However, Ohito's ethical stance to prioritize student learning illustrates the emotional nature of the public vulnerability created by self-study research.

The public-facing nature of self-study research inevitably leads to moments of discomfort. As the practitioner/researcher exposes the inner sanctum of beliefs,

emotions, and perspectives about experiences and practices, distress about disclosure is natural. However, as the empirical examples in this section illustrated, attending to the methodological guideposts of self-study research such as generating candid assessments of self through systematic interrogation helped sustain the ethical practices of both the practitioner and researcher. Arguably, the disposition of self-study researchers to be vulnerable to critique might make them more attuned to ethical adherence. In self-study research, the teacher educator and the researcher are on display and so are the ethical actions of both. Although every representation of practice is ultimately based on the integrity of the researcher, the fundamental epistemological stance of self-study research that dismisses the divide between the researcher and the researched seems to underscore ethical conduct and practices.

Present and Future Ethical Issues as a Legitimate Methodological Tradition

The growth of self-study research in the last few decades has exposed how researchers negotiated ethical dilemmas associated with a methodological tradition that is unapologetic about developing a deep understanding of the practices of teacher educators. Ostensibly, self-study researchers have developed an ethical praxis, which Brandenburg and Gervasoni (2012) defined as an "active, anticipated, and awaited researcher response to ethical issues arising as a result of self-study research" (p. 188). Across the three areas described in this chapter, identity, relationships, and public vulnerability, self-study researchers approached ethical knotty situations with care for others and fidelity to the rigors of the methodology. This consistency is a result of the maturity of self-study research as a legitimate methodological tradition. However, everything is not always perfect. Although the widespread resistance by ethics boards to self-study research has subsided, self-study researchers continue to grapple with the ways in which institutional review boards frame issues such as public vulnerability as a possible ethical breach.

As DeTardo-Bora (2004) argued, institutional review board was created with positivistic research designs in mind. Thus, the review process for practitioner-focused inquiry is typically unsuitable. According to DeTardo-Bora, in many situations institutional review boards are unfamiliar with practitioner-focused inquiry or the ethical guidelines that support practitioner research. Therefore, members of an institutional review board often perceive that objectivity is the trade-off when reviewing a self-study research proposal. Brown (2010), a member of an institutional review board, confirmed the perception of practitioner-focused inquiry as ethically unsuitable research. She recounted that:

> When undergoing my own internship period as a new IRB member several years ago, I questioned my IRB mentor as we reviewed together a teacher research proposal. My mentor wanted to reject the proposal as written, claiming it would be impossible for a researcher soliciting participation from his own students to avoid coercion. I countered, ultimately successfully, that the field of teacher research was well respected and that rejecting the

proposal for that reason would logically extend to all teacher research proposals, since by definition they involve teachers engaging in research in their own teaching settings. This stance by the IRB would stifle important voices and would be unacceptable.

Although there is no easy fix to the positivism inherent in the institutional review board process, Pinnegar and Hamilton (2010) suggested that in order to mitigate positivistic-based objections to self-study research, faculty ought to work with their institutional review boards in order to anticipate misperceptions of the self-study research. What I hope this chapter has provided the reader are some anchor points for conversations or responses to institutional review boards. The permanence and depth of self-study scholarship should serve as an important index to refute disagreements with review boards. The ethical parameters that govern the conduct of the practice alongside the decades of studies that addressed the unfolding ethical questions that emerged in the midst of research should generate trust in the methodology.

Additionally, my hope is that this chapter also demonstrates the ethical integrity of the methodological tradition of self-study for other purposes within the institution such as tenure and promotion. Butler (2016), for example, illustrated some of the challenges he faced as a pre-tenure self-study scholar. His evaluations leading toward tenure consistently questioned the empiricism of self-study research and framed self-study research as basic descriptions of instructional activity. At one point in his pre-tenure career, his department chair encouraged him to abandon self-study scholarship. Despite these challenges, Butler persisted as a self-study scholar but also had to educate his administration on the contours of self-study research.

What Butler's pre-tenure experience highlighted is how resistance to self-study research continues to operate within institutions. However, his story is also a reminder of the importance of educating those in power about self-study research. Butler effectively created space for the next junior self-study scholar at his institution. Within the self-study community, educating others about the methodology is a multi-generational action. The growth of the self-study school is a testament to scholars in the 1990s and 2000s who actively challenged the positivist conventions of academic research and educated others about the potential of systematically peering into the black box of teacher education practice. With a robust international community of self-study scholars, it might be easy to become methodologically dogmatic. However, as a methodological tradition grounded in vulnerability and openness, it is important for self-study scholars to expand the theoretical and methodological contours of the field, which will beget new ethical questions.

From critical theoretical or conceptual standpoints, different ethical perspectives will emerge. For example, de Freitas and Paton (2009) troubled the tacit assumption that the reflexive use of "I" in self-study research evokes unfettered access to an author's thoughts. Drawing on poststructural theory, they argued that the self in reality is a bundle of selves socially constituted and organized. Therefore, the tacit assumption of the use of "I" in self-study research suggests a unitary and stable self, when the self is a constellation of conflicting partial identities. When self-study is considered from a postmodern perspective, ethical considerations such as bias or value are not just assessed by reporting but by the transparency in which the bundle

of selves is acknowledge and how those biases conflict and respond to context and power.

Similarly, Sandretto (2009) explored the potential contradictions that existed when conducting a self-study research project within a poststructural framework. For example, poststructural theories challenge the humanist discourses that underpin self-study research and privilege the narrativization of stories as an accurate retelling of experience. According to Sandretto, poststructural theories trouble this foundational concept and enable us "to acknowledge that our knowledge is limited and partial" (p. 98). Indeed, much of the assumptions made about the ethical character of self-study research in this chapter are based on the belief in the humanist discourses that poststructuralism questions. Based on a different set of theoretical and methodological assumptions such as poststructuralism, the basis to assess ethics would most certainly change.

As a methodological community that has worked diligently to legitimize our place in the sunny fields of accepted research, self-study must continue to extend the vulnerability and humility that characterizes the tradition. Critical theories and methods will continue to challenge, question, and interrogate the concepts and principles that helped define self-study as a methodological tradition. In order for self-study to continue to evolve, the community must embrace how some of the presuppositions and assumptions that have guided the field such as representations of self through a humanistic lens that assumes consciousness, agency, and rationality might be problematic or limiting. The perspectives offered by critical theories and methods such as feminist research methods (Taylor and Coia 2014), visual media (Horwitz 2012), or poststructural theories (Strom and Martin 2013) must be openly and thoughtfully considered and incorporated into our methodological discourse. These new approaches are bound to help the self-study community produce different knowledge *and* produce knowledge differently (St. Pierre 1997). However, critical interrogation does not mean abandoning questions of ethics.

Self-study research will continue to be intersubjective. Even when viewed through a poststructural prism, it is necessary to ask ethical questions of identity, relationships, and public vulnerability. What is the ethical responsibility of self-study researchers to position themselves within relations of power, knowledge, authority, and truth? What ethical sensibilities exist as self-study researchers deconstruct identity or power relations in public? What ethical exigencies exist for those alongside us in self-study research? Ultimately, what ethical "first philosophy" must be applied to self-study research that extends beyond any theoretical, philosophical, or methodological approach? These ethical questions and many more which escape our contemporary imaginations must be put into dialogue and debate as the self-study school continues to explore new questions of self and practice.

As such, it is important for self-study scholars to make ethical dilemmas and issues more explicit in their methodological descriptions. Because self-study intertwines the researcher and the researched, the visibility of ethical considerations of issues such as identity, relationships, public vulnerability, and power not only advances the credibility of the self-study but also helps other scholars recognize the kinds of questions, tensions, and dilemmas that exist when researching oneself.

Ethical transparency will also serve to facilitate the growth of the self-study school. What new ethical considerations must be accounted for when self-study extends into other professional arenas? What fixed and fluid conceptions of the "self" must be considered in self-study research? How will new theoretical approaches challenge standard self-study methodological practices? What ethical guidelines of practice must be reconsidered in light of evolving methodological considerations? Openly discussing ethical issues in the reporting of self-study research will facilitate the legitimacy of self-study in the sunny fields of education research.

Conclusion

In this chapter I have tried to raise a few insights into the ethics of self-study research. Relative to 2004, the self-study methodological tradition is now firmly entrenched in the sunny fields of legitimized educational research. Self-study scholarship has proliferated outside of the initial incubators of the methodology such as self-study-specific books, journals, and conferences. This new reality transforms these venues into incubators for new debates about the form and function of the methodology. The relative legitimacy of the field is important, because the questions of the ethical conduct of researcher and practitioner in self-study research are relatively stable. For example, the seminal work of Bullough and Pinnegar (2001) in *Educational Researcher* was a critical link in establishing quality and ethical self-study practices. As a generation of self-study scholars appropriated and debated those ethical guidelines, self-study methodological modalities gained empirical momentum. Standard ethical practices within self-study became regulated as the community regulated and guarded its ethical and methodological boundaries. Looking forward, as the methodological tradition expands, new theoretical, methodological, and ethical questions will materialize. These new questions must be approached with the reflective stance that characterized the historical arc of the self-study community.

researcher in sociolinguistics; Shawn is an experienced self-study researcher who is new to sociolinguistic framings originating in the Francophone academy. In this chapter, we consider our changing roles as novice and expert to analyze and interpret the ways in which the two research traditions might learn from each other and, in particular, the vulnerabilities and challenges Cécile faced engaging in collaborative self-study as an experienced researcher from other reflexive research traditions. The chapter is thus an analysis of an ongoing collaborative self-study and critical friendship that provides a critique of self-study methodology. We conclude by highlighting the role of language and power inherent in any consideration of self-study methodology and methods.

Introduction

In this chapter, we will use our perspectives as insiders and outsiders to each other's research communities as a device for exploring challenges to self-study from sociolinguistic French scholarship and challenges from self-study to the same scholarship. Cécile is an associate professor of French education at Simon Fraser University and was completely educated within a set of sociolinguistic frameworks in France before moving to Canada 15 years ago. Broadly speaking, her research has explored the teaching and learning of French as a second language (FSL) in minority language contexts in both France and Canada. Cécile has long used a reflexive stance in her work, but, more recently, she has turned to self-study methodology as a way to understand further her identities as a researcher and teacher educator. Shawn is a reader in the history and philosophy of science, technology, and education at the University of Cambridge. He has worked with self-study methodology since beginning doctoral studies with Tom Russell 15 years ago and has been particularly interested in the transition from teacher to teacher educator and the lenses that the history and philosophy of science and technology bring to understanding self-study methodology. Prior to his current position, he was an associate professor of science education at Simon Fraser University.

We began a critical friendship (Schuck and Russell 2005) a number of years ago, and one recurring theme in our work together has been to realize that we move freely between the roles of novice and expert throughout our conversations. For example, Cécile is new to self-study methodology, but she has a robust understanding of how to situate herself within ethnographic and sociological research, particularly within questions pertaining to language acquisition. Shawn is well-published in self-study methodology, but until conversations with Cécile, he has lacked a theoretical framework with which to consider questions in language education, despite having explored language education in a number of ways earlier in his career. A few

personal details are relevant in the interest of being transparent to the reader: we are recently married, and thus we draw attention to the fact that references citing Sabatier are referring to Cécile's work before 2019. We have written academically in both French and English, and we have both taught in both languages, although Cécile has taught more in French and Shawn has taught more in English. Our language of personal communication is French.

Setting the Scene: A Newcomer to Self-Study Methodology (Cécile)

In June 2017, I began my journey into self-study methodology to understand my own practice as teacher of French as a second language (FSL) and teacher educator. I was educated and trained as a FSL teacher in France; my educational background is in sociolinguistics and multilingual language acquisition. I use *la didactique du plurilinguisme* (e.g., Coste 2015), a sociological perspective on language teaching and learning to describe, interpret, and analyze all processes underlying language learning, teaching, and acquisition. I moved into the field of self-study through my involvement in Shawn's research program, ostensibly designed under the broad umbrella of critical friendship method that help him to describe, interpret, and analyze his pedagogy of teacher education using self-study methodology alongside colleagues in teacher education. Early on, I noted the following:

> I understand self-study as a scholarship that helps teachers and teacher educators to make sense of their practice and their assumptions about teaching and learning and to allow them to build strong(er) professional identities. I also understand it as a reflective stance about teaching and learning, supported by theory and an analysis of professional practice. (Cécile's Research Journal, June 2017)

My journey to and through self-study has neither been straightforward nor easy to understand. As someone who was formed in the French Academy, the implicit assumptions created via the largely anglophone scholarship in self-study have been difficult to navigate, although the results have been personally and professionally rewarding. In a chapter explicitly devoted to the history of self-study in the first edition of this handbook, Loughran (2004) was quick to situate the field along a long intellectual genealogy that, in part, reflected broader movements in the academy. Indeed, one might sum up the genesis of self-study methodology in the following way: teacher educators became interested in making explicit the very reflective practices they expected teacher candidates to engage with.

Something that is understandably absent from Loughran's (2004) history of self-study is a discussion of related, concurrent, interests in reflexive practices within French academic circles and traditions of thought. Of course, this is unsurprising given that the vast majority of published self-study work, particularly in the early stages of the methodology in the 1990s, was constructed and enacted in English within scholarly traditions most familiar to the American, Australian, British, and

Canadian academies. When approached to consider the broad theme of "challenges to and from self-study methodology," my immediate reaction was, as a relative newcomer, hesitation. I soon realized, though, that not only were my feelings of uncertainty around understanding self-study and its expectations documented by members of the community (notably by Mena and Russell 2017), but also I was perhaps positioned to ask questions of the methodology that others are not. Although new to this particular methodology, I am neither new to the academy nor to the ideas of reflexive practice, autoethnography, and practitioner-based forms of research. Additionally, as a plurilingual scholar, I recognize that how one approaches intellectual problems and discourses is, in part, a function of the languages one uses to communicate. Indeed, a key feature of my early work in this field has been the relevance of both language and initial academic formation in how one thinks about self-study methodology and practice (e.g., Sabatier and Bullock 2018).

The purpose of this chapter is to offer a provocation to the field of self-study grounded in a continuing self-study of my own transition to the field. In so doing, I hope to add to work begun by Bullock and Madigan Peercy (2018) that explored challenges from inside the self-study literature and outside the self-study literature:

> A review of literature from "inside" and "outside" the field is generative for thinking about the affordances and critiques self-study would do well to address as it moves forward as a methodology, a set of communities, and a vital contributor to research in teacher education. At the outset of this project, we expected to read very different sets of critiques from inside and outside the methodology of study—not only were we incorrect in our hypothesis, but it seems that there was a remarkable coherence to the field regardless of literature. It is clear from the literature, for example, that self-study methodology offers a valuable way to develop professional voice as a teacher educator in multiple contexts, within multiple kinds of pressures. The methodology provides a conduit for a variety of kinds of collaborative work and a way of engaging in the professional development of teacher educators. It is also clear from the literature that self-study is haunted by concerns of relevance within the broader discussion in teacher education; a claim that we find interesting given the number of people writing about self-study outside of the "internal" academic work. (p. 24)

They further posited that part of the confusion around critiques of self-study perhaps lay in nomenclature across traditions. It is this confusion, compounded by both language and academic cultures, that is my jumping off point for this chapter.

Thus I take a slightly different frame to think about challenges to and from the field. My provocation is grounded in my status as an insider-outsider to the field. I am an insider in the sense that I have attended a self-study ("Castle") conference and American Educational Research Association (AERA) sessions, as well as published in *Studying Teacher Education*. I am an outsider in the sense that I have spent the bulk of a 20-year career in research working with ideas from the French academy and, mostly, writing in French. My challenges to self-study come from a consideration of theoretical frameworks with which I am most familiar. The challenges I receive from self-study refer to the ways I have been challenged, indeed disrupted, as a result of engaging in this work. Throughout the chapter, I sometimes write in first person (a challenging task for any French scholar, I might add) when referring to my own experiences in both text and excerpts from the research journal

I have kept for 3 years. The rest of the chapter, with the exception of the following section, is co-constructed by Shawn and me and is written in more of a traditional style to analyze both excerpts of my self-study data and to introduce relevant literature. We hope that moving between first person and third person accounts in this way helps to highlight some of the boundary crossing that we both have had to do as we develop new understandings of self-study together.

Finally, I wish to highlight the role of language as a mediator in any academic work. My thinking is mostly done in French through French primary sources, and so a significant challenge from self-study to me has been to understand ideas framed in English, which are often both linguistically and conceptually unfamiliar. I am indeed grateful to my coauthor and critical friend for talking through these concepts in French and in English to help me mediate these challenges. We have provided all of the English versions of citations from French sources. Given the questions about inclusion and equity that have been raised via self-study methodology (e.g., Kitchen and Bellini 2012; Kitchen et al. 2016; Smith et al. 2016; Skerrett 2008), I hope that this chapter about challenges can be useful for those considering issues around linguistic inclusion, plurality, and self-study.

Setting the Scene: A Newcomer to *la didactique* (Shawn)

In Bullock (2018) I used the metaphor of an "accidental" language teacher educator to highlight my longtime, if tacit, engagement in language education, teaching, and learning. After a few years as a secondary school physics teacher, I took on a unique role in which I was a language and literacy teacher for a group of schools in a large Canadian school board. Doing so afforded me the opportunity to work with elementary and secondary colleagues across all subjects and provided 2 years of professional engagement with educational research under the broad umbrella of literacy education. I retained many of these ideas when I transitioned into full-time doctoral studies and an academic career, most clearly in a paper in which I explored what one might do with ideas around science literacy in teacher education (Fletcher and Bullock 2012).

With hindsight, I realize that I have never had a theoretical framework to interrogate my understanding of language education and in particular to separate discussions around "literacy" and discussions about language acquisition, teaching, and learning. Among other experiences, I took an extended amount of French growing up in Ontario, was required to pass a translation exam as a part of my MA in history, and routinely code-switched between languages and terminology while teaching various martial arts (Bullock 2014). Despite these experiences, it was not until conversations with Cécile that I realized that I was a language educator, despite my unwillingness to identify as such.

As a result our collaborative self-study and critical friendship, I have spent a considerable amount of time learning about *la didactique* from conversations with Cécile, from reading relevant literature, and from attending and presenting at conferences and academic events in France. Thus, our critical friendship, from

my perspective, offers opportunities for both of us to learn from and with each other's immersion in different academic worlds. My role in this chapter has been to a different kind of critical perspective to Cécile. Although Cécile has used *la didactique* as a starting off point from which to understand and interpret self-study literature, I have engaged in the opposite directions. These conversations, mediated between scholarship in two languages, have been enormously useful for me as a self-study "insider" and as a novice "outsider" to *la didactique*.

Distance, Professionalism, Vulnerability, and Self in Research

In this section of the chapter, we explore the challenges and tensions associated with the subjectivity of self-study research and, in particular, how these challenges and tensions manifest for someone who is both new to the methodology and familiar with other conceptualizations of reflexive research. Specifically, we explore three challenges from self-study methodology to those who engage in reflexively oriented research by using vignettes authored by Cécile, who is relatively new to self-study but who is also an experienced qualitative researcher formed by experiences in the French academy.

To begin, we argue that our personal and professional stories are never far from the postures that we deploy when conducting our research. Our experiences as teachers and teacher educators, as well as our life stories, nourish our professional identities (Bullock 2014; Bullock and Sabatier Bullock 2019; Sabatier and Bullock 2019). In self-study, researchers operate from and embrace the premise of their own subjectivity and "present evidence of meaning and relationships among phenomenon from the authority of their own experience" (Pinnegar 1998, p. 32). Yet, assuming the implication of their subjectivity in their research, their posture, and their practice, sometimes, offers resistance and tensions. One early source of tension for me emerged during my participation at the Castle Conference of 2018:

> I feel like a fish out of its aquarium. Shawn has been so reassuring and patient even when I resisted his suggestions for how we might present in a manner appropriate to this conference; yet, I'm so uncomfortable; I'm not sure I will be able to present our work the way he would like us to do. It's too personal. This is not "how" I'm used to talk about research in a conference. I don't want to expose my inner thoughts; I don't want to appear unprofessional... It reminds me of this first day at Simon Fraser University, with all the faculty associate teachers in our teacher education program. How uneasy I felt when I was asked to introduce myself. I spoke about my qualifications, about my work with teachers and what I would like to do with student teachers... they all listened and then somebody asked me: "Yes, but *who are you*, Cécile?!" (Cécile's Research Journal, August 2018)

The frustration I felt with both occasions at which I was asked to, in my view, be personally vulnerable highlights French scholars frequently discuss the difference between *le soi* (the self) and *le récit de soi* (the story of the self), often underlying the complexities of working with both simultaneously. For example, Altet, Desjardins, Etienne, Paquay, and Perrenoud (2013) draw attention to the fact that tensions

transpire when engaging in problematizing one's self into one's practice. Such tensions have to be taken seriously as they may hinder the benefits of conducting self-study in teacher education. To answer the question "Who am I?" is tantamount to being interested in the way we define ourselves and in the representations that we construct in our relationship with others. As Butler (2005) points out, it is in the relationship with others, in their injunction, that we are led to sketch the contours of our identity. Butler argues, in part, that one accounts for oneself when one is asked and that constructing an "I" is, in part, a reconstruction of past actions. Yet, self-study does not solely depend on the ability to reconstruct an experience. It has much in common with Schön's (1983) concept of the *action present* that time period in which one is able to affect one's actions. Put another way, self-study methodology constitutes the *prerequisite condition* as a means of assuming responsibility for one's actions and making sense of one's actions. LaBoskey (2004) framed this as the methodological requirement of being self-initiated and self-focused. Such a focus requires *le soi* (the self) and *le récit de soi* (the story of the self) to interact in ways that were initially uncomfortable for Cécile.

The tension Cécile experienced at the Castle Conference demonstrates that even though she had embraced self-study methodology in theory – mediated via reading relevant literature and writing her first self-study paper – she still had to enact it in her practice as scholar. As LaBoskey (2004) argued, she had to make the results of her self-study public. What is often not clear from self-study literature, however, is that the ways in which one is expected to make the results of practice public go beyond traditional mode of academic knowledge dissemination. A self-study presentation at a self-study conference is a singular experience, particularly if one is used to claiming a degree of distance from one's research, implicitly or explicitly.

Thus Cécile struggled with the idea of appearing inadequate and vulnerable as a researcher, publicly. The transition from the personal to the professional sphere was experienced with discomfort. Cécile was faced with a paradoxical situation: on the one hand, she adopted the multifaceted process of self-study in private; on the other hand, she resisted enacting this "singular experience of the self" (Martucelli 2002, cited in Bertucci 2009, p. 45) in public. For Cécile, the challenge was to reflect on her epistemological postures and to reconsider her role, not only as a researcher but as a witness of her own experience. This reconfiguration leads to engaging *with* her experience instead of thinking *about* it. In her exploration of the meaning that sociolinguists (Cécile's educational background) make of their relationship to their field of research and their research object, Bretegnier (2009) emphasizes that engaging with one's field of research "should not be reduced to an artificial, casual exercise that makes direct causal links between the thematic choices of research and socio-identities and experiential traits of researchers" (pp. 35–36). Put another way: Cécile felt as though she was being put in a position to present her self-study work in a way that precisely opposed the foundations of her academic training. She had to re-examine her ways of knowing by revisiting the epistemic, affective, and social dimensions that were at stake in her identity as a scholar. Fundamental to this process was the question of "distancing"; that is, the implication of researchers within their inquiry.

Distance: How Close Is the Researcher to Their Research?

At the outset of my self-study work, I sought to give meaning to my practice by problematizing my narrative of teacher educator and research. Doing so suggested that I articulate the tensions that arise in conducting self-study and that I use these tensions as jumping off points for as a place of meaningful expressions of self. By doing so, however, I found that professional habitus as a scholar, and some of their foundations, were called into question. One of these foundations finds its source in my scholarly background in sociolinguistics. The distancing or implication of the researcher from their research field is a quarrel that is still discussed in social sciences in general, in sociolinguistics in particular, and perhaps in Francophone sociolinguistics most particularly. It is not an exaggeration to suggest that questions of distance are those most likely to provoke distrust and tension in my journey as a self-study scholar – a fact made all the more relevant by the intensity with which self-study scholars examine the construction of self in relation to identity and practice.

The basic questions of the objective/subjective distance of the researcher from their research object and its subsequent question of the implication/neutrality for the research bear the mark of certain conceptualizations of positivism. For many decades, a particular view of being objective was prevalent, and it claimed that we can read reality from our observations in relatively unproblematic and disinterested ways. Labov (1972), considered one of the first sociolinguists, referred to the "observer's paradox" (p. 209) when discussing the effects of the researcher's involvement in their research design. As Bretegnier (2009) argued: "For the sake of asserting scientific rigor, the figure of the researcher still appeared as a neutral figure, which made it possible to conceal the question of their own representations on their so-called 'object' of research—at the time a delicate or even taboo question. It would have required researchers to think differently about the then untenable paradox of the articulations between 'objectivity' and 'subjectivity'" (p. 29).

We are all likely familiar with the development of the qualitative paradigm drawing from the phenomenological perspective. Researchers have reclaimed more and more their social individuality; yet the fact remains, as Castellotti (2009) points out, that research (and a researcher) which would reflect on its action, its effects, and the changes that it produces into practice is "sometimes still either little recognized, or even badly perceived or valued." As a result, "there is the permanence of an epistemology that considers researchers as being apart, free of psycho-social and emotional enrolment" (Castellotti 2009, p. 138).

It is clear that the sociolinguistic frameworks in which Cécile has operated during her career still carry a certain amount of baggage regarding the distance between the researcher and the research. Her primary framework, *la didactique du plurilinguisme*, sets up French didactics (that are very different from English or German conceptualizations of didactics) as a relational way of understanding how to apply educational theories to problems of practice understood from plurilingual perspectives. Through our self-study work, we have realized that the operating frameworks of *la didactique* still conceptualize the researcher as an actor on the

research, reflexive though they may be, and thus someone with a certain amount of distance. It is small wonder, then, that Cécile encountered some questions when she came to self-study, which blurs lines and concepts of distance even further. Self-study, we have come to realize, is more than reflexive practice. As Loughran (2005) stated, a clear definition and set of methods for self-study methodology have not emerged. But it is clear to us that one of the methodology's defining features is the challenges it poses to distance – and perhaps this is part of the underpinnings of some of the critiques it has received from the research literature.

Questioning Conceptualizations of Professional Ethos

In Sabatier and Bullock (2018), we shared a vignette of Cécile's early experiences as a teacher educator in Canada that has turned out to be a more significant challenge than originally anticipated:

> Early in her career at the university, [Cécile] was asked to introduce herself to a group of teacher candidates. She responded by introducing her professional qualifications and the frameworks in which she worked; as is customary in France. A seconded teacher working within the teacher education programme, somewhat dismissively, stated in response: "Yes ... but who are you?" Cécile was unused to being asked to define her identity to teacher candidates in this way ... there was clearly an accepted way to talk about who one is as a teacher and it did not match her initial expectations. To be asked a question of "Who are you?," in that fashion, implied that her response was somehow lacking in substance and that she had thus failed to cross the border from education professor "from abroad" to teacher educator at Simon Fraser University (SFU). (Sabatier and Bullock 2018, p. 263)

It is clear that there is a cultural dimension to how the concept of a *professional* is constructed; such dimensions are also at play in how we consider the concept of a teacher and a teacher educator. The French term for teacher educator, *formateur des enseignants*, implies a particular engagement with, and responsibilities for, how new teachers come to be. The excerpt above reveals that the culture of teacher education at Cécile's workplace found her way of presenting herself lacking. Perhaps Cécile was particularly attuned to the implications of these sorts of questions because, as a language educator, she recognizes that one of the first things one teaches students of a new language is how to present themselves: one's name, where they come from, and some other basic personal details are the early features of almost any course of instruction. With some further distance from this original incident, Cécile is also prepared to hypothesize that part of the reason she was questioned in this particular way was a result of a difference in the professional ethos of local schoolteachers and the French academy.

Guibert (2013) investigated the reasons for which secondary school French teachers tend to resist engaging in reflexive practice. He argues that French school-teachers tend to develop social representations of the teaching profession that are not very conducive to the construction of knowledge from situated and enacted practice. Instead, they tend to develop representations that are closely adapted to the concept

of *compétence*, a term that might best translate as an action one is able to take based on professional knowledge. Such representations result in the construction of professional identities, the relationship with oneself, and the way in which the relationship to knowledge develops over a career. For Guibert, these representations are culturally rooted in the professional ethos teachers (and researchers, we add) develop about their role as models for others. Such professional representations both draw upon and make a mark upon individual and collective dimensions of professional identity.

It is thus relatively clear both why Cécile had the reaction that she did and why her colleagues likely thought very little about the potential effects of the exchange. Returning to a previous example of Cécile's experiences of the Castle conference, which provoked a profound questioning of her research stance, we can see that self-study of teaching and teacher education practices offers methodological hope for the power of question conceptions about what it means to be a teacher and a teacher educator, including but not limited to the questioning of different professional ethos. Although Cécile already claimed subjective approach in her previous body of research, she would now argue that self-study methodology requires her to adopt an in situ professional stance of a researcher and a realization that she is *in* the research and not simply doing research *on* her practice (in French, we would say this is a difference between *être en recherche* and *faire de la recherche*). Pinnegar and Hamilton (2009) called attention to the ontological stance that self-study research requires, and we see the tension that Cécile articulated between differing conceptions of a professional ethos as crucial to fulfilling said ontological commitment. We also highlight, however, that these two stances, are not incompatible – and it is not just self-study researchers who articulate the compatibility between these stances. Wentzel (2012) considers that *being in research* leads to another way of thinking about practice, of questioning it, and also of understanding and interpreting it. Adopting such a research stance is not easy or simple. It uncovers a final tension that we refer to as *vulnerability as enaction*.

Vulnerability as Enaction

It is one thing to feel vulnerable as a researcher; we expect that most researchers have this feeling across disciplines. We naturally feel vulnerable when sharing new ideas, when arguing against established frameworks, or when venturing into a field for the first time. We would argue that this sense of vulnerability tends to be compounded for self-study researchers, as the object of our study is not particles, literature, or social systems: our research is on ourselves in relation to identity and to our practice. Self-study methodology requires and invites a public scrutiny on who we are in how we teach future teachers. In so doing, self-study requires us to be vulnerable through our own actions as researchers and as teacher educators.

Cécile struggled with accepting the required vulnerability as a researcher in self-study. In fact she resisted it in many ways, at times feeling she was in conflict with herself, with her relation to scientific knowledge, with her practice as scholar, and

with her relation to others, researchers, and systems of thought. Cécile's malaise and feelings of resistance disappeared from the moment she situated herself in the process of "being in research." This unique stance promotes meeting with oneself in an availability of self which in turn allows a disposition of mind conducive to listening, to dialogue, and to what Allender and Allender (2008, p. 145) call "finding power in practice."

When Cécile agreed to turn her vulnerability into enaction, she realized that this vulnerability could be a rudder in the often-turbulent waters of navigating a new system of thinking and research. Schön (1983) spoke of the swampy lowlands of practice; and indeed, self-study owes a considerable intellectual debt to Schön's way of conceptualizing knowledge of practice. For example, he reconceptualized professional knowledge as *knowing-in-action*, and it is here that we suggest that a part of self-study methodology is *vulnerability-in-action*. It is difficult for us to imagine a sense of self-study that does include vulnerability – LaBoskey (2004), for example, argues that we make the results of our self-studies open to public scrutiny. Thus the vulnerability required by self-study methodology is no longer an impediment, but a mechanism for action. One can again find warrant for this approach in the extant literature as well as within the self-study literature.

Roger, Ruelland, and Clot (2007) insist on the importance of professional controversies, loosely defined as an argumentative, structured, and continuous discussion on a given subject. Crucially, one is also required to engage in these experiences with professionals, researchers, or teachers, as mechanisms for adapting and developing practices. Taken in this way, vulnerability is no longer the result of an inadequate relationship with knowledge, but, on the contrary, it is an internalization of an embodied research process which takes into account the fact that each scholar evolves in their own environment, with their own rules, in their own world. It is the premise of the researcher's "motivation to act" (i.e., enaction) in self-study. It is from the awareness of the problematic situation that a process of clarification of conflicting values begins (including during the dialogue with critical friends). Such a process allows a step back necessary to adopt a sufficient emotional distance to mobilize the theoretical and conceptual frameworks which will help us to understand our practice and to transform it. In other words, vulnerability as enaction paradoxically allows Cécile to enter into a process of questioning her practice and her research stance. Embracing her vulnerable self in self-study amounts for Cécile to having a singular experience *of* her "self," *with* her "self," and *by* her "self" (Samaras and Freese 2009).

Through discomfort and in search for equilibrium, Cécile's vulnerability neither halts nor restricts the meaning of her experience and the construction of knowledge that flows from it. In this sense, Cécile's vulnerability is an experience that is both individual and social. According to Molinié (2009), the self "never appears as a fixed point, eternally defined, but as the middle point of the never-ending gravitational pull of individual experience" (p. 121). A reflexive approach such as self-study methodology is also, in itself, a social experience because it calls for "an accounting of all the suffering and the difficulties that accompany the current process of de-composition and re-composition" of professional identities (Tardif 2012, p. 64).

Vulnerability as enaction, then, is a necessary part of self-study methodology that requires an understanding of the effects of individual experiences and collective experiences as teachers, teacher educators, and researchers. Such understanding allows for a process of construction and reconstruction of these professional identities through self-study methodology and a particular kind of openness that Cécile needed to realize in her journey. It is a process full of challenges to and from self-study and to and from the researchers, and it is to these challenges that we now turn.

Self-Study Challenged: *Une posture didactique, du dedans et impliquée*

So far, we have discussed challenges to and from self-study research by considering moments in Cécile's journey as a newcomer to the field, having been formed as a researcher and teacher educator in a language and country without a tradition of self-study as conceived within self-study of teaching and teacher education practices methodology. We labeled these challenges as the challenge of distance, professional ethos, and vulnerability as enaction and, in part, concluded that said challenges required a mindset of *being* in the research, a conclusion supported by Pinnegar and Hamilton's (2009) concern about privileging ontology over epistemology in self-study.

In this section of the chapter, we examine the additional challenges that come from French didactics toward self-study. In many ways, said challenges come from Cécile's initial mindset and the reflective turn required by self-study, even for an experienced researcher familiar with subjective approaches to research in education. Thus while the previous section articulated challenges *from* self-study to Cécile's framework as a researcher and teacher educator, this section explores the challenges *to* self-study that come from Cécile's previous experiences as a researcher within French didactics. Our key organizing framework comes from comments Cécile made in her research journal after about a year of working with the methodology:

> Isn't self-study *une didactique impliquée*, a didactic stance, whose posture is anchored "from within" (*une posture du dedans*) to access the significations of teaching and learning and explicitly give meaning to professional knowledge and problematize teachers' selves in their practice in order to reframe their beliefs in the act of teaching? (Cécile's Research Journal, July 2019)

Motivated in part by work from Bullock and Madigan Peercy (2018), we wish to add to conversations from within the self-study literature by using frameworks and literature not typically employed by self-study researchers. Here again, we aim to navigate challenges to .and from self-study by considering our roles as insiders and outsiders to various literatures and modes of thought. We note that self-study literature tends to argue for a certain coherence about self-study approaches, if not a "correct" way to do self-study. We also note that external critiques of self-study may see this assertion as problematic. We aim to further complicate the discussions

by challenging what it means to "be" in self-study research by using ideas from Cécile formational scholarship, *la didactique du plurilinguisme*. The three challenges to self-study that we explore here are *une posture didactique*, *une posture du dedans*, and *une posture impliquée* – roughly translated as a didactic stance, from within one's self, that requires a self-conscious approach to reflexive research. Each challenge complicates further what we see as a fundamental challenge posed by self-study that of *being* in the research as a teacher educator and as a researcher.

A Didactic Stance/Une posture didactique

In a chapter discussing the ethical considerations of self-study (Bullock and Bullock 2019), we already underlined the necessity of adopting a didactic stance, as understood by the Francophone conceptualization of *la didactique*, rather than a pedagogic one, to engage in self-study methodology. By "didactic stance," we mean the creation of a meaningful learning space which takes interest in acquiring knowledge. In doing so, the didactic perspective cannot be reduced to a simple matter of pedagogy. We also acknowledged the epistemological baggage around the word "didactic" in English, particularly given that the word looks quite similar to the French *didactique* and the German *Didaktik*, despite the fact that the three concepts are conceptualized quite differently in each of the three languages and associated scholarly traditions. Given that the vast majority of scholarship in self-study of teaching and teaching practices methodology has been written in English, we acknowledge that the idea of a "didactic stance" might seem initially uncomfortable for certain readers. We also direct readers to Loughran's (2006) critique of the often casual use of the term *pedagogy* as a synonym for teaching strategy, without reference to the different philosophies and conceptual underpinnings of the term.

Vergnaud (1999) argues that *la didactique* is not to be set in opposition to pedagogy. It tends to concern itself more with the challenges of analyzing the content of the activities involved in learning, particularly from a social and cognitive perspectives. For Coste (2015, p. 18), "*la didactique* operates at a meta-level in relation to pedagogy and what happens in class, or more generally, in activities aimed at learning." It is thus a way of thinking about teaching and learning, grounded in reflexive approaches, situated in practice, and aimed at improving learning. We see immediate parallels with LaBoskey's (2004) requirements that self-study of teaching and teacher education methodology be self-initiated and focused, improvement-aimed, and interactive while using multiple, primarily qualitative methods and seeking exemplar-based validation (pp. 842–852).

The term "didactic" (*la didactique*) directly refers to the theoretical and conceptual framework that is adopted by Cécile when she documents, questions, analyzes, and interprets her teaching and learning practice. *La didactique du plurilinguisme* (plurilingualism) is a conceptual offspring of *la didactique des langues et de cultures* (languages and cultures), itself an offspring of a larger discipline – *la didactique générale* (general) – that aims to articulate theories of teaching and learning within situated professional practice and the social contexts they are embedded in. For

scholars in *la didactique du plurilinguisme*, teaching and learning are complex matters that are situated in multiple social contexts. Like self-study methodology, *la didactique* makes explicit the knowledge inherent to teaching and what Munby and Russell (1994) referred to as the *authority of experience*, which arose from a concern articulated in the following way:

> If Schön is correct that there is a knowledge-in-action that cannot be fully expressed in propositions and that learning from experience has its own epistemology, then our concern is that learning from experience is never clearly contrasted with learning that can be expressed and conveyed in propositions. (p. 92)

Multiple self-study scholars have referred to the authority of experience as a foundational element of knowledge gained from the self-study of teaching and teacher education. Similarly, *la didactique* and its various conceptual progenies arose from concerns about the nature of knowledge gained from the experiences of language educators gained in the crucibles of changes to immigration patterns in France in the late 1960s. *La didactique du plurilinguisme* indeed arose from the interrogations of researchers in *la didactique des langues et des cultures* in the 1990s about the relationships between the teaching of mother tongue and foreign languages and foreign languages between them. *La didactique du plurilinguisme* appears as an attempt which aims "to constitute a body of possible responses to the needs of an educational actions and approaches to teaching aimed at a majority or partially multilingual public" (Dabène 1994, p. 166). Similarly, Coste (2014) argued that researchers and teacher educators need to risk asking themselves and others how *la didactique* is meant to aid in the "development of capacities to act in and with several languages" (p. 455). Like self-study, *la didactique* requires a certain practical orientation to improving practice.

The transition from French didactics focused on languages and cultures to Cécile's particular areas of expertise, those focused on plurilingualism (Dabène 1994; Billiez 1998), or of linguistic plurality (Coste 2015) was characterized by a close and comprehensive examination of the role of the researcher in didactics. More specifically, researchers began to question how individual journeys, professional progress, and the construction of scholarship as social action (in the sense given by Webber (1978) and Touraine (1992)) are intertwined. Moreover, French didacticians began considering how between reflections on and interrogations of their scholarship might be operationalized in order to attain educational changes in pluralistic societies. Thus, like self-study, French didactics are anchored in a socio-constructivist perspective, in which "research is always a work of interpretation and scholars are always in the thick of the research process rather than distanced from it" (Cousin 2013, p. 3).

A Stance from Within/Une posture du dedans

The second challenge we pose to self-study is what we refer to as "a stance from within." While the first challenge, a didactic stance, might be a relatively

straightforward transition to and from self-study, adopting a "stance within" has a certain degree of unfamiliarity for newcomers to self-study methodology. The expression calls attention to the very notions at the core of self-study methodology: reflexivity and reflective practice. It is not difficult to find any number of references to either term in English language scholarship; it is far more challenging to find coherent approaches to either term. Like many popular ideas in educational research, one risks a shallow consensus in which it is far too easy to assume that we are using words in particular ways. As Cousin (2013) notes, for example: "Sometimes reflexivity is treated as a synonym for 'reflective practice' with the result that its distinctive attention to positionality and knowledge construction is neglected or simplified" (p. 4). Cousin's affirmation immediately questions the language used to discuss how to qualify our inquiry stance: is it about reflective (reflect) practice or reflexive (analyze) inquiry? And how are those terms understood, particularly across theoretical frameworks, languages, and context? One person's idea of reflexivity could be another person's concept of reflection, which in turn might be what yet another person calls critical reflection. Such confusion, we argue, seems particularly likely when one conducts self-study across multiple languages.

This set of challenges helps to address explicitly the idea of positionality in self-study and how positionality (or "distance") may generate understandings and insights on our practice in contexts. Engaging in self-study should not be limited to or reduced to a mere confessional account of the limitations of one's perspective on teaching and learning in practice. If the first steps require stopping and thinking about one's practice to problematize it, what Schön (1983) called *problem framing*, the second steps require researcher to adopt an analytical approach that considers "the genesis, the procedures and the consequences of our actions" (Bertucci 2009, p. 44). In so doing, the researcher operating from perspectives offered by French didactics and self-study takes on a stance from within, "demanding a reflexivity of the actor who analyses their actions from the inside" and thus problematizes that assumptions that make their "professional knowledge possible" (Bertucci, p. 44). From this perspective, a "posture from within" allows a reflexive practice with external aim. But *la didactique* offers caution as well: Perrenoud (2013) argued that all forms of reflection are not reflexive. Furthermore, even if we are all capable of reflection, we are not always in a reflexive disposition. Such a disposition is a necessary condition for change; it is a form of lucidity whose components are intellectual, emotional, relational, institutional, and in relation with identities. As Perrenoud (2013) notes:

> The reflexive posture is only relevant for those who live a certain *tension* between their ambitions and what they manage to do. It takes a certain amount of disappointment, frustration and therefore failure for thought to take hold of the problem. (p. 83)

Berry (2007) offered tensions as a framework for analyzing her practices as a science teacher educator. Although there is considerable merit in using her seven tensions as tools for understanding one's own practice, we would argue that the heuristic of tensions itself is of potentially far more value. The challenge of

developing a stance from within to self-study, offered by *la didactique*, offers another set of tensions in addition to those articulated within the self-study literature. This challenge reminds us that the turn-to-self advocated by self-study is not self-evident.

A Self-Conscious Stance/Une posture impliquée

The final challenge to self-study comes from the "meta" level that Coste (2014) argued was essential to adopting a framework of *la didactique*. Doing so implies that one must adopt a "self-conscious stance," which we define as an explicit acknowledgement and definition of just what it means to be in the research and to examine one's own practice. Writing from outside of self-study methodology but within broader anglophone traditions of reflexive practice, Cousin (2013) provided a helpful articulation:

> The methodological debate in practitioner research has shifted from how to minimise subjectivity to that of thinking more about how to bring oneself into the research process self-consciously. This involves an acknowledgement that the self is the research tool in the inquiry rather than a threat to its objectivity. (pp. 4–5)

Writing several decades before, Touraine (1992) warned that "it is difficult to separate the individual from their social situation … the actor is a reflexive mode of construction of social experience and a founding principle of the analysis of the manifestations of individual and collective life" (cited in Bertucci 2009, p. 47). Taking the implications of this claim seriously calls for what Francophone scholar Tardif (2012) referred to as *the return of the actor* (p. 55) in his examination of the research paradigm that has emerged since Schön's work. Within the setting of self-study, meaning making is a social activity even when we are doing it on our own. The scholarly communities associated with self-study call to mobilize the notion of social actor "understood as a principle of intelligibility of the social" (Tardif 2012, p. 55).

The challenges faced by Cécile led her to assert and mobilize the dispositions, motivations, meanings, and ways of thinking that allow her to act in her given situation. She was, in other words, forced to re-examine her role as a social actor. Cécile appears in her self-study researcher thus as a social actor who seeks to understand her social activity (teaching and learning for example). This social activity implies room for maneuver, choices, and decisions on the part of the actor involved in contingent social situations (Castellotti 2009; Tardif 2012). Cécile's choices and positionings are co-constructed in an articulation between the different fragments of her history and all that have contributed to it. They allow her to assert, drawing on her theoretical background (*la didactique du plurilinguisme* and sociolinguistics), a dialectical link between pre-constructed material (her knowledge base derived from her educational background) and elements under construction (her reflection on her action) which are subject to questioning when conducting self-study. Her self-conscious stance is characterized by an adaptation and a constant negotiation of the forms of intervention of the researcher according to what is sought to be understood.

Lastly, Cécile's involved positionality results in a critique of established categories and ideologies that imprisoned her ways of thinking and her social practice (Apple 1995; Tardif 2012; Zeichner 1996), as an individual, as a teacher, as a teacher educator, and as a self-study scholar. Her self-conscious turn requires her to consider the ways in which research in self-study is a force of contestation in the face of established power. For Touraine (1992), "the subject constitutes a social and political actor who moves in a social space to be understood as a field of conflicts, negotiations and mediation between rationalization and subjectivation, which constitute the two aspects that are both opposite and complementary to modernity" (p. 457). Self-study scholars such as Berry and Forgaz (2018) call for a new relationship with knowledge, identities, and power. One way of responding to that call is to consider how self-study methodology demands a self-conscious stance.

Power and Language in Self-Study

In this chapter, we have interrogated Cécile's experiences as an experienced Francophone scholar who has recently begun engaging in self-study methodologies. We have also used Shawn's experiences within self-study as a way to analyze Cécile's transition into the field while simultaneously considering his relative newcomer status to *la didactique*, Cécile's field of expertise. In so doing, we have articulated three challenges from self-study methodology to Cécile's work as a scholar: the challenges of distance, professionalism, and vulnerability each caused moments of tension and opportunities for reframing. We have also articulated three challenges to self-study methodology offered by Cécile's background in French didactics and sociolinguistics: a didactic stance, a stance from within, and a self-conscious research stance. In articulating the latter, we might reasonably ask self-study researchers for clarifications around what it means to adopt stances familiar to both self-study and French didactics, particularly when warrants come from different traditions.

We wish to conclude our chapter with an exploration of two perspectives that arise from the six aforementioned challenges to and from self-study. The first new perspective explores what Cuenca and Park Rogers (2019, p. 45) name "the recognition of power" in self-study research. The second perspective explores the role of language(s) in conducting self-study as Cousin (2013) declares that "we have to use the social tool of language to make knowledge claims and this requires us to think about the implications of this process" (p. 6).

Power and Self-Study

In Cécile's research journal, we find some evidence of her early explorations of power within self-study, largely due to the choices she makes as a teacher educator and as a researcher:

> Self-study is in other words a political inquiry stance. As such, power is at stake between myself, the students I'm interacting with in my classes, my colleagues, but also with any institution that imposes on me what I need to teach and sometimes how I need to teach. Yet, as a self-study scholar, I have to be critical of the social ideologies that are circulating. Which means I also need to be critical of how I represent reality. Which words? Which languages? Languages are far from being neutral. When I use French, it is generative of a way of seeing and talking about something that may be different from when I use my other language, English. Thinking about the words I use, about when I code-switch from one language to the other, is also part of being reflexive, isn't it? (Cécile's Research Journal, July 2019)

Language plays a significant role, here, because Cécile has had the experience of being in the dominant majority culture in France doing research with minority language populations in French urban environments and also being in a minority Francophone context conducting research with minority language populations in mostly English-speaking urban environments. Self-study is a useful way of uncovering Cécile's logics of actions and motivations while reflecting on her struggles in teaching and learning contexts when doing self-study leads to "the potential to critique the rather narrow and instrumentalist view of teacher education practice and scholarship furthered by policies in many countries" (Vanassche 2018, cited in White and Jarvis 2018). In doing so, this critical approach, as soon as it starts, uncovers the inextricable relations that link Cécile's own knowledge and ways of thinking and the social ideologies about learning and teaching, about identities, and about the social relations of domination. The need to better explore these ideologies and reflect on the connection between the reflective practitioner (be it a teacher, a teacher educator, and/or a scholar) and the sociopolitical issues related to education is conducive of power structures that crisscross self-study, whether we like it or not. Cuenca and Park Rogers' account to attending to the (in)visibility of power in self-study resulted in the call for "more attention to be given to the ways in which power shades the ethics of engaging in collaborative self-study research" (p. 55).

Languages in Self-Study Research

As a "basis for knowing" (Bullock 2009) and a space for developing professional knowledge about teaching teachers, self-study methodology uses language as a heuristics for meaning making and interpretation. When Cécile writes about her experiences in one of the two languages that are part of her linguistic repertoire, or when she mixes the two idioms, she sets in motion a series of linguistic and cultural mediations that give meaning to her subjectivity and that deserve to be interpreted. In order to identify her logics of actions as teacher, teacher educator, and researcher, and to highlight the identity foundations that underlie her activity, it is thus necessary to align her subjective dimension with a methodological device (a sociolinguistic, cultural, and critical discourse analysis) that allows to study the words that give meaning to her subjectivity, her history, and her experiences. Cousin (2013, p. 6) mentioned that "Once we name something, we have created a cultural layer to it; we have assigned to it a signifier."

The question of languages in research and scientific writing brings out a resolutely new sociolinguistic perspective in doing self-study. It focuses on the notion of mediation that Aden (2012) defines as being "at the foundation of our shared understanding." Mediation underlies all the situations and processes of linguistic and cultural contacts facilitating (or not) the circulation of information, interpersonal relationships, and social integration (Huver and Lorilleux 2018). It refers to any intervention that aims to reduce the distance between two (or even more than two) poles that are in tension with each other. When conducting self-study research in two languages, Cécile engages in a concatenation of linguistic, cultural, and cognitive mediations that make content and contexts intelligible.

Alternating between the use of French and English or otherwise interacting in multi- or plurilingual mode within the same turn of phrase highlights that linguistic plurality needs to be more investigated in conducting self-study research. The circulation of ideas, concepts, and notions, from one framework to another, from one language to others, lies in the ways in which these ideas, concepts, and notions are transformed by the different linguistic and intellectual traditions (Zarate and Liddicoat 2009). Exploring the ways in which they shape our understandings and insights of our practice will help us to gain a deeper understanding of changing research contexts and take into account other norms and modes of thinking. McDonough and Brandenburg (2019) address this issue by urging self-study researchers to "engaging with ethical issues in and across cultures" (p. 175).

Perplexing Politics: Framing Challenges to and from Self-Study

Self-study methodology is challenging as a research approach because it examines the extent to which one is living out one's values. It requires one to discuss and re-examine them in a way that values can evolve in response to examined practice (Russell 2007). By nature, self-study calls for a variety of theories and multiple qualitative methods. As Samaras and Freese (2009, p. 9) note, "self-study scholars come from various theoretical orientations and conceptually frame their studies accordingly." By doing so, "there is no one way, or correct way, of doing self-study. Rather, how a self-study might be done depends on what is sought to be better understood" (Loughran 2007, p. 15). Throughout both our work together and in the writing of this chapter, in which we have deliberately crossed boarders of language and academic cultures, we have explored perspectives offered by both power and language in an effort to better understand the perplexing politics of self-study methodology.

We recognize that there are any number of ways in which one might frame challenges to and from self-study. Bullock and Madigan Peercy (2018) examined challenges raised from within self-study literature and those raised in the extant literature, concluding in part that there was perhaps not as great a difference in concerns as one might originally think. In examining challenges to and from the self-study, we argue that one must always begin with an acknowledgment of what Segall (2002) called the *reading positions* associated with the endeavor. For example, we might examine questions such as: What categories of research and associated

assumptions are we adopting and discussing in our work as self-study scholars? What frameworks, paradigms, and discourses shape our foundational ideas as teacher educators and as researchers? What are the intellectual and social histories of these ideas? How do our assumptions frame our understanding and insight about teaching, learning, and our identities?

These questions bring to mind Bullough and Pinnegar (2004) discussion of the "four perplexing clusters of problems for self-study," which are the problems of definition, ontology, form, and scholarship (p. 340). We have touched on each of these throughout this chapter via an examination of a research tradition, *la didactique*, that has not been widely explored within most anglophone scholarship although it shares many of the goals of self-study methodology.

In this chapter, we have taken the perspectives of a researcher at once new and experienced to highlight the perplexing politics of challenging self-study. We, as a research community, naturally expect self-study of teaching and teacher education to challenge newcomers, but to what extent do new ideas from other research traditions continue to permeate the corpus of self-study literature? In the years that come, we hope that both novice researchers and experienced researchers from other methodological traditions continue to contribute to self-study methodology. In particular, we challenge both newcomers and the existing community to explore, from first principles, the epistemological, ontological, and axiological assumptions they have both about self-study methodology and about other methods and methodologies they seek to combine within a self-study framework. If self-study methodology is a hybrid methodology, as Bullough and Pinnegar (2001) suggested, then how do researchers from other methodological traditions navigate this hybridity in their own work. Additionally, we strongly encourage researchers who conduct self-study research in languages other than English to make explicit the particular challenges and opportunities that multiple languages offer to self-study. We hope to read more cross-cultural and crosslinguistic self-study research, written in multiple languages and for multiple academies. For those familiar with existing traditions of self-study in English, this will require a willingness to work through the history of the development of the field over the past 30 years with fresh pairs of eyes. For those new to self-study, this will require a willingness to help self-study researchers understand the ways in which other research traditions have grappled with similar ideas, particularly in other languages. In both cases, it is important to resist the temptation to automatically assume that we are either talking about the same issues using different words or approaching ideas in diametrically opposed ways. We hope that this chapter has provided one illuminating possibility: a consideration of the ways in which self-study both challenges and can be challenged.

Part III

Self-Study and Teaching and Teacher Education for Social Justice

The third part of the *International Handbook of Self-Study of Teaching and Teacher Education Practices* encourages the self-study community to increase its explicit commitment to social justice, embrace a more political stance, and, ultimately, engage in self-studies that result in social action and change. The part begins with chapters that lay the theoretical foundation for research in self-study and teaching and teacher education for social justice. In the second segment of the part, chapters move from analysis of theoretical frameworks and review of the self-studies conducted in the past to illustrations of current self-study research focused on application, social action, and ultimately change. The chapters in this part invite teacher educators to examine how to combat blatant and implicit violations of power and privilege across the globe and focus on the teaching and teacher education of those who are marginalized, invisible, and voiceless.

The Role of Self-Study in Teaching and Teacher Education for Social Justice

16

Monica Taylor and Michael Diamond

Contents

Abstract

Some concerns for inequity and injustice have always been present in self-study, but the blatant violations of power and privilege abound today globally. There is a constant threat to those who are not part of the dominant culture. We continue to grow more and more concerned for the rights of all who are othered: children,

those of color, women, non-binary people, the LGBTQ community, poor, second language learners, immigrants, non-Christians, and people with disabilities. We recognize that examining oppression through an intersectional lens can magnify the impact of these injustices. We worry about all those who are marginalized, invisible, and voiceless: children and young people in our schools, the teachers who work with them, our school families and communities, our preservice teachers, and ourselves as teacher educators in schools, community colleges, and university settings.

In this overview chapter, we begin by reflecting on how the S-STEP community has examined issues of equity and social justice in teacher education. We describe the ways in which this focus has emerged from the early Castle Conferences, several edited collections, to an extensive volume of articles published in the *Studying Teacher Education* journal. We then discuss the themes that have arisen around issues of social justice within S-STEP with illustrating examples from over 30 years of research. Finally we conclude with a preview of the chapters in the social justice section and the possibilities of self-study research for the future. Our intention for this chapter is to encourage the S-STEP community to increase their explicit commitment to social justice, embrace a more political stance, and ultimately engage in self-studies that result in social action and change.

Introduction

This is one of anger's most important roles; it is a mode of connection, a way for women to find each other and realize their struggles and their frustrations are shared, they are not alone, not crazy. If they are quiet, they will remain isolated. But if they howl with rage, someone else who shares their fury might hear them, might start howling along. (Traister 2018, p. 230)

These movements aren't about anger. We're not angrily saying "Black Lives Matter." We're declaring it. It's a declaration. We want to be seen as robust, full human beings that have anger and have joy. We want to be able to just freely have that joy. Like everybody else does. (Cullors and Burke 2018)

At the time this chapter was written, we were acutely aware of the troubled times in which we were living. Never in our wildest nightmares would we have predicted that in 2019 we would be worrying about the rights of so many marginalized people. Inequity and injustice have always been present in our work in self-study, but the blatant violations of power and privilege abound today globally. There is a constant threat to those who are not part of the dominant culture, to those who are not white, male, heterosexual, middle/upper class, dominant language speaking, Christian, and able-bodied. We continue to grow more and more concerned for the rights of all who

are othered: children, those of color, women, non-binary people, the LGBTQ community, poor, second language learners, immigrants, non-Christians, and people with disabilities. We recognize that an intersectional lens can compound this oppression too. We worry about all those who are marginalized, invisible, and voiceless: children and young people in our schools, the teachers who work with them, our school families and communities, our preservice teachers, and ourselves as teacher educators in schools, community colleges, and university settings.

We react to these times as "robust, full human beings" (Cullors and Burke 2018) with a mixture of emotion, anger, joy, sadness, frustration, and love. Our emotions unite us as they help us to cross the boundaries and borders and move into collective action. As Traister (2018) reminds us, being quiet limits our capacity to transform, and so we need to "howl with rage" (p. 230) to find others who are howling and together devise ways to fight for justice. We want all humans to have the freedom to "have that joy" (Cullors and Burke 2018) and so in our self-study community, we too can come together to fight for social justice.

How can we advocate for, and empower those whose human rights are under attack? How can we ensure that our self-study work of examining how to prepare and develop teachers demonstrates an explicit and transparent commitment to social justice and equity for all? How do we help to push ourselves as self-study researchers to move from talking about these commitments theoretically to taking them up and enacting them in our teacher education practices and research? How do we extend our self-study scholarship in ways that invite agency and activism? How can we impact and transform pedagogy, curriculum, and school structures to be more equitable, to open spaces for and elicit the voices of those who are so often invisible and voiceless, and to use our scholarly platform as a means of partnering with those who are othered and collaboratively working toward change and transformation?

Although not all self-studies revolve around questions of social justice, they potentially could because as Griffith et al. (2004) wrote in their chapter in the last handbook, "A self-study does not require asking questions about social justice, but moral and political issues are swimming just below the surface if one cares, or dares, to look" (p. 656). Picking up on these moral and political issues, from its inception, some members of the Self-Study of Teacher Education Practices (S-STEP) community have used the self-study platform as a means for analyzing and understanding how we address equity and justice in teacher education. Griffiths et al. (2004) explained: "Self-study provides a useful and organic way to address issues of equity and justice. We can use self-study to uncover the ways in which an unjust society is mirrored in our assumptions, teaching practices, and beliefs about the world" (p. 656). With a focus on how we prepare teachers to combat inequity and address the needs of the marginalized and others, we could conduct self-studies in order to become "conscious of our as yet unconscious responses in order to reflect on and reconstruct them" (pp. 656–657). The self-study process provides "a pathway to change" (p. 657) moving away from notions of difference and diversity as "problems" (p. 659).

We recognize that in order for our research to continually strive for social justice, the S-STEP community has to acknowledge that as Griffiths (2003) wrote, "Social justice is a dynamic state of affairs that is good for the common interest where that is

taken to include both the good of each and the good of all, in an acknowledgement that one depends on the other. The good depends on mutual recognition and respect and also on a right distribution of benefits and responsibilities" (p. 54). Working toward social justice requires that individuals are willing and committed to research that serves their own needs as well as the needs of the greater good. This stance involves a reciprocal interdependence that relies on collaboration and a shared sense of purpose, two distinct qualities of the S-STEP community.

Social justice work is challenging, emotionally taxing, and at times risky. There are no easy answers when we open ourselves to examine diversity, difference, equity, and discrimination and more often than not what we discover can "implicate us personally, at least partially, in the injustices we uncover" (Griffiths et al. 2004, p. 656). The riskiness and discomfort of exploring social justice issues may explain why some self-study researchers shy away from this focus and yet, as we demonstrate below, some members of this community have been concerned with inequity since its inception. We only hope that this chapter will provide the impetus for others to join in our fight for justice.

Besides the necessary mutuality of social justice work, conducting self-studies focused on social justice is an ongoing and never fully attainable process. "It is," wrote Griffiths (2003), "dynamic in that it is never–could never–be achieved once and for all. So getting it is a matter of resolving possible tensions about the well being of individuals, of whole societies, of social political groups" (p. 54). Researching for social justice is a utopian endeavor, one that is always under construction and never fully actualized. This is a daunting challenge to face – how do we continue to find the strength and hope to do this work when it is never achieved and never ending? Perhaps it is in communities like S-STEP that we have the collective support to cultivate the courage and commitment to keep working through these issues.

In this chapter, we begin by reflecting on how the S-STEP community has examined issues of equity and social justice in teacher education. We describe the ways in which this focus has emerged from the early Castle Conferences, several edited collections, to an extensive volume of articles published in the *Studying Teacher Education* journal. We then discuss the themes that have arisen around issues of social justice within S-STEP with illustrating examples from over 30 years of research. Finally we conclude with a preview of the chapters in the social justice section and the possibilities of self-study research for the future. Our intention for this chapter is to encourage the S-STEP community to increase their explicit commitment to social justice, embrace a political stance, and ultimately engage in self-studies that result in social action and change.

Part One: The S-STEP Community and Social Justice – Our History

From its inception, there existed a small number of S-STEP members who were committed to examining issues of social justice. Their concerns were not those of the majority nor were their self-studies necessarily positioned as addressing issues of

inequity or social justice. As Griffiths et al. (2006) reflected, "It is possible to say *both* that self-study research is replete with studies related to social justice *and* there is very little self-study of social justice issues" (p. 229). At the first Castle Conference in 1996, there were three self-studies that centered on topics that implicitly fall under the umbrella of social justice. These included one self-study that examined the identity of an Asian teacher educator (Oda 1996), a second that explored the "multicultural" perspectives of teacher educators (Johnson and Allen 1996), and a third that investigated how teacher educators support "special education" teachers (Lomax et al. 1996). These themes were perhaps more diluted than the ways in which we currently think about injustice, and yet they were consistent with those that emerged during the 1990s. In particular we saw interest in singular identity characteristics of teachers and teacher educators and anti-racist and equity-oriented paradigms that fell under the umbrella of "multicultural education" (Banks 1997; Gay 2000; Ladson-Billings and Tate 1995; Sleeter and Grant 1987) and increased concern about the implications of the Individuals with Disabilities Education Act (IDEA 2004) and the ways to support special education teachers (Yell and Shriner 1997). These three self-studies represent an initial and relatively safe exploration of those who are marginalized or othered. There was one additional self-study however that did use the term "social justice" in its title that focused on how bicultural factors influence teacher educators as agents of social justice (Garcia and Litton 1996). This was the first mention of "social justice" in the S-STEP community.

Two years later, in 1998, at the S-STEP Castle Conference, the number of self-studies addressing even the faintest aspects of social justice doubled and their lenses expanded to include issues of gender, feminism, sexuality, immigration, and diversity (Butler et al. 1998; Hamilton 1998; Hamilton and Guilfoyle 1998; Perselli 1998) and teacher education practices supporting "social justice" (Vavrus and Archibald 1998). These self-studies provided teacher educators with opportunities to explore their own experiences of injustice through the tenure process (Hamilton and Guilfoyle 1998), their own immigrant identities as a resource for their teacher education practices around diversity (Butler et al. 1998), sex and gender as personal/political terrains in a junior high school (Perselli 1998), and teacher education practices for diversity and social justice (Hamilton 1998; Vavrus and Archibald 1998).

Taking a look through the proceedings of the S-STEP 2000 Castle Conference, it is apparent that not only did the number of self-studies focused on social justice issues continue to increase, but the studies themselves seemed to narrow and deepen in terms of critical reflection and explicitness. Of the eight self-studies in 2000, Anderson (2000) examined how to incorporate "aboriginal" or what might currently be called indigenous perspectives in teacher education practices, while Brown (2000) confronted the myth of racelessness, and Johnston (2000) considered how students could act as "cultural consultants." Griffiths (2000) and Hamilton (2000) both problematized the challenges of working for social justice and the often uncomfortable and subversive hats that we take on as advocates and change agents. Guidry and Corbett-Whittier (2000) looked at how their teacher education practices could challenge stereotypes and Teemant et al. (2000) investigated how their

teaching could nurture cultural, linguistic, and learning diversity. Finally, Manke (2000) analyzed power dynamics and the ways to understand them.

In response to this heightened examination of social justice within the community, in 2001, a conversation about focusing more explicitly on social justice issues emerged on the S-STEP listserve (Kitchen et al. 2016b). Teacher educators discussed their concerns about inequities and their commitment to teacher education as a means of rebalancing. Opening these conversations was a risky endeavor, and the reception was mixed, with some feeling as if they were being personally attacked and others responding with enthusiasm to the idea of facilitating conversations about "diversity from members living in the borderlands of identity" (p. 2). As so often is the case, many continued to discuss these tensions that had arisen within the community at the 2002 Castle Conference.

Interestingly, even though several self-study researchers emphasized the need to devote more time and attention to social justice issues in 2001, the 2002 Castle Conference only included four papers that revolved around this focus. All of these papers, however, critically investigated issues of power and privilege. Bass (2002) developed a self-study that examined privilege and race. Cockrell et al. (2002) explored the use of theater of the oppressed as a reflective tool for self-study. Johnston expanded her initial self-study on students as cultural consultants (Johnston 2000), collaborating with Johnston et al. (2002). Finally, resilience and resistance in urban teacher education were the focal points for Peterman and Marquez-Zenkov (2002).

The conversations about the centrality of social justice in teacher education and more specifically the S-STEP community continued during the 2002 Castle Conference. As Griffiths et al. (2004) described in their handbook chapter, this conference discussion led to a proposal of a diversity theme for the following conference. "The proposed theme" however "obviously touched an edge" (p. 693) as several in the community questioned how conference themes were decided. Similar to what we have written above, Griffiths et al. (2004) noted how little social justice work was included in the self-study field prior to 2004. Regardless of the limited attention to this in the past, they argued that the very nature of self-study invites reflection of the tenets of social justice. They wrote "the process of self-study contains the respect for humanity that is in accord with social justice" and "the work of social justice involves knowing the self" (p. 655). They wondered why others didn't see these connections and surmised that more than anything else researchers were fearful of critically examining their power and privilege. They asked "How much defensiveness is there protecting new identities and privileged social positions? Are we airing dirty laundry?" (p. 655). They recognized that "We don't always want to look. These are hard questions. Issues related to diversity, difference, equity, discrimination, and injustice have no easy answers and often implicate us personally, at least partially, in the injustice we uncover" (p. 656). But ultimately they wondered, "Can we afford, in teacher education, to be safe?" (p. 656). They saw it as imperative for self-study scholars to reflect on the lack of commitment to social justice of the community and the need for all of us to push out of our comfort zones and probe issues of power and privilege.

Despite some of the dissention and not having an explicit diversity theme, as many as 12 of the papers at the 2004 Castle Conference focused on social justice issues (Fitzgerald et al. 2004). Notions of social justice ranged from focusing on multicultural perspectives (Canning 2004) and teacher identity in a multicultural world (Vavrus 2004) to examining oneself and one's discourse from the lens of racism (Fitzgerald 2004; Spraggins 2004), feminism (Coia and Taylor 2004), gender equity (Seaton 2004), and Marxism (Perselli 2004). Teacher educators studied their own practices within the contexts of urban school reform (Craig 2004) and diverse classroom communities (Heston and East 2004; Tudball 2004). Fitzgerald et al. (2004), in particular, intentionally crafted her self-study to explicitly investigate her own biases in response to the tensions that emerged in the listserv conversations. She came to the realization that as she evaded "facing white privilege" (p. 111) she gave her students permission to do the same. Finally, Griffiths and Poursanidou (2004) and LaBoskey (2004b) both looked very specifically at how they taught about social justice to beginning teachers and how their students in turn took up these stances.

Self-Study and Diversity: Volume 1

Some of the 2004 Castle papers were later developed and published in the first volume of *Self-Study and diversity* (2006), a collection "grounded in the acknowledgement that educators have responsibility to address equity and access issues inherent in teaching" (Tidwell and Fitzgerald 2006, p. xiii). Chapters ranged from addressing diversity in terms of race, ethnicity, gender, disability, and power, as well as broader issues of social justice, multiculturalism, and ways of knowing. As a whole, these self-studies revolved around change in relation to equity, access, and social justice. Many of the authors, however, were still of dominant cultures. They used self-study to examine their positionalities and their approaches to teacher education pedagogy for social justice.

More specifically, this 2006 edited collection was organized into five sections according to self-study methodologies used. Section one focused on the use of the autobiographical method as a means of examining how to address difference. Through an exchange of life narratives and musical histories, Pritchard and Mountain (2006) demonstrated the power of sharing stories as a means of finding connection and affirming diversity. In his self-study of raced and gendered discourse in a classroom of African-American students, Spraggins (2006), an African-American teacher, was able to uncover his own prejudices. In section two, authors used explicit theory to guide their autobiographical process. Taylor and Coia (2006) problematized their authority in their teacher education classes using a feminist lens. As they unpacked their co/autoethnographic process, they begin to notice the authority they share in their collaboration mirrors how authority is reciprocally constructed in their classes. Using Marxism as a theoretical agitation, Perselli (2006) probed her teaching stance, committing to unearthing assumptions and sitting within the unknown. Finally Vavrus (2006) and his preservice teachers engaged in multicultural critical autobiography as a means of disrupting the status quo. Teacher

educators examined how they teach preservice teachers to develop a social justice stance (Freidus 2006; East 2006; Kroll 2006) in section three. The next section included collaborative self-studies of teacher educators problematizing their commitments to social justice (Fitzgerald et al. 2006), their professional development of mathematics teachers who work with students with learning disabilities (Guðjónsdóttir and Kristinsdóttir 2006), and the conflicts and tensions that arise between the objective and subjective nature of teaching when examined through a lens of race, gender, power, and class (Good and Pereira 2006).

Finally in the last section, authors used artifacts and visual representations to explore their self-studies. Using photographs, Griffiths et al. (2006) examined the power dynamics in their research partnership in a university setting. Manke and Allender (2006) explored how artifacts facilitate understandings of diversity. Tidwell et al. (2006), similarly, wrote about how teaching practices and contexts can be unpacked for cultural differences through the creation of nodal moments. Throughout this first edited volume, the complexities of walking one's talk as socially just educators who are negotiating power and privilege came up again and again. Several authors noted how important it was to make themselves vulnerable to inquire about these issues honestly and thoughtfully. Much like the initial stages of any body of work, the collection was the first step or tiptoe for the S-STEP community to begin to explore issues of diversity and inequity. Many of the authors, writing from dominant racial positioning, began by examining their own identities as teacher educators through a singular lens of identity. Others focused on the challenges of preparing teachers for diversity and teaching for social justice while a third group experimented with alternative and creative methodologies. Most of the chapters remained relatively neutral or even apolitical.

Self-Study and Diversity: Volume II

Ten years later, in the 2016 volume, a larger number of international teacher educators addressing diverse populations and issues within education were included. Attention was paid to inviting teacher educators from much more varied contexts beyond the United States such as South Africa, Thailand, India, United Arab Emirates, and Canada. In this volume, there was an increase in inclusion of non-dominant voices from diverse cultures. With this shift, the volume editors also noted a shift "in the diversity discourse from the margins of self-study, and teacher education more broadly, to being one of the important issues of concern to teacher educators" (Kitchen et al. 2016b, p. 1).

This volume included five critical autobiographical self-studies in which marginalized teacher educators explored their own stories of "coming to know themselves and their cultural contexts in order to become effective teacher educators and agents of change" (Kitchen et al. 2016b, p. 5). In particular, Kitchen described his experiences as a queer teacher educator and reflected on how his journey has been inside out (Kitchen 2016). As an indigenous teacher educator, Hodson (2016) recounted his experiences of powwow and time among the Maori as a "powerful process of

decolonization for Aboriginal men" but also an essential lens for preservice teachers (p. 29). Cortez-Castro (2016) narrated the complexities of trying to succeed in the dominant culture as feminist Chicana. Using her vivencias, or lived experiences as testimonio, she provided a model of resilience and courage for socially just teacher educators. Similarly, through participatory action research, Mazurett-Boyle (2016) and Latin@ teachers with whom she worked provided counterstories to disrupt the dominant narratives about English Language Learners. Finally Sowa (2016) explored the complexities of educating preservice teachers in the United Arab Emirates about teaching for social justice within a context that has traditions and customs that restrict equity for all.

Additionally, there are chapters within this volume that examine the challenges of teacher education in and across diverse settings and contexts. Ratnam (2016) described the process of mentoring an Indian colleague to move from a teacher educator to a researcher. Within this complex mentorship, cultural norms and positioning had to be mediated and negotiated. Through what they call aesthetic memory-work, Pillay and Pithouse-Morgan (2016) created a space to problematize their personal and professional connection and separateness. Their collaboration provided them with a new way to frame their work with university educators in the South African context. Nyamupangedengu (2016) constructed a self-study that chronicled her transition from teaching high school genetics for 14 years in Zimbabwe to developing culturally responsive curriculum and pedagogy in the science of genetics course for preservice teachers in multiracial South Africa. Faikhamta (2016), another science teacher educator, focused on his pedagogical content knowledge in the Buddhist context of Thailand. He drew connections between the reflective process of Buddhism and self-study and sees the way each can support one another.

Finally, two chapters in the 2016 collection addressed the complexities of promoting socially just teacher education when the teacher educators and the preservice teachers themselves are part of the dominant culture. In his chapter, Brubaker (2016) illustrated the process of developing a critical thinking course where preservice teachers were invited to investigate their assumptions about classroom discourse, civil rights teaching, and the larger concept of freedom through dialogic inquiry. Meacham and Meacham (2016), two teacher educators, drew from their own othered experiences as an African-American and a Korean, to design and teach disruptive literacy practices for multicultural literature to their mostly white preservice teachers. These practices push their students to move away from dichotomies and extremes and move toward a more nuanced and complicated framework.

Gender, Feminism, and Queer Theory in the Self-Study of Teacher Education Practices

Prior to the release of the above edited collection, with the hopes of a more narrow examination of gender and sexuality, Taylor and Coia (2014a) curated a collection of self-studies. The volume began with a literature review, providing an overview of the emergent themes within the fields of gender, feminism, and queer theory in

the S-STEP research from its beginnings until 2013 (Taylor and Coia 2014b). Some highlights from the literature review included the consideration of gender with an intersectional lens (Brown 2000; Conrad et al. 2010; Khau and Pithouse 2008; Mulholland and Longman 2009; Schulte 2005, 2009; Tamdgidi 2009); gender stereotyping in schools, with preservice teachers, or in university contexts for teacher educators (Brown et al. 2008; Perselli 1998; Weber and Mitchell 2000; Wilcox et al. 2004); and the relationship of gender, power, and agency (Cole and Knowles 2004; Khan 2012; Perselli 2004; Thomas and Beauchamp 2010). A number of the self-studies used a feminist framework to analyze practices and problematize authority in the classroom (Arizona Group 1996, 2000; Coia and Taylor 2004, 2013; Hamilton and Guilfoyle 1998; Kuzmic 2002; Manke 2000; Masinga 2013; McNeil 2011; Sandretto 2009; Taylor and Coia 2006, 2009, 2010; Skerrett 2006). Finally Taylor and Coia (2014b) pointed out that the focus on sexuality and the use of queer theory in teacher education in general has only become more common in the last 15 years. In the S-STEP community, the first self-studies focusing on sexuality began in 1999. For the most part, there were several self-studies that discussed addressing the sexuality of K-12 students and teachers. For example, in their self-study, Mulhern and Martinez (1999) examined confronting homophobia, Heston (2008) reflected on the challenges of addressing sexuality in teacher education, and Brown et al. (2008) described the potential constraints that religion poses on preservice teachers and their acceptance of LGBTQ students. Moving to a focus on teacher educators and their sexuality, Weber and Mitchell (2000) analyzed how dress could conform or oppose gender and sexuality expectations, while Biddulph (2005) used mural making as a means of problematizing his identity as an out gay teacher educator. Additionally several self-study researchers used queer theory as a critical lens for their examination of their teaching practices (Manke 2005; Perselli 2002; Thompson 2006).

Within the volume, several of the chapters focused on "thinking with theory" (Mazzei and Jackson 2012), in particular feminist and queer theories. Strom et al. (2014) explored their process of becoming using rhizomatics through a poststructural feminist lens. In doing so, they were able to disrupt the binaries that often constrain in academia, and they began to examine themselves as more of a collective which opened new ways of thinking about their identities. Continuing to think with theory, Hamilton and Pinnegar (2014) argued that self-study always exists in a zone of inconclusivity. To illustrate this concept, they analyzed their previous self-studies through feminist, positioning, and queer theories. Two chapters, using gendered and feminist lenses, addressed an important but often overlooked issue: the role of emotions in teaching and learning. Using a feminist epistemology of emotions, Forgasz and Clemans (2014) analyzed their teaching practices to demonstrate how important feeling is as a legitimate way of knowing when becoming a teacher. Using a masculine researcher lens, Kuzmic (2014) also explored the epistemological significance of emotions as part of his researcher subjectivity and self-study methodology. He very honestly problematized how his male privilege continued to favor his rationality, dismiss his emotions, and perpetuate the patriarchy. Moving from the patriarchy to the matriarchy, Tidwell et al. (2014) explored how growing up in a matriarchy influenced her notions

of gender in her teaching practice. Incorporating family stories, narratives of early teaching experiences, and her current work as a teacher educator, she presented complex scenarios through a matriarchal lens. Brubaker (2014) also examined his gendered assumptions when he taught a preservice teacher education course on diversity. Acknowledging that most of his students were female and identified as religiously conservative, he described the challenges of democratic practice and maintaining his commitment to diversity. Kitchen (2014) described the usefulness of queer theory as a means of exploring his teacher educator identity anew. Re-examining past self-studies, he was able to illustrate the potential of queer theory as a means of disrupting masculinity and heteronormativity. Applying queer theory, Martin (2014) then deconstructed mythological stories alongside his own elementary teaching narratives to reveal gender norm conformity. He demonstrated how ingrained gender norms are in our schools and society and how difficult it is to combat these norms. Finally, Coia and Taylor (2014) used what they called a "nomadic jamming" to examine the teaching of a course on gender and education. They reflected on how their poststructural feminist beliefs enabled them to embrace the unpredictable and take a stand on fighting for social justice.

Studying Teacher Education: A Journal of Self-Study of Teacher Education Practices

Beyond edited volumes, we realized how important it would be to examine the S-STEP community's journal, *Studying Teacher Education* (*STE*), and articulate how issues of social justice have been taken up there from 2005 to the present. Analyzing journal articles across time helped us to further identify key voices, notice patterns and trends, and set the stage for the salient features that we highlight in the section below.

It is not surprising to note that the first *STE* articles to address issues of diversity and social justice were written by Griffiths and Poursanidou (2005) and Schulte (2005), as their voices were prominent in the first handbook as well. Building upon previous work, Griffiths and Poursanidou (2005) narrated their collaborative self-study on teaching social justice issues to preservice teachers. They argued that social action can only be taken in collaboration with others, even if working together across differences can prove to be challenging. Recognizing her own identity markers in her students, Schulte (2005), in her courageous self-study, found that examining her own white privilege helped her to scaffold these sorts of explorations for her preservice teachers. She realized that to prepare teachers for diversity and multiculturalism they first have to examine their own identities and power. As the first *STE* articles on social action and diversity, these articles laid a critical foundation for the work.

Interestingly, in 2006, an entire issue was focused on "culture as a frame for studying teacher education" (Russell and Loughran 2006) in general terms, but two articles in particular focused on teaching sociocultural perspectives in education (Skerrett 2006) and engaging in cross-cultural dialogic inquiry (Sakamoto and Chan 2006). Intending to improve their teacher education practices, these researchers

approached their self-studies in very different ways. Skerrett (2006) used an intersectional lens to examine how her own gender, race, ethnicity, and class influenced her relationships with her preservice teachers and their interactions together. Her power and authority were questioned by her students because of the intersections of her identity. Sakamoto and Chan (2006) instead offered insight into the potential of cross-cultural dialogue as a means of professional development. As they wrote, "The experience of interacting with foreign cultures shaped perceptions of our childhood experiences as well as our view of our work as teachers" (p. 226). These articles began to demonstrate a more complex view of identity and the challenges of working across cultures.

Continuing to think seriously about how to prepare preservice teachers for diverse populations and to teach critically and for social justice, several important self-studies emerged in the journal with this in mind. Both Johnston-Parsons et al. (2007) and Prado-Olmos et al. (2007) problematized what they could learn alongside their students of color. Focused on preparation for urban classrooms, Ketter and Stoffel (2008) documented a yearlong study within an urban writing classroom with a prospective teacher and identified what was learned in teacher education that proved beneficial. Skerrett (2008), on the other hand, examined her own biography to help her consider experiences that would have better prepared her for urban teaching. She suggested expanding coursework in the historical, political, and sociocultural influences on urban education and in designing culturally responsive curricula. She also recommended restructuring field experiences to offer richer classroom-based learning opportunities for preservice teachers and extending fieldwork into urban communities. Acknowledging as others have that preservice teachers do not represent the same diversity that they see in the classroom, White (2009) investigated the use of her preservice teachers' emotions as a means of critically engaging with diversity. Bates and Rosaen (2010) faced a different dilemma in the field. They examined how their preservice teachers learned about diversity within suburban classrooms. Lee (2011) too focused on his clinical supervision of student teachers and the extent to which he addressed social justice during observations. Aware of the importance of studying graduates teaching in high-needs urban classrooms and the impact of teaching them about socially just practices, LaBoskey (2012) sought to transform her teaching practices based on what she discovered. Most insightful was her analysis that, "Most transformative were revelations that my unconscious uncertainties about working with extreme challenges had placed limitations on these teachers' abilities in this area and that I had been giving mixed messages about the role of joy in the elementary curriculum" (p. 227). Finally, Capitelli (2015) conducted a self-study exploring her facilitation of a teacher inquiry group for novice teachers of English Language Learners (ELLs). She recognized the value of an inquiry group as a space for teachers to collaboratively examine and improve teaching practices for ELLs and recommended facilitating similar types of groups for teachers in diverse contexts. As we looked through these articles, we were struck with how S-STEP researchers expanded their contexts of social justice work to include their teacher education courses, preservice teachers' clinical experiences, supervision, and observation of student teachers, graduates' teaching, as well as teacher inquiry groups.

Another important theme that emerged in the journal around addressing issues of social justice was the use of self-study and especially collaborative self-study to examine the identities and practices of teacher educators through a variety of different lenses. Bair et al. (2010), for example, used a self-study methodology to explore their own emotions and how these emotions came into play when differences existed between faculty and students in terms of race, gender, and sexuality. Conrad et al. (2010) examined how their intersectional identities as Black professors impacted their educational philosophy and student-centered teaching in a white rural community. Moving from racial and ethnic identities to socioeconomic status, Cutri et al. (2011) narrated a thoughtful self-study that identified their funds of knowledge from experiences of poverty and how these funds of knowledge were useful as they moved into academic positions. Two collaborative self-studies were focused on cross-cultural reflective dialogue and the insights gained when teacher educators shared how their different cultural perspectives influenced their pedagogy (Hu and Smith 2011; Makaiau and Freese 2013). Philip (2013) used a method of self-interviewing to understand the nuances, complexities, and tensions in the purposes of teaching social foundations to preservice teachers. Aware of the intercultural misunderstandings that can arise, Hu et al. (2016) shared the challenges a Chinese doctoral student and a Dutch supervisor faced working together. Finally, several researchers conducted collaborative self-studies focused on their own teaching dispositions (Pennington et al. 2012), their culturally responsive pedagogy (Han et al. 2014), and also the ways in which teacher/researchers could deterritorialize neoliberal thought and practice using rhizomatics (Strom and Martin 2013).

More recently in 2015, LaBoskey guest edited an entire issue focused on self-study for and by novice elementary classroom teachers with social justice aims and the implications for teacher education. The issue was unique in that all six articles described research situated within the context of the elementary credentialed and Master's degree program at Mills College, providing a multilayered lens of perspectives from diverse researchers "with varying intentions, time frames, and levels of focus" (p. 97). Reading this issue as a collection offered valuable insights into the ways that socially just reflective practice and self-study were taken up by classroom teachers. Additionally, the issue was special in that four out of the six pieces were written by classroom teachers who explored authentic burning questions around challenges to which many teachers could relate and from which they could benefit and gain new insights. For example, framed as a social justice issue, Miller (2015) examined how to increase and transform her third grade students' attitudes about reading through the use of choice and differentiated reading groups. Similarly, Byrd (2015) explored how what his second graders' attitudes and orientations were about reading. Jones (2015), concerned that she was perpetuating a pedagogy of poverty, investigated the use of a new pedagogical structure called Academic Choice, which invited her kindergarten students to take more ownership of their mathematics work. Offering an analytical response to these self-studies, Hamilton and Pinnegar (2015) identified the challenges of this methodology as well as how self-study supports the work of teachers and teacher educators in urban settings. Adding a third layer to the issue, LaBoskey and Richert (2015) shared a self-study that demonstrated how

studying program graduates can help to transform socially just teacher education practices for urban schools and also how non-teacher educators can offer insights into the preparation of candidates and the nurturing of their own inquiry stance. As the last article, Bauman (2015), a classroom teacher and Mills College graduate, explored gun play in her suburban kindergarten classroom. This issue was significant in that it placed both socially just teacher education and teaching for social justice front and center and by including a variety of perspectives about the work, it offered many access points and insights for teacher educators and teachers alike. LaBoskey (2015) curated an issue that illustrated how committing to social justice teaching must be taken up by teacher educators and classroom teachers together in a reciprocal effort that resulted in support and also insights for transformation.

Exploring the most recent issues published between 2015 and 2018, we are excited to note an increase in self-studies published in the journal that address social justice issues through critical theoretically rich lenses. In particular, the articles described here all center around race, power, and privilege. Ragoonaden (2015) combined critical pedagogy and self-study in order to examine praxis-oriented teacher education in an urban school. Through investigating her personal experiences and her professional practice, she found herself confronting tensions that emerged through her own power and privilege and the realization of otherness and oppression. Smith with her critical friends, Smith et al. (2016), composed an autoethnographic self-study that centered around how her background as a Black immigrant educator and multilingual communicator affected her multicultural teacher education practice with predominantly white monolingual preservice teachers. Approaching the concern of having predominantly white preservice teachers who are being prepared to teach diverse populations, Barnes (2015) used critical whiteness studies as an analytical lens for the data she collected in a community inquiry project. The conclusions from her self-study cautioned teacher educators "not to create community-based projects that reify deficit or stereotypical beliefs about others" (p. 13). Soslau and Bell (2018) developed a collaborative self-study which explored how they, as white teacher educators, addressed the challenges that emerged for their white teacher candidates in the field. Finally, McCarthy (2018) designed a self-study which provided a vehicle to model critical self-inquiry for his preservice teachers. His conclusion was rather than having a goal of transforming students' beliefs, instead he should focus on inviting students to engage in critical inquiry alongside him. These self-studies represented a more transparent, explicit, and honest examination of power and privilege in teacher education and the potential of this criticality leading to transformation.

Part Two: What Do We Know Already About Self-Study and Social Justice?

As we examined a sampling of the historical trajectory of social justice within the S-STEP community, we were encouraged to see the momentum that it has gained. In this next section, we highlight some of the salient features that we believe are

important to emphasize and consider as we move forward in adopting a more transparent and explicit to social justice within the S-STEP community. These criteria have the potential to move us from a neutral and more simplistic and even privileged stance, to one that is critical, honest, and more nuanced. We are encouraged by the fact that these features emerged when we examined a variety of self-studies from 1996 to the present focused on issues of inequity and social justice drawn from conference proceedings, the first handbook, the volumes described above, and the STE journal. Although the S-STEP community has much room for growth, we believe that the seeds for social justice activism are present and can provide a foundation for this difficult and important work. In particular, to promote social justice through self-study, we need to embrace intersectional identities, construct counter-narratives to expand ways of knowing, recognize that neutrality is complicity, and, finally, encourage self-studies that lead to action. As we continue to expand the social justice scholarship of S-STEP, we ask the community to consider these characteristics and interpret and apply them to research in individual and unique ways.

Embracing Intersectional Identities

> Intersectionality is a lens through which you can see where power comes and collides, where it interlocks and intersects. It's not simply that there's a race problem here, a gender problem here, and a class or LBGTQ problem there. Many times that framework erases what happens to people who are subject to all of these things. (Crenshaw 2017)

Crenshaw (1989) defines intersectionality as a lens that acknowledges the overlap of various social identities such as race, gender, sexuality, and class and the ways in which power emerges and intersects from these social identities to produce systemic oppression. Although the term "intersectional" was not explicitly used within the S-STEP community, from as early as 1998, some self-study researchers have presented their identities through an intersectional lens (Hamilton 1998; Perselli 1998; Vavrus and Archibald 1998). At the 2000 Castle Conference, Johnston examined the process of inviting preservice teachers to act as "cultural consultants" in her initial teacher education courses. Later in 2004 in a co-authored chapter, in her own voice, she described her students "as different in many ways. Most were African American but also we had Asian American and Hispanic students. They varied in age (21-45), background, family structures, religion, gender (although only two were men)..." (Griffiths et al., p. 665).

For many self-study researchers, there was interest in exploring the influence of their own intersectional identities on their teaching. For example, in the self-study that she described in a co-authored handbook chapter, Bass (Griffiths et al. 2004) examined the challenges of a white middle-class, Jewish woman teaching primarily African-American and Latino working-class students. She problematized that many of the injustices her students faced stemmed from their diversity of "color, culture, religion, gender and poverty...." (p. 688). She worried about the ways to both honor

and promote her students' voices as well as provide them with the necessary academic knowledge and skills to be successful in the academy. In her second self-study, she constructed a critical autoethnography where she reflected on her short memory pieces using "filters of race, class, gender, privilege, religion, sexual orientation, and differing ability" (p. 691).

Taking up some of these calls to action, Skerrett (2006) used her self-study to explicitly address how her own intersectional identity of race, ethnicity, gender, age, and social class, and the personal and professional experiences she had because of this complex identity influenced her relationships with her students. She concluded that some of her initial concerns about her race, gender, and social class negatively influenced some students' perceptions of her teaching competence and position of authority in the classroom. Vavrus (2006), in his study of teacher identity formation in a multicultural world, concluded that requiring preservice teachers to explore their ethnic and racial identity formations was not enough. Reflecting on his findings, he decided to add several additional identity topics in order to provide more space for students to consider their intersectional identities. These new assignments asked preservice teachers to explore their language, cultural identity, gender and sexuality identification, religious and spiritual identity, and socioeconomic class status. McNeil (2011), combining critical race theory and poststructural feminism, developed an intersectional theoretical lens to examine how her presence as an African-Canadian teacher educator disrupted the white space of the academy and created tensions for her white preservice teachers. For her, theory was counter-discursive and could be used in "charting a more productive, harmonious, equitable, responsive and interactive learning context in university classrooms" (p. 141). She argued that faculty play a particularly important role in breaking down institutional, racial, and cultural barriers between students and faculty of color. More recently, Cortez-Castro (2016) explicitly described her researcher perspective: "As a feminist Chicana, I understand my world through the intersectionality of race, gender, sex, place, and class, which occur simultaneously in my life and have shaped my identity/ies" (p. 40).

The intersectional lens offers a much more nuanced way of thinking about our teacher identity, the identities of our preservice teachers, and the interplay of identities on our pedagogy and practices. An intersectional framework allows researchers to acknowledge the complexities of identities, where we may feel oppressed, for example, as a person a color but may benefit from our male privilege. Adopting intersectionality helps the self-study researcher to recognize how power and privilege collide and intersect to produce systemic oppression and to potentially discover vehicles to transform or change the dominant discourse or narratives.

Constructing Counter-Narratives to Expand Ways of Knowing

> Together, in our cramped apartment on the South Side of Chicago, they helped me see the value in our story, in my story, in the larger story of our country. Even when it's not pretty or perfect. Even when it's more real than you want it to be. Your story is what you have, what you will always have. It is something to own. (Obama 2018, p. x)

Throughout the self-study research on social justice, we found examples of counter-narratives or what Griffiths (2000) calls "little stories" which talk back to the narratives that perpetuate the status quo and reinforce the dominant discourse about education. Counter-narratives or little stories that address race, ethnicity, social class, language, ability, gender, and sexuality can provide alternative truths that show how "the grand narratives of social justice can be disrupted, queered, deepened, given a fine grain and reshaped" (Griffiths et al. 2004, p. 685). These stories help to highlight the tensions of power, the awareness of multiple perspective and ideas, and the possibility of voice. Counter-narratives or little stories can be told through a variety of ways of knowing and do not need to adhere to the conventions of the academy. As Vavrus (2006) wrote, "personal narratives explain social phenomena" (p. 92). This can be particularly beneficial when there are a variety of different narratives that include multiple points of view or perspectives. But just telling our stories is not enough – we need to make sense of our identities, assumptions, and dispositions (Schulte 2004, p. 720). As we read through the self-studies focused on social justice, we were moved by the many diverse and unique narratives that they included; our own personal stories and life histories; the narratives of our students, preservice and in-service teachers, and the families and communities in which they work; and especially those whose voices are so often silenced or invisible.

Counter-narratives and/or little stories narrated by those who are marginalized often invite and necessitate alternative ways of knowing. In their chapter, Pritchard and Mountain (2006) presented their self-study through a script that documented their performance. The script combined personal stories, hip-hop lyrics, folk songs, and poetry. For them, "a performance event, one where art, humanity, diversity, and identity were the frame, was a more appropriate medium than a traditional paper" (p. 1). They wanted their chapter "to be about the personal and situational intersecting with the professional so that a multitude of possibilities for effective and transformative teaching result" (p. 1). Their alternative format allowed them to tell their stories "in the truest ways" and provided them with the confidence "to approach teaching in ways that are counter to the prevailing pedagogical fundamentalism" (p. 17).

Similarly, Cortez-Castro (2016) as a woman of color, a Mexicana, incorporated testimonios or "first person accounts . . . of simple everyday moments in life" into her self-study as a means of sharing her vivencias, or lived experiences and disrupting her "way of knowing" (p. 39). She crafted a testimonio to, as she wrote, "share snapshots of my story straddling between multiple worlds as a Mexican-American woman, a mother of four, wife, teacher educator, daughter, and sister" (pp. 39–40). She reflected, "Although we each have a different story to share, my intention is to make my counter-story public to both disrupt silence and to provide an avenue to learn from each other's life stories" (p. 39). By inviting others to read her testimonios and witness her vulnerabilities and struggles, Cortez-Castro hoped to encourage other women of color to find their own means and reflective process to strengthen their voices.

Using several alternative ways of knowing, in their chapter, Pillay and Pithouse-Morgan (2016) shared "a poetic re-presentation of workshop participants' memory stories" and then reflected on their emerging understandings through aesthetic memory-work. They described aesthetic memory-work as an arts-based research approach that invites an analysis of memories of artifacts from the past about aesthetic experiences. Moving into another way of knowing, sharing these artifact memories led them to construct found research poems. Having this collective aesthetic experience led them to conclude that "connecting to our selves and to each other through aesthetic memory-work has created spaces for problematising established forms of separateness and for moments of acknowledging entangled connectedness" (p. 134). This was particularly important in the context of South Africa, "which carries a destructive legacy of omnipresent disconnection and fragmentation" (p. 121).

The self-study methodology naturally invites researchers to explore counter-narratives and alternative ways of knowing, for it centers around blending the personal and the professional. Within the context of addressing social justice issues, opening up and expanding spaces to include diverse voices, perspectives, and narratives that disrupt and challenge the status quo is paramount. Inviting multiple truths more honestly represents the ways in which one's story is partial, dynamic, and always under construction and also highlights the possibilities of change and transformation.

Neutrality Is Complicity in Teacher Education

> Washing one's hands of the conflict between the powerful and the powerless means to side with the powerful, not to be neutral. (Freire 1995, p. 122)

Too often the narratives in schools and universities are that educators need to remain neutral that they should not be political with their students and preservice teachers. As Vavrus (2006) wrote, "I find that teachers generally presume a politically neutral identity that is underscored by the belief that they treat all students equally" (p. 89). Yet this recommendation naively disregards the ways in which injustice and inequity are normalized in schools and even teacher education programs. More often than not teachers and even preservice teachers have little idea about the ways in which they themselves perpetuate these inequities. Brown (2004) furthered, "It is apparent that the normalization of inequity renders the dynamics of race and social class invisible to those who are privileged and not faced on a daily basis with the injustices of inequity, or not provided with an education that fosters an understanding of our collective history" (p. 564). We would extend this statement to include the intersectional dynamics of race, class, gender, sexuality, language, and ability.

Our responsibilities as teacher educators are political in that a substantial amount of work needs to be done to expose preservice teachers, and especially those who are privileged, so that they can resist the normalized unjust teaching practices that

operate on individual and institutional levels. In fact one ongoing challenge for this work is that most teacher educators are white and privileged (Kroll 2006) and the majority of teacher candidates are as well (Ladson-Billings 2001; Perry et al. 2013). With this in mind, we must very consciously guide preservice teachers to see that being neutral is complicity with an oppressive system that continues to reproduce the status quo. We hope instead to heighten the consciousness of our students regarding the complex realities they will face in their quest "to make a difference" (Freidus 2006, p. 115). What does liberatory teacher education look like? How do we explore and strengthen the political stance of our teacher education practices? Within S-STEP, there are already numerous examples of self-studies that seek to improve pedagogy focused on consciousness raising. We provide a few exemplars below to illustrate why this salient feature is important within teaching for social justice.

In Iceland, Guðjónsdóttir and Kristinsdóttir (2006) designed a self-study to explore how to best prepare special educators to teach mathematics to children with learning disabilities. They initiated the study well aware that "students with learning disabilities (LD) in mathematics are highly likely to experience narrowly defined learning opportunities" and "while teachers accept that able students can find their own way of solving problems, they believe that this is too difficult for slower learners" (p. 199). Concerned that there is often a divide between special education and mathematics education, they sought to find ways that they could scaffold teaching that were liberatory and not deficit focused. Using cognitively guided instruction as a framework, teachers were asked to find two or three students, develop problems for them, and then analyze their way of thinking as they solved the problems. More often than not, the teachers struggled to ask children clarifying questions to understand their thinking. Instead they were more comfortable explaining how to solve the problem. The challenge became how to support teachers in what Freire (1995) would call "problem posing pedagogy" where they actively listen to and appreciate the ways in which children are thinking about mathematics. Although they did not explicitly call their self-study political, Guðjónsdóttir and Kristinsdóttir (2006) were asking their teachers to develop counter-hegemonic practices that disrupted the ways in which children with learning disabilities are positioned in mathematics.

Another example of teacher education content that challenges the hegemony is Kitchen and Bellini's self-study on a LGBT workshop they facilitated. Recognizing that LGBT students continue to experience high levels of homophobia and bullying in schools and there is limited LGBT inclusive curriculum in teacher education (Macgillivray and Jennings 2008), Kitchen and Bellini (2012) conducted a self-study to better understand how the workshop they developed and facilitated helped their preservice teachers become aware of the significant challenges faced by LGBT students in schools. Their own collaborative letter writing provided a means of reflection on the process of teaching the workshop as well as a consideration for the personal experiences that led them to teach about LGBT issues. As they wrote, "We realized that our personal experiences led us to engage in the political act of addressing an important social issue" (p. 215). Interestingly their approach to this work, however, was not overtly confrontational or ideological. Instead they focused

on professional ethics and potential strategies to implement in the preservice teachers' practice. Kitchen, in the journal entry that he shared, reflected: "So are we political? We do not impose our ideology on teacher candidates. We do not force feed them unpalatable theory, even though it has informed our understandings. At the same time, politics (like teaching) is the art of the possible" (p. 217). Insightly Kitchen and Bellini demonstrated that imposing our political beliefs on our students does not in fact empower them. Our job is to offer them new ways of knowing and thinking that open potential avenues for change.

Similarly, Arce (2013), as an educator of social studies education, described her self-study where she examined how she inspired, developed, and raised the social consciousness of her Spanish-speaking bilingual teacher education students without proselytizing. She specifically asked, "To what degree could this one course, offered bilingually, provide ample guidance for students to apply teaching approaches that counter the traditional Euro-centered social studies curriculum used in California?" (p. 237). To do this, she integrated a number of student-empowering activities that allowed her and her students to contest hegemonic ideology within schools. Constructing a collective learning community with her bilingual students provided the necessary safe space for all involved, including her as the teacher educator. By modeling and experiencing liberatory teaching, Arce's students were able to imagine the possibilities of challenging "multiple layers of hegemony in educational settings that perpetuate social, cultural, and linguistic inequities" (p. 249).

Teaching for social justice requires that we acknowledge the political nature of our work. Neutrality is simply not acceptable as it reinforces the status quo and the kinds of oppressive systems that are in place institutionally. The examples above demonstrate the complexities of developing teacher education practices that raise consciousness but do not necessarily preach or impose beliefs on our preservice and in-service teachers. Liberatory practices necessitate co-construction and classroom environments and activities that open dialogue and invite new strategies and ways of knowing to emerge. As LaBoskey (2009) wrote, "...there is great compatibility between self-study methodology and social justice teacher education, but the connection is not automatic. . . .. For the methodology of self-study to truly serve as a social justice education, we must 'name it to claim it'" (p. 81).

Encouraging Self-Studies That Lead to Action

> ...this is research which is underpinned by a concern for social justice. So it was important in all the studies to respect and value individual selves, to seek out diversity through partnership and consultation, and to aim to make a difference through individual and collective actions (Griffiths 2003). (Griffiths et al. 2009)

As we read through the self-studies on teaching for social justice, we felt inspired at the commitment and care our S-STEP colleagues have for their preservice and in-service teachers and the students, families, and communities to which they teach. So many of the ways in which social justice was conceptualized centered around

significant social issues. How do we ensure that the work we are doing does not take place in a vacuum, tucked away in the ivory tower of the academy? How do we position our work so that there is influence, impact, or even transformation? What does it mean to be agents of change or participate in collective agency? As these questions emerged for us, we were heartened to find that some of the self-studies explicitly centered around social action. We believe that this focus on social action is very much a means of being what LaBoskey (2004b) called "improvement-aimed." Teacher educators committed to teaching for social justice ultimately hope to prepare and nurture teachers who are equipped to critically examine the world, problematize the institutions that maintain social inequities, and eventually transform them. Below we share two exemplars of self-studies that very deliberately lead to social action and transformation. We hope that these exemplars, along with many of the chapters in this section, will inspire others to engage in self-studies that lead to social action.

Mitchell et al. (2009) described in detail their self-study exploring the use of photography albums with South African teachers as a means of creating social action texts about the impact of HIV and AIDS. They noted that although the general consensus is that education is the key to sustainably fighting the spread of HIV and effects of AIDs, little to no attention had been paid to preparing teachers to do this work with youth. They believed that using photography would bring "things to light in both personal and public ways and to offer multiple theoretical and practical perspectives to social import" (p. 119). Once the photo albums were composed, they asked the teachers to share them as a performance. This was a crucial move from acknowledging a social issue to beginning to think about ways to make change. Mitchell et al. (2009) reflected, "Presenting the album is a crucial step in articulating problems and imagining change. Indeed, our contention is that the very act of looking at the performance produces change" (p. 129). They pointed out that real change on the ground cannot stem from top-down initiatives, but rather teachers and students themselves need opportunities to grapple with injustices in their local contexts and generate their own possibilities for action.

Within a university context, De Los Rios and Souto-Manning (2015) co-constructed and documented their experiences as Chicana/Latina teacher educators in predominantly white institutions of teacher education. They explained that they used testimonio "to dialogically explore together how the teachings of Freire have influenced our lives as Latinas from adolescence to graduate school, as former school teachers in urban and rural contexts, and presently as engaged scholars and teacher educators" (p. 273). They developed "testimonios co-creado" as a way of blending their stories and voices. In particular, they looked at how their use of Freirean-inspired culture circles enabled them to find literacies of power within the contexts of the grassroots communities with which they work and the preservice and in-service teacher communities with which they nurture. "If we are to change the current landscape that (over)privileges Whiteness in teacher education," De Los Rios and Souto-Manning (2015) wrote, "Teacher educators must stop resisting change or engaging in what we call 'pretense pedagogy'" (p. 272).

We conclude this section with the strong call to arms with which De Los Rios and Souto-Manning (2015) ended their article, one that we think is a call to arms for all

those committed to teaching for social justice in the S-STEP community as well. They urged, "Let us work together to envision possibilities for engaging in problematization and critical transformation in teacher education and, most importantly, in teacher educating. Let us envision possibilities for a critical pedagogy of teacher education. Freire's work offers us a powerful example of the possibilities that lie ahead" (p. 289). Many of the authors in this social justice section have taken this call seriously and have focused their self-studies on urgent injustices that need immediate and sometimes risky attention. Next we will explain the order of the chapters in the section and introduce their authors.

Part Three: Self-Study and Teaching and Teacher Education for Social Justice

The chapters in this section have been organized into two parts. We begin the section with four chapters that lay the theoretical foundation for the research in self-study and teaching and teacher education for social justice. ▸ Chap. 17, "Preparing Teachers to Teach for Social Justice," written by Sowa and Schmidt, provides a rich and detailed literature review of the self-studies that have been conducted focused on teaching and teacher education for social justice. For the chapter, they analyzed self-study articles from 2000 to 2017 that examine social justice education in teacher education coursework and preparatory programs. They describe two key themes that emerged from their analysis: mirrors and windows. Self-studies that act as mirrors examine the researchers' identities, their work as teachers and researchers, and their use of self-study to examine and improve their social justice teaching. Self-studies as windows, on the other hand, focus on systemic change in teacher education programs and the diverse contextual variables that influence their work as teacher educators. They conclude the chapter by offering future recommendations for self-study research on teaching for social justice.

Taylor and Coia, in ▸ Chap. 18, "Co/autoethnography as a Feminist Methodology," provide a retrospective analysis on their co/autoethnography research over the past 17 years. In particular, they highlight how their self-study methodology has taken up and enacted feminist principles through the illustration of salient features of co/autoethnography. Their chapter begins with some history of how co/autoethnography emerged for them within the context of self-study and then offers a methodological definition with descriptions of key tenets and illustrative examples from their extensive work. These feminist tenets include making meaning when identities are fluid, dynamic, and under construction; identities are dialogical; a focus on the everydayness; co/autoethnography invites our whole selves; and drawing on aesthetic experiences. Finally, they too note the increased interest in social justice in the S-STEP community, but as others have written they do not think it is enough. They offer a call to action, encouraging more self-study research that goes beyond improving teaching to preparing teachers to take collective action and insist on change.

In ► Chap. 19, "LGBTQ Themes in the Self-Study of Teacher Educators," Martin and Kitchen recognize the continued homophobia and transphobia that are deeply embedded in society and the dire need for teacher educators to alter the conceptualizations of gender and sexuality that currently exist in schools. Using queer theory as a theoretical framework, this chapter richly reviews the literature of self-study of teaching and teacher education and how it has addressed LGBTQ themes. They discuss the following themes present in the S-STEP literature: queering teacher educator identities, queering pedagogical practice, and queering classrooms and curriculum. With a relatively limited amount of attention paid to LGBTQ themes in self-study, this important chapter offers teacher educators insights into how anti-homophobic and anti-transphobic practices can be incorporated into their future curriculum and research.

Óskarsdóttir, Guðjónsdóttir, and Tidwell address the challenge of meeting the growing needs of students with inclusive settings in ► Chap. 20, "Inclusive Teacher Education Pedagogy," an important and often overlooked theme in S-STEP. Inclusion rests upon the principle that every learner should have equitable access to education in schools that are organized in the spirit of universal design. These are difficult entities to negotiate and most of the work of designing inclusive practices in schools falls to teachers. Specifically, they define inclusion and offer an analysis of how teacher educators have used self-study to prepare preservice teachers to work in inclusive educational settings. A recent example of self-study research on inclusive practices is shared as a means of demonstrating new understandings of inclusion and inviting other self-study researchers to take up these new conceptualizations of inclusion for future research.

In the second part of the section on self-study and teaching and teacher education for social justice, the chapters move from an analysis of theoretical frameworks and a review of the self-studies conducted in the past to illustrations of current self-study research that are focused on application, social action, and ultimately change. The second part begins with ► Chap. 21, "A Rhizomatic Self-Study: Aiming at Social Justice in a Conflictual Environment," where Barak, Tuval, and Turniansky examine the use of rhizomatic self-study in the context of the conflictual and contradictory environment of Israel. What does teacher education that promotes a social conscience look like in a context that so often is positioned as a binary? How do teacher educators pay attention to minor and unheard voices and open windows to understand multidimensional and unpredictable environments? This chapter demonstrates how a rhizomatic self-study invites a more egalitarian discourse between diverse cultures, moving beyond cultural diversity toward fairness and a socially just environment.

Allison and Ramirez, in ► Chap. 22, "Employing Self-Study Research to Confront Childhood Sexual Abuse and Its Consequences for Self, Others, and Communities," discuss the difficult and much neglected theme of how self-study research can be used to demystify the taboo of childhood sexual abuse (CSA), as well as other forms of exploitation and abuse. They describe their own experiences of teaching about CSA in their teacher preparation programs and their reflections about the process. A strong feature of their chapter is the skillful ways in which they

demonstrate the tenets of social justice and advocacy that inform their teaching about CSA. They point out how CSA has historically been silenced despite the destructive repercussions of CSA for individuals, families, and communities across all socio-economic backgrounds, religions, races, and cultures. Their chapter reminds teacher educators of the urgency of preparing teachers to advocate for students who have experienced CSA or other trauma.

Continuing the theme of urgent social action, in ▶ Chap. 23, "Participatory Visual Methodologies in Self-Study for Social Justice Teaching," Mitchell, Moletsane, MacEntee, and de Lange describe the work of teachers in rural areas of sub-Saharan Africa who are using participatory visual methodologies like participatory video, cellphilming, and photovoice to examine and address a lack of social services in schools and communities. They note so profoundly, "some of the least resourced communities in terms of teacher support in South Africa are the places where teachers (and the school itself) are in the best position to make a difference in the community." These participatory visual methodologies help teachers and teacher educators to see and make visible key issues and also offer platforms for reflection and engagement. In this chapter, they share four case studies of work with preservice and in-service teachers and illustrate how the visual can be used to initiate a "starting with ourselves" approach for future socially just self-study.

▶ Chap. 24, "Theater of the Oppressed for Social Justice Teacher Education," written by Bhukhanwala with Dean, investigates the challenges of designing preservice teacher education practices based on Boal's Theatre of the Oppressed (TO). They begin with a literature review of self-studies that are focused on socially just teacher education as well as those exploring the use of arts-based approaches for social justice. They continue by presenting several examples of their own self-studies on using TO practices in student teaching seminars and how the experience of TO led to insights about diversity, power dynamics, and cultural frames of reference. Finally they share the challenges of incorporating TO in teacher education and the potential future self-study research that could be conducted on TO.

Finally, in ▶ Chap. 25, "Engaging My Whole Self in Learning to Teach for Social Justice," Hannon crafts a self-study using an intersectional approach that investigates how being a black, middle-class, female educator and parent of a child with a disability impacts her personal and professional learning as a teacher educator. Providing a multi-textual narrative, she intersperses vignettes of teaching moments that show how her experiences as a parent influenced her work as teacher and teacher educator. Working with students with disabilities and being a mother of a child with autism led her to acknowledge the foundational teaching dispositions that undergird her. These are being person-centered, strength-based, flexible, and reflexive. Her chapter helps teacher educators to consider how traditional teaching often marginalizes and disregards the cultural capital of students and families of color, especially those with disabilities.

These are troubled time in which we are living, where the human rights of so many are being questioned and potentially put at risk. In S-STEP, since its inception, there has always been some concern about inequity and injustice in

schools, communities, society, and even the global world but now more than ever it is imperative that our work as teacher educators deliberately and explicitly prepare teachers to listen to those who are marginalized, advocate for their rights and needs, and disrupt the oppressive systems that maintain the status quo. Our self-study methodology naturally lends itself to the work of examining and dismantling injustice and yet for the most past this community as a whole has shied away from committing to this endeavor. These troubled times should serve as the catalyst for S-STEP to move from tentatively and implicitly addressing issues of social justice to collectively recognizing and acknowledging the potential of what can be done as a community. We need to let go of the more naïve, simplistic, and even privileged lens of neutrality and instead take on a stance that is highly critical, honest, nuanced, and above all action oriented. We recognize that this social justice work is complex, difficult, risky, and daunting but together we can overcome our apprehension and fight for change. The chapters in this section have a variety of purposes for the S-STEP community: to provide a mirror to examine how we have addressed social justice in the past, to offer action-oriented examples of self-studies that could inspire future research and advocacy, and finally to invite the community to radically imagine, enact the possible, and use self-study to dismantle the systems that perpetuate injustice. We need to start howling with rage collectively in solidarity with those whose howl may not be heard.

Preparing Teachers to Teach for Social Justice

Mirrors and Windows

17

Patience A. Sowa and Cynthia Schmidt

Contents

Abstract

This chapter focuses solely on self-study research that intentionally examines teaching and teacher education through the lens of social justice. Our research questions center on approaches self-study researchers use to implement a social justice education in their courses and teacher education programs. We define social justice teacher education and describe the criteria used for selecting research articles from 2002 to 2017 that met the criteria. We describe our methodology and identify two broad themes that resulted from our analysis of the research articles, i.e., mirrors and windows. The mirror represents self-studies which focus on the identities of the authors, their work as teachers, their roles as

researchers, and their use of self-study to reflect upon and improve their teaching. The window denotes self-studies which describe the process of implementing systemic change in teacher education programs and the contextual factors which affect the work of teacher educators. Research articles are further described as they relate to the two themes. We conclude with recommendations for future self-study research in teacher education for social justice.

Introduction

Teacher educators and educational researchers have long emphasized the need for teacher education programs to ground themselves in principles of social justice to facilitate teacher candidates' acquisition of skills and dispositions needed to teach diverse and marginalized children, communities, families, and social groups. These advocates call for programs which do more than simply mention or celebrate diversity among people. Principles of social justice, they stress, should permeate teacher education programs both in policy and in practice (Cochran-Smith 2004, 2010; Zeichner 2011). Researchers emphasize the need for teacher preparation courses to confront issues of race, class, sexuality, ability, gender, transgender, ethnicity, and language, so preservice teachers learn to recognize the structural inequities in society and address principles of social justice in their teaching (McDonald 2005; McDonald and Zeichner 2009). Social justice is frequently discussed as a tenet of the self-study of teacher education practice, because self-studies lead teacher educators to examine their own practices and unpack their values, beliefs, biases, and tacit assumptions to better prepare themselves and their students to teach for social justice. (Loughran 2004; LaBoskey 2004). Similarly, Griffiths et al. (2004) state:

> ... self-study provides a useful way to address issues of equity and justice. We can use self-study to uncover the ways in which an unjust society is mirrored in our assumptions, teaching practices and beliefs about the world. ... Through self-study we can explore, with our current and future teachers, the complex moral issues inherent in the pedagogies they choose and the curriculum they are required to teach as well as in the relations they will have with diverse students, who live in a globalised, interconnected world (p. 650).

The purpose of this chapter is to review self-study research on social justice from 2002 to 2017. We asked the following questions:

- How do teacher educators who practice self-study teach through a social justice lens?
- How do teacher educators who practice self-study foster the enactment of social justice pedagogical practices with their preservice and in-service teachers?

This review of the research on self-studies and social justice will define social justice teacher education, describe the methods used to select the literature, explore the themes which emerge from the studies, discuss the implications of our findings, and make recommendations for future self-studies.

Teaching for and About Social Justice

We define social justice teacher education as teaching that aims to address and change inequities and injustice in the world. Theories and pedagogical frameworks such as multicultural education, culturally relevant and culturally responsive pedagogy, critical literacy, critical race theory, gender studies, and queer theory all incorporate aspects of Fraser's economic, cultural, and political dimensions of social justice (Fraser 2005, 2009) and embody what it means to teach for social justice. Multicultural education has the goal of providing an equitable education for all children. The National Association of Multicultural Education (NAME) defines multicultural education as a process of education infused in all aspects of schools, school systems, and education with the goal of academic achievement and social justice. Additionally, multicultural education:

> ... helps students develop a positive self-concept by providing knowledge about the histories, cultures, and contributions of diverse groups. It prepares all students to work actively toward structural equality in organizations and institutions by providing the knowledge, dispositions, and skills for the redistribution of power and income among diverse groups. Thus, school curriculum must directly address issues of racism, sexism, classism, linguicism, ableism, ageism, heterosexism, religious intolerance, and xenophobia (NAME n.d.).

Similarly, culturally relevant and culturally responsive pedagogy addresses how and why teachers can and should focus on social, cultural, political, and economic aspects of teaching diverse students for social change and academic achievement (Gay 2010; Ladson-Billings 1995a, b; Villegas and Lucas 2002). As with most theories of social justice education, critical literacy has a foundation in Freire and Macedo's (2005) work on literacy as reading the word and the world. Critical literacy consists of learning how to analyze and interrogate texts to reveal the ways in which texts are socially constructed, how relations of power and injustice can be seen through these texts and in the world, and the various roles of readers in deconstructing texts. (Comber 2015; Freebody and Luke 1990; Marsh et al. 2015). Similarly, scholarship on gender, queer, and transgender theories explore the issues of power and identity in these marginalized groups and the need to disrupt social and cultural beliefs, such as heteronormativity (Stryker 2013; Wilchins 2011). Critical race theory examines race, racism and the beliefs, laws, economics, and sociocultural practices which allow institutional and systemic racism to exist and persist. In the sphere of education, critical race theory can serve as a tool to analyze inequity (Ladson-Billings 1998; Ladson-Billings and Tate 2017). Teaching for social justice in teacher education or socially just teacher education means teacher educators are

tasked with developing the knowledge, skills, and dispositions of preservice and in-service teachers, so they recognize the diversity of their students, develop equitable ways of teaching, provide children with the tools and strategies to understand systems of inequity that exist in societies, and facilitate understandings of how texts children read and view support and reinforce systems of inequity and oppression. Accordingly, teacher educators must equip themselves with understandings, dispositions, and skills to implement social justice teacher education. Teaching for social justice also involves using these understandings, dispositions and skills as a springboard to work for social change (Duncan-Andrade 2005; Hackman 2005; Lipman 2004). All the actors or stakeholders in education, teacher educators, preservice teachers, families, and school communities must become "conscious actors in the world" (Gutstein 2003, p. 40). Gutstein suggests "helping young people develop a sense of personal and social agency" (p. 40) is essential in working toward achieving equity. The terms teacher candidates and preservice teachers will be used interchangeably in this chapter.

The next section of this chapter describes the methodology we used to review the research literature on self-studies of teacher education practices and social justice.

Methodology

Stance of the Researchers

We come to this review of self-study research and social justice as friends, self-study researchers, former colleagues, and teacher educators. Our friendship, careers, and experiences have taken us through various paths. We met as colleagues, bonded as friends, and grew together in our understandings of and commitment to social justice teacher education. Patience was born in Ghana, while Cynthia is a white middle-class Midwesterner. We turned to self-study to critically reflect on and make improvements in our teaching. Patience's background is in teaching English learners and Cynthia's in literacy. The school of education where Cynthia taught has, as its mission, the preparation of preservice teachers to teach in urban settings. In the United Arab Emirates (UAE) where Patience taught in a college of education, the mission of hte college of education and the university is to prepare leaders who are globally aware and culturally responsive. As teacher educators we infused our courses with methods to prepare our teacher candidates to understand and appreciate the diversity of children they would encounter in their classrooms (Sowa 2016; Sowa and Schmidt 2017). We scaffolded teaching for social justice by developing a critical literacy stance ourselves and engaging our preservice teachers in critical literacy practices to promote social justice (Lewison et al. 2008; Luke and Freebody 1999). We both experienced the tensions inherent in fulfilling our ascribed roles as university faculty and the sheer amount of work it takes to thoughtfully support preservice teachers as they learned to teach for social justice.

Parameters for the Review of Literature

To conduct this study, we performed a systematic review of the literature on self-study in teacher education practices and social justice. We developed explicit criteria for selecting studies to be included in the review. We then searched for the studies using the said criteria and screened the studies to ensure they included the criteria (EPPI Center 2007). Many self-study scholars state most self-study research has an inherent social justice orientation because self-study researchers tend to explore issues of equity, diversity, advocacy for marginalized groups, multicultural education, culturally relevant pedagogy, and educational transformation (Berry and Hamilton 2013; LaBoskey 2004, p. 832). However, self-studies selected for this chapter specifically focus on teaching and teacher preparation through a social justice lens. The articles selected explicitly highlight the terms *social justice*, *socially just*, *teacher education/preparation*, and *in-service* and *preservice teachers* as keywords or descriptors. Also selected are studies which used the term social justice in titles and in abstracts. It should be noted that although self-studies may be completed in other professional areas, this chapter will focus solely on self-studies about teacher education. The next section describes our data collection and analysis process.

Data Collection and Analysis

We searched for the self-studies in research databases such as ERIC, Scopus, EBSCOhost, Education Full Text, and Academic Search Complete. We also explored the journal *Studying Teacher Education*, the Springer *Self-Study of Teacher Education Practices* book series, the *International Handbook of the Self-Study of Teacher Education* (2004), and the self-study group's biennial Herstmonceux Castle conference proceedings for research studies which met our criteria. The articles and chapters were limited to peer-reviewed empirical research studies published in English within the last 15 years – the years 2002–2017. From the review and screening, we selected 51 self-studies which met our criteria.

To examine the self-studies, we grouped them into three categories: individual self-studies, collaborative self-studies, and administrative self-studies. We then explored each category separately and coded the studies for emerging themes and patterns. We define individual self-studies as research by and about the teaching of the researcher or author. Loughran (2004) describes self-study as inherently collaborative in that researchers collaborate with each other to study their teaching and learning. He posits "there is an ongoing need to be able to view the teaching and learning process from different perspectives. Thus, the value of collaboration and the notion that self-study is advanced when it is a shared adventure" (p. 33). Self-study researchers may collaborate with colleagues, teacher candidates, and in-service teachers. They may also collaborate with a critical friend. We define collaborative self-studies as studies conducted and co-authored by more than one person. Administrative self-studies are studies which may be individual or collaborative but focus on the reform and/or administration of teacher education programs. We are cognizant of the fact that these categories can and do overlap.

Self-Study Methods

The self-studies selected for this chapter use different forms of qualitative research to explore learning and teaching. The methods researchers used include auto-ethnographies (Pennington et al. 2012; Prado-Olmos et al. 2007); case studies (Griffiths et al. 2004); focus groups (Galman et al. 2010); multi-case analysis (Schoorman and Bogotch 2010); dialogue or conversations (Fitzgerald et al. 2006; Griffiths et al. 2004; Ketter and Stoffel 2008); rhizomatics (Strom and Martin 2013); and narrative self-study (Sowa 2016) to analyze their teaching practices. Table 1 identifies the number of articles which met our criteria from different geographic locations. The next section of this chapter discusses the themes which emerged from our review of the literature on self-study and social justice.

Findings

This section describes the themes which emerged from the review of literature.

Themes: Mirrors and Windows

The themes which emerged from our analysis of data are the themes of self-studies as mirrors and windows. We borrow and adapt the metaphor of mirrors and windows from the Arizona Group (1996), Mitchell and Weber (2004), and Batchelor and Sander (2017) to describe these themes. Batchelor and Sander (2017) described the phenomenon of the integrated form of self-study research education "as a mirror (looking at ourselves) and a window (looking at teacher education)" (p. 69). In our study the mirror denotes the identities of the authors, their work as teachers, their roles as researchers, and their use of self-study to reflect upon and improve their teaching. The window represents the process of implementing systemic change in teacher education programs. It also represents the need for self-study researchers to use their research to look outwardly, that is, "look out of their windows" at the injustices in the world, take social action, and work toward a commitment to the principles of social justice in communities beyond the university and K-12 class-rooms. This category describes the work of teacher education program

Table 1 Geographic locations

administrators or faculty administrators who practice self-study to improve their programs and their work as administrators (Manke 2004), teacher educators whose work is affected by external issues, and those who make connections beyond the university and K-12 classrooms. The next section explores the theme of self-studies as mirrors.

Self-Study as a Mirror

Analysis of self-studies in this chapter reveals teacher educators frequently examined their personal identities and explored their roles as teachers and researchers. In self-study, the roles of teacher and researcher are inextricably linked with personal identity. Schulte (2004) further explained this phenomenon by stating "All practitioner knowledge is integrated with problems of practice. Self-study demonstrates that these problems of practice are also indelibly connected to the educator, and that recognizing these connections can serve to bridge one's beliefs and actions to improve one's knowledge about one's practice" (p. 710).

The theme of self-studies as mirrors emphasizes the reflective nature of self-studies regarding implementation of social justice education. Griffiths et al. (2004) note that "the work of social justice involves knowing self" (p. 655). Teacher educators look inward at themselves and their personal identities and consider how their race, gender, and socioeconomic status, as well as their experiences and contexts, influence their interactions with preservice teachers (Kelly-Jackson 2015; Lee 2011; Ohito 2016; Perselli 2006; Schulte 2004; Sevier 2005; Skerrett 2006, 2010). These researchers also explored the ways their identities privileged or disadvantaged them in their work as teacher educators.

Skerrett (2006) noted how her status, as an immigrant, faculty of color, and former teacher in urban schools, was a double-edged sword because it gave her the confidence and expertise to teach for social justice but also resulted in tensions with her mainly middle-class white preservice teachers who questioned her experience and authority. Ohito (2016) positioned herself as a black educator teaching primarily white middle-class preservice teachers and described how she used the "pedagogy of discomfort" to provoke her students into deeper reflection about "race, racism and white supremacy" (p. 454).

In her self-study about preservice teacher clinical supervision, Lee (2011) described her initial discomfort as a Korean immigrant when relating to American teachers and mostly white preservice teachers. She was vividly aware of "cultural differences in language and the need to negotiate meanings between people" (p. 4). Implementing her supervisory role through a social justice lens and conducting self-study research led her to learn how to negotiate the different cultures and to a "rediscovery of her cultural identity" (p. 3). "Initially, I tried to assimilate into American culture," she stated, . . . "What I learned was to value my Korean ways of being and to use them in productive ways in a different culture" (p. 16).

Galman et al. (2010), white teacher educators, emphasized that teacher educators can more effectively implement an antiracist pedagogy if they explore their own practices and beliefs and interrogate whiteness in teacher education. They discovered

through their self-study data and focus group interviews with current and former students of color that they inadvertently catered to white comfort by silencing or marginalizing conversations about race in their courses. Therefore, they highlighted the need for faculty and teacher education programs to "interrupt white racial knowledge" and to do so "aggressively, yet tenderly" (p. 234). Trout (2017) described how she introduced the ethic of caring in her courses to address the tensions that had risen between her, a white teacher educator, and her students of color. Trout's self-study helped her realize the importance of paying attention to the needs of her preservice teachers and ends by stating "in racially and culturally diverse classrooms, caring habits can help teacher educators from dominant groups gain critical self-awareness" (p. 39). Calling herself a pākehā, that is, a white New Zealander, Warren (2014) explored how self-study helped her become more critically aware of her role as a "bicultural teacher educator" and her personal and professional responsibility to resist colonial discourses which position teachers and students in ways that perpetuate social injustice for Maori. Similarly, White (2009) a "white, female, middle-class teacher educator" (p. 5), discovered that for teacher education to become truly transformational, teacher educators must teach on emotional and intellectual levels to address the challenges of helping preservice teachers examine issues of diversity and equity. In Henderson and Hyun's (2017) self-study of Henderson's mixed-method course, Henderson initially questioned her ability to effectively address issues of race and racism as a white middle-class teacher educator. Henderson's experiences caused her to explore her identity and improve her pedagogical practices by facilitating more discussions and assigning more readings on social justice, equity, race, and racism. Both researchers concluded that implementing social justice education depends less on *who* that is, the race of the teacher educator, and more on *how* the conversation is facilitated. In contrast to the above studies, Prado-Olmos et al. (2007) addressed tensions which emerged as they taught their preservice teachers of color in a multicultural education course. They found they were uniquely positioned as faculty of color to emphasize the importance of learning about diversity and equity in the face of resistance from preservice teachers of color who questioned "what they could learn about diversity" (p. 93).

Studies on social justice and teacher education research stress the importance of teacher educators participating in professional development which helps them address their own prejudices and biases as well as strengthen their understandings of what it means to teach for social justice (Cochran-Smith et al. 2009; Cochran-Smith 2010; Galman et al. 2010). Consequently, in their collaborative self-study, Pennington et al. (2012) critically examined their own dispositions to better cultivate the dispositions of their preservice teachers. These researchers noted how collaborative self-study among teacher educators from various disciplines led to the unpacking of their own problematic dispositions toward their preservice teachers. This process facilitated critical awareness leading to their growth as teacher educators. The next section in this review explores the strategies teacher educators use to prepare themselves and/or their preservice teachers to teach for social justice.

Self-Study as Reframing

One of the purposes of self-study is the study of one's teaching practices with the goal of improvement (Hamilton and Pinnegar, 1998; Loughran et al. 2004). Self-study is reframing, that is, the systematic reflection of teacher educators to "open themselves to new interpretations and to create different strategies for educating students" (Hamilton and Pinnegar 1998, p. 2). Consequently, most of the studies reviewed in this chapter describe a variety of strategies teacher educators use in their university coursework to prepare preservice and in-service teachers to teach for social justice. In this research, faculty examine the impact of their teaching on themselves and the students they teach. In terms of the former, teacher educators have found that by interrogating their teaching practices, they become more aware of their strengths, challenges, vulnerabilities, and the actions needed to improve their teaching. Courses described by self-study practitioners in this review of the literature include civic education and social studies (Lowenstein 2010; Sevier 2005); social justice education (Boyd and Noblit 2015; Freidus 2006); multicultural education and diversity (Prado-Olmos et al. 2007); primary design and technology (Aston 2009), critical literacy (Skerrett 2010; Sowa 2016), physical education (Flory and Walton-Fisette 2015); integrated arts, social studies, and literacy (Bartlett 2009); field supervision (Lee 2011; Perselli 2006); mathematics (Harrison 2015; de Freitas 2008; Van Laren 2011); and elementary education (LaBoskey 2012; LaBoskey and Richert 2015; Regenspan 2002).

Improving Teaching

Studying one's teaching practices calls for looking inward and then opening up and becoming vulnerable. Although this can be challenging, self-study researchers value this reflective process in their efforts to improve their teaching. Schulte (2005) noted "one needs to stand in one's own vulnerability in order for it to become a strength" (p. 41). Knowles (2014) made herself vulnerable by asking peers and students to give her feedback on her teaching. In her discussion about of her role as a supervisor of preservice teachers, Lee (2011) learned that vulnerability is valuable and crucial to building trusting relationships.

Student assignments, classroom observations, interviews, questionnaires, course surveys, and focus groups provided insight into how researchers might strengthen their teaching and preservice teacher learning. Teaching in challenging contexts was the overarching goal of LaBoskey's (2012) course in elementary education and the university teacher education program. While she observed her students' considerable strengths, she also discovered she had inadvertently "placed limitations" on their abilities to work in these situations because of her own uncertainties about working in challenging schools. Additionally, LaBoskey discovered she had been "giving mixed messages about the role of joy in the elementary curriculum" (p. 244). To improve her teaching, LaBoskey (2012) committed to finding more resources to support her current students, and continuing to observe her former students in their classrooms every year. Preservice teacher feedback through a survey taught Bartlett (2009) that she "could have done more to emphasize social justice issues over

technical aspects of teaching" (p. 37). Similarly, Knowles (2014) discovered student and peer feedback on her teaching led to "powerful new knowledge" (p. 89). Lee's (2011) self-study led to improved supervision practices. In her self-study of her preparation of Emirati preservice teachers, Tensions of teaching through a social justice lens led Sowa (2016) to be more intentional and purposeful in planning lessons and discussions with her Emirati pre-service teachers.

Some of the studies explore the changes and improvements in self-study researchers' teaching over time (Henderson and Hyun 2017; Flory and Walton-Fisette 2015; Ketter and Stoffel 2008; LaBoskey 2009; Lee 2011; Sevier 2005; Sowa 2016). Sevier (2005) described the changes he made while teaching his social studies methods course, while Sowa (2016) discussed how she reframed her teaching over a period of 8 years to move teacher candidates toward teaching for social justice. Flory and Walton-Fisette (2015) conducted their study for a year and Griffiths and Poursanidou (2005) for 2 years.

Resistance is a theme featured in many self-studies explored for this chapter (Boyd and Noblit 2015; Faulkner and Crowhurst 2014; Freidus 2006; Galman et al. 2010; Johnston-Parsons et al. 2007; Ohito 2016; Prado-Olmos et al. 2007). Teacher educators recognized this resistance on the part of their mostly white preservice teachers and used various means to move them toward teaching for social justice. Consequently, hese self-studies explore a variety of pedagogical strategies used to scaffold preservice and in-service teachers in enacting teaching for social justice. Teacher educators modeled teaching for social justice to influence how their students think about and practice teaching (Loughran 2004). These strategies included modeling dialogue and think - alouds where faculty explicitly unpacked the reasoning behind their pedagogical decisions (Lee 2011; Ritter 2012; Torres and Mercado 2004). Burke (2016) used her own illustrated storybook to involve preservice teachers in reflecting about and critically analyzing the everyday common metaphors used in school rhetoric. Others focused on the impact of one or two pedagogical strategies on student beliefs, attitudes, dispositions (Fitzgerald et al. 2006; Aston 2009; Sevier 2005; Skerrett 2010; Faulkner and Crowhurst 2014) and practical knowledge (Bartlett 2009; Kavanagh 2017). Fitzgerald et al. (2006) described how they collaborated to develop preservice teachers' dispositions related to teaching for social justice. However, for some self-study researchers, having the dispositions to teach for social justice is not enough. These researchers posit dispositions must also be accompanied by pedagogical skills and developing professional judgment through practice. To achieve these goals, Bartlett (2009) tasked her preservice teachers with designing eight-lesson social justice units in their integrated arts, social studies, and literacy course, which teacher candidates then taught in their field placements. Kavanagh (2017) argued that "specifying practice allows teacher educators to engage preservice teachers in representations . . . of teaching that intentionally bring social justice issues to the fore" (p. 161). Coursework assignments which teacher educators used to scaffold teaching through a social justice lens included reading, discussing and responding to articles, developing portfolios, targeted field placements, focus groups, illustrated story books, autobiographies, inquiry projects, service learning projects, teacher research, reflective journals, and self-studies.

Field placements are a frequent topic of self-studies in general because they are a key component of teacher preparation. Self-studies about field placements explored this chapter include studies describing assignments to compare between well-resourced and under-resourced schools (Sevier 2005) supervision (Lee 2011; Perselli 2006) and teaching in classrooms. Included in this category are self-studies which examined collaboration with in-service teachers in K-12 schools (Ketter and Stoffel 2008; LaBoskey 2009, 2012; LaBoskey and Richert 2015). Collaborating with K-12 schools enables teacher educators to help teacher candidates and in-service teachers make theory to practice connections, develop their practical knowledge, and provide them with experiences in different contexts. Teacher education programs which prepare students to teach for social justice very often place them in urban, highly challenging contexts and/or schools with culturally and linguistically diverse learners to help them develop the skills needed to teach in these settings (Ketter and Stoffel 2008; Kroll 2012; LaBoskey 2009, 2012; LaBoskey and Richert 2015). The goal here, as LaBoskey (2009) stated, is to scaffold teacher candidates in creating "positive, educative learning environments for all children, especially those in high-need urban contexts" (p. 73). Ketter and Stoffel (2008) collaborated to conduct a year-long self-study in Stoffel's middle school writing class in an urban charter school. For Ketter, this experience proved to be invaluable as it gave her insights into the realities of inner city classrooms and helped her become more aware of theory to practice connections she could use in her preparation of teacher candidates. Such experiences, Ketter suggested, also give teacher education faculty credibility among their preservice teachers and test their beliefs about how to prepare teachers to teach for social justice, especially regarding issues of behaviour management. Most of all, Ketter stated her experiences led her to believe her preservice teachers "need to be learning the discourses of power, but . . . also need to learn about the cultural and political contexts of these discourses" (p. 141). Kroll (2012) concluded that teaching in-service teachers' inquiry and self-study was a powerful way of developing habits of mind, critical questioning, and transforming teaching and learning for social justice. Similarly, LaBoskey and Richert (2015) taught their graduate students to conduct self-studies "to research and improve their teaching in urban elementary schools" (p. 164). Like the self-study assignment LaBoskey and Richert (2015) developed for their graduate students, tasks designed by self-study researchers were developed to engage students in interrogating the status quo and to reflect more deeply about their values and issues of equity and diversity, thereby raising their critical consciousness (Aston 2009; Boyd and Noblit 2015; Burke 2016; Lowenstein 2010; Regenspan 2002; Sevier 2005; Sowa 2016; Torres and Mercado 2004; Van Laren 2011). The next section of this chapter examines how teacher educators navigate their roles as faculty while implementing social justice teacher education.

Exploring and Navigating Faculty Roles

Moule (2005) explored her teaching, service, and research roles as a faculty of color, while her college implemented a social justice-themed teacher education program. An analysis of her work over 5 years revealed she was "carrying an inequitable

proportion of the needed changes" compared to her colleagues (p. 39). Moule realized that her passion and belief in implementing social justice teacher education, and making it succeed led to work overload, and that difficulties in managing her faculty roles could jeopardize her quest for tenure. In their collaborative self-studies, Schoorman and Bogotch (2010) and Gemmell et al. (2010) reflected on their roles as researchers. Gemmell et al. (2010) described their journey of discovery as they examined their research identities in a university which emphasized excellence in research. These self-study researchers discussed their achievements, frustrations, and difficulties as they tried to balance their agendas of social justice, their research, and their role as teacher educators. Similarly, Schoorman and Bogotch (2010) critically reflected on their roles as social justice researchers and the challenges they faced in their institutions. Their objective was to ensure that principles of social justice permeated their work as teacher educators and researchers. Their work needed to:

> exemplify emancipatory practice, which includes how we think about the purpose of research, and who it serves, how we re-conceputalize re-conceptualize the relationship between the researchers and the researched and being critically aware of the power structures being perpetuated or challenged by the research process and the product (p. 261).

Schoorman and Bogotch (2010) also described the characteristics of a multicultural/social justice researcher. These are "the commitment to a common good, the redefinition of the researcher-researched relationship and the interrogation of the traditional roles, norms and power dynamics of academic research and researchers" (p. 249). The second theme, self-studies as windows, is discussed in the section below.

Self-Study as a Window

As stated above, the second theme that emerged from our analysis of self-studies was self-studies as windows. These self-studies are characterized as windows looking outward at contextual factors and issues which affect the work of teacher educators. This theme also includes the approaches they use to research and collaborate within their own institutions, in schools, and in communities. Studies by van Laren (2011) and An (2016) explored outside forces which influence the work they do. An (2016) focused on high-stakes state testing requirements for teacher candidates. She described the challenges she faced teaching social studies with a social justice lens after the introduction of the EdTPA, a subject-specific performance-based assessment that teacher candidates were required to take for teacher certification. According to van Laren (2011), in 1999 the South African government mandated that HIV/AIDS education be infused into all areas of education. To address this issue, van Laren integrated HIV/AIDS topics into her mathematics courses. She found HIV/AIDS integration in the teaching and learning of mathematics education "provides opportunities to take action for social justice" (p. 333).

Administrative self studies. In 2004, Manke wrote about the need for and importance of self-studies by administrators which critically consider how

stakeholders in teacher education build community, address issues of power, and collaborate to work for social justice and teacher education reform. Consequently, administrative self-studies "have considerable potential for revealing the impact of today's educational changes in the world of practice" (p. 1367). Administrative self-studies in teacher education are necessary because the preparation of teachers involves institutions of higher education, schools, and school districts, all of which require management. When Manke wrote her self-study, she noted there were only three self-studies of administrative practices. For this review, we only found two studies about administrative self-studies which focus on social justice: Manke's study (2004) and Hamilton's (2002) narrative about leading an initiative to introduce social justice as a major theme of the college of education where she worked. Hamilton's reform efforts were unsuccessful. The college curriculum committee decided to table the consideration of social justice as a theme for the college. This experience led Hamilton (2002) to think more critically about her position of privilege and status as a white woman faculty member of a university college of education.

Conclusion

In our analysis of self-studies with a focus on social justice education, themes which emerged are self-studies as mirrors and windows. All self-studies are reflective, but self-studies which are mirrors are particularly self-reflective as they demonstrate how the personal identities, teaching, and research of teacher educators are inextricably intertwined. In these research studies, teacher educators looked inward and reflected on their race, personal experiences, socioeconomic status, dispositions, their privileged positions as teacher or supervisor, and how these factors influenced the way they prepared preservice and in-service teachers to teach for social justice. Conducting self-studies helped these teacher educators to raise their own critical consciousness (Aston 2009; Boyd and Noblit 2015; Burke 2016; Lowenstein 2010; Regenspan 2002; Sevier 2005; Sowa 2016; Torres and Mercado 2004; Van Laren 2011).

The mirror as self-reflection also includes self-studies which served as learning tools to help teacher educators improve their teaching. Through the analysis of teacher candidate coursework, conducting interviews, surveys, and discussions with critical friends and teacher candidates, teacher educators' systematic research revealed their strengths, vulnerabilities, biases, and values thereby helping them to reframe their teaching in ways that were more consistent with social justice education. This in turn helped them grow as teacher educators (Bartlett 2009; Flory and Walton-Fisette 2015; Knowles 2014; LaBoskey 2012).

Pedagogical strategies teacher educators used to scaffold and foster preservice and in-service teaching with a social justice lens include autobiographies, developing unit plans, artwork, responding to research publications, field experiences, and reflective journals. Some self-studies focused on changing attitudes and dispositions, while others focused on fostering the learning and enactment of pedagogical

strategies designed to promote social justice. Only a few self-studies emphasized research in K-12 classrooms with in-service teachers; clearly, more of these self-studies are needed. Regardless of the topic explored, and methodology or pedagogical strategies used, all the self-studies as mirrors explicitly or implicitly unpack the tensions of implementing a social justice curriculum among the competing factors of meeting accreditation standards and ensuring teacher candidates pass assessments like the EdTPA. Teacher educators also navigated the tensions arising from university expectations for research and tenure and implementing a social justice education.

Self-studies as windows are research studies which help teacher educators and administrators of colleges or schools of teacher education look outwardly and away from university classrooms to explore institutional and external factors which can affect their teaching for social justice. Included in this theme are research studies that focus on programmatic and institutional change led by university faculty and/or administrators. There is more research needed in this area, especially studies like Cochran-Smith et al. (1999), which explore how faculty members with different philosophies and ideologies collaborated to develop a teacher education program which emphasized teaching for social justice. McDonald and Zeichner (2009) emphasize the need to ensure that teacher education programs have a social justice focus in content, structure, and quality. More self-studies are needed regarding teacher educators' use of self-study methodology to study these types of institutional reforms and programs. The theme self-studies as windows also includes research that connects teacher preparation with external communities and factors which influence teachers work in schools, such as high-stake testing and national curriculum mandates. Needed in self-study research on social justice, are studies which describe teacher education programs linked to social movements that "prepare teachers to take both individual and collective action toward mitigating oppression" (McDonald and Zeichner 2009, p. 597). McDonald and Zeichner also state "social justice teacher education programs might benefit from connecting their work with other social movements, locally, nationally, or globally and provide some historical and international examples of such efforts" (p. 596). Additionally, the canon of self-study research needs more international studies from teacher educators working in the Global South or low- and middle-income countries (LMICs). As Table 1 indicates, most self-studies examined in this chapter are from the Global North. Of the 51 studies, 41 are based in the United States, 2 are based in South Africa, and 1 is based in the United Arab Emirates. Self-study practitioners, through the American Educational Research Association (AERA), the self-study special interest group, and the Herstmonceux Castle conference, should continue to reach out to international scholars from the Global South. Through the self-study of teacher education practices, teacher education worldwide can only be made stronger with the addition of voices of scholars from these countries. Encouraging and fostering the inclusion of more studies from the Global South in research and collaboration are essential in this era of globalization. "Why is there so little self-study on social justice issues?" is the question Griffiths et al. (2004) asked in their research on knowledge, social justice, and self-study. Since these researchers wrote their case

studies, and as this chapter demonstrates, there has been an increase in the number of self-studies on issues of social justice. However, we still need more. As asserted above, we need more self-studies which concentrate on researching in-service teachers in K-12 rural and urban schools, more from LMIC countries, and we need more self-studies connected to social movements. Additionally, we strongly advocate for more self-studies which explore LGBTQ issues, language learning, inclusion, and disability. As the research reviewed in this chapter demonstrates, self-studies can and should be used to prepare teacher candidates and in-service teachers to teach for social justice.

Co/autoethnography as a Feminist Methodology

18

A Retrospective

Monica Taylor and Lesley Coia

Contents

Abstract

In this chapter, we show how co/autoethnography, a self-study methodology, has enabled us to put into action feminist principles through concrete examples from a series of self-studies we have conducted over the past 17 years. Using salient features of co/autoethnography, we hope our readers will see the possibilities of advancing their understanding of their practice through feminist self-study methods and approaches. By providing a retrospective look at how

M. Taylor (✉)

e-mail: lcoia@agnesscott.edu

co/autoethnography is a feminist self-study methodology, we examine the past and offer a glimpse into how self-study could expand to include more of a focus on examining teacher education practices through the intersectional lens of social justice. We begin the chapter with some history and background of how our methodology of co/autoethnography emerged within the context of self-study. After providing a definition, we illustrate its key tenets using narrative examples from past co/autoethnographies. In doing so we make connections to self-study literature that explicitly draw on feminism while looking to the future. We hope through this work to show how our aims as socially just self-study researchers are enriched by a feminist perspective.

Introduction

As far back as 20 years ago at the first Castle conference, Barnes (1998) noted that the self-study group was a caring and supportive community that offered educators an environment based on openness, a commitment to collaboration, and a willingness to see topics anew through reframing. Within this community, the possibilities of what is studied and how questions are studied are endless. In self-study, there is no recipe, no single truth (Loughran 2004). This is why we were drawn to self-study and we are sure this is why many others also find their home in this academic community.

At the very heart of self-study is the radical idea that those who practice have something important to say about that practice. As an academic and professional community, self-study works to ensure that all who come to it see it as a home, a place where we have a voice: one that has epistemological and ethical weight. All voices have merit in our community. We take care to be open to shifting our attitudes as our community moves and grows as we engage together in constructing an environment that can accommodate and support us all. In many regards, this is why Zeichner (1999) called self-study "the single most significant development ever in the field of teacher education research" (p. 8).

In the self-study community, we do not pretend omniscience but claim knowledge based on our experience. What we, as practitioners, have to say about our practice is important not just for us as particular practitioners in our own particular context but for others similarly situated. Thus we understand ourselves as a community who can speak to each other of what we know and can share that knowledge with others in a wider community that share similar fields of practice.

Within this context of openness, voice, and ownership of meaning making resides a deep-seated commitment to concerns about equity, diversity, and social justice. Often self-study researchers choose to examine their practices

personally, collaboratively, and programmatically around social justice change in terms of race, ethnicity, gender, disability, and power or more all encompassing lenses like multiculturalism and alternative ways of knowing (Tidwell and Fitzgerald 2006). For this chapter, we focus on our self-study research through the lens of gender and feminism. The self-study approach, as laid out above, enriches, affirms, and provides a way of researching our practice, but it importantly also dovetails with many of our feminist beliefs and practices.

In this chapter, we show how co/autoethnography, a self-study methodology, has enabled us to put into action feminist principles through concrete examples from a series of self-studies we have conducted over the past 17 years. Using salient features of co/autoethnography, we hope our readers will see the possibilities of advancing their understanding of their practice through feminist self-study methods and approaches. By providing a retrospective look at how co/autoethnography is a feminist self-study methodology, we examine the past and offer a glimpse into how self-study could expand to include more of a focus on examining teacher education practices through the intersectional lens of social justice. We begin the chapter with some history and background of how our methodology of co/autoethnography emerged within the context of self-study. After providing a definition, we illustrate its key tenets using narrative examples from past co/autoethnographies. In doing so we make connections to self-study literature that explicitly draw on feminism while looking to the future. We hope through this work to show how our aims as socially just self-study researchers are enriched by a feminist perspective.

Part I: Our Feminisms

> Feminism goes wherever we go. If not, we are not. (Ahmed 2017, p. 15)

Throughout our careers we have been moved by a sense of injustice and by a sense that something is in fact not right. These feelings, senses of wrong, motivate us to examine our teacher education practices to ask ourselves what we could do as teachers and teacher educators to address this. We wonder how we are complicit in these wrongs, the limits of our complicity, and how we can help to redress them. We have always seen ourselves as feminist teachers. We have been drawn to feminism as a lens for understanding the injustices we experience and witness in our personal and professional lives. Feminism provides a central perspective on our identities as women such that for us being feminist teachers is intellectual, embodied, and emotional. Our feminist perspective on our necessarily gendered community seeps into the language we use in our everyday lives as well as our teaching practices and research. We bring it into our classrooms, conferences, and reading of texts. Sometimes, of course, words alone cannot capture our feminism, as feminism is manifest in our bodies, in the ways we move in the world, are positioned and perceived by others, are used to communicate, and are guarded and how we use our bodies to interpret our students and their interactions with their students.

Just like our talk, we use our bodies to perform our teaching as well as a vehicle for learning. Our feminism exists in our minds and bodies.

We are moved by a sense of injustice in our minds and bodies, and therefore in response we must take action and make real change. This work is built from individual struggle but requires that it be done collectively. We cannot do this work alone as individuals or isolated in the collaboration that we have created by ourselves. As Ahmed (2017) writes: "Feminism as a collective movement is made out of how we are moved to become feminists in dialogue with others" (p. 5). We need to work with others – in order to feel buoyed and supported, in order to make change in ripples rather than linearly, and in order to have a shelter and a space to re-energize. hooks (2000) defines feminism as "the movement to end sexism, sexual exploitation, and sexual oppression" (p. 33). But this does not mean it is separate from race, class, sexuality, language, or ability. Feminism is a movement that needs to be both still and in motion; it needs to be taken up – by ourselves, our students, our academic colleagues, our teacher partners in schools, and the greater community. It needs to be everywhere – transcending and disrupting race, class, sexuality, language, and ability. For as Dzodan (2011) reminds us, feminism will be intersectional or "it will be bullshit."

Coming to Co/autoethnography Through Autobiography

> A feminist is any woman who tells the truth about her life. (Woolf 1929)

Although not always explicit, it is not surprising that our methodology of co/autoethnography is built upon feminist principles. Self-identifying as feminists was in fact the very reason we were drawn to each other 20 years ago. Monica was interviewing for her first professorial position at a small liberal arts college where Lesley was working. Intending to conduct a more informal interview, Lesley invited Monica into her office. Monica noticed a copy of *The Education Feminist Reader* (Stone 1994), and we immediately shared our enthusiasm for Maxine Greene, Nel Noddings, and Elizabeth Ellsworth. Although we came from different educational fields, it was in that moment that we realized our shared deep-seated commitment to feminism:

> The longing to tell one's story and the process of telling is symbolically a gesture of longing to recover the past in such a way that one experiences both a sense of reunion and a sense of release. (hooks 1998, p. 431)

From the beginning of our collaboration, we were interested in exploring the use of autobiographical reflection with our preservice teachers. We had both, individually, come to understand that our purpose as teacher educators was less about equipping our students with the tools and more about helping them to understand who they were becoming as teachers (Britzman 1986). We recognized the ways in which autobiography had the potential to provide women a space to share their

narratives, which were often either dismissed, overlooked, or presented through a patriarchal lens (Heilbrun 1988; Smith and Watson 1998). As feminist educators, we saw validity in personal narratives, expanding the kinds of ways of knowing accepted in academic settings to those that are personal, subjective, communal, relational, and even embodied. We understood that there wasn't a single story and we wanted to discover how we could invite multiple voices into our classroom, particularly those voices that are rarely heard or noticed. Drawing from Witherell and Noddings (1991), we encouraged our students to write personal narratives as a way of making meaning of who they were as students and who they were becoming as teachers embedded in particular cultures, languages, genders, belief systems, and histories. We hoped that the use of personal narrative would invite students to present their stories in complex ways, where their identities could legitimately be seen as fragmented, fluid, and dynamic. We believed writing autobiographical reflections would be a valuable tool in helping our students find their voices as beginning teachers. We introduced this assignment in our middle school methods course and provided students with a series of prompts to consider as they wrote their stories, also asking them to reflect on the writing process (Taylor and Coia 2001). Collecting their narratives and reflections, and our field notes, we created a relatively traditional research relationship. We, the teacher educators, were the researchers, and our preservice students were the participants, and we used the constant comparative method inductively (Glaser and Straus 1967) to derive our findings.

For many of our students, writing autobiographical narratives felt very much like thinking as a teacher. We reflected: "Writing autobiographically encouraged students to unearth, clarify, and make concrete the beliefs and concepts that they already held about teaching rather than focus on new information. Our preservice teachers were able to connect their past, present, and future selves and strengthen their perspectives on teaching" (Coia and Taylor 2006, p. 21). We were excited by these findings as we believed this was a process for students that had the potential to help them realize how they could make meaning for themselves. This realization very much paralleled our feminist beliefs about teaching. We understood that our students needed opportunities to come to know for themselves, where they started with their own past experiences and constructed understandings from their histories (Brownlee and Berthelsen 2008). Also for many of the students, sharing and discussing personal narratives in class helped build a safe and trusting community. Although several of our findings felt positive, we still realized that there were limits to using autobiography in a class. We questioned whether requiring students to write these narratives would influence the authenticity and reflexivity of their pieces. Like Ropers-Huilman (2001), we understood that just because we "invited" them to reflect this did not mean their reasons for doing so were authentic or purposeful. And as she points out, at no time did our students feel that they could say: "I've already been reflecting, teacher, so I don't need to do this assignment, but thanks for the opportunity" (p. 54). There was some discomfort too on our part in reading our students' personal narratives as outsiders examining their lives through the lens of some authority. We were reminded of the feminist critiques of autobiographical writing and its lack of criticality. We worried that our students would simply

reproduce the narratives of the master without problematizing issues of power and authority (Smith 1998). How could we continue to reflect through autobiography but in more authentic and critical ways?

Our first move was quite simple. We decided to put together a group of teachers to reflect alongside of us using autobiography. Aware that teachers often feel either isolated or without agency, we hoped that writing together as a group would provide a space to explore freely, potentially strengthen our beliefs and convictions, and inspire us to grow as teachers. Writing and analyzing alongside the teachers also shifted how we conceptualized our research methodology to a more participatory method. The group could also avoid the slippery slope of navel gazing: we were exploring our individual narratives within a community, so although these were private stories, they were shared publicly. From the start, we understood that this work had to be done in an organic way so that each individual in the group had the opportunity to explore coming to know in different ways. What we shared in common was the experience of writing reflective narratives, sharing them as a group, and participating in a discussion.

Our community created a space where we could safely share a wide range of our experiences and feelings – we were not restricted to only presenting our successes. We were able to be vulnerable and to share our personal and professional selves, validating the importance of questioning, of recognizing uncertainty, and even of being emotional. Additionally, several of us noted that our group meetings were a time to analyze and theorize about our teaching, something we rarely had opportunities for in our daily teaching lives. Doing this together strengthened our community and at the same time blurred the boundaries between individuals (Taylor et al. 2002).

> Our way was messy. (Coia and Taylor 2006, p. 24)

We began to question whether the autobiographical method served our needs or limited us. Our collaborative work no longer focused on a singular "I." We needed a different sort of methodology that could help represent the more complex understanding of self. Autoethnography intrigued us, especially Reed-Danahay's work in anthropology and Lionnett's work in postcolonial literary theory. As Reed-Danahay (1997) explains, "Autoethnography is a fluid concept, synthesizing both a postmodern ethnography, in which the realist conventions and objective observer position of standard ethnography has been called into question, and a postmodern autobiography, in which the notion of the coherent, individual self has been similarly called into question" (p. 2). Our work with the teacher group required that we begin to shift our research methodology to find a means to use ethnographic methods to analyze our autobiographical writing. Our narrative analysis was no longer just for our private selves – we were sharing our stories with one another, and the meaning making was occurring through our interactions and discussions.

Looking back at the evolution of our co/autoethnographic methodology, we wonder if our move to a more collaborative analysis process was driven by our

feminist principles and the commitment to examine ourselves together within the larger social contexts. Were we trying to create a space where we could be more critical and also more prone to take action? Were we looking for a methodology that would ignite political action as Zeichner (1993) called for or a means of doing what Griffiths (1994) describes as "critical autobiography"? Were we seeking a community to develop our feminist subjectivity? Were we, like Griffiths (1994), hoping for a methodology that would draw from both Haraway and Harding's epistemologies which "depend on taking individual perspectives and combining them, politically, into group perspectives" (p. 74)?

We soon came to realize that despite its obvious attraction and applicability, autoethnography was limiting as it did not seem able to reflect or capture how we were analyzing our narratives together in collaboration. Our self-study methodology required us to embrace the idea that we could "research ourselves only within the context of others" (Coia and Taylor 2009, p. 7) because our meaning making was relational and emerged in dialogue and conversation. Our relational epistemology had emerged organically as we grappled with our teaching in the context of our relationship. As Lysaker and Furuness (2011) write:

> . . . a relational view of knowing and knowledge is grounded in the idea that we come into being in and through relationship (Belenky et al. 1986). All knowing and learning come from our human need for connection with others and with the world. Given this epistemic stance, it follows that our knowledge of the world is mediated by our relationships with those around us . . . (p. 187)

With this stance in hand, we searched for a methodology that would capture this lived experience and one that would mirror the interpersonal nature of teaching.

Tending to relationships and caring for our students intellectually and interpersonally undergirded our teaching (Noddings 1984, 1992). We understood that our students "come to us not as problems to be solved, but as people becoming" (Taylor and Coia 2009, p. 171). We strove to build caring relationships with our students in order to model and guide them to develop as caring teachers. We recognized that these relational tenets of teaching and learning emerged from our feminist ideology for as Noddings (1992) writes, "only if education is organized around centers of care are we likely to avoid the domination of groups in power" (p. 169). With the complexities of the relationships, with each other and our students, firmly in mind we developed what we came to call co/autoethnography: a methodology that captured the power and importance of our relationships.

Almost immediately we also realized that co/autoethnography was a better fit for the self-study community than autobiography or even autoethnography because it explicitly values relationships and collaboration. Change can occur individually but there is greater change when this work is done with others. In the self-study group, great emphasis is placed on interaction and the potential of what can emerge within a community of learners (LaBoskey 2004; Pinnegar and Hamilton 2009). The context for co/autoethnography includes the wider community: our relationships with

ourselves, our past, our connections through literature, art, and music, as well as our connections to our self and others, including our professional communities.

Part 2: How Do We Define Co/autoethnography?

> But for every real word spoken, for every attempt I had ever made to speak those truths for which I am still seeking, I had made contact with other women while we examined the words to fit a world in which we all believed, bridging our differences. And it was the concern and caring of all those women which gave me strength. (Lorde 1984 p. 41)

Co/autoethnography is a self-study feminist research methodology that takes autoethnography, "a form of self-representation that complicates cultural norms by seeing autobiography as implicated in larger cultural processes" (Taylor and Coia 2006a, p. 278), and moves it beyond the singular to the plural. This methodology focuses on the ways we construct knowledge and in particular how we do so together, for as we have argued, "Knowledge is social and individual. It has to do with who we are. The knower is important" (Taylor and Coia 2006a, pp. 280–281). We come to know through the interweaving of our stories through dialogue so that validity, insight, and analysis all emerge as we write together exploring issues of concern. We investigate our own selves within the social context of our relationship as well as the larger culture of teaching. Creating a co/autoethnography and reflecting about our teaching in this particular way are rich endeavors: it is not conducted in a vacuum.

Our experiences, research, and knowledge of the literature are vital and explicit components of our methodology such that, as we have noted, "[o]ur analysis is derived from the theoretical, practical, and personal knowledge we bring to conversation" (Coia and Taylor 2006, p. 26). There is a reciprocity between these knowledges that both inform and are informed by one another. The back and forth of this process allows a means of "coming to know that does not privilege either the subjective or the objective" (Coia and Taylor 2006, p. 26).

> We write into each others' lives. (Coia and Taylor 2006, p. 26)

Co/autoethnography heightens our awareness and increases our understanding of our blurred identities as teachers, friends, and women, but this is only something that we can do in collaboration with one another. We rely on the caring and strength of our relationship, as Lorde writes above, to push us to be critical, and honest, and to embrace the partial, complex, and multifaceted nature of our relationships. As we note, "We are not interpreting each other by rewriting our stories according to some preconceived format of what needs to be included, whether narrative or theoretical; but then again, the process demands we reject some posited innocence or the primacy of raw experience" (Coia and Taylor 2006, p. 26).

Our methodology is critical, approaching critique in a feminist way, through relationship. In co/autoethnography, "[t]he narrowing of space between writers

encourages the retelling of stories, so we encounter our autobiographies not as fixed entities but rather as texts that encourage a re-examination, re-living, dialogue, and inquiry. Through this re-telling and re-writing we are forced to examine our beliefs from different perspectives and initiate change" (Coia and Taylor 2002, p. 149). It is in the listening and recounting of stories, rather than the acting or telling, that leads to critical analysis. We read through our stories, looking for insights and making meaning. Sometimes the meaning of stories changes as we dialogue together. Our words and memories are not static – they shape shift and evolve as we consider them together.

> We are not inserting ourselves in a story where we have no business, or trying to make ourselves invisible as traditional researchers did. We are insiders and outsiders. We are talking about our own experiences but they are analyzed from a number of perspectives and vantage points, including our own... (Coia and Taylor 2006, p. 26)

The purpose of self-study is to improve our practice by systematic research by us as practitioners. Thus, the core idea undergirding and motivating self-study is the idea that the practitioner, the teacher, can know. At the heart of both co/auto-ethnography and self-study is the insight that the practitioner's knowledge is expert knowledge. To hold this position involves reducing or eliminating the traditional power imbalance between the research and the subject of that research. Early on in the course of our self-studies, we came to understand that our collaboration itself produced knowledge (Coia and Taylor 2004, p. 72) in our acknowledgment of the teacher's subjectivity, of being the subject and the object of the research, and being the person who can both practice and improve one's practice. "The private voice, the subjective voice" as we have shown in our previous writings (Taylor and Coia 2006a) "is necessary if the distancing and objectification of education is really to be rejected" (p. 281). The knowledge we construct through our co/autoethnographies makes real the idea that the boundaries between ourselves are permeable and that together are responsive to the language and conditions that create our identities. The knowledge we produce is ours, but it resonates.

What does co/autoethnography look like in practice? Building upon the feminist notions of relational knowing, all co/autoethnographies involve at least two researchers. It is *in relationship* that data are generated through a nomadic writing process that includes writing, rewriting, and sharing stories, discussion of pre- and post-writing, reflective writing and response, analysis of theory and research, and the collaborative generation of new texts. There is no particular order to this process. To some extent, it resembles improvisation, boundary crossing, or even what we have called "nomadic jamming" (Coia and Taylor 2014). As we explain, [o]ur process is nomadic, inviting a mixture of improvisation as well as knowledge from experiences in our past, present, and future. Co/autoethnography allows us to 'move about' (Minh-ha 1986/1987) because teaching practice has no clear or set bounds, and "if we stay in one place, thought, or framework for too long, we could become stuck" (Coia and Taylor 2017, p. 59). What constitutes a narrative can be flexible too. We have mostly written stories, reflections, and dialogues, but the texts we produce

could be poetry or visual or audio texts. Similar to the fluidity of the text, our method of communicating is also fluid and can be either electronic or face to face.

Essential parts of the co/autoethnography process are conversation and dialogue, through which our themes and patterns emerge. These interactions include our responses, questions, and even our own stories to one another's narratives but also connections we make to literature, other research, art, music, and our daily interactions both inside and outside of the classroom. Much like the Arizona Group (2006), our dialogue becomes a process of knowing. We have explored how the dialogic process itself leads to insight, suggesting that "[i]nsight comes in telling our stories to one another. We do not tell the stories because we have insight: they are not complete in that way, with their lessons neatly attached" (Coia and Taylor 2013, p. 10). Consistent dialogue and discussion are key for co/autoethnography, so that we have opportunities to make meaning together.

Once we have identified our themes, we turn to the crafting of the co/auto-ethnography. Together we write and rewrite our narratives, bringing our multiple perspectives as feminist teachers, women, and writers to the piece. Our drafts resemble a work of Middleton's (1995) that has influenced us. In this article, Middleton breaks with the traditions of academic writing and blurs the lines between the personal and the professional. She integrates "everyday experiences which are usually rendered invisible in academic writing" (p. 87) to show how our "lived reality" can generate our feminist educational theory. As feminist researchers, we craft our co/autoethnography by blending personal and professional stories, pushing the conventional boundaries of academic writing. We pay close attention to the imagery of our language and the ways in which it may impact the reader.

At this juncture it is important to note that co/autoethnography is trustworthy. It demonstrates its trustworthiness by adhering to the criteria Richardson (2000) outlines for writing as a means of inquiry. Thus, a co/autoethnography is trustworthy if our writing contributes to the field of teacher education in a substantial way, speaks to and moves the readers, has esthetic merit, expresses a reality, demonstrates reflexivity both in terms of how "the producers and the products" are presented, and finally leads to the generation of other ideas or writing. The criteria speak to our methodology because they allow for fluidity and change – the kind of fluidity and change that are valued when we believe as feminist meaning makers that our identities are fluid, dynamic, and always under construction.

It might be tempting to present co/autoethnography as a series of clear easy steps or a recipe to follow faithfully, especially with the pressures we feel in the teacher education context around standards, criteria, and rubrics. Yet we know from our own research experience, as well as those of others in self-study, that what we learn cannot always be described in concrete, definitive, and generalizable ways. Our learning is complex and messy and is not readily or usefully translated into propositional knowl-edge (Coia and Taylor 2014). With that in mind, we are not naïvely encouraging the taking up of this feminist methodology over another. We are not privileging our messy complicated process over a more traditional positivist, technical methodology. For if we did, we would be acting in a hypocritical manner. This would not invite disruption, rather it would just offer substitution (Coia and Taylor 2017).

Making Meaning When Identities Are Fluid, Dynamic, and Under Construction

> Women, I believe, search for fellow beings who have faced similar struggles, conveyed them in ways a reader can transform into her own life, confirmed desires the reader had hardly acknowledged—desires that now seem possible. Women catch courage from the women whose lives and writings they read, and women call the bearer of that courage friend. (Heilbrun 1997, p. 138)

> We are teacher educators, but no matter how it may feel at times, this is not all we are. None of us is solely defined by our identities as teachers, and our identity as teachers is not solely defined by us. The conceptualizations of identity as complex and culturally informed motivates our development and use of co/autoethnography. A corollary, central to our methodology, is that identity is dialogical. We maintain our identity in relation to others. (Coia and Taylor 2009, p. 3)

We start from the assumption that our identities are in flux, dynamic, and always under construction. While we may, in any particular context, privilege one aspect of our identity, that moment and that identity is not forever. As a consequence we do not worry over much with beginnings or origins, or with producing a clean finished product. As we have previously noted, "the stories we tell are not finished;" rather they create spaces for a purpose: to open and continue a conversation (Taylor and Coia 2006a, p. 274). For our self-studies, although we are interested in how our past informs our present, we are always in the middle, in the midst of our stories. In our co/autoethnography exploring issues of power and authority, for example (Coia and Taylor 2004), we consciously acknowledge that there is no point, nothing fixed from which we can begin. Just as we always begin somewhere in the middle, we also recognize that "[t]here is an important sense in which no co/autoethnography is ever complete, although the findings of each co/autoethnography can be valid" (Coia and Taylor 2009, p. 15).

Our identities are socially constructed and produced. We define ourselves but we are also defined by others within a particular culture. Being teacher educators now at this time and in this cultural space involves being constructed in a specific way using a shared discourse. There are multiple interpretations of who we are, and there is room for this identity to be malleable, shifting and moving in response to the needs within the culture. It is in this complex space that our co/autoethnographies are constructed as we explore how we are defined by our relationships, conversations, and interactions with others.

Identity Is Dialogical (Coia and Taylor 2009)

> Are you talking Monica?
> No. I am listening. (Skype conversation, February, 2012) (Coia and Taylor 2013)

> We make ourselves in part out of our stories about ourselves and our world, separately and together. The great feminist experiment of remaking the world by remaking our ideas of

gender and challenging who has the right to break the silence has been wildly successful and remains extremely incomplete. Undoing the social frameworks of millennia is not the work of a generation or a few decades but a process of creation and destruction that is epic in scope and often embattled in execution. (Solnit 2017)

We are looking at ourselves from the inside and outside. (Coia and Taylor 2006, p. 27)

Our process begins with our relationship and the ways in which meaning is constructed through a collaborative analysis. When we write our teaching lives, we bring together and create aspects of ourselves. Relying on the trust that we have built with one another as well as with our students over time, we identify what is happening in our classes through the collaborative self-study experience. In doing so, we strive for reciprocal and bilateral relationships (Coia and Taylor 2004).

We draw from the poststructural feminist work of Ellsworth (1989), Britzman (1993), Lather (2001), and St. Pierre (2000). As Britzman (1993) writes: "All categories are unstable, all experiences are constructed, all reality is imagined, all identities are produced, and all knowledge provokes uncertainties, mis-recognitions, ignorances, and silences" (p. 22). Our feminist methodology does not look for *the* answer or *exactly* what is going on. It cannot become "routinized, stable, and predictable" and instead needs to "shake" things up (Lather 2006, p. 1). As feminist teachers, we embrace uncertainty, unpredictability, and unknowing (Britzman 1993; Coia and Taylor 2013, 2014; Ellsworth 1989; Taylor and Coia 2012). We are always searching, questioning, examining, and investigating. We are careful not to be stuck or to latch onto one idea or concept too wholeheartedly. This work never lets up because we hope never to become complacent.

Co/autoethnography is about being open rather than fixed in the ways we interpret our teaching, experiences and the world. In this we agree with Weedon (1987) who reminds us that "meaning can never be finally fixed. Every act of reading is a new production of meaning" (p. 134). This is equally true for co/autoethnography: every act of writing and rewriting brings new meaning. All aspects of our identity are, on some level, available for inquiry providing a richness to the self-study, recognizing the importance of the self as a source of insight without fixing that self in one place with one story for all time. In co/autoethnography we see this feminist stance manifested in our teaching and writing about our teaching in the ways we welcome uncertainty into our classrooms. Allowing for uncertainty and unpredictability opens up space for others to be heard, and for us this is central to our work as teachers using self-study to improve our practice, where we are provided with never-ending room for "moving about" (Minh-ha 1986/1987, p. 7). As liberating as this can be, it can also make us feel uncomfortable and unsettled. The discomfort is, however, important for it forces us to continually question our teaching practices. These evolving and often evocative questions "are constantly moving," and "one cannot define, finish or close" (Lather 2001, p. 184) the process or the questioning. We believe this is one reason we were initially drawn to the self-study of teacher education practices: the way it aligned with our feminist beliefs on the importance of focusing on *our* authentic and often dynamic questions as they shift and change to the rhythm and beats of the teaching dance, a dance that is never a solo performance (Coia and Taylor 2013).

A Focus on the Everydayness

> Feminism is wherever feminism needs to be. Feminism needs to be everywhere. Feminism needs to be everywhere because feminism is not everywhere. (Ahmed 2017, p. 4)

> The stories we have told are everyday events. There is nothing extraordinary about a student sharing a personal experience or a presentation in class by a visitor. These are ordinary small moments in a teaching life, part of our on-going story of learning to teach. They talk of the ways in which the pedagogy and content of our teaching are in continuous negotiation with our lived experience and ideas about teaching. (Coia and Taylor 2014, p. 164)

As a feminist methodology, co/autoethnography often addresses the prosaic moments of our classes rather than critical incidents or dramatic episodes. This is because we focus on what Bateson (1997) calls the "everydayness" of experience. For it is in the day to day of our lives that the real learning takes place. In many ways this too is a feminist stance as it acknowledges the blurring of personal and the professional and gives value to our daily interactions as women. The everyday for women is not simple or mundane. It is the landscape where power and constraint are manifest as we have seen in our work where we "honor the everyday as sites for reflection on issues of power and authority" (Coia and Taylor 2017, p. 59). We like to study "the planned unpredictable moments in the classroom. . . Our interest is in the unpredictable, spontaneous, small moments that are out of control, as we suspect this is where the learning occurs" (Coia and Taylor 2014, p. 160). In short, teaching occurs in the "continuous negotiation with our lived experience and ideas about teaching" (p. 164).

We are grounded in our everyday lives as women – we cannot remove our gender from our research. Examining our teaching through a gendered lens has happened organically as we have crafted our methodology of co/autoethnography. This may be due in part to our commitment to feminist principles in our teaching and research. We recognize the importance of focusing research on "women's diverse lives" (Bloom 1998, p. 144) and "listening to women tell us about their lives and experiences" (Harding 1991, pp. 123–124). We acknowledge how compelling the writings of Anzaldua, Lorde, and hooks are and echo Ahmed's (2017) sentiments about them when she writes, "here was writing in which embodied experience of power provides the basis for knowledge. Here was writing animated by the everyday: the detail of an encounter, an incident, a happening, flashing like insight. . .. I began to appreciate that theory can do more the closer it gets to the skin" (p. 10). When we construct our co/autoethnographies, we attempt to emulate our feminist foremothers, bringing theory into the everyday and the everyday into theory.

This orientation towards the everyday is very much evident in our work. For example, in one of our earlier pieces, when examining our feminist authority, Lesley told the story of one of her students, Annie, who was struggling to figure out how to respond to her students who were wearing T-shirts with confederate flags. In our second round of reflective dialogue, Monica shared a snippet of conversation that she had with a friend about parenting. She wrote:

You know I have been thinking about Annie. Her story really reminds me so much of motherhood. I was talking to a friend the other day. She told me her six year old attended a birthday party when she was the only one wearing a dress and was so upset about being different from everyone. We talked about how much harder it is for us as parents to watch our children go through the conflicts, insecurities, and challenges of childhood. It is more painful for us to witness our children in pain then for us to be in pain ourselves. I think it is the same experience for our students. (Taylor and Coia 2006b, p. 57)

This anecdote as well as a return to the feminist literature helped us to think through our co/autoethnographic findings on authority in the classroom. As we continued working through the chapter, we began to realize the parallels that were present between the ways in which Monica parents and her teaching stance around issues of authority. We wrote, "Unconditional nurturing does not work in any part of Monica's life, whether working with Lesley, her students, or bringing up her sons. In all cases there are moments of being cared for and of caring. For Monica, this project has meant a realization that caring and authority are not only complimentary but also need to be seen, as Applebaum (2000) argues, in relation with each other" (Taylor and Coia 2006b, p. 65). Here, as so often in our work, we have discovered that in order for us to examine how we engage with our students, we have to consider the ways in which our self is constructed in relation to others outside of the classroom (Taylor and Coia 2009).

Co/autoethnography Invites Our Whole Selves

Who we are, to whom we are related, how we are situated all matter in what we learn, what we value, and how we approach intellectual and moral life. (Noddings 1992, p. xiii)

Recently, Griffin (Monica's youngest child) saw his teacher in the supermarket. He could not believe it. He laughed and laughed. He could not believe that she shops or eats. We are all aware of this construction of the teacher as one who lives and breathes school, a person who is barely a person, someone with few personal attributes or emotions. Although we find this understanding of the teacher frustrating and baffling, we also play into it with our own lack of acknowledgement that we, too, bring our whole selves to the classroom. (Coia and Taylor 2009, p. 4)

We share this story as it is one to which many can relate, and it is not just restricted to K-12 teachers – our own students often forget that our lives are rich and full and involve more than just answering emails and providing feedback on papers. We recognize and value that we are teacher educators. But that is never all that we are. Being educators and researchers requires us to bring our whole selves into our work. We draw from the personal, professional, and political to inform our teaching and our research. When we think about or reflect on our teaching, we are not able to separate who we are as people from who we are as teachers. Who we are is important (Hamilton and Pinnegar 1998; Korthagen and Russell 1995; LaBoskey 2004) and includes all facets of our identities, how we identify ourselves, our relationships with others, our past experiences, as well as what we care about. Early on in our work,

Monica reflected: "I think that was the first time I realized that so much of who I am as a teacher is who I am as a person" (Coia and Taylor 2002, p. 50). We understand that teaching is "an intentional personal activity" and that therefore "it is people who teach" (Taylor and Coia 2009, pp. 170–171). We come to our teaching and research as persisting beings whose identities are complex and who have a history. As we wrote, "There is no such thing as a discussion of the disembodied or impersonal practices of teaching. All discussions of practice involve the personal whether or not this is explicitly acknowledged" (Coia and Taylor 2009, p. 4). For example, when teaching, Monica brings multiple identities to the classroom including herself as a teacher, mother, daughter, sister, dancer, and music lover. Her identity as teacher takes the lead but she cannot shake off the other identities that are present.

There is value to this holistic stance; by bringing our bodies, hearts, and minds to our research, we are able to unearth our values, beliefs, and motivations underlying our teaching. When we began our co/autoethnographic work, and wrote with former students and teachers, we saw the group as "an outlet for our feelings and a mechanism to explore our teaching experience... In our sessions there is freedom to express doubts, fears, concerns, plans, goals, etc." (Taylor et al. 2002, p. 11). This was a space unlike any other: it was the only space where we could share our "innermost feelings and thoughts about our lives as teachers" (Taylor et al. 2002, p. 11).

By challenging the dominant hegemonic and patriarchal notions of research with a capital R that center around objectivity, rationality, and separation from the self, co/autoethnography, situated within a feminist framework, offers an alternative, a means of blurring of the boundaries between the mind and the body, between the personal and professional, and between the political and the nonpolitical. Including our whole selves and examining everyday experiences become a way to challenge the "dominant discourses which can construct other individuals and groups in relation to many aspects of gender and education" (Cole 2009, p. 563).

For us this has meant allowing the personal into our teaching and interweaving the everyday narratives of friendship, of feminist friendship in particular, into our professional conversations. We share our personal feelings because they are a part of our whole selves and because they are another way of knowing (Jaggar 1989). We cannot remove or separate our feelings from who we are and how we engage in our work in institutional contexts that restrict and constrain. We understand Ahmed (2014) when she reflects in her blog that "talking about personal feelings is not necessarily about deflecting attention from structures. If anything, I would argue the opposite: not addressing certain histories that hurt, histories that get to the bone, how we are affected by what we come up against, is one way of deflecting attention from structures (as if our concern with our own pain or suffering is what stops certain things from just "going away")" (Ahmed 2014, para).

Even after working together now for 17 years, the constant demands of our professional lives and the need to produce often interfere with the tending of our personal relationship. We set the intention of caring for our relationship each week, but the outside pressures often distract us from what is most important to us – our long-term friendship, the history we have together, and the unconditional support we

have for each other. Co/autoethnography has been our way to "exist in relation" to each other: how we "can be in relation to others" (Ahmed 2017, p. 14). Conducting self-study alongside one another is about "gaining critical self understanding," and through our connections, we are able to find "intellectual and personal knowledge" (Bloom 1998, p. 151).

We know that our conversation cannot be neatly parceled into "work" and "personal." We remind ourselves to update each other on news about our families, share our feelings about a particular challenge at our college or university, or draw from our lived experiences to help provide insights into our teaching. We take time to engage with one another on a personal level, knowing our personal relationship plays an integral role in our collaboration. When we are rushed or on deadline and our conversations are all business, the loss of the personal is not mentioned, but there are emails afterwards that catch each other up on what is important, what is going on in our lives. The personal and the professional live together in our relationship and our work.

Bringing of our whole selves into our work is not unproblematic. We do not want to over-romanticize our relationship and how we work together. We are still two individuals working together. We do not always agree on what we are trying to say. We do not always understand where the other person is going with an idea. We try to capture our honest dialogue, and sometimes, because of our close relationship, we make assumptions, or take ideas for granted, or disagree. We want our research to be critical which requires a certain vulnerability that occurs when we share of ourselves. When we think about these issues, we are reminded that it is the strength of our friendship and our long-term collaboration that helps us welcome and navigate these tensions.

Drawing on Aesthetic Experiences

Other times, as we craft our co/autoethnography, our personal lives are evident in our writing as we draw on the aesthetic experiences we love and that serve to inspire us. It is not unusual for readers to discover references in our writing to musical bands, literature, poetry, theatrical performances, podcasts, or even pop culture. Reading the word and reading the world are ways of knowing that we embrace and use to make sense of our practice (Freire and Macedo 1987). Our lives in the world inform who we are becoming as teachers, so bringing the world into our writing provides a way for us to connect to our readers. As we carefully select which aesthetic texts to include, we consider how these pieces will resonate or ring true for the reader (Coia and Taylor 2013). In an article where we try to uncover our feminist pedagogy, for instance, we frequently quote one of our favorite authors, A. S. Byatt, as a way to illustrate and engage the reader but also as a way to share of ourselves – our love of Byatt, our fascination with her evocative language from which imagery and emotions emerge, and the memory of the awe and wonder of seeing a beautiful butterfly. We chose the following quote from Byatt because we knew it would set the stage for our narrative about realizing that making a checklist of characteristics of feminist pedagogy would not help us to understand our teaching:

Morpho Eugenia. Remarkable. A remarkable creation. How beautiful, how delicately designed, how wonderful that something so fragile should have come here, through such dangers, from the other end of the earth. And very rare. I have never seen one. I have never heard tell of anyone who has seen one. (Byatt 1992, p. 21)

We used the metaphor of capturing and cataloguing moths and butterflies to provide insight into our teaching:

The gardens where we work, where the butterflies live, look messy. Classrooms are rich complex environments where experiences are not lined up in neat rows that can be dealt with separately. We are not dealing with a mono-culture but a rich ecology. Nonetheless, in an effort to isolate and capture our particular experience as feminist pedagogues, we brought out our butterfly nets. We turned to the literature with a large butterfly net and set about capturing the characteristics of feminist pedagogy as if they were butterflies to be pinned in place in a display case. We captured the attractive red admiral (building community), along with the massive moon moth (voice). We even snared the elusive small brown echo moth (listening). Now we had a set of principles: all out of context. They provided a function, but were limited. We had performed the collectors' task. We had isolated our specimens and placed them individually in a protected place to preserve them. We found it all too easy to run through lists of characteristics and say 'Yes, did that'. But somehow we seemed to have missed the point. We were at an impasse. (Coia and Taylor 2013, pp. 6–7)

We could have chosen to describe our realization of focusing on the wrong aspects of our teaching in a more traditional and straightforward manner, but this would have omitted parts of ourselves and ignored the value of using literature and other creative arts as part of our research.

Part 3: Co/autoethnography: Moving Forward for Social Justice

I was going to die, if not sooner then later, whether or not I had ever spoken myself. My silences have not protected me. Your silence will not protect you. (Lorde 1984, p. 41)

. . . a feminist perspective on reflective practice can open the door of the classroom to the world and invite political actions that expand her sphere of influence locally, regionally, or even nationally. Our poststructural feminist lens transforms or reimagines reflective practice as a political endeavor with an explicit focus on recognizing power both when it is unequal and needs to be challenged and when it can be used for action to promote social justice practices. (Coia and Taylor 2017, p. 60)

Our co/autoethnographic methodology found a home in the self-study community. Besides a general openness, our work built upon those self-study researchers who adopted a feminist stance before us (Arizona Group 2000, 2004; Galman et al. 2010; Griffiths 1998; Hamilton and Guilfoyle 1998; Manke 2000; Samaras et al. 2004). Their feminisms are manifested in the ways they approached knowing as partial and socially constructed (Arizona Group 2004; Ellsworth 1997), how they conceptualized their epistemology of collaboration (Griffiths 1998), as well as in a commitment to examining power and authority through self-study (Arizona Group

1996; MacGillivray 1997; LaBoskey 2004; Skerrett 2007). Several self-study researchers have also adopted a poststructural feminist approach to their research on teaching (McNeil 2011); race and language in the classroom (Johnston 2000; Johnston et al. 2002); intersectional testimonio (Cortez-Castro 2016); problematizing text, voice, and representation (Ham and Kane 2004), interpretation (Hamilton and Pinnegar 2014); what it means to be a teacher educator (Abrams et al. 2012; Strom et al. 2014; Strom and Martin 2013); self-study methodology (Sandretto 2009); reflexivity (Kirk 2005); the paradoxes of praxis (Perselli 2006); transgressing academia (Gamelin 2005); and emotions and teacher education (Forgasz and Clemans 2014; Kelchtermans and Hamilton 2004; Kuzmic 2014). More recently there have been a number of self-studies that use feminism as a tool for social action. Some of these include Masinga (2013) who used positioning theory (Davies and Harré 1990) to examine her work with women teaching sexuality education in South Africa and Wood (2009) who problematized the influence of the patriarchy on normative beliefs about gender and sexuality in HIV prevention education.

As we reflect on the work we have done over the past 17 years, we acknowledge that although we use co/autoethnography for social justice, not all our self-studies are explicitly motivated by social justice concerns (Taylor and Coia 2014), but even if a particular self-study does not address feminism directly, our feminism is always present in our use of co/autoethnography. This is because for us, first and foremost, feminism is opposed to inequalities and injustice particularly around issues of gender and sexuality. Our feminist stance is a commitment to social justice. It starts by recognizing the reality and injustice of sexism and seeks through various methods and practice to address this.

Co/autoethnography is continually focused on criticality and most importantly action. Co/autoethnography as a self-study methodology and reflective practice provides an anti-oppressive vehicle that centers on a teacher educator's power to address various levels of injustice, that is, ideological, structural, and operational. It allows for a complex process based on the multiple dimensions of power and resistance and the importance of navigating the in-betweens. When we engage in this methodology, there is opportunity for change through action. Indeed, rooted in experience understood from sociocultural perspectives with insight gleaned from each other and the world, co/autoethnography has the potential to be transformative.

What does this look like in the everyday moments of teaching and in our research on our own practice? Co/autoethnography "allows us to make our assumptions problematic while at the same time incites us to take a stand: to place as central our convictions around issues of feminism and more generally social justice. It invites us to reflect-in-action, recognizing that to be feminist teachers means to be engaged in action on an ongoing basis" (Coia and Taylor 2017, p. 59). As Burns and Walker (2005) reflect, "What feminist methodologies have in common is a shared commitment to drawing attention to the deep and irreducible connections between knowledge and power (privilege), and to making problematic gender in society and social institutions in order to develop theories that advance practices of gender justice" (p. 66). We hope we have shown that our development and use of co/autoethnography in the self-study movement are examples of just such a stance.

How can we encourage more feminist self-studies focused on social justice and on social action? Where are the openings and possibilities for this work? How can we put into action LaBoskey's (2004) call to the self-study community "to find ways to maintain the complexity, include more vices, detect bias, and disrupt our ways of knowing" (p. 824)? How can we increase the use of self-study as a means for social action and change? We realize, echoing LaBoskey (2009), that this involves asking the "hard questions about equity of ourselves, our programs, and our students" (p. 81). But it is also about taking risks and being willing to take a stand publically and use co/autoethnography as a platform to expose injustice, organize community action with our students and teachers, and examine critically the ways in which we enact justice in our teacher education classrooms and schools. In Sowa's (2016) self-study on developing preservice teachers' notions of social justice, she echoes our commitment, emphasizing the need to strengthen "the social action phase of social justice" (p. 22). We appreciate that there has been an increase of interest in diversity, intersectional stances, and even social justice topics in self-study, but we do not think it is enough.

We are living in contentious and troubled times where the toxicities of patriarchy infect our classrooms, schools, and communities. Our research cannot just be for the improvement of our teaching practices. It has to address how we can better prepare socially just teachers who are willing and equipped to take collective action and insist on change.

LGBTQ Themes in the Self-Study of Teacher Educators

19

A Queer Review of the Literature

Adrian D. Martin and Julian Kitchen

Contents

Abstract

In spite of the increased social acceptance and legal advances for LGBTQ people globally, homophobia and transphobia are deeply embedded in the fabric of society. These status quo conceptualizations of gender and sexuality will continue in classrooms and schools unless teacher educators offer affirmative LGBTQ perspectives to dispel phobias and promote inclusive practices that advocate for and ally with LGBTQ youth. Therefore, the purpose of this chapter is to investigate how the literature of teacher education, particularly the self-study of teacher educator practices, has attended to LGBTQ themes. Queer theory is employed as a theoretical framework to guide the analysis of the reviewed literature. The

results of the review reveal three major themes, which are analyzed in the context of SSTEP: (1) queering teacher educator identities, (2) queering pedagogical practice, and (3) queering classrooms and curriculum. The chapter identifies how insights from this body of work can inform the research and practice of teacher educators in the interest of promoting teacher education that advance anti-homophobia and anti-transphobia in educational contexts at large. The chapter concludes with a discussion on the findings and recommendations for future research on LGBTQ themes, particularly in SSTEP.

Keywords

Self-study · Teacher education · Professional development · LGBTQ · Queer theory

Introduction

The self-study of teacher education practice (SSTEP) community has always been a welcoming place for teacher educators. Over the past 20 years, it has expanded its scope to examine issues of cultural diversity and welcome a diverse range of practitioners. This is evident in the 11 chapters in the social justice section of this handbook, compared to 3 chapters in the first handbook (Loughran et al. 2004). Similarly, *Self-Study and Diversity II* (Kitchen et al. 2016) features predominantly minoritized authors, whereas most of the authors in *Self-Study and Diversity* (Tidwell and Fitzgerald 2006) were mainstream teacher educators attending to diversity issues.

As teacher educators who identify as queer, we feel welcome in the SSTEP community. At the same time, we are aware that lesbian, gay, bisexual, transgender, and queer (LGBTQ) people are largely absent from the discourse in our community. Many of our colleagues have given limited thought to heterosexual and cisgender privilege, let alone explored how queer theory might serve as a useful lens through which straight and queer educators might view identity, experience, and practice. LGBTQ themes and experiences, while no doubt included in many courses, are largely invisible in the SSTEP literature. In this chapter, we draw attention to queer perspectives and how they might inform teacher education practice and research on practice by queer and non-queer teacher educators.

Issues relevant to diversity and teacher preparation have garnered increased attention over the past quarter century. Scholars, advocacy groups, and activists have contributed toward the development of frameworks for teaching that proactively and affirmatively acknowledge diversity in the classroom, positioning it as a resource for learning (e.g., Gay 2000; Ladson-Billings 2009). Many teacher preparation programs seek to promote such a pedagogical orientation among teacher candidates with a stand-alone course focused on multicultural education or by embedding existent coursework with connections to the relationship between diversity and the educative experiences of students in schools (Zeichner 2009). For teacher educators investigating their own practice, such a focus provides insight on attending to issues of diversity in their work

with teacher candidates (e.g., Tidwell and Fitzgerald 2006; Kitchen et al. 2016). Self-study has focused on examining culturally responsive teaching in higher education (Han et al. 2014), promoting students' awareness of how cultural similarities and differences can influence educative experiences in schools (White 2009) and investigating how one's cultural identity mitigates the trajectory of one's academic and professional career (Cortez-Castro 2016).

While such inquiry has substantially contributed to the literature on diversity and teacher education, providing a scholarly foundation from which teacher educators can draw to incorporate diversity issues in their own professional practice, it is limited by the primary focus on diversity in relation to culture and language. Despite calls to attend to diversity more broadly, issues relevant to gender, gender identity, and sexual orientation remain peripheral in teacher education and educational research (Gorski et al. 2013; Murray 2015; Taylor and Coia 2014). Normative conceptualizations of gender and sexuality that serve to perpetuate heteronormativity – the dominant social discourse that individuals are either biological male or female with a corresponding gender identity who are sexually attracted to members of the opposite sex (Sullivan 2003) – are emotionally and psychologically deleterious to both *straight* (*straightjacketed* into narrow roles) and queer (marginalized as deviant) individuals. As teacher educators are instrumental to how teacher candidates construct professional identities, interpret the aims of professional practice, and attend to difference in classrooms and schools, it is imperative that they explicitly attend to LGBTQ issues through pedagogy and curriculum.

For LGBTQ people, invisibility further marginalizes their presence in institutions of education (Martin 2014b). Insights from teacher educators who engage LGBTQ themes in the classroom are critical to heightening the visibility of queer students and educators. This is especially important given the all too often reported instances of bullying, harassment, violence, and attacks experienced by LGBTQ youth in schools (Blackburn and Pascoe 2015; Espelage 2015), which is abetted by teachers who turn a blind eye or choose not to intervene (Human Rights Campaign 2016). Evidently, such unsafe settings contribute to LGBTQ youth being almost five times more likely to attempt suicide than heterosexual peers (Center for Disease Control and Prevention 2016), at a greater likelihood for absenteeism because of feeling unsafe or uncomfortable at school, and more likely to drop out than other students due to peer victimization or discriminatory actions on the part of school authorities (GLSEN 2016). In spite of the increased social acceptance and legal advances for LGBTQ people globally, homophobia and transphobia are deeply embedded in the fabric of society. Such status quo conceptualizations of gender and sexuality will continue in classrooms and schools unless teacher educators offer affirmative LGBTQ perspectives to dispel phobias and promote inclusive practices that advocate for and ally with LGBTQ youth.

Organization of the Chapter

The purpose of this chapter is to investigate how the self-study of teacher educator practices literature has attended to LGTBQ themes and how insights from this body

of work can inform the work of other teacher educators and researchers to inform future self-study in the interest of promoting teacher education practices that advance anti-homophobia and anti-transphobia in educational contexts at large. We begin with a discussion on queer theory both as a useful lens through which to view sexual and gender issues and as a framework to guide our review of the literature. This is followed by a review of literature relevant to LGTBQ themes in the study of teacher education practices. As there are few LGTBQ-themed SSTEP publications, the search was widened to include other studies of practice by teacher educators. The results of the literature review reveal three major themes, which are analyzed in the context of SSTEP. Finally, we conclude with a discussion on the findings and recommendations for future research on LGBTQ themes, particularly in SSTEP.

It is our hope that increased awareness will help teacher educators foster the development of educational contexts in which all students and teachers can safely, affirmatively, and equitably participate as their authentic selves, free from fear, intimidation, or harassment based on sexism and heteronormativity. As advocates for queer students and teachers, and as gay men ourselves, this work is both professionally relevant and personally meaningful.

Part I: Queer Theory

Queer theory is a critical discourse that offers deep insights into personal identity, social relationships, and social hierarchies. It emerged in the 1990s as a series of critiques leveled against normative gender and sexual identity categories (Wilchins 2014). Drawing from the work of the poststructuralists in the second half of the twentieth century, scholars such as Eve Sedgwick (1990), Judith Butler (1990), and others (e.g., Muñoz 1999; Warner 1999) articulated emergent understandings of gender and sexuality as discursive social constructions. Sedgwick (1990) writes:

> That's one of the things that "queer" can refer to: the open mesh of possibilities, gaps, overlaps, dissonances and resonances, lapses and excesses of meaning when the constituent elements of anyone's gender, of anyone's sexuality aren't made (or can't be made) to signify monolithically. (p. 8)

This quotation conveys that queer theory is a critical theory that seeks to understand gendered identity and critique orthodox conceptions of gender and sexual orientation that privilege heterosexuality (Alexander 2008). With roots in feminism, gay and lesbian studies, identity politics, and postcolonial theory, "queer theory seeks to disrupt and to assert voice and power" (Tierney and Dilley 1998, p. 59) and "offers methods of critiques" (Britzman 1995, p. 154) against white, male discourse that normalize identity and shield power and privilege. Also, it challenges the binaries of sexual orientation and gender identity by disrupting heteronormativity and questioning static categorizations such as male and female or gay and straight. By aligning with feminist and other critical perspectives, queer

theory helps in "remapping the terrain of gender, identity, and cultural studies" (Alexander 2008, p. 108).

Queer theory posits that dominant social perspectives on gender and sexuality are natural consequences of biological sex. For example, a biological female will identify and recognize herself and be recognized as a woman and be sexually attracted to the opposite sex (i.e., be heterosexual). This lens perpetuates the idea of the gender binary (men and women) and heterosexuality as normal, natural, and desirable (Mayo 2007). Simultaneously, this heteronormative paradigm marginalizes and pathologizes identities and individuals that fail to align with it (Carpenter and Lee 2010). This ideological framework undergirds both structural and interpersonal instantiations of homophobia and transphobia (Pascoe 2012).

In contrast, queer theory suggests that gender and sexuality are discursive social constructions that are reproduced across time and space through sociocultural interactions (Butler 1990; Wilchins 2014). Consequently, biological sex in and of itself is not a predictor of gender or sexual identity, and normative gender and sexual binaries (male/female, heterosexual/homosexual) are rendered fallacious. From a queer theory perspective, this enables the possibility for a continuum of gender and sexual identities that the individual performs as an enactment of the self, open to interpretation and reinterpretation. Thus, the term *queer* signifies gender and sexual subjectivities that resist the heteronormative paradigm; queer is an emancipatory and performative ontological position, mercurial in nature, not an essentialist identity category. In short, gender and sexual identities do not emerge via a developmental process, but instead as a performative construction and reconstruction, both as synchronistic and diachronic phenomena.

In this way, queer theory decenters heteronormativity as the dominant lens through which to understand gender and sexuality. Adopting a queer theory lens enables a nuanced interpretation of social practices and beliefs that uphold or work against heteronormative ideals. Education researchers have adopted queer theory in various ways, such as investigating the role of schooling practices and structures to reify or disrupt normative gender and sexual identity categories (e.g., Pinar 2009). Others have contributed theorizations of queer pedagogies in the interest of dismantling heteronormative discourses, policies, and practices (Britzman 1995; Shlasko 2005), to identify means of promoting equitable schooling experiences for LGBTQ students (Helmer 2015), or to question the need for LGBTQ educators to *come out* to students and colleagues (Brueggemann and Moddelmog 2002).

Shlasko (2005) asserts that mainstream education is complicit in perpetuating dominant gender and sexual norms. Given that these diminish the capacity for LGBTQ members of the school community to fully partake in systems of education, it is vital for educators and other school personnel to actively problematize, challenge, and disrupt heteronormativity. We concur with Zacko-Smith and Smith (2010) that LGBTQ educators must be accompanied by equally visible and active allies in the process of *queering* education and teacher education (Goldstein et al. 2007) through personal reflection, pedagogy, and curriculum that attends to LGBTQ issues. Studies by teacher educators engaged in such work are critical as a base on which to build more queer-positive teaching practices, educational policies, and scholarly teacher education research.

We employ queer theory as a guiding lens in our analysis of SSTEP and other teacher education literature relevant to LGBTQ themes in teacher education. We consider how the studies have sought to include individuals and/or representations of individuals outside of normative gender or sexual identity categories and how the work engaged in by the teacher educators sought to deconstruct these normative conceptions. In the following section, after a brief description of our search procedures, we analyze the literature for themes relevant to the practice of teacher education.

Our review of queer theory, in the context of our educational experiences, highlights the need for "dialogue on gender and sexuality in education [to become] an integral part of all teacher education programs" (Martin 2014a, p. 155). As Kitchen (2014) writes:

> While queer theory is only one lens through which to view education, it does illuminate areas of self and practice that are often overlooked as we go about our daily lives... Enhanced perception can lead to more educative experiences for our students and contribute to social justice for all. (p. 139)

Part 2: Literature Review

A preliminary review of the SSTEP literature found that, aside from our own contributions (Kitchen 2014, 2016, 2017; Kitchen and Bellini 2012; Martin 2014a, b), there were no readily available self-studies on LGBTQ themes. Thus, we widened our review to include empirical studies by teacher educators on LGBTQ themes published in peer-reviewed journals and academic publications. While conceptual literature on queer theory and LGBTQ issues in education and teacher education informed our thinking, we narrowed our inclusion criteria to (1) studies by teacher educators investigating their professional practice and/or teacher education program that (2) focused on LGBTQ themes relevant to teacher education. We sought to include international work and limited ourselves to studies published in English but placed no limits on the publication period in order to capture the full scope of the literature. Electronic databases were searched for key terms: *teacher education*, *teacher educator*, *teacher preparation*, *self-study*, *LGBTQ*, *gay and lesbian*, and *queer*. Our search was supplemented by a hand search of mainstream journals in teacher education and education, SSTEP Castle Conference proceedings, and edited academic volumes on LGBTQ issues in education. This preliminary search resulted in 215 records, which were narrowed to 44 studies after a review of abstracts and summaries, of which 32 satisfied our criteria for inclusion. For each of these 32, we recorded the purpose, theoretical framework, methods and analysis, major findings, and implications/recommendations. Additionally, a series of prompts helped to guide analysis: e.g., contribution to the work of teacher educators on LGBTQ issues, affirmative inclusion of LGBTQ individuals, possible contributions to self-study, and relevance to future research.

Overwhelmingly, the literature focused on teacher educators investigating their own teaching practice in a university-based teacher education program. The earliest

publication was from 1998 with most (22) published from 2010 to 2017, confirming this as an area of emergent scholarly interest. The studies were primarily from the English-speaking world – the United States (15), Canada (7), Australia (3), and South Africa (2) – while the other four did not specify national context. Two employed mixed methods, with the remainder being qualitative. Journal entries, interviews with teacher candidates, reflection on practice, narratives, and observations were the primary data sources. While we are careful to avoid generalizations based on this modest data set, this review offers insight into efforts, initiatives, practices, and policies that can be taken up by teacher educators and teacher educations program to address heteronormativity, reduce homophobia and transphobia, and build queer inclusive communities in schools and universities.

We now turn to the results and discuss the major findings of the studies. An iterative process of reading and rereading the research tables and notes led to the identification of themes across the literature. The results illustrate the myriad ways that teacher educators explore LGBTQ issues in relation to their practice and to the field of teacher education. Most of the studies reflected elements of more than one of the themes, suggesting that the self, pedagogy, curriculum, teacher education programs, and LGBTQ themes are often intertwined.

We identified three main areas of focus: (1) queering teacher educator identities, (2) queering pedagogical practice, and (3) queering classrooms and curriculum. Further analysis led to the identification of subcategories. Lastly, the information generated in each category was then reexamined through the lens of queer theory's deconstruction of dominant gender and sexuality identity norms. We employ the term *queering* in the spirit intended by Britzman (1995): "thinking differently about what discourses of difference, choice, and visibility mean in classrooms, and on our own education" (p. 152).

Queering Teacher Educator Identities

A prominent theme in the literature is the importance of teacher educators reflecting and critically examining how sexuality and gender inform their approaches to LGBTQ issues. This approach is evident in the work of practitioners who identify as queer (Cosier and Sanders 2007; DeJean 2010; Grace 2006; Grace and Benson 2000; Hermann-Wilmarth and Bills 2010; Kissen 2004; Kitchen 2014, 2016, 2017; Kumashiro 1999; Martin 2014a, b; Sapp 2001a, b; Sarmiento and Vasquez 2010; Turner 2010; Whitlock 2010) and individuals/teams who do not (Benson et al. 2014; Kearns et al. 2014). All these studies involved an examination of one's gender or sexuality to better understand one's practice and support teacher candidates. Queer teacher educators paid particular attention to the implications of being out in schools and universities and how to persevere in academia.

Queering Oneself to Understand Teaching Practice
Nine studies reported on teacher educators attending to queerness as an aspect of their own professional identities. With the exception of Kissen's (2004) work that

reported on her inquiry as a teacher educator and mother of a lesbian daughter, the remainder of the studies offered narratives of LGBTQ teacher educators through studies that shed light on how queerness is related to one's professional practices (Kitchen 2016, 2017; Martin 2014a, b; Kumashiro 1999; Sapp 2001a, b; Whitlock 2010). How being queer shaped, informed, and constructed learning experiences and pedagogy in teacher education courses was a main focus with the researchers concluding that as with other aspects of self (e.g., cultural background, socioeconomic status, nationality), being queer informed their teacher educator identities. Sapp (2001a, b), for example, studied his longitudinal journaling that chronicled his professional experiences as a gay man. Similar to Kumashiro (1999), Sapp critically analyzed the intersection of his identities, for him as a gay man who was raised Baptist in the Southern United States. Self-disclosure about his gay identity to his students was important to promote an LGBTQ-inclusive learning context and to work against the marginalization of queer identities in classrooms. Other studies examined similar work, emphasizing how normative constructions of gender influence practice (Kissen 2004; Kitchen 2017; Martin 2014a; Whitlock 2010) and the efficacy of narratives on the self to better understand how gender and sexual identity norms are being upheld (or dismantled) in one's classroom.

Teacher Educators and Teacher Candidates Mutually Investigating the Queer Self

Whereas the researchers in the previous section examined queerness and self to better understand their own practice, others engaged in such work with students. Autobiographical, auto-ethnographic, and shared writing with students were productive sources for study (DeJean 2010; Grace 2006; Hermann-Wilmarth and Bills 2010; Sarmiento and Vasquez 2010). These emphasized the relevance of linking one's queer self to professional practice as a teacher educator, facilitating the inclusion of LGBTQ students in the classroom, and recognizing the particular supports they need for entry into the teaching profession. Disclosing one's positionality in relation to gender and sexuality and engaging in sustained conversation with teacher candidates on LGBTQ issues are ways to "...interrogate anti-queer stances and actions as they consider the parameters and possibilities of an ethical and just educational practice for queer persons" (Grace 2006, p. 829). Although such work may not fully eradicate some preservice teachers' hesitation to LGBTQ inclusiveness (Kearns et al. 2014), it may enable LGBTQ teacher candidates to feel less isolated and more prepared to engage in their future practice (Benson et al. 2014).

DeJean's (2010) inquiry on his experiences as a gay male teacher educator working with Jeannie, a lesbian teacher candidate in Australia, showcases the affordances for LGBTQ teacher candidates to learn from LGBTQ teacher educators. DeJean and Jeannie collaborated on a series of questions, journaled, and interviewed each other about experiences as a teacher/future teacher and as a queer person. For Jeannie, learning from DeJean's professional and personal experiences assisted her sense of ability to persevere in the teacher education program and work through her fears and concerns about being a lesbian who would likely work in rural

Australia. DeJean served as a role model for Jeannie, providing professional and emotional support from an insider perspective, something his non-LGBTQ colleagues would have been unable to do. This kind of collaboration supports the recognition that "different communities in education need different kinds of support for equity to occur" (DeJean 2010, p. 240).

Teacher Educators Mutually Investigating the Queer Self

While the previous studies emphasized supporting teacher candidates by collaboratively exploring the self with teacher educators, two studies investigated professional practice and identity among queer teacher educators themselves (Cosier and Sanders 2007; Grace and Benson 2000). Drawing largely from narratives of professional and personal experiences, these authors provide nuanced accounts of the challenges experienced as queer individuals in the academy and in teacher education. Both works suggest that investigations among queer teacher educators can shed light on myriad forms of LGBTQ oppression and homophobia in higher education. The authors reported instances of homophobic comments made by students during classroom instruction, complaints made to department chairs and deans that they were pushing a "gay agenda," and lack of support among faculty colleagues. Such work demonstrates a need for "…rewriting [higher education] culture to refuse a culture of oppression and violence, which is all too often cast as the lot of the queer person" (Grace and Benson 2000, p. 90).

Self-Studies Queering Teacher Educator Identity

We are the authors of the only published self-studies on queering teacher and teacher educator identities. Adrian Martin (2014a), in "From Adam and Eve to Dick and Jane," examines how heteronormativity constrained him as a queer teacher working alongside elementary school students; this study, along with a companion piece (Martin 2014b), is considered later in this literature review.

Julian Kitchen has written three self-study chapters in which he reflects on his personal identity as a gay man and professional identity as a queer teacher educator. In "Inqueeries into Self-Study," after introducing queer theory to educators in self-study, Kitchen (2014) suggests that "[q]ueer theory can be employed by self-study practitioners as a means of critically and playfully examining tensions related to sexuality, gender and heteronormativity in their own practice" (p. 134). Applying a queer theory critique to a graduate course paper he wrote in 1995, Kitchen demonstrates how queer theory and autobiography might be applied together in self-study. After critiquing his writings through a queer theory lens, he concludes, "As the opening story illustrates and subsequent examples reinforce, reflection on and analysis of heteronormativity and heterosexual privilege can sharpen our perceptions of ourselves and our contexts" (p. 139).

In "Inside Out: My Identity as a Queer Teacher Educator," Kitchen (2016) writes, "I recount my experiences as a queer teacher educator in order to examine the importance of teacher educators' cultural identities and, particularly, how being gay informs my identity as a teacher educator" (p. 13). In this narrative self-study, Kitchen explores his journey from confusion to acceptance as a gay man, his

transition from closeted teacher to out teacher educator, and the decision to engage in queer issues as a researcher and activist. He ends by inviting queer teacher educators to be more visible, urging straight educators to take a stand by "modelling comfort" (p. 24) and incorporating LGBTQ themes in the curriculum, and reminding all that "[s]imple actions can make a world of difference to queer teachers [and] students" (p. 24).

The importance of all teacher educators reflecting on their sexuality and gender identities is developed in Kitchen's (2017) chapter "Critically Reflecting on Masculinity in Teacher Education through Self-Study." In order to illustrate the need for reflection on the importance of examining male hegemony, Kitchen juxtaposes professional stories with scholarly understandings of masculinity. In a story about an opening lesson, Kitchen in suit and tie lists his credentials as an education law instructor, as well as his leadership roles and areas of funded research, before mentioning his identity as queer teacher educator. Reflecting on the story, he writes:

> Revisiting the incident through storytelling also helps me see other ways in which masculinity informs my presentation of self. I offset potential subordination by emphasizing markers of hegemonic masculinity through my business suit, sense of authority, and emotional restraint. Thus, I am partly complicit in hegemonic masculinity—benefitting from the positive stereotypes of white males—even as I disrupt conventional notions. Also, I evidently experience a degree of gender strain as I evidenced by my adoption, in embodied (clothing, physique and body language) and disembodied (authority manifest in academic achievement) ways, of masculine ideals. (p. 91)

Through this incident, Kitchen invites all teacher educators to consider how they consciously and unconsciously live out their sexual and gender identities. He also draws attention to how Kuzmic (2014) overcomes unconscious sexism in his personal and professional lives by unpacking male privilege. In this chapter, Kitchen is particularly concerned with encouraging all teacher educators to examine their gender presentation in order to dispel stereotypes and "treat all students—regardless of gender presentation or sexuality—with care" (p. 98).

Queering Pedagogical Practice

Pedagogical practice undertaken in teacher education classrooms was a primary area of investigation in 19 of the studies reviewed (Asher 2007; Benson et al. 2014; Cosier and Sanders 2007; Francis and Msibi 2011; Goldstein et al. 2007; Kearns et al. 2014; Kitchen and Bellini 2012; Macintosh 2007; Martin 2014a; Mcconaghy 2004; North 2010; Richardson 2008; Robinson and Ferfolja 2001; Sapp 2001a, b; Sarmiento and Vasquez 2010; Turner 2010; Vavrus 2009; Whitlock 2010). Overwhelmingly, the teacher educators reported inquiries on how to present LGBTQ issues to their teacher candidates and whether or not these learning experiences facilitated a willingness on the part of the students to better attend to such issues in their own future professional practice. For some, promoting LGBTQ awareness began with reflective experiences and activities that required teacher

candidates to recognize and consider their own positionalities and how these mitigate their lived experiences (e.g., Robinson and Ferfolja 2001; Vavrus 2009). Others emphasized games or lessons centered on this same aim (Cosier and Sanders 2007; Kearns et al. 2014). Some investigated instances of student resistance to engage in lessons that focused on LGBTQ topics (e.g., Richardson 2008; Mcconaghy 2004). We take up each of these foci in the subsequent sections.

Games, Exercises, and Activities

Eleven studies in the review provided examples of games, exercises, and learning activities that teacher educators employed to introduce and discuss LGBTQ themes with their students. In general, these were aimed toward promoting the awareness that the affirmative inclusion of LGBTQ individuals should be part of the professional responsibilities and duties of teacher candidates. Learning activities that involved engagement with LGBTQ-related media were a featured approach among some of the teacher educators (Benson et al. 2014; Francis and Msibi 2011; North 2010; Richardson 2008; Vavrus 2009). Novels and films about LGBTQ individuals provided an opportunity for teacher candidates to reflect on the life experiences of LGBTQ individuals and how they, as future teachers, could affirm or marginalize these identities. Other teacher educators sought to support similar insight by providing their students with role-playing scenarios, such as LGBTQ students in critical situations or the implementation of LGBTQ-related curriculum (Benson et al. 2014; Francis and Misibi 2011; Kearns et al. 2014).

Such experiences promoted teacher candidates to reflect on themselves as future educators of LGBTQ students and what actions they might take in their future classrooms to facilitate an inclusive classroom environment. Still, some of the teacher educators sought to promote student awareness and insight on LGBTQ themes through an examination on how nonheterosexual and non-cisgender individuals are socially marginalized. These teacher educators described learning activities and games designed to actively provoke student thinking about gender and sexuality as socially created constructs (Cosier and Sanders 2007; Goldstein et al. 2007; Macintosh 2007). Cosier and Sanders (2007), for example, created "queer bingo"; this variation on the game provided art education teacher candidates insight on artists and other historical figures whose queerness has overwhelmingly been ignored. The authors articulate the challenges and opportunities present in crafting queer-affirming art curricula and learning experiences conducive toward queer literacy. While this activity was productive for some of the students, Cosier and Sanders report that others mistook this as an effort to promote a "gay agenda." Clearly, such an attitude is indicative of prevalent social discourses sympathetic to homophobia and transphobia. Potentially, a starting point for teacher candidates to engage with LGBTQ themes may simply be to develop a shared understanding on what terms such as "gay and lesbian," "sexual identity," and "transgender" mean. Kitchen and Bellini (2012) report on the use of lectures, group discussion, and case study analyses as supports in an effort for teacher candidates to define such terms and contribute to the development of ethical knowledge on LGBTQ issues (such as bullying) and the role of teachers as advocates for all students. Their self-study

suggests that teacher educators need to create safe and comfortable spaces for all of their students to discuss these issues. Such an environment might potentially diminish teacher candidates' assumption that coursework and learning experiences relevant to LGBTQ issues are part of a "gay agenda" enacted on the part of the teacher educator.

Autobiographical Writing Practices

The use of autobiographic, auto-ethnographic, or reflective writing was a prominent theme in nine of the studies reviewed. These researchers employed writing as a critical pedagogical strategy to help teacher candidates better teach LGBTQ youth. Most of the researchers also wrote about themselves as a means to improve their own professional practice in this area. Overwhelmingly, these studies highlight the efficacy of self-examination in helping to create safe spaces for LGBTQ students in schools (e.g., Kearns et al. 2014), identifying the relevance of LGBTQ issues on one's professional practice (e.g., Robinson and Ferfolja 2001), and the intersectionality of one's identities and educative experiences at school (e.g., Asher 2007; Sarmiento and Vasquez 2010; Vavrus 2009).

The central purpose of three studies was an examination of the self on the part of teacher educators (Kearns et al. 2014; Martin 2014b; Whitlock 2010). Martin (2014b) and Whitlock (2010) each conducted a critical analysis of their teaching practices as queer individuals. Each suggests that there is no single approach to engaging students on LGBTQ issues; rather, such an aim should be tailored and contextualized to the needs of a given community. All teacher educators, including those who identify as LGBTQ, should reflect upon their own assumptions and interpretations of gender and sexual identity and the implications of these for the educative experiences of their students. For example, Kearns et al. (2014) focused on assessing the impact of an integrated training program on teacher candidates' abilities to identify and address the need for safe spaces in schools. They contend, after examining their own positionalities, that heterosexual teacher educators should explicitly acknowledge their privilege when engaging in ally work and ongoing learning about LGBTQ issues. Such a stance may in turn encourage non-LGBTQ teacher candidates to as identify as allies with the LGBTQ community.

Robinson and Ferfolja (2001) and Vavrus (2009) both attended to reflective self-examinations among their teacher candidates. The studies suggest that autobiographical/reflective work with their students reflects the hegemony of traditional, stereotypical gender, and sexual identity stereotypes. Vavrus (2009), for example, discussed how graduate teacher candidates completed an 18 hour module on gender and sexuality. Analysis of the auto-ethnographic narrative writing assignments gathered from 38 participants indicated that, with few exceptions, their former educative experiences reflected heteronormative norms through overt actions (on behalf of their own teachers) or by their silences relevant to LGBTQ issues. Some narratives provided by LGBTQ teacher candidates indicated a sense of internalized homophobia, whereas all of the participants reported having heard unchallenged homophobic slurs during their schooling years. Vavrus suggests the need to provide teacher candidates with deep, critical, and sustained reflection on one's positionality

to support teacher identities that are sensitive to how LGBTQ subjectivities are marginalized in schools.

The authors of four studies dealt with joint examinations of the self among teacher educators and teacher candidates. Sapp's work (2001a, b) explores journaling as transformative and writing about his experiences as a gay man in education as a way "…to model that my journey to my Real Self had drastically changed who I was, and thus, how I taught" (Sapp 2001a, p. 20). Life narratives were a pedagogical template for his teacher candidates, who learned that becoming a student of oneself is a necessary, vital, and integral aspect of being an educator. Asher's (2007) study on teaching a multicultural education course for elementary preservice teachers employed autobiographical writing to raise awareness of race and class as always implicated in discussions of gender and sexuality. Sarmiento and Vasquez (2010) interrogated the intersectionality of their own identities as a Latina teacher educator and a gay male Latino preservice teacher via shared narratives that supported his coming out process with his family. A sense of safety and affirmation surfaced from the interpersonal and cultural parallel between the teacher educator and student. These studies highlight that sharing narratives of self about LGBTQ issues, identities, and experiences between teacher educator and students was productive, affirming, and educative.

Resistance to LGBTQ Inclusion

Despite the productiveness of the previously discussed pedagogical practices and the use of reflective writing to engage teacher candidates on LGBTQ issues, the literature highlights how teacher educators were met with resistance by some students. While referenced in multiple works, six studies focused on instances of such resistance. Overwhelmingly, this reflected homophobic and/or transphobic ideologies that diminished the likelihood of teacher candidates' willingness to affirm LGBTQ students in their future classroom.

Some teacher candidates were reluctant to be allies or resistant to engaging with LGBTQ themes (Francis and Msibi 2011; Kitchen and Bellini 2012; Vavrus 2009). The authors of these inquiries (from South Africa, Canada, and the United States, respectively) examined their experiences conducting workshops, modules, or seminars devoted to LGBTQ topics. Despite proactively cultivating a comfortable classroom environment (Kitchen and Bellini 2012), promoting self-reflection and drawing from varied texts (Vavrus 2009), and explicitly discussing heterosexism and homophobia (Francis and Msibi 2011), many participants expressed tension as they grappled with the topics. Some were passively or actively resistant to enacting LGBTQ-inclusive practices in their future classrooms. Such tension and resistance may be attributed to cultural knowledge, beliefs, assumptions, and dominant conceptions of LGBTQ individuals the students may possess. Richardson (2008) and Francis and Msibi's (2011) inquiries into their practices in South Africa suggest that the teacher candidates were challenged by the prospect that parents would accept their adolescent as LGBTQ potentially because of prevalent misconceptions about LGBTQ identities. Similarly, Mcconaghy's (2004) and Robinson and Ferfolja's (2001) studies observed that students frequently regarded sexual and gender

minorities as deviant and LGBTQ-related lessons as an affront to their culture. Some even went so far as to accuse the teacher educators as possibly being deviant themselves.

Strongly held beliefs are often resistant to change, especially for those of a religious or spiritual nature. Awareness of students' cultural beliefs and perspectives students possess can aid teacher educators in incorporating LGBTQ themes into their courses. Kitchen and Bellini (2012), in their self-study, were able to frame such issues in a relational and respectful manner. Only 6 of their 134 respondents in Canada indicated any level of discomfort with the topic: a self-identified devout Christian appreciated the information but was "not too comfortable," an immigrant was "a little uncomfortable to hear that Professor Kitchen is gay" due to norms back home, and a third student was uncomfortable with gay-straight alliances (GSA) (p. 218). Kitchen and Bellini also helped prospective Catholic educators frame their practice in terms of anti-homophobia and anti-bullying. Nonetheless, the literature highlights how efforts to engage teacher candidates on LGBTQ topics were frequently met with resistance based on religious beliefs (Francis and Msibi 2011; Mcconaghy 2004; Richardson 2008; Robinson and Ferfolja 2001; Vavrus 2009). This reflects a larger social discourse that equates LGBTQ acceptance with religious persecution (Mcconaghy 2004) and the "undermin[ing] [of] dominant heterosexual family values" (Robinson and Ferfolja 2001, p. 125). In jurisdictions with LGBTQ human rights protections, it may be productive to emphasize the legal obligations of teachers for all of their students (including LGBTQ youth) as legitimate, moral, and ethical imperatives in one's professional practice (Kitchen and Bellini 2012).

Queering Classrooms and Curriculum

The third theme, which overlaps with pedagogy, is the need to make classrooms and curriculum more queer-friendly. The 11 studies in this section report on efforts by teacher educators to modify teacher education programs or curricula as LGBTQ-inclusive (Benson et al. 2014; Francis and Msibi 2011; Goodrich et al. 2016; Kearns et al. 2014; Kitchen and Bellini 2012; lisahunter 2015; Mathison 1998; Martin 2014b; Mcconaghy 2004; Robinson and Ferfolja 2001; Vavrus 2009). Most of these focused on the processes of initiating and implementing LGBTQ-focused workshops and how to support teacher candidates to enable inclusive classroom settings (Benson et al. 2014; Francis and Msibi 2011; Goodrich et al. 2016; Kearns et al. 2014; Kitchen and Bellini 2012; Vavrus 2009). Others report on K-12 teachers and LGBTQ youth to identify how to better determine what teacher education programs should do relevant to LGBTQ issues (Martin 2014b; Mathison 1998; lisahunter 2015). Similarly, Mcconaghy (2004) and Robinson and Ferfolja (2001) aimed to expand the foci of required coursework to attend to issues of difference, diversity, discrimination, and social justice for LGBTQ individuals. Collectively, these studies suggest that, for many teacher candidates, engaging in this kind of work is filled with fears and concerns about themselves and their livelihood; for many of the teacher educators, engagement in this kind of inquiry and initiatives in their

teacher education programs is a form of activism. Each of these foci is taken up in the subsequent sections.

Fear About Enacting LGBTQ-Inclusive Practices

While teacher candidates' ambivalence and resistance are significant issues, as discussed under pedagogy, another challenge is their concern that LGBTQ-inclusive practices will be met with hostility by students and the community. Several studies (Benson et al. 2014; Francis and Msibi 2011; Kearns et al. 2014; Kitchen and Bellini 2012; Vavrus 2009) noted that, despite affirmative LGBTQ programs, workshops, and experiences in their programs, teacher candidates lacked a sense of efficacy and indicated fearfulness about engaging in such work in their classrooms. Teacher educators reported that the workshops, modules, and trainings described in these studies were largely successful in that they provided a conceptual and empirical basis for teacher candidates to consider LGBTQ issues in education and themselves as teachers of LGBTQ students. Despite the affirmative responses and deemed success of these initiatives, many teacher candidate participants were fearful of loss of employment by administration or upsetting parents if they engaged in such discourse or practice in their future professional practice. Although the teacher educators expressed that the workshops, modules, and integration of LGBTQ content supported teacher candidates to realize the importance of engaging in advocacy, anti-homophobia initiatives, and implementing LGBTQ-inclusive curricula, it did not suffice to counter fears the candidates possessed.

Such fears were expressed among LGBTQ and non-LGBTQ teacher candidates. The work by Benson et al. (2014) is unique in that it explores the efforts of the authors (a queer woman, man, and straight ally) who developed workshops intended to support queer preservice teachers by providing a safe space that would explicitly attend to challenges relevant to homophobia and heteronormativity that they would confront in K-12 settings. The authors' study detailed how they engaged in interviews with the queer preservice teachers and utilized questionnaires on their responses to the workshops and their own meaning making of the workshops. These teacher educators reported that while their efforts enabled queer preservice teachers to feel less isolated and better prepared to engage in their student teaching placement and future practice, they nonetheless had anxiety about negotiating their relationship with their field supervisors and cooperating teacher and fears similar to those recounted by Martin (2014b) in his prior experiences as a teacher and those discussed in his self-study on teacher educators (Martin 2014a). Even within the context of facilitating GSA programs, many LGBTQ educators are reluctant to do so in fear of disclosing their identities to their colleagues and students (Kitchen and Bellani 2012). Despite the productiveness of workshops like Benson and colleagues', "safe spaces cannot be made safe enough for some queer students. . ." (Benson et al. 2014, p. 391).

Queering Classrooms and Curriculum as Activism

Modifying or including LGBTQ-relevant courses, modules, curricula, or workshops was constructed as activist work in seven studies (Goodrich et al. 2016; lisahunter

2015; Martin 2014a, b; Mathison 1998; Mcconaghy 2004; Robinson and Ferfolja 2001). The teacher educators discussed efforts and approaches not only to support teacher candidates in their future work with LGBTQ students but also as a form of political activism. Forms of determining what teacher educators could do in their classrooms and teacher education programs were by working alongside with K-12 teacher activists themselves (lisahunter 2015; Martin 2014a) or reaching out to LGBTQ youth to learn more about their schooling experiences (Mathison 1998). Martin (2014b) discusses how his critical investigation on his professional identity as an educator is influenced by his queer identity and disposition to advocate for his students:

> The positioning of my identity as a gay man, a queer, in relation to the dominant cultural conceptualization of manhood, has facilitated the development of a psychogenic empathy towards others deemed *other*. My queerness serves a lens toward an elevated awareness of difference in myself and in those around me. (p. 173)

His critically queer examination of more than a decade of teaching practice suggests that daily, mundane actions and discourses in classrooms can serve as a form of activism.

Other studies emphasized efforts in teaching from an anti-homophobia stance by incorporating LGBTQ themes in courses traditionally devoted to diversity and social justice (Robinson and Ferfolja 2001) and as a means of countering negative discourses about LGBTQ individuals (Martin 2014b; Mcconaghy 2004). The study by Goodrich et al. (2016) shed light on how a diverse group of teacher educator activists (gay White male, straight bicultural female, gay Latino, and straight White male) explored their professional work in a service learning project to raise awareness of K-12 LGBTQ issues and include queer curriculum in an undergraduate teacher preparation program. The researchers indicate that "Throughout the process of our work we encountered institutional resistance-pushbacks-from the entire structure of public education, including school district personnel, individual schools, and individual classrooms" (Goodrich et al. 2016, p. 221). Teacher candidates participated in role-play scenarios and group conversations and viewed LGBTQ-relevant media/ videos; however, the authors conclude that future activist work to "queer" classrooms must involve not only preservice educators but practicing classrooms teachers and school leaders as well. Ultimately, these studies indicate that LGBTQ work for LGBTQ students and teachers may better take root should coalitions be built among various education stakeholders.

Part 4: Queering Self-Study: Moving Forward in Practice and Research

The self-study of teacher education practices community reads self-studies with a view to improving our own practices. The literature review in this chapter offers theoretical and practical approaches we might employ in our teacher

education classes. Through the lens of queer theory, a commonality among the studies was a focus on understanding the professional and educative experiences of individuals whose identities do not align with heteronormativity in academic and schooling contexts. The studies in the literature review contribute to an emerging knowledge base on the role of teacher educators and teacher education programs (particularly for teacher candidates) to address the affirmative inclusion of LGBTQ individuals in classrooms and curriculum. While many studies are by queer teacher educators, allies also offered useful approaches to advancing safe, inclusive, and affirmative educational settings in schools and universities through the collective efforts of diverse stakeholders. At the same time, the findings illustrate the challenges that confront teacher educators in this important work.

The paucity of studies – particularly self-studies – is a good reason for SSTEP practitioners, queer and allies, to inquire into LGBTQ themes. One of the challenges in academia is finding a fresh topic and perspectives to explore and share with colleagues through articles and chapters. The few full-fledged self-studies in this review hopefully demonstrate that ours is a productive and generative methodological approach to gain insight on LGBTQ issues in teacher education and the ways teacher educators attend to these in their professional practice. Kitchen and Bellini's (2012) manuscript, we suspect, was positively reviewed and quickly published because *Studying Teacher Education* recognized that it filled a gap in the field. As LGBTQ themes remain under-researched in SSTEP, queer and non-queer practitioner-researchers would do well to explore such themes when studying our practice.

One generative approach is to apply a queer lens in theorizing about education. The language and perspectives offered in queer theory help identify and deconstruct how normative constructions of masculinity, femininity, and gender roles influence the professional practice of teachers and teacher educators, as well as the experiences of students and teacher candidates. Hamilton and Pinnegar (2014) suggest that queer theory, as an interpretive lens alongside feminist theory, calls us to reconsider "what gendered notions of our actions as teachers and teacher educators contributed to our interpretation of ourselves in relation to our practice" (p. 47). Any self-study could be enriched with the inclusion of such a lens, as it might disrupt tacit sexual and gender assumptions, as Martin (2014a) and Kitchen (2016, 2017) illustrate.

Teacher educator identity is an important theme in the self-study literature. As much has already been published, queering the gaze offers a fresh perspective on a familiar theme. As there are already self-studies by gay men (Martin 2014a; Kitchen 2016), there is a need for more exploration of bisexual, transgender, and other queer teacher and teacher educator identities. While gender and sexual identities beyond the binaries of heteronormativity merit exploration, queer-themed inquiries by non-queer teacher educators storying their experiences are equally important. Self-studies of masculinity by Kuzmic (2014) and Kitchen (2017) serve as models of how any teacher educator might apply theory in exploring our identities as we work alongside teacher candidates.

The studies in this literature review also offer methodological templates for conducting self-studies about LGBTQ themes in teacher education. These findings highlight the productiveness of such inquiry and the ways in which queer or ally positionality might inform engagement and practice with teacher candidates on such topics. Martin's (2014a) self-study suggests the utility of reflection on social discourses and norms as an entry point for such work. He argues for the need to support:

> classroom environment[s] where they [students] are not pinned down by a particular identity or gender. Students (and teachers) can bask in smooth space wherein they approach learning as an inquiry into the unknown rather than a journey towards the predetermined end point of womanhood for girls and manhood for boys. (p. 151)

Such learning environments would queer normative teacher education and enable a scholarly context for SSTEP to explore LGBTQ issues.

Kitchen and Bellini's (2012) self-study of an LGBTQ workshop illustrates that a single lesson or problem (e.g., employing trans-inclusive language) might be the basis for a rich inquiry. At the same time, as most studies attended to phenomena over a duration no longer than an academic year, multi-year longitudinal self-studies would enable more nuanced and in-depth insights on how changing social discourses and attitudes toward LGBTQ individuals and issues are attended to in teacher education. This kind of work could inform in what areas advances are being made by teacher educators in their classrooms as well as theoretical, pedagogical, and programmatic modifications that could be made for persistent challenges raised against the inclusion of LGBTQ individuals or themes not only in teacher education, but in the field of education at large.

There is also a need for more self-studies by classroom teachers and educators working in the community and higher education. Martin's (2014b) inquiry on the intersectionality of his identities as a gay man and elementary educator calls attention to the complex professional landscape that queer educators must navigate and how queerness can function as a productive fount for pedagogical activity. Teacher educators should take up similar explorations via a queer theory approach, potentially exploring not only gender/sexual identities in relation to the professional self but also in relation to the intersections of race, culture, and class. Such work would provide insight on these themes and would be of value for those confronting challenges (from administration, colleagues, or students) in community colleges and universities. This work would also be of benefit for those outside English-speaking context and non-Western/industrialized nations.

In conclusion, the literature in the LGBTQ themes in teacher education sheds light on ways SSTEP inquirers can facilitate inclusive professional identities, pedagogical practices, and educational communities through practice and inquiry into practice. When teacher educators explicitly take up these themes, they will create more inclusive teacher education classrooms and contribute to the emergence of schools in which LGBTQ people are no longer on the margins of education.
