Contents

Abstract

One of the major challenges for teachers and teacher educators in modern times is the continuous search for pedagogy and approaches to meet the growing diversity within inclusive schools. Ideas of inclusion assume that every learner has equitable access to education and that schools organize learning spaces that accommodate everyone in the spirit of universal design. Facing these challenges, school systems and teachers have to consider how they can respond. We argue, like

others have before us (Ainscow 2008; Meijer 2003), that teachers are the key to developing inclusive practices and pedagogies in schools.

In this chapter we examine and discuss the ways in which teacher educators have employed self-study in order to research how they are preparing teacher students (preservice teachers) for working in inclusive education settings. We will explain the ideology of inclusion and provide a review of the available self-study research that focuses on inclusive education. We then provide a recent example of self-study research on inclusive practices and discuss how such self-study research has supported new understandings of inclusion, has resulted in the reconstruction of support services in one school, and has informed our thinking about further research.

Introduction

Globally the issue of teacher education is high on the policy agenda where the role of teachers, and therefore of teacher education, is recognized as paramount in moving toward a more inclusive education system. Ideas of inclusion assume that every learner has equitable access to education and that schools organize learning spaces that accommodate everyone in the spirit of universal design (Hall et al. 2012). Facing these requirements, school systems and teachers have to consider how they can respond. Teachers are the key to developing inclusive practices and pedagogies in schools as they are the ones who, based on their beliefs and knowledge, decide and choose the learning environment where learners are meant to study and work within the structures of the school system. It is expected that teachers create inclusive classrooms and differentiate their teaching for diverse group of students, including learners with disabilities (Hutchinson and Martin 2012). Inclusion is an ongoing process, a never-ending quest, aiming for increased participation in education for everyone involved.

However, people define inclusion in different ways; some describe it as representing the participation and education of disabled learners and special needs learners in mainstream or general education (Rogers 1993; Salend 2010). This view focuses on special needs as the prerequisite for inclusion, meaning that it is a part of special needs education. Those who adhere to this definition hold the worldview that the difficulties learners experience in school are a consequence of their impairments or shortages. Thereby, they exclude the possibility that learners' difficulties can be attributed to failure in relationships, to the fact that curricula and approaches to teaching and learning are not responsive to diversity, or that difficulties can arise from the social pressures homes and communities bring into schools (Booth 2010; Slee 2011).

For others, the development in defining inclusion comes from the notion of diversity, rather than disability, and how schools respond to and value a diverse group of students. Diversity is a natural characteristic of a school community, mirroring the wider community, and it can be explained as the range of characteristics that result in a perception of difference among people. This perception of difference can elicit responses in others that can either be favorable or unfavorable to the individual in question (Lumby and Coleman 2007).

In this chapter, we aim to examine and discuss the ways in which teacher educators have employed self-study in order to research how they are preparing preservice teachers for working in inclusive education settings. The term preservice teacher is used in this chapter to refer to teacher learners, student teachers, and teacher candidates. The chapter has five sections. The first section explains inclusive education and how that has developed, linking it to research on teacher education for inclusion. The second section examines how teacher educators are emphasizing inclusion as a social justice issue of equitable practice. The third section focuses on inclusive pedagogy employed in teacher education. The fourth section addresses reflection in practice through a critical perspective on transforming practice toward inclusion. The fifth section provides a recent example of self-study research on inclusive practices and discusses how such self-study research has supported new understandings of inclusion, has resulted in the reconstruction of support services in one school, and has informed our thinking about further research.

Inclusive Education

The appropriate preparation of mainstream teachers is crucial if they are to be confident and competent in teaching children with diverse needs. The principles of inclusion should be built into teacher preparation programs, which should be about attitudes and values, not just knowledge and skills (World Health Organisation 2011).

Currently, there is an ongoing debate about what components are needed for a successful approach to addressing inclusive education in teacher education courses (Symeonidou 2017). At the same time, teacher educators are constantly looking for more effective ways of incorporating inclusive education as an integral part of the teacher education. Guðjónsdóttir (2006) point out that although the idea of inclusion regulates the curricula and education systems in many countries, the meaning is interpreted differently in different countries and even between professionals in the same country. Many associate inclusion with disabled students or students with special needs (Department of Education and Science 2007; Rogers 1993; Salend 2010), while others believe it is about reducing barriers to learning and participation for all students (Ainscow and Kaplan 2005; Corbett 2001; Florian 2008). Guðjónsdóttir (2006) argues that medical and remedial models of education for special populations should be replaced with reconstructionist, sociocultural, and pedagogical approaches that focus on issues of equity, entitlement, community, participation, and respect for diversity. Her perspective is that inclusive practices

serve all students and respond to their needs through reflective practice, collaborative problem solving, creative teaching, and authentic assessment.

Research on teacher education for inclusive education (European Agency 2011a) has identified four core values that are essential for all teachers who are developing and sustaining inclusive practice and as the base competences for preservice teachers preparing to work in inclusive education systems:

1. Valuing learner diversity: Learners' differences are viewed as a resource and an asset to education.
2. Supporting all learners: Teachers have high expectations for all learners' achievements.
3. Working with others: Collaboration and teamwork are essential approaches for all teachers.
4. Continuing personal professional development: Teaching is a learning activity and teachers must accept responsibility for their own lifelong learning. (p. 9)

Embedding these values in teacher education programs serves to empower teachers and support them in developing a wider range of responses to learners who experience difficulties in their learning. Being explicit about these values helps to establish the potential of teacher education as an important factor in bringing about change. The next four subsections discuss these important values further.

Valuing Learner Diversity

Inclusion is aimed at diverting attention toward inequalities presented in exclusion and discrimination against diversities. Diversity in this chapter is defined as race, ethnicity, gender, gender identity, sexual orientation, age, social class, cognitive ability, physical ability or attributes, religious or ethical values system, national origin, and political beliefs. Thus, inclusive education is a movement against exclusion of any kind and a reaction to political segregation and social inequality (Petrou et al. 2009). As the goal of inclusion is to work against inequality and nurture people's sense of belonging in school and society, inclusive schools aim to find ways to educate all their learners successfully and work against discrimination, which can lead to a more inclusive, just society that allows everyone to be a valid participant (Booth 2010; Slee 2011; UNESCO 1994, 2001).

Inclusion is fundamentally grounded in the ideologies of social justice, democracy, human rights, and full participation of all (Ainscow and Kaplan 2005; Florian 2008; Guðjónsdóttir and Karlsdóttir 2009; Jónsson 2011). These ideologies are connected and dependent on each other in various ways. A critical social justice perspective emphasizes that people with their different abilities, characteristics, and backgrounds should be "celebrated and valued, not quashed, ignored or assimilated" (Ryan and Rottmann 2007, p. 15). Critical social justice does not advocate treating everyone the same because that would simply prolong inequalities that are already in place. Rather, through this perspective, individuals and groups should be treated

according to their abilities, interests, and experience; that is, they should be treated equitably. Treating individuals equitably rather than equally provides the potential to counteract existing inequalities (Ryan and Rottmann 2007). Those advocating for critical social justice seek a world that is fair and equitable for everyone, where everyone has the chance to reach their own goals.

Developing inclusive practice demands a welcoming disposition toward a diverse learner population, an understanding of learning as a creation of meaning, and an assumption that all learners are inherently competent. Inclusive practice requires flexibility in structures and processes (such as classroom schedules and resource allocation) and works within a social justice framework to respond to diversity. Thus, diversity implies that the "myth of the normal child" (Baglieri et al. 2011, p. 2124) needs to be dismantled. This means unraveling the ideologies of difference such as whiteness (Leonardo 2009) and ableism that position some learners as normal while others are marginalized. It is this very marginalization that produced a need for students who were different to be integrated into the traditional educational model, which was created without them in mind in the first place (Florian and Spratt 2013; Waitoller and Artiles 2013). Dismantling the ideologies of difference requires taking a critical and reflective stance toward the myth of the normal child. Creating a learning environment encompasses different cultural and linguistic practices where a variety of abilities and ways of knowing informs participation and the medium for learning. In so doing, an understanding of the term "diversity" must be expanded beyond disability or ethnic difference to focus on the value of differences in gender, socioeconomic status, cultural groups, abilities, learning styles, and interests (Ainscow et al. 2004). This requires a shift from emphasizing the source of learning difficulties or difficulties in school from within the learner or stemming from his/her social circumstances to viewing as problematic for the learner the influence of the system of education or the learning environment (UNESCO 2009). From this perspective, educators must be active in identifying these systemic hindrances and use available resources to remove them (UNESCO 2001).

Supporting All Learners

The development of inclusive education has moved from emphasizing teaching to emphasizing learning, away from the teacher-directed classroom that has been the dominant trend in education and toward classrooms where individuals' learning is stressed. While the placement, access, and presence of diverse learners in classrooms are important factors for achieving inclusive education, they are not enough; the critical issue is the teaching and learning that takes place inside classrooms (Ferguson 2008; Guðjónsdóttir 2003). Inclusion requires teachers to take on the responsibility of developing schools where all children can learn and where all children enjoy the sense of belonging. In this effort, teachers are central because of the important role they play in creating spaces for participation and learning, especially for marginalized children or those who might experience difficulties in school (Rouse 2008). This, in turn, requires that the education of teachers adequately prepares them for taking on this challenging task.

The principles for inclusive pedagogy are based on the fundamental premise of rejecting ability labeling as a deterministic notion of fixed ability that has historically underpinned the structure of education (Florian and Spratt 2013). Inclusive pedagogy is particularly aimed at contesting practices that represent provisions for most with additional or different experiences for some (ibid.). This very act of focusing on difference intensifies the isolation and marginalization of children and adds to the social construction of disability (Grenier 2010). Every learner brings valuable resources and experiences into the classroom that teachers should notice and make use of. Rodriguez (2007) characterizes resources as personal strengths and qualities which emerge from and shape life experiences. Wertsch (1998) considers cultural resources as mediational tools for people to make meaning and to act in the world. In that sense, culture is seen as funds of knowledge (Gonzalez et al. 2005) which are resources to draw upon in the process of learning and in empowering learners.

Teachers who understand their learners' resources and develop a deep personal knowledge of each learner are in a better position to differentiate teaching and learning in their classrooms. The key idea here is that while learners can be different across many dimensions, the most significant difference for education resides in the way they approach and respond to learning tasks and situations, rather than in their pathological or cultural categorizations (Florian 2008). This idea presents a challenge to teachers, where they are asked to let go of being reactive to those differences and, instead, employ responsive practice (Guðjónsdóttir 2000).

Working with Others

Collaboration between classroom teachers and support services is considered to be a crucial foundation for enhancing inclusive practices (Ainscow and Miles 2008; European Agency 2011b; O'Gorman and Drudy 2010; Skrtic 2005). The challenge is for teachers and others with different skills and expertise to work together and problem solve in order to respond more effectively to learners (European Agency 2017; Ferguson 2008). Collaboration is, therefore, an essential ingredient and condition of inclusive practice. Research suggests that it is most likely to be beneficial when collaborators each have something to contribute, share mutual goals, work together voluntarily, contribute equally, and share responsibility for making decisions and achieving learner outcomes (Friend et al. 2010; Guðjónsdóttir 2003).

The term collaboration refers to how practitioners and others interact and work cooperatively to accomplish a task or series of tasks in and for various situations, such as in meetings, in teams, for addressing learning and overall well-being (Friend et al. 2010). Through collaboration, the parties should be able to reach mutual understanding about how to solve problems and settle complex practical and ethical dilemmas (Devecchi and Rouse 2010). Essential prerequisites to effective collaboration include developing partnerships, keeping the learners' needs central, creating trust, establishing a common understanding, and committing to the time needed to successfully collaborate. If these aspects of building collaboration are not developed

thoughtfully, the lack of these elements can become barriers to the effectiveness of collaboration (Soan 2012). Furthermore, flexibility and joint responsibility are factors that are important for effective collaboration (Hodge and Runswick-Cole 2008; Hunt et al. 2003). Flexibility is needed in moving away from ineffective teaching practices and being prepared to start over in brainstorming new ideas. The collaborating team then collectively shoulders the responsibility of working for the interest of the learners' success and creates clearly defined roles among the team members in the pursuit of that work (Hunt et al. 2003; Kugelmass and Ainscow 2004).

Working collaboratively within schools can facilitate professional learning by affecting the way people think about teaching and learning (Ainscow et al. 2006; Guðjónsdóttir 2000; Ryan 2006). Collaboration between teachers, support staff, and parents creates the potential to build sustainable inclusive practice where participants interact on equal footing, reflect on practice, and search for an atmosphere of critical inquiry and trust.

Continuing Professional Development

Central to educators' professional learning is reflecting on how to do better for the learners for whom they are responsible. Thus, the commitment teachers display for their professional practice can be understood by conceptualizing the links across care, reflection, and improved practice (Day et al. 2005). Reflection in practice is important to bring issues out into the open in order for teachers to reframe their understanding of known situations. The concepts of reflection and reflexivity have been used interchangeably in the literature (Berger 2015; Finlay 2002). Finlay (2002), however, argues that these two concepts can be viewed as representing a spectrum where both are important elements of the research process. On one hand, reflection is described as retrospective as the practitioner thinks about or makes sense of his or her practice and is the critical foundation of learning and growth. On the other hand, reflexivity is a process of subjective self-awareness that is continuous and dynamic, and it is characterized by being introspective in reflecting and correcting one's thoughts, values, and actions (Steen-Olsen and Eikseth 2009). Reflection and reflexivity can be critical, as well, as they provide the tools for problematizing one's own assumptions and practices.

Sandelowski and Barroso (2002) explain reflexivity as "the ability to reflect inward toward oneself as an inquirer; outward to the cultural, historical, linguistic, political, and other forces that shape everything about inquiry; and, in between researcher and participant to the social interaction they share" (p. 222). Thus, reflexivity is employed by turning the researcher lens back onto oneself in order to recognize and take responsibility for one's actions and subjectivity in the context of the research (Berger 2015). As Bass et al. (2002) explain, "reflexivity can push reflection past defensiveness into transformative learning" (p. 67).

By reflecting on self in practice, the teacher is able to associate her beliefs with how she expresses those beliefs through actions (Tidwell and Heston 1998). Thus,

reflection offers to make sense of the dynamics within practice, revealing the fundamental assumptions represented within and "inspires coming to know not only what I do, but why I may act in particular ways" (Wilcox et al. 2004, p. 280).

Social Justice as Inclusive Practice

There is a need to explore, unpack, and discuss what an inclusive school looks like, how disability is viewed, and how to respond to diversity by establishing a discourse and conversation based on shared understandings (Fauske 2011). Thus, this dispels the myth that all teachers or teacher educators share an understanding of inclusive education and of what inclusive practice involves. Without a deep and ideological conversation about inclusive practice and pedagogy among those who have the power to shape schools, there is a risk that schooling will continue to be unfair, inequitable, humiliating, and painful for some learners (Brantlinger 2005).

Social Justice

A critical aspect of inclusive practice is the concept of social justice. Within an educational setting, social justice is realized through the focused attention on providing education for all. The inclusive school exemplifies meaningful educational and social experiences for every member of the learning community.

Griffiths and Poursanidou (2004) reported on their self-study where they conducted an investigation into the teaching of inclusion, equality, and social justice to fourth-year preservice teachers during their final half year at university. They pointed out that issues related to diversity, difference, equity, discrimination, and injustice have no easy answers and often implicate us personally in the injustices we uncover. These issues are often deeply felt, uncomfortable, and unsettling to confront. Learning about them requires a confrontation. Thus, the effects of learning about inclusion and injustice are hard to ascertain. According to the experience of Griffiths and Poursanidou, collaboration and self-study related to social justice are difficult. From their collaborative self-study, they learned that the conversation about their teaching was inspiring and cheering. They found it worthwhile to conduct an inquiry into changing an aspect of their practice in order to know why things were going as they did. At the same time, they found self-study methodology got in their way of collaborating, because participants were not ready to collect data and were unwilling to allow any observations in their classrooms. Griffiths and Poursanidou found that issues of social justice can be uncomfortable subjects for self-study researchers, which may be the reason there are few self-studies focusing on social justice (Griffiths et al. 2004). Griffiths and Poursanidou concluded that their collaboration helped them to improve their teaching module, and apart from the questions about self-study, the conversation was cooperative and open. The critical conclusion was that they were unable to help each other investigate their own collusions and resistances with respect to injustice, or to ask the hard questions about the reasons

why injustice flourishes in the school. Their study indicates how difficult it can be to conduct a self-study on social justice, even with respected colleagues. In the end, they ask if social justice has a chance without examining practice and asking these hard questions about social injustice occurring in schools (Griffiths and Poursanidou 2004).

Fitzgerald (2004) refers to Griffiths (2002) and her self-study colleagues at the 2000 and 2002 castle conferences when she decided to look into how she addresses and/or avoids addressing diversity as she taught a course to preservice teachers. Fitzgerald used inclusive philosophy to guide her university teaching, with the goal to prepare future teachers to accept any child who walks into their classroom and to forge a full partnership based on two-way communication with any and all adults attached to each child. Through the self-study of her practice, she realizes her lack of knowledge and skill in preventing color-evasion and power-evasion (Frankenberg 1993). This discovery led her to make a conscious effort to tell her "I am a racist" story (2004) in her effort to explore her teaching identity.

When teachers lack an identity that incorporates a transformative multicultural perspective, they are likely to use mainstream teaching and learning approaches. Such an absence of a multicultural identity can perpetuate an academic achievement gap that results in higher average standardized test scores for white students than for students of color (Vavrus 2002). Vavrus (2004, 2006) conducted a self-study focusing on his work with preservice teachers. He felt that the term social justice is used indeterminately because the concept of social justice is quite complex within its myriad interpretations and historical usage. He wanted to learn how critical reflection on multicultural learning and teacher identity formation can deepen an understanding of multicultural education and help the development of an antiracist teacher identity. In his teaching and through autobiographical research, Vavrus extended the ethnic identity formation from a historical, family-based legacy to racial identity formation. He found that these changes proved to be a critical turning point for himself and his students and that the racial identity formation allowed them to look critically at their unquestioned racialized identities. Nevertheless, he felt that the responses from students were relatively flat and did not differ much from former tasks. Through his self-study inquiry he realized that he needs to provide a pedagogy that is more explicit about theories of social justice. He found it even more important to explore what social justice might look like in practice. His conclusion was that these findings encourage him to further study his own assumptions and practices (Vavrus 2004, 2006).

Trust is central in any course on diversity and education. Coia (2016), in her self-study of her university teaching, looked at the interplay of self and others in developing trust. Teaching a course on diversity, she found it important to create conditions of trust. To Coia, the focus must always be on student learning where her responsibility was to create a learning space where students share assumptions and beliefs about identity, fairness, and how the world works. She believed that in a trusting atmosphere, students can work toward creating their own knowledge and gain necessary confidence in what they know. Coia reports that as the practice of reciprocal trust was planted in her class, there was evidence in her data that for some

students trust in their own judgments and beliefs grew stronger. Furthermore, some students were more open to change due to the trust they experienced in her classroom. The main outcome of the study was Coia's (2016) deeper understanding of the value of vulnerability in all teaching, but particularly in teaching about diversity. Analysis of the data showed a growing acceptance by her students of Coia's own vulnerability displayed in her teaching. Students' class reflections used in this self-study revealed that they perceived her expression of vulnerability as a moment to build trust. Her findings suggest that trust can be strengthened by re-examining the role of others.

Theory into Practice

There is a challenge to find ways to open a professional dialogue with teachers and preservice teachers that recognizes, analyzes, and deepens the mutual understanding of the meaning of the living theory implicit in teachers' practice (Cochran-Smith and Fries 2005). Whitehead's (1989) use of living theory refers to one's practice which exemplifies an understanding of teaching and learning within the context of specific experiences.

Gassman and Tyler-Merrick (2006), although coming from two distant countries (the United States and New Zealand), collaborated around their self-study of special education. Their intention was to investigate how they met the needs of their university students, asking themselves if the types of experiences, opportunities, and instruction they offer in their educational practices provided what their preservice teachers needed. The core of special education is meeting the needs of each individual, and they were interested in examining their university teaching to see how it was mirroring that core value. In their conclusion, they state that they had managed to meet the needs of their students in many ways. They found that through modeling, open discourse, and intentional linkage between coursework and practical applications, they created learning spaces for their students to learn and to be ready to meet the needs of exceptional learners. They reported that the use of self-study research methodology gave them the insights they needed to improve their practice. Tyler-Merrick found that she needed to draw her teaching from a more holistic model so that the theory the preservice teachers learn can be applied in the real world of their classrooms. She also learnt that interactions with her students were useful for her to be able to meet the needs of the individual. This included reviewing course content and instructional approaches, but most importantly listening and responding appropriately to the voices of the preservice teachers. Through self-study, Gassmann learned that she needed to validate the instructional approaches and the course content, while determining how she was connecting theory to practice. Gassman and Tyler-Merrick (2006) reported that their main learning about their practice came from reflecting on what and how they teach, and actually listening to the students and responding to their needs. They also realized there is a difference between the theoretical world and the real world – making the links between these two different worlds is the key. In the end, they recognized that self-study has become an important addition to their repertoire of research methods.

Thompson (2006) explored the tense spaces that unfold daily in his university teaching within special education teacher preparation. He points out the tension he finds in "inclusive/special education" (p. 252), where theorists with more of a special education background often advocate for individualized student curricula and specialized teacher training. On the other hand, inclusive/special education, developed through the lens of true inclusion, focuses on anti-oppressive education, tackling issues of gender, race, and sexuality. In his self-study work on his teaching practice, Thompson's analysis of his data focused on three emerging issues: identity closures, paradigmatic extremes, and breaking through extremes. He found these three foci led to a new theoretical perspective for him, as well as a new practical terrain for inclusive/special education. This theoretical shift began with what Thompson (2006) described as a theoretical crisis, where he engaged in much reflection about his practice that led to him recognizing and finally embracing his positivist self. While he felt that positivist understandings of special education were limited for his students, he also recognized that such tools (a toolbox of strategies to use with students) were most helpful to them. He learned that the more practical his courses were (the more he relied on the positivistic view of special education), the more his teaching evaluations improved. This experience led to a period of what he termed a theoretical complexity. He remained committed to understanding how oppression operates for students with disabilities and found great promise and merit in critical social justice and postmodern queer approaches. Yet, the complexity emerged when he found that he easily yoked the positivist paradigm with the practical and yoked the critical (through queer and anti-oppressive foci) with the theoretical. This experience led Thompson to question how he could account for his intellectual identity and the pedagogy he desired. He wanted to be both a real teacher educator within special education and an inclusive educational theorist. Self-study methodology helped him better understand his practice through asking those questions for which he felt he needed answers, such as:

> Does teacher education identification necessitate an/Other? Can identity only be defined against Others, so that no matter how often, or how layered, or how comfortable identification is "with" our like educational communities that at least one Other is required to render a sense of identification completeness—indeed a sense of identity. And, if we all need an Other, can the Other be so seemingly temporary, extemporaneous, and so readily situated? (Thompson 2006, pp. 254–255)

Marks (2010) conducted a self-study as she taught a course, Students with Special Needs, that focused on issues in relation to disabilities in neighborhood schools. The course aim was to have students challenge the hidden assumptions and received wisdom of traditional special education and to develop a critical understanding of disablism, ableism, and their relevance to the classroom teacher. The students were encouraged to frame their understanding and practice within a social justice perspective. Marks (2010) finds special education and disability studies often conservative subjects. Coming out of a variety of models of service provision (such as the medical, deficit, and expert models), there has been, more often than not, an

emphasis on cure, of compensating for deficits, and on the inherent "specialness" of those who work in the field. This sort of focus has led to a preponderance of "nurturing" and "expert" metaphors that are common in education, as well as metaphors that relate more strongly to charity and religion.

In her teaching, Marks's intention was to model the pedagogy and the philosophy she wanted her students to adopt when they became teachers. She used children's literature, media, and popular culture in her course, hoping that it would make enough variation to demonstrate different ways of teaching and an understanding of inclusion and social justice. She felt that her students responded well to her approach. However, the students focused more on the deficit perspectives and called for more practical components and more focus on different types of disabilities and intervention. Marks's analyses were that her students called for practical tools to inform their teaching rather than developing a critically informed praxis. Her conclusion was that in the future her challenge is to find ways to make links between theory and practice that are both clear and practical.

Dalmau and Guðjónsdóttir (2017) conducted collaborative self-study of their teacher education practice for almost two decades. Their longitudinal study suggests that the attainment of an inclusive community in teacher education programs is situated in the public/personal dialectic between the transformation of individual values, worldviews, ethics, and practice, and the sociocultural and structural factors that mediate equity, access, and opportunity in educational systems. They found that a critical element of their practice through the years was providing the opportunity for preservice teachers to engage in reflection and inquiry of learning/teaching, inclusion and the sociocultural context of education. By opening up a space to use the methodology of self-study of teacher education practices the practitioners not only used inquiry methods to understand their practice but also to understand how their transformation developed.

Guðjónsdóttir, on her sabbatical leave, team taught alongside her colleagues in Australia for one semester about inclusion. The team decided to conduct a self-study of their educational practice. The intention in their teaching was to use cases from the students´ practicum for reflections. The team soon learned that for the preservice teachers it was not easy to write a case that was without quick (non-reflective) judgments, personal views, and solutions. Moreover, they also learned through their self-study that the team collaboration helped them to look at the students' cases from varying perspectives (Guðjónsdóttir et al. 2007).

One of the study methods the team applied to support the preservice teachers was the Praxis Inquiry Protocol (PI). The PI is intended to frame a reflective and action-oriented commentary (Guðjónsdóttir et al. 2007; Kruger 2006). The preservice teachers used the protocol to write cases from their experience related to inclusion or exclusion of students. Dalmau and Guðjónsdóttir (2017) explain that as students use this protocol, they use their professional cases and go through four steps of the PI Protocol, that is, they describe, question, explain, and theorize their case. In the end, they propose changes to their practice. Guðjónsdóttir et al. (2007) discuss how the principles and practices of collaborative self-study were particularly complementary

to the developing of the PI Protocol. Through their self-study the participants listen to each other's experiences, questions, and analysis.

Although the preservice teachers struggled with the four dimensions in the beginning and wanted to conclude without relating to theory or support their understanding and action with arguments, little by little, working through the process they began to recognize how helpful it is to look at the practice from these critical and active dimensions. The team commented that although teachers often feel they think as researchers when they look at their practice and respond to their findings, they do not often do that systematically by recording, analyzing, relating to theory or making arguments by connecting theory and practice (Guðjónsdóttir et al. 2007). In parallel ways, as teachers of teachers, the team found the transition from teacher to facilitator and participant in the learning inquiry was challenging. Even though they had espoused inquiry based approaches to teaching and learning for many years, they found that the systematic use of the praxis inquiry protocol revealed to them how much they had to learn, how much they needed to change. Finally, this approach to teaching and learning became a powerful way of supporting educators to break free from the deficit model (Guðjónsdóttir et al. 2007).

Other groups of teacher educators have also used the PI Protocol in their teaching. Kelly (2017) conducted a self-study of teacher education practice along with one Indigenous and two non-Indigenous colleagues at Victoria University. The team worked with preservice teachers (PSTs). Implementing the PI Protocol with her colleagues, she decided to use it in her teaching. The team focused on the inclusion of Indigenous perspectives in their teaching. The idea that educators should start with students' questions in their teaching became their pedagogical commitment (Guðjónsdóttir et al. 2007). Kelly (2017) reports that the connections between the dimensions of the PI Protocol and an awareness of technical, epistemological, and ontological factors provided a rich opportunity for PSTs to recognize and evaluate complex interactions across the learning and life outcomes of students, educational policies, sociopolitical and cultural factors, ethical considerations, and the ongoing discourse of education. The team was able to develop research opportunities for their preservice teachers which were connected to the big questions they brought with them to the course, and thus developing an appreciation of epistemological perspectives. Kelly (2017) points out that through these teaching methods the preservice teachers began to reframe and reconstruct their worldviews, and together with that they managed to deepen their commitment to collaborative and transformative action (Dalmau and Guðjónsdóttir 2002).

It is interesting to see how the findings from the collaborative self-study between the Indigenous and non-Indigenous educators working with the PSTs were used in the teaching. Their aim was to support reconciliation, social justice, empowerment, professionalism, creativity, and moral purpose. They built their lectures and seminars on the collection of their ongoing data. Through their analysis and interpretation, the team found that the PSTs were listening, talking, questioning, and then coming to appreciate the common elements people have when they want to live together and become activists and socially just. The teacher educators and the preservice teachers started with experience, dialogue, and learning together. In the end Kelly (2017)

comments that although she had worked with Indigenous educators over the previous two decades, this was the first time she had worked in a team-teaching situation in the same lecture theatre with an Indigenous lecturer and the combined seminar groups. Through self-study the team learned that the collaboration highlighted the effectiveness of working together and with the PSTs to reject the colonial discourse whereby Indigenous knowledge and experience is seen as peripheral to their understanding of the purpose of education and to themselves as educators and as twenty-first century citizens.

Inclusive Pedagogy

According to Florian (2014), inclusive pedagogy is an "approach to teaching and learning that supports teachers to respond to individual differences between learners, but avoids the marginalization that can occur when some learners are treated differently" (p. 289). The term pedagogy appears in the educational literature to explain the disparate and complex issues of the teaching profession. Three consistent uses of the term "pedagogy" can be found in the literature: (a) to cover teaching methods, instructional programs, and curricula; (b) as an all-embracing term for education in poststructuralist thought; and (c) to express and address moral education and discourse about teaching and learning (Bruner 1996; Freire 2005; Van Manen 1991, 1999). Thus, pedagogy is composed of the act of teaching and the ideas, values, and beliefs informing, sustaining, and justifying that act (Alexander 2013).

The practice of teaching diverse groups of learners is grounded in a pedagogy that includes more than skill in using prescribed instructional practices. Rather, this practice integrates professional knowledge about teaching, learning, and child development and involves an ethical and social commitment to children. Pedagogical qualities of responsive professional teachers are witnessed in those who understand child development and individual differences, are committed to the education of all learners, and have a knowledge base which enables them to differentiate between learners and the subject as they develop a curriculum that includes all (Guðjónsdóttir 2000).

As Dalmau and Guðjónsdóttir (2017) developed their teaching on inclusion through their self-study of their teaching education practices, new understandings of the impact of inclusion/exclusion on learning emerged. These findings affected their search and development of responsive pedagogy in inclusive practices. They report that through the years, they have learned from teachers and preservice teachers that if the goal is to transform education into a responsive inclusive practice it is essential that teachers are prepared to understand and use responsive pedagogical approaches for the education of all. It is also important that teachers become articulated contributors to professional discourse, research, and knowledge creation. According to their self-study, many of the teachers in their studies have identified a lack of pedagogical preparation as a major obstacle in their efforts to create curricula that includes all students in their classrooms. Through their self-study Dalmau and

Guðjónsdóttir realized the importance of continuing education through lifelong learning and opportunities to participate in educational courses along with their teaching.

Another pedagogy-related issue identified by the teachers in their study is the conflict they experience between general and special education pedagogical approaches. The teachers identified differences in ethics, developmental understanding, and approaches to curriculum development. This is in accordance with Thompson (2006), who also experienced conflicts between the positive special education approach and inclusive education.

Guðjónsdóttir and her colleagues (Guðjónsdóttir and Jónsdóttir 2012; Guðjónsdóttir et al. 2016) conducted self-study research as they developed and reconstructed a course that was to prepare teachers to work in inclusive practices. They explored how they developed an understanding of what it means to respond to diverse learners, and if their teaching approaches were appropriate for meeting different needs and situations of their students. As they developed the course, their intention became more and more focused on diversity in all respects. This was seen in how they offered different options of tasks, readings, and presentations. In their findings, they reported that their goal was to offer a versatile buffet of courses from which students could sample. They combined the inclusive theory that builds on responsive practices and differentiated instruction for all learners with innovation education that builds on the notion of creativity and knowledge to meet needs or solve problems that learners identified. Through their self-study inquiry, they realized that the affordances of both theories integrated naturally. They learned that these approaches worked well together because they build on participation and achievement as learners dealing with real-life issues develop a capacity of action and critical and creative thinking. Guðjónsdóttir's and her colleagues' intention was to practice what they preach and to respond to the diverse needs and experiences of their students by offering different tasks, various readings, and multiform projects. Thus, they made sure that both the course content and their teaching reflected inclusive and innovative practices. They wanted their instruction with their preservice teachers to be open to diversity and to offer them a lived experience (Whitehead 1989). As they began to transform their teaching on inclusion, they decided to build their teaching methods on innovation and entrepreneurial education (IEE), to get their preservice and in-service teachers to use IEE approach to create inclusive school practices (Guðjónsdóttir and Jónsdóttir 2016). The IEE approach focuses on looking for needs and finding solutions and applying creativity and knowledge to solve the problems. The aims of IEE are to help people develop capacity for action as well as critical and creative thinking through dealing with real-life issues (Jónsdóttir and Macdonald 2013).

The first student assignment Guðjónsdóttir and her colleagues developed for the updated course was participating in a discussion thread on inclusive ideology and policy. Analyzing the discussion in the beginning of the term, the team found that many of their students expressed doubts about the inclusive policy and practice. However, as the course progressed over the semester, students' discourse toward

inclusive education changed in a positive direction. Little by little through the course, the students realized the pedagogy behind IEE and began to use the approaches to expand their thinking about their practice and to tackle the challenges they encountered in inclusive schools.

Around the world teachers are expected to create inclusive classrooms and to differentiate teaching for diverse students, including learners with disabilities (Hutchinson 2014). Through self-study of educational practices, over the past 25 years, Hutchinson studied the preservice courses she teaches that focus on inclusive teaching for students with disabilities. In these courses she expects preservice teachers to engage in varied collaborative learning and tiered activities, to discuss dilemma cases, and to challenge their assumptions. Initially she focused on modeling, but gradually the candidates taught her that it was not enough; she also had to help them to "unpack" inclusive teaching. Then her goal became to add to the common understanding of teacher educators' and candidates' the complex perceptions of the connections between the teaching methods experienced in teacher education and teaching methods candidates implement during their practica, with the focus on inclusive teaching specifically. In addition, she deliberately sought to understand how the candidates and she, together, could unpack rather than overlook or hide the complexity that is inclusive teaching with the goal of improving her practice.

Martin and Hutchinson (2016) taught preservice courses on inclusive education for more than 20 years using cases in their teaching. At the same time, they have conducted a self-study of their practice where their role has both been a teacher educator and a critical friend. In their teaching they expect their preservice teachers to engage in collaborative learning and tiered activities – much like they would use in their inclusive practice – while discussing dilemma cases and challenging their assumptions. Martin and Hutchinson found that their main task was related to the process in the class, how to create an open-ended learning space and to create sufficient trust and that encourages students to challenge one another's perspectives. The goal in their teaching was that when their preservice teachers become teachers they will open up about their experiences with exceptional learners. They hoped that they will be ready to step in when the children are at a loss and do not know what to do or how to proceed. But this was not easy. Martin and Hutchinson had to learn how to scaffold the uncertainty. They said that to be flexible and responsive to the classroom dynamic meant that they had to listen to what the students were saying in very different ways. However, their critical friendship was helpful, and as Audrey said "Nancy's ever patient, ever incisive, ever non-judgmental, and ever empathic responses that showed me how to listen flexibly and responsively, how to model for my students, and how to begin to come to terms with the discomfort, anxiety, and vulnerability that were constant companions" (p. 368) supported her to achieve her goals. They agree that teaching with dilemma cases has kept them fresh and invigorated while they searched for ways to help their preservice teachers assume a critical stance and teach for inclusion of students with disabilities (Martin and Hutchinson 2016).

Self-Study of Inclusive Practice: An Example

Through self-study, Óskarsdóttir (2017) gained a unique insight into her practice as a coordinator of support in an elementary school and an understanding of the complexities involved in improving practice toward inclusion. She searched for ways to improve herself as a leader as well as transforming the practice of support through questioning the practice of support and inclusion and the politics and policies behind such practice. What follows is her first-person account of her research.

The compulsory school act in Iceland states that schools should be inclusive (Compulsory School Act 91/2008). This means that schools need to provide every learner with quality education according to their needs and ability, and to remove barriers to participation in learning and social situations to enable learners and their parents to belong in the school community. Given the fact that the policy calls for significant restructuring of school organization, it is important to consider how and whether the organization of special needs education and the support structures operate according to the ideology of inclusive education.

This research focused on how I, a coordinator for support services at the Waterfront school (pseudonym), a compulsory school in Iceland, worked on developing the organization of support toward inclusive practice. Inclusive practice is grounded in the ideologies of social justice, democracy, human rights, and full participation of all. In using the term inclusive practice, I sought to demonstrate that there are many factors that impact the processes of inclusion in a school setting and to emphasize the fact that inclusion is a process that can never be completed. The research was framed in the concepts of collaboration (across classroom teachers and support services), leadership for inclusion, and reflective practice, as these three concepts are considered crucial for reconceptualizing education practice to become inclusive.

The self-study methodology was employed in this research to allow for understanding my role in transforming practice. The purpose was to examine the support service in Waterfront School through the lens of inclusive practices and my role in improving leadership and collaboration for inclusion. Traditionally, self-study has been connected mostly with teacher education practices at the higher education level (LaBoskey 2004; Tidwell et al. 2009). However, I found that elements of this research methodology suited my research purposes where "self-study is a personal (ly) situated inquiry" (Samaras 2010, p. 72). Significant factors for my study were elements such as focusing on my experience in practice and not aiming for placing judgment on others through the research process. The personal in self-study meant that my voice would be an important valued source of knowledge in my professional setting as the goal was to increase understanding of practice and my role as a practitioner and bring about essential improvements or even transformation of practice (Guðjónsdóttir 2011; Guðjónsson 2011).

The second focus of the self-study methodology is that it is a "critical collaborative inquiry" (Samaras 2010, p. 72). Hence, self-study is both personal and interpersonal and through communication and dialogue with colleagues (as well as a critical friend), I could confirm or challenge the understandings that developed in my

study and extend my conception of practice and how it affected pupils, teachers, parents, and other stakeholders (Guðjónsson 2011; LaBoskey 2004).

From the outset, by keeping a critical stance toward my practices and the study with the assistance of a critical friend, I adapted, changed, and negotiated the questions, purpose, and importance (Tidwell et al. 2009). Thus, my practice as a coordinator for support services evolved along with the study, sometimes without me being consciously aware of it. I was able to recognize these transformations through discussions with my critical friend and through reflecting on practice as it presented itself in my data (Tidwell et al. 2009). My research added to my personal and professional knowledge but did also contribute to knowledge of the school, inclusive practice and school development.

This self-study in and of my practice was divided into three distinct phases: the reconnaissance phase, enactment phase, and reflective phase. In the reconnaissance phase I interviewed administrators, teachers, and support staff working at the school in order to achieve insight into how the people I work with understand inclusion and into their views on the support system and collaboration. Analysis of this phase illustrates the voices of staff working with pupils in the school by highlighting their perception of inclusion and their ideas about how the support system could be improved. Based on this analysis, I created an action plan that I implemented in the next cycle of the research, the enactment phase.

In the enactment phase, the organization of the support service was transformed according to analysis of the data from the reconnaissance phase and the process was recorded in a self-reflective research journal. Furthermore, the viewpoints of parents, pupils, and learning support assistants were gathered on inclusive practices in the school. The analysis of this phase gave insights into how the coordination of the support system was developed, what the main challenges were, and how collaboration between general educators and the support staff in the school was transformed.

In the reflective phase, I reflected on my learning through the self-study, alone and with others, as I analyzed the data and gained understanding of my development in thinking and practice. Through reflection and with the assistance of critical friends, I transformed the findings into a story from which others might relate and perhaps learn from.

Findings from this study cast a light on the factors constraining or facilitating the restructuring of the support service as inclusive practice in a school. The findings show that even though I was committed to improving the practices of support, there were influences and barriers to those improvements that made the whole process complex. Breaking away from the discourses of disability, charity, and pathology that dictate the practice of support, thereby changing my own and others' mind-set, proved to be the greatest challenge.

My contribution to knowledge is the provision of a firsthand account of a middle manager endeavoring to change practice toward inclusion. Furthermore, I used the understanding gained from the research to form a model of an inclusive education system, which can be employed to inform school change across system levels, to explore inclusive practices, and to support teacher education and professional development. Through the research process, I have gained an understanding that

creating an inclusive support system is a complex venture. It is bigger than improving collaboration and leadership of the coordinator for support. I have learned that the position of a coordinator for support needs to be reconceptualized. While the teachers are responsible for meeting the daily needs of their pupils, the coordinator for support services has a role to provide the support and advice required to assist each teacher in fulfilling their statutory duties.

Concluding Remarks

In this chapter, we have seen the connections across special education, inclusive practice, social justice, and education within a diverse society. The complexity imbedded within effective inclusive practice reveals the importance of understanding the *what* and *how* of practice and how that knowledge informs our understanding of teaching and teacher preparation. What we learned reviewing the self-study research on social justice was that self-study researchers early on found it very difficult to study social justice within their practice (Griffiths 2002; Griffiths et al. 2004). They struggled with collecting data on their own practice or effectively enabling others to collect data on how they are addressing social justice in the classroom. Researchers asked if it was even possible to study social justice within classroom practice; it was too personal and too risky. Coia (2016), in her research on her own vulnerability as an educator, demonstrated she was ready to bring that personal forward and to be visible, willing to be vulnerable with her students. This enabled her students to do the same, creating a community of educators ready to study social justice and to examine how that can be seen in their own practice.

Because inclusive practice builds on social justice, it is necessary for educators to research what is reflected in practice to know what and how we are practicing thus far. Social justice and inclusive education are so interconnected, we realized through these studies that it is not possible to research inclusive education without examining the social justice aspect of such practice. Social justice in education is about addressing diversity, and opening up education for all, that education is for all learners.

Teacher education needs to be further developed if it is to effectively prepare teachers to meet the needs of diverse learners in the classroom. Findings from the teacher education for inclusion project (European Agency 2011a) reinforce this concern in preparing teachers for a diverse society. Specifically, they suggested developing more effective recruitment and selection processes, improving teacher education systems including initial teacher education, induction, mentoring, and continuing professional development, and, improving school leadership. Self-studies on inclusive practice in teacher education concur. Self-study researchers in teacher education have come to realize the critical value of preparing preservice teachers for the diversity within classrooms. It brings to the fore the importance of teachers (both teacher educators and teachers in the field) understanding how effective learning happens, where students' resources are embedded within the planning and instruction to create meaningful experiences for each learner.

We also learned, through examining the research in self-study on inclusion and special education practice, about the conflict that arose between traditional positivistic approaches to teaching students who are different and the inclusive model of teaching all students. Specifically, the seductive nature of positivistic teaching enables a more prescriptive approach (a tool box of strategies) to be used when addressing students with special needs. As Thompson (2006) describes, this creates a sense of false security to his preservice teachers but is void of any real understanding of how to be effectively inclusive in teaching. It undermines the teacher in attempting to create that collaborative learning environment where students' resources inform practice in the classroom. It also creates a theoretical conflict for the teacher educator.

By studying our practice through self-study, our efforts to create more effective pedagogy are informed through our better understanding of how practice connects to theoretical values. By collecting data on our practice, we can see how students are making sense of inclusive education over time. As teacher educators, we are better able to meet the individual needs of preservice students through changing our practice as we respond to our self-study data.

A Rhizomatic Self-Study: Aiming at Social Justice in a Conflictual Environment

21

Contents

Abstract

In this chapter, we discuss the meaning of rhizomatic self-study and explore its potential in promoting social conscience and coping with challenges of social justice. Adopting the Deleuzo-Guattarian rhizomatic conceptualization, we inquire into the dynamics of conflictual and contradictory environment. Through these lenses we view the multiplicity of rhizomatic connections beyond the major binary oppositions such as Jews and Arabs and become attuned to the minor voices that are not part of our daily discourse but influence the ways we experience our reality. The study is based on personal stories, stemming from our experience as Israeli teacher educators teaching in an environment rife with overt and covert conflicts. It brings up our unheard/heard voices and opens a window for understanding this multidimensional and unpredictable environment.

Through this study, we expose the effect of minor voices in revealing the hidden facets of the conflict and the rhizomatic interactions connecting its different layers. Thus rhizomatic self-study becomes a process that allows for more egalitarian discourse between diverse cultures, moving beyond cultural diversity toward fairness and a socially just environment.

Introduction

Some of the major challenges of teacher education today relate to the need to educate teachers toward an environment in which we cannot foresee the spectrum of changes that will occur and the opportunities and the difficulties our graduates will face are unpredictable. What we do know is that technological, social, and demographic changes bring issues of social conscience and challenges of social justice to the forefront (Cochran-Smith 2009; Han et al. 2014; Zeichner 2009). These matters require flexibility and creativity in developing professional and relational capabilities and the ability to learn and improve our practice in an environment rife with overt and covert conflicts.

Israel, like many countries, faces daily challenges of cultural and social class diversity posed by groups with diverse needs and groups in conflict living side by side. The local context of our study in Israel adds the dimension of both our students and ourselves belonging to groups with a long history of "intractable conflict" (Bar-Tal 2007; Salomon 2002) that increases tension and mistrustful relations between groups. The Israeli-Arab conflict is national, cultural, religious, political, and military. The conflict, rooted in Israel's early days as a nation-state of the Jewish people, has a history of violent confrontations with neighboring Arab states and a tension that is also reflected in the attitude and status of the Arab minority living in Israel. This conflict has strongly influenced the collective identities of both Jews and Arabs (Maoz et al. 2002), and the potential of overcoming it is questionable (Bar-Tal et al. 2014; Bekerman and Zembylas 2010). Taken together, these challenges call for rethinking the questions of how to promote learning in a socially just environment that attends to the inequalities and hierarchies shaping our lives and educate teachers to do the same and become agents of change.

The intersection of social justice, self-study, and teacher education has been studied in the context of groups in conflict, and some researchers have explored these relations through self-study. Galman et al. (2010), studying their beliefs and practices about race, found their "beliefs and practices perpetuated and reinforced white racial knowledge" (p. 229) and discovered they missed opportunities to discuss race and racism in the classroom. Focusing on teacher education in the United States, Juárez and Hayes (2010), a white female and a black male, used the critical race theory methodology of counter-storytelling to examine their teacher

education experiences and bring a strong indictment against "how the racial power of Whiteness sabotages social justice in education" (p. 245). An important outcome of Lee's (2011) self-study of his supervision of teacher candidates to prepare them to teach for social justice highlights the issue of identity in relation to social justice practices. Lee realized that through building relationships with his students, he became more comfortable with his own Korean cultural identity and stopped trying to totally assimilate into American culture. Confronted with the existing gaps in status and power in the United States, Conklin and Hughes (2016) explored their practice of justice-oriented teacher education and offer a pedagogical framework to educate white teachers to teach equitably in socially heterogeneous classrooms.

Part 1: Challenges of Multicultural Teacher Education Program

Our Context

We are teacher educators (past and present) in ACE (Active Collaborative Education), a 1–2-year, post-graduate teacher education program that educates K-12 and special education teachers in Israel. Our students represent the multicultural faces of Israeli society: immigrants and Israeli-born, secular and religious, and Jews and Arabs. The program includes about 160 students and 15 staff members. We, the teacher educators, are also a heterogeneous group in terms of disciplinary backgrounds, gender, religion, and practical experiences. We meet every other week to discuss and inquire into various issues, arguing and voicing our different opinions along the way. The rationale of the ACE curriculum is based on the understanding that the wisdom of practice is developed through the intertwining relations of personal experiences and negotiations of meanings within the context of a collaborative learning community (Turniansky et al. 2010). Collaborative learning is deeply embedded in our daily being, our teaching, and our research. The ACE curriculum is based on a set of intertwined workshops, not an aggregate of courses. Most of these workshops are co-taught by the program's team of teacher educators, many times a team of both Arab and Jewish tutors. The program aims at educating open-minded teachers able to develop versatile ways to cope with the complexities of the society they are going to face.

Our many years of working and studying our practice in a multicultural team with a multicultural student body has led to our understanding that questions of social justice within the multicultural context are essentially questions of identity (Boylan and Woolsey 2015). Confronting these questions forces us to move away from familiar zones of comfort and into a nomadic journey of becoming: a transformative process that influences new and previously unthought-of emergences (St. Pierre 2011).

In our chapter, we discuss the role of self-study in promoting the exploration of possibilities toward meeting the above challenges. Adopting the boundary-crossing theoretical lenses of Deleuze and Guattari (1987), we suggest rhizomatic self-study as a significant tool for learning and becoming within multifaceted environments.

The chapter begins with a theoretical background relating briefly to the Deleuzo-Guattarian rhizomatic conceptualization as a framework that accentuates the dynamics of connected and interrelational flows and the meaning of educational edge (Gorodetsky and Barak 2008, 2016b) as the processual context for understanding multidimensional and unpredictable environments. The chapter then explores the meaning of rhizomatic self-study and examines its significance by interpreting our experience of being teacher educators within such an environment. In conclusion, we inquire into the potential of rhizomatic self-study for coping with contradictory and conflictual situations.

Part 2: Rhizomatic Conceptualization: A Theoretical Background

Rhizomes on the Edge

Borrowing from the field of biology, the rhizomatic framework offered by Deleuze and Guattari (1987) is an invitation to a divergent, non-dichotomous, and non-hierarchical observation of processes and phenomena. A rhizome is a type of plant stem that runs either on or under the surface, spreading itself horizontally by growing additional roots and stems as it goes. Many rhizomatic plants are considered invasive and very difficult to get rid of since a new plant can grow from any piece left in the soil. Moving this idea into a social and educational context, the rhizomatic conceptualization evokes the temporality of experiences and their multiple unforeseen possibilities. Its broader social implications address non-hierarchical social structure of interactions and facilitate the discourse of social justice that exposes otherness voices (Cole 2008; Massumi 2002; Roy 2003; St. Pierre 2011; Strom and Martin 2013).

The Deleuzo-Guattarian theorization opens a different framework to understand learning processes – a nonbinary way that addresses possibilities and connections (Roy 2003). It is a subversive conceptualization presenting an alternative to our habitual linear, rational understanding of the world which is more like the way a tree grows (an arboreal conceptualization). Rhizomes are expansive and ephemeral by their nature and pertain to an infinitely modifiable net with many entrances and exits. Rhizomic growth highlights the dynamic, chaotic, and open nature of the meshwork of connections which cannot be predicted in advance. A rhizomatic system is characterized by connectivity that is in constant flow, far from stability, always transforming and regenerating (Larsson and Dahlin 2012; Semetsky 2008; Yu 2006). These systems are free of rigid boundaries and dichotomies and can create simultaneous connections and interactions along different dimensions (Deleuze and Guattari 1987; Gale 2007). The rhizomatic conceptualization provides an insightful framework for the conceptualization of unthought within the thought (St. Pierre 1997). It offers openness that disrupts hierarchical categorization and allows grasping the power of nonlinear relations and sociocultural interactions.

Conceptualized as outside of the established order, the Deleuzo-Guattarian theorization resonates also with educational edge environments which are boundary

spaces, far from equilibrium conditions. These are shaky environments where learning is embedded within a continuous search for new and yet unavailable educational potentials (Gorodetsky and Barak 2008, 2009, 2016a, b). An educational edge is a deterritorialized or nomadic space wherein participants need to leave the known and the familiar while moving toward the exploration of new and unknown territories. These unaccustomed spaces demand the redefining of ways of being and acting. An educational edge resembles an ecological edge, comprised of the variability of its participants, the difference of their histories, personal and cultural, their explicit and implicit knowledge, and their emotional and moral commitments, which they bring to the collaborative learning setting. The audibility of different voices and the blend of diverse backgrounds challenge taken-for-granted routines and beliefs, thereby reopening, revaluating, and re-problematizing questions of societal divides and transformative possibilities (Baker et al. 2017; Knowles 2014). The unpredictability of the edges also imposes vulnerability, ambiguity, and risk taking on the participants and continuous processes of negotiations to enable their existence within. The potential of an educational edge to become fertile ground for innovation and change depends upon the blend of personal experience and knowledge of individuals that are intertwined within the fabric of the various voices, thus becoming the knowledge of the community (Tuval et al. 2011). Through this perspective that resonates with the unique features of Deleuzo-Guattarian thinking, we take our rhizomatic self-study into a conflictual educational environment in teacher education.

Rhizomatic Self-Study

Self-study came into being as a boundary-crossing approach that reached beyond the mainstream of educational research (Loughran and Russell 2002). It began as a challenge to common traditions of research that did not match teachers' and teacher educators' ways of living and learning which are characterized by constant change. Self-study makes room for heterogeneity and the inner tensions and living contradictions of teachers and teacher educators (Berry 2007; Elijah 2004; Whitehead 1993). Moreover self-study, in many cases, is not confined within conservative methodological borders; it embodies both a research approach and a way of life: "Self-study as praxis ... is where epistemology and ontology meet, unfold and inform each other" (Knowles 2014, p. 100). The relations creating the manifold-layered complexity of self-study break down the traditional theory-practice gap and offer insights regarding the weaving of epistemological and ontological worlds of teacher educators (Bullough Jr. and Pinnegar 2001; Loughran and Russell 2002; Taylor and Coia 2009).

Reenvisioning self-study through the concept of the rhizome is inspired by the notion of self-study research as representing "... a potentially unending, and at the same time deepening, pool for research" (Pinnegar and Hamilton 2009, p. 32). It resonates with a rhizomatic configuration that has neither a beginning nor an end; rather, it always grows in the middle. The rhizomatic conceptualization diverges into

wide-ranging directions, forming multiple connections and assemblages, thereby allowing us to explore and read the trajectories of impossibilities, fluctuations, and interactions among the diverse participants. Rhizomatic research, like self-study, suggests a provocative framework that breaks through strict methodological regulations, offering an approach that is free of defined routes and routines (Clarke and Parsons 2013; Fullagar et al. 2017; Gale 2010; St. Pierre 1997). The added value of this approach is openness to the surprises and the serendipitous learning that occur along the process. It views research as a nomadic process aiming at exploring the complexity of the environment without committing to prescribed pathways (Grellier 2013; Guerin 2013). There is a hope in rhizomatic research that by creating a "... path toward breaking binaries (between researching and teaching), the conversational act of resurrecting pedagogical ideas becomes a powerful educational possibility" (Clarke and Parsons 2013, p. 42).

Linking rhizomatic thought to self-study highlights its fluidity and interconnectedness, an evolutionary study that cannot be designed and predicted in advance. It enables us to grasp various aspects of multifaceted situations. This is a methodological linkage that illuminates the ontological turn (St. Pierre 2011) of the research and addresses the value-laden complexity and the inherent contradictions of a subjective approach. Rhizomatic methodology is based on multiplicity and sensitivity to the different planes where relationships are formed and interconnected and cross over each other (Honan and Sellers 2006). Rhizomatic self-study within this framework is collaborative, reflecting the collective experiences and weaving together individuals' practice and research as a way of professional life of the community. A collaborative context is inherently multivocal and includes the histories, experiences, perceptions, and dreams of many meaning-makers (Gutiérrez et al. 1999; Taylor et al. 2014; Zeichner 2010). Collaborative self-study, by its nature, increases attention to the different voices and addresses issues of social justice, referring to the potential of change (Bodone et al. 2004; Griffiths et al. 2004). The discourse on collaboration in self-study provides a way to look at processes that are taking place, to expose their complexity, and to clarify their meanings. Addressing the complexity of collaborative self-study through the rhizomatic lens allows viewing the processes as nonlinear and socially branched, evolving in many different directions. It embodies the processual tools that enable us to sustain the dynamics and the vitality of the community along the way. Collaborative self-study thus becomes a "boundary-crossing" process (Akkerman and Bakker 2011), a journey into the experiences of newness and openness (Barak et al. 2010; Lee 2011; Monroe 2013; Williams and Berry 2016; Williams et al. 2012).

A rhizomatic self-study constitutes an invitation to a generative and challenging journey into undiscovered territories. It offers different angles of observation and new ways to understand situations. Rhizomatic self-study, as we propose to examine in this work, is a study in the interrelational space between all involved, a sphere where boundaries are blurred. The study is based upon creating a space for nonmediated encounters between different territories of personal, cultural, and professional life experiences – an edge environment. The shared space enables us to look at the full complexity of the learning environment and to study its dynamics in many

ways and in different directions. The potential of the rhizomatic lens to reveal the different facets and layers of educational processes and to be able to look beyond the familiar and the known is beginning to be heard in self-studies in recent years (Barak 2015; Martin and Strom 2017; Strom and Martin 2013). Strom and Martin (2015, 2017), in their insightful work, relate directly to power inequalities and offer the Deleuzo-Guattarian framework in self-study as a model for examining and clarifying questions of social justice. This approach offers a new look at questions relating to race and gender, as well as a reexamination of learning frameworks of recent years such as inclusive education and globalization in teacher education (Goodley 2007; Ledger 2016; Strom et al. 2014). The rhizomatic framework, as a platform that brings silenced voices to the forefront, is closely related to self-studies that inquire into social justice questions, as mentioned in the beginning of this chapter. We hope that these self-studies will open up new edges enabling transformation and change.

Part 3: Exposing the Minor Voices Through Rhizomatic Self-Study

Our chapter is an example of a collaborative self-study that illuminates the significance of the rhizomatic lens to read overt and covert processes occurring in a group of student teachers and teacher educators, representing the major Israeli ethnic groups of Jews and Arabs with their variety of voices and attitudes and the conflicts between them. We view our collaborative self-study as rhizomatic research relating to the spaces of our existence and the spaces of our transformation as teachers and researchers. As a rhizomatic system, the study is always in the making, and we present some of its actual and possible ramifications as an example of the complexity of the process and its significance in our professional life. The rhizomatic approach enables us to deal with the complexity of an entire, changing reality as a nexus of processes: flowing and essentially interactive.

Our rhizomatic self-study brought up personal narratives and the ways people make sense of their experiences, followed by collaborative processes that expand the interpretive perspectives. It is based on personal reflective vignettes and conversations regarding our experience of being teacher educators within a multicultural environment. The study evolved following our understanding that the context of Jews and Arabs learning together surfaced a sense of unease mainly brought about by Hebrew language difficulties and low discussion participation among Arab students and different interpretations of behavioral expectations. The difficulties we faced were not new to us, and they often arose in our meetings, yet we were walking in circles, not reaching new understandings or insights. Realizing that our perceptions regarding educating teachers from different cultures need to be reopened (Lee 2011; Monroe 2013), we decided to explore our own stories and those of two other team members, Adiba and Amnon (who we'd like to thank for their stories and their participation in the ensuing discussions), with the goal of enabling us to surface and make necessary changes. Together we represent the heterogeneity of our team members: four women and one man, four Jewish and one Arab, four Israeli born, and one born and raised in the United States. Each of us chooses one of her/his

previously unheard stories, leading to the subset of vignettes presented here. Each story was written at home and then sent to the other four story writers for personal reading. The five of us then met and discussed the stories together.

Adapting the rhizoanalysis approach (Strom and Martin 2013), the vignettes and the conversations' protocols were collaboratively read and discussed both as singular texts and as interconnected nodes, serving as varied layers of interpretation and exposing different voices, explicit and tacit, affecting our experiences. The rhizoanalysis approach is attuned to movement and linkages, inquiring into the relational and intersubjective assemblages of our *becomings*. This approach is more of a mindset than a procedure. It blurs distinctions between data and interpretation and sees data as being created in the process (data walking) (St. Pierre 1997; Strom and Martin 2013; Waterhouse 2011). The foundation of the study lies in its liberation from defined routes and procedures as it aims to expose the interconnectedness of a rhizomatic tapestry, thereby gaining insights into the different layers of our lived experiences.

The subset of vignettes presented here explored unheard voices and connections we were unaware of before. Discussing the vignettes together exposed another dimension of the intertwining rhizomatic connections which are revealed later. These are co-/autoethnographic journeys (Chang et al. 2013; Taylor and Coia 2009), in which the personal and professional stories are told and cocreated giving voice to sociocultural differences and enabling the emergence of new connections.

Telling our unheard stories gave us the opportunity to join together on a different journey which encouraged us to bring to light unsolved complex feelings and thoughts about our own experiences. These talks enabled us to talk more openly about our individual and mutual experiences as teacher educators (Barak et al. 2016). However, the current stories we told served as last but temporal frames in the long history of our collaboration as teacher educators in ACE (most of us are team members more than 15 years). The vignettes and the conversations studied in this work are only a fraction of the many stories we told and conversations we had.

In this chapter, we chose to present some of the vignettes that express the experience of teachers who have two unique characteristics: Adiba, an Arab woman; Bobbie, a Jewish woman who grew up in the United States; and Amnon, a Jewish man born in Israel.

Where Is Waldo? Exposing the Hidden Facets of the Conflict

Learning, conducted mainly in Hebrew, creates asymmetry between native Arabic speakers and native Hebrew speakers. When Arab students express themselves in Arabic to the Arab mentor, I don't fully understand what's being said but feel it's important to them.

We promote progressive educational concepts opposite to the student's familiar reality, but my experience is that the distance between the progressive approach and the known reality for Arab students is much greater than for Jewish students. Sometimes I feel it's impossible to completely bridge the gap and I'm not always sure it's ethically right to reduce it. There's a kind of statement that there is a better education and we know what it is. It may be perceived as condescending. (Amnon, Jewish mentor)

Over the years, we have been aware of the major visible gaps between the groups of Jews and Arabs participating in the program. The conflicts between the groups, as we describe above, are anchored in the broad contexts of history and the sociopolitical situation of the groups, and we are constantly examining ways to deal with them. Amnon's vignette above reflects the gap between our intentions to create an egalitarian environment and a program suitable for everyone and the reality in which not everyone experiences it in this way. The intercultural conflict exists behind his words relating to the condition in which the curriculum is constructed and attuned to the dominant culture, thus creating a clash with the needs of the minority group. The sense of asymmetry he is talking about points at the potential of the situation to develop into a deep conflict between the groups. Amnon's statement demonstrates the language differences present between Arabs and Jews because the Arab students often find it difficult to express themselves in Hebrew, which is a second language for them. He is also describing the cultural differences between students. Specifically, Arabs participate less in the group discussions because they are less accustomed to an open discourse that allows them to express feelings and emotions. Being aware of those gaps, we tried several ways to confront them. For example, we found that including personal and professional identity issues within the curriculum is one of the ways to raise and deal with the tensions described (Mansur 2016) such as the fact that the vast majority of participants in most of the discussions in class are Jewish students. Nevertheless, we felt there were layers beyond the visible insights we had described and we looked for ways to uncover them.

The Deleuzo-Guattarian conceptualization also provides us with lenses to view the multiplicity of rhizomatic connections beyond the major binary oppositions such as Jews and Arabs' ethnicity differences and to develop sensitivities to minor voices unheard/heard, often without being aware of them. They invite us to observe the inner and the cross diversity among the conventional categories, to see the richness and multidimensionality that exist within them, and to become attuned to their meanings. The concepts of major and minor voices come from the Deleuzo-Guattarian concepts of *major* and *minor literatures* (Bogue 1997; Deleuze and Guattari 1986; Deleuze et al. 1983). While the *major literature* represents the conformed or mainstream literature, which repeats and conserves the traditional norms and hierarchies, *minor literature* (e.g., the works of Lewis Carroll or Franz Kafka) does not transmit tradition, but rather is attentive to nuances and the emergence of the unexpected. *Minor literature* (e.g., Carroll's, *Alice in Wonderland*) connotes the notion of estrangement and liberation, shifting the discourse away from the center, and thus enables the emergence of a new center attuned to other voices – i. e., those that live and act within the same language and yet speak differently. This is a more concrete language which addresses specific and singular occurrences (Gorodetsky et al. 2017). In this sense, the major language operates through known rules, emphasizes the common denominator, and divides and defines clear categorical boundaries, while the minor language undermines boundaries, produces meaning in motion, and increases the value of subjectivity. The minor language forces us to be aware of the arbitrariness of the existing distinctions and to listen to "other" voices peripheral and outside of what we know and expect (Shoshana 2013).

Shoshana found in his study that gifted students of lower socioeconomic status who attended boarding school with teachers and students of higher-class status adopted a major language regrading social groups. They tended to abolish and even deny the unique identity of their countries of origin and related to the differences between groups only on the dimension of eastern versus western origin. Their siblings who stayed at home and studied in their own neighborhood were much more aware of their ethnic identity and reflected minor language that is attentive to the diversity of nuances and differences of each country.

The next vignette, Adiba's "embarrassing moments," provides us a glimpse into the minor voice she exposes, a voice previously unheard.

Embarrassing Moments

Often, during class discussions, a subject comes up similar to a topic I discussed with an Arab student earlier in the week.

I see the student is not participating, not stating her opinion like she did when we privately discussed the same subject, and it bothers me because I know she has something to say on this subject.

Sometimes I try to surreptitiously give her a hint, by gesture or quiet word unnoticed by other students or staff, to remind her of our conversation.

In some cases, the student "responds to my request" and participates.

Then, I have mixed emotions. One is joy she is participating, expressing her opinion and getting positive responses to what she said, and feeling good. But on the other hand, I feel she did it for me and that bothers me.

Once a Jewish student noticed me giving the 'hint' to an Arab student, and she looked at me . . . Then I felt uncomfortable . . .

Sometimes I feel I should not do it . . . Adiba (Arab mentor)

Adiba's vignette emphasizes the emotional complexity of the situation. She wondered whether she should approach the Jewish and Arab students differently and the significance of her being an Arab mentor in terms of the students' expectations. Adiba related to an identity conflict, professional and personal, and described the tension that accompanied her choices and modes of action (Gatzke et al. 2015; Kunnen 2006; Turniansky et al. 2009). Her decisions depended upon conflicting alternatives and the inevitable preferences she was making between the options she had. Adiba's questions highlight the invisible facets of our conflictual environment and call our attention to its different layers. Her internal conflicts affected not only her and her behaviors; they shaped the discourse and learning environment of her whole class. Discussing Amnon and Adiba's vignettes, it appears that while Amnon related mainly to the major language of the conflicts we live, Adiba brought up its minor voices. Looking at these voices as rhizomatic lines that spread through and across our collaborative environment allows us to see beyond the polar vectors of Jews versus Arabs or men versus women, to reveal the different shades of the conflict and the ways they meet and collide.

The following partial transcription of a conversation in which reflections on co-teaching experiences are discussed reveals that neither the major nor the minor

languages are comprehensive representations of the situation. Rather they exist together side by side. The undercurrent of assumptions and divergent routes that connect them are exposed in the conversation that developed during our collaborative process of interpreting the vignettes.

> Adiba: Maybe because I am an Arab and want to help Arab students . . . . So how come that I feel disturbed doing so? . . . . I ask myself, how am I perceived by others [my co-teachers] . . . . When Amnon [my Jewish co-teacher] sees me helping Aisha [Arab student], how does he look at me?
>
> Bobbie: Maybe inside, you're afraid your help to an Arab student is interpreted as favoritism, while helping a Jewish student is just seen as part of the job?
>
> Adiba: I didn't think about it, you're right . . .
>
> Amnon: For me it's more a problem that I do not speak Arabic. Adiba, you can help Jewish students and talk to them because of the language and because you're a woman and you have more practical experience than me. . . A man, and I do not know Arabic . . .
>
> Adiba: I might not want to be perceived as an Arab instructor . . . {for example} when Bobbie [the Jewish co-teacher] invites everyone in the group to speak up, she looks at the Bedouin girls and says, "I want to hear the others," and I'm sure that addresses the Bedouin, but the invitation is not directly given . . .
>
> Amnon: We [Jews] have another problem of not remembering the names of the Arabs well . . .
>
> Bobbie: I have difficulty with Bedouin girls' [names] due to lack of clues: their hair is covered, I'm missing information . . .
>
> Amnon: I feel it bothers them that I do not remember the names . . . and I also feel [co-teaching with Adiba] that I take over . . . it bothers me . . . sometimes I feel I talk about progressive and subversive ideas and ask myself what it means to them [the Bedouin]? The kind of world I'm talking about . . . .

It is interesting to follow the meshwork of interactions that are revealed during this conversation, the rhizomatic lines connecting the individual stories. Adiba expressed the question marks that affect not only her and her behaviors but also those who hear that they are accustomed to relating to the major aspects of tension. Her thoughts exposed the simultaneous scripts she runs regarding how she should act with Arab and Jew students and how her Jewish partners will interpret and understand her behavior. The discussion also revealed that the intercultural, gender, and personal conflicts are intertwined and cannot always be separated. Amnon became emotional and exposed the surprising story about him, a Jewish male, feeling inferior during several occasions of co-teaching with Adiba. In addition, Bobbie and Amnon [Jewish mentors] demonstrated the inherent asymmetries in their relationships to Jews and Arab students. They knew most of the Jewish students by name but had difficulties in remembering names of Arab students because of missing signifiers they are used to using. The tensions and conflicts described are both intercultural and interpersonal, touching upon our values and aspirations and expressing thoughts and wishes about the paths we should take. Each of us has experienced contradictory commitments between different desires, and the forces of reality and our professional practices are often an amalgam of these opposing forces. The conflict thickens this way as the different strata are in constant movement, folding and refolding toward each other. It complicates the situation, on the one hand, but allows many directions for understanding and developing, on the other.

Another expression of the minor voice in revealing the hidden layers of the conflict is expressed in Bobbie's three-part story below:

It's Not Fair

One day, a holiday when Muslim students were absent, some Jewish students complained: "It's not fair. Why do they get off both for our holidays and their holidays?"

The question got me so angry that I responded: "Perhaps you should ask why the college doesn't think Muslim holidays are important enough to close the College like they do for Jewish holidays." They didn't understand my point.

I added a childhood story about the "problem of going to school in the USA with a matzah sandwich." They still didn't understand. Again, my familiar feeling of helplessness. (Bobbie, Jewish mentor)

See Not, Hear Not

Group meetings are mainly discussions. Arab students usually participate little if I don't turn to them explicitly. And when they do participate, it's not clear if anyone besides me is listening. Other students' cellphones start "working overtime." There are few reactions to what they say. The word "transparent" describes the situation well.

There's a feedback loop – I talk, you don't respond. You don't respond, apparently you have nothing worthwhile to say. You talk, I don't listen. You don't listen, I won't talk . . .

A circle within a circle – insiders and outsiders. And apparently nobody seems interested in changing the situation. (Bobbie, Jewish mentor)

My Story

I tell the story as if there are "good guys" and "bad guys" but that's not the case. People are who they are, with their beliefs, values and culture. Perhaps after 20–30 years (or more), we can't change things in a short year or two.

This isn't good for me. I leave these situations feeling frustrated and helpless. Should I keep trying to change something outside or do I have to change my own expectations and desires? (Bobbie, Jewish mentor)

Bobbie's emotional response expressed above might have an effect opposite to the one she hopes for. The frustration and helplessness she expresses may serve as an unintended model of noncompassionate, inequitable teaching leading to more resistance (Conklin and Hughes 2016).

Bobbie's stories include her personal background and experiences of "being different" when she was young (a Jewish girl in a majority Christian society) with her current sociopolitical awareness and beliefs. Her stories, like all the vignettes above, expressed thoughts, associations, feelings, memories, and internal speech that took us to the reality of our collaborative and multicultural space. They told of uncomfortable situations, exploring the wish to change and reflecting different experiences within the collaborative space we shared and our multifaceted identities within it: pedagogical mentors, teachers, males and females, and Jews and Arabs. The encounters and the rhizomatic interactions between the personal stories and the common discourse made it possible to see the processual flow that occurs along the way. Thus, for example, relations between minority and majority groups, or relationships of power and abilities, changed when viewed from different angles, and a range of interpretations exists for each situation described. All the possibilities existed in various stories, and the tellers did not attempt to give clear answers; rather they

raised questions within their stories – reflective questions on practice, often with ethical undertones. These are questions we did not allow ourselves to ask before, those we try not to touch – perhaps because they were too sensitive.

- Should I treat them differently?
- Who and what must be changed?
- Should change be part of our program's agenda?

Part 4: Discussion

The conflictual reality reflected in this work is complex and includes diverse manifestations. Conflicting narratives and individual aspirations create a never-ending journey that demands navigating among desires and tensions which can lead to participants becoming entrenched in their own worlds and thereby becoming a barrier to dialogue and change (Dooner et al. 2008; Kemp 2013; Mansur et al. 2011; Taylor et al. 2014). This work explores the potential of rhizomatic self-study to expose the various spheres of our lived conflicts. The expression and deliberation of the conflictual questions brought up in the study opened for us more meaningful choices that create a sense of belonging, responsibility, and mutual commitment. The short stories told in this study are stratified and meaningful and give us several perspectives for interpretation and understanding. The main effect of the study is the exposure of the minor voices of the conflict and the threads connecting its different layers. Bringing up our unheard/heard voices enables us to open a window to the dynamic interplay of the various spheres and the potential of rhizomatic self-study to create connections in our contradictory and conflictual environment.

This study reveals a range of rhizomatic connections carrying challenging consequences that are exposed throughout the process. The different voices uncovered in the study are not always easily held together cognitively or emotionally. They portray different interpretations of the same situations, perceptions of status and hierarchy within the team, and accompanying feelings. However, the exchange of stories, though personal and emotional and painful at times, is an essential element in such intercultural encounters (Chubbuck 2010). The conflictual situations that are revealed express who we are and the personal-social-cultural history that shape our experiences of being and teaching. The setting we created allows the coexistence of different narratives, and the characteristics of that setting must be taken into account when considering the processes we describe. The environment of an educational edge, as described in this chapter, being unencumbered by rigid and established norms and routines, is a turbulent, demanding environment but also a fertile ground for dialogue and change. The ambiguity and the unknowability of the landscape encompass vulnerability and risk taking while remaining open to the emergence of unforeseen possibilities (Gorodetsky and Barak 2008, 2016a). The potential of rhizomatic processes of self-study to outline ways of coping with conflicts relies upon the negotiations and dialogues conducted within the educational edge environment, a collaborative space where more adaptive forces and coping methods can be found.

Rhizomatic self-study is not an ultimate recommendation for solving or erasing the conflicts, but rather marks the possibility of bringing them to the surface in the shared space with room for the different voices. It offers conditions and tools for listening, understanding, and creating discourse in which diversity is a source of power and affinity areas are revealed. Awareness of the major and minor voices and the rhizomatic connections that create their spectrum of interactions enables deeper processual reflection on our students' and our own learning processes.

The discourse between the various voices created an environment in which we, as teacher educators, developed a new perspective on look at the relations between the majority and minority voices in the group. We believe this understanding has a social and educational value that influences the ways we discuss questions of social justice between ourselves and with our students, in relation to the contexts our students will encounter as educators. The rhizomatic self-study serves, in this regard, as an amplifier that allows us to listen to and hear more voices and their varied undertones. It facilitates an interweaving of rhizomatic formations, mapping the augmented reality in which we live where the multiplicities create the dynamics and affect the ability to change (Barak 2015). This is an augmented map where there are no real distinctions between the virtual and the real and the explicit and tacit voices. Rather, there is a continuum of mixed and juxtaposing worlds that embodies the difficulties and turbulence along with sagacity and resilience and offers an experience of renewal that embraces the multiplicity of different possible and unthought-of experiences (Wallin 2011). The study illuminates the potential of rhizomatic self-study to become a process that allows for more egalitarian discourse between different cultures, moving beyond cultural diversity toward fairness and a socially just environment.

We look at rhizomatic self-study not as an isolated research approach but rather as a way of life, a praxis that offers an ongoing possibility (Knowles 2014) to become more sensitive and responsive to the complex rhizomatic systems through which we understand and interpret our actions and pave their paths. The rhizomatic self-study creates the conditions for the exposure of beliefs and flows of desires letting the rainbow of different voices become visible and developing effective connections. It is an opportunity to clarify attitudes and perceptions on conflictual issues as well as on social hierarchies and intersectional relations among hegemonic and minority groups, thereby promoting more equitable and egalitarian relations in the community itself and perhaps beyond.

Through this study, we have come to know each other better as individuals, benefited from mutual support, and built a stronger and more just community. Collaborative rhizomatic self-study is both an invitation to the participants to leave their original comfort spaces and to join together on a nomadic journey and a support to help them do so. This is a challenging journey with tensions and conflicts, as well as sprouting of new processes and promotion of more open and trustful relations.

Employing Self-Study Research to Confront Childhood Sexual Abuse and Its Consequences for Self, Others, and Communities

Abstract

This chapter discusses the, as yet largely unrealized, potential of self-study research to demystify the taboo of childhood sexual abuse (CSA), as well as other forms of exploitation and abuse. We share how we each have endeavored to include instruction about CSA in our work with preservice teachers and to study

the implications of our instruction for ourselves and students. Our work is situated within the tenets of social justice and advocacy that have long traditions in self-study. Across our careers as teacher educators, we have consciously worked to hold ourselves to ideals of social justice. We see our focus on CSA as an attempt to confront an injustice that has historically been silenced but has devastating consequences for individuals, families, and communities across all socioeconomic backgrounds, religions, races, and cultures. Likewise, we strive to prepare teachers who will advocate for students who have experienced CSA or other trauma. While this chapter focuses primarily on our efforts to teach about and study our practice surrounding CSA, it has the potential to inform teaching and scholarship in teacher education dedicated to many other difficult/taboo topics (i.e., mental health, homelessness, suicide).

Keywords

Childhood sexual abuse · Advocacy · Social justice · Caring · Preservice teacher education · Collaborative self-study · Trauma theory

Introduction

It is hard to think of a topic most people will avoid discussing more than childhood sexual abuse (CSA). In agreement with others (Al-Zboon and Ahmad 2016; Bolen 2001; Pohl and Hazzard 1990), we assert the widespread reticence is important to note because it has been a contributing factor to CSA's historic and ongoing insidious prevalence. Furthermore, the prevailing silence surrounding CSA in many cases serves to compound the devastating consequences CSA victims suffer across their lifetimes (Colarusso 2010; Levenkron 2007). As teacher educators, we believe prompting more open discussions about CSA among our peers and with the teacher candidates with whom we work is a matter of social justice. We position our practice and our self-study research focused on CSA within the traditions of social justice and advocacy that have long histories within the S-STEP community.

In this chapter, we begin by defining our conceptualization of *social justice* and *advocacy*, focusing specifically on how these ideals have been foundational to the teaching practices and scholarship of many self-study researchers. Next, we discuss the appropriateness of self-study as a methodology for addressing difficult and/or taboo topics, including CSA. Within the chapter, we discuss the risks and benefits we have experienced in our personal and professional lives through disclosing our CSA histories and using our experiences to inform our practice and research. We outline the self-study methodology we utilized in studying our practice and provide overviews of our individual approaches to teaching about CSA in our courses. Included are our retrospective reflections on how the work has impacted us and how we hope to refine our practices moving forward. In conclusion, we offer recommendations for those wishing to engage in an intentional study of CSA or other similarly difficult topics in their work with teacher candidates. While this chapter focuses on our efforts

to teach and conduct self-study research on CSA, we believe readers will come away with insight related to teaching and studying a range of other topics that have historically been considered taboo, including domestic/dating violence, substance abuse, incarceration, homelessness, mental health, depression, and suicide.

Part 1: Background

We, Laurie and Valerie, came to be research and writing partners, and to authoring this chapter, as a result of intersections in our academic preparation and our professional lives. We first met as doctoral students at a university in the Western USA, where we had courses, research interests, and academic mentors in common. Our friendship grew out of both commonalities and appreciation for differences across our professional, academic, and personal lives. When we completed our degrees, we made concerted efforts to maintain and strengthen our friendship despite moving to different regions of the USA and each facing the demands of new professional lives as teacher educators. We initially began conducting collaborative research, in part, so we could ensure we stayed in contact with one another. We have continued as collaborators because we have consistently found our co-research and authorship to be enjoyable, gratifying, and personally and professionally valuable.

Laurie is currently an associate professor of education at a state institution, Appalachian State University in North Carolina, USA. She teaches courses in the undergraduate and graduate middle grades programs including courses in diversity, culturally/linguistically responsive pedagogy, and young adolescent development. Valerie is an associate professor of education at a private liberal arts institution, Susquehanna University in Pennsylvania, USA. She teaches courses in both the elementary and secondary education programs including courses on literacy development and secondary education pedagogy, classroom management, and differentiation.

Traditions of Social Justice and Advocacy

Within the S-STEP community, there is a long-standing tradition of promoting advocacy and social justice through teaching and the self-study research of teaching practices (i.e., Knowles 2014; LaBoskey 2004). Teaching for social justice is a theoretic frame shared by those who describe themselves as social constructivists (i.e., Samaras 2002), humanists (i.e., Allender and Allender 2008), critical theorists (i.e., Schulte 2009), critical race theorists (i.e., de los Rios and Souto-Manning 2015; McNeil 2011), feminists (i.e., Taylor and Coia 2014), and queer theorists (i.e., Kitchen 2016; Kitchen and Belini 2012; Manke 2005). These teacher educator scholars and others (i.e., Kroll et al. 2005; LaBoskey and Richert 2015) have advocated for learners to be educated in a manner that does not require them to deny or hide some aspect of who they are or what their life experiences have been. A guiding aim, as articulated by Kroll et al. (2005), is to prepare teacher

candidates who enact practices that enhance the likelihood that their students will "live in a more equitable and just society" (p. 5). Schulte (2009) summarized the goal, "to prepare teachers to transform schooling into a just and equitable learning experience for all" (p. 24). To date, numerous teacher educators have engaged in self-study inquiries as an avenue of advocacy for historically underserved and/or marginalized learners. Representative works include improving the secondary school experiences of LGBT students (Kitchen and Belini 2012), confronting deficit thinking about economically disadvantaged students (Allison-Roan and Hayes 2012; Cutri et al. 2011), and combating cultural, racial, and linguistic biases (Han et al. 2014; Makaiau and Freese 2013; McNeil 2011; Poyas 2016; Smith et al. 2016).

Over the past two decades in particular, teacher education research, and self-study research more specifically, has embraced a definition of social justice that strives to "recognize, name, and combat" issues in schools and society, particularly those that marginalize students in some way (Spalding 2013, p. 284). CSA is a taboo topic that is rarely, if at all, addressed and therefore difficult to combat. It is our hope that our efforts to confront CSA will simultaneously empower our students and enhance their capacities to advocate for and support children in their future classrooms who have been victimized. Ultimately, we believe breaking the silence surrounding CSA has the potential to decrease the stigma felt by victims and increase the capacity of our society to protect others from being victimized. Like Pennington et al. (2012), our goals in teacher education have always included critical reflection, increased awareness, and social consciousness, for ourselves and our students. While many self-study scholars focus these goals on issues of race, culture, class, and sexuality (which we also value and address), our personal experiences with CSA and our belief that it should be named and confronted led us to engage in self-study focused on it, despite the potential risks and vulnerability we recognized.

We see our research as an avenue of advocacy aligned with adolescent educational philosophy, particularly because the majority of our preservice teachers will work with adolescents (an age group that has grown in recent years to include those students from approximately 9 through nearly 25 years old). Throughout our teaching and scholarship as teacher educators, we have made a professional commitment to uphold the tenets of advocacy from the seminal paper of the Association of Middle Level Education entitled *This We Believe* (AMLE, formerly NMSA 2010). In this theoretical and practical publication, AMLE purports being a student advocate is an essential responsibility of educators and that advocacy revolves around two aspects of commitment: advocating for individual students and advocating for the profession overall. In this case, we seek to disrupt the status quo of both teaching and teacher education so that topics such as CSA are no longer silenced or considered taboo, creating a paradigm shift that not only addresses the needs of individual students but restructures the landscape of schools and communities to "transform teachers, their students, and the knowledge with which they work" (Knowles 2014, p. 89), freeing them from limiting or oppressive norms that result in alienation or stigmatization. *This We Believe* (2010) posits that each student benefits greatly from having at least one adult advocate who is responsible for supporting them through their academic and personal development. Particularly with survivors of CSA, an adult advocate

who is willing to actively support the student, as well as work toward broader contextual change, is paramount.

CSA: Prevalence, Consequences, and the Ethical Imperative for Educators

CSA knows no bounds. It is pervasive across all demographics: race, culture, religion, and socioeconomic class worldwide (Al-Zboon and Ahmad 2016; Russell 1983). Admittedly, it is nearly impossible to know the full scope of the problem because CSA has historically been, and continues to be, vastly underreported (Bolen 2001; Pohl and Hazzard 1990). According to Pohl and Hazzard (1990), estimates from retrospective studies in the USA and around the world ranged from as low as 6% to as high as 62% of all children are sexually abused. The estimations that are most universally accepted indicate that as many as one in three girls and one in six boys will be victims of sexual abuse or assault before they reach adulthood (Bolen 2001). Nearly half of all cases of CSA involve children under the age of 12 (Pohl and Hazzard 1990). One source, *Darkness to Light* (www.d2l.org 2013), has reported incidents are down in recent years. We contend that regardless of whether the percentage of victims is closer to 6% than 62% and the actual incidences of CSA have decreased, CSA is an insidious and devastating trauma that has impacted the lives of too many children and adults.

Over 60% of CSA victims never tell anyone or wait until much later in life to disclose their abuse history (Darkness to Light 2013). In 90% of cases, victims know their abusers; it is most frequently someone trusted by the child or his/her family (Corwin 2002; Rossman 2005). Almost universally, victims blame themselves for the abuse and internalize the shame. Child victims who do not disclose the abuse, or are otherwise not discovered, do not receive the support needed to mitigate the long-term psychological and social harm of the abuse (Levenkron 2007). Adult survivors who maintain the secret of the abuse and do not receive support from their communities and/or qualified, compassionate mental health professionals are at significant risk of life-altering consequences. These consequences include, but are not limited to, suffering from depression, engaging in risky and self-harming behaviors, and developing unsupportive and abusive personal relationships (Colarusso 2010; Levenkron 2007). These psychological and social effects can be devastating, often worsening over time. Specifically, with school age survivors of CSA, consequences might include obesity, social isolation/withdrawal, substance abuse, dropping out, and/or criminal behavior (Darkness to Light 2013).

Once children are school age, teachers are usually the adults, aside from their parents, with whom children spend the largest percentage of their time. Further, teachers because of the nature of their roles and responsibilities are positioned to know the students in their classrooms better than other non-related adults in the students' lives. We, along with other educators (i.e., Schultz 2003), assert that effective teaching – that is, learner-centered teaching – is predicated upon teachers knowing each of their students as unique individuals, being observant of students'

variable behaviors and emotions, being committed to and adept at listening to students, and, ultimately, being seen by students as caring and trustworthy. In short, we agree wholeheartedly with Noddings (1992):

> The first job of the schools is to care for our children. We should educate all our children not only for competence but also for caring. Our aim should be to encourage the growth of competent, caring, loving, and lovable people. (p. xiv)

Students/children will only grow into competent, caring, and we would add emotionally and socially healthy, people if they are educated by teachers who have the capacity and the will to know them (and their histories, the good and the bad) and embrace and educate them without reservation.

Despite the worldwide prevalence of CSA, the well-documented lifelong, debilitating consequences for abuse survivors, and the uniquely consistent and extensive opportunity for teachers to identify and support students who are victims, the inclusion of instruction about CSA has been and still is conspicuously absent from nearly all teacher preparation programs and courses (Al-Zboon and Ahmad 2016; Goldman and Grimbeek 2008). Preservice teachers generally report understanding that they have a legal obligation as mandatory reporters, but they consistently indicate feeling insufficiently prepared (Al-Zboon and Ahmad 2016) because formal instruction about CSA is "insufficient and sporadic" (p. 15). Goldman and Grimbeek (2008) documented:

> Recent research in the USA, UK, and Australia suggests that teachers often feel inadequately prepared to deal with the issue of child abuse, and that many appear not to know how they are supposed to behave in response to a suspicion of child sexual abuse. (p. 294)

In Pennsylvania, where Valerie works, following the 2011 high-profile child molestation case against Jerry Sandusky, longtime assistant football coach at Pennsylvania State University (Penn State), additional background clearance requirement and an online mandatory reporter training certification were instituted by the state for all preservice and in-practice teachers. The background checks are designed to prevent individuals with criminal convictions for child abuse or neglect from being allowed access to children in schools and childcare facilities in the state. The online certification module is intended to ensure school personnel understand their legal responsibility to report all suspected child abuse and neglect. While these measures are important, they are far from comprehensive and foolproof. Most notable, because abuse is rarely reported, most abusers are not convicted offenders, so they are not discoverable through clearance reports. Additionally, the online module may result in teacher candidates and teachers having a greater understanding of their legal obligation, but it falls short of motivating teachers to be vigilant in their roles or to consider ethical dimensions of their work with children who have a history of CSA or other forms of abuse and neglect.

In North Carolina, where Laurie works, the Penn State case also had an impact, resulting in more stringent policies for educators. However, North

Carolina's reporting policies are less than clear and leave much up to interpretation (Mason 2013). At the preservice level, background checks are required every 6 months. These are intended to ascertain any potential risk the candidate might pose to students. Once candidates are employed, however, they are required only to have one check prior to employment. If they continue in that position/school, there is no further inquiry. There is no mandatory training or professional development specifically addressing CSA, reporting procedures, or intervention practices. That does not mean, however, that educators are exempt from reporting. In fact, while the law previously stated that the reporter must have "actual knowledge" that a child was abused, an updated version of the law in 2013 now states that every person or institution who *suspects* abuse must report the situation to the county department of social services. Failure to do so, knowingly or willfully, constitutes a Class 1 misdemeanor and can result in criminal penalty. An important note is that the law is inherently problematic because educators feel the tension between mandatory reporting and maintaining relationships of trust and caring that are at the heart of teaching and student advocacy. With the law requiring reporting, there are many children who can receive the help that they need. However, the strict nature of the law might also require a report that will do more harm than good. This is a "long-standing and ongoing" tension that will continue until the North Carolina law is clarified (Mason 2013, p. 63). Likewise, it would be beneficial for the law to require preservice teachers to be trained in not only the legality of CSA but the ways in which they might advocate for victims, provide resources, and help mitigate potentially harmful effects of speaking out and coming forward.

Goldman and Grimbeek (2008) and Al-Zboon and Ahmad (2016) advocate for including more systematic and comprehensive instruction about CSA in preservice teacher preparation programs. We agree that more needs to be done to ensure preservice teacher candidates are prepared and have the confidence to see and report suspected CSA. Reporting is a legal imperative that will hopefully result in ongoing abuse being stopped and victim(s) being provided with competent physical and mental health care.

As importantly, we believe it is vital that preservice teachers be prompted to consider the ethical dimensions of their work with CSA survivors. As teachers, they will undoubtedly work with students who have been directly or indirectly impacted by CSA, and they need to develop the dispositions and skills that will enable them to embrace and support these students. All teachers, we assert, need to have the capacity to know a child as a survivor and not attempt to silence or discount the influence of the trauma on the child. Our position resonates with Dutro and Bien (2014) who stated:

> The loss of loved ones, family members in prison, physical or sexual abuse, transiency, homelessness, illness, and removal from a parent's care are not unusual events for children and youth to experience in the schools in which we work, but they are always extraordinary events and their entrance into classrooms does matter (such experiences cannot but matter to the child experiencing them) and, we argue, must then count in the everyday epistemologies and emotional life of teaching and learning. (p. 13)

We hope that teachers wholeheartedly embrace, nurture, and educate children in their classrooms who have experienced the trauma of a loved one's death or a serious illness or injury. Yet, specifically in cases of CSA, we hope teachers can set aside their own revulsion for the abuse or judgment of the situational circumstances to see the child as a valued member of the learning community. In all instances, regardless of the sources of traumas, teachers should foster a nurturing and supportive educational environment and provide learning opportunities that do not require children to hide their pain, pretend they have not been traumatized, or otherwise self-censor their lived experiences and the corresponding emotions.

Given the prevalence of CSA, the misconceptions common among practicing and preservice teachers, and the potentially long-term devastating consequences for survivors, we felt the imperative to use our collective backgrounds in self-study and our roles within teacher education to imagine different responses and to proactively work to educate and empower our students, who will likely encounter student (s) in their future classrooms who have experienced CSA, either personally or indirectly. We believe it is the responsibility of all who work with youth to know, understand, and advocate for CSA survivors. Often, students disclose to an adult outside their family; frequently this is a teacher with whom they have a trusting relationship (i.e., Danza 2012).

Why Self-Study of Teacher Education Practices?

Coia and Taylor (2014) concluded that greater attention is being given to matters of social justice in teacher educator practice and research. Teacher educators' practices and the articulated missions of teacher education programs often focus on issues of equity, with the aim of ensuring the pedagogy, content, and curriculum teacher candidates enact is relevant, respectful, and empowering to learners from diverse communities and with diverse identities (i.e., Kroll et al. 2005). Often, responsive teaching is positioned as being attuned to the background experiences and needs of students based on their affiliations with particular communities and/or identities (i. e., linguistic, socioeconomic, cultural, racial, religious, gender/sexuality). These initiatives are worthwhile, but they are framed with a wide-angle view of what teaching entails and who learners are. We contend that such a view may risk masking the fundamental relational nature of teaching and the interpersonal ethical dimensions of interactions between students and teachers. We do not seek to discount the necessity of teacher candidates possessing strong pedagogical and content knowledge. Beyond that we recognize the value of teacher candidates having a deep understanding of their students' communities and identities, as well as an appreciation for the discursive role students' communities and identities play in shaping and being shaped by students' school experiences. Notwithstanding, aligning with Coia and Taylor (2014), we have prioritized in our teaching, and related research, advocacy for teachers having the dispositions and preparation to see, hear, and nurture each student, and act thoughtfully and ethically within their "everyday lives" (p. 166) with students. Self-study provides the tools for interrogating the

relational and ethical nuances in our own efforts for continual professional growth and our "everyday lives" as teacher educators endeavoring to prepare teacher candidates to fully and wholeheartedly know, care for, and teach the individuals in their classrooms.

Self-study methodology is well suited to inquiries intersecting schooling and its consequences, social issues, and the unique attributes, identities, and experiences of particular learners and educators. Whereas other methodologies often attempt to insulate or control for researchers' influences, perspectives, and/or histories, self-study research acknowledges, critically explores, and utilizes the dependencies between researchers'/educators', as well as learners', private/emotional and public/cognitive spheres. Dutro and Bien (2014) noted, "Teachers and students are too often asked to live and teach within myths of schools and classrooms as spaces in which the emotional and personal can be bracketed from the cognitive" (p. 11). Rather than continue that forced disconnect, we embrace self-study in all its paradoxical complexity (Samaras and Freese 2006), appreciating that it is both individual and collective, personal and interpersonal, private and public, and emotional and cognitive.

Developing the dispositions and capacities to know and care for one's students must begin with coming to know one's self and interrogating the influence of one's lived experiences, one's identities, and one's taken for granted assumptions on relationships and interactions in the present and future (Bullough and Gitlin 2001). Self-study has been a means for us to do this in our own personal and professional lives, and we strive to foster similar mind-sets and motivations with our preservice teachers. As Spraggins (2006) asserted, who we are and how we perceive ourselves and respond to our contexts are in considerable measure shaped by voices from childhood "that continue to whisper to us throughout our adulthood. Unless we take conscious measures to counter these voices, they inform all areas of our lives, including our work" (p. 45). For all who teach, this means it is paramount to systematically and critically reflect on one's memories as a child and student, questioning how past experiences and the emotions associated with them inform views of learners; what is valued as good, familial, and important; and what is perceived as negative, "other," and trivial. If we hope to prepare teachers who are willing and equipped to work against the status quo of inequity and injustice, we must guide them in the process of critically examining their lived experiences and how those experiences were shaped and defined within a broader historical and sociopolitical context. In agreement with Vavrus (2006), we "can help fill a gaping hole in critical pedagogy by providing students opportunities to pursue issues at an emotional level where memories are recalled and consolidated and then related to their formation of teacher identities" (p. 93). It is important to note that our students, like their own future students, may have histories that include episodes of trauma and violation. We must be prepared to hear and assist all our students in interrogating their histories, both those who had relatively idyllic childhoods and those who, like us, have memories that are painful to recall and come to terms with.

Within the self-study community, many teacher educator/scholars have pursued inquiries that spring from, are informed by, utilize, and/or interrogate the educator's

life stories. There is consensus in the S-STEP community that who we are and how we teach are undeniably aligned (Coia and Taylor 2014; LaBoskey 2004). Stated most succinctly by LaBoskey (2004), "We teach who we are" (p. 829). If we hope to refine our teaching practices, we must begin with seeking to know ourselves better. For the two of us, that meant reflecting on and talking about a dimension of our pasts we had previously sought to keep hidden from ourselves and others. As we began this inquiry into our own practice, we realized that our unwillingness to share our own experiences was only further reinforcing the victimization we felt and maintaining the taboo and silence surrounding CSA.

Part 2: Breaking Our Personal Silence

We, Valerie and Laurie, first broached the topic of CSA professional and academically at the S-STEP 2014 Castle Conference, along with two other co-authors/presenters (Allison-Roan et al. 2014; Ramirez and Allison 2018). For both of us, that presentation marked the first time we had disclosed in a professional or academic context and in an open manner that our investment in the topic was intensely personal. In our paper presentation session, we spoke candidly, but not without fear and trepidation, about our identities as CSA survivors.

The 2014 Castle Conference presentation and our collaborative reflection afterward could be defined as a "nodal moment" (Tidwell 2006) for the two of us. Consistent with Tidwell's definition, it was a specific moment, experience, or event we identified as significant because it carried consequences for informing or influencing our future beliefs and actions. During and following our presentation, we experienced considerable disequilibrium and vulnerability (Ramirez and Allison 2018). Rather than retreat from those feelings, we chose to envision them as an opportunity for our own learning and growth and potentially a means to contribute to teacher education research and the self-study community (Guilfoyle 1995).

The presentation left us feeling emotionally spent as a result of our personal disclosure and subsequent vulnerability. But more so, we were disturbed as a consequence of witnessing and attempting to manage, ostensibly unsuccessfully, the disclosure and vulnerability of others in the room who had been directly or indirectly impacted by CSA in their personal or professional lives. Following the presentation, in an effort to debrief, we met with two critical friends and longtime self-study educators, Donna and Jerry Allender, to engage in reflective dialogue focused on collectively exploring what had transpired, examining our individual and shared emotional responses, and interrogating our efforts to respond in a manner that was ethical and promoted understanding and growth. Each of us thought aloud about how we had experienced the session, what we had observed in our participants, and what we felt were the consequences of the session for ourselves and those in attendance, whether or not they vocalized an experience with CSA. Collectively and individually, we were uncomfortable with what we perceived to be our inadequacies to be of assistance to our academic colleagues who were emotionally triggered by the presentation's topic and discussion. Our purpose was not to

come to definitive conclusions, but instead to pause the moment and intentionally, collaboratively reflect on our perceptions.

Despite the uneasiness we experienced following the presentation, we committed ourselves to incorporating CSA as a topic in courses we taught in our respective preservice programs and to studying the impact on ourselves and our students. We recognized our decision to include CSA in our courses, to engage in and publish self-study research focused on our efforts, and to advocate for other teacher educators to do likewise positioned us in a complex moral/ethical landscape. Pinnegar and Hamilton (2009) posited self-study methodology "requires attention to ethical action," which they define as "taking actions in which we operate from a position of humility and love" (p. 106). However, self-study researchers' ethical obligations are not met by simply attesting to the goodness of one's intentions and the purity of one's heart. In concert with Pinnegar and Hamilton, we assert that the ethics of our decision-making and actions are "pragmatic, relational, and based on experience" (p. 106). In each moment, we must be attuned to the fluidity of our context, attend to consequences of our actions for others, and make wholehearted efforts to learn from our experiences. We need to continually seek to honestly understand our motivations and to reconcile the intended and unintended consequences of our actions.

Samaras (2011), in speaking to practitioner researchers stated, "You need to develop an awareness of your ethical responsibility about how to gain information with regard to human dignity, individuals' lives and their psychological and physical well-being" (p. 145). For us, the 2014 conference presentation, the conversations and other forms of communication that preceded and followed, and our subsequent research and teaching on CSA have been a journey of personal and professional self-discovery and growth. While we value our own growth, it must be balanced by our ethical obligation to others, including the teacher candidates we teach and our teacher educator colleagues. In the end, it will be these communities who assess our ethical integrity as educators and self-study scholars.

Methods

Though the topic of our paper at the 2014 Castle Conference was CSA, it was not until 2015 that we intentionally incorporated CSA as a topic in our respective methods courses (Ramirez and Allison 2018). Valerie incorporated the topic in a secondary education methods course she teaches in the fall of her students' senior year. Student data were collected for the 2015 cohort that included 14 students from a variety of academic majors. Laurie incorporated the topic in her middle grades methods course that she teaches in the fall of her students' senior year. Student data were collected from the 2015 cohort that included 27 students representing a variety of content areas.

Data sources for our collaborative self-study included assigned readings, teaching agendas and notes, researcher journals, students' questionnaire responses, coursework and feedback, and face-to-face and electronic discussions. In this chapter, we report on data collected and interrogated between August 2014 and

January 2016. During this time, because of geographic proximity, Valerie was able to have numerous face-to-face discussions with Donna and Jerry Allender, who continued to serve as our critical friends. Because of distance, discussions between Valerie and Laurie were generally via email with an occasional face-to-face meeting, and Laurie's engagement with Donna and Jerry was almost exclusively through email or via phone.

Prior to presenting the topic to students and assigning readings and assignments, we collaborated on the texts we would use, how we would introduce the topic and conduct discussions, and what activities and assignments our respective students would complete. We discussed our choices and the rationale behind them, but we did not, in the end, use all the same texts or assignments/activities, allowing for flexibility based on our different experiences and institutional contexts.

Included in our thinking about and planning for our instruction, we sought to prepare ourselves for the possibility that one or more of our students would be survivors or otherwise personally impacted by sexual abuse. To the extent possible, we discussed and contemplated how interactions with students, particularly abuse survivors, might unfold. Following our classes, we carefully recorded our memories of the teaching experiences and reflections on our efforts and their potential consequences. Within our reflections were our perspectives on how our histories as survivors were influencing our teaching and how our teaching enactments were informing our identities as survivors. We shared our journals electronically with one another and Donna and Jerry, providing opportunities for critical perspective taking (Samaras 2011). "We attended to issues of trustworthiness by using this collaborative methodology (Taylor and Coia 2009). Using multiple data sources and questioning, challenging, or validating each other's interpretations by serving as a community of critical friends strengthen this work" (Ramirez and Allison 2018, p. 451).

Students' responses to questionnaires, written work, and contributions to discussions and conversations were analyzed to discern students' understanding of the topic and the impact of our instructional efforts. We independently read and reread, coded, and analyzed them in an iterative process following a grounded theory approach (Glaser and Strauss 1967). We looked for similarities and differences across our data sets and sought to understand the influence our efforts had on students and us. While we recognize the importance of systematic data analysis, self-study methodology allows for flexibility in the research process, focusing more on the nature and topic of the study (Loughran and Brubaker 2015). As we stated in Ramirez and Allison (2018), "Using a grounded theory approach within a self-study allowed us to go where the data took us, rather than forcing adherence to a strict method of analysis. Exploring the themes that emerged, independently and collectively, gave us a broader view of the issue beyond specific contexts or individuals. Working with trusted friends/colleagues, particularly with a topic like CSA, allowed for a move beyond the personal to a deeper understanding of the issue and its potential for broader contributions to teacher education (Northfield 1996)" (p. 451).

Part 3: Demystification/Disrupting the Silencing of CSA

Below, we share summaries and reflections of our experiences preparing for and teaching our classes about CSA. This research, including data samples, was orignnally published in Ramirez and Allison (2018). Included are representative data excerpts from our journals and respective students. Prior to teaching our respective class sessions dedicated to CSA, we discussed with one another and with our critical friends possible instructional strategies and texts. While we chose some common elements, our approaches were distinct. Descriptions of our approaches and outcomes for self and students are included here in the hope they provide other teacher educators with suggestions for how they might structure their own instruction. It should be noted that what is described are our first attempts to teach about CSA, and we recognize we have much to refine in our future practice.

Valerie:

   Numerous face-to-face discussions and email exchanges with Laurie, Donna, and Jerry took place between summer 2014 and fall 2015, leading up to me introducing CSA as a topic in my course. Although I never articulated this to them, I think one of the purposes for me in all that verbal and written processing was so, first, I wouldn't back out of my commitment to the project and, second, so that I had ample opportunities to imagine myself being both brave and successful once it came time to carry out my instructional plans. I often felt very apprehensive about the prospects of including the topic in my course. A good portion of the fear was a result of knowing that in order for the instruction to be truly powerful for students, it would be essential to disclose my identity as a CSA survivor.

   I have included other "stories" from my difficult childhood in my courses as teaching tools and thus have practice in using them productively so that they illuminate or enlarge the discussion without overshadowing the learning objectives (Allison-Roan and Hayes 2012). That is what I hoped to do in bringing my survivorship into the discussion. "I wanted my experience to make the topic more than a theoretical discussion of the bad things that can happen to children, and instead, position CSA in the room with us. But I understood that doing it in a manner that was productive for students (in a way that caused them to confront and question their assumptions) would require pedagogical skill and thoughtfulness. Preparing my mental script for the teaching took me hours of discussion with Laurie and our critical friends and hours more of quiet contemplation before I felt confident" (Ramirez and Allison 2018, p. 452).

   In designing the course, I chose to schedule the topic midway between midterm and the end of the semester. I hoped that by that point in the semester, we would have a strong and open learning community. However, as the semester unfolded, I was concerned that this particular cohort of students was not as receptive to me and my teaching as I had hoped, and I had misgivings about being vulnerable with them:

Given how challenging this group of seniors has been so far for me, I'm more than a little nervous about introducing the topic and teaching about sexual abuse. (14 October 2015)

When it came time to introduce the topic, I followed Donna's advice and used a brief questionnaire to solicit students' beliefs and background knowledge about CSA. At the end of the preceding class meeting, students completed the questionnaire consisting of ten open-ended questions. Before the next class meeting, I compiled their responses. In the process, I was surprised to discover a significant number of my students believed CSA was not particularly prevalent and that children from background unlike their own were the typical victims. In response to the prompt "What children are most likely to be abused?" the majority of students responded similarly:

- *Children from low socioeconomic standing*
- *Parents who drink too much or parents who do drugs*
- *Most likely to happen to children growing up in nontraditional families*

Conversely, I was heartened to read some of their responses to the last prompt on the questionnaire, "What are your first thoughts/gut reactions to facing this topic as part of your teacher education program?"

- *Why haven't we talked about this before now?*
- *I think it is an important topic to face as part of the teacher ed program.*
- *Uncomfortable, yes, but necessary* (Ramirez and Allison 2018, pp. 452–453).

At the beginning of the next class, I passed out copies of the compiled responses and allowed students time to read them. Using texts (i.e., Bolen 2001) and the National Sex Offender Public Website (NSOPW n.d.), I provided direct instruction to correct the misconceptions students had about who is abused, how prevalent abuse is, and the rarity of the abuse being discovered. I provided a list of some common signs of abuse teachers might notice in children and adolescents and a brief description of the potential long-term consequences for abuse victims who do not receive support.

From there, I asked students to consider their legal versus moral obligations as teachers to CSA victims. I related the discussion to a reading on trauma theory (Dutro and Bien 2014) we had read and discussed earlier in the semester. I then had students listen to an audio recording of a short excerpt from Danza (2012). In the excerpt, Danza describes his response to learning one of his teenage female students had been sexually abused. Danza reflects that his response of reporting the suspected abuse to the authorities was legally appropriate and defensible, but in the aftermath of the situation, he had felt uneasy, worrying that perhaps he could have and should have done more to support her. I asked my students to contemplate the legal versus ethical dimensions of his response and consider if and how they might have responded differently if they were in similar circumstances.

Following their discussion of the Danza scenario, I provided students with copies of our Castle Conference paper (Allison-Roan et al. 2014) and asked them to silently read it. In brief, the paper presented a fictionalized account of a student disclosing to her professor she had previously been abused. In the paper, Laurie and I each claim the disclosure had been made to us, and we describe our (imagined) reactions and response to the disclosure. In doing so, we each shared that we felt our responses to the student were inadequate. We had not provided meaningful support, and the student likely felt marginalized or silenced as a result of our ineptitude. Within the paper, Laurie and I acknowledge that we are both CSA survivors.

Below is an excerpt from my journal that describes what occurred once my students had read the paper:

> *After they finished, I asked them to think and share what I had done by having them read the paper. It was one of those moments in teaching where I as the instructor got to watch the awareness wash over them. Not much was initially vocalized but the wheels turning in their heads was almost audible ... Someone pointed out that among other things in the text, I had disclosed to them that I was once the victim of CSA. This lead to me circling back in my discussion with them to something one of them had said earlier in the class about balancing the desire of acknowledging and supporting students with traumas in their lives with not allowing a trauma to become the student's identity. From there, I described for them (channeling discussions I had had with Donna, Jerry, and Laurie) how the harm of CSA is located more profoundly in keeping the secret and internalizing the shame over time than it is in the actual violation(s) the child was subject to. It is for that reason teachers, in particular, need to be prepared and receptive to seeing, hearing, and supporting CSA survivors; so students will share and, once they have, they will be helped to find their voices and be able to place the shame where it belongs – with the perpetrators ... I ended our discussion by emphasizing that their role as teachers is not to provide ongoing counseling to children but rather to be empathetic listeners and advocates, a safe, compassionate adult who sees and supports the whole child.* (22 November 2015, Ramirez and Allison, 2018, p. 453)

Following class, I made my way to my office, and within a few minutes, one of my students came in asking if I had time to talk. "Without sharing details, Jenny disclosed she had also been a victim of CSA and told me she appreciated the class discussion (Pseudonym. Data pertaining to this incident are used with the informed consent of the student and with the understanding of protected anonymity.). It had been "intense," but it had helped her" (p. 454). In the conversation that unfolded, I attempted to be a good listener and to offer my perspective or advice only when I was confident that was what she wanted.

> *I felt effective in hearing what she needed me to hear and to validating her experiences and feelings. At the same time, as someone 30 years her senior, I could give her some perspective on the importance of talking and finding support. I also emphasized that she will likely have points throughout her adult life where she will be influenced by her history and will need to come to terms (multiple times over time) with the consequences of surviving CSA. I think the conversation was productive and affirming, and I think I managed my role as her professor effectively – in other words, I think there is little risk she will expect me to be her "therapist."*
> (22 November 2015, Ramirez and Allison 2018, p. 454)

Both the class session and my visit with Jenny felt effective and empowering. "I came away knowing I could use my history as a survivor to be helpful to someone else and to educate my students – survivors and non-victims – without making the learning experience into a group therapy session and/or inappropriately about me and my story" (p. 454).

In my instruction and discussions of CSA with students (and others), I did not disclose details of the abuse I experienced. I did not wish to dwell on the details, and they would be of no service to students. Instead, I had four objectives I hoped students come to in learning I am a CSA survivor. First, I hoped to confound latent assumptions they might have about abuse survivors – who might be abused and what might their adult lives include. Second, I hoped they would see survivors are numerous but each is unique. Third, as someone who held the secret of my abuse well into adulthood, my life history is common. And finally, CSA does have lifelong consequences (more so when it is not disclosed/discovered early and/or victims do not receive competent support), but individuals who are survivors should not be defined by their histories of abuse.

Laurie:

After the 2014 conference presentation, I realized that for most of my adult life I have not fully faced my experience with CSA. "Unlike Valerie, my memories of it are fleeting and fuzzy, so it has always been easy for me to brush it off as not particularly influential in who I am today. The difficulty I saw, felt, and heard at our conference presentation helped me see that I had not given this topic the gravity it deserves. When approached by Valerie to continue with this project, I immediately saw the importance it could have in how I view my role as a teacher educator and how my preservice teachers might see themselves as influential in the lives of their young adolescent students. Despite some misgivings, I agreed to include it as a topic in my senior methods course" (Ramirez and Allison 2018, p. 454).

Because my course is sort of a "catch all" and not strictly tied to a particular content area, I have a lot of freedom to examine a wide range of topics. Like other teacher educators who espouse social justice and critical consciousness and reflection, my course focuses on diverse perspectives, particularly issues of race, class, sexuality, gender, religion, etc. as well as those that specifically affect young adolescents, such as suicide, violence, substance abuse, and others. My students did not seem particularly surprised, at least on the surface, to see that sexual abuse was a topic we would address. This initially assuaged my reservations some, and I began planning how I would approach the material with the guidance of my coauthor and critical friends. Unfortunately, because of the nature of my class and its shortened time (students have courses for 10 weeks followed by a 5-week full-time internship), we had a lot to cover, and, during preparation, I began to worry it might seem a superficial "add-on" to an already packed syllabus. This was reflected in my journal reflection:

Is one day going to be enough to really get to the heart of this matter? I imagine there are survivors in the class, simply given the statistics, and I don't want them to feel that we trivialized or minimized their experience. As a survivor myself, I tend to do that and I am going to really make an effort to give it the weight it deserves. (4 September 2015, Ramirez and Allison 2018, p. 454)

This topic, because of its personal nature, was scheduled a bit later in the semester. While I know my students well by their senior year, I wanted time to reconnect after the summer break and reestablish relationships of trust among our learning community. "We had already discussed a wide range of issues, including what constitutes a *text* and how we might read different texts given our diverse backgrounds and experiences. It was scheduled for early October (approximately week 7 of 10)" (Ramirez and Allison 2018, p. 454). I gave the students the Dutro and Bien (2014) reading about trauma studies with little preview of what was to come. At the time, I felt my goal was to not sway their thinking in any particular way, but I recognize now that perhaps this was a subconscious attempt to distance myself from the topic. The students read the article in preparation for class discussion and wrote a reading response. While I do these types of reading responses frequently, I intentionally chose this week for a response, concerned that without it, the discussion would stall, if it began at all. I read the responses prior to the next class and pulled the common themes to start the discussion, without names or any other identifying information attached. The goal of these responses is to foster discussion or debate or highlight experiences that relate to the theories or research; rather than me dictating the discussion, this allows students' voices to determine the direction. "Students were a bit put off by the "scholarliness" of the reading, but were able to find some points with which to connect" (p. 455). The key points of focus from reading responses were, in order of commonality:

- *Fear of overstepping their boundaries or saying/doing the wrong thing*
- *Otherness or marginalization of students (either that it was "wrong" or they did it themselves)*
- *Wounds carried into the classroom versus those inflicted by schools (and how any teacher who would do that should not be a teacher)*
- *Advocacy for all students (p. 455)*

We discussed these reading response themes as well as other points from the reading at the beginning of class. "Fear was, by far, the most common response, particularly when we began to talk about other issues beyond the reading, building to our discussion of CSA" (p. 455). Most of the males in the group expressed fear of saying something wrong to any student, male or female, who might approach them with this experience, but were particularly wary of addressing this with young female students. We discussed Dutro and Bien's (2014) notion of the witness of the trauma having to experience the pain in order to more fully understand it, and students overwhelmingly wanted to maintain some professional distance. "One student in particular vocalized her concerns in being the sole witness to a

student's 'testimony,' stating in our discussion: 'If a student came to me and told me he/she had been sexually abused, I wouldn't feel comfortable talking to them without an administrator or a counselor. Is that my job?'" (Ramirez and Allison 2018, p. 455). Her question led to quite a lengthy debate, with most agreeing that they were not "trained" to be counselors and that a student who disclosed CSA would need "help" they could not provide. They felt that it was their responsibility to listen and provide resources to the student, but not necessarily bear critical witness as Dutro and Bien (2014) suggest. Even as they espoused the belief in advocacy for all students, in cases of CSA, they seemed quick to evade and pass the responsibility to someone else, such as a counselor or administrator. "We discussed how, potentially, their resistance to that level of engagement might further marginalize the student and perpetuate the status quo of silence and taboo surrounding CSA" (Ramirez and Allison 2018, p. 455). Further, we circled back to tenets of middle level education that highly prioritize advocacy and relationships. From that lens, the students began to feel difficulty; one student said: "Well, of course we need to be there for every student, no matter what. We need to hear them, acknowledge what they have been through, and help however we can" (Class Discussion, 5 October 2015, p. 455).

Next, we looked at excerpts from two case studies which students read in small groups together during class (Colarusso 2010). "The case of Luis, a 15-year-old, summarized his sexual abuse by an older, trusted male; his issues centered on poor academic performance and his tendency toward aggression and bullying. Nadine, a 14-year-old girl, was sexually abused by a male teacher at her school. Her case focused on her reaction to the abuse, i.e., pulling her hair out, fear of males, and delay in building age-appropriate relationships. The preservice teachers' in-class responses to these cases were overwhelmingly shock and disgust" (Ramirez and Allison 2018, p. 455). One male student expressed frustration, remarking: "Well, I feel set up to fail based on Nadine's story. She would probably be afraid of me even though I have never and would never do anything like that! I know I'm a big guy, but I'm a teddy bear!" (Class Discussion, 5 October 2015).

While reading and discussing these cases, we connected back to the Dutro and Bien (2014) article and their concept of students' experiences as texts that teachers and other students can "read" and should fully "witness." The students responded much more strongly to these cases; one student in particular noted, "I honestly don't know what I would do if a student came to me with something like this! It makes me sad and angry and I wouldn't know what to say or do" (Class Discussion, 5 October 2015). As I facilitated the discussion, I strived purposefully to let the students do most of the talking. Hearing specifics in case study students' own voices, rather than about CSA in the abstract, seemed to heighten their awareness and sense of responsibility. Students were visibly and vocally appalled at the abuse the two students reported.

We returned to philosophy of middle level education and theories of adolescent development as we explored these cases. Of particular interest to students was a citation from Colarusso (2010): "the adolescent who is developmentally ready for

adolescent infatuation is extremely vulnerable to sexual predators" (p. 33). "Five of the preservice teachers, four of whom were women, admitted to having crushes or experiencing infatuation during childhood or adolescence" (Ramirez and Allison 2018, p. 456). As is typical, those crushes were on adults in positions of power who had frequent contact with students, such as coaches, teachers, preachers, neighbors, or family members. Interestingly, this point in the conversation was lighter, and students enjoyed sharing stories of their crushes, perhaps not fully making the connection of how easily those relationships can be manipulated by those with power and influence and become abusive. Still, quite surprisingly, no single student shared their personal experience of abuse. "Perhaps, if I had shared mine, they would have felt less vulnerable?" (p. 456) My decision to not share mine is something I think about often and have reflected on at length.

"After class, I reflected on the day and thought about how to move forward. The students seemed okay with the lesson. None seemed further traumatized. But did it make any sort of difference? I had no way of knowing" Ramirez and Allison 2018, p. 456). Only much after the fact, I had two students comment in their course evaluations that they appreciated the lesson on sexual abuse. One noted, as did Valerie's student, "It's about time we talked about this. Of all the classes we've had, this is the only time anyone has ever mentioned it" (Course Evaluation, Fall 2015, p. 456). Maybe for a small few it did matter. "I do believe it was a necessary topic of discussion and exploration and plan to continue the effort in the future, perhaps more deeply and personally in order to see a greater impact" (p. 456). What was abundantly clear in my final journal reflection about this experience was that:

> I would definitely do this differently next time, but I'm glad I tried it. It was uncomfortable for me this first time, so maybe the students were picking up on that . . .. I don't know if sharing my story would have helped or made them more uncomfortable! That will have to be part two of this journey. I just hope (and do think) they walked away with a bit more awareness of the prevalence of CSA and the way it has and continues to be hushed and stigmatized. I hope they really see how what happens in schools can inflict trauma and/or further traumatize students who have already been through so much. (6 October 2015, p. 456)

Since our initial study, we have continued to explore the topic of CSA, include it in our instruction of preservice teachers, and reflect on the implications for our students and us (Allison, Ramirez, Allender, and Allender 2016; Ramirez and Allison 2018). As of yet, we do not have extensive student data that would allow us to draw broad conclusions about the consequences of our efforts for our students. It is our hope that over time, we will be able to gather and analyze more comprehensive data of short- and long-range consequences for students and their emerging practice as beginning teachers. In the meantime, we are able to share what we have concluded about the consequences for ourselves and our practices. While more than 4 years have passed since our 2014 Castle presentation, we still feel the effects, which further serves to highlight the importance of bringing this topic out of the darkness and into the light, particularly in teacher education.

Valerie:

> As a survivor of CSA, I spent many years denying to myself the psychological and social consequences of my abuse history. Only a few people in my inner circle of friends and family knew of the abuse prior to 2014, I never confronted my abuser, and it has never been openly acknowledged or discussed in my family of origin. One of my primary motivations in maintaining my silence into middle age was a fear my identity as an abuse survivor would become the predominant lens through which others viewed me. In the eyes of others, I risked being seen as damaged goods, emotionally fragile, or, perhaps worse, fixated on my victimhood.
>
> Taking the step to share my abuse story, to lay bare my vulnerability, was, it turned out, an avenue for greater self-understanding. No matter my efforts to conceal and deny the consequences of the abuse to myself and others, it has, across the course of my life, had significant impact in my relationships and in my view of myself. Like many survivors, I struggle with issues of trust, I struggle to feel the merit of my accomplishments, and I have unrealistic expectations of perfection for myself and others. While these are all negative traits, I can also see that my history of abuse has been to some degree responsible for my drive to succeed academically and professionally. It has shaped my personality to be skeptical of following others' advice without careful scrutiny. It has also resulted in me being disposed to having an optimistic view when I encounter obstacles/setbacks in my personal and professional path. These are aspects of who I am that I value in spite of how I came to them. As a result of my work with Laurie, Donna, and Jerry, I now see myself as a survivor and not a victim of CSA. I have harnessed my history to use it productively to impart an important improvement in my instruction of preservice teachers. (Ramirez and Allison 2018, pp. 456–457)

Laurie:

> Over time, I have continued to reflect on and analyze the impact this study has had on me professionally and personally. Professionally, I have developed a greater understanding of the importance of learning through cognitive dissonance, both for myself and my preservice teachers. This space in which we experience discomfort is crucial for meaningful transformation to occur. Beyond the discomfort is an opportunity to examine the reasons behind it. What prompts or perpetuates our feelings of fear, vulnerability, and unease? Getting to the heart of that is what I strive more to do now, no longer afraid of repercussions such as poor course evaluations or awkward silence from my students. Prior to this work, I often erred on the side of backing down rather than pushing forward and I can see, in retrospect, that it benefitted no one. Growth, including my own, comes with the need for risk taking and I am no longer unwilling to engage in that process, knowing that I need to support my students and understand their individual experiences and limitations. I see myself as a more effective advocate for my students and the profession because I am no longer content silencing myself or being silenced in my professional work. This has been an eye opening and liberating endeavor in my growth as a teacher educator.
>
> Personally, this journey with Valerie and our critical friends has helped me realize the various experiences with and reactions to trauma individuals might have, particularly with regard to CSA. No one's story is better or worse, no one's reaction is right or wrong, and I am better equipped to listen and support others, encouraging them to share if and when they are comfortable. As in the professional realm, I no longer feel the need to silence myself or allow myself to be silenced. As we have progressed through this journey, while extremely difficult at times, I have noticed a change in both the way I talk about my own CSA and the way I respond to others who share their stories with

> me. I have engaged more openly and purposefully with friends and family in discussing the influences CSA has had on my life in general, my relationships, and my sense of self. Like Valerie, I never confronted my abuser, further preserving the silence surrounding my abuse. Unfortunately, I will never have that opportunity, as he died in July 2016. However, this self-study, I believe, has achieved, at least for me personally, precisely the goal we hope for our students. I have a greater understanding of the issues surrounding CSA. I have an improved sense of voice and agency as a result of my lived experiences. And, just as importantly, I feel empowered to better educate my preservice teachers, engaging with them in dialogue and reflection, to advocate and act on behalf of their students, schools, and communities. I see this work as having overwhelmingly positive implications for me and, hopefully, for my students. Bringing this taboo topic to light aligns with my ideals of what schooling should be – transformational and ethically just, and I will continue to work toward those goals. (Ramirez and Allison 2018, p. 457)

Advocacy and Action

As we engaged in this self-study initially, our primary goal was to use our own personal experiences with CSA and the knowledge that it is so prevalent in our society to better prepare future teachers with the understandings and tools to address CSA in their future classrooms and communities. We know all too well the taboo nature of the topic, as we have spent decades in silence. This journey has reaffirmed our belief that the silence and stigma attached to CSA must end. We endeavor(ed) to do this in our personal lives and continue to strive to break the silence in our professional practices as well. As part of that effort, two outcomes of our work began to shine through: advocacy and caring.

Advocacy and caring are elements of teaching that we have always believed in and espoused, regardless of the level at which we have taught. As we stated in the introduction to this chapter, AMLE (2010) posits that all students benefit, academically and personally, from having an adult advocate. Advocacy, in their view, is not a single event or something that occurs at a particular time of day or year. Rather, it is "an attitude of caring that translates into actions, big and small" as adults respond to the needs of each individual student (p. 35). Many students have concerns about things that happen outside the school setting and need opportunities to engage in supportive dialogue about them with a trusted adult. They also need to feel cared for, valued, and heard. Bessel van der Kolk (2014), whose life work has centered on trauma in children and adults, asserts that silence reinforces the isolation of trauma, while the reverse, feeling listened to and understood, actually changes our physiology. Providing spaces for CSA survivors to speak the truth and be heard is the first step in recovering from the damage of both the abuse and the subsequent silence.

Noddings' (1992) extensive body of work related to caring in education likewise asserts that regardless of our stage in life (i.e., infancy, childhood, adolescence, adulthood, old age), "We need to be cared for in the sense that we need to be understood, received, respected, recognized"; however, current societal conditions have left many feeling uncared for, "especially adolescents feel uncared for in schools" (p. xi). Noddings (1992) summarized her vision of teaching by extending Dewey's (1902) immortalized quote, "What the best and wisest parent wants for his

own child, that must the community want for all its children" (p. 3). Noddings (1992) argued:

> We must start with a vision of ourselves as wise parents of a large heterogeneous family and ask, *What do I want for all of them? For each of them?* Then we can commit ourselves to enacting this vision for all our children. (p. 180)

Further, Noddings (2010) decried, "We tolerate a system of public education that forbids us to discuss with our students some of life's central concerns" (p. 494). As teacher educators, we have endeavored to advocate for teaching practices (both systemic and everyday) that mend the unnatural divides between emotional and cognitive and personal and public.

Thus, we believe advocacy and caring are critical components of teaching and teacher education. Intentional relationships formed and forged by a teacher can truly be transformative in the life of a child who has experienced CSA or other trauma (Souers and Hall 2016). With preservice teachers, developing dispositions and skills of caring and advocacy can be a struggle because typically preservice teachers have limited ongoing interactions with the age group of students they are preparing to teach; additionally preservice teachers' overall life experiences are more limited. Valerie has found imbedded course field placements (specifically one-on-one tutoring opportunities) paired with ongoing reflection and in class discussion to be useful in supporting her preservice teacher candidates to develop a deeper sense of responsibility for individual learners. As Laurie's teaching description in this chapter illustrates, case studies are particularly effective in prompting preservice teachers to move from the theoretical to the concrete in a low-risk environment and to give them the opportunity to develop mental scripts they can draw upon in the future. Case studies allow teacher candidates to expand and, in some ways, generalize theories (Yin 2018). They can then formulate a response to a scenario, analyzing it for goodness of fit against their articulated ideals, and, hopefully, applying it confidently if or when necessary.

Teachers have power and responsibility in cases of student trauma and must recognize that "trauma is not locatable in the simple violent or original event in an individual's past, but rather in the way its very unassimilated nature—the way it was precisely not known in the first instance—returns to haunt the survivor later on" (Caruth 1996, p. 4). We do offer a caution, however. There is the potential for teachers or other educators to go beyond listening and understanding students' experiences toward appropriation or an unhealthy connection to the trauma (Souers and Hall 2016). In our work as teacher educators, we must ensure preservice teachers understand the difference between caring and advocacy and unhealthy/unhelpful appropriation. We need to clearly communicate that children who have experienced trauma need caring teachers not in place of other invested professionals (i.e., therapists, social workers) and family and community members but in tandem with them. Souers and Hall suggest teachers engage in self-care practices, finding something regular and intentional to help avoid the danger of compassion fatigue. These self-care practices will, of course, vary for each individual, but are

arguably essential for all educators and all who work with CSA survivors and others who have experienced trauma.

Part 4: Conclusions and Next Steps

In making our initial forays into including CSA as a topic in our courses and as a focus of self-study research, we were struck by the extent to which doing so was vastly uncharted territory both among self-study researchers and within the broad field of teacher educators. In our exploration of the literature, we found no evidence that it has been previously specifically studied by our self-study colleagues. While some teacher education scholarship on CSA exists (i.e., Al-Zboon and Ahmad 2016; Goldman and Grimbeek 2008; Grindler et al. 1995), this research has been predominantly conducted by individuals who do not identify as teacher educators (i.e., mental and public health providers and researchers). Additionally, the largest body of research is not particularly current (i.e., Bolen 2001; Conte 2002; Pohl and Hazzard 1990; Russell 1983). From time to time, the topic of CSA is momentarily prominent in the popular press, typically following the discovery/disclosure of a cluster of victims (i.e., Catholic Church, Jerry Sandusky, Larry Nassar), but, to date, that media attention has not correlated to significant numbers of teacher educators exploring the intersection of CSA with their roles and responsibilities.

As much as anyone, we appreciate how challenging teaching about and researching CSA can be. It is not an enjoyable topic to immerse oneself in or to ask others to think about and discuss. Despite our personal investment and histories, repeatedly, we were tempted to discontinue our initiative. Only through the support of one another and our critical friends did we find the will to persist. It is precisely because this work is difficult that it must be done. We adamantly believe our efforts focused on CSA are a matter of social justice. We also understand that not all teacher educators will be able to engage in this work, either as a result of their relationship with the topic or the context of the courses they teach. Instead, we advocate for the intentional and comprehensive inclusion of the topic in all teacher education programs, even while knowing not all teacher educators will be responsible for teaching about CSA in their courses. Those teacher educators who have personally experienced CSA might be the most powerful voices in preparing preservice teachers to see and support CSA survivors, but we do not believe one must be a survivor to be a strong educator and advocate. The most important criterion, we believe, is to be thoroughly and accurately educated on the topic and to be committed to engaging in potentially difficult conversations in a manner that respects the experiences and needs of others (i.e., students, colleagues). As a result of recent high-profile cases in the USA (Jerry Sandusky in 2011 and Larry Nassar in 2017), and the legal jeopardy those cases have exposed institutions and their stakeholders to, a number of states have enacted legislation dedicated to educating individuals who work in health, sports, and education (including teachers) on signs of CSA and their legal obligation to report suspected abuse. An important first step would be for teacher educators to

avail themselves of trainings/workshops originating from legal mandates, empha-sizing the goals of student care and advocacy.

If we hope to give all children educations that empower them, we as teacher educators must prepare teachers who are able to truly know and care for them. All aspects or dimensions of children's lives that make them feel unsafe, insecure, damaged, or inferior create significant barriers to learning and to children being happy, contributing members of their communities (family, school, and society) now and in the future. Regardless of the source of children's pain, teachers must be prepared to recognize it and work with others (i.e., school and community based) to alleviate the harm. But, that is not where their ethical obliga-tion ends. We believe the teachers we prepare must be able and willing to know the life experiences of their students, to provide students with a learning context that does not require them to hide or silence their experiences or emotions, and ultimately to see the inherent worth of each student in their classroom.

We hope to continue our efforts to include CSA as an instructional topic in our respective courses. Our preliminary study focused primarily on implications for us personally and professionally. We believe the logical sequence of our inquiry will to interrogate more fully how our instructional practices concerned with CSA are experiences by our respective students. Longitudinal study is necessary to explore questions such as: *Once our students become teachers, how, if at all, do they relate our instruction of CSA to their roles and responsibilities as teachers? How, if at all, does our practice impact those who are not survivors of CSA? How might they position it in their work? How, if at all, does it differ with those who are survivors of CSA?*

Finally, we hope to encourage other teacher educators and self-study scholars to dedicate time and energy to the topic of CSA and its intersection with their professional and personal lives. CSA and other difficult topics (i.e., mental illness, depression and suicide, domestic violence, addiction) have been largely missing from teacher education and self-study research. We assert that in order to fully embrace self-study research and teacher education as a means for advocating for all students and working toward social justice, we cannot continue to shy away from topics that make us feel uncomfortable. Every day those topics represent realities in children's lives and manifest far-reaching devastating consequences for them, their communities, and society at large. If we truly seek to prepare teacher candidates who enact practices that enhance the likelihood that their students will "live in a more equitable and just society" (Kroll et al. 2005, p. 5), we need to focus our teaching and research on what we wish would go away.

In conclusion, we offer a caveat. Perhaps the reason so little self-study has tackled difficult taboo topics (including CSA, mental health, and suicide) is because the work is not only unpleasant, but it also has the potential to lead its researchers into frightening and treacherous emotional territory. For this reason, we recommend teacher educators committed to teaching and studying their efforts to address taboo topics, particularly those topics with which they have a personal history, do so with close attention to caring for themselves. We observed that being immersed in the topic of CSA took a toll on our emotional well-being and had consequences

for those in our inner circles of family and friends. In the end, we found it essential to do the work as a collaborative initiative with a trusted friend and with compassionate and wise critical friends. These relational connections allowed us avenues for putting into words what we experienced in repeatedly having to hold in our minds memories and images that were painful. Unlike some of our other self-study inquiries, we have had to intentionally take breaks from this work, as it was draining and prolonged engagement caused us to experience sometimes debilitating feelings of sadness, anger, and anxiety. While we felt urgency to produce texts describing our CSA-focused teaching and self-study, we found we needed to be patient with ourselves and with one another because the consequences of trying to push through were too high. We encourage others who take up the call to study difficult topics that they know through personal experience consider seeking out the support of mental health-care professionals. Psychotherapists, psychologists, and/or social workers could be of service in helping self-study researchers navigate the sometimes blurry lines between productive and healthy reflection and self-study and unhealthy preoccupation or obsession. Though this work is particularly difficult, we will end by reiterating that the more fully teachers and teacher educators interrogate and come to terms with their own histories (personal and educational), the more capable they will be in supporting and educating others (Bullough and Gitlin 2001; Spraggins 2006).

Abstract

Some of the least resourced communities in terms of teacher support in South Africa are the places where teachers (and the school itself) are in the best position to make a difference in the community. As we highlight in this chapter, in rural areas of sub-Saharan Africa in particular, schools are one of the few social services available to children and young people, with teachers expected to play an important role. The visual, and especially in the context of participatory visual methodologies such as participatory video and cellphilming, along with photovoice can be used by teachers and teacher educators both for seeing and making visible key issues and for providing important platforms for reflexive engagement. Four case studies of work with preservice and in-service teachers and teacher educators draw attention to the ways in which the visual can help to support a "starting with ourselves" approach. These case studies point the way to new areas for using self-study in relation to addressing social justice issues.

Introduction

As employees of the state, teachers as duty bearers are responsible for ensuring the rights of children, not only to education but to safety, health, and other basic needs. For example, the UN Convention on the Rights of the Child (CRC) holds that "the State along with non-state responsibility-holders (parents, guardians, caregivers) are duty bearers – that is, they have duties and obligations under the CRC, legally binding them to respect, protect, and fulfil children's rights" (https://europa.eu/capacity4dev/sites/default/files/learning/Child-rights/2.8.htm, Retrieved January 04, 2018). Ironically, the least resourced communities in terms of teacher support are the places where teachers (and the school itself) are in the best position to make a difference in the community. As we highlight in this chapter, in rural areas of sub-Saharan Africa in particular, schools are one of the few social services available to children and young people, with teachers expected to play an important role. While schools globally are often positioned as the antidote for all social ills (poverty, unemployment, Human Immunodeficiency Virus (HIV) and Acquired Immune Deficiency Syndrome (AIDS), gender-based violence, teenage pregnancy, and so on), as numerous studies have highlighted, these institutions often also oppress. To illustrate, a report published by the South African Council for Educators (SACE 2017) focuses on the professional misconduct of teachers, in terms of assault, abuse, rape, harassment, and improper sexual relationships with learners. This report also emphasizes the magnitude of sexual misconduct in schools in South Africa and points to the complexities of the environment in which such misconduct takes

place, particularly highlighting the influence of culture, patriarchy, intimidation, exploitation of vulnerable learners, financial incentives for the parents to drop a case against a teacher, and bribing the learner to keep silent.

In the context of these contradictions, we reflect in this chapter on the significance of self-study in teaching for social justice. In particular, we reflect on our work in which we have been using participatory visual methodologies (PVM) in understanding and improving our practice to effect social change in and through teacher education programming and the implications of this work on the self-study of teacher education practices (S-STEP) scholarship. Three of us (Claudia, Relebohile, and Naydene) have been working together first at the University of KwaZulu-Natal in South Africa, with our early work focusing on the use of photovoice, drawing, and participatory video in HIV prevention in rural schools and communities. With Naydene later moving to Nelson Mandela University as Research Chair in HIV and AIDS Education, we took this work to a community of practice (CoP) involving teacher educators from all higher education institutions in South Africa, where we used PVM to understand our work in integrating HIV and AIDS in the teacher education curriculum (see Case Study 4). Later, Katie would become involved in this work first as a Master's student in the Faculty of Education at McGill University, Canada, with Claudia as her supervisor. She travelled to South Africa in 2010 to conduct a collage training workshop with preservice teachers involved in one of our projects (Youth as Knowledge Producers or YAKP). In 2012, this time, as a doctoral student at McGill University, Katie again travelled to South Africa to conduct a follow-up study on the impact of the YAKP training in participatory visual methods on the participating student teachers and learners (see Case Study 3). The four of us continue to collaborate (with Katie as a postdoctoral scholar at York University, and now at University of Toronto) using PVM to understand and address sexual violence against girls and young women in Canada and South Africa, as well as several other African countries (Ethiopia, Kenya, and Mozambique). A key focus of our work is on the use of PVM as a self-study tool for understanding and improving our practice in teaching for social justice in teacher education. We use four case studies to ask: How might the use of PVM facilitate a self-study of practice of social justice teaching among teacher educators?

The purpose of the chapter then is to explore how the use of PVM with teacher educators might facilitate self-study of their practice of teaching in the context of addressing social justice. The chapter is divided into four sections: (1) conceptual framework to frame our self-study and social justice work within Van Manen's (1990) notion of "starting with ourselves"; (2) participatory visual methodologies and teachers' reflexivity, in which we map the literature focusing on PVM and teacher reflexivity; (3) the reflexive eye: case studies, where we use four case studies to illustrate the ways in which we have used PVM to enable reflexivity among teacher educators and student teachers so as to contribute to teaching for social justice in teacher education; and (4) the discussion section where we reflect on how the four case studies illustrate the use of PVM in self-study, developing reflexivity, and teaching for social justice in teacher education contexts. We conclude the chapter by reflecting on how PVM might provide tools for self-study and reflexivity

and social action in teacher education for social justice and the implications of this work for the S-STEP scholarship.

Part 1: Conceptual Framework – "Starting with Ourselves"

In framing our self-study for social justice work, using PVM, we draw on Van Manen's (1990) notion of "starting with ourselves" (p. 29) as a conceptual framework, a reflexive approach that teachers and teacher educators have been using in sub-Saharan Africa in addressing social justice issues in their classrooms and institutions as a whole. "Starting with ourselves" refers to the studying of one's own practice as teacher and teacher educator and deepening one's reflexivity about one's practice: what it is aimed at achieving, what it achieves, and how it might be changed to better suit the context. The nature of participatory visual methodology, we have found, enables participants to look at themselves and their own lives (work), to articulate their thoughts, to reflect, to look back, and to revise their own understanding of their lives (Mitchell et al. 2017), and as such it is useful in self-study and teaching for social change. There is a burgeoning body of research on how teachers and other professionals engage in looking into their own practices in order to deepen an understanding of what they do and why and in relation to improving practice through greater self-awareness. In particular the chapter builds on the work of researchers and practitioners interested in self-study practices and self-study research in South Africa (Pillay et al. 2016, 2017; Pithouse et al. 2009; Pithouse-Morgan and Samaras 2015; Pithouse-Morgan et al. 2019). Taken as a whole, this body of literature draws attention to the social justice context in which teaching in post-apartheid South Africa occurs.

Participatory Visual Methodologies and Teachers' Reflexivity

Participatory visual research encourages "reflexivity on the part of the participants to learn about their own lives" (Whiting, Symon, Roby, & Chamakiotis, 2016, p. 19, cited in Mitchell et al. 2017, p. 12). A subset of literature on practices associated with reflexivity and social justice in teaching and teacher education in South Africa are studies which we regard as "the reflexive eye." These studies focus specifically on the work of teachers as cultural producers through the use of participatory visual methodologies such as drawing, photovoice, participatory video, and cellphilm production (see Mitchell 2011; Mitchell et al. 2017; Theron et al. 2011). In this section we consider some key studies of participatory interventions led by researchers primarily at Nelson Mandela University and the University of Kwa-Zulu-Natal, highlighting the significance of participatory visual work with in-service and preservice teachers and teacher educators. We draw attention to the term "reflexive," noting that although not all of the studies started with the idea of self-study as a specific set of pedagogical practices, all began with the notion of "seeing for ourselves" which then became the basis for further reflexivity.

Photovoice

We started our PVM work with photovoice, a method developed by Caroline Wang (Wang 1999; Wang and Burris 1997) in which marginalized groups use cameras to examine community issues and to identify and/or develop solutions to them. By putting cameras in the hands of the participants, the method enables community members' perspectives to inform understanding about the issues and the solutions aimed at addressing them (Molloy 2007). Informed by this scholarship, our photovoice work has involved giving teachers and teacher educators cameras to document what they see as critical issues in addressing HIV and AIDS and related issues of poverty and sexual violence in their teaching builds on the work of Wang (1999). For Mitchell et al. (2005), this research began with the idea of "the face of AIDS" with teachers and community healthcare workers in a rural area "learning together" through their images of challenges and solutions to addressing HIV and AIDS. In a related study, De Lange et al. (2006) describe research in which teacher educators at the University of KwaZulu-Natal represent the body as a key feature of deepening an understanding of what needs to be done to address the epidemic. In another study Olivier et al. (2009) used photovoice as a tool through which teachers explored issues of poverty and HIV and AIDS in a township community in the Eastern Cape. In this work, which they termed "picturing hope," they focused on the idea of reflective practice and self-study.

Photovoice has also been used with preservice teachers. Stuart (2006–2007) explored the use of a visual arts-based approach to address HIV and AIDS with preservice teachers at the University of KwaZulu-Natal. The project responded to the suggestion that teachers needed to explore their own understanding, attitudes, and perceptions of the disease if they are to deal confidently with the demands it places on them as educators in schools. Building on her own background in Media Studies, Stuart engaged 13 preservice teachers, who had enrolled in a Guidance and Counselling module, in using photographs and drawings to capture their views of HIV and AIDS and to construct messages for their peers. She then analyzed the photo texts as socially and culturally embedded constructions. She was interested in how they were affected by, and could have an impact on, cultural and social discourses. Reflections on the photo texts and their associated processes by both the researcher and preservice teachers led to suggestions as to the pedagogic possibilities of using a visual arts-based approach in education to address HIV and AIDS. The study concludes with a discussion of what a visual arts-based approach can contribute to teacher education, particularly in relation to self-study and reflexivity, and the value of this work in relation to the instructor's self-study as well as the students' work on self-study. Stuart also considers the limitations of such an approach, noting that it is critical to embed sufficient information about HIV and AIDS within the pedagogical tools of participation.

Drawing

Drawing, a method used in qualitative research, offers an innovative way – using paper and pen or pencil – into the life worlds of children and adults alike. According to

Theron et al. (2011), its potential for enabling reflexivity makes it a useful method in self-study. Pithouse (2011) offers a fascinating overview of drawing metaphors as a self-study methodology for teachers. Taking this up, Van Laren (2007–2011) conducted a study of preservice teacher education that specifically focuses on curriculum integration. Working in the area of primary mathematics education, she examined how as a teacher educator she might integrate HIV and AIDS education into such teaching areas as probability and data handling. In her study, she looked at the general attitudes of preservice teachers to the idea of integrating HIV and AIDS into mathematics, noting that female preservice teachers were more predisposed to this work than were males and that black preservice teachers saw the value in the work more than white preservice teachers did. She concluded that it is critical to try to get at the teaching metaphors of the preservice teachers accessed through their drawings. Further, she notes that in an area such as mathematics which is generally regarded as a "high-status" subject, there may also be the possibility of a higher status for the actual work around HIV and AIDS. Significantly, in her work, Van Laren draws attention to the links between the self-study of the educator (in this case herself) and the potential for the self-study of the preservice teachers with whom she works.

Participatory Video

Participatory video refers to the production (typically though not always in groups) of various genres of video to address critical social issues (Milne et al. 2012). Rather than the idea of outside filmmakers documenting what is happening in classrooms, this approach takes on the idea of the teacher's gaze (see Moletsane et al. 2009). In several studies, teachers represented issues related to community partnerships as approaches to addressing poverty and HIV and AIDS. An example of this can be seen in the work of Olivier et al. (2009) when teachers in one community in Eastern Cape of South Africa engaged in "picturing hope." In another study community members outside of education such as community healthcare workers worked alongside teachers and learners to document what they saw as critical issues in relation to addressing poverty and HIV and AIDS (Mitchell et al. 2005; Mitchell and De Lange 2011). The focus of the interventions as they relate to teacher education speaks to the importance of participatory methods and of teachers having personal and professional input in both seeing what the issues are and also working toward community-based solutions. What is key here is the way that producing the films supports reflexivity particularly when the producers can look critically at their own work to see what is missing and what else needs to be done.

Part 2: The Reflexive Eye – Case Studies

In this section we take a close look at four case studies of reflexivity, self-study, and social action in South African educational institutions. The cases that we present are based on work in which we all have been involved in various ways

over the last decade, and so there is a sense of a collective voice even though we have chosen to write up the cases individually using something of auto-ethnographic stance. Each highlights a different **angle** on reflexivity and self-study (e.g., the use of digital technology, the idea of taking action, memory work), various visual **tools** (photovoice, photo-elicitation, drawing, and cellphilm production), and involving varying **groups** (rural teachers, preservice teachers, teacher educators).

Case Study 1: Digital Voices – My Cellphone/My Teaching

Claudia Mitchell

The component of this section devoted to teachers screening their own cellphilms is adapted from "Participatory Visual Methodologies: Social Change, Community and Policy" (Mitchell et al. 2017). Our study involved 35 teachers in rural KwaZulu-Natal and Eastern Cape who used cellphones to produce cellphilms (participatory videos made with cellphones) both to study social issues in their teaching environment and to explore the ways in which technology could be incorporated into their teaching. The cellphone is arguably one of the most accessible forms of digital technology available to teachers in rural South Africa and as such has the promise to be an important tool for transforming teaching practices (DeMartini and Mitchell 2016). It is also a useful tool for reflexivity and self-study (Mitchell et al. 2016). When I first developed the proposal for the study, *Digital Voices*, with Relebohile and Naydene, we had just completed an in-depth national study with close to 7000 preservice and in-service teachers in South Africa on the theme of "being a teacher in the age of AIDS" (HEAIDS 2010, p. 90) (see also Case Study 4).

Digital Voices of Rural Teachers in South Africa: Participatory Analysis, "being a teacher in the age of AIDS" and Social Action (2011–2014) was a study funded by Social Sciences and Humanities Research Council of Canada, with me as principal investigator and Naydene and Relebohile as collaborators. *Digital Voices* was a logical next step of our team's work since these critical areas were identified by teachers for further analysis (e.g., witchcraft, virginity testing, HIV and AIDS denialism), but in ways that suggested that it was the teachers' voices that were most needed in the analysis of these sensitive and culturally specific issues. We saw the significance of a participatory framework which would put teachers at the center of change. We also acknowledged the value of having different groups of teachers working together, and so we engaged teachers from two provinces, Eastern Cape and KwaZulu-Natal. Over the course of 18 months, our team facilitated what we came to term digital retreats where teachers in each province learned how to produce cellphilms, most of which, though not all, dealt with youth sexuality and HIV and AIDS. In past publications we described the actual process of cellphilm production (Mitchell and De Lange 2013; Mitchell et al. 2014) as well as how some of the teachers took on their own individual cellphilm projects, using the technology for aesthetic expression (Mitchell et al. 2016).

At one of the later digital retreats where the two groups came together to reflect on their work with cellphilm production, they engaged in several self-study activities, including planning out screenings of their own cellphilms within their school groups, determining their audience and the venue, and organizing a small budget for planning. Some of their guiding questions were: What does it mean for a group of teachers who do not identify as filmmakers to screen their films before live audiences and how does this type of activity contribute to self-study? Who would they choose as their audience? What would they need by way of materials or support to carry out the screening? The digital retreat activities also provided reflexive practice with the technology, where teachers worked in pairs to interview each other about how working with cellphilms could have an impact on their teaching. In the section below, I offer brief accounts of these screenings as a way to highlight the potential for reflexivity and self-study.

Screening One

The first screening event involved 110 Grade 6 learners from the Life Orientation (LO) classes. The screenings included two cellphilms: *Be Enlightened* and *Breaking the Silence 2*. *Be Enlightened* tells the story of two girls (played by two of the participating teachers) who find a condom in their schoolyard but mistake it for a balloon. A teacher (also played by a teacher) finds the girls playing with the condom, notices that the girls are confused about what it is, and takes this opportunity to teach them what condoms are used for, but also emphasizes that they are for adults and not for children and that the children must avoid contact with them. *Breaking the Silence 2* is about two girls whose mother discovers them looking at pornography on their cellphones. At first the mother is angry, but she then decides to talk to her daughters about safer sex. Later in the cellphilm, she has to defend her decision to talk to the children about sex, a decision their father, who is angry when he finds out, did not support.

After the screening, the learners were divided into groups of eight to address questions prepared by their teachers: What were the films about? What where the themes of the films? What did you like about the films? What do you do when someone asks you a question about something you don't understand? Focusing on the messages in the cellphilms, the learners' responses suggested that they "enjoyed learning about condoms and appreciated the messages in both cellphilms about talking frankly with parents or teachers about sex in order to get accurate knowledge" (MacEntee 2013, p. 6). Interestingly, in response to a teacher's closing remarks, one learner raised his hand and asked, "*Why do teachers or adults get to have sex?*" and another male learner asked, "*What if you don't have money to marry someone?*" (p. 6) (This was in reference to the tradition of a man paying lobola or a bride price in order to marry a woman). MacEntee (2013) comments, "Teachers expressed an admiration for the learners' knowledge and their ability to express themselves by asking questions" (p. 7). However, they were taken by surprise by the questions. In their post-screening interview, "they noted the importance of discussing and teaching about condoms to the learners and explained that this was why condoms were emphasised in their cellphilms" (p. 6).

Screening Two

The second screening involved 34 Grade 11 and 12 learners, all members of the school's Peace Club, a group that focuses on promoting peace and peaceful conflict resolution among learners in and around the school. The teachers chose to screen *Breaking the Silence 2* (described above) and *Teen Vibe*. The latter tells a story of two girls who decide to sneak out at night to go to a party while their mother sleeps. The two (and supposedly others at the party) get drunk and are driven home by a man. At first the mother is angry and she scolds them for their behavior. However, she calms down and sits with the girls to talk to them about safety, sex, and sexual violence. In the post-screening discussions, the learners identified such themes as the importance of listening to parents, prioritizing education and one's future before romantic relationships, and avoiding alcohol and peer pressure. *Breaking the Silence 2* was introduced by an animated discussion on adolescence, sex, and abstinence facilitated by one of the teachers. After the screening, the teachers asked the learners questions about whether their parents talk to them about sex and, if so, how they do this. The learners talked about parents as a source of information and support for youth. However, they also highlighted the need for young people's independent decision-making about healthy sexuality. For example, with both parents and teachers emphasizing abstinence before marriage, the learners felt that youth sexuality was largely ignored in conversations. Other issues the learners raised included peer pressure, love, transactional sex, and low self-esteem as contributing to early sexual debut among young people.

Screening Three

The third event involved 29 members of the Community Catholic Youth Group and was facilitated by 3 of the participants: a Grade 4 (female) teacher and 2 secondary school female teachers, a Life Orientation teacher and a Social Science and IsiZulu teacher (teacher who teaches isiZulu, one of the indigenous languages of South Africa). As part of introducing the session, the teachers stressed that they wanted to hear from the learners "about the challenges [you face as young people] and how you overcome them" (MacEntee 2013, p. 8). To underscore this, they introduced the youngest teacher among them as being "still a youth and [one who] is still experiencing some of these challenges as we speak" (p. 8). Three cellphilms were screened: *Breaking the Silence* 2, *Teen Vibe*, and *Teen Pregnancy. The latter* tells a story of a girl who goes to a party and gets drunk. A few weeks later, she discovers that she is pregnant. She is scared of what her parents will say and what will happen to her.

In the post-screening discussions with learners, the teachers facilitated a question and answer session, from which themes such as whether or not cellphones should be allowed at schools, the use of different mobile apps, and the appropriate age at which to start dating were discussed. In particular, following the screening of *Breaking the Silence*, a learner directly asked the youngest teacher what age she was when she started dating. In an interview with Katie, she admitted feeling uncomfortable "as she interpreted the learner to be asking, in a thinly veiled manner, at what age she began having sex" (p. 8). In response to the cellphilm, *Teen Vibe*, the learners initially focused on the poor sound quality of the cellphilms. The facilitators then

steered the dialogue to the issue of whether parents talk to the children about sex or not and what strategies would work best for them to engage in such conversations with their parents. While they agreed that it was difficult to talk to their parents, they also identified other adults, such as sisters or brothers, to whom they could talk.

Of interest is the ways in which the teachers themselves responded to screening their productions, both before and after the public events. To understand these responses, MacEntee and Mandrona (2015) use Boler and Zembylas's (2003) pedagogy of discomfort framework. According to MacEntee and Mandrona, first the teachers experienced discomfort with finding the best ways to engage learners in discussing HIV and AIDS. Seemingly projecting their own discomfort, "some teachers worried that the audience members would not feel comfortable engaging in a discussion about sexual health and that the teachers' existing relationships with these young people might hinder dialogue" (p. 48). Second was the teachers' discomfort with teaching children about condoms. Linked to this was a third form of discomfort the authors identified involving teaching about alternatives to abstinence only as a way of preventing the spread of HIV. Throughout the day, the teachers punctuated every screening by reminding the audience (their learners) of the importance of abstinence until marriage. As a result, when a Grade 6 boy asked for alternatives to abstinence in the event that he was not willing to wait or that for him marriage would not be possible because of his poverty and the inability to pay the bride price, the teachers were taken aback.

Clearly, as we note elsewhere, in many ways it was an act of bravery on the part of the teachers to screen these cellphilms to the learners in and around the schools. Teachers in rural KwaZulu-Natal (and elsewhere in South Africa) are typically not filmmakers and have very little access, if any, to technology. Although they had assistance from Katie at the screening events, even the process of using technology in teaching (setting up an LCD projector, speakers, and laptop) is not something with which many rural teachers are familiar (DeMartini and Mitchell 2016). In addition, several of the participants were not Life Orientation teachers, the school subject in which the issues addressed in the cellphilms are usually taught. This means that even though there is a move to integrate the issues more broadly into the school curriculum, these particular teachers are typically not the ones whose responsibility is to deal with issues of sexuality. Scholarship in South Africa suggests that teachers (including LO teachers) are often reluctant or unable to teach issues related to sex, sexuality, and HIV and AIDS (Francis 2012; Masinga 2009). Thus, the screenings by this group of teachers must be seen as an opportunity to strengthen their willingness and capacity to teach about these issues but also to stimulate dialogue between them and their audiences (their learners) and others in and around the school.

Case Study 2: Self-Study and Taking Action – New Teachers Address Gender-Based Violence

Naydene de Lange

I teach and conduct research in the education faculty at Nelson Mandela University in South Africa. One of the projects in which I have been involved for the last

4–5 years has been with preservice teachers who themselves have experienced some form of gender-based violence (GBV) during their schooling and who are studying in a higher education context where GBV is prevalent (Clowes et al. 2009). Moreover, they are likely to be posted to teach in a school context where, as Burton and Leoschut (2013) and many others point out, GBV is prevalent. It is in this context that I conducted a study with Relebohile and Claudia, titled *Digital media for change and well-being: Girl-led "from the ground up" policy-making in addressing sexual violence at a university in South Africa*. We established that we wanted to engage first-year female preservice teachers – who come from schools in rural contexts – to understand what GBV is, how they can resist it in their own lives at home and at university, but critically, as we explore here, how they could be enabled to become activist teachers addressing GBV in their own classrooms and schools when they began teaching.

In embarking upon this work, I invited all the first-year female preservice teachers who came from rural areas to participate in the project. This was informed by research which indicates that many young women who are first-generation university students from rural areas are often particularly vulnerable in a university context which is new and strange to them (Petersen et al. 2009). In total, 14 first-year female preservice teachers, between the ages of 18 and 23, who called their group Girls Leading Change (GLC), participated in the project. The project drew on participatory visual approaches in engaging with the GLC. As my colleagues and I have found, tools such as photovoice, drawing, and cellphilm production are useful when the topic to be addressed is sensitive and also when the participants might have difficulty in expressing themselves. This methodology could enable change and encourage activism. In this case, we started off with participatory video as method, using cellphones to make cellphilms about the first-year preservice teachers' own schooling (Mitchell et al. 2017). We used two prompts: "Looking back at your own schooling in your community, discuss good/nice/happy/pleasant experiences at school" and "Looking back at your own schooling, discuss experiences of feeling unsafe at school." In total the GLC, for the last prompt, created four cellphilms: *forced marriage*, *sexually transmitted marks*, *stepfathers raping their stepdaughters*, and *your choice is up to you*. As an example, the cellphilm, *sexually transmitted marks*, showed how a teacher coerced a learner in his class to have sex with him, promising her good marks/grades in the subject he taught her. The planning, filming, and screening of the cellphilms facilitated discussion and enabled the preservice teachers to look back and reflect on their own lived experiences in their communities and schools and to begin to think that such experiences need not be the norm and that something could be done about it.

The production of *sexually transmitted marks* also served as a segue into the topic of GBV at university itself, and in the next phase, the preservice teachers created cellphilms about feeling safe and feeling not so safe in and around the university as a female student. The screening of these cellphilms and the ensuing discussion were aimed at deepening their and our understanding of female preservice teachers' experiences of sexual violence and to facilitate our thinking about how we could make the messages of the cellphilms more visible and get policy-makers to clearly

see (and remember) the messages. To do this, the preservice teachers produced policy posters, a media form which consisted of a carefully produced photograph or drawing making the issue visual, accompanied by a clear and strong message. One example was "My body, your toy? No such luck." Policy is usually made by policymakers in a top-down way, and those affected by the issue are seldom asked to inform the policy. Here the GLC women were presenting the images and messages in a way that clearly asked the policy-makers to see what the challenges for female students on the university campus are. The group had very clear ideas of what needed to be done, and as part of the follow-up, they created action briefs, linked to the policy posters and cellphilms. Each action brief contained a description of a situation on campus, a clearly defined problem, and a set of solutions which focused on, from their perspective, what the university structures and what the students themselves could do to address the situation. Using these tools to engage with policy-makers provided the GLC with opportunities to hold dialogue about what was problematic and how it could be addressed. At the same time, the activities also facilitated reflection.

There may be many ways in which reflexive visual approaches to address social justice issues can be linked to self-study. At one level, there is the idea of critical reflection itself leading to greater self-awareness, something that can be seen in relation to the cellphilm workshops. At another level is the idea of taking action based on the idea of improving one's own teaching practice. Thus, in this section, I take a "*what difference does this make*" approach and consider what some of these teachers are now doing in their own classrooms since they graduated.

I was very interested in the fact that some of the preservice teachers wanted to do similar work with girls and young women back in their rural hometowns, or in the schools they were doing their work-based learning, as a way of "paying forward" what they had gained. Takatso Mohlomi (all names used in this section are real names), for example, worked with learners at the secondary school where she completed her schooling and presented a workshop, *Dreaming into the future.* In a report for the faculty newsletter, she wrote the following:

> On the 30 November 2015 I did a motivational talk in one of the schools – [name of school] – in the rural areas of Eastern Cape. This was an idea driven from my heart and was influenced by many factors. One of the key factors was aligned with my joining the group of young woman – 'Girls Leading Change' – led by Prof Naydene de Lange (in the Faculty of Education). We are a group of young pioneers of change who stand for wellbeing and addressing issues of violence against women and girls. As a young woman who grew up in the rural areas and who has experienced all the challenges and consequences that come with living a rural life, I realized that had I had a motivational speaker in my early adulthood, who spoke as I did in this motivational talk, I might have made even better decisions in terms of career choice.

In her first year of teaching at a secondary school, she continues her gender activism work and sent me the following WhatsApp message:

> My school is planning on taking action against women violence and say it is enough! We plan on having a walk to a distant hall from school. Can we use the GLC posters at our silent walk on Wednesday? After the walk, I believe we will have them on the school's walls or staffroom.

After the walk, Takatso sent me another WhatsApp message and a photograph: "*It was a success* . . ." (Fig. 1).

The experiences of the participants have also led to taking up other social issues. In her first year of teaching, Sandisiwe Gaiza now at a primary school in Motherwell, a township of Port Elizabeth infamous for abuse of drugs and alcohol, wrote:

> This became my concern as a new teacher who wants to make change. As the rapid increase of drug abuse increased at school [it] led to high rate of drop out and absenteeism. I started helping out in the school choir which consists of 120 learners (60 boys and 60 girls) . . . I had an idea if I spend time with them, they can get to trust me, create a bond with them and create a safe space. So, we practice from Sunday to Sundays. The idea behind practicing all the time was to keep them busy and less focused on their socio-economic issue. During our rehearsals, we sit down forming a circle (circle time). Individuals talk about things that are bothering them. We have a rule which says "Whatever happens in the circle should stay there". At times, they write letters telling me how they feel and what had happened at home as many come from abusive homes and in homes where their parents are giving birth for them to be care givers. I use weekends to talk a lot about issues that are happening in our country. One was the selling of women's bodies. We (the choir) made awareness about that as we marched to Motherwell police station. We got men to sign our petitions of awareness.

Another aspect of "taking action" has been in relation to curriculum. Zethu Jiyana, in her second year of teaching at a secondary school, talks about what she has applied to her own teaching from participating in the project in several ways. She integrates gender work in the Life Sciences subject she teaches and also did a lesson on "We are equal" and got the boys and girls to work together to clean and sweep

Fig. 1   Takatso's learners using GLC posters at a silent march against violence

the class, using the moment to discuss equality and stereotyping. She sent me this photograph (Fig. 2).

National Women's Day is celebrated in August, and Zethu addressed the learners at school, speaking about the challenges girls and women face today. She also supported the Facebook initiative, *Stop violence against women*, by posting a photograph of her with learners on the Facebook page. She also had the opportunity to address the learners at assembly:

> I talk about how to build them to become independent, not depend on other people, not to find themselves in situations whereby they may be abused . . . but to know that they have rights and they also have responsibilities along with those rights. They have channels to follow if those rights are being violated. . .

Finally, some of the preservice teachers talk about the significance of critical dialogue as a key feature of teaching. Bongiwe Maome, in her final undergraduate year, writes:

> Our work with the GLC has helped me understand the value of critical dialogue and exchange especially in addressing social issues/challenges – in order to gain a better understanding of the issue from the perspectives of those directly and indirectly affected by it. And so, I started the #SheTalk sessions at the university. The sessions are a platform for students, by students, to have those difficult and crucial conversations that are very often overlooked in our communities as well as in higher education institutions. They are a platform for both young men and young women to express themselves and their opinions on issues like sexuality, sexual violence, education, poverty . . . without fear of judgment.

Bongiwe will be taking up a post at a secondary school and so plans to continue such talks at school:

Fig. 2 Zethu's "We are equal" lesson

> I as teacher, will be hosting these sessions at the school I will be teaching at and let them grow from there. The whole objective is to create a network of young women in different levels of their academic careers, that can share with each other their stories, opinions and guide each other . . . I am now a teacher that sees her learners not only as academic beings but as developing members of society; individuals that go through a great deal of social, economic and personal trials before they can enter a classroom and perform academically.

While applying their GLC work in schools and communities might seem a small drop in the ocean in addressing GBV in South Africa, these teachers are drawing on their insider knowledge to engage other girls and young women and boys and young men in dialogue toward social change. It is work of this nature, in contrast to interventions imposed from the outside or in a top-down way, which enables personal work, a prerequisite for change on a personal level as well as in the public domain. While change does not come swiftly, through using participatory visual research with this group of 14 preservice teachers over a period of 5 years and still continuing, the rest of the team and I have seen how, as in-service teachers, they are now making their voices heard in their new spaces.

Case Study 3: Preservice Teachers Looking Back to Look Forward

Katie MacEntee

Teachers continue to struggle to engage learners in HIV and AIDS education. The topic is highly stigmatized in many communities, informed partly by belief that talking about sex and sexual health with adolescents will encourage them to have sex. Fearing parents or community backlash, lack of support from school administration, as well as a lack resources and pedagogical training, teachers tend to become reticent to raise these issues in their classrooms (Ahmed et al. 2009; Francis 2010). As highlighted above, they also face personal discomfort bringing up issues of the body, gender, and sexuality with their students (Baxen 2010; Francis and De Palma 2015). As a way to empower new teachers to tackle these challenges in their teaching practice, a youth-focused project at the University of KwaZulu-Natal, Youth as Knowledge Producers (YAKP) (Youth as Knowledge Producers (2008–2010), which was a study funded by the National Research Foundation, with principal investigator Jean Stuart and collaborators Naydene De Lange, Claudia Mitchell, Relebohile Moletsane, and Rob Pattman, explored the ways in which introducing participatory visual methodologies to preservice teachers might increase their self-reflexive practice with regard to their approaches to HIV education. The project also aimed to provide preservice teachers with training and opportunities to gain experience facilitating these methods in different educational contexts.

Between 2008 and 2010, the YAKP project engaged 44 preservice teachers in exploring different participatory arts-based methods in HIV and AIDS education including photovoice, participatory video, and collage (YAKP also introduced participants to other arts-based methods, such as drumming and image theater). The participants worked in small groups to create their own visual media. They discussed their creations and what they learnt about HIV and AIDS as a result of the

production and sharing process, as well as how these methods might be integrated into classrooms and other educational initiatives. This was followed by opportunities for the preservice teachers to take on the role of workshop facilitator.

Here I focus on three of the preservice teachers' reflections on the use of participatory visual methods to promote self-study and social justice teaching (This analysis draws from MacEntee (2016, 2017)). Sarah (her name and all others are pseudonyms) was in her third year of the 4-year Bachelor of Education at UKZN, specializing in language education (English and Afrikaans). Monique was in her final term in the Bachelor's program, specializing in drama and physical education. David had graduated from the Bachelors and was pursuing a Masters in the Faculty. I approached this study as a process of engaging participants in looking back at their experiences with YAKP in order to look forward at the implications of these experiences on their preservice teacher training and future teacher practice. Using a variety of methods including photo-elicitation, photovoice, and interviews, I drew on the work of Mitchell (2015) and Walsh (2012), who both reflect on the ongoing impact of their youth-based participatory visual study, *Fire + Hope*. Five years after the study was complete, Mitchell and Walsh used the passage of time as an interpretive lens to explore participants' ongoing and shifting understandings of the research experience on their lives. I similarly approached the YAKP participants' reflections on YAKP (from 2008 to 2010) as interpretations of events from their situated perspectives in 2012.

For the photo-elicitation interviews, the participants and I scrolled through a collection of 20 photographs that had been taken during YAKP events in 2010. Open-ended interview questions were designed to further stimulate participants' memories of events and inscribe meaning to these events in a narrative fashion. The participants were asked more direct questions about their theoretical understandings of participatory visual methodologies and their significance when used for HIV and AIDS education. I also facilitated a photovoice process in which each participant took five photographs in response to the researcher-generated prompt, "*What difference does the arts make to HIV and AIDS?*"

The photo-elicitation interviews and photovoice methods allowed the participants to use images to help them remember events from the YAKP in 2010. The emphasis on narrative allowed participants to construct their own understandings of events and ascribe their importance to these memories. The photovoice acted, then, as a means through which participants could reiterate aspects of their understandings, with a prominence of the images and captions describing their perspectives on the methodological contributions of participatory visual methods to HIV and AIDS education. For instance, Sarah dedicated a photovoice image and caption that emphasizes the importance of tailoring curriculum to the interests of learners (Fig. 3).

In the interview, she describes following up with members of YAKP research team to find ways of integrating different techniques into her teaching practice: "even now, I still approach Dr. Stuart and ask her, like especially with English, I remember going to her and asking:

Fig. 3 Sarah's photovoice image "Knowing the interests of pupils"

> How can you teach literature in a critical way? What makes learners think about some of the real issues that are affecting them in their lives and also in terms of the bigger picture in terms of the world as well?

Since YAKP, Sarah has continued to seek out and find resources and support in order to engage her (future) learners to make links between curriculum content with issues that are important to them.

Perhaps because of their chosen areas of specialization (sexual health and HIV and AIDS education fall within the Life Orientation curriculum, which none of the participants in the follow-up study were specializing in), the participants did not feel the teacher education program had exposed them enough to the content or means of HIV and AIDS education as part of their formal professional training. YAKP was the only chance they had to try out facilitating participatory visual methods in order to teach about HIV and AIDS. The participants particularly valued the YAKP-initiated opportunities to co-facilitate workshops with their peers and with learners. Outside of YAKP and when the project finished, they felt less comfortable and were sometimes confronted by their mentor teachers for wanting to integrate contentious topics such as HIV or GBV. David explained:

> Sometimes being part of YAKP might not be such a good thing, if you don't know how to negotiate with the culture that exists in schools and in communities. Because you could be ostracized for talking about things that are taboo. You could be challenged for bringing new techniques ... I'm not saying that this attitude exists by and large [in all schools], but when I think about some of my teaching practices in schools, it's not so easy.

YAKP influenced the preservice teachers to reflect on their previous exposure to HIV and AIDS interventions. While AIDS activism is present on campus (e.g., email campaigns, testing clinics, and peer education initiatives in student residences), the interventions they were aware of were described as top-down, prescriptive, and

boring. In contrast, YAKP was experienced as participatory, student-centered, and creative. David observed, "It was amazing. There was no lecture. I was constructing meaning."

YAKP's collaborative training process had preservice teachers working together to create visual media. The participants attributed this to a stronger sense of collegiality among the YAKP participants: "This is something to say about the group that is different than the rest of the population because the group is less judgmental. Or maybe more embracing" (David). They said that it led them to appreciate what can be learnt from hearing multiple perspectives. Sarah reflects on having her peers give her collage feedback during the training workshop: "Being assessed by other group members as well. I think that was a really cool idea, because you learnt also to respect other people's points of view and respect them and it kind of makes you look at things differently as well." Monique captures this sense of peer collaboration in a photovoice image and caption about participation (Fig. 4).

Similarly, David emphasized the importance of dialogue with his peers: "a participatory approach to critical issues like HIV and AIDS, you learn to understand and listen. So, I think somehow that is a life skill for basically everything. Listening, understanding before taking a position." Learning together, giving and receiving feedback, actively participating, and dialoguing with their peers about HIV and AIDS were themes that the participants associated with a strength of the YAKP.

The increased awareness of HIV and AIDS developed during YAKP served the participants immediately in their personal and professional lives. After her first training session with YAKP, Sarah remembered: "After the workshop I think I googled some information just to find out more and kind of gain a wider perspective on this disease. Because [you] can be personally affected by it but you don't really

Fig. 4 Monique's photovoice "Participation: Actively involved with your peers"

know much. So, yeah, for me that was one of the successes. It encouraged me to find out more." YAKP seem to bring about a more liberal understanding on issues related to gender and sexuality. As David observes: "There is a marked difference between our people, YAKP, and the rest of the world, because they seem to be informed . . . they can talk more openly around sensitive issues and sex is pretty sensitive in our community." YAKP preservice teacher participants appear to have developed a sense of agency that enabled them to seek out more information independently and to confront sometimes difficult topics in a process of constructive dialogue.

There were other examples of impact. Participants noted that they developed their general interest in teaching for critical social justice as a result of their involvement with YAKP. In the 2 years following YAKP, they continued to look for ways to engage learners in making connections between the curricular content and their everyday lives. Second, the project had an impact on their actual teaching methods. All the participants expressed commitments to integrating participatory visual methodologies into their teaching. As Sarah observed: "Now, I'm like, empowered whenever I teach to use creative methods that get learners interested." As part of a cross-departmental initiative in the Faculty of Education, David has integrated collage into his teaching on oppression. He had also used image theater. He explains, "We talk around sexism. Homophobia. Xenophobia. It focuses on the theory of oppression. So it is perfect for this." Monique foresees integrating the learner-centered approach into her drama education: "I think I would use drama. I think it is really fun and it doesn't really pinpoint who the messages are [directed towards], it is just exactly how you receive it." She created a photovoice image that further emphasizes this sentiment (Fig. 5).

Monique's photovoice image, which emphasizes the role of "displaying a message" and "reaching all," draws attention to the ongoing nature of this type of initiative and the capacity to invite continued engagement and sharing of visual

Fig. 5 Monique's photovoice "Display Message"

media in order to understand the diversity of experiences and develop community-based change.

Sarah reports, "The more you interrogate the pictures the more truths you get." In her photovoice, she expresses this in relation to multiple forms of expression (Figs. 6 and 7).

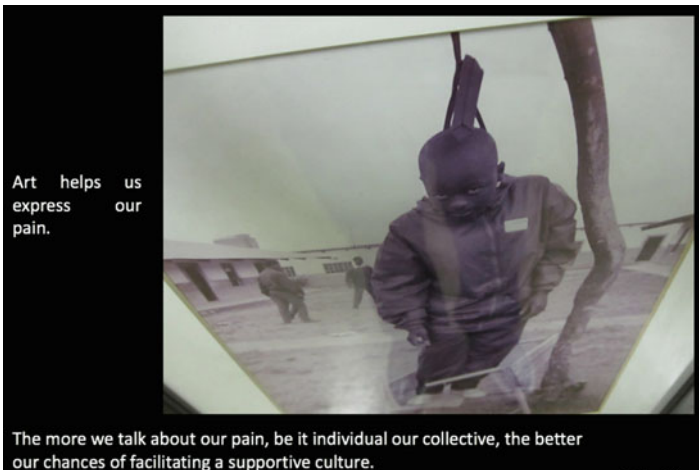
Sarah's statement makes particular note of the dynamic nature of participatory visual methods as allowing for big concepts to be adaptable to the needs of particular
Fig. 6 Sarah's photovoice "Various lenses of Xpression"


Fig. 7 David's photovoice "Art helps us express our pain"

groups of learners and individuals. This is reiterated in one of David's photovoice images that depicts an image taken as part of another UKZN research project on youth and HIV and AIDS and hangs in the university:

The participants were unanimous in finding the arts to be a novel and exciting way to approach the socially complex aspects of living and working in communities facing ongoing epidemics of HIV and GBV. David reflects:

> At the heart of education should be the development of the people, I mean ourselves, but also the audience [learners/community]. And a lot of time, the audience when it comes to educational projects have been passive. And the one good thing is that people are participating. Whether it is sticking a picture on a piece of paper or whatever, they are becoming active. And not all the time do people communicate verbally but I can see they are engaging vicariously and their body language.

During YAKP these new teachers developed an interest in the pedagogical opportunities afforded by integrating participatory arts-based methods into their teaching. They expressed a commitment to their learners and recognize the challenges they might face in asking for help from their teachers. Monique projects her ideas for her future:

> I think we've learnt about inclusive education. Trying to include everybody . . . But I think that . . . inclusivity should stretch beyond the classroom. You understand? Finding out, like, in a school you can't say my day starts at 8 o'clock and it ends at 2 o'clock, that's it. That's as far as I'm going to educate learners about HIV or anything in general. It is that it should stretch beyond that.

For Sarah, this commitment to her future learners also includes looking for creative ways to engage them in curriculum, even when there is scarce access to resources. This is most succinctly expressed in one of her photovoice images (Fig. 8).

As a participant in YAKP, she learned to have a sense of agency and the capacity to use what is at hand in order to engage learners in developing critical consciousness and engage in community-based change.

This case study reflects on only a portion of a larger study, which includes different stakeholder perspectives on the implications and effectiveness of integrating participatory visual methodologies into initiatives aimed at engaging with the intersections of GBV and HIV and AIDS in South Africa. I have focused on the responses of three teachers who were trained as part of the YAKP project, all of whom found their experiences refreshing and generative. They described themselves as developing an increased interest in knowing and learning about the complexities of the AIDS epidemic. They also described becoming more open to listening and learning from the diversity of perspectives and experiences associated with the epidemic. As David summarized:

> More than sexuality, I think, it is an opportunity to think about ourselves in our lives and in our communities. Maybe sexuality is the entry point but it is certainly not the end point. I mean, I've re-configured my stance on sexuality and religion but the project wasn't really talking about those issues directly.
Fig. 8 Sarah's photovoice "Using materials that are accessible"

Using locally sourced materials and their own ingenuity, the participants described themselves as excited and willing to engage their learners in what might be challenging and controversial topics associated with GBV, HIV, and AIDS prevention and intervention.

While the three participants' reflections may be susceptible to my own bias (especially given my previous involvement in YAKP as a collage trainer), they are helpful in outlining areas for future research and action. This includes the recognition that the role of educating new teachers in participatory visual methodologies is multi-leveled. On one level, preservice teachers need to be introduced to a novel methodology. The YAKP model used experiential activities that allowed the participants to create the visual media themselves and share this media with peers. This was an opportunity to learn the method and gain personal insights on their understandings of HIV and AIDS. Moving from "doing it ourselves" in the training workshop to facilitating the methods with others seems to have been a critical step for the participants. It was when they worked with learners in the rural high schools that an appreciation of the methods to engage young people and an awareness of community-based, youth-centered knowledge seems to have developed. Learning to use participatory visual methods can inform not only teachers' approaches to HIV education but also have a wider impact on their approach to teaching more generally. In their feedback, the participants suggested that they would have benefited from more ongoing support from the research team/teacher educators once the initial training session is complete and in contexts that may not always be initially supportive of these creative, youth-centered approaches. With such ongoing support, it is likely that these methodologies would offer more nuanced and varied ways of learning and responding to the impact of GBV and HIV and AIDS on their and their learner's lives.

Case Study 4: Building Sustainability in Addressing Social Justice Issues – Studying a Community of Practice of Teacher Educators

Relebohile Moletsane

How can we take the lessons learned from small scale and sometimes once off interventions in reflexivity and social justice to work at a national scale? I write this section as the current Chair of the HIV and AIDS Education Community of Practice (CoP), made up of a group of teacher educators from all 25 universities in South Africa. The HIV and AIDS Education CoP is a special project under the governance of the South African Higher Education and Training HIV/AIDS (HEAIDS, an initiative of the Department of Higher Education and Training. (http://heaids.org.za/about/mission-vision/ retrieved December 31, 2017). Its first Chair was Naydene de Lange. Launched in 2010, this Community of Practice was established specifically to respond to the recommendations of the *HIV and AIDS in Teacher Education* report (HEAIDS 2010) based on a pilot study with 7000 in-service and preservice teachers conducted in 2008 and 2009 aimed at studying the efficacy of various models of curriculum integration to address HIV and AIDS. Of particular relevance to this chapter is the fact that the pilot project was informed by several key principles, including "the significance of instructors' own self-knowledge and how they engage with HIV/AIDS (through reflexivity and self-study), and the need for ongoing professional support; participatory methodologies and preservice and inservice teacher engagement; flexibility and collaboration" (HEAIDS 2010, p. vii). In evaluating the pilot study, the implementation and evaluation team for the study was made up of Ken Harley, Claudia Mitchell, Relebohile Moletsane, Tessa Welsh, Naydene De Lange, Lesley Wood, and David Donald, who made several recommendations to HEAIDS and the teacher education sector which are particularly relevant to the idea of self-study:

- Recommendation 8: Provide preservice and in-service teachers with opportunities for experiential learning in communities affected by HIV/AIDS (p. xviii).
- Recommendation 9: Implement strategies to increase preservice and in-service teachers' ability to reflect personally as well as professionally so that they can model attitudes and behavior rather than simply teaching (p. xix).

In support of these recommendations, the CoP's mission is to provide "an opportunity for education experts working in Higher Education (HE) to collaborate, network, share knowledge and provide collective suggestions on issues related to HIV and AIDS teaching, learning and research" (HEAIDS 2017, p. 2). This work includes sharing best practice but also providing ongoing professional support to its members.

Since its inception in 2010, the CoP has met annually over 2–3 days around key aspects related to the integration of HIV and AIDS education into the higher education curricula. Using a workshop approach, a key feature of these sessions has been the use of participatory visual methodologies both as pedagogical tools to be supported in teacher education and as tools for facilitating reflexivity,

engagement, and decolonization more broadly (see, e.g., a guide developed as part of the workshops *Using a different lens for HIV and AIDS Education* and a travelling exhibition produced by the CoP participants: *Seeing, Believing and Acting for Change, Integrating HIV and AIDS in Higher Education Curricula*). Thus, the workshops are participatory in nature, using such methods as drawing, photovoice, and cellphilming.

In 2016, we administered an open-ended questionnaire which focused on what the CoP members were teaching in relation to HIV and AIDS and the ways in which they were using the resources developed by the CoP over the years (see HEAIDS 2017). We also however invited members to reflect on two key questions:

1. If you had to choose one component of the CoP which has contributed to sustaining it, what would it be? Why do you think this?
2. What has the CoP enabled you to achieve in terms of HIV and AIDS work within teacher education (teaching, research, and engagement) at university? (HEAIDS 2017).

In my own reflexive piece looking back over the 5 years, I comment on how the CoP had influenced my work:

> While my research, engagement and teaching have shifted from a direct focus on HIV and AIDS, this issue has remained an organising tool for thinking on the social aspects of HIV and AIDS and their implications for education. My work has moved more into Gender Equality, gender based violence, gendered poverty, sexuality and sexual and reproductive health. The annual meetings of the CoP provide a supportive and productive space in which, together with colleagues we explore these issues (the what, where, why, when), as well as a variety of methodologies for researching and teaching them. Linked to this, the CoP has provided teaching and learning resources that I have used with my students in class as well as in supporting their research. The tools developed during the CoP (and the creative and participatory processes for doing so) have often led to developing more tools and methodologies with my students and colleagues. (HEAIDS 2017, p. 15)

Other colleagues made similar comments. Bev Moore from Rhodes University observes:

> The colloquium discussions gave me time to reflect on my own practices and whether or not I am giving the appropriate support to empowering the diverse student population that I interact with. One of the most memorable occasions of the colloquium was that by the second gathering, it was evident that there was mutual respect among the members of the CoP . . . Collegiality overflowed. They felt comfortable to approach me and I was comfortable to approach them to address various concerns and seek advice. During these sessions, it was unmistakable that the CoP members had become a 'family' with a common approach towards knowing and learning . . . I feel privileged to be included in this 'family'. (HEAIDS 2017, p. 5)

Another member, Julialet Rens, from Northwest University (Potchefstroom Campus) highlights collegiality:

> I have learned from my colleagues . . . and that would be the one component that is valuable
> in sustaining this CoP. In our day to day work we tend to lose sight of the bigger picture and
> it is very important to keep the discourse going about various creative and innovative ways
> of dealing with the HIV and AIDS issue at the tertiary level. (HEAIDS 2017, p. 6)

Dipane Hlalele, of University of the Free State, highlights the significance of the common focus of the CoP: "genuine concern about the pervasive presence of HIV and AIDS" (p. 14).

A significant part of the CoP was that it included academics who were busy with their doctoral studies (as well as other students whose work focused on some aspect of HIV and AIDS in Education). Fumane Khanare, for example, was teaching at the University of KwaZulu-Natal and completing her doctoral studies under Naydene de Lange's supervision at the Nelson Mandela University. She wrote:

> When I look back to the 2013 the CoP conference provided a safe space to share my doctoral
> ideas, in particular, I was afforded an opportunity to present the methodology chapter of my
> thesis during the conference. The comments, ideas, critical questions and suggestions from
> the conference participants, experts in the PVM research and other PhD candidates/students
> provided insight that enabled me to think critically and about the 'how' and 'why' my
> research methodology strengthen my work and successfully become productive. When I
> reflect forward I see opportunities that are grounded in the actions I have already taken.
> (HEAIDS 2017, p. 14)

That the HIV and AIDS Education CoP is now in its 8th year is testimony to the dedication of the many academics involved and their collegiality and their willingness to share resources and learn from each other. As the HIV and AIDS epidemic continues to wreak havoc on the lives of young people in communities and educational institutions in South Africa, the work of the CoP continues to be important. Efforts to sustain it and to continue to innovate are even more significant, a task that teacher educators, as reflected in their reflexive pieces (HEAIDS 2017), are well aware of. It is key that we continue to engage in self-study of our own lives as members of communities, as well as of our teaching and research practice in our various institutions. It is only when we engage in co-researching and co-learning through collaborative continuous professional development that the work of the HIV and AIDS Education CoP might contribute to addressing the impact of the HIV and AIDS epidemic on the education sector.

Part 3: Discussion – Self-Study and Social Change

As we have highlighted in the case studies above, this work using participatory visual methods starts with an orientation to reflexivity. The work is somewhat paradoxical. In one sense it is not that the markers of injustice in South Africa are invisible. It is only necessary to drive a few kilometers from any major airport in the country or to visit one of the thousands of schools that still lack water and sanitation, electricity, libraries, or computers to see what teaching and learning in post-apartheid

South Africa means. In another sense, however, and this is why the visual can be so provocative, there is the notion of confrontation or, as the South Africa anthologist David Medalie (2017) terms it, a type of politics of recognition. When we see our teaching contexts through the co-production of various images and captions vis-à-vis drawings, photos and videos, and other narrative forms, we are also, we posit, more likely to "see ourselves" and "see for ourselves." Indeed, this takes us back to the Weber and Mitchell (2004) chapter in the first edition of *The International Handbook on Self-Study.* It is this aspect of the visual that is particularly vital to self-study and social justice. It is perhaps harder to look away when we ourselves have been part of the co-production of images and are, at the same time, audiences of the images of the various groups in a participatory project producing images. We might also think of this work in the context of the work of Boler and Zembylas (2003) on a pedagogy of discomfort, as noted above, or, as Knowles (2014) notes in her article on self-study and social justice in teaching, as a vulnerability where we have to acknowledge/recognize both privilege and oppression. But perhaps working with the visual forces us to confront the idea of change and especially the question of whether we would even recognize change if we saw it. The case studies, we argue, suggest that it is precisely the recognition of need for change and perceived change that gives this work its edge.

They also reveal a set of commonalities in relation to process and in the context of participatory visual methodologies. This is something that both Weber and Mitchell (2007) and Olivier et al. (2010) describe in previous work with participatory video where they talk about four important features of the work in relation to the visual: reflexivity (the group can stand back to both review the work but also to reflect on the work), collectivity (meaning-making through a collective voice), co-construction of knowledge (linking to the social construction of knowledge), and embodiment (being there and being visible). While all are important, we want to draw particular attention to the idea of collectivity and collective voice, something which may seem to fly in the face of "self" in self-study but which is so apparent in the various accounts noted above. For example, the cellphilms produced in the first two cases come out of group work, and even the screenings by the rural teachers were facilitated by a group of teachers who planned the event and reflected on the event. Their reflections are based on what they experienced together. And while the individual members of GLC are now in their own schools and classrooms, it is impossible to ignore their recognition of how important the group was and continues to be. For the preservice teachers who were part of YAPK, their comments indicate that they too had a group identity and that they felt special. Over and over again in the reflections of the members of the CoP is the idea of collegiality and learning from each other. These are powerful messages about the strength of collectivity in advocating for social change.

Located within a "starting with ourselves" conceptual framework, each of these studies highlights the ways in which participatory visual approaches support the possibilities for looking inward while at the same time drawing attention to the ways that the social context of audiences, exhibitions, and screenings serve as platforms for change in relation to social justice issues. Clearly this is work that also lends itself to new questions and new areas for study. Pithouse-Morgan et al. (2015) as a group of

teacher educators and first-time producers of a digital animation use the experiences attached to several screenings of the short animation dealing with HIV and AIDS to engage in their own self-study as a result of working with different audiences. The study of audiencing, as visual researcher Gillian Rose (2012) notes, becomes a key feature of reflexivity in working with the visual. Another promising area of research can be seen in relation to memory work and teacher's self-study through the visual and in relation to addressing social justice issues. Strong-Wilson et al. (2016), for example, describe a project initiated by a group of teachers and teacher educators to engage in what they call multidirectional memory through producing digital stories. In another study by Strong-Wilson et al. (2015), teacher educators use the digital in relation to multidirectional memory in self-study to interrogate how they might address the colonial legacies of schooling in Canada and South Africa. Finally, we consider the potential of this work with new teachers. To date the transitions from being a preservice teacher working in someone else's classroom to being a new teacher in one's own classroom remain areas understudied in relation to taking up social justice issues such as gender equality. How might new teachers use cellphilming and other visual-reflexive tools in negotiating these new spaces?

Conclusion

In the first edition of the *International Handbook on Self-Study*, Griffiths et al. (2004) questioned why there was so little attention paid to social justice issues in the literature on self-study. Since then, the idea of self-study for social justice occupies an increasingly significant place in the field. In contexts where there are vast inequalities based on intersectionalities linking class, race, geography, and gender as is the case in South Africa, it is not surprising that self-study for social justice has come to occupy an even higher profile in professional learning, offering many implications for other country contexts such as Canada where attention to the shameful legacies of colonialism in relation to Indigenous education is vital (see Pithouse-Morgan et al. 2019). What we have highlighted in this chapter is a strong recognition of the social and political contexts within which our teaching takes place. Clearly it is important to ensure that both preservice and in-service teachers have opportunities to engage in work of this nature and to work toward building a critical mass of teachers who are able to engage in the difficult dialogues needed to bring about change in South Africa.

Contents

Abstract

Teacher education programs frequently have explicit courses and structures designed to prepare teachers for increasingly diverse social contexts. This chapter explores the value and inherent challenges experienced in employing pedagogies based on Boal's (*Theater of the oppressed*. (trans: McBride, C., & McBride, M.). New York: Urizen, 1979, *Games for actors and non-actors*. New York: Routledge, 2003) *Theater of the Oppressed* (TO) with pre-service teachers. It

begins with a review of social justice teacher education within the self-study literature as well as the unique value of arts-based approaches within self-study teacher education practices to promote social justice. We then offer examples of how we, as teacher educators, engaged in self-studies in the context of an arts-based student teacher seminar employing TO practices and how TO contributed to both the authors' and students' insights related to diversity, power dynamics, and cultural frames of reference. The challenges faced in using TO in teacher education are then examined for the lessons they offer teacher educators.

Keywords

Self-study · Teacher education · Theater of the Oppressed (TO) · Social justice · Forum Theater · Image Theater · Embodied practices

Introduction

> I perceived being oppressed and feeling silenced by my mentor teacher during my first seven-weeks of student teaching. (Mandy, a Caucasian, mid-career changer, student teaching in a 5th grade classroom including African-American, Latino, Asian, and white students)

> I talked to the students about English being my second language and how much more I would know in Chinese. (Lan, a young Chinese immigrant woman student teaching in a 4th grade classroom including African-American, Korean-American, and white students)

Teacher educators around the world are seeking ways to support teachers like Lan and Mandy whose linguistic and cultural backgrounds differ substantially from those of their students. Recent years have witnessed an ongoing increase in immigration which in turn has transformed the demographic population of teachers as well as the students they teach. In addition, there has been a rise in nontraditional teacher population – that is individuals coming into the teaching profession as a second or a third career (Olsen 2010). Such changes have caught the interest of education researchers and scholars who have been studying about issues of multiculturalism and diversity including its impact on the emotions and challenges that traditional and nontraditional teachers experience today in the context of ever-changing demographics.

We are mid-career teacher educators working in a private liberal arts university in the mid-Atlantic region of the United States. The question that arose for us, two teacher educators/researchers working within a certification program at the undergraduate and graduate level, was how we might use an embodied practice such as Theater of the Oppressed (TO) to engage student teachers like Mandy and Lan to further explore issues of power, privilege, and oppression. How might we engage them in critical conversations to understand their assumptions and cultural frames and imagine possibilities and new ways to interrupt and change the oppressive patterns and behaviors in self and/or institutions and communities? In addition, how might we use the learnings from our work to further our craft of using TO activities as teacher educators to create a socially just teacher education program?

In this chapter, we first provide an overview of the review of social justice teacher education within the self-study literature followed by an overview of the use of arts-based approaches within self-study teacher education practices to promote social justice teacher education. We then discuss one specific arts-based approach, namely, TO, as a tool for exploring issues of power, privilege, and oppression within a teacher education program. Finally, we highlight ways of addressing challenges of using TO within a socially just teacher education program and draw implications for future self-study research.

Part 1: Review of Social Justice Teacher Education Within Self-Study Literature

Across the landscape of self-study in teacher education, there is a shared urgency and passionate concern for issues of equity and social justice (Cochran-Smith and Lytle 2004; Hamilton and Pinnegar 2015; Kitchen et al. 2016; LaBoskey 2015). Topics related to diversity and diversity issues (including cultural, economic, racial, and gender) have been on the forefront in professional meetings (e.g., AERA, SSTEP) as well as in written academic materials such as journals, reports, etc. Specific to self-study of teacher education, attention to these issues has increased, as was called for in the last *International Handbook of Self-Study in Teacher Education* (2004). The distinct value of self-study of teacher education research in bringing about more democratic and equitable teacher practice was cited by many who reflected on its history (Brown 2004; Griffiths et al. 2004; Schulte 2004). These authors further cited the need for increased focus on issues of social justice in the professional knowledge generated in self-study of teacher education research. A review of titles, abstracts, and keywords in *Studying Teacher Education*, a journal of self-study of teacher education practices, revealed that between its inception in 2005 and 2010, 14% of articles are specifically referred to issues related to diversity or other terms related to social justice (multiculturalism, poverty, urban education, race, sexual orientation, etc.). Between 2011 and 2014, the average percentage of articles addressing social justice issues within self-study research was 23.5%, and in the volumes from 2015 and 2016, the percentage had grown to 47 of included articles explicitly naming topics related to the broad category of social justice.

Tidwell and Fitzgerald's (2006) professional learning text *Self-Study and Diversity* collected self-study research of teacher education with equity and access as focal issues. They explicitly acknowledge the responsibility of teacher educators to address the diversity and access issues inherent in schooling. They reflect that a central theme across self-studies addressing diversity was transformation through active learner engagement in both the pre-service in-service teachers being taught and the teacher educators carrying out the self-studies. Indeed, teacher educators engage in self-study with the explicit hope that new insight and shifts in perspective will influence their practice (Loughran 2002; Zeichner 2007). Brown (2004), in the *International Handbook of Self-Study of Teaching and Teacher Education Practices*, noted a paucity of attention to issues of social justice in the self-study literature

despite the growing body of educational research evidence for the powerful influence of teacher attitudes and beliefs on the culturally competent and just practice of educators. She notes that the methods, goals, and dispositions inherent in self-study distinctively align with the "messiness" and complexity of self-reflection in regard to our biases, prejudices, or limiting constructions with regard to race and class. She cites the contributions of the self-study literature at that time along with a call for further work in social justice self-study.

> It is through self-reflective inquiries carried out by educators whose dispositions embrace an open-minded, wholehearted, responsible approach to the teaching-learning process that we have gained an understanding of the race and class meanings that are embedded in their self-constructions and relationships with students, in the curricular texts and educational programs designed, and in educators' forms of resistance to social justice and transformative curricular design. It is through these self-studies that we may continue to gain insights into the particular ways in which the normalization of inequity manifests itself throughout the educational system, gain an understanding of probable means of intervention, based on the unique histories of the persons and institutions with which we are involved, and gain a profound understanding of the theoretical implications that this local work has for educational practice and hence, for teacher education. (Brown 2004, p. 568)

Brown (2004) calls self-study researchers to attend to this challenging work as a way to contribute to the democratic transformation of education at both the personal and institutional level. Griffiths et al. (2004) also appeal for more attention to issues of social justice in the self-study of teacher education. The authors took a dialogic approach in their exploration of self-study researchers' willingness (and unwillingness) to take on the work of developing professional knowledge specific to social justice issues. The authors' dialogue reveals the emotional complexity and perceived risk of this work, and they delineate the value of telling and listening to little, personal stories which serve to counter, disrupt, and critique the broader societal educational narratives and professional knowledge.

Schulte (2004) addressed the role of self-study in the development of professional knowledge in multicultural teacher education toward the goal of preparing teachers for diverse settings. She cites critical reflection about values and beliefs as a key to the teacher educator's transformative process through self-study. She sees the knowledge derived through self-studies from both the individual view of the teacher educator and the view of teacher preparation programs as important contributions to the professional knowledge related to preparation of teachers for diverse settings. Schulte, along with the other handbook authors (Brown 2004; Griffiths et al. 2004), call for the self-study research community to increase attention to issues of social justice, diversity, and multicultural understandings to promote a more socially just world. Their work laid the groundwork for an expanded body of self-study research, as well as the methodological standard to include the cultural, racial, and socioeconomic contexts where self-studies are situated and a grounding in the ethic of care and social justice in self-study practice and research (LaBoskey 2004, 2009; Pinnegar and Hamilton 2009).

While issues related to diversity are gaining more visibility in national and international forums, Zembylas and Chubbuck's (2012) work remind us that grappling with diversity on a day-to-day basis has an immediate impact on the emotional

lives of the teachers. These researchers assert that working in diverse classrooms creates additional emotional demands on the teachers.

The tensions that teachers, including student teachers, experience between knowing and being, theory and practice, and the technical and existential are dialogic relationships that are "produced because of social interaction, subject to negotiation, consent, and circumstance, inscribed with power and desire" (Britzman 2003, p. 26). For many teachers, these tensions produce negative emotions such as anger, anxiety, and fear and cause a state of exhaustion, hopelessness, or powerlessness that can impact their effectiveness and satisfaction with teaching (Bloomfield 2010; Britzman 2007; Merryfield 2000; Nias 1996; Olsen 2010), as well as their decisions, actions, and reflections (Zembylas 2005). Many times these tensions are held within one's body. Thus, teaching is complicated, emotional, interpersonal, and an embodied experience that is often important to the development of the emerging teacher identity. Like Sutton (2005) and Zembylas and McGlynn (2012), we believe that helping teachers to cope with the emotions of negotiating increasing multiculturalism is as valuable as helping them to learn the (academic) tools they will need to work in diverse and multicultural classrooms. Thus, in socially just teacher education programs, emotions play an important role in realizing or disrupting inequities.

The focus of social justice education is wide and varied. Some theorists/educators focus more on examining and challenging underlying structures (Apple 2000; Freire 1998), while others like Nieto (2004) and Souto-Manning (2011) emphasize the role of cultural identity. Bakhtin (1981) and Foucault (1984), on the other hand, examine ways in which the use of language privileges some groups while marginalizes others. Like Freire (2004), Zembylas and Chubbuck (2012) note the power of emotions to motivate transformative actions toward building a more humane and socially just society. All of these approaches reveal different aspects of oppression and thus are points of intervention. Thus, in this chapter, we see the purpose of social justice education is to (a) enable teachers to develop habits of heart and mind that are necessary for critically examining issues of power, privilege, internal and external oppression, and their own socialization within oppressive systems (Boal 2003, 2006); (b) allow teachers to engage in critically interrogating their own emotion-laden beliefs, examining privileged positions of power and socialized ways of seeing and being in the world (Zembylas and Chubbuck 2012); and (c) foster imagination to look for openings and possibilities and promote a sense of agency to interrupt and change the oppressive patterns and behaviors in self and/or institutions and communities to which they belong to create a more socially just world (Greene 1995; Hinchion and Hall 2016; Hooks 1994; Zembylas and McGlynn 2012).

Arts-Based Approaches Within Self-Study Teacher Education Practices to Promote Social Justice Teacher Education

Given the abstract and deeply internal nature of the self-directed explorations described in the process of self-study related to issues of social justice, we turn to the unique value of arts-based approaches to make visible the invisible under

examination in this emotionally complex work. Weber and Mitchell (2004) suggest several key features that make visual artistic modes particularly valuable for the representation of self-study research. Several of the cited features include reflexivity, capturing the ineffable, holistic communication, revealing the universal in the particular, making the familiar strange, embodiment, accessibility, and making the personal social and more activist. The marriage of arts-based approaches to self-study has undergone thorough examination as many self-study researchers now employ these methodologies in their work (Mitchell et al. 2013; Samaras 2009, 2010). This chapter seeks to consider a particular performative pedagogy, Boal's (1979, 2003) *Theater of the Oppressed* (TO), as a valuable arts-based tool for transformation and wholehearted exploration of limiting beliefs and expanded perspectives.

Placier et al. (2008) described the value of using TO within social justice teacher education. They noted developing teachers' expanded awareness of diversity and power issues in the work of teaching. Further, they found participants described the tools and vocabulary for problem posing and perspective-taking useful. Despite the resistance from students, engaging in the TO work with students resulted in improved attitudes and multicultural understandings in the program over time.

Published self-studies incorporating TO methodologies are small in number. Cockrell et al. (2002) engaged in a self-study collaboration explicitly seeking to discover the value of TO activities with pre-service teachers in achieving the desired outcomes in a course on teaching for democracy and social justice. Despite evidence of some expanded awareness of diversity, the authors' primary insights are related to the students' resistance to the TO activities. Bhukhanwala (2012) noted her learning from a self-study of her application of TO in a student teaching seminar. She noted that the activities offered opportunities to engage with developing teachers in critical conversations about their own cultural frames and how self-reflection through the TO activities enabled new awareness and agency in responding to challenging dilemmas. She also reflected on the important role the TO facilitator plays in shaping the conversation toward important underlying beliefs and cultural frames at the core of the Boalian underpinnings of the work and not getting caught up in the teacherly advice trap when teachers presented their real-life student teaching dilemmas from their classrooms. Forgasz and Berry (2012) presented a self-study exploring the potential of Boal's Rainbow of Desire as an enacted practice employed collectively by a teacher education faculty for reflection and professional development. They explored the potential of this TO activity as a tool for self-study and reflected that it "appears to offer a useful means of surfacing the problematic (via the enactment of an oppression) and seeing into, interpreting, and reframing experience (through employing a variety of viewpoints)" (p. 108). Additional and closely related self-study has explored various embodied pedagogies in teacher education contexts (Forgasz et al. 2014; Forgasz and McDonough 2017; McDonough et al. 2016).

Boal (2003, 2006) and Jordi (2011) assert that due to socialization and institutional practices, individuals often participate in the world in mechanized ways, and as a result, the human body is a site for feelings and oppression. Therefore, one part of social justice education includes becoming aware of one's habituated ways of

being and acting in this world. Embodied participation in arts-based practices has the ability to engage our aesthetic sensory capacities, awaken our senses, and (re) activate our imagination to look for possibilities – imagine what could otherwise be (Lawrence 2012; Greene 1995; Pagis 2009). Authentic engagement with embodied practices (such as the arts) offers an aesthetic space for us to tap into embodied emotions and embodied knowing – which concerns knowledge that may not be yet present in our conscious mind (Butterwick and Lawrence 2009; Forgasz 2014). Researchers like Forgasz and McDonough (2017), Lawrence (2012), and Satina and Hultgren (2001) assert that embodied knowing triggers affective knowing (emotions), which in turn triggers cognitive knowing. It is in the telling and retelling of our embodied lived experiences and/or our silenced voices through the arts (and other embodied and contemplative pedagogies) as individuals and as collectives that we make visible our thoughts and feelings. Furthermore, in listening to our experiences and those of others, we begin to deepen our inquiry and explorations of our lived experiences and imagined possibilities (Bhukhanwala 2007; Bhukhanwala and Allexsaht-Snider 2012; Bhukhanwala et al. 2016; Cahnmann and Souto-Manning 2010; Estola and Elbaz-Luwisch 2003; Forgasz 2014; Harman and French 2004). Like Butterwick and Lawrence (2009), we too argue that incorporating embodied learning and art forms (specifically TO) into a critical discourse fosters deeper learning and creates an aesthetic space for transformative learning. We define arts-based practice as a practice that employs a systematic use of artistic processes, the making of artistic experiences to illuminate, revel, understand, and examine lived experiences (Eisner 2008; Cole and Knowles 2008).

The process of effecting a change in one's frame of reference by critically examining those assumptions, perceptions, thoughts, and feelings that may be divisive/alienating and moving toward a more inclusive, self-reflective experience is what Mezirow (1997) refers to as *transformative learning*. Drawing from the work of Cranton and Taylor (2012), Dirkx (2001), Kroth and Cranton (2014), Mezirow (1998), and Mezirow and Taylor (2011), we define transformative learning as a shift that emerges from awareness that stems from critically reflecting on one's emotions and on a disorienting experience. The awareness (explicit and/or implicit) offers new possibilities that could allow for creating more open and inclusive ways of thinking and being in this world.

Part 2: Theater of the Oppressed: A Theoretical and a Practical Resource

A specific embodied and an arts-based tool that we have used within social justice education is Theater of the Oppressed. TO is not entirely a new pedagogy for self-study researchers. Forgasz and Berry (2012) published a self-study on teacher educators' own participation in Boal's Rainbow of Desire. They concluded that Boal's Rainbow of Desire technique engaged participants in a reflective practice and self-study by challenging their taken-for-granted assumptions and by integrating multiple perspectives they were able to look at their practice in new ways. Forgasz

and colleagues (2012, 2014, & 2017) have published widely on the value of using embodied pedagogies as a reflective practice. Placier and colleagues have also studied the use of TO in teacher education (Burgoyne et al. 2005, 2007; Cockrell et al. 2002; Placier et al. 2005a, b, 2008). They have written extensively about their use of TO with student teachers at their university in Midwestern United States to support their students' development of socially just ideals and their understanding of costs and privileges of diversity including self-study-focused projects. They highlight the value of building a culture of trust among the participants when exploring sensitive topics using TO activities.

Our work with creating spaces for social justice education in teaching and teacher education is also informed by Boal's *Theater of the Oppressed* (1979). This approach is grounded in the work of Freire's *Pedagogy of the Oppressed* (1970) and creates a safe aesthetic space for people to come together, rehearse for reality, and restore dialogue (Bhukhanwala 2007; Bhukhanwala and Allexsaht-Snider 2012; Boal 2003, 2006; Cahnmann and Souto-Manning 2010; Harman and French 2004). Furthermore, participation in Boalian Theater could provide student teachers with a tool that they could effectively use to engage in empathy and perspective-taking for understanding their students' perspectives and strengthening their relationships with their students and others (Bhukhanwala and Allexsaht-Snider 2012).

From a Boalian approach, active engagement and imagination can be realized in the aesthetic space. For Greene (1995), aesthetic spaces allow students and teachers to imagine as a way of engaging in empathy and perspective-taking: "It is becoming a friend of someone else's mind" (p. 38). Within this approach, theater is a reflection of daily activities, serving the function of bringing a community together for celebration, entertainment, and dialogue (Blanco 2000), as well as for posing problems and generating multiple possibilities, which can become stepping stones into different ways of thinking and acting (Popen 2006). Within aesthetic spaces, we dramatize our fears, give shape to our thoughts/perceptions, and rehearse our actions for the future. We "make possible imaginative geographies, in which opportunities for transitive knowing are freed up" (Popen 2006, p. 126) and transformative learning can occur.

Critical performance pedagogies such as Theater of the Oppressed can promote transformative learning by "giving voice to people, awakening the soul, and creating space for action, both privately and publicly" (Merriam and Kim 2012, p. 65). More specifically, the participants are involved in "identifying issues of concern, analyzing current conditions and causes of a situation, identifying points of change, and analyzing how change could happen and/or contributing to the actions implied" (Prentki and Selman 2000, p. 8). The reflexive and embodied nature of this approach allows us to understand the experiences in deeper and newer ways, imagine possibilities, and rehearse for future actions (Butterwick and Lawrence 2009).

Thus, we assert that in Boalian activities, teachers, through embodied participation, create a theatrical dialogue to interrogate their habituated ways of seeing and being in the world, the oppressive systems, and their socialization practices within these systems, voices, beliefs, and emotions that are silenced and finally to imagine ways to interrupt, change, and transform. Next we introduce the context of our

research on TO in teacher education. Several of the core practices regularly employed are described, and examples of our self-study of this practice are shared.

Context of Our Research Using Theater of the Oppressed Within a Teacher Education Program

Our broader study was situated in a teacher education program in a liberal arts university in the mid-Atlantic United States. The undergraduate and graduate student teachers participated in a voluntary, supplemental seminar during their student teaching semester. In this chapter, we draw on data from the five arts-based student teaching seminars that were offered on a semester basis over 2 years. The group size for each seminar ranged from 4 to 12 participants, featuring a blend of undergraduate and graduate level student teachers in the areas of early childhood, elementary, and special education, as well as dual certification (a combination of these areas of education). The participants were between the ages of 22–50 and included traditional undergraduate, graduate, and nontraditional career-changing pre-service teachers. The undergraduate students were earning their bachelors in education, while the graduate students had a wide range of backgrounds (e.g., Radio/TV/Film, Physical Therapy, Liberal Arts, Communications, Business, etc.). Two teacher educators (Foram and Kim) co-facilitated these seminars. Over the 5 semesters, a total of 34 student teachers participated in this study, 11 at the undergraduate level and 23 at the graduate level. Of these, 33 student teachers were females and 1 student teacher was a male. The ethnic makeup of the group included 30 Caucasians, 3 African-Americans, and 1 Asian student teacher.

Seminar Activities

The seminar met bi-weekly, and activities were developed in response to student-generated themes and issues of dilemmas identified in their student teaching contexts. Each week included warm-up games and other active norm setting and trust/community building. Of the many techniques that Boal has developed, in our work, we have used and will share some details about the following: Theater Games, Image Theater, and Forum Theater.

Theater Games

The games that we often employ are selected from *Games for Actors and Non-Actors* by Boal (2003). After an explanation and a demonstration, we all play the game and then stop to debrief. The purpose of these theater games is to provide varying structures to bring the developing teachers' lived experiences into our teacher education classroom for playful analysis, reflection, and reimagination. Games serve to create a shared, novel sensory experience which enlivens the senses and provides developing teachers' valuable shared data to be unpacked and reframed outside of the traditional language-based model of learning. As an example, we share our adaptation of a Boalian game titled "Walk" that we have often used in our work.

Walking often is a mechanized movement, and though we have our own individual gait, walking often alters according to place and the roles we play. Becoming aware of our walking can be a way in which one can get in touch with one's inner thoughts and feelings and those of others. In facilitating this game, the joker (facilitator) asks the group to come to the center of the room and invites them to walk around in circles, lines, or in a pattern they desire but in a way that would not cause them to bump into someone else and hurt them. The specific prompts we use are as follows: *walk like yourself*, *walk when in a hurry*, *walk in a garden*, *walk like a teacher in your school*, *walk as a principal in your school*, *walk as a child you adore in your present classroom*, *walk like a child you have difficulty connecting with in your present classroom*, and *walk like a teacher you would like to be*.

At the end of the activity, we take a few minutes to debrief and share what we became aware of through our participation in this embodied activity. The student teachers often share some of their metacognitive thoughts related to things they took for granted or things that may have become mechanical to them in their world. The awareness leaves them with a deeper understanding of themselves, others, and the influence of power in their relationships.

Forum Theater

The third Theater of the Oppressed activity that we will describe is called Forum Theater. In this activity, the teachers are invited to bring in the dilemmas they are facing in the classroom which are then enacted in a role-play format. After the role-play is initially enacted, the *spectators* (other prospective teachers in the audience) are invited to enter into the role-play to try out possible interventions and become *spect-actors*. The active spect-actors use this aesthetic theatrical space to rehearse interventions that they could consider using later in real life (Boal 2003). We play the role of *joker* (facilitator), who after each role-play invites the spect-actors (student teachers) to enter the role-play and enact their strategy. The spect-actors accept or reject the solution based on what feels right to them. In the final step, the participants reflect on the rehearsed strategies and try the strategies in the real world of their classrooms. The purpose of Forum Theater is to generate many possible solutions and engage the participants in critical thinking (Boal 2003) creating a self-repeating model.

Foram's Vignette: Jokering in a Social Justice Teacher Education Program

The vignette presented here highlights the teacher educator's experience of *Jokering* (facilitating) Forum Theater with pre-service teachers and the pedagogical insights she gained from examining her own practice.

For the self-study inquiry, Foram invited Kim to play the role of a critical friend. Kim was a co-facilitator of the student teaching seminars. As a result she shared an understanding of the context and experience and had ample opportunities to observe Foram in the seminar meetings. As noted in self-study literature, critical friends provide a supportive and a nurturing environment to allow for both intellectual and emotional learning (Clark 2001; Kitchen et al. 2008; Samaras 2010). The specific data sources for the inquiry were as follows: videotapes of all the seminar meetings

which were reviewed to examine Foram's practice of facilitation of Boalian Theater activities; ongoing post-session notes from conversations with Kim, who served as a critical friend; transcribed interviews with student participants; and personal reflections on facilitations. The data were analyzed using open and axial coding (Strauss and Corbin 1998) to identify themes, categories, and properties.

Like other Boalian activities, in Forum Theater activities, the Joker plays an important role. Fundamental to Boal's theatrical process is a facilitator, someone who keeps things moving (Schutzman 2006), someone who takes responsibility for logical running of the TO activities (Cahnmann and Souto-Manning 2010), and someone who both supports the participants and raises critical questions to engage the spect-actors in critical thinking (Osterlind 2011). Boal refers to this person as the "joker," in reference to the wild card in a deck of cards. Just like the joker in a deck of cards, a TO joker can also assume a role as needed, "sometimes director, sometimes referee, sometimes facilitator, sometimes leader" (Linds 2006, p. 122), and sometimes spect-actor, engaging in a discourse of posing questions, examining social structures, and generating possibilities (Boal 2003; Schutzman 2006).

In Forum Theater presentations, Boal typically played the role of the director, facilitator, and critic (Boal 2006). After generating multiple possible interventions to the same situation, Boal asked the spect-actors to consider if the intervention were real, could it happen? By asking such questions, Boal engaged with the spect-actors to challenge and problematize any overly simplified solutions that had been offered. Through the processes of generating possibilities and examining the "realness" of the solutions, the TO participants engaged in a "rehearsal for revolution" (Boal 1979, p. 155).

On examining her role, Foram learned that as a teacher educator, she too wore multiple hats in her classroom that included taking responsibility for the logistical decisions of TO activities; selecting TO structures to work with; supporting, inviting, and engaging students (including those who were shy and tentative); addressing the audience by posing questions to examine the situation and realness of the solutions; and jumping in to "spect-act" when appropriate.

During the seminars, many of the student teachers brought to light the challenges they experienced with student(s) in their elementary classrooms. In posing these challenges, they often raised issues around classroom management and searched for strategies that could help them to "fix" the behaviors of their students. Foram often noticed an absence of the critical perspective in exploring these tensions despite having been exposed to these ideologies in their coursework. She wondered about the role she could play as a teacher educator in helping students to develop a critical lens and supporting them as they critically examine their assumptions and cultural frames in making sense of diversity. It was through the ongoing process of debriefing with Kim that she reflected on her assumptions and recognized that somewhere she was taking for granted that the students could automatically engage in critical reflections. She came to see the value of including explicit and intentional questions that could have the potential to engage the students in critical reflections.

Taking this awareness into her classroom as a TO Joker, she generated a series of questions that she could use to engage her students in critical reflections: What happened in the enactment? What are the power relations among the characters? What type of relationship does this protagonist establish with the antagonist in this scene? What could be the protagonist's thoughts and feelings? What could be the antagonist's thoughts and feelings? How does this scene end? What other strategies could possibly lead to a different outcome, especially an outcome that could be more humane and democratic and would establish an open channel of communication?

We next share an example of a Forum Theater activity that illuminates Foram's role as a joker in promoting critical reflections on examining one's assumptions and cultural frames in understanding difference.

Why can't they just be quiet? Jessica∗ (a pseudonym), a Caucasian student teacher teaching a diverse group of second-grade students in a suburban school district, came to one seminar meeting describing her frustration with her students' failure to follow directions and her inability to understand why they would continue to talk despite being told over and over again not to do so. After the role-play was enacted and a few responses generated by the spect-actors, the joker (played by Foram) raised questions to engage Jessica and others in further exploring the assumptions she could be bringing into the interpretation of the situation.

> Foram: Jessica, who is a "good" student?
> Jessica: Someone who follows directions and someone who does not have to be told things over and over again.
> Foram: What were your experiences with talking in your elementary classroom?
> Jessica: (Straightening up) Oh, we never talked.
> Foram: You never talked. Why did you not talk? Were there rules about talking?
> Jessica: I went to a private Catholic school. Our teachers told us once and as students we complied. Our teachers never had to say things over and over again . . . (Sharing her insight). I guess I am expecting my second graders to be like how we were growing up in a Catholic school environment.

Having awareness about her own cultural frame, Jessica was able to see how this could be impacting her interpretation of student behavior. Jessica reported that she could now see the humanity of her students and was more willing to be tolerant of their "chattering" behavior. She explained that having this awareness helped her to question her expectations and engage in perspective-taking as one possible response to understanding difference.

Based on our experiences of facilitating TO activities within a classroom context, we have come to recognize that the joker plays an important role in supporting the student teachers to reflect critically. We learned that asking explicit questions initiated students to engage in critical conversations regarding their assumptions and cultural frames.

Image Theater

In Image Theater, participants mold their bodies as if they were made of clay, and they may begin to feel the dynamic nature of a world that can be (re)created (Boal 2006). For Boal (2003), in Boalian Theater, images do not remain static. Instead the images are a beginning point and can be transformed to convey further direction or intention. In Image Theater specifically, participants are invited to make still images of their lives, feelings, experiences, and oppressions. Boal (2003) argues that images reflect memories, imagination, emotions, and visions of a future world as we want it to be. For him, images are translations, where the sculptor of the image and the readers of the image "bring things that exist within one context to another context" (Boal 2006, p. 41). In this sense, image is a metaphor as it is a symbolic representation.

In a metaphorical and a visual way, images could specifically help teachers to interpret their work. Lakoff and Johnson (1980) explain that metaphors are symbolic representations and require an understanding and experiencing one kind of thing in terms of another. For example, Johnston (1992) argues that images help teachers put their perspective in a nutshell and cut across different layers of their experiences.

Our purpose for introducing Image Theater was to engage the participating teachers in expressing their deeply held beliefs and perceptions about themselves, their relationships with their students, and their purposes for teaching. We would begin the Image Theater activity with a prompt and then invite the participants to create a frozen image by molding their body as if they were clay, followed by naming their image and reflecting on their individual and the collective images. A few examples of the prompts that we have used are as follows: "Images of your classroom today," "Images of the issues you have grappled with during teaching," "Images of your perceived strength as a future teacher," "Image of a future teacher," and "Your metaphor as a teacher." In our work, we have noticed that creating embodied images and reflecting on them thereafter lead to other possibilities of thinking and feeling. These possibilities are rehearsed, and in this way, the process becomes self-repeating.

Occasionally, we have extended the Image Theater activity by adding an arts-based activity right after creating embodied images to deepen the reflective engagement with image work. For this extension activity, we use Play-Doh as a medium for the participants to share and reflect on their symbolic and/or actual representation. The following vignette highlights Kim's learning about her identity and biases through her participation in Image Theater followed by an arts-based activity using Play-Doh.

Kim's Vignette: Using the Arts to Reflect on Professional Identity and Biases

Using Image Theater with students as part of their arts-based student teaching seminar, we first invited the participants to create an embodied image of a metaphor that would best describe their teacher identity. After the participants created their embodied image and labeled it, we then invited them to create an arts-based representation using Play-Doh. Creating and reflecting on her metaphor, Kim became aware of how her engagement in the arts-based seminar created insights

and tensions that resulted in changes in both her self-perceptions and consequently her professional development. Kim has shared her learnings from this experience at the Self-Study of Teacher Education Practices Conference (Dean and Bhukhanwala 2014).

Kim served as a co-facilitator of the arts-based student teaching seminar, and in the Fall of 2013, she undertook a self-study of her learning through the arts-based approaches about her identity as a developing teacher educator. Foram served as a critical friend for this study, and the data sources included session video, photos, artifacts, session debriefing and planning noted, as well as in-session journaling and written reflections.

As part of our work with student teachers, we engage with the students as a strategy to build shared context as teachers and to model risk-taking for our students. Aligning with a Boalian approach to attending to power dynamics, this strategy of joining with students in the work reflects Schulte's (2004) perspective that, "By engaging preservice teachers in transformative experiences while simultaneously modeling one's own transformation process, a teacher educator is providing two experiences to the preservice teacher: how to be transformed and how to transform others" (p. 714). In an activity exploring teacher identity, Kim employed the metaphor "trampoline" as her teaching metaphor. She noted in her reflection that she saw herself as a teacher who accepted students and the energy they brought to learning and then served to ignite passion and enthusiasm in the students such that that energy increased at an exponential rate and the students were thrust to higher levels of engagement, commitment, and learning. This aligned with her long experience as a school-based inclusion facilitator, where she frequently spoke to resistant audiences and honed her skills in "selling" and "igniting." The trampoline metaphor captured Kim's perceived strengths (spontaneity and responsiveness) and resonated with the positive aspects of evaluations she received in her teaching.

The following semester, Kim chose to develop a new metaphor based on departmental restructuring of the school of education which resulted in the need to formalize many informal structures and develop new roles and protocols. This led to significant role diffusion and a feeling of chaos that caused some anxiety for Kim, and she felt that she needed to be more organized and structured to cope with the demands this shift placed on her. The trampoline metaphor felt too uncontrolled and lacking the structure she felt was demanded of her approaches to practice in her work.

A second impetus for revisiting her metaphor was her developing insight about her expectations of passivity in students. Kim reflected that in the context of the arts-based seminar, she often was struck by the powerful insights the students shared. Some of these students had previously been in courses that Kim had taught, but she had perceived these students as somewhat disengaged. This was based on their reserved participation in discussion. Her first instinct was to identify these students as different from her in their more quiet nature in the classroom. She reflected that she was privileging verbal engagement and the social skill of mirroring her enthusiasm. Further reflection revealed that several of the students who most "surprised her" were African-American. Participating with students in Theater of the

Oppressed and arts-based activities helped her to see these students in a different light and understand that her expectations for depth were based on the students' communication style and thus, for many students, were mistakenly low. Many of the activities we facilitated created opportunities for the students to reflect and engage deeply in a context where permission for risk-taking was explicit and participation was highly contextualized to individualized, student-centered funds of knowledge. Tidwell (2002) notes the challenge of teacher educators is to value the students' ways of knowing and ways of negotiating their learning, an understanding which Kim found through reflection as well.

Insight into her faulty expectations of passivity in students as well as her flawed beliefs that her energy and passion were a key impetus for student engagement rather than the students' deep connection to their experiences and construction of content knowledge lead her to explore a new metaphor. This new metaphor could help her to reimagine her interactions as a teacher educator outside the arts-based seminar and in her teacher education classroom. She devised a metaphor to help her support students in taking more ownership in their learning. Kim changed her metaphor of teacher as a "trampoline" to teacher as a "ladder." For Kim, "ladder" represented more linearity, structure, and focus as opposed to the diffuse energy of the trampoline. This metaphor reflected the value Kim newly placed on the students' agency in climbing, reaching, and claiming their learning. However, Kim felt that this metaphor was "forced."

Later in the semester, participants were invited to transform their metaphors by altering or recreating their artifact. At this point, Kim chose to construct a blended metaphor that pulled together the inherent strengths present in the "trampoline" metaphor and the "ladder" metaphor. She named her combined new metaphor as "scaffolded trampoline." She noted that she saw this configuration as an addition of structure to the model of enthusiasm and passion instead of a replacement. This allowed room for Kim to value the passion and enthusiasm she modeled for students while consciously creating space for students' ownership of their learning and explicit reminders to create space, classroom climate, and explicit expectations beyond traditional classroom discussion and writing assignments for all students to make visible their passion and transformation.

Thus, through the embodied processes of creating images and/or arts-based representations, Kim examined her beliefs, biases, and ways of being within her practice. The TO activities allowed her to see her students in a new light and then engage in an activity asking her to transform her vision of herself as a teacher served as a tool for powerful and uncomfortable insight. Kim became more self-aware, and in turn her practice became more focused on empowering student voice and power in the learning process. This shift reflects the outcomes Schulte (2004) cites when teacher educators engage in critical reflection of their practice:

> The transformation of teachers can also lead to more democratic classrooms where teachers recognize the power dynamics in educational processes and society. When teachers make these power dynamics explicit to their students, they also put up for examination the teacher's power within the classroom. The primary goal is that through better understanding

themselves and their positions within their classroom, teachers will begin to better understand their students, especially those who are different from them. (p. 712)

Enacting arts-based explorations allowed her to imagine new possibilities and new ways to reimagine her practice as a more aware and socially just teacher educator.

Part 3: Addressing Challenges in Using Theater of the Oppressed Toward a Socially Just Teacher Education Program

In their work, Placier et al. (2008) identified both the value of using TO within social justice teacher education and the potential challenges they experienced. Challenges such as student resistance to TO activities and their resistance to the notion of "oppression" were two of the biggest obstacles they encountered. We agree that resistance creates a block to the experience itself which may then impact the learning from the experience. Similarly, Forgasz and McDonough (2017) have identified willingness to be vulnerable and unfamiliarity to the pedagogy as posing two additional challenges when working with embodied pedagogies such as TO. Lawrence (2012) argues that "promoting embodied pedagogies often means breaking through boundaries and challenging dominant ideologies and epistemologies that tell us our minds are the primary sources of learning" (p. 76). We have noticed this as being true in our experiences of working with TO activities as well.

Grounded in our learnings from using TO within teacher education (Bhukhanwala et al. 2016), we argue that a teacher educator who wishes to use TO in his/her classroom should first seek some form of experiential training both as a participant and as a facilitator. The activities should be used intentionally, and an effort should be made to create a conducive learning environment. We have identified the following characteristics that could support the students in participating in embodied activities such as TO and in examining their frames of reference and eventually imagining ways to transform them.

A Shared Ordeal

The seminar brought together groups who were experiencing similar dilemmas at a given time. This shared understanding allowed peers to empathize with, support, as well as learn from one another. We believe that this was an important characteristic, because when student teachers perceived that someone else's dilemma was similar to their own or they were also likely to experience this dilemma in the future, the student teachers took ownership in the learning (Bhukhanwala et al. 2016). They took a stance of a learner, rather than the stance of an "expert." From the stance of a learner, the student teachers were more likely to put themselves in the situation, examine their frames of reference, generate possibilities for themselves, and learn those generated by others. In this sense, student teachers worked in a safe space to rehearse for reality.

On the other hand, when the student teachers took the stance of an "expert," they were more likely to exclude themselves from the situation and suggest what someone else could do to fix the situation. From our perspective, Boalian Theater is more about rehearsing possibilities and engaging in collective problem-solving, rather than "telling" or "fixing." Thus, having a shared ordeal allowed for student teachers to take ownership and take the stance of a learner, which in turn supported the work.

Starting with a Participant Dilemma

Student teachers can take ownership of their learning process when the disorienting dilemmas explored in the seminar meetings come directly from their lived experiences. In these instances, student teachers are more likely to see the relevance of their participation to their life outside the seminar meeting and are further motivated to work through the dilemmas, imagine possibilities, and take action.

Creating a Safe Space

It is important for participants to feel safe when engaging in this work since, for many, working with an embodied pedagogy itself is a relatively new experience and often puts them outside of their comfort zone (Bhukhanwala et al. 2016). Therefore, it is important for facilitators to take intentional steps to create a safe space. We did this by creating group norms with the participants early in the semester. Some examples of the norms the groups set include keeping confidentiality, being respectful, listening rather than passing judgment, stepping up, and making the experience new. We (the facilitators) often added an additional norm that involved being playful and playing within the parameters of one's own body. Our purpose in adding this last norm was to help the participants recognize that they had a choice in deciding how they wanted to participate and how much they wanted to share.

Being Vulnerable and Learning from Experiences

All participants and facilitators engaged in the activities and took turns taking risks and being vulnerable. As facilitators, we made this nature of the work explicit to the participants and modeled it for them through our participation as well as by listening, supporting, and scaffolding the participants in their moments of vulnerability. For example, in arts-based activities like Play-Doh and pipe cleaners, we (the facilitators) too shared and examined dilemmas we experienced as teachers in our university classrooms. Like the student teachers, we used the aesthetic space to examine our frames of reference, engage in imagining possibilities, and connect and empathize with our students.

Empathetic Peer Involvement

The activities often involved working and collaborating with peers. We have noticed that the group benefits most when participants come into this work from a frame of reference that is more situated in empathy and learning, rather than in advice-giving. For peers to empathize, they need to recognize the connections between their experiences and the dilemma being presented and then engage in generating solutions as ways of creating possibilities, not only for others but also for themselves (Bhukhanwala et al. 2016). We encouraged and reminded participants to ask themselves, "How is this true for me?" when exploring peers' dilemmas.

Role of the Facilitator

Facilitators play a variety of critical roles in optimizing the value of the TO activities. These include creating a safe environment, listening to disorienting dilemmas, selecting Boalian and other arts-based activities that could best support the examination of a dilemma, engaging the participants in an embodied critical reflection and a discourse, inviting participants to imagine possibilities, and guiding them toward newer frames of reference that could enable the student teachers to have agency to transform an oppressive or a divisive experience to one that felt more inclusive, democratic, and humane.

Implications for Self-Study and Self-Study Research

Through self-study research, we have come to understand that teachers today are posed with new challenges. Many teachers perceive teaching to be a complex experience as something to "survive," as opposed to a time of profound growth and transformation. The emerging tensions are often held within one's body, making teaching a complicated, emotional, interpersonal, and embodied experience. By examining the participants' experiences and their discomforting emotions and critically reflecting on our own experiences and emotions as facilitators/participants, we have come to see that TO activities offer rich opportunities for learning within a teacher education program seeking to be socially just.

Furthermore, in using Mezirow's (1997) framework for creating transformative learning experiences, we found that arts-based approaches can offer a space for transformative learning. Through embodied theatrical dialogue, these participants (a) made visible their dilemma and discomforting emotions; (b) reflected on their beliefs, thoughts, feelings, and assumptions; (c) engaged in perspective-taking; and (d) used imagination to redefine the dilemma and/or rehearse possible alternative actions. Through embodied engagement, teachers identified new ways of engaging, negotiating, and using their voice and agency to change a divisive and power-driven relationship to a more open, inclusive, democratic, and humane one.

The challenges that we experienced when studying TO as a teacher education practice are as follows: (a) our seminars required voluntary participation, while all students were required to attend a mandatory seminar each week throughout their student teaching seminar. This slightly impacted the duration, frequency, and participation of the students in the TO-based seminars; (b) during analysis, we drew much of our data from photographs and videos of each seminar meeting. These methods allowed us to generate rich and robust data. However, we also learned that viewing hours of video data was time-consuming and pushed us to become more systematic and disciplined in our work; (c) while critically reflecting on our practice and our assumptions and biases, we found that we had to stay open to what we found. Sometimes this became a partial challenge, and working with a trusted critical friend allowed us as researchers to be both human and at the same time willing to look at our assumptions in new ways; and (d) we experienced moments of tension when our insights from the work revealed less than ideal aspects of our program, and we took the learnings from our larger research study to make programmatic changes that went beyond our own classrooms.

To further this work, we invite teacher educators to engage in collaborative self-study and experiment with TO activities. Collaborative self-study creates safe spaces for teacher educators to experiment, to be tentative, to be vulnerable as well as to challenge each other's taken-for-granted assumptions, support learning, and provide feedback. In addition, we encourage them to share their learning about using TO activities in socially just teacher education programs as a way to continue the dialogue and to further deepen our collective knowledge and craft.

Abstract

Situated within the framework of intersectionality, this self-study examines how being a Black, middle-class, female educator, and parent of a child with a disability influences my personal and professional learning. In this chapter, I present vignettes of teaching moments that detail how my experiences as a parent informed my roles as teacher and teacher educator. My classroom interactions with several students with disabilities in addition to my feelings of exclusion as the mother of a school-age child with autism shed light on four guiding principles I learned to embrace as the cornerstone of my teaching dispositions and pedagogy: *person-centered*, *strength-based*, *flexible*, and *reflexive*. Through storytelling, I examine significant moments of tension between my teaching practices and my parenting beliefs that represent how traditional ways of teaching often marginalize and disregard the cultural capital of students and families of color, especially those with disabilities.

Introduction

2004 I can hear my own words echoing in my head, "I have no interest in teaching special education, students, or otherwise." I was entering my second career at 26, and I'd just begun my teaching career as an alternate-route certified high school English teacher. My only confidence rested in my love of literature. I knew English content, I knew how to connect with students, but I did not know how to connect my content with my students. I did not know if what I was teaching was working, if students were learning, and if it worked because the students and I had a good rapport or because they were genuinely interested in what I had to say. I felt safe resting in the knowledge of my own intellect, the teachers' manuals, and the support of my peers, but honestly, I knew that was not enough. As a new teacher, I also knew there might be students whose learning needs exceeded my teaching capabilities. My novice teacher self-efficacy in teaching students with special needs was exceptionally low (Sze 2009), and I believed the stakes for students with special needs were too high for me to be insecure and unprepared. Not only did I question my ability to teach students with special needs well, but I also had little interest in learning how to. I never thought I had the patience or the skill to teach students with disabilities, let alone the patience to develop the skills it would take to do so successfully. Those were the students who made me nervous.

Part 1: Acknowledging the Tensions Our Multiple Identities Bring to Teaching

Raising Autism

I have two children, a 15-year-old daughter, Nile, and a 14-year-old son, Avery, who is living with autism. Autism and autism spectrum disorders (ASD) are described as neurological impairments that affect one's social communication, reciprocal inter-actions, behavioral rigidity, and repetitive behaviors (Center for Disease Control and Prevention 2016). Avery was diagnosed at 21 months old, and when you have a child who is diagnosed with autism, you also have a family that has autism. To others, I have described autism as a different way of seeing, hearing, thinking, and feeling, and this definition has worked for us. It demanded that I see things differently from the way I experience or remember them. Raising a young, gifted, and Black son living with autism comes with its own set of challenges, rewards, rules, and expectations. It comes with questions that I grapple with every single day, as a parent, educator, entrepreneur, and marital partner.

The identities of being a Black, middle-class, female educator while embracing the culture of (dis)ability give me unique, complex, and often contradictory perspec-tives on the ways we enact schooling (Brown 2004; Elijah 2004). For example, the educator in me is risk-taking and wants to change the world through knowledge and empathy, while the Black mother in me wants to protect my children from harmful teachers who believe school culture is more valuable than family culture. My personal and professional worlds have collided as my young Black autistic son is navigating through the educational system. This collision sits at the heart of the tensions I have attended to as an educator and parent because my son is identified as both Black and having a disability.

Meeting the educational needs of children like mine – children with layered identities who have been historically minoritized (Sleeter 2011) – is a complex task that requires teachers and teacher educators to develop a critical sociocultural consciousness that allows them to acknowledge how power, race, privilege, and ableism shape their beliefs about students and their teaching practices. Therefore, the purpose of this self-study is to acknowledge the intersectionality of my identities and explore, with specificity, the complex and sometimes contradictory positions of being an educator and a parent of a Black man-child with autism. Intersectionality, as Crenshaw (1989) describes, aims to disrupt the privileged norms that undermine the experiences and voice of the Black woman. It allows for a "both-and" under-standing rather than an "either-or" compartmentalization of one's multiple identities.

In this chapter, I present conflicting and often competing narratives – representing the culture of schooling and the ways teaching culture marginalizes and disregards the cultural capital of families of color (Brown 2004; Lalvani 2015). First, I acknowledge my relation to race, disability, and teacher education and situate my understandings within the literature on intersectionality. Next, I discuss the relevance of self-study to teacher learning. Then, I explain my self-study methodology and

present several narratives from which I draw my findings. Last, I close with implications for teachers and teacher educators. This self-study examines the following questions:

- In what ways does being a Black parent of a child with a disability influence my personal and professional role as a teacher and teacher educator?
- What have I learned from my personal experiences that helped me to be a more empathetic and socially just teacher?
- How have I used my experiences to challenge teachers to think differently about children, families, and their own pedagogy?

Growing Up Black

Over the course of my career, I have taught hundreds of students. The ones who transformed my teaching, my thinking, and my beliefs about students, families, and teachers remain fresh in my memory as if it were only yesterday that they sat in my classroom. Reflecting back, I realize that I have always advocated for the students whom I believed to be marginalized. Maybe that was because I, too, felt marginalized. Growing up as a middle-class Black girl in predominantly white schools, I rarely saw people who looked like me in my schools – students or teachers; yet I was expected to speak for "all things Black" (Hooks 2003; Kelly 2007). During those years, 1985–1995, Black teachers only represented eight percent of the teaching force with no Black teachers in my elementary schools, one in middle school, and a handful of teachers in high school. Excluding my family, my academic cheering section was silent while being loudly praised on the field hockey athletic field. My family taught me that I would have to work harder to be viewed as academically capable.

Fortunately, I grew up around Black educated women educators. My mother was a teacher, and it was no surprise that her friends were teachers as well. What I remember most about growing up in the hallways of her high school, where she was both a student and teacher, was how those women found ways to bring their entire selves to the classroom and school community (Maloney 2017). They shared themselves, their talents, gifts, and values with their students, even when it conflicted with curriculum and school practices. The experiences I had with my teachers were very different. My teachers were white, and the focus of the instruction was not particularly culturally relevant or responsive (Ladson-Billings 1994; Villegas and Lucas 2002). I was not privy to my teachers' lives and experiences in the way that I experienced my mother's friends, and it was not until later that I realized my teachers did not have to make a conscious decision to bring their values into the classroom in the ways my mother and her friends did because my teachers' values were hidden and embedded into the very fabric of the educational system (Annamma 2015; Beyer 2001; Brown 2004; Freire 1998, 2000; Ladson-Billings and Tate IV 1995).

White middle-class beliefs about schooling, students, and the purposes of education were already present as evidenced by one-size-fits-all discipline

practices, Eurocentric curricula, teaching strategies, and ways of engaging parents (Casey 2011; Crenshaw 1995; DeMarrais and LeCompte 1999; Labaree 1997; Yosso 2005). In this way, I experienced my mother's beliefs about the practice of good teaching very differently than how I was being taught (Ladson-Billings 1995). When I became a teacher, I, too, desired to bring my entire self to my classroom (Hill Collins 2015; Maloney 2017). Most of my students were marginalized brown and Black students identified as disabled because of their inability to conform. Some of the earliest self-directed learning in which I engaged was on the topic of working with students with special needs in the general education classroom, an area I knew was crucial to becoming a successful teacher to all students. For me, educating students with disabilities became a driving force in my professional learning.

The reality of (perceived) disability in my classroom and in my home was and continues to be extremely personal for me. My dedication to these students in particular has become defining to my professional identity. I have taught students with disabilities in my classroom, advised them during extracurricular activities, and raised one in my home. Each of the students explored in this chapter represents a transformational part of my career development journey. They have been the most influential in developing my teaching beliefs, pedagogy, and self-efficacy as a mother, teacher, and teacher educator.

Part 2: Intersectionality and Self-Study While Black

Conceptual Framework

Throughout my doctoral studies, I have been wrestling with questions about intersectionality. That is, how do race, gender, disability, and parenting influence one's learning and practices as an educator? Intersectionality lends itself to taking a deeper look into my own motivation for teacher learning. However, as a Black woman, I wondered what I could learn as an educator from the racial undercurrents in my own narratives (Clandinin and Connelly 2004). Like others who engage in self-study, I believe there is power in storytelling. Storytelling has a way of bridging the gaps between cultures and allowing people to connect with one another on an emotional level (Elijah 2004). Storytelling also helps to document and clarify the different ways I come to know and understand the world around me (Hooks 1989). What could other teachers and teacher educators learn about me, my children, my family, and families like mine as a result of sharing my story? In essence, this project helped me to (a) understand what I could learn about my own intersectionality and teaching practices and (b) provide an opportunity for other teachers and teacher educators to learn about the ways in which storytelling through self-study could be used to help them learn more about their students and their lives (Brown 2002; de los Ríos and Souto-Manning 2015; Skerrett 2006; Villegas and Lucas 2002).

Hill Collins (2015) defines intersectionality as "the critical insight that race, class, gender, sexuality, ethnicity, nation, ability, and age operate not as unitary, mutually

exclusive entities, but as reciprocally constructing phenomena that in turn shape complex social inequalities" (p. 2). She asserts that issues of equity and social justice are challenges that can be addressed by examining intersectionality and education. That is, by looking at one's own identities, teachers can begin to disrupt the hegemony of schooling and enact practices that help to create equitable experiences for all students, especially those who have been historically marginalized. This chapter, which I share through a series of vignettes, details how my experience as a Black mother of a child with a disability influenced my interactions with several students with disabilities and sheds light on the four guiding principles I adopted from my own learning. It reflects major moments of tension that demanded a shift my beliefs and practices in order to meet the needs of my students.This particular project looks at my learning as a teacher through the conceptual frameworks of self-study (LaBoskey 2004) and intersectionality (Crenshaw 1989) and identifies the teaching dispositions I believe to be most critical and informative to my development as a Black woman, parent, teacher, and teacher educator.

LaBoskey (2004) describes the methodology of self-study of teacher education practices as a way for teachers to acknowledge gaps in their knowledge and learning but also with the intention of immediately addressing those learning needs for the benefit of both the students and themselves. Embedded within a self-study is the belief that knowledge is socially constructed and co-constructed, particularly between teachers and students. In this way, both parties are challenging one another to learn about themselves and each other. As such, narratives and counter-narratives are essential in examining one's beliefs and practices as a teacher. This study is no different, and teaching culture plays a significant role in the broader questioning of my teacher beliefs (Taylor and Coia 2009).

I liken parts of my experiences advocating for my son while embodying multiply-marginalized identities to those of women of color described by Sanchez-Hucles and Davis (2010) who discuss gendered racism and women of color in leadership. As a leader in my home, classroom, and school, my presence in professional settings is often perceived as threatening and disruptive to the mainstream narratives that seek to dismiss or invalidate my voice. Intersectionality sits at the cornerstone of my identities, and self-study allows me to explore them within my experiences understanding race and disability.

Learning how to teach students with disabilities in the general education setting presented many tensions that I desired to explore. LeDoux et al. (2012) found that when learning to teach students with disabilities, communication and collaboration with other colleagues in addition to meaningful and supportive professional development were critical to teachers' self-efficacy. Cassidy et al. (2018) also capture this sentiment when they state, "As high school educators with varied levels of experience in the field, we recognized our students were being taught to regurgitate information upon request, rather than to think, plan, and act independently. We found ourselves forgetting to teach the whole child, with the understanding that life skills played a significant part in their future success" (p. 34). Exploring the tensions and knowledge gaps within myself was going to require establishing new

teaching norms and a reframing of what I perceived my role as an educator and teacher educator to me.

Normality in my classroom often meant common standards for learning content and teaching to the middle, which inherently segregated students. Normality in my mothering often meant suppressing my feelings, ignoring physical pain, and defining my competence by the satisfaction of the patriarchy I was responsible to serve. In consideration of all of this, a self-study seemed to be the most appropriate way to investigate and examine my personal-professional learning in the broader context of race and disability because of its focus on the recursive duality and interconnectedness of both teaching and parenting. I used this research methodology to document my learning because it requires I use multiple lenses to reflect on my own lived experiences.

Additionally, self-study relies on storytelling which challenges both the teller and the listener. It challenges the teller to reflect and communicate authentically, and it challenges the listener to recognize that their lens is a filter through which they judge and understand an experience. This self-study positions me as both the teller and the listener and documents my experiences as I interacted with three very different students at various points in my career. Through the analysis of my own narratives, I question how those experiences challenged me to not just think differently about my teaching but also adapt my teaching accordingly (Clandinin and Raymond 2006). Additionally, a self-study provides the opportunity for me to present a counter-narrative to the traditional white, female, able-bodied voices of teachers in that this study is documenting how race and disability influence my expectations and personal learning (Milner 2007b).

My Self-Study Methodology

Self-study of teacher education practices (S-STEP) is a continually developing and useful field of research that focuses on the importance of teachers examining their own pedagogical lens and its influence on their planning, implementation, and assessment of instruction (Darling-Hammond and Hyler 2013; Loughran 2004; Taylor and Coia 2009). Couched within the undercurrents of race, gender, and disability, my developmental needs as a Black parent have informed and influenced my professional learning as a Black teacher.

For this study, I retrospectively wrote several narratives documenting transformational experiences in the school setting. From these narratives, I conducted a narrative analysis and reviewed them for mentions and notions of intersectional personal tension and professional growth (Clandinin and Raymond 2006). Most specifically, I focused on how disability and race influenced my motivation for teacher learning in addition to how that learning was enacted in my classroom. From this analysis, I identified the following central themes: *person-centered*, *strength-based*, *flexible*, *and critically reflexive*. These themes are defined and discussed in detail within the findings section.

I use the term *person-centered* to capture the idea that teaching practices should be focused on the student or person that is the recipient of instruction and not the priorities of the teacher. Person-centered instruction positions the learning needs and learning motivations of the learner at the center of instruction. *Strength-based* instruction focuses on the students' strengths and rejects a deficit-based approach to teaching. This approach to instruction uses students' strengths to actively supplement their growth areas. The theme of being *flexible* directly confronts the presumptions of power in relation to teachers and students. It acknowledges that oftentimes when working with students with disabilities, the assumed rules regarding power and authority may not be clearly understood by either party. In these moments, a posture of flexibility, which is in direct opposition to the traditional white, middle-class views of authority and power distribution, often allows for the compromising and revisiting of previously established expectations. Lastly, *reflexivity* refers to teachers' abilities to not only see themselves and their lenses but engage in patterns of behavior that require them to change their practices based on their new understandings. Reflexive teachers are constantly in a state of development and adjust their practices based on the needs of their students. The practice of reflexivity can often cause even the most successful of teachers to question their own effectiveness which is why it is critical for teachers to have the opportunity and means to collect data about their teaching as well as a strong support network of colleagues.

Lastly, a key factor of this self-study is the importance of using storytelling to recount and document my experiences from multiple and layered perspectives. As a parent, I want what I believe my children need and deserve from their schooling experiences. As a teacher, I understand the boundaries of education and what are reasonable expectations for my children's teachers. With that said, my sense of responsibility to my role as an educator often supersedes my role as a parent. For example, I have allowed my children to experience teachers who did not have the skills or disposition to support them in order to provide their teachers with teachable moments. These are tensions that I capture in this chapter and fuel my internal conversations.

In the following section, I present chronological vignettes highlighting moments of knowing that led to a deepened understanding of my students with disabilities and my own teaching pedagogy. These teachable moments often stemmed from my missteps. The first story recounts the very beginning stages of learning about autism and the benefits of applied behavior analysis as a therapy for autism. Through my interactions with my son, Avery, I document how his needs sparked my interests in disabilities studies and how my personal learning steered my professional choices. In learning how to teach my son, I also enacted that learning in my classroom as a teacher. The second vignette describes a student, Lisa, and details how my classroom became a laboratory of sorts to test the various techniques and strategies I was learning as a behavior therapist. Because I was not working specifically with students with autism, I learned to adapt those strategies to suit my needs. Lisa helped me to view my students differently. The third narrative speaks of a student with autism named Pierce. Through our interactions, I explore the ideas of hierarchy, power, deference, and compliance. Pierce challenged my beliefs about control, flexibility, and the willingness to negotiate.

Part 3: Disability, Race, Parenting, and Teacher Learning

2004: Is a Mother Not a Teacher?

When I began teaching, I was already 6 months pregnant with my second child. I mention this because teaching constantly engaged my motherhood and mothering. For example, much of the rapport I was able to develop with my students was situated in my ability to guide, correct, and even discipline them as if they were my own children. My mentor always told me that building rapport with your students was everything. If you could build good rapport with them, you could teach students anything. Oftentimes, their parents would approach me during back to school night or parent teacher conferences and express appreciation for how they could tell I embodied many of the beliefs and values they shared for their children. Few students even took the liberty to call me "mom." Although I may not have had the best teaching pedagogies and answers for my students, both students and parents trusted that I could care for them, shape them, and develop strong relationships with them. The majority of my students were Black and brown young men, similar to that of my unborn child. They became some of the first students to expose my teaching strategies as insufficient.

Like many of my students, feeling unprepared gives me anxiety. Nothing in all of my education and experiences could have prepared me for raising a Black son with autism. When Avery was diagnosed with autism at 21 months, I had been teaching for approximately 2 years. According to my teacher evaluations, I was doing well, but internally, I desired more. I knew what worked for me and my students in my classroom, but I did not know why it worked nor did I understand the theory to support my practices. I could not explain to another teacher why I did what I did. I just knew that it worked. I also could not explain why the same strategy would not work for them in their classrooms. They, like Avery, challenged my ignorance and demanded I learn how to justify my mothering practices.

For the first 2 years, Avery was the most accommodating and unbothered child. He rarely cried, would sit in the high chair without complaining, and could entertain himself in his crib for hours. His lack of interactions with the other children in our residence was what concerned me the most. He had no interest in playing with anyone else, and things that would have typically bothered the neurotypical child did not affect him. I thought maybe he was deaf. So, we took him to the audiologist, and his hearing was fine. There was something that was not fine, and we had yet to put our fingers on it. He did not yell, get scared, or seem to be bothered by anything. He had no visible desire to communicate with any of us. He expressed no need for words. Although Avery remained nonverbal until shortly before kindergarten, he was communicative. Unfortunately, most times, we could not understand what he was communicating. Every morning for 6 months, there were tears, screams, kicks, and tantrums from everyone in my home. I just wanted to get to work. I just wanted Avery to get dressed. While Avery was generally nonverbal, his symptoms of autism were loud, visible, and belligerent. The wrestle of getting dressed in the morning left all participants exhausted and defeated. Nothing I seemed to do would make

morning routine any more successful. I questioned my ability to mother and care for my child. I doubted my ability to meet the needs of my special needs child – a feeling eerily similar to my novice years as a teacher. Once again, the stakes were too high for me to fail, but in this circumstance, I did not have opportunity to choose my students, content, or strategies. I had no strategies, and nothing was working. How was I going to meet the needs of my students with special needs if I could not even meet the needs of my own child? In front of me sat a beautiful, Black toddler whom no one, especially his mother, was able to reach or teach. Avery's trajectory was looking dim. With the already existing disproportionality of Black male students in special education, an invisible disability such as autism could make Avery a prime target for unprepared teachers.

Avery posed a new set of challenges, a new set of accommodations, and a new set of rules with which I was completely unfamiliar. I said that I never wanted to teach special education, but now, I did not have a choice. Avery became my only student, and the stakes were too high not to do something about it. I had a brief window to reach my son and learn as much as possible as quickly as possible if I was going to help provide him with a better quality of life. There was a fire and a fury growing inside me to fight – fight past my own insecurities, my own limitations, and my prejudices. What would his teachers say about him when he misbehaved? What would they say about me? How many parents had I judged based on their child's behavior? What knowledge, skills, attitudes, and dispositions did I need to develop to be able to reach my son and number one student?

It was in that reconciliation between my head and my heart I knew I was not a good enough teacher for any of my students and that my learning as an educator was going to have to change. I was going to have to learn something different and do something different if I was going to give Avery or any of my students with special needs the chance to be successful in the institution of public schooling. I knew that as a mother I could love my child. But as a teacher I did not know how to teach him how to improve his skills, his behavior, or his communication. I was also afraid that not only did his teachers know less than I did about how to teach him, but they did not love him and were not compelled to learn about him in the ways that I was.

Autism was becoming deeply personal to me and my family. I believed that if I was a teacher who did not know how to teach her own child that there were teachers even further distanced from teaching a child with autism. Avery needed his teachers to be able to teach him with skill, love, and compassion. This required learning on all our parts. We needed to be person-centered in our priorities, strength-based in our strategies, flexible in our approaches, and reflective in our practices.

2006: Follow the Leader

My own personal and professional learning have always been tied to what I was experiencing in the moment, and all of my moments were about Avery. Avery was all consuming. Sometime around my third or fourth year of teaching, a young, racially ambiguous, gender-nonconforming student entered my ninth grade English

classroom. She was a student of color with a wavy ponytail, fair-skinned, and a slightly offset front tooth. She looked a lot like me. She was full of energy, her peers listened to her, and she always had something to say about everything. Her name was Lisa, and Lisa asked questions incessantly. Lisa had so many questions that neither me nor her peers could get a complete thought out of our mouths before she rattled off a series of more questions.

I appreciated her intuitiveness and willingness to engage in class, but her uncontrollable outbursts were beginning to make her classmates less and less appreciative of her quirks. Several students had expressed to me their annoyance with Lisa. She was constantly interrupting them, and they didn't feel they had the chance to speak as freely or process things as slowly as they needed to when she was in class. Lisa was a student who rarely missed class unless she was called out for a project in her cosmetology elective, and on those days, I could hear the true and uninhibited personalities of the rest of the class. I noticed a difference when Lisa wasn't present, but the class also needed to be able to function productively when she was present.

At home, Avery's early intervention behavior therapist recommended applied behavior analysis (ABA) (Alberto and Troutman 2003; Foxx 2008; Harris and Delmolino 2002) as the best intervention for children with needs like Avery. During his therapy sessions, I would watch her mannerisms, listen to her tone of voice, and try to memorize all of the strategies and tricks she used to teach Avery how to do what seemed to me as simple things like roll a ball or stack a box. I needed to know more. I needed to be able to be his teacher when there were no therapists around. I found a 15-credit Applied Behavior Analysis program and a 12-credit Educating Individuals with Autism program at Pennsylvania State University and enrolled in both of them simultaneously. I was teaching school all day and spending another 3 to 4 hours every night taking class and completing assignments. ABA was completely new to me. It wasn't like teaching in a classroom where you learn new skills that build on previously mastered skills. I was learning something completely new and outside of my wheelhouse. What I learned over the next 15 months would reshape my teaching practices and how I interacted with my students, how I listened to them, and certainly how I motivated them. Most importantly, I would have the skills to help Avery be more successful in school and at home as well help his teachers understand how to teach a child like mine.

ABA helped me to understand that in order to make my classroom a healthy and functioning learning environment for all of my students, I had to think differently about Lisa. I was going to have to shift my classroom procedures in order for this to work. Meanwhile, at home, I was doing the same thing for Avery. His tantrums were frequent and destructive, and something had to be done or my house would soon be destroyed. I began observing and documenting Lisa's calling out behavior to hopefully understand the underlying reasons why. In an 80-minute class block, Lisa was averaging 30–40 unprompted verbal responses. It seemed that when her comments and interruptions happened most, it was because she was trying to make sense of what we were discussing in the moment. In other words, she was processing her thinking aloud. This did not happen in group settings nor did it happen when she was working independently. Simply asking her to be patient or

think before she spoke was of little consequence. Lisa would call out what sounded like unanswerable questions, and it was driving her classmates crazy. At one point, the other students began to talk over her or ignore her, but their frustrations were growing because Lisa was controlling all of the airtime and therefore monopolizing my attention. I often wondered if my daughter, Nile, was also feeling this way at home since Avery was also monopolizing my time. It seemed that every thought and every conversation I was having at home was about Avery. My daily question of how I make Avery do what I need him to do always superseded everyone else's needs and wants.

At school, I needed to modify Lisa's behavior to help focus her own thinking but also to create a more participatory environment for the other students. I started with reminder notes on random students' desks. All of the notes in some way referred to the desired behavior I wanted Lisa to exhibit such as thinking before speaking, not interrupting others, and interacting with her peers. The desk notes read something like this: "Did the person next to me have a chance to offer her/his opinion?", "Is the question I have answerable?", or "Does what I have to say add or take away from the conversation?". Throughout this process, I also realized I had other students who had difficulty interacting with their peers. More notes appeared on students' desks: "Did I respond to my peers with respect?", "Did I offer my opinion today?", "Am I staying focused?" and "Did I write down my homework?". As desks and seating arrangements were constantly being rearranged, all students were benefitting from the note cards. These constant reminders were helping the class overall, but by now Lisa's other teachers were beginning to talk about her, the disruptive talking, and the possible need for a referral to the child study team for more specific interventions.

In my head, Lisa was Avery, and if other teachers were talking about Lisa, they were also talking about Avery. I needed something more individualized for Lisa. I began to reward her with praise when she raised her hand to talk and created a self-monitoring system that slowed her response time and allowed more students to participate. Instead of me creating something for her, Lisa and I discussed what I observed that we thought her interactions should look like and how we could create a plan to move forward to help her to reach her goals. I realized that if this was going to work for Lisa and all of us, she needed to be able to meet her own goals, not simply my goals. The same went for Avery. Although he was only in kindergarten and barely verbal, learning how to communicate with him and gain his buy-in on simple things like getting dressed in the morning was critical in accomplishing any task.

Lisa and Avery were shaping how I saw my students, my practices, and my willingness to compromise. It was in this year that I began to learn how to better handle power struggles in my classroom and in my home. I watched teachers all the time struggle to assert their authority and position in the classroom to make students comply. In those situations, the student ends up losing. Avery had autism, and compliance was not an easy task for him. My fear is that teachers who didn't understand what I'd learn about compromise were imposing their will onto Avery. He was never going to respond well to that kind of instruction, and his teachers were never going to be able to see the best in him just the behaviors they wanted to change in him.

2010: A Seat at the Table

It is always an odd dance of sorts no matter the partners or location. In every school, with every IEP team and with every new school year, my husband and I exchanged looks at the mandatory IEP meeting, each mentally deciding what role we would play and be expected to play in the decisions that would shape our son's educational experiences. Although my husband Michael and I were not strangers to this dance, most of our son's teachers seemed to be unaware there was even a dance taking place.

Michael and I had decided to uproot our family and move from comfortable South Jersey to rural central Pennsylvania so that Michael could pursue his doctoral studies. At the time, Nile was 8 and in the third grade. Avery, our son, was 6 and in the first grade. After 3 incredibly successful years in a preschool disabled classroom and a year in kindergarten at a P-3 neighborhood school in a small racially diverse South Jersey town, Avery was entering a new school away from everything he'd ever known. Until now, he had the same classmates, same one-on-one aide, same hallways, and most importantly, same teachers. He knew them, and they knew us. It felt so relieving to have such a good working relationship with his school and teachers. They didn't just know him; they knew us as a family. Avery's teachers were a huge part feeling comfortable.

Avery's preschool disabled teacher was fantastic. She was young, energetic, firm, and always willing to learn about her students and their families. Miss Armand was a young, white, teacher, who knew that if she was going to help the most vulnerable children in the school to be successful in school, her best allies and supporters were her students' parents. She once told me, "there is always something that I can do as the teacher to change the environment for my students." This attitude and belief system sticks with me to this day.

I was 31 and had been teaching English at a career and technical high school for 7 years; and honestly, I was ready for a brain break. I was granted a leave of absence from my school district to begin graduate school and landed a job working with preschool disabled children at a developmental daycare. But, I had some anxiety. I anticipated moving to central Pennsylvania would be a challenge. Special education procedures and laws operated differently in PA from NJ. Services we were used to receiving may not be available to us now. Also, the fact that we were moving from a racially diverse school to a school in rural central Pennsylvania concerned us a bit, too. Were the teachers going to be able to meet his needs? Were they going to want to meet his needs? Were they going to listen to us as Avery's parents and fellow educators? What about the fact that we were Black? Would that invalidate our expertise? Would they value our voices about Avery and his future? Did they value the voices of any of their parents? These were a lot of questions, and we would soon find out the answers to them.

We had no idea what to expect at that first full IEP meeting. I'd made sure to front load the new school with Avery's 137-page case history dating back to when he was 3. If they'd read it, they would have some reasonable understanding of his strengths, goals, needs, and certainly, how involved we were as parents. Still, I was scared for Avery. Michael and I sat at the conference table in the small teacher's breakroom exchanging

glances and trying to decide not only how we would position ourselves but how the team would position us. We were young, Black, educated, and informed parents of a child with autism. Would we be welcomed or perceived as threatening? Which one of us would be on offense? Which one of us would be on defense? It is only in hindsight that I realized that during those meetings, we were positioning ourselves as both allies and adversaries with the school personnel, positions we still hold today.

Avery's new teacher, principal, speech pathologist, occupational therapist, and school psychologist were all crammed around an inappropriately sized table. As the team discussed Avery's goals, objectives, and behaviors and we asked how he was progressing, Avery continued to be compared to all the other students in his class. For example, it sounded something like, "In comparison to his peers, Avery is . . . on target . . . behind . . . normal." I clearly remember Michael stopping the conversation because we'd never been in a meeting like this. Never had my 6-year-old Black son with autism been measured for success next to his white typically developing counterparts. He was one of two children of color in the classroom, and the other was born and raised in the same town that we now resided.

This approach to Avery and his learning was a problem for us because by all academic measures Avery far exceeded his peers when we enrolled him to the school, and now we were supposed to be happy that he was "normal." They were normalizing him. Their goal was not to grow him and push the boundaries of what he did well and supplement his areas of need. Their goal was to help him to fit in and be like all the other students. His exceptionality was being ignored or at least dismissed. I knew that Avery was never going to fit in because exceptional children aren't meant to fit in. Exceptional children challenge their environment and those in it. Exceptional children help point out that one size does not fit all and that the status quo is not an appropriate measure for student success.

As a teacher, I was supposed to hone my students' strengths and use those strengths to supplement their weaknesses. Avery's needs through the years helped me to understand that. But this school did not share this belief system. They had an awesome opportunity to learn about this child and their teaching practices, and they were letting it pass them by. For example, Avery had a photographic memory. He read the dictionary for fun and entered the first-grade reading on a third-grade level. Unfortunately, the language arts schoolwork he was given was first grade spelling words he'd already mastered in preschool. I suggested differentiating his work to meet him at his level. I suggested instead of spelling tests, which he was constantly receiving 100% on, why not challenge his areas of growth, and ask him to use the words in sentences or develop a list of synonyms.

As they saw it, their job was to make sure he could keep up with his peers. There was clear tension and dissonance in our values. A student could be gifted and receive special education services. It was absolutely possible, and I knew this to my core because I'd seen it in my own classroom. Some of the students who presented as having the most significant of challenges were challenging my beliefs about schooling and its purpose and function in ways that shaped my pedagogy. Although he'd never stepped foot in my classroom, Avery and his essence were living and emanating throughout my classroom and had infiltrated my teaching practices.

I was becoming the teacher I wanted my son to have. Why didn't Avery's teachers want the same thing? Were they already the teachers they wanted their children to have? Was the teaching culture holding them back? Was the bureaucratic nature of schools a barrier to innovation and differentiation? Were the teachers even prepared to handle a student like mine? Did they overlook Avery's exceptionality because he was Black? Were expectations lower for him because he was a student of color? All of these questions were racing through my mind as I tried to decide what was best for my son and what his teachers needed to know about him.

2012: For No Good Reason

I'd just returned back to the classroom from a 2-year leave of absence where I worked in the behavioral health field when I met Pierce. Pierce was a white freshman male student in my inclusion English class, and it was clear to me that Pierce was on the autism spectrum even before I took a look at his records. It should come as no surprise that Pierce had only ever had one teacher of color before he reached ninth grade. I wasn't just a teacher of color, I was Black and proud to be Black. I'm not sure how Pierce was making sense of this, but somehow, we managed to work it out.

Pierce loved three things: food, dragons, and drawing. Everything else was on the periphery, including school. Pierce wanted to study culinary arts which I found incredibly interesting because he was always hungry and wasn't allowed to eat the food in culinary arts. It became my habit to keep extra snacks in my desk so that Pierce could focus in class and not let his hunger distract him from our classwork. When Pierce was "hangry," a contemporary mash-up of hungry and angry, he had a tendency to growl and hiss at everyone. I found this incredibly entertaining, but his peers were less tolerant. Pierce was also a talented artist and helped me to understand how easy it was to isolate a person who doesn't conform to the norm or status quo. His head was constantly down, he hated working in groups and talking to his peers, and most of all hated being told what to do. Again, I felt like I was experiencing Avery in my classroom, every day.

At this time, Avery was entering the third grade. I was at the point in my career where I understood the concepts of applied behavior analysis (ABA), but I also knew that ABA was about achieving the results of the adult/teacher/therapist. We established the goals for our students; and we worked hard to push our students to reach those goals. It was prescriptive and was intended to produce a certain set of outcomes. However, in my own personal and professional practices, I knew that this was only a piece of the puzzle and not the entirety of the interventions Avery needed. In my home and classroom, I had begun to adapt ABA to consider the needs of the person. Lisa and Avery taught me how to do this.

My concerns for Pierce were not academic. He could do whatever I'd ask him to do. He just didn't want to. Finding ways to motivate him were extremely difficult because like any teenager, his moods and preferences changed every day. One thing was consistent, Pierce liked food. Pierce was the student who made me break

my "no eating in the classroom" rule and "stop doodling" rule and "bathroom privileges" rule. He showed me, repeatedly, that they were illogical, random, and often unnecessary. The day he finally yelled at me, "how am I supposed to control when I have to poop!", I knew I'd taken classroom management too far. What was I doing? Why was I trying to control my students' bodies? Why was what I wanted for him more important than what he wanted for himself? I had no good reason for making students comply other than for the sake of compliance and being in charge. They were learning to follow directions but they weren't learning from those directions.

Pierce was drawing further and further into himself, and I needed a way to connect his interests and his strengths with those of his classmates. As a teacher, I had the opportunity to use all of Pierce's interests as connection points for all the rest of the students. From then on in the semester, every example, every anecdote, every activity was based on what I knew about Pierce. For example, when I taught descriptive writing, I used dragons. Pierce loved dragons. This way, he was immediately drawn into the class discussion, and the other students easily adapted to the topic because they were relatable. When we broke into small groups, I was able to bring up the idea of autism because I used Avery as the example.

Throughout the course, Pierce and his classmates had a better understanding of one another and were much more accepting of each other's differences. We were all required to be flexible in understandings and expectations, and I believe we all grew as a result of that experience. I know this to be true because during the second semester of Pierce's freshman year, I had to cover the class for his culinary teacher. Pierce was once again snarling at his teachers and classmates, but because of how we practiced talking to one another and their familiarity with one another, Pierce's classmates from our English class were able to help advocate for him in other spaces. They knew how to diffuse his responses and modeled it for other students and teachers. Pierce's teachers, my colleagues, were grateful for the students' interventions because the students were able to set clear boundaries that even his teachers did not know how to set.

It was the same for Avery at home and at school, and this was important to me because Avery was also relying on his classmates, their relationship, and their compassion to help him navigate the hegemonic practices of schooling. For example, did it really matter that Avery wanted to sit in the blue chair when the teacher wanted him to sit in the red chair? Why was there a rule about not sitting in the blue chair? It was arbitrary, and if I was going to be a better teacher, I couldn't be an arbitrary rule maker. The stakes were too high. They were too high because the deck was triple-stacked against Avery. He was Black, male, and had a developmental disability. There were implicitly bias assumptions people, particularly teachers, already had of him because he was a Black male. Avery could not afford for his teachers to also be dismissive of him because he had autism. Both Pierce and Avery required that I be reflective about myself, my beliefs, and my teaching in order to help create learning environments that were flexible.

Part 4: Findings Through Self-Study

For the past 12 years, I have been engaging in critically reflective practices even before I knew how they were defined (Brookfield 2000). I challenged myself to push past my own limitations as a teacher and place the onus of responsibility for my students' success on me and not my students, just as I do as a mother. As with parenthood, some things in teaching are not easily controlled for or manipulated. In my experience, the teaching culture sometimes prioritized content over empathy and assimilation over individuality. However, the mother in me compelled me to choose empathy and individuality.

Lisa, Avery, and Pierce taught me four fundamental truths about my teaching. In order to help them to be successful, I needed to be *person-centered*, *strength-based*, *flexible*, and *critically reflexive*. That is, I was not the center of my classroom, my students were. If I were going to help them to learn, I had to know and understand their skills and strengths so that I could use them to supplement their weaknesses. I could not do that while focusing on my own needs and objectives which means I had to collaborate with them rather than demand their compliance. In order to do that, I had to be flexible in my approaches, ideas, understandings, and demonstrations of learning. I could no longer engage in the typical power struggles that so many teachers engage in because that is either how they were taught as students or how they were encouraged to teach as teacher candidates. Power struggles with students only damage students, and their parents trust us every day to do no harm. Lastly, I had to be critically reflexive, that is, learn from all that I was experiencing and choose to do something differently. This involved asking myself a series of questions. Was I creating an inclusive and equitable environment for my students with the greatest needs? Were the teachers around me? Were Avery's teachers? How could I be sure? I could not be sure. Therefore, I walked into every department meeting, IEP meeting, and teacher conference prepared for other teachers to be underprepared to meet the needs of my child and children like him. Similar to the ways that as a teacher I made presumptions about my students, their parents, and their experiences, I made assumptions about my own competency and the competency of the teachers with whom I engaged, both personally and professionally.

This self-study forced me to reflect on my own instructional practices, both within my home and my classroom, and revealed the overlapping dispositions of teaching and mothering. Described in the literature as *othermothering* (Hill Collins 2000; Mawhinney 2011), this phenomenon occurs when students are viewed and cared for by their teachers as if they were biological children. This concept is validated in the presented narratives.

Not only did I learn to attend to my students' needs in the same way I learned about my son, but I deliberately used the knowledge gained in one setting to inform another setting. In other words, my home was a classroom, and my classroom became a reflection of the struggles and successes I was experiencing with Avery. This could present as the following day's journal assignment, an interesting interpretation on a particular passage of Steinbeck's novel *Of Mice and Men*, or an

opportunity for students to engage in a conversation about their own strengths and limitations. I came to realize that as an othermother, my students could not afford for me to allow my teaching self-efficacy to excuse me from learning how to meet their needs. Toward this end during my fourth year of teaching, I founded Greater Expectations Teaching and Advocacy Center for Childhood Disabilities, Inc. (GETAC); and, for over a decade, I have spent countless hours reading, training, working, and advocating for families affected by autism spectrum disorders and educating the professionals who support them.

Similar to other self-studies that examine teaching through a critical lens, my personal background strongly influenced my professional choices (Arce 2013; Milner 2007a; Skerrett 2006). As a Black mother, I enacted my role as a teacher with my whole self. In other words, my role as a teacher engaged and embodied every fiber of my existence as a Black mother. I am a teacher and teacher educator because I am a Black mother. Rather than privileging whiteness and able-bodiedness, like the school culture in which I grew up, I chose to commit to teaching in ways that use the intersectionality of my classed, raced, gendered, (dis)abled identities to create meaningful learning experiences for my students that capitalized on their strengths and knowledge.

The following section examines these themes and their relation to my motivation for learning as a teacher and parent. These themes demonstrate how my interactions with students and the schooling system helped to shape my teacher beliefs and teaching practices. These beliefs included what good teaching is, the harm caused by color blindness, and how important it is for students to be affirmed in their cultural and racial humanness (Apfelbaum et al. 2012; Ladson-Billings 2000). However, among those beliefs was also the unacknowledged influence of ableism on my teaching pedagogy and mothering self-efficacy (Baglieri et al. 2011). I had to redefine the demands and expectations I have of myself, Avery, and my students. Additionally, when I experienced challenges in my teaching practices, I learned to default to compassion and flexibility over power and control.

Person-Centered Planning

For me, person-centered instruction centralized the student and their needs at the heart of planning for instruction. It challenged practices that prioritized curricula and outcomes over students. In an arena where high-stakes testing such as PARCC and edTPA influence curricular choices, shifting my focus to teaching students versus teaching content while also helping my colleagues to do the same was in direct opposition to the ways in which schooling was often enacted.

My motivation for trying to find a solution to Lisa's behavior was unfortunately not about her. Using a primarily behavioral approach to classroom management was to help me maintain control and power in the classroom. In inviting Lisa and Avery to collaborate with me, it presented the appearance of a partnership. These mistakes are not unlike those of other novice teachers and parents.

The school personnel had clearly defined their responsibility in Avery's programming, and that responsibility did not include helping him to exceed expectations. I knew how critical it was for him to excel in as many areas as possible. His teachers were operating from a place of compliance not cultural competence. For my classroom, I learned that planning for instruction in a person-centered manner meant that I needed to focus on the needs and agenda of my students first and mine second.

My personal experiences with schools inevitably trickled into questioning my classroom practices. Was I ignoring my students the way other mothers in my family were ignoring and dismissing me? Was I prioritizing my most vulnerable students the way I wanted Avery's teachers to prioritize him? How could I help teachers become better at seeing their students' personalities and not their perceived deficiencies? One way that I did this was by allowing Avery to stay in classrooms with teachers who I knew needed the most growth. In those classrooms, I intentionally allowed my child to create teachable moments for his teachers, case managers, and even principals. There was great risk in this strategy, but there was greater risk to more students if I did not allow Avery to challenge his teachers' beliefs about disability. Both Avery's teacher and I needed to be more flexible in our preconceived notions of what teaching was supposed to look like and how students were supposed to respond to that teaching.

Strength-Based Approach

Having a strength-based approach to teaching has implications for students, their families, and me. As a mother, it was important for me to recognize and identify not only Avery's strengths but also mine, our family's, and our family structure. I believed that schooling was failing my son by not capitalizing on the skills that could to propel him academically and socially.

This sentiment is not unlike those made about the teaching of exceptional and gifted children who are also male students of color (Owens et al. 2016). As a novice teacher, I often overlooked students who I experienced were not "easy to teach." They required more thought and skill than I thought I possessed, and I had to work extra hard to find their strengths. Sometimes, my students had difficulty finding my strengths as well.

Learning to identify and capitalize on my own strengths was a process that I learned alongside my students. My experiences with Lisa in the early part of my career impacted how I interacted with the rest of the class. All students began to benefit and learn from my individual work with Lisa.

Flexible Boundaries

Being flexible meant overlooking my own notions of what motherhood was supposed to look like and being willing to embrace the new ideas of mothering. A constructivist approach to mothering, especially as a Black mother, disrupted the

deepest of mothering traditions and expectations I had for myself. Because I was focusing on Avery's needs and his ability to conform with traditional expectations of how children should behave, my approaches were questioned, my strategies were challenged, and most of all, my experiences and knowledge were dismissed. I was frustrated and tried to transfer the need for conformity to Pierce.

In my home, Avery's needs dictated where we went, what we did, what we ate, and so on. I prioritized his needs over those of my husband, my daughter, and my own. In order for us to get the compliance we needed from Avery, his most basic needs had to be met. I was differentiating instruction in my home before I knew what differentiating instruction was. Why was I having so much difficulty applying this philosophy to Pierce in my classroom? Why was inflexibility in my classroom so difficult for me to accept? What professional expectations were inhibiting my ability to demonstrate flexibility and create rules that were just as differentiated as my instruction. Learning to be flexible and redefine my role as a mother and teacher was critical in my development.

So often in schools, we enact white middle-class norms and values and disguise them as rules. This is evidenced in school discipline policies (Skiba et al. 2011), the disproportionality of Black students in special education (Harry and Klingner 2014), and the acceptable forms of cultural capital expected from parents (Yosso 2005). Avery could be minoritized into any of these categories. When students do not or cannot comply with those rules, they are labeled as problems or troublemakers (Shalaby 2017). I was the mother of a potential troublemaker.

Critically Reflexive Disposition

A critically reflexive disposition is one that closely examines the teaching choices made with an expressed desire to immediately respond to and adjust future choices. To be critically reflexive, it is not enough to only acknowledge growth areas. The reflection must come with action. A self-study helps to identify practices and interactions where immediate adjustments need to occur in addition to highlighting patterns of behaviors (McHatton et al. 2013).

It was my feelings of unpreparedness that reiterate the importance of teachers conducting self-studies. Reflexivity helped me to examine and identify my fears about failing my students and my family by problematizing my own teaching instead of pathologizing my students. In doing so, I was able to enact teaching that was more socially just, equitable, and culturally responsive (Cochran-Smith 2004; de los Ríos and Souto-Manning 2015; Villegas 2007).

While some may argue that I may have placed too much responsibility for my students' success on myself, it was critical for me to provide my students with as many advantages in their education as possible given their already marginalized experiences. My early school memories of feeling invisible deeply resonated with me, and I viewed my students as extensions of myself (Hankins 1998).

Cunliffe (2004) articulates that critically reflexive practitioners "question the ways in which they act and develop knowledge about their actions. This means highlighting ideologies and tacit assumptions—exploring how our own actions, conversational practices, and ways of making sense create our sense of reality" (p. 414). Being a critically reflexive teacher challenged my understandings of authority, disability, and race in relation to my practices of parenting and teaching.

Critical reflection helped me to see just how closely I associated my ability to be a good mother with my ability to be a good teacher. I internalized Avery's successes and challenges and subsequently did the same with my students.

Part 5: Implications for Teacher Education

The daily interactions teachers have with students are worth documenting. Every day, we have experiences that influence our beliefs about students and our teaching abilities, and we have the opportunity to learn from our narratives. Many times, our narratives contain the deeply hidden beliefs, values, and perceptions we have and remind us how differently others experience the world. Hankins (1998) recalls how revisiting her journals challenged her notions of equity, students of color, and white privilege. She asserts:

> As a teacher, I hold the knowledge and serve it out my way at a specified time, denying the knowledge and history each child brings with them. I perpetuate a White, middle-class school agenda that continues to sort children by race while calling it performance... In order to do that I have to scrutinize the ideology of my White-female-southern-middle-class upbringing, to understand ways I may stand in the way of the equal dissemination of that power. If African American children consistently perform less well than their White counterparts in my classroom, could I be the problem? (p. 92)

Students of color, students who are disabled, and those who do not otherwise conform to the cultural norms of their environment are extremely susceptible to disrupting the culture of teaching in that they remind us of their realities by attempting to connect with us. In trying to learn more about myself and teaching practices, self-study has helped me in the following ways:

- To develop a critical sociocultural consciousness by examining the narratives of one's lived experiences.
- To meet the needs of all learners by learning how to focus on the needs of one student.
- To establish an environment that values social justice and respect and prioritizes students over content and meets their physical, social, emotional, and academic needs.
- To identify gaps and growth areas in teaching pedagogy.

Critical Sociocultural Consciousness

Examining the intersectionality of one's identities is especially important for educators who want to bring awareness and reconciliation to two main concepts: who we perceive ourselves to be and how our students perceive us. The concept of identity and the development of a critical sociocultural consciousness are necessary as the percentage of culturally and linguistically diverse students have increased in public schools. So long as cultural dissonance exists between teachers and students, the knowledge of how race, class, and ableism inform our values is important. Teaching preservice teachers to discuss and examine the impacts of racism, sexism, ableism, capitalism, and heteronormalism in their own experiences is profoundly impactful on how teacher candidates see both themselves and their students. By using self-study and intersectionality as both a framework and methodology, preservice teachers are challenged to recognize and understand the lenses, biases, and pedagogies they brought with them to the classroom.

   Albeit controversial, helping preservice teachers to actualize the potential of tools such as the edTPA for their own professional learning and helping in-service teachers to understand their roles as cooperating teachers as teacher educators, the idea of self-study is inherently embedded within many of the already existing structures of K-12 education. Teacher educators can capitalize on such tools to encourage self-study and preservice learning.

Focusing on One Student

My goal for Avery's teachers, the teachers with whom I worked every day, and my own teaching was to prioritize the needs of their students over our own desired goals and outcomes. It was important for me as an educator to stop "teaching to the middle" and focus on the students who required more understanding, more empathy, and more effort. Because teaching and advocating for students with disabilities were so close to my own experience, the approach of meeting the humanistic needs of my students required that I pay attention to not just my students' learning needs but to their familial, emotional, and intellectual needs as humans.

   When I first began mentoring novice teachers, I knew that I wanted to prepare them to be able to work with students like my child and parents like me and my husband. This belief in being person-centered guided my work with novice teachers. For example, one of their primary assignments was to identify a student who required more of them and maybe even perplexed them a bit. That student became the center of our own teacher inquiry for the remainder of the year. I asked them to journal about their beliefs and interactions with their focus student in an effort to help them better understand their own practices. Each month, we would revisit those journals and experiences, try to identify our beliefs through our decision-making, and rely on the collective group of our fellow novice teachers

for checks and balances. Examining one's own pedagogy helped my teachers to reconcile the person they perceive themselves to be with the person the data reveal they were.

Teaching for Social Justice

As a Black mother and educator, self-study has provided me with the opportunity to explore how my advocacy for an equitable and empathetic educational experience for my son with autism has shaped my own pedagogies as a teacher and teacher educator. The end of goal of advocating for my son was to make school experiences better for all students. Learning to advocate was not an easy endeavor. My assumption was that if this process was difficult for me as an educator, how much more difficult might it be for the less educated and less informed parent of color who did not know school language and understand how schools work. While there remains a constant tension between my beliefs about teaching and learning and the structure of schooling, which in many ways systematically marginalized students of color especially those with disabilities and their families, my resolve to challenge preservice and in-service teachers is unwavering. My role as a teacher educator is a form of activism.

With a focus on social justice, self-study can help teachers and teacher educators to create culturally responsive environments for their students that prioritize their funds of knowledge as well as attend to their physical, social, emotional, and academic needs. When considering students with disabilities, it is important to understand cultural and familial norms and impact on the learning environment. Appreciating students' cultural community wealth (Yosso 2005) can help to inform pedagogy.

Gaps in Teaching Pedagogy

Not only do we as educators benefit from understanding of how our identities shape our teaching practices, but our students benefit from our clarity of mind with regard to our motivations and intentions for teaching and learning. Self-study helps to develop that clarity of mind and identify our beliefs, motivations, and gaps in our perceptions about teaching practices. Acknowledging my own intersectionality allowed me to better understand the choices I made as a teacher and teacher educator. Critical self-reflection, which is different from the development of a critical sociocultural consciousness, examines teaching practices on a micro level and lends itself to a close examination of the choices we make as educators based on our beliefs and motivations.

Using my personal experiences as a professional compass for learning to teach students with special needs in general education settings was transformative to my development as a teacher and teacher educator. Informed by the power of my own narratives, I am confident that engaging in self-study is a worthwhile endeavor that has the impact to inform practice and create educators prepared to meet the needs of all learners.

Part IV

Self-Study Across Subject Disciplines

The fourth part of the *International Handbook of Self-Study of Teaching and Teacher Education Practices* features chapters that explore self-study in a specific subject disciple. The part opens with an introduction to the concept of a discipline and an overview of the discipline-focused chapters. Each chapters that follows explores the notion of engaging in self-study through a discipline-focused lens: English Language Arts, English Language, Mathematics, Physical and Health Education, Science, Social Studies, and Technology. The discipline-focused chapters provide an overview of the self-study work completed thus far. These chapters serve as a foundation from which varied discipline-focused and interdisciplinary self-studies may emerge and develop. They lay the groundwork for us all to envision new pathways to enhancing teacher education and better prepare beginning teachers for their work in these subjects. Together, the chapters in this part are a collective call to scholars to cross boundaries in order to bring together the knowledge and approaches from self-study and specific disciplines to develop more robust studies and understandings of teaching and teacher education.

Self-Study Within and Across Disciplines

Come Together, Learn Together, Change Together

26

Alicia R. Crowe

Contents

Abstract

Self-study researchers focus on improvement through the development of a deeper understanding of practice. The subtitle of this chapter, "Come Together, Learn Together, Change Together," embodies the essence of this process. As a field we have a history of continually coming together to learn and change. Crossing boundaries and engaging with a wide variety of disciplinary knowledge, perspectives, and approaches is a way for us to continue to extend self-study research. In this chapter, I explore the potential of discipline-focused self-study to contribute to understanding and improving practice. I highlight how the chapters in the section that follows provide examples of how disciplinary knowledge and skills enrich our understanding of phenomena. At the end of the chapter, I provide examples to contemplate regarding how we could use disciplinary knowledge and perspectives to frame and reframe problems of practice based on Schwab's (1983) commonplaces for curriculum decision-making.

Introduction

Self-study is concerned with improvement through the development of a deeper understanding of practice (LaBoskey 2004). Self-study is rooted the context of teaching and teacher education (Loughran 2004a) and deeply influenced by reflective practice (Russell 2004). In teaching, we called to solve problems, many of which are ill-structured and contextual. Schön (1983) identified *problem setting* as essential to solving such problems. Schön described problem setting as "a process in which, interactively, we *name* the things to which we will attend and *frame* the context in which we will attend to them" (p. 40). For Schön, problem-setting in a profession such as teaching with "ill-defined situations" is not a technical task so much as one that requires us framing and re-framing problems in new and different ways. Framing and reframing problems is a core principle of self-study, according to Loughran (2004b), claimed Loughran that those engaged in self-study must "provide and/or utilize data that is appropriate for the given situation, that offers new ways of seeing the taken-for-granted aspects of practice and , that helps to offer genuine opportunities for framing and reframing" (p. 184). In this spirit, the chapters in this section help us contemplate how we might use disciplinary knowledge and perspectives to provide to frame and reframe problems of practice. The chapters in this section establish common ground for these conversations to begin in and across seven disciplines. Taken together, they enable us to expand self-study by drawing on disciplines to come together, to learn together, and to change practices in new ways.

Why disciplines? A discipline is a field of study organized around a common set of purposes, processes, structures, concepts, and theories (Schwab 1963). Academic disciplines, such as mathematics or biology, have a relationship to school curriculum but the connection is neither direct nor a case of replication of the discipline in schools. Though important, the nature of a discipline is only one consideration for educators in decisions about school curriculum (Schwab 1963). Just as academic disciplines contribute to conversations about school curriculum so do they for teacher education curriculum. As such, a next step for a field that studies teaching and teacher education is to consider how disciplinary knowledge, theories, and perspectives can help us think about and engage in our self-study work in new ways and how self-study can broaden the knowledge in these disciplines.

Disciplines are human constructions and have changed over time (Schwab 1963). The disciplines, as we know them now, began to take shape in the 1800s as a result of previous periods in Western civilization, including the Scientific Revolution and the Industrial Revolution. As knowledge became more specialized, disciplines emerged in more distinct forms (Klein 1990). Disciplines are useful organizing frames that make explicit different ways to think about and study phenomena. For example, the questions a biologist asks about climate are different than those of a political scientist

as are what they study, but as a citizen, both inform me in developing a more thorough understanding of climate. The same can be said for developing our knowledge of teaching and teacher education. The theories and perspectives that a science teacher educator brings from science will provide a different view than those of a social studies educator. Framing and reframing as self-study researchers through varied influences from disciplines such as science, social studies, and literacy can help us develop more complex and nuanced understandings of the phenomena of being a teacher educator.

The Emergence of Disciplinary Focused Self-Study Work

Russell (2004) observed "the unique nature of teacher education as a discipline" (p. 1203). As teacher educators, we typically began in a discipline, "whether it is a familiar school subject such as English or geography or a foundational subject such as sociology or philosophy" (Russell 2004, p. 1203) before coming to teacher education. Although Russell describes this to further an argument for the uniqueness of teacher education as a discipline, it also serves as a reminder of the many disciplines on which we may draw as self-study scholars framing and reframing problems of practice. Although no single chapter in the *International Handbook of Self-Study of Teaching and Teacher Education Practices* provided an overview of self-study influenced by a discipline, some explored possibilities for self-study of practices in professional areas beyond teaching and teacher education. In "Self-Study in Professional Practice," Wilcox et al. (2004) began an exploration to position the use of self-study in library science, higher education, and occupational therapy. The crux of their argument was that self-study helps practitioners outside of teacher education "transform their practice," "develop professional practices," and engage in "lifelong learning" (p. 307). Though they did not detail the promise that disciplinary knowledge and perspectives can bring to self-study, their work shows that even at the point of the handbook, early in the history of the field, there were conversation about the benefits of crossing disciplinary boundaries and bringing self-study to fields outside of teacher education.

After 2004, as the field grew, so did the number of areas that scholars explored. As practitioners increasingly turned to self-study, more began focusing on the subjects they taught. In 2010, the first of four collections on discipline-focused self-study were published. Crowe's (2010) collection of social studies focused self-study, for example, included a foundational chapter, a theoretical argument for the relationship between self-study and social studies education, and seven studies. This collection was designed to provide a foundation for future scholars in social studies education to engage in self-study. Three other volumes followed in quick succession with mathematics focused self-study (Schuck and Pereira 2011), science focused self-study (Bullock and Russell 2012), and physical education focused self-study (Ovens and Fletcher 2014). Each volume included example self-studies as well as conceptual pieces. These volumes exemplify attempts of self-study teacher educators to begin to more clearly situate self-study within the disciplines that they teach.

Over the last 10 years, publication of discipline-focused self-study has continued. We are even seeing self-study scholars bring in discipline-specific theories into the self-study. For example, Pithouse-Morgan and Samaras (2019) work is grounded in Vygotsky-influenced sociocultural theory and Bakhtin's concept of polyphony. Though these are theories that had long crossed into studies within education, this chapter exemplifies self-study scholars using theories from disciplines outside of teaching and teacher education to frame and re-frame their endeavors.

Convergences and Divergences: Considering the Section Chapters

To move ahead with this endeavor, we need to understand what has been completed thus far. The chapters in this section provide reviews of self-study literature grounded the seven disciplinary contexts that appear most often in the self-study literature: Reading, Writing and Language Arts, English Language Teaching, Mathematics, Physical and Health Education, Science, Social Studies, and Technology. In each chapter, the reader is introduced to the notion of discipline-focused self-study through the lens of teacher education in a specific subject area. Each chapter highlights different ways to examine the self-studies in their fields and introduce theories, areas of emphasis, and topics that provide new ways to frame our self-study work, whether we are members of one of these subject area communities or not. Reading them together, one is poised to contemplate how disciplinary concepts and theories can influence and guide their self-study work and the field of self-study. The chapters in this section form a foundation from which we can begin to expand and enrich self-study work by using discipline-focused lenses.

The chapters converge on exemplifying the ways theories or concepts from disciplines can help us frame our understandings but diverge in how they do this. Along with how the chapters help us think about using disciplinary knowledge, the chapters show three areas on which disciplinary-focused self-studies converge: collaboration, becoming a teacher educator, and being a teacher or teacher educator. In this overview, I provide insight into how each of the seven chapters can help us consider the use of disciplines in self-study and then I share about the three areas of study that emerged as shared interests across the subject areas.

Understanding the Potential of Discipline-Focused Self-Study

Understanding how self-study scholars diverge from one another in terms of how they frame their studies can help us all gain different inspiration for studying our own practice. Each chapter holds something that any self-study scholar can take away to consider for their own work. In this section, I describe ways to use disciplinary knowledge and perspectives as shown to use by each chapter in this section.

In ▶ Chap. 27, "Reading, Literacy, and English Language Arts Teacher Education," Edge and Olin provide readers with a review of reading, literacy, and English

Language Arts focused self-study. They approach their review using a theoretical framework borrowed from the disciplines, specifically Rosenblatt's Transactional Theory of Reading and Writing (1978/1994, 2005). Not only does this chapter include a depth of explanation of self-studies up-to-date, it models the use of a disciplinary lens to interpret self-study work. This is one way that self-study can gain from disciplinary knowledge. The analysis and interpretation reported in the chapter also helps the field of reading, literacy, and English language arts teacher education to grow. Through Edge and Olin's use of a theoretical frame that is familiar to all in that field, those new to self-study can better their individual self-studies and the state of self-study related to the discipline.

In ▶ Chap. 28, "Self-Study and English Language Teaching," Peercy and Sharkey provide a review of English language teaching self-study and research closely aligned with the characteristics of self-study but not identified as such. As part of their chapter, they provide a history of English language teaching and background on the connection to applied linguistics, which they argue has yet to be coupled with teacher education literature. In their work, they have identified a key way that self-study scholars may proceed that would simultaneously invigorate the field of self-study and enhance the knowledge base in English language teacher education. This is a second way that a discipline can be connected with self-study.

In ▶ Chap. 29, "Self-Study in Mathematics Teacher Education," Schuck and Brandenburg review mathematics focused self-study. In their chapter, they connect works within mathematics focused self-study to the broader self-study research agenda. For example, challenging beliefs is studied within self-study and with self-study in the context of mathematics education. They explain that this research highlights "the tensions and contradictions that exist for teacher educators when they work at creating a vision of mathematics as creative and dynamic and as a human endeavor." As a field, discipline-focused or subject-focused self-studies can expand our understanding of a phenomenon common in teacher education, like challenging beliefs. The more we explore this phenomenon in different contexts the more nuance and understanding we gain as a field. This is a third way that discipline-focused self-study can contribute.

In ▶ Chap. 30, "S-STEP in Physical Education Teacher Education," Fletcher and Ovens explain the emergence of physical education focused self-study. Self-study research began as physical educators doing self-study for a broader audience that just physical educators. As this research progressed, and building off the work of self-study work in science and literacy, physical educators began to engage in self-study in and for physical education teachers and teacher educators. Fletcher and Ovens write, "The research reviewed showed how PETE researchers have drawn from and built upon insights generated by S-STEP researchers conducting their work in other subject areas, such as science and literacy." This valuable but easy to overlook element is an important step on the path to extending self-study boundaries by building on the works of those engaging in similar works across subject areas within self-study. Fletcher and Ovens's inclusion criteria show a move in their field this way. The nature of physical education, as they explain, is such that in the literature a

connection to other fields such as outdoor/adventure education and sport coaching already exists. This type of interdisciplinarity is a stepping stone that self-study can look to in conversations about how to use disciplinary knowledge and theories in our work. We can ask ourselves: What disciplines or fields are most closely related to mine? How do theories and concepts from those fields inform my inquiry?

In ▶ Chap. 31, "Self-Study of Science Teaching and Science Teacher Education Practices," Bullock shares examples of science focused self-study. In his foray into the literature, he focuses in yet another way – taking self-study teacher education concepts to a boarder conversation. He chose three constructs that have become foundational to self-study teacher education literature that came from science educators: "Munby and Russell's (1994) *authority of experience*, Berry's (2007) *tensions*, and Loughran's (2014) *self-study as professional development*" to serve as lenses through which to critique educational research. Using disciplinary concepts from self-study to consider another field is an example of how self-study can contribute to other disciplines.

In ▶ Chap. 32, "Self-Study in Social Studies Education" Crowe, Levicky, and Mooney share their review of social studies focused self-study. Their analysis finds that many scholars studied their practice in relation to diversity and social justice. As well, they analyze the self-studies in their review through the lends of two concepts key to their discipline, teaching for transformation and teaching for democratic living. They find a variety of ways that these are reflected in the works of social studies focused self-study scholars. From their chapter, we see yet more ways to use disciplinary knowledge and perspectives, notably four concepts important in social studies education: diversity, social justice, teaching for transformation, and teaching for democratic living. Each can and has been used to inform self-studies outside the social studies context. What is different is the literature in which these concepts are grounded. As someone wanting to examine your practice as someone teaching for democratic living, reading the work of social studies educators doing the same thing could bring you to new understandings of democratic living that might change how you interpret and understand your practice.

In ▶ Chap. 33, "Technology Teacher Educators," Figg and Jaipal-Jamani help us explore how we can expand our work with technology focused self-study. This chapter focuses on the teaching of technology rather than teaching with technology. They particularly delve into a rich discussion of the construct of Technological Pedagogical and Content Knowledge (TPACK) framework. This discussion prepares any reader with a foundation for further thinking about research into the teaching of technology. Though they focus on advocating for self-study by and for technology teacher educators, this framework could be used by any of us as we begin to explore our teaching with technology. For example, I might use this framework to contextualize my own self-studies as a social studies educator developing how do I as a social studies educator develop my own TPACK?

These chapters offer many insights about self-study situated within these seven subject areas. In particular, as highlighted in this opening chapter, the authors' framing of their reviews as well as the self-studies they reviewed provide readers

with multiple disciplinary-based theories and concepts that they could use to frame and re-frame problems of practice and to interpret what they see in their practice.

Understanding Areas of Convergence

Explorations in the self-study discourse community ultimately lead to new insights that can be brought back to their discipline-focused communities. This is most evident in the ways the seven chapters examine collaboration, becoming a teacher educator and being a teacher educator. In each instance, divergence offers insights into how to develop our understandings of practice within our disciplines and alternative ways of conceptualizing our work as educators within our disciplines. By combining our shared disciplinary understandings with insights into research and practice from self-study, we can build richer and more complex knowledge bases for research and professional practices in our disciplines.

Collaboration

Collaboration has been a central part of self-study since its inception. Bodone et al. (2004) explored collaboration as a common characteristic of self-study in the handbook. As well, LaBoskey (2004) notes the roles that collaboration had played to that point in self-study endeavors. In the chapters in this section, there was evidence that collaboration remains valued within the field. Schuck and Brandenburg found what they termed "a focus on collaboration" in the self-studies in mathematics teacher education they reviewed. The focus showed collaboration through learning communities, through critical friendships and between teacher educators and either student teachers or teachers in schools. Crowe, Levicky, and Mooney found four ways that social studies scholars engage in self-study through collaboration: collaborating through critical friendships, collaborating on a self-study with a shared research focus, engaging in a collaborative as part of one's own self-study, and studying the collaborative process in self-study. Figg and Jaipal-Jamani highlight how collaborative self-study can be used to support teaching with technology in courses that re not primarily about technology learning. Peercy and Sharkey found evidence of English language teaching focused self-studies that specifically highlight the value of collaborative groups for professional development. Even the authorship of the chapters shows the emphasis on collaboration as six of the seven chapters are co-authored. Edge and Olin make this collaboration explicit when they describe their review and writing process as "collaborative meaning-making."

Becoming a Teacher Educator

Explorations of complexities of becoming a teacher educator emerged as well. The idea of becoming a teacher educator in self-study dates back to the very beginning. As Loughran et al. (2004) explained, one of the initial lines of questioning that came together with others to form self-study came from a group of scholars thinking about

their practices and experiences becoming a teacher educator. Guilfoyle et al. (1995) name it "becoming a teacher of teachers" (p. 35), it has continued to be a focus in self-study ever since (Williams et al. 2012). Turning to the chapters in this section, the theme of becoming a teacher educator appeared in most chapters, notably English language, science, social studies, mathematics, and physical education. It does seem a natural step as the field continues to expand. It is a quick jump in thinking from "how do I transition from being a teacher to a teacher educator?" to asking "how do I transition from a social studies teacher to a social studies teacher educator?" Peercy and Sharkey found that a focus on identity was an important area in the emerging focus on English language teaching in self-study. One of the identities identified was that of English language teacher transitioning to English language teacher educator and scholar. Crowe, Levicky, and Mooney offer several examples of social studies teacher educators sharing studies of becoming social studies teacher educators, with some scholars having published more than piece elaborating on their experience of becoming.

Being a Teacher Educator

Beyond becoming, the reviews also revealed a theme of "being" a teacher educator. Taken together, discipline-focused self-studies provided insight into the complexity of the experience of being a teacher educator by exploring and unpacking the pedagogy and practices of teachers and teacher educators in their disciplines. Although the disciplines examined differed, multiple studies examined aspects of the life of a teacher educator engaging in teaching. In some studies authors explored how their beliefs aligned with their practices as a teacher educator, while others chose to examine strategies or content specific to their discipline. Bullock highlights three constructs vital to self-study that originated from science teacher educators' inquiries. Fletcher and Ovens' review of physical education self-studies revealed physical education teacher educators engaging in self-study to problematize their practice, to enact critical pedagogies and to be innovative in their practices. Schuck and Brandenburg describe studies that offer insight into mathematics teacher educators' concern for changing beliefs. Mathematics teacher educators used self-study as they considered the connection between teaching and practice – both their own beliefs and practice as well as the preserve teachers' beliefs and practices and preservice teachers. Through the chapters we are offered a range of perspectives on being a teacher educator.

Looking Forward: Challenging Ourselves to Grow

It is now time to begin robust conversations about how self-study research should proceed within subject disciplines in teacher education. We can begin by considering the benefits of the reciprocal relationship between self-study and disciplinary theories and knowledge: Self-study brings new ways of knowing to other disciplines while disciplinary knowledge can deepen our self-study work by using theories and frameworks from other disciplines to reframe problems of practice and experience.

My hope is that the convergence of ideas from other disciplines with self-study can lead to a proliferation of understandings around various phenomena in teaching and teacher education while also bringing self-study to other disciplines.

A defining characteristic of self-study is that it is improvement-aimed (LaBoskey 2004). Over the last 20 years, I have found that it is not just our self-studies that are improvement-aimed. Indeed, the field of self-study is entirely focused on improving teaching and teacher education practices. As the field of self-study continues to grow, it offers us many opportunities to expand the ways we engage in our work, to constantly improve. As Dewey (1933) and Schön's (1983) work on reflective thinking and practice is central to self-study, the field helps us with problem setting (Schön 1983) and using disciplinary knowledge is a way to reframe how we see and name problems, how we approach our self-study work, and the types of knowledge that we create. In Dewey's (1933) explanation of reflective thinking, both the process and the attitudes he described require new ideas to process. Throughout the process, each aspect can benefit from knowledge and use of concepts and theories from disciplines – from what we notice and decide to act on to what we conclude. Further, as Dewey explained, there are also attitudes that influence reflective thinking. For example, he shared that we must be open-minded, both open to new ideas and active in searching out new ideas, to engage in reflective thinking. Disciplines are an area we can explore to provide us with many different ideas to use as we examine our practices.

Whether it be the way we approach a problem of practice, how we frame our questions, or what theoretical perspectives we come from, we will all grow in our knowledge of practice as we extend ourselves and engage in discipline-focused self-study (self-studies with clearly defined connections to disciplinary knowledge). At the same time, we contribute to the development of new knowledge in the disciplines that we draw from and we bring a new methodology, self-study, to that discipline. With discipline-focused self-study, we increase the number of ways in which we can engage with and learn from self-study.

Beyond noting benefits of the discipline-self-study relationship, it is helpful to consider ways to engage in self-study within this relationship. Here I use Schwab's (1983) commonplaces to consider in curriculum decision making – teacher, student, content, and the teaching-learning context – as a frame to provide some examples of the mutually beneficial relationship between disciplinary knowledge and approaches and self-study research. (For others who build on or connect Schwab and self-study see Kitchen's work in press on self-study and relational teacher education.) Schwab explained that knowledge and experiences related to these four, as well as curriculum-making, are required to move scholarly knowledge to curriculum (1978). If we follow Schwab's guidance, we can see many ways that disciplinary knowledge and self-study research can be brought together to deepen our knowledge of curriculum and, in turn, improve teaching and teacher education.

Schwab (1978) argued that it was important to have knowledge of teachers when making curriculum decisions. Discipline-focused self-study can help us further develop knowledge of teachers and teacher educators. For example, understanding what it means to teach a discipline like science. As a science teacher educator, one

might explore how their beliefs about the nature of science influence how they teach. This would further our understanding of teacher education and science teacher education. As well, disciplinary knowledge might help us reframe a taken-for-granted way of thinking as a teacher and develop knowledge of teaching and teachers in yet another way. Just as a physics teacher who studied ballet sees and can explain the physics of dance, so might we take from physics the concept of inertia and Newton's first law of motion to reposition our thinking about learning. Consider for a moment thinking about teacher learning as Newton's object and our actions as teachers, the political milieu of the community, and actions of others in the school as Newton's external force acting upon that object. Reframing thinking learning in this way, rather adopting only a developmental view of teacher learning, can open our minds to the complex, nonlinear relationship between teacher learning or teacher change and context. Thinking like this might induce me to ask: What am I doing that is keeping my learning as a teacher "in a state of rest?" What are the situations where I am inclined to by forces to "move" or learn as a teacher?

Schwab (1978) also identified knowledge of the learner as necessary for sound curriculummaking. Discipline-focused self-study can help us explore questions of how we engage with our students around the concept of diversity. Many disciplines, such as art, literature, social sciences, and sciences, address diversity and each can be used to help understand how students think about diversity and, in turn, how we can change as the teachers of those students. At the same time, engaging in self-study of the teaching and learning of diversity can add to the understanding of diversity in the fields from which we connect, whether sociology or biology.

Content, or the subject matter to be taught, is a third area of knowledge and experience that Schwab (1978) stated is needed for curriculum decision-making. Disciplines open doors to new ways to think about content and self-study can be pivotal in that. One way is by expanding our own knowledge of subject matter by learning from different disciplines than our own. Though it may not seem so on the surface, there is much to be learned by social studies educators from the self-studies of science educators. For example, a social studies educator may read a science educator self-study of their understanding of the nature of science, as mentioned above, and begin to consider how their understanding of social studies shapes how and what they teach. Following this interest, the social studies educator might not only explore the idea of nature of science but also begin to study their practice. Besides leading to a self-study that contributes to a more robust knowledge base around the connection between teacher educators' beliefs and practices, a discipline focus can do more.

The teaching-learning context has many levels as Schwab has explained (1978, 1983). Since self-study is self-initiated and often focused on the most local of contexts, perhaps beginning with the immediate teaching-learning context of the classroom culture is best. Self-study can help mathematicians (not just mathematics teacher educators) examine their practices as mathematicians and teachers of mathematics to improve their ability to help others understand mathematics. For example,

if a group of mathematicians want to understand their teaching practices and the culture of their classrooms, they could ground their thinking and their collaborative self-study in the notion of trust-generating citizenship from political science (Allen 2004). By borrowing from political science while engaging in self-study, these mathematicians would both bring self-study to mathematics and political science to self-study.

Curriculum-making is the fifth area that Schwab proposes knowledge of and experience with is needed for curriculum planning. Self-study can help us consider this. Self-studies demonstrate curricular decision-making in terms of the decisions about practice illustrated across chapters in this section. One way to extend this body of work is to broaden the experiences being examined to include curriculum planning and decision-making process of our own courses. For example, a teacher of educational psychology course might engage in self-study work that provides insight into how a specialist in education psychology makes sense of interactions and then enacts decisions about curriculum. As a next step, that same scholar might use disciplinary knowledge and theories from psychology to analyze, interpret, and share their experience, thereby adding to both the fields of self-study and teaching educational psychology.

Self-study has a history of crossing disciplinary boundaries and not confining itself to predetermined academic silos. Indeed the beginnings of self-study as an organized group began when as veteran Tom Russell, a group of novice teacher educators (Karen Guilfoyle, Mary Lynn Hamilton, Stefinee Pinnegar, and Margaret Placier), and audience members together engaged in reflective practice on how to work collaboratively to improve their teaching (Loughran 2004a). They crossed the boundaries between experienced and novice teachers and crossed the borders between the disciplines they taught. Drawing from academic disciplines is not a truly new endeavor – it is merely extending a tradition of crossing boundaries already started. As we look to the future of self-study as a field, I hope we are all challenged to engage with and in discipline-focused self-study to improve teacher education, to continue to develop our knowledge of practice, and to increase the number of ways to engage in and learn from self-study.

Abstract

Framed by the Transactional Theory of Reading, this systematic review explores the meaning self-study researchers made from studying teaching practices in the content areas of reading, literacy, and English language arts education. Three groupings of literature, meeting LaBoskey's (2004) descriptors of self-study research and published 2006–2017, were collected. In-case and cross-case analyses resulted in discovering three themes in the literature: self-study researchers in reading, literacy, and English language arts education (1) positioned themselves as active readers and meaning-makers who explored their practices through self-study; (2) studied the tensions they experienced like "texts" from which they discovered new understandings; and (3) utilized content-area knowledge, strategies, skills, and contexts to frame, guide, or inform their self-study and to make meaning from their professional practices with the goals of improving their practices and informing their field. Considering these themes in their broader content-area contexts, self-study and the content areas of reading, literacy, and English language arts share similar aims: seeking understanding through meaning-making, sharing knowledge from meaning made, and making the process of meaning-making more visible to self and others. These commonalities can be assets to the knowledge generation informing both education research and reading, literacy, and English language arts education; these commonalities can also be potential sources of tension and spaces for transformation. Implications challenge teacher educators in reading, literacy, and English language arts to consider self-study of teacher education practices not only *in* content areas but also *for* content areas. Literacy and self-study are transformative tools, transactionally moving each other forward.

Introduction

As two literacy and English language arts teacher educators and self-study researchers, we immersed ourselves in recent (2006–2017) self-study of teaching and teacher education practices literature related to the content areas of reading, literacy, and English language arts education to discover what we might learn from the meanings teachers/teacher educators made from studying their teaching practices and to consider how the fields of reading, literacy, and language arts education and self-study might contribute to, advance, or challenge one another to move forward. This chapter contributes to the larger bodies of knowledge in teacher education, self-study, and reading, literacy, and English language arts education by addressing self-study research in the content areas of literacy, reading, and English language arts education.

From our systematic, theoretically driven review, we discovered three themes in the literature: self-study researchers in reading, literacy, and English language arts education (1) positioned themselves as active readers and meaning-makers who explore their practices through self-study; (2) examined the tensions they experienced as "texts" from which they discovered new understandings; and (3) used content-area knowledge, strategies, skills, and contexts to frame, guide, or inform their self-study and to make meaning from their professional practices with the goals of improving their practices and informing their field. Considering these themes in the broader context of our field, we see both self-study and the content areas of reading, literacy, and English language arts as sharing similar aims: exploring through examining stories lived and told and seeking understanding through meaning-making. We have come to see these commonalities as assets to the knowledge generation informing both education research and reading, literacy, and English language arts education. We also see these commonalities as potential sources of tension and spaces for transformation. The stance from which one seeks to read the "texts" of teaching and learning in order to better understand teaching practices, both frames and guides one's attention, and thus, the meaning that is made. The collaborative nature of self-study methodology offers multiple perspectives from which teaching and learning can be considered. Stance versatility (Beers 2003) is necessary and critical for generating knowledge that contributes to understanding one's own practices in a particular context as well as generating knowledge to share with others. We see the need to challenge reading, literacy, and English language arts educators to engage in self-study research and to do so from multiple positions or stances toward the objects or teaching "texts" that they study.

Organization of Review

This review has five major sections:

- Theoretical Perspective: Reading, writing, teaching, and learning as transactional processes
- Methodology: Within-case and cross-case analysis of self-study literature
- Findings: Self-study researchers
  - Actively read and make meaning through exploring their practices
  - Examine tensions as "texts" from which they discover new understandings
  - Use content-area knowledge, strategies, skills, and contexts to frame, guide, and/or inform their self-study of teaching or teacher education practices
- Discussion: (Re)considering self-study of teaching and teacher education practices through a content-area lens
  - Sharing purpose
  - Seeking to make the "invisible" more visible
- Conclusion

Theoretical Perspective: Reading, Writing, Teaching, and Learning as Transactive Processes

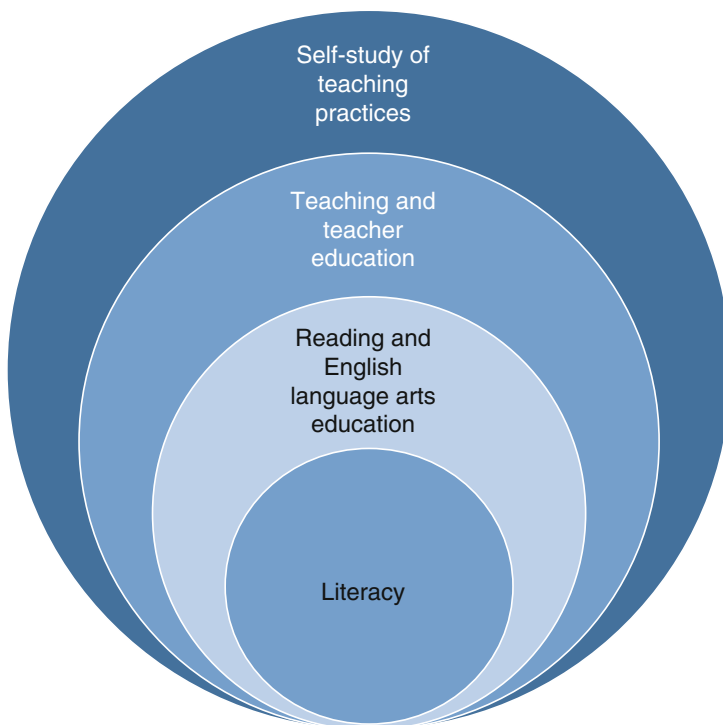
We frame our inquiry within the disciplinary theoretical lens of meaning-making, namely, the Transactional Theory of Reading and Writing (Rosenblatt, 1976/1994, 1994, 2005), making specific connections to the aims and purposes of self-study in order to speak to Vanassche and Kelchtermans's (2015) and Zeichner's (2007) calls for accumulating knowledge across self-studies, "especially within specific content areas" — knowledge that is committed to a "practice-based, yet theory-building research agenda" (Vanassche and Kelchtermans 2015, p. 523). Next, recognizing that "the aim of self-study research is to provoke, challenge, and illuminate rather than confirm or settle" (Bullough and Pinnegar 2001, p. 20), we illuminate findings from the existing knowledge gained from a theoretically informed review of reading, literacy, and English language arts education self-study research. Finally, we incite our fellow self-study researchers and our community of literacy/language arts educators to re-see through a literacy lens the transformative, agentive power, potential, and responsibility of self-study research to inform multiple facets of our work. As represented in Fig. 1, at the center of the concentric contexts of literacy,


Fig. 1 Concentric contexts of literacy, English language arts and reading, teaching and teacher education, and self-study of teaching practices

English language arts and reading, teaching and teacher education, and self-study of teaching practices, we see literacy as a transformative tool. We agree with Moje et al. (2000):

> Because literacy practices are shaped by discourses, literacy can be considered a powerful tool that can be used to claim a space or establish an identity or voice in various social interactions. The ways one uses literacy can have a profound impact on whether a particular literacy event, and its concomitant practice, is valued. (p. 166)

We assert that consciously adopting stance versatility, teacher education literacy practices can advance self-study as a transformative space for teaching and teacher education.

Educational researchers are charged to be explicit about their theoretical stances and to align those stances with methodologies (LaBoskey 2004; Smagorinsky 2008). We framed our inquiry into reading, literacy, and English language arts education self-studies with the view that teaching and learning are transactional and that teaching and learning to read are transactive processes (Barr 2001; Edge 2011; Edge and Betz 2017; Hall 2006; Probst 1987; Purcell-Gates et al. 2017). *Transaction* refers to an event, a total situation in which each element or factor is conditioned by and conditions the other. Knowing, the knower, and what is known share an ecological relationship, each conditioning the other (Dewey and Bentley 1949; Rosenblatt 1978/1994). Our stance toward teaching and learning is grounded in the Transactional Theory of Reading and Writing (Rosenblatt 1978/1994, 1985a, 1994, 2005) and frames our review of the literature presented in this chapter.

The Transactional Theory of Reading and Writing

The Transactional Theory is most commonly associated with Rosenblatt's Transactional Theory of Reading and Writing (1978/1994) and with Reader Response Theory, which is the Transactional Theory applied to literary criticism and to the teaching of literature (Probst 1987). The essence of this theory is that "[e]very reading act is an event, or a transaction involving a particular reader and a particular pattern of signs, a text, and occurring at a particular time in a particular context" (Rosenblatt 1994/2005, p. 7). The reader and the text are not fixed entities acting upon one another like parts of a machine or colliding billiard balls, explained Rosenblatt; the reader and the text are "two aspects of a total dynamic situation" (1994/2005, p. 7).

Rosenblatt's Transactional Theory holds particular implications for the construct of meaning. Rosenblatt wrote, "'meaning' does not reside ready-made 'in' the text or 'in' the reader but happens or comes into being during the transaction between reader and text" (1994/2005, p. 7). It is the live circuit between a particular reader and a particular text in a particular context (1978, 1994, 2005). "Meaning—whether scientific or aesthetic, whether a poem or a scientific report—happens during the interplay between particular signs and a particular reader at a particular time and

place" (Rosenblatt 2005, p. x). Meaning is not an object or even an idea; it is a doing, a making, an event in time (Polkinghorne 1988; Rosenblatt 1969, 1978, 1985, 1994, 2005; Unrau et al. 2013).

The Transactional Theory also holds particular implications for the role of the reader in the reading process. Inciting a paradigm shift away from seeing the reader as a generic and passive recipient of knowledge in a text or seeing learners as sponge-like recipients of knowledge from a teacher, the Transactional Theory positions an individual as an active contributor or "world maker" in the dynamic event of sense-making, of reading, and of knowing; it invites educators ". . .to see the reading act as an event involving a particular individual and a particular text, happening at a particular time, under particular circumstances, in a particular social and cultural setting, and as part of the ongoing life of the individual and the group" (Rosenblatt 1985b, p. 100). The Transactional Theory positions the reader as a knower who is an active agent in the process of reading and knowing through the "reciprocal, mutually defining relationship" (Rosenblatt 1986, p. 122) between the individual and the text in a specific context.

Teaching and Learning as Transactional

Building on existing research (Barr 2001; Hall 2006; Rosenblatt 1985a), Purcell-Gates et al. (2017) review of research on teaching literacy and learning to read draws upon Rosenblatt's Transactional Theory to extend the ecological relationship between a reader and text in a particular context during a reading event to teaching and learning in the learning to read event. They "use the term *transaction* to indicate that teaching and learning are viewed as *one* process and not an interaction of two separate entities" (Purcell-Gates et al. 2017, p. 1220). Purcell-Gates and colleagues expand the definition of "'teaching reading' to one of 'teaching/learning to read,'" and they intend "the two terms to be interchangeable" (p. 1220). We agree with Purcell-Gates and colleagues, that teaching and learning are transactional; they are one process not merely an interaction of two separate entities. Teaching and learning share an ecological relationship; in the transactional paradigm, teaching and learning co-construct each other.

Extending the Transactional Theory to Self-Study of Teaching Practices

Framing our review of existing self-study literature in the content areas of reading, literacy, and English language arts with the theoretical perspective that reading, writing, teaching, and learning are transactive processes, we consciously extend the definitions of "reader," 'text," and "context" to the situation of self-study of teacher education practices. Said another way, we found the epistemological tenets of Rosenblatt's Transactional Theory to connect with and extend to self-study methodology. In self-study, one's self (one's thoughts, actions, ideas, personal history, existing knowledge),

one's contexts, and one's professional practices can be objects of study; they are texts self-study researchers compose, read, and make new meanings from investigating. One purpose of S-STEP research is to articulate and to refine one's professional expertise and understanding of teacher education practices (Vanassche and Kelchtermans 2015). Another purpose is to produce knowledge that can inform "the complex and ever-changing process of teaching" (Gatlin et al. 2002, p. 13) to generate understandings that can be shared with others (LaBoskey 2004). Contexts are varied but clearly articulated in existing literature. "The knowledge developed in and through self-study cannot be disconnected from the complex reality it refers to, and is embedded in" (Vanassche and Kelchtermans 2015, pp. 515–516). The rich contexts in which knowledge of teaching and teacher education are evoked or discovered through self-study research have potential to inform, in context-sensitive ways, the broader, multifaceted knowledge bases of teacher education and reading, literacy, and English language arts education.

Epistemologically, we view individuals – that is, teachers, students, teacher educators, and researchers – as active meaning-makers (Edge 2011). As active, agentive meaning-makers, individuals use their existing knowledge, their linguistic-experiential reservoir (Rosenblatt 1978/1994, 1994, 2005), to attend to cues in communicative signs or *texts*. Using a combination of senses and framed by particular purpose(s), readers make sense, that is, they read or negotiate the text to make meaning (Draper and Siebert 2010; Rosenblatt 1978/1994, 1994, 2005). Readers make sense of external, multimodal texts which may include, for example, classroom situations, learners, curriculum, and alphabetic print texts; readers also compose and make sense of their internal texts including their own ongoing conceptual understandings and sense of identity. Each reading event is situated in particular contexts, which include professional practice settings, K-12 classroom teaching and learning settings, as well as the broader social and cultural contexts outside of "school," of which they are a part. One's linguistic-experiential reservoir is colored by social and cultural contexts and also contributes to those contexts, like a text ever being revised and (re)composed, as asserted by Geertz (1973/2008) who described society is an ambiguous cultural text that individuals read and compose. New understandings may broaden one's existing knowledge, and they may deepen or burrow that knowledge (Langer 2011). For individuals whose existing knowledge is "on the verge," new, revised, or transformed understandings may create a sense of "wobble" (Fecho 2011) as they work to recompose what they know and/or how they know. Building from earlier research (Edge 2011), we consciously adopted a stance toward our review of the literature guided by the Transactional Theory. As we proceeded, we gained additional insights into the connections between self-study methodology and the theoretical underpinnings sketched in the above section.

Methodology

Findings presented in this chapter emerged from a systematic review, framed by a theoretical perspective, guided by an inquiry question, and resulting in summarizing empirical evidence that fit a priori eligibility criteria. Our process replicated

Vanassche and Kelchtermans (2015) systematic review of self-study research published 1990–2012. Attending to the broader terrain of S-STEP, Vanassche and Kelchtermans gathered two data sets: one data set "consisted of publications that were judged by the S-STEP movement itself (as acting editors or reviewers) to be of a quality that warranted publication," while the "second data set consisted of self-study works published in journals and books outside the S-STEP community after scientific peer review" (p. 511). Our review focused on recent (2006–2017) S-STEP literature related to the specific content areas of reading, literacy, and English language arts education.

To search and map this terrain, we first utilized databases such as *ERIC* and Google Scholar using the following search terms: self-study and literacy, self-study and language arts, self-study and English language arts, and self-study and reading. We looked for studies published in the last decade (2006–2017). These search terms generated a list of 301 potential articles. For the first round of data collection, we read abstracts and skimmed articles to eliminate studies that were not self-study in nature. We utilized the descriptors LaBoskey (2004) laid out for components of quality self-study research that included as follows: initiated by and focused on the self, improvement aimed, and interactive; utilizes multiple, mostly qualitative methods; and defines validity in terms of trustworthiness in order to determine which studies would be included in our analysis. We eliminated articles that reflected on or about one's teaching but did not include research methods or data sources. We also eliminated studies that were focused on a directed study of literacy/language arts content (self-directed or self-initiated studies of content or self-driven study of English or language skills) as those studies did not provide data relevant to teacher education or to self-study of teaching practices.

We did not include self-studies focused on language, language learning, linguistics, English language learners, or English as a second language, since these topics are related to another chapter in this volume (see Peercy & Sharkey, "Self-study and English Language Teaching"). Also, while international in scope and in contributions from international S-STEP researchers, this review was limited to publications written in the English language.

Data

We gathered publications from three groupings of literature. The first grouping included literacy/language arts teacher education articles, book chapters, and monographs published within the S-STEP community. We searched the seminal *International Handbook of Self-Study of Teaching and Teacher Education Practices* (Loughran et al. 2004), The *Springer Press* book series (18 books), and the articles published in the 13 volumes (2005–2017) of *Studying Teacher Education: A Journal of Self-Study of Teacher Education Practices*. The second data set included peer-reviewed self-study works published outside of the self-study community in journals such as *Journal of Curriculum Studies*, *Teaching and Teacher Education*, *Teacher Education Quarterly*, and the *Australian Journal of Teacher Education* in teacher education and disciplinary journals such as

Reading Improvement, *English Journal*, *Journal of Adolescent and Adult Literacy*, *English Education*, *Research in the Teaching of English*, *Language Arts*, *College English*, *Reading Teacher*, and *Journal of Reading*. The third data set drew from the Castle Conference proceedings and included six volumes, published biennially, in the last decade (2006–2016). In total, our final set included 77 publications with 18 journal articles from *Studying Teacher Education*; 17 publications from teacher education and disciplinary journals (including one dissertation); and 42 papers from the published S-STEP Castle Conference proceedings. All sources were peer-reviewed publications.

Initial Wonderings

From our reading of background literature, we formed initial wonderings; these wonderings became tentative and flexible frames for inquiry into the existing, yet previously unexamined disciplinary collection of self-study research related to literacy/language arts and reading education. We wondered:

1. For what purposes and around what wonderings are teacher educators in the disciplines of English, language arts, reading, and literacy conducting self-studies of their teacher education practices – either as a concept (theoretical or methodological foundations) or as an empirical research practice (Vanassche and Kelchtermans 2015)?
2. What tensions are present in and between the content area of literacy/language arts and reading and self-study research?
3. How, in what ways, or to what extent do the "fields" of (a) literacy/language arts, (b) teaching and teacher education, and (c) the self-study of teacher education practices contribute to, advance, or otherwise challenge each other through self-study research?
4. If we use the Transactional Theory to guide our reading of self-study research:
   (a) What meanings do teachers/teacher educators make?
   (b) What "texts" do they read and make meaning from?
   (c) What are the contexts in which they make meaning?
   (d) What knowledge and experiences do they identify as guiding/informing their meaning-making?
   (e) How might the meanings they make contribute to the field(s) of self-study, teacher education, and/or literacy/language arts education?

Research Questions

As we continued to discuss the background literature and to engage in early data analysis, we synthesized our wonderings into the following inquiry questions:

Using the Transactional Theory to frame an analytical, disciplinary reading of existing self-study literature related to reading, literacy, and English language arts education:

1. What is learned from self-study researchers' meaning-making in the content areas of reading, literacy, and English language arts?
2. What meanings might we – two literacy and English language arts teacher educators and self-study researchers – make about how teacher education in our content areas and self-study of teaching/teacher education practices might contribute to, advance, or challenge our fields?

Data Analysis

We replicated the in-case and cross-case data analysis approach Vanassche and Kelchtermans (2015) utilized for their systematic review of self-study literature. We selected their study as a model since it reviewed all self-study literature from the beginnings of S-STEP to the present. Our review differed from that of Vanassche and Kletchermans (2015) in two ways: (1) our review focused on self-studies related to the specific content areas of reading, literacy, and English language arts education; and (2) we employed a theoretically informed analytical reading – that is to say, we analyzed data through systematic interpretive reading that was guided by a theory as a specific disciplinary frame – to address our research questions.

Within-Case Analysis

First, we conducted a within-case analysis (Miles and Huberman 1994), examining each individual publication as a unit of analysis. We kept notes in charts that included (1) the bibliography for reference; (2) the specific content area – literacy, English language arts, or reading education – (3) the focus of the content area (Was the content area the context, the topic, the researcher's area of expertise, or a combination?); (4) reader/text/context notes (Who are the meaning-makers? What "texts" did they make meaning from? What was the context of the study?); (5) research findings; and (6) meaning-making notes (e.g., Do the researchers address their meaning-making? Is meaning-making explicit/implicit in positioning who they are in relationship to their research? Is meaning-making implied or stated in the methodological framework? Is meaning-making implied or stated in data analysis? To what extent do the researchers provide examples of making meaning? Do the researchers address the metacognition/how they made meaning in their inquiry?). During the within-case data analysis stage, we met weekly via Skype to discuss our memos, observations, and thinking about what we were reading. We also kept notes as critical friends to track our conversations and meaning-making process. Through discussion, we engaged in constant comparative analysis (Strauss and Corbin 1998), coding data for emerging themes, patterns, and outliers.

Cross-Case Analysis

Next, we conducted a cross-case analysis (Miles and Huberman 1994) to cluster data around themes across publications. Analytic coding and constant comparative analysis continued. The "recursive nature of the data collection-analysis-

interpretation process" inspired new questions, additional reading, and emerging insights over time (Pinnegar and Hamilton 2009, p. 149). We iteratively checked interpretations against the data and modified or refined, if needed, as we proceeded. We then produced a new themes chart with examples across studies. During the writing of this chapter, we further refined our responses to the inquiry questions we asked; thus, employing writing as data analysis (Richardson and St. Pierre 2005), we continued to engage in discourse and collaborative meaning-making, checking our interpretations against the texts, re-reading as necessary, and parsing out themes in relationship to the emerging whole of the study and the chapter. Once again, our running notes as critical friends helped to document our collaborative meaning-making process during the data analysis phase of our review.

Findings

In the literature we reviewed, self-study researchers included teacher educators, university program leaders, K–12 teachers, and combinations of these professionals. Contexts for meaning-making included university settings, K–12 professional development settings, and K–12 classroom settings.

Self-study researchers' meaning-making addressed the understandings they developed in relationship to studying their practices. Researchers reported studying and making meaning from the following "texts": teacher education programs; teaching practices in light of policy or program changes, mandates, or self-initiated changes; methods and approaches utilized or integrated into teaching; transitioning; educators' ongoing understanding, beliefs, or assumptions about teaching, professional development, and/or teacher education; and K–12 students' or teachers' learning processes and needs (see Table 1). Few studies (e.g., Kosnick and Beck 2008; Kosnick et al. 2009) addressed a longitudinal perspective of student learning; however, several studies referenced or addressed insights into professional practice over time (e.g., Martin and Dismuke 2014; Sugarman 2011).

In the content areas of reading, literacy, and English language arts education, (1) self-study researchers positioned themselves as active readers and meaning-makers who explored their practices through self-study. (2) Self-study researchers made meaning from studying tensions as "texts" from which they could discover new understandings. (3) Self-study researchers used content-area knowledge, strategies, skills and contexts to frame, guide, or inform their self-study and to make meaning from their professional practices with the goals of improving their practices and informing their field. Each of these related themes, while consonant with the larger body of self-study literature, reflects the content area/disciplinary values in which the studies were situated. In the following sections, we explicate these three themes, providing some examples and a sense of the relationship between each theme, and the content area in which the self-studies were situated.

Table 1 "Texts" from which self-study researchers reported making meaning

Teacher education programs	Teaching practices in light of policy or mandates	Methods, assignments, or approaches utilized or integrated into teaching	Transitions	Teacher/teacher educators' ongoing understanding, beliefs, or assumptions about teaching, professional development, and/or teacher education	K–12 students' or teachers' learning processes and needs
Kosnik and Beck (2008), Kosnik et al. (2009)	Edge et al. (2014), Martin et al. (2011), and Ciuffetelli Parker (2008)	Bartlett, (2006), Bartlett and Frambaugh-Kritzer (2014), Erickson and Young (2008), Fecho et al. (2006), Frambaugh-Kritzer and Stolle (2014), Holbrook et al. (2010), and Kew et al. (2010), Kosnik et al. (2011), Kosnik et al. (2012), Martin and Desmuke (2010), Martin and Desmuke (2014), Miller (2015), Mukeredzi (2014), Nicholson and Galguera (2013) Parr and Woloshyn (2013), Parsons (2015), Reynolds (2016), Rosean and Terpstra (2012). (2016), Sugarman (2011), Thomas and Geursen (2016), Tidwell et al. (2006), Tidwell et al. (2014), and Vogel and Bartlett,(2013)	Cameron-Standerford et al. (2016), Martin and Chase (2010), Kosnick et al. (2009) Schiller (2011), Schimpf (2014), Shoffner (2016), Sugarman (2011), and Olan and Kaplan (2014)

Self-Study Researchers Position Themselves as Active Readers and Meaning-Makers Who Can Explore Their Practices Through Self-Study

Teachers' and teacher educators' meaning-making from exploring their learning about practice became a clear theme. In the discipline of English language arts and in reading and literacy theory, particularly the Transactional Theory of Reading and Writing, the act of reading a text can be viewed as a meaning-making event and as an opportunity for exploration (Farrell and Squire 1990; Rosenblatt 1938). In Rosenblatt's (1938) seminal work, *Literature as Exploration*, reading is viewed as exploration. A reader reads to imagine possibilities; to discover cultural assumptions values, and patterns; to reveal diverse possibilities; and to see and re-see self, others, and the world beyond in relationship to the texts explored. Teacher-researchers who explored their practices in the content-area contexts of reading, literacy, and English language arts education positioned themselves as active readers who could make meaning from teaching events through self-study of their teaching practices over time, from employing literacy/language arts and reading knowledge to explore professional practices and by negotiating tensions.

Exploring Practice Across Texts and Over Time

Teacher educators described how self-study allowed them to frame their individual practices and comprehensive contexts as "texts" that they read and made meaning from in order to see and re-see their teaching and learning. Self-study researchers explained how across texts their meaning-making involved transactions, negotiations, tensions, dialogic interactions and responses, and establishing connections between practice, theory, and learning (e.g., Bartlett 2006; Bartlett and Frambaugh-Kritzer 2014; Clift 2009; Crafton and Smolin 2008; Fecho et al. 2006; Frambaugh-Kritzer and Stolle 2014).

As self-study researchers studied and engaged with the texts of their teaching experiences, they made meaning over time and in collaborative spaces. Self-study researchers acknowledged that even though learning may be an individual activity, collaboration led to transformative practices (Frambaugh-Kritzer and Stolle 2014; Martin and Dismuke 2014). Although self-study researchers initially struggled to find the focus of their literacy and educational exploration, it was over time (and from previous self-study) and in collaboration with others that they were able to share an insider/outsider deeper understanding of their own teaching and learning (Bartlett and Frambaugh-Kritzer 2014; Cameron-Standerford et al. 2016; Edge et al. 2014; Elliott-Johns 2014; Martin and Dismuke 2014; Olan and Kaplan 2014). For example, Frambaugh-Kritzer and Stolle (2014) state that:

> After our ten-year dedication into understanding new literacies, we now know our teaching of new literacies would not be as effective without experiencing these phases of investigation and investment; which not only informs us but makes us confident in our recommendations to other teacher educators. (p. 86)

It is in the dedication of exploration and examination that the discussion of teaching as well as subject-specific knowledge and learning are addressed. For example, Bartlett (2006) stated self-study provided her with opportunities to reflect and grow, as well as critically look at her own practice over time. Sugarman (2011) utilized an action research approach to her self-study of teaching practices and examined teaching nonfiction reading strategies to her third grade students over three cycles of data collection, discussion with critical friends, and reflection on her teaching. Over time and through interactions with colleagues, Sugarman explored the relationship between her personal content knowledge and her reading instruction and discovered how she and her students co-constructed content knowledge. Sugarman wrote that studying her personal content knowledge in teaching her students to read "changed [her] understanding of the way knowledge is constructed in [her] classroom" (p. 31). She also unexpectedly discovered how empathizing with her students enabled her to co-construct content knowledge with them; developing empathy enabled her to discover opportunities to co-construct knowledge with her students. Critically exploring her teaching practices over time impacted her students' reading abilities and also enabled Sugarman to reconceptualize Shulman's (1986) conception of pedagogical content knowledge to include teacher's "self-knowledge as it intersects with pedagogy and content" (Sugarman 2011, p. 40).

Similar to existing knowledge about how readers of traditional (alphabetic print) texts explore literature to discover new possibilities, self-study researchers in the content areas of reading, literacy, and English language arts discovered new understandings resulting from exploring their practices over time. This process of discovery and exploration served to challenge and ignite self-study researchers' teaching practices.

Exploring Practices in Literacy, Reading, and English Language Arts Content-Area Contexts

Numerous self-study researchers (e.g., Fletcher and Bullock 2012; Magee 2008; Parr and Woloshyn 2013; Reynolds 2016; Rosean and Terpstra 2012; Shoffner and Boche 2014; Sugarman 2011) used reading, literacy, and English language arts content-area knowledge to explore their teaching for purposes of improving their practice and developing understanding. A second theme, explicated later, addresses how self-study researchers used content-area knowledge, skills, and strategies to frame or to guide their self-study; in this section, we highlight how self-study researchers explored their practice by actively and critically reading their own and others' professional practices.

Magee (2008), for example, explored her teaching, unarticulated assumptions, and professional identity by making meaning from her written metaphors about teaching. Citing Berliner (1990), Magee explained metaphors are powerful tools that "can reveal a deeper sense of who we are as professionals, uncovering aspects about ourselves that perhaps we did not know existed in our practice (p. 223). Knowing the important role motivation plays in reading, Miller (2015) set out to rethink her approach to reading instruction by bringing a love for reading back into her fourth grade classroom. After she observed a colleague's reading instruction and realized

the culture for reading was positive, engaging, and interactive through the use of small groups, Miller explored the relationship between small, differentiated reading groups and her students' reading motivation. Miller wrote that exploring the relationship between small groups and reading motivation "had profound effects on our classroom culture, on [her] students' motivation to read, and on [her] own self-concept as a teacher" (p. 112).

Reynolds (2016) utilized dialogic instruction as a theoretical perspective to explore whole-class discussions in his English language arts methods class and to help him shift away from the initiation-response-evaluation (IRE) pattern of talk in his university classroom. Inspired by knowledge of English/language arts and reading scholarship (e.g., Applebee et al. 2003; McCallum et al. 2011; Nystrand 2006; Wilkinson and Son 2011) that documents the effectiveness of dialogic instruction, Reynolds aimed to include dialogic, whole-class discussion as a key instructional method in his class. He sought to provide students with the opportunity to use language and discussion in collaborative ways that resulted in co-constructing knowledge and understanding. As a result of his study, Reynolds began to notice students' gaze was on him during long discussions; that he asked questions he had answers for; and that discussions followed a back-and-forth pattern. Through self-study, Reynolds explored his teaching and the theoretical view of discussion stemming from research in his content area; as a result, he made changes to his teaching and proposed alternative ways to consider Nystrand's (2006) view of dialogic interaction in the classroom.

Parr and Woloshyn (2013) used knowledge of reading comprehension and strategy instruction to conceptualize their self-study into integrating strategy instruction into Parr's first-year university elective English course. Understanding that readers who are metacognitively aware are able to monitor understanding, Parr and Woloshyn explored Parr's explicit teaching of comprehension strategies and detailed insights related to documenting and analyzing Parr's textualized teaching practices (field notes, weekly reflections), student responses (pre- and post-instructional questionnaires, written reflections), and transcribed discussions with a critical friend (author 2). Findings detailed patterns and insights related to implementing strategic comprehension instruction into postsecondary teaching practices aimed at promoting first-year university students' metacognitive awareness through strategy instruction.

While the majority of articles included one or more self-study researchers who self-identified as a literacy or language arts educator, Fletcher and Bullock (2012) were science and physical education teacher educators who used literacy as a central frame for exploring their teaching and making meaning from learning about practice in practice. Communicating that multiliteracies was an "attractive and useful framework on which we could hang our theoretical hats" (p. 21), these teacher educators engaged in a self-study in order to (1) to "interpret and analyze the meaning of literacy in [their] respective content areas and (2) to challenge one another to analyze the enactment of pedagogies based on [their] understandings" (p. 19). Fletcher and Bullock made meaning from examining their understandings of research in physical literacy and scientific literacy, as well as their approaches to engaging teacher

candidates in thinking about literacy in their content areas. Data included blogs and transcribed bi-weekly meetings "and focused on the dynamic interplay between [their] conceptual understanding of physical and scientific literacy as concepts and [their] attempts to model literacy-based pedagogies explicitly for [their] students" (p. 29). Fletcher and Bullock summarize:

> Self-study provided a methodology that allowed us to develop our understandings of physical literacy and scientific literacy. Our ongoing discussions encouraged us to find meaning within the existing literature and to make meaning as we encountered problems of practice in our teacher education classrooms. Significantly, we learned that our developing understanding of literacy in our disciplines did not immediately or directly translate into practice; collaborative self-study again provided a means for us to challenge one another to live our values as teacher educators." (p. 31)

Findings resulted in deepening their understandings of literacy in their specific disciplines and also in discovering the challenge of enacting in their teaching what they had come to understand about disciplinary literacy. Fletcher and Bullock stated that they found meaningful connections in the existing literature that enabled them to understand how literacy related to science education and physical education. When enacting their knowledge about literacy in their teacher education classes, they discovered the challenge.

Navigating and Negotiating Tensions While Exploring Professional Practices

Learning through self-study can result in meaning-making that inspires new visions for teaching and continued research; however, it can also make meanings that are troubling. Nevertheless, navigating and/or negotiating these tensions was another way that self-study researchers frequently learned through self-study. For example, Fletcher and Bullock (2012), whose study was presented as an exemplar of learning from literacy frameworks in the preceding section, also noted that learning "about the research on physical and scientific literacy were made problematic by the potential challenges of practice" (p. 25). Data focused on "the dynamic interplay" between conceptual understanding of literacy concepts and their efforts to explicitly model literacy-based practices for their students. "The ways in which we enacted our pedagogies often created new problems of practice that required further analysis, which encouraged us to seek help and insight from one another as critical friends, which then led to new actions" (p. 29).

Tysseling and McCulley (2012) acknowledged the struggles they experienced implementing "wikis as a digital resource that serves a vital role as a digital space for teacher education" (p. 291). As self-study researchers navigated, grappled with, and questioned the tensions they faced, dialogic interactions and additional learning occurred. Ciuffetelli Parker (2008) problematized and wondered about how to "shift away" (p. 55) from a prescribed curriculum and a top-down, transmission model of teaching. Beyond navigating with the tension of questioning the curriculum used, Ciuffetelli Parker realized how possessing and enacting academic freedom led to an internal struggle about enlightening the team of part-time instructors who

relied on the prescribed curriculum. Navigating and negotiating curricula changed while exploring her teaching practices; enacting wonderings and valuing experiences were part of Ciuffetelli Parker's meaning-making self-study journey.

In the studies we reviewed, self-study researchers realized tensions between learning, teaching, wondering, knowing, and acting are present within contextual and pedagogical spaces (Elliott-Johns 2014; Erickson et al. 2012; Erickson and Young 2008; Fecho et al. 2006; Kosminsky et al. 2008; Magee 2008). While learning from practice often prompted new tensions, self-study researchers identified and described moments in their meaning-making transactions when they experienced internal turmoil or tensions (Berry 2007) as they explored their teaching practices. Navigating and negotiating tension from enacting their wondering from their teacher education practices led to additional learning through meaning-making and additional inquiry.

Self-Study Researchers Make Meaning from Studying Tensions as "Texts" from Which They Can Discover New Understandings and Wonderings

Self-study methodology enabled educators to negotiate tensions and to make meaning from their experiences. Utilizing self-study methods to study the tensions experienced by self-study researchers resulted in the helpful exchange of ideas, collaboration, a validation of teaching and learning, and the exploration and additional inquiry about pedagogy (Magee 2008; Martin and Chase 2010; Pratt-Fartro 2012).

Experiencing Tensions

While negotiating tensions was a way self-study researchers explored their practice, tensions were also fertile ground for engaging in discourse and collaboration; for situating and resituating professional practices; and for generating new understandings through self-study where struggle, conflict, and/or discomfort were encountered. During the comprehensive analysis of self-study researchers' studies, we noticed how their pedagogies, learning, and socially constructed ideas were shared, problematized, critiqued, unpacked, and clarified or extended.

Self-study researchers identified and described how internal tensions rooted in practice had the potential to encourage interrogation of those tensions as dilemmas and opportunities for examining the institutional experience (Elliot-Johns 2014). Through self-study methodology, teacher-researchers were able to externalize and critically examine tensions that they were previously unable to identify in an explicit manner (Frambaugh-Kritzer and Stolle 2014, p. 86). For example, Pratt-Fartro (2012) addressed challenges and dilemmas teachers and teacher educators experienced when they received feedback, evaluations, or comments from students and colleagues. Erickson and Young (2008) discovered their teaching practices were not congruent with their beliefs about learning; nevertheless, this discovery generated a new tension, as they weighed the desire to enact their beliefs against the desire to

cover curriculum that might be necessary for teacher candidates to know. Self-study methodology led to altering their teaching practices but also prompted new tensions as practitioners considered the impact of enacting their understandings in their teaching contexts.

Tensions Prompt Discourse and Collaboration

One's history of literacy experiences impacted private understandings and the way an individual researcher interacted with others; yet, self-study, through collaboration with critical friends and the use of an heuristic approach, enabled self-study researchers to reposition their orientation; to see anew; to deal with the challenges of engaging in the intricacies of disciplines, pedagogies, and programmatic evaluations (Kosnik et al. 2008); and to interact with trusted colleagues in safe spaces where exploration permeated (Boche 2014; Crafton and Smolin 2008; Fletcher and Bullock 2012; Gísladóttir and Guðjónsdóttir 2014).

Self-study promoted opportunities for researchers to step back and reposition their orientation or stance toward their work (Boche 2014; Crafton and Smolin 2008; Erickson and Young 2008; Fletcher and Bullock 2012; Gísladóttir and Guðjónsdóttir 2014; O'Looney et al. 2010). Self-study researchers acknowledged the importance of sharing, exchanging, and engaging in collaboration through layers of interactions for meaning-oriented understanding (Fletcher et al. 2016). Boche (2014) declared:

> In order for teacher educators to stay abreast of current classroom practice to inform their practice as well as how they teach pre-service teachers, continued collaboration with practicing teachers is needed. As this study has shown, there is no 'right' way to collaborate and guidelines that reflect working with practicing teachers are needed. In my subsequent research experiences with practicing teachers, I have learned to focus on hearing and putting their voice ahead of mine, as that is where the power for change exists. Success, for me, is no longer determined by teacher or student satisfaction of a given project, but rather through the insight gained through the process and what can be gained from this insight in the broader educational field. Only upon further reflection and study can teacher educators better articulate how these interactions can better serve both populations of practicing teachers and pre-service teachers. (p. 34)

As self-study researchers engaged in pedagogical and theoretical dialogue (Gísladóttir and Guðjónsdóttir 2014), they checked data and clarified, validated, and reframed ideas and assumptions about respective classroom communities; enacted literacy theories in practice; and generated, revisited, and/or retained ideas that lead to inquiry, exploration, and tension (Fletcher and Bullock 2012; Crafton and Smolin 2008; O'Looney et al. 2010).

Self-study researchers claimed that as they ventured into inquiry and study of teaching practices, collaboration helped them revisit and enact literacy data and ideas in practice and theory while engaging in dialogue with experts from their fields of practice (O'Looney et al. 2010; Tidwell et al. 2006). Self-study researchers shared and expanded their private thoughts and tensions with other experts from their fields, obtaining different views and possibilities for their inquiries and tensions as texts.

Tension as a Text That Can Be Repositioned and Reframed Through Self-Study Research

Self-study researchers grappled with maintaining their own practices, beliefs, perspectives, and vision of self throughout their explorations and inquiries (Craig 2009; Elliott-Johns and Tessaro 2012; Erickson and Young 2008; Pratt-Farto 2012; Shoffner 2016). The more self-study researchers grappled with their tensions, the more they engaged in internal dialogue in an attempt to make sense of their tensions (Erickson and Young 2008; Shoffner 2016). For these researchers it became evident that tensions were a text that, when analyzed and examined through self-study, repositioned and resituated their explorations. For example, Erickson and Young (2008) revisited their ongoing tensions related to promoting teacher candidates' owning their learning. They questioned if they were willing to resituate and reposition themselves in a space of constant tensions. Similarly, Pratt-Fartro (2012) framed her internal tension, situated in a particular context, as a text she could examine. She reframed her vision of herself as leader in a community of teacher educators and repositioned herself as a self-study researcher who could contribute to pre-service and in-service teachers' literacy growth.

Miller (2015) situated her teaching and tensions within the context of "the fourth-grade slump" (p. 104), when students' test scores tended to drop, and when she felt the pressure to help her diverse students perform adequately on high-stakes testing. Miller positioned this tension as a text that she can read through an alternate lens. Miller (2015) writes, "While high-stakes testing is one way to approach the troubling reality of poor performance in the middle grades, I wanted to explore an alternative response: *What would happen if I built a reading program that emphasized enjoyment of the reading process?*" (p. 104). Observing another teacher's reading instruction helped Miller to envision new possibilities through teaching approaches that resonated with what she wanted to incorporate into her classroom. Through systematically examining the tension between what was and the idea of what could be through the use of small, differentiate groups, Miller reenvisioned her practice. She explained, "I was driven to understand more deeply within my own context. As I began dismantling, addressing, and rethinking the roadblocks that I saw standing in my way, a shift took place" (p. 112). It is through "re-reading" the context and the tension in her teaching with an alternate lens that Miller reimagined and re-created her teaching to foster her students' motivation to read.

Self-study researchers positioned their tensions as texts that could be studied and recomposed in light of re-contextualized beliefs, knowledge, teaching practices, visions, assertions, and ideologies that could better inform teacher education, self-study research methods, and teacher-researchers' own understandings (Elliot-Johns and Tessaro 2012: Shoffner 2016).

Tensions as a Text from Which New Meanings, New Understandings, and Transformations Are Generated

Self-study researchers engaged in dialogic interactions that enabled them to connect their tensions and experiences as a means to make meaning; revisit; and make new understandings from their actions, existing assumptions, biases, ideas, and visions;

and acknowledge spaces where transformative learning and teaching takes place, not only for the self but for others as well (Crafton and Smolin 2008; Elliott-Johns and Tessaro 2012; Erickson and Young 2008; Erickson and Young 2011; Gísladóttir and Guðjónsdóttir 2014; Kosminsky et al. 2008; Olan and Kaplan 2016; Shoffner 2016; Ciuffetelli Parker 2008; Thomas and Geursen 2016; Tidwell et al. 2006).

For example, recognizing the tension between the theoretical grounding of their methods courses and the policies and procedures in their classroom practices, Erickson and Young (2008) studied changes to their courses as well as their lived experiences through the process of aligning classroom practices with their beliefs about teaching and learning. "Making even small changes to our teaching practices was challenging. Our data were laced with words like *struggle*, *concern*, *difficult* or *ambivalent*" (p. 116). Erickson and Young studied artifacts from their interactions with one another, interactions with students, and their individual reflective journals. Erickson and Young documented how they experienced new tensions as they made pedagogical and procedural changes meant to align their practices with their beliefs about teaching. However, new tensions these new tensions led to opportunities for their students to take more responsibility in their learning and for them to model the practices they hoped their students would implement in their future classrooms. Both self-study researchers and students made new meanings and understandings about learning and teaching where knowledge was not solely transmitted, but constructed in a transactional manner.

As self-study researchers experienced and embraced tensions, they looked at their practice from different perspectives and in multiple roles while questioning their learning and teaching and the transformations that may transpire from the exploration of tensions. Shoffner (2016), an experienced academic, problematized how dilemmas and tensions with practice provided new understandings and perspectives as she examined those tensions from the different perspective of a learner or novice during a fellowship experience.

When self-study researchers explored new understandings in the context of dialogic interactions, both social constructions and the social and dialogic nature of language led to transformation. Crafton and Smolin's (2008) research depicted their initial explorations about and insights gained from their work to include a more intentional use of language within a social practice to achieve transformation. The authors also emphasized how their work expanded self-study literature "by taking seriously the essential social and dialogic nature of language and what that can mean for a deeper, expanded understanding of collaborative self-study" (p. 85). Similarly, Ciuffetelli Parker's (2008) sense of pedagogical self-discovery and tensions (grappling between her self-identified ego and instructional and theoretical approaches) enabled her to take a step back, look closer, and understand the value teachers have as curriculum planners. She also used reflective and narrative approaches as a lens to view teachers' professional development. Expounding on her self-study journey, Ciuffetelli Parker explained her self-study of her teacher education practices and engaging in collaborative self-studies with others led to insight about policies and procedures for assessing teacher candidates during their practicum, her own development as a new assistant professor in academe, restructuring a teacher education

program, and changing practices. The exploration of tensions in the self-study research not only served as a conduit for new meanings, new understandings, and new transformations but also served as key process for self-study researchers' meaning-making.

Self-Study Researchers Use Content-Area Knowledge, Strategies, Skills, and Contexts to Frame, Guide, or Inform Their Self-Study and to Make Meaning from Their Professional Practices with the Goals of Improving Their Practices and Informing Their Field

Self-study research in reading, literacy, and language arts education demonstrated how self-study researchers (a) used disciplinary strategies and/or techniques in their self-study; (b) tapped into content-area experiences to make meaning; and (c) used disciplinary knowledge as a frame to explore teaching, teacher education, or self-study methodology.

Considering the theoretical framework guiding our study, we recognize the dynamic relationship between meaning-making, the researcher as meaning-maker, and the particular contexts in which meaning is made. In the transactional theory, an individual's meaning-making process is informed by their linguistic-experiential reservoir – the language and experiences one brings to the meaning-making event – and is guided by one's attention and stance toward the text. With this in mind, we kept notes during the data analysis stage, charting the stated purpose of each study, the context(s) of the study, and the knowledge and experiences self-study researchers identified as either prompting their study, informing their study, or guiding their study. In attending to self-study researchers' identified knowledge and to language indicating sense-making in their published manuscripts, we aimed to consider the potential relationship between each researcher's content-area knowledge and experiences to their self-study. While no means exhaustive, we provide some examples of the reading, literacy, and language arts knowledge and experiences self-study researchers identified in their study and either directly stated or implied in connection to the meaning that they made from their self-study.

Reading, Literacy, and English Language Arts Strategies and Techniques Used in Self-Study

Self-study researchers utilized strategies and techniques commonly found in reading, literacy, and English language arts education. These strategies and techniques were, at times, studied after having been utilized as an approach to teaching and then repositioned as a text or object that the researcher(s) critically examined in their self-study of teaching practices. In other studies, the strategies and techniques were a means to make sense of data or to represent findings. Across examples, we clearly saw that teachers and teacher educators writing about self-study in reading, literacy, and English language arts content-area contexts utilized knowledge of disciplinary views, strategies, and techniques.

Metaphorical Thinking

Recognizing that metaphorical thinking is a way that she represented her pedagogical theory, Magee (2008) read the metaphors in her dissertation as texts she could examine, deconstruct, and interpret. Comparing and contrasting her metaphors, she reflected upon them as a way to further inform herself about her philosophy of teaching and learning. Making meaning from her written metaphors also became a vehicle to understand the tensions and conflicts she discovered between her beliefs and the expression of those beliefs on the written pages of her completed dissertation. Reading and analyzing her use of metaphors, she addressed the way educators can use metaphors and metaphorical thinking to understand self and the relationship between self and the assumptions one brings to teaching.

Using New Literacy Strategies

The multiliteracies view of literate practices influenced by cultural and linguistic diversity, multimodality, and new media and digital technologies (Cope and Kalantzis 2000; New London Group 1996) are also evident in self-studies. Several self-study researchers (e.g., Kew et al. 2011; Martin and Dismuke 2014; Pithouse-Morgan and Samaras 2014; Rosean and Terpstra 2012) demonstrated using knowledge, skills, and approaches as strategies related to the sociocultural perspective of language and literacy in the New Literacy Studies (Gee 1999; Lankshear and Knobel 2006). Other researchers utilized approaches to diverse literacy practices across contexts from studies of new literacies (Kew et al. 2011; Lankshear and Knobel 2006). These views "share the theoretical stance that literacy practices are multiple, social, and situated" (Rosean and Terpstra 2012).

Seeking to address the disconnect between knowledge of literacy and language research and teacher education in language and literacy, Kew et al. (2011) engaged in using new literacies as a strategy to bridge a theory-practice divide and to explore how self-study might initiate teachers into the New Literacy Studies. In the context of a graduate course, practicing teachers documented situated understanding of new literacies through engagement in using selected multimodal, digital, tools and social practices (blogging and online gaming), course readings, discussion, and self-study. Findings included shifts in mindsets, connections to classroom teaching, situated understandings, and illustrated how two teachers (Kew and Given) began to approach literacy and learning from a sociocultural perspective. The authors wrote, "We see these qualitative self-studies as small but positive steps towards more extensive engagements with new literacies in teacher education" (p. 80). Self-study was a way to capture and examine learning about new literacies by engaging in literate practices in social settings.

Martin and Dismuke (2014) focused on changes they made to their writing methods course as a result of incorporating new literacies composition with digital tools in social contexts through collaborative self-study in their writing methods courses. In addition to the focus of the classes, writing was used as a method of understanding self, with "teachers freewriting their way to understanding themselves and their histories as writers" (p. 148); as a medium for making explicit connections between theory and practices; as a way for teacher educators to understand

multimodal composition processes; and as self-study data. Referring to insights from their previous self-study (Martin and Dismuke 2010), the teacher education researchers "considered it essential that teachers engaged in experiences as both writers and teachers" in their courses, and they "purposefully engaged students as adult learners in order to foster development of powerful experiential understandings" (2014, p. 148). Students in these methods classes composed types of writings typical for K–8 classrooms (e.g., memoir, interview/feature article, poetry, reading response, multigenre product), in multiple genres and using new technologies for writing and representation across multiple modalities. Model compositions produced by former students served as examples to new students; Martin and Dismuke also implied that these compositions were data examined to illuminate their teaching practices and changes in those practices over time. The authors reported realizing that although student-produced compositions increased in use of technology and multimodal elements such as music or color to communicate tone, showing student-produced models was not sufficient for instruction. Teacher modeling and explicit instruction were equally important. Martin and Dismuke realized that to understand the process themselves and provide instruction that would make explicit connections between university course experiences and K–8 classrooms, they wrote alongside their students. Understandings from participating as writers themselves resulted in changes to their course instruction. Meanings made from engaging in writing and studying students and researchers' own writing over time resulted in understandings about teaching and the role of teacher educators. Martin and Dismuke wrote that they did not water down their curriculum to infuse digital writing products and processes into their courses. "Instead, our evolving curriculum and instruction seems richer to us and thoughtfully interwoven as we continue to focus on and build understandings of writing and effective writing instruction" (p. 150). Having used writing as a way to understand how to compose and how to model the composition process for their students, they stated:

> The key to our efforts has been that we are journeying in concert with our students, teachers, colleagues, and each other (Tyselling and Laster 2013) towards greater understandings [;] writing and technology has to occur systematically, with teacher educators in the lead, not left haphazardly to factors such as teachers' prior knowledge or dispositions about digital tools." (p. 150.)

Martin and Dismuke (2014) utilized their knowledge of writing-to-learn, of modeling the writing process as writers alongside their students, and of explicit teaching as they taught; they also implied that they read student examples and their teaching like multimodal compositions.

In a transcontinental (USA and South Africa) self-study of teaching practices with university educators from diverse disciplines and working in diverse contexts, Samaras et al. (2016) sought to "gain insight into the network of the interconnectedness of [their] transcontinental experiences: the similar and dissimilar, the contiguous and non-contiguous, and the linear and nonlinear nature and impact of [their] work" (p. 164). Data from their study included found poems constructed

collaboratively by 21 conference participants attending a presentation led by the 2 lead authors (Pithouse-Morgan and Samaras 2014) at the tenth International Conference on the Self-Study of Teacher Education Practices. Data analysis and the representation of findings included composing found poems from data. Samaras et al. (2016) wrote:

> Found poetry is a literary arts-based research practice that involves selecting words and phrases from data sources and rearranging them into poetic form (Butler-Kisber 2005). Found poems are composed "with the expressed purpose of presenting data that remain faithful to the essence of the text, experience, or phenomena being represented" (Furman et al. 2006, p. 27). The found poems were written on posters and performed by the groups. (p. 166)

The coauthors also wrote poems in response to the found poems, generated a double voice poem (Johri 2015), made found poems from written reflections, and composed a poem written in response to these poems. Their poetic dialogue process evolved from composing found poetry to represent research data to interpreting that data in the form of new poems which allowed for the subjective responses of the researchers. The sequence of composing poems thematically portrayed "multidimensional conversation, which served to pull together significant threads woven through the diverse data sources" (Samaras et al. 2016, p. 167). Their collaborative writing resulted in a multiverse manuscript which represented their findings, communicated their understandings, made visible the network of human knowledge, and demonstrated methodological bricolage. Generating, performing, and analyzing found poems as a multimodal literacy strategy communicates the poetic dimensionality of polyvocal learning and the fluid, connected process of the researchers' collaborative self-study.

Mental Modeling: Making the Invisible Visible

Many self-study researchers reported attempts to make the implicit explicit (e.g., Kosnik et al. 2008; Martin and Dismuke 2014) and to make the invisible process of thinking about literacy (e.g., Calderwood and D'Amico 2008; Fletcher and Bullock 2012) or thinking about teaching (Edge et al. 2014), or about mentoring (Olan and Kaplan 2014) more visible. Mental modeling and making the complex process of thinking visible are approaches shared with literacy/reading instruction (e.g., Beers 2003; Buehl 2014, 2017). Often, modeling was a strategy employed to make visible the what, how, when, and why educators know, do, and are.

For instance, Kindle and Schmidt (2013) discovered the first author's use of modeling professional language when interacting with preservice teachers (PTs) as a discipline-informed approach to scaffolding PTs development as teachers. In another study, Martin et al. (2011) modeled their sense-making about educational contexts in order to help prospective teachers to navigate state-mandated assessment of literacy subject matter and instructional practices; the complexity of teaching and of reading; as well as the "delights of teaching" (p. 365) from candidates' field experiences. They wrote, "Our experiences help clarify the importance of being conscious of what is and what is not being taught and modeled in one's courses through curriculum choices and

instruction/assessment practices" (p. 367). Addressing the dual roles in which teacher candidates reside – that of student and beginning teacher– Martin and colleagues explicitly attended to students' social/emotional needs as students while furthering candidates' professional knowledge and action and concluded that teacher educators need to recognize the implications of their attention or inattention to the complexities of candidates' roles as learners and as beginning teachers. Modeling enabled these teacher educators and self-study researchers to purposefully attend both to their own and to PTs' sense-making. In the discipline of reading and literacy education, in particular, attending to purpose, modeling sense-making, and making the invisible process of thinking visible are each key tenets; Martin and colleagues employed these tenets, not just as content for PTs to learn but also as teaching methods and as data utilized for self-study.

Think-Aloud Strategy

A think-aloud strategy (Davey 1983; Olshavsky 1976) is a metacognitive strategy often used in reading instruction to make visible the largely invisible process of thinking while reading (Beers 2003; Wilhelm 2001). Some teacher educators (e.g., Berry 2004; Crowe and Berry 2007; Kosnik 2007; Loughran 2006; Loughran 2007) have studied think-aloud as a metacognitive strategy for explicitly modeling thinking processes about teaching.

Kosminsky et al. (2008), teacher educators from special education, physics education, secondary science education, and English education, investigated their use of think-alouds in order to understand their own perspectives and reasoning; their use of think-alouds (how, when, and what to think aloud); and an ecological perspective of the environment that enabled think-alouds to be open and safe spaces for learning despite the risk of criticism from others when thinking out loud. Commenting on the rich findings from using and studying think-alouds, one of the authors (Kane) wrote:

> Think-alouds create opportunities to expose the dialogic nature of tensions that emerge within the daily practice of teachers. Think-alouds reveal to students that teaching is far more than what is observable as a teaching practice. [Author 1] demonstrates that a think-aloud enables her to use her own practice as a teachable moment, and this suggests that the timing of the think-alouds may be critical. The challenge of exposing and negotiating the tension between content and process and between knowledge and experience should be tied to the moment or site of the tension. (p. 199)

Kosminsky, Russell, Berry, and Kane conclude:

> Sharing think-aloud experiences may be a productive way for teacher educators to share engaging moments in their teaching with others interested in self-study and in opening up the process of becoming a teacher to those who are learning to teach. Think-alouds facilitate student teachers examining themselves as teachers and as learners. (2008, p. 200)

Similar to its use in literacy, reading, and English language arts education, the think-aloud was a strategy utilized for teacher education practices and studied as a metacognitive tool by self-study researchers.

Exit Tickets

Exit tickets are an after-reading and after-learning strategy utilized to help learners synthesize or possibly extend their thinking about what they read or what they learned in class before leaving (exiting) the class and/or to communicate learning, questions, connections, or parts of a lesson that a learner enjoyed (Beers 2003). Kosnik et al. (2008) report that their use of "ticket-out-the-door" (p. 204) served as an innovation that enabled students to communicate with their teacher educators, to reflect on their learning, and to identify what they were learning. In the context of an after-reading strategy, learners can become more agentic by using exit tickets as a tool to attend to their own reading and learning, as well as to communicate their needs as learners. In the context of self-study, teacher-researchers foster learners' agency to see, own, and communicate learning and needs. Exit tickets were and can be data to examine pre-service teachers' learning and teacher educators' teaching practices.

Visual Images

In the reading and literacy education knowledge base, sketching images can be a way to provide readers and learners with an opportunity to comprehend, to make meaning, and to discover new meanings. When a reader or learner sketches an image of what she/he has read or learned, the sketch transmediates communication from one sign system to another (e.g., from print to visual) (Harste 2000). Jarvis et al. (2012) generated images about being teacher educators as a strategic way to help new faculty transition from their former work in school-related settings (e.g., teaching or leadership) to their new roles in a school of education in a UK university.

> Creating visual images for reflection was a process introduced by the first author at the initial group meeting. Gauntlett suggests that this is one of many creative and visual methods that can be used for exploring identities and can also provide a starting point for thinking about issues, and communicating them to others (Gauntlett and Holzwarth 2006). This form of representation allows for the metaphorical; the being able to express something difficult to put into words (Gauntlett 2007). Visual images also allow colleagues to document perceptions of practice without writing. This was important as writing in an academic context was seen as an issue for some new staff from professional backgrounds. What was also important was that drawing was not a requirement but a suggestion. The drawing of 'How I see myself in my practice now' formed a key element of each session because the new staff members requested this, not because it was expected. (Jarvis et al. 2012, p. 43)

Generating, sharing, and discussing visual images became a way to explore issues and tensions related to pedagogy and professional identity in higher education. As individuals moved from a position of expert to novice again, they explored tacit professional knowledge that needed to become explicit so that the new staff could have the tools necessary to identify aspects of their practice, articulate underpinning theories, and explain and model their knowledge to students of teaching. Visual images also served as data to capture the new faculty participants' perceptions and changes over time. This visual data was utilized to analyze the role of collaborative self-study as a strategy for faculty induction into higher education.

Edge et al. (2014) also used visual images to make meaning through collaborative self-study. As three members of a group of eight teacher educators representing the content areas of literacy, special education, educational leadership, and one elementary (grades K–5) reading specialist teacher, this group inquired into how they used visuals as texts to re-see their worlds and to help others to construct meaning. Data included university students' images, images in picture books used to teach in university and elementary classrooms, images teacher educators produced to communicate complex ideas in university classes, and images that graduate and undergraduate students responded to, through class discussions or through written responses in online discussion forums. The group of eight self-study researchers also produced the image of an iceberg to communicate the experience of self-study and the phenomenon of re-seeing their practice from new points of view that enabled them to see beneath the surface of their instructional decisions and use of visual images to construct or to convey meaning.

Content-Area Experiences to Inform Self-Study

Several self-study researchers noted that their reading, literacy, and English language arts-related experiences initiated a self-study, informed the basis of their self-study, or became evident in the findings of their self-study (e.g., Cameron-Standerford et al. 2016; Edge et al. 2014; Kew et al. 2011; Kindle and Schmidt 2013; McDermott 2010; Martin et al. 2011; Sugarman 2011). For example, Kindle and Schmidt (2013) collaboratively explored the way that one instructor's scaffolding and strategic prompting guided the development of PTs. Kindle and Schmidt explicitly stated that experience teaching reading guided Kindle's instructional approaches and interactions with individual PTs:

> Karen's experience in reading instruction in Reading Recovery (Clay 1993) had had a profound influence on her teaching. The principles of starting with the known, following the child, and strategic prompting within the zone of proximal development (ZPD) are ingrained in her teaching interactions, with both children and PTs. This parallel was not apparent at first, but emerged in the course of our analysis of transcripts of Dialogic Inquiry Groups (DIGs); small groups that met regularly during the semester to support PTs during a case study assignment and to foster collaborative inquiry and problem solving. (p. 83)

In this study, the first author's experiences teaching reading became readily evident to the second author who observed Kindle interacting with PTs. Findings from their self-study resulted in rich descriptions of four "key moves" the instructor made that appeared to facilitate PTs' knowledge development, skills, and professional dispositions. These key moves included shifting instructor stance from authority figure to expert peer; using strategic prompts to promote inquiry, problem-solving, and critical thinking; modeling professional language; and the transfer of responsibility (p. 89). Kindle and Schmidt concluded their article with meanings that they made about the role of self-study and the use of their disciplinary knowledge and experiences to frame their study. They noted that Schmidt's perspective as an outsider helped Kindle to see her teacher moves and her scaffolding preservice teachers' learning and independence, actions that had become less visible to Kindle because

they had become routine. The first author's experiences as a reading teacher guided her interactions with PTs and her efforts to scaffold their development. The relationship between her prior experiences as a reading teacher, her disciplinary knowledge, and her teacher education practices became evident through collaborative self-study. In addition, Kindle and Schmidt consciously and purposefully used their content-area knowledge to frame the analysis and the discussion of their study.

> It is our belief that by framing our analysis and discussion into the familiar contexts of scaffolding and strategic prompting with the metaphor of balanced literacy instruction, we can make the findings applicable to a wider audience and begin to build a framework for envisioning teacher education in literacy in terms that are related to our professional Discourse community. (p. 98)

Kindle and Schmidt's meaning-making from their self-study resulted in thinking about ways to contribute to the broader discourse community (Gee 1999, 2001). Thinking about how PTs "need the scaffolding provided by the instructor and the prompts at critical moments" (p. 99), the researchers made plans for continued research that could help to problematize the politically charged climate in which teachers face scripted curriculum and in which schools of education find themselves facing scrutiny and accusations of limited efficacy. Through their collaborative self-study, the richness of experience in teaching reading, knowledge of scaffolding, and realizations about how this experience and knowledge informed a teacher educator's interactions with PTs came to light led to improving teacher education practices and spurred plans for further research.

Content-Area Knowledge as a Frame to Explore Teaching, Teacher Education, and Self-Study Methodology in Self-Study

Content-area knowledge acted as a frame for conceptualizing teaching, teacher education, or self-study methodology in several self-studies in literacy, reading, and English language arts education (e.g., Cameron-Standerford et al. 2016; Fletcher and Bullock 2012; Kindle and Schmidt 2013; Kosnik et al. 2012; Parr and Woloshyn 2013; Parsons 2015; Rosean and Terpstra 2012; Sugarman 2011; Vogel and Bartlett 2013). For example, Kosnik et al. (2012) integrated technology and multiliteracies pedagogy into two co-taught literacy courses. They concluded their self-study by framing teaching from a multiliteracies inquiry stance:

> In addition to expanding readings to include literature on multiliteracies, discussion of the concept, and greater use of digital technologies, we adopted the question "What does it mean to be literate in the 21st century?" as an overarching question for our literacy courses. Having this question as the framework for the course immediately sent a message to students that we were thinking very broadly about literacy, encouraging them to think beyond the textbook and consider how their personal literacy practices inform their views of literacy. (p. 177)

In asking an overarching literacy question for their courses, these teacher educators position themselves and their students as inquiring learners who can critically consider teaching and learning through the lens of literacy. Furthermore, there is

an implied relationship between an individual's "personal literacy practices" (p. 177), texts that are read, and how teachers and learners understand twenty-first century literacy.

Parsons (2016) explicitly framed her literature for adolescents course with two literacy/language arts literary theories: Rosenblatt's (1978, 1994) transactional theory and Langer's (1995) theory of envisionment building. Parsons wrote that these two theories shaped her approach to teaching, responding to, and discussing literature. She also demonstrated that she read her students' written transactions to literature, in order to make meaning about her teaching, through the lens of these same theories. Throughout the course, students read one novel each week and crafted a three-part written response. Part one encouraged an aesthetic stance and part two, an efferent stance in order to shift from "being in and moving through" the text to "stepping back and objectifying the experience" (Langer, 1995; Rosenblatt 1978/1994). Part three was written after discussing the text and students' written responses to parts one and two in class; this part encouraged students to communicate the meaning that they made from reading and discussing the texts. Through self-study, Parsons examined her students' written responses to the final three course texts, three trans-themed novels – literature, that is, a subset of LGBTQ literature, featuring characters who identify as transgender and that explore the transgender experience. Reading and making meaning from these responses through a clearly articulated position toward literature, toward students' responses to literature, and toward the LGBTQ community, Parsons proposed to make changes to her teaching, and then she problematized those very changes:

> Students' responses indicate that I could improve my teaching practice around trans-themed novels by teaching them how to employ critical theories to interrogate sociocultural assumptions. Their responses also indicate that a single trans-themed novel cannot foster understanding and acceptance of gender variation. Good practice might include multiple texts and integrating trans-themed literature within other themes, including queer consciousness/community novels, including novels with transgender narrators, and including biographies, memoirs, and informational texts. As I present my rationale for changes in practice, I also trouble those same practices. "While students critiqued 'society' they expressed minimal awareness that 'society' is a construction." (p. 942)

Parsons' response to her students' written responses to literature model the kind of multiple stances and critical reading that she articulated in her summary of Rosenblatt's Transactional Theory (1978/19940 and Langer's (1995) envisionment building. From these two theoretical frames, Parsons made the point that readers can adopt a primarily aesthetic stance to immerse themselves in the experience of the reading; they could also adopt a more critical efferent stance that aims to examine their own reading and to take a more informed view from the reading experience. Parsons demonstrates each of these stances toward her students' written responses to literature and to her own teaching practices. Her stances and meaning-making are clearly framed by the literary theoretical frameworks.

Kindle and Schmidt (2013) explicitly state that as reading teacher educators, they framed their teaching and their self-study research in literacy/reading teacher

education research, self-study teacher education research, and literature related to scaffolding, particularly during classroom discourse. For instance, specifically drawing from research on reading, literacy, and English language arts methods instruction and programs (e.g., Clift and Brady 2005, Lacina and Block 2011; Sailors et al. 2005; Snow et al. 2005), Kindle and Schmidt wrote that "Reading teacher educators should structure courses in ways that guide PTs in analyzing instructional situations and constructing appropriate responses to these real-life teaching contexts" (p. 85). Their self-study documents their aim to do just this. Findings from their study included four "key moves" (p. 89) that they liken to the types of scaffolding seen in early reading instruction. They concluded:

> It is our belief that by framing our analysis and discussion into the familiar contexts of scaffolding and strategic prompting within the metaphor of balanced literacy instruction, we can make the findings applicable to a wider audience and begin to build a framework for envisioning teacher education in literacy in terms that are related to our professional Discourse community. (p. 98)

Kindle and Schmidt made direct connections between their study's findings, their meaning-making, and implications to the broader field of teacher education through a literacy/reading frame.

Drawing from 4 years of collaborative self-study, Cameron-Standerford et al. (2016) utilized transactional reading and learning theory (e.g., Dewey 1938; Dewey and Bentley 1949; Rosenblatt 1978/1994; Rosenblatt 2005) to frame their view of themselves as teacher educators and researchers and as active meaning-makers who could read, discuss with critical friends, and learn from their teacher education practices (LaBoskey 2004).

> We defined *text* in a broader sense to include the idea that lived experiences once textualized (Edge 2011) could then be shared, interpreted, reinterpreted, and analyzed. Textualizing our lived experiences and studying them through collaborative self-study methodology, we have learned how to construct meaningful understating about our teaching practices. We have learned how to empower others—prospective teachers, practicing teachers, administrators, and colleagues to intentionally study their own lived experiences like texts. (p. 371)

However, making meaning from teaching is not enough. They assert there is still a need to articulate the process for making meaning from experiences. Citing their earlier work (Edge et al. 2016), they concluded:

> It is in harnessing our experiences—textualizing them—that we can see them as an object, a text we can read and learn from. Textualizing experiences goes beyond reflection; it objectifies a lived experience in a way that permits both an individual and others to first see the experience outside of themselves and then to re-enter the reading of that experience as a new event through which one makes meaning. (As cited in Cameron-Standerford et al. 2016. p. 375)

Framing their self-study with the Transactional Theory of Reading and learning, these authors examined their teacher education practices as texts.

Discussion, Recommendations, and Conclusion

From the outset of our review, we wondered, "How might meanings made from reading, literacy, and English language arts education self-studies continue to contribute to, advance, or challenge the purposes and goals of self-study, understandings of teacher education, and the work of reading, literacy, and English language arts leaders and educators?" These foci need not be viewed as separate or exclusive; throughout this systematic review and metasynthesis of the literature, we noted many instances these three foci explicitly intersected (or transacted) in a single self-study. In other instances, the interactive nature of knowledge and experience from teacher education, self-study, and the content areas was implied, but not overtly stated.

While reading the three groupings of culled literature with our question in mind, we observed that many studies seemed to stop short of including discussion or providing implications for the content-area disciplines in which the studies and/or researchers were situated. Self-study researchers frequently offered insights and recommendations for self-study research and for teaching; however, few addressed content-area implications of their self-study research. Given the scope of the journals in which we found the self-study literature (typically teacher education focused) or other sources for dissemination (such as the Castle Conference proceedings), we wondered if self-study researchers "stopping short" of considering their disciplines as more than a research context was a purposeful intention (e.g., to reach a broader audience, to fit within the assumed or real boundaries of a particular publication venue, or to focus on teacher education), if it was a tacit assumption laden within self-study teacher education practices or perhaps a combination. Our discussion led us to reflect on and to wonder about our individual research as well as the collective body of S-STEP research in our content areas:

- To what extent are we, as S-STEP researchers, generating and communicating knowledge that impacts our content-area fields?
- As teacher educators and self-study researchers, is our scholarly focus on content areas of literacy, reading, and English language arts of a proximal-distal nature (Polanyi 1966, 2009)?
- If we are attending to teacher education from our content-area contexts, how might we "turn" and "look back" to purposefully consider how our findings shape, contribute to, and construct our content areas?
- How can we purposefully and consciously attend to self-study, teacher education, *and* the content areas in S-STEP research?
- How can or do we, as an S-STEP community, contribute to the knowledge base in the content areas through S-STEP research?
- While the inclusion of self-study in the content areas is an important S-STEP advancement taken up in this handbook, the positioning of "in the content areas" might be a problem – a wondering, a tension, and an exploration for future S-STEP inquiry. How might we consider S-STEP research *for* the content areas?

As we move forward, as individuals and as a field, ever situated in the dynamic intersections of self-study, teacher education and the content areas of literacy, reading, and English language arts, we are reminded by the literature we reviewed to revisit our positionality, to take a step back from our work and from our self-study research to re-see what we already understand through collaborative discussion. As Martin and Dismuke (2014) aptly described, deeper understandings, new connections, and opportunities for improved practice come from the iterative processes of collaborative discussion. With the aim of creating an opportunity to discuss the existing knowledge generated by self-study research in literacy, reading, and English language arts education, we now take a step back from our findings to aim to re-see these findings through the multivocal, multifaceted prism of voices from our broader field. In doing so, we consciously return to the purpose of this review and to the concentric contexts of self-study, teacher education, and the field of literacy English language arts and reading education. Within this multifaceted context, we framed our inquiry utilizing the disciplinary theoretical lens of meaning-making, namely, the Transactional Theory of Reading and Writing (Rosenblatt 1978/1994, 1994, 2005). Once again, at the center of the concentric contexts of literacy, language arts and reading, teaching and teacher education, and self-study, we see literacy as a transformative tool.

Reviewing the literature, we came to see that both self-study and the discipline of literacy and language arts share purposes of seeking understanding through meaning-making and generating new knowledge from meaning made. Self-study research in the content areas of literacy, English language arts, and reading clearly reflected self-study researchers sought understanding and learned from studying their professional practices. They learned about their practices, about their students, about their professional milieu, and about being and ever becoming as educators. This finding resonates with the broader self-study theme that "when seriously adopted, self-study of teaching and teacher education practices supports meaningful learning about practice" (Loughran 2004, p. 183). Nevertheless, we assert that self-study researchers did not learn simply from going through the motions of doing self-study in the same way that a reader's eyes moving over printed words on a page does not equate comprehension. It is through transaction with the "texts" of teacher education practices and through discourse with others that self-study researchers made meaning. We see the common purposes guiding self-study and guiding the content areas of literacy and English language arts as an asset to the knowledge generation informing both educational research and literacy, English language arts, and reading education. Nevertheless, we see this commonality as a source of tension; the stance from which one seeks to read "texts" in order to understand, both frames and guides one's attention, and, thus, the meaning that is made. Stance versatility (Beers 2003) is necessary and critical for generating knowledge that contributes to understanding self, teaching and teacher education, and content-area education. We see the need to challenge reading, literacy and language arts educators to engage in self-study research from multiple positions or stances toward the objects or teaching "texts" that they study.

Connecting these shared purposes, we envision how both self-study and literacy in language arts seek to make the largely invisible process of meaning-making more visible to self and to others. Self-study methodology was how teachers and teacher educator-researchers made meaning from their professional practices. Framed by the Transactional Theory, it was clear to us that self-study researchers transacted with internal texts and external texts (Durkin 1993); they attended to communicative signs in their interactions with one another, their internal tensions, teaching artifacts, student artifacts, methods of instruction, programs, and contexts of practice. In a sociocultural perspective of literacy, reading and writing are meaning-making endeavors through which humans search for meaning, construct it, negotiate it, communicate it, refine it, and even contest it within the many contexts (e.g., social, cultural, historical, political, economic) of which they are a part and to which they contribute (Gee 1996, 2008; Lankshear and Knobel 2007; Smagorinsky 2001; Smagorinsky and O'Donnell-Allen 1998; Wilhelm et al. 2001). Literacy in the discipline of English language arts "revolves around the desire to understand the human condition" as expressed through texts (Manderino and Wickens 2014, p. 29). Self-study is "one way of understanding the world" (Kovach 2009, p. 29). We see in the overlapping spaces of self-study and of the content areas of literacy, English language arts and reading the potential to challenge, discover, question, and inform while making more visible the complex and valuable work of educators.

We situate the above assertions in relationship to the two tensions Vanassche and Kelchtermans (2015) posited that "self-study researchers need to consciously position themselves time and time again: the tension between relevance and rigour on the one hand, and the tension between effectiveness and understanding on the other hand" (p. 518). We assert that consciously adopting stance versatility as a literacy practice can advance self-study as a transformative space for teaching and teacher education. Ultimately, we hope to incite our fellow self-study researchers and our community of literacy, English language arts, and reading educators to re-see the transformative power, potential, and responsibility of self-study research to inform multiple facets of our work.

Reviewing self-study literature through a theoretical lens – through the epistemological and pragmatic underpinnings of the Transactional Theory of Reading and Writing (Rosenblatt 1978/1994, 1994, 2005) – afforded us with the ability to see and re-see existing scholarship from a particular, critical vantage point. Given the importance of this theoretical frame in the context of the content areas of English language arts, literacy, and reading education (Purcell-Gates et al. 2017), the findings from our review offer insights from a disciplinary, theoretically informed perspective:

- Literacy/reading, teaching, and teacher education are complex processes and practices.
- Teaching, teacher education, and reading/literacy include cognitive-in-the-head skills, strategies and processes set within socioculturally constructed literacy practices which are situated within the context of power relationships, values, beliefs, histories, and attitudes.

- Teaching and learning share an ecological relationship, mediated by events, and facilitated by similar literate skills, practices, and processes.
- Teaching and learning, teaching and teacher education, and reading and writing are transactive processes.

Through our systematic review and metasynthesis, we made meaning about what we reviewed. That meaning-making is both rooted in and guided by the framework we employed and the questions that we asked. In this final section of this chapter, we aimed to communicate those meanings as a way to engage the broader self-study community in discourse. These ideas are not offered to "fix" or solve problems but, rather, to evoke additional conversations – points from which we may, through continued discourse and action, continue to make new meanings that ever nudge our understandings forward; our steps, surer-footed, onward; and our hearts and minds present, awake, and open to the prismatic possibilities ahead.

Abstract

English's current status as the world's lingua franca has raised questions about language learning, language teaching, the education of teachers of English, and the practices of teacher educators who prepare those teachers. While it has been recognized that we know little about the ways in which teacher educators in all disciplinary areas are prepared and go about their work, these insights seem

particularly lacking in the literature about teacher educators who prepare teachers of students learning English, or what we characterize here as English language teaching (ELT). In this chapter, we examine 30 peer-reviewed articles that met our search criteria from the 2 major disciplinary strands that contribute to ELT scholarship: applied linguistics and education. Included are 14 articles that specifically identify as self-studies and 16 articles that share common methodological commitments with self-study, but do not explicitly identify as self-studies. Two major themes emerged from our search, a focus on the professional (e.g., teacher, teacher educator, scholar, language learner) and social identities (e.g., race, gender, parent, transnational, immigrant, bi-/multilingual, monolingual) of teacher educators working in ELT, as well as the locus of their work (e.g., coursework, practicum, coaching, mentoring), highlighting the deeply situated nature of the work of ELT professionals. Our review illustrates that lack of interaction between the literature in applied linguistics and education has limited the uptake and use of self-study methodology in ELT scholarship. We argue that scholarship that engages in various forms of self-inquiry in ELT would benefit from rigorous use of self-study methodology.

Introduction

As the world continues to globalize, the call for a lingua franca has arisen in economic, educational, and political spheres. Nowhere is this more evident than in education, where facilitating students' access to the language of commerce and influence is critical for their future success. English's current status as the world's lingua franca (Seidlhofer 2011) has raised questions about language learning, language teaching, the education of teachers of English, and the practices of teacher educators who prepare those teachers. While it has been recognized that we know little about the ways in which teacher educators in all disciplinary areas are prepared and go about their work (e.g., Conklin 2015; Goodwin et al. 2014; Knight et al. 2014; Lanier and Little 1986; Loughran 2014), these insights seem particularly lacking in the literature about teacher educators who prepare teachers of students learning English, or what we will characterize here as English language teaching (ELT).

Although the scholarship in practitioner inquiry (e.g., Cochran-Smith and Lytle 1999, 2001, 2009; Zeichner and Noffke 2001), including teacher research, action research, narrative inquiry, and self-study, has been accorded a growing respect across the field of general teacher education and has experienced some uptake in ELT research in the last two decades (e.g., Bailey et al. 2001; Barkhuizen 2013;

Barkhuizen et al. 2013; Burns 2010; Edge 2011; Edwards and Burns 2016; Hawkins and Irujo 2004), the literature base in which ELT teacher educators make a reflexive turn to self is still quite limited. This is surprising given the field's "sociocultural turn" (e.g., Block 2003; Hawkins 2004; Johnson 2009; Johnson and Golombek 2011) and particularly so given that the teaching, learning, and use of language are so deeply intertwined with issues of identity, power, and agency. This also means that there are many untapped questions in ELT related to identifying the knowledge base for ELT, *how* teacher educators convey that knowledge, *what* pedagogies of teacher education are being used, and *whether and how* teachers' practice and their students' learning are affected by the approaches being used. For instance, in his review of the research on ELT practice, Wright (2010) noted that we lack important information on how ELT educators develop. In their extensive review of ELT teacher preparation, Faltis and Valdés (2016) asserted that there is

> little consensus among teacher educators about the kinds of knowledge, skills, and inclinations teachers need to develop in order to be *good* and *effective* . . . teachers and advocates for students who are speaking a language other than English or are bilingual language users. (p. 549)

Furthermore, Johnson (2015) argued that we need an empirical basis for the practices of ELT teacher education, and Johnson and Golombek (2020) have called for the knowledge base of ELT to "include greater attention to [ELT] pedagogy; that is, what teacher educators do and say in their activities and interactions and the reasoning behind those activities and interactions" (p. 117). Clearly, the need for self-reflective work among ELT teacher educators is being recognized.

While self-study would seem to be an optimal methodology for exploring questions related to teacher educators' practice, and for making connections between those practices and what occurs beyond the efforts of teacher education programs, it has limited representation in ELT research as compared to other recently adopted self-inquiry approaches, including narrative analysis and autoethnography. Given self-study's commitment to exploring questions at the "nexus between public and private, theory and practice, research and pedagogy, self and other" (LaBoskey 2004, p. 818), we believe that the use of S-STEP methodology could make critical contributions to the kinds of questions the ELT field is asking.

This chapter explores the existing S-STEP research in ELT and identifies areas where further investigation is needed. We had two main purposes: (1) We aimed to provide a foundation for those in ELT who are unfamiliar with self-study methodology, so that they might see how self-study can support particular areas of investigation in ELT; and (2) we hoped to inform those who are familiar with self-study methodology – generally from a disciplinary background in education – about the current state of the field in self-study (and related) work in ELT and the current strengths and gaps in the literature base. As we discuss below, the research in ELT is a hybrid, informed by at least two major disciplinary areas – applied linguistics and education – and is a relative and perhaps reluctant latecomer to the self-study scene. Because of a dearth of ELT research that uses self-study methodology, our chapter is

comprised of peer-reviewed empirical and conceptual ELT studies that explicitly use self-study methodology *and* scholarship in ELT that shares many of the same intentions of self-study. To be identified for consideration in this review, studies needed to adhere to at least some of LaBoskey's (2004) five research design characteristics for S-STEP: self-initiated and self-focused; improvement-aimed; interactive with others; use of multiple, primarily qualitative methods; and establishment of trustworthiness through convincing exemplars from the data. We used these criteria to frame our identification of scholarship that identified itself as self-study, as well as work that did not name itself explicitly as self-study, but that we felt shared intentions with self-study. The research questions for this chapter are as follows:

1. What is the existing research base of peer-reviewed studies in English language teaching (ELT) that use either self-study methodology or a research methodology that shares common intentions with self-study?
2. How do the identified studies add to the knowledge base for teaching and teacher education within ELT?
3. What does this review of the literature reveal about gaps in our understanding of ELT education that self-study methodology could support?

Because of the complexity of the development of ELT, we begin our chapter with a brief discussion of the lack of S-STEP in ELT. Next, we provide a historical overview of ELT, intended to situate readers in a sociohistorical understanding of the field's development and to frame our suggestions for advancing future research in ELT at the end of the chapter.

Missing an S-STEP? The Paucity of S-STEP in ELT

Despite the acceptance of practitioner research more broadly – and S-STEP more specifically – in the literature in teacher education, the use of self-study methodology is noticeably absent from the major research venues in ELT (Peercy and Sharkey 2020). Here we address this gap and identify some early signs of S-STEP in the ELT literature and highlight several areas of focus within the ELT community that share affinity with S-STEP, yet do not identify as such. We argue that more widespread use of S-STEP methodology in ELT scholarship could serve to connect important reflective lines of inquiry to one another – both within ELT and across ELT and general teacher education – thus strengthening the knowledge base and the areas in need of further investigation in teacher education related to preparing teachers to work with English language learners (ELLs). Furthermore, we argue that ELT scholars who are beginning to promote a more articulated and visible reflexivity of teacher educators (e.g., Edge 2011; Golombek 2015, 2017), as well as teacher educators who prepare and support teachers of ELLs in a variety of ways, might find that the S-STEP research base validates their inquiries and provides a rich array

of resources – from new theoretical lenses to robust and rigorous methodologies and pedagogical practices.

Historical Overview: A Genealogy

Because of the complex development of the field of ELT, we provide a brief historical overview of some of its development and disciplinary roots. Our aim for this contextualization is to position readers to appreciate a deeper understanding of the literature we identified, as well as reasons for the existing gaps in self-study in ELT. As we began tracing and unpacking the disciplinary roots and the development of the field, we came to realize how ELT is indeed quite different from other disciplines (such as those featured in this section of the handbook). Unlike other subject areas such as mathematics or science, English language learning is not necessarily part of formal schooling. In other words, ELT comes in many different forms and can frequently involve teaching in settings outside of a compulsory school setting (such as for-profit English schools or teaching adults through community organizations). This is worth noting because a good deal of the research in ELT comes from these settings. Another difference is ELT's definition as both a profession and an area of study (Hall 2016), since ELT is formed by those who identify with particular professional organizations and is also a specialized postsecondary area of focus.

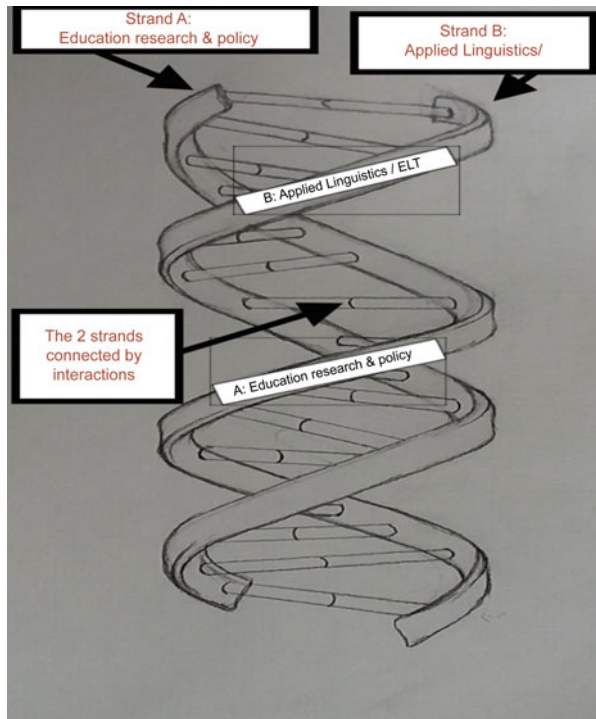
This investigative process was invaluable as it afforded us the opportunity to question some of our own assumptions regarding the absence of S-STEP and build a new appreciation of the complexity of ELT. This line of questioning led to mapping our own professional roots and influences. As self-identified language teacher educators and researchers housed in colleges and departments of education focused on preparing teachers of PK-12 learners, we constantly draw on the research and policy from two disciplinary strands, education and applied linguistics (the major field of study underpinning ELT). Thinking about dual strands and investigating origins, we wondered if, in fact, we had accidentally begun a professional genealogy. Before conducting the literature search for this chapter, we assumed we would find a robust body of scholarship from the major ELT publication outlets that drew on general teacher education research and policy, especially given the dramatic increase of English in schools and schooling across the globe (Graddol 2006) and the impact of migration patterns on school demographics in English-dominant countries (Batalova and McHugh 2010; Costley and Leung 2014; Oliver et al. 2017).

However, although it seemed natural for us to connect the two strands, we learned there is a dearth of scholarship that brings together methodological approaches and key findings across applied linguistics and teacher education to inform research, policy, and practice in ELT. We found ourselves part of a smaller teacher education community (or gene pool) than we anticipated. We became inspired by the image of a double helix, the structural model of a DNA molecule consisting of two parallel strands, which are only connected through interactions of base pairs. Perhaps the "professional DNA" of some scholars working in ELT is composed of the two

strands, education and applied linguistics, and the activities of scholarship within S-STEP are base pairs that can cause the interactions (see Fig. 1). However, we also found that these two strands often operated independently. This was evident to us in much of the literature that has methodological affinity with S-STEP but lacks cross-conversations between the two disciplinary homes (education and applied linguistics). In fact, it was these studies that tended to lack the methodological and analytical rigor of those explicitly identified as using self-study methodology.

Keeping the metaphor of the double helix in mind, here we elaborate upon the applied linguistics strand of our model. The purpose of this section is to help readers unfamiliar with ELT better understand its origin, development, and myriad manifestations across contexts. We also aim for our description of the two strands to help frame the findings from our literature review.

The activity of English language teaching and learning has a documented history over 500 years old, including the prominent example of materials development and instruction designed for the influx of Protestant refugees to England in the late sixteenth century (Howatt and Widdowson 2004). However, it has only been in the last 60 years, with the development of two major organizations, Teaching English to Speakers of Other Languages (TESOL), based in the USA, and the International Association of Teaching English as a Foreign Language (IATEFL), based in the UK, that ELT as a profession has been formalized (Canagarajah 2016). As Hall (2016) notes, the profession encompasses a range of positions, from

Fig. 1 The disciplinary roots of ELT


classroom teachers, curriculum developers, and administrators to trainers and assessors, serving learners across the life span, and these actors populate a variety of geographical and institutional contexts and settings. An illustrative but not exhaustive list of examples includes a public high school in St. Paul, Minnesota, serving recently arrived Somali refugees; a private bilingual primary school in Bogotá, Colombia; a publishing house in the UK specializing in ELT textbooks; an adult English migrant program in Sydney, Australia; a university-based intensive English language program in Vancouver, Canada; an online TESOL certificate program; an evening Business English class in a language school in Osaka, Japan; and a nonprofit testing company that produces standardized language exams. This range of contexts also reflects the disparities among the actors in terms of purposes of ELT activity: "as 'business' or 'industry,' as 'education' or as a 'service'" (Hall 2016, p. 2). Consequently, naming the purpose and context of the ELT activity indicates disciplinary influences, level of required formal training and/or credential, and the research (academic or product-oriented) that may define and evaluate the activity. Teaching in PK-12 public schools typically entails some type of official licensure or certification granted at a state (e.g., in the USA) or national office of education (e.g., in the UK), and traditionally the training is housed in schools or departments of education at the university level. However, qualifications to teach English as an additional language in adult education programs, in language schools, and at the university level vary greatly. Further, these requirements may not necessarily include any type of credential and, if required, not one that is obtained through an office or department of education. For example, teaching in a university-based intensive English program (IEP) usually requires a graduate degree in applied linguistics or English but not an education credential. IEPs are typically noncredit-bearing programs of study consisting of 18–20 h of instruction per week. IEPs are located in universities in English dominant and non-dominant countries. Given that those degree programs are typically housed in colleges or departments of English, applied linguistics, or rhetoric, the faculty identify as experts in their disciplinary areas (e.g., phonetics, pragmatics, discourse analysis) and not as teacher educators. Furthermore, it is unusual for applied linguistics students to take courses typically required in an education degree program (e.g., child and human development or learning theories). Thus, coursework in education tends not to inform applied linguistics programs that are preparing language teachers for non PK-12 settings.

A key factor in understanding the existence of the double strands of the helix seems to be that the formalizing of ELT as a professional activity with professional organizations that created peer-reviewed research journals (i.e., TESOL and IATEFL) *pre-dated* national legislation requiring K-12 public schools to attend to the specific needs of non-English-speaking children, thus reifying the individual development of the two strands of our helix. Here we highlight key developments in the USA that shed light on how national education policy has affected the education strand of ELT.

Although linguistic minorities had been attending public schools in the USA for more than a century before the Bilingual Education Act (BEA) was passed in 1968, there were no federal policies or guidelines on how to best serve these children

(Wright 2005). But even the BEA failed to set specific parameters or expectations for schools regarding instructional programs and practices (Sharkey 2009). Given that the BEA was passed against the backdrop of the Civil Rights Movement, it is not surprising that the main group of advocates for these children were those professional educators and scholars – largely from the Latinx communities – who supported bilingualism and viewed students' existing access to English-medium curriculum and schooling as inadequate. In 1975, the US-based organization called the National Association of Bilingual Education (NABE) was established and launched the peer-reviewed *Bilingual Research Journal*. Unlike TESOL or IATEFL, NABE was created to focus primarily on K-12 education and with a mission "to advocate for educational equity and excellence for bilingual/multilingual students" (NABE 2017). It is beyond the scope of this chapter to delve deeper into the relationship – at times contentious, more recently collaborative – between TESOL and NABE, but in situations where English is half of the bilingual program, ELT is an activity that occurs within bilingual K-12 education.

After 1968, the next ground-shaking federal legislation that affected K-12 English learners in the USA was the passage of the No Child Left Behind (NCLB) Act of 2001, which required public schools to include these students' performance in their annual reporting (Wright 2005). Although the BEA of 1968 stated that language minority students should be taught grade-level content and have access to the mainstream curriculum, without naming specific recommended practices or having sanctions "with teeth," there was little pressure for schools to better serve these learners. As a result of NCLB, and then of the widespread adoption of the US Common Core State Standards in 2009, more mainstream teacher education programs began addressing linguistic diversity issues in their programs, and an emerging strand of scholarship focused on defining and developing the academic literacies that language learners needed to succeed in schools (Bunch et al. 2014; Kibler et al. 2014; Valdés 2004). This standardization and accountability was not restricted to the USA; K-12-focused ELT scholars from Australia and the UK also reported the impact of mainstream curriculum reforms on ELLs and on the preparation of teachers (Hammond 2014; Menken et al. 2014). One could argue that it was the accountability and standardization movement that created the robust education strand within the ELT scholarship. Before these pressures, there was little motivation for mainstream educators to draw on the applied linguistics research.

We hope that this brief overview provides some insight into the development of the complex field of ELT and helps illuminate two of the major strands of scholarship, practices, and policies that have shaped this discipline, as well as the professional identities of ELT educators.

Literature Review

In this section of the chapter, we share the methods we used to search the ELT literature from applied linguistics and education that utilized self-study methodology, or that shared at least some of LaBoskey's five intentions of self-study, despite

not identifying as a self-study. We then describe the criteria we applied to narrow our initial pool of results. Finally, we thematically group the articles we identified and describe their focus and contributions to the literature.

Finding the Sources

We began our review process by identifying peer-reviewed journals in the two previously described areas of scholarship that we identify as aligned with the historical development of ELT: applied linguistics and education (for a complete listing of journals searched, see Table 1 in the appendix). We identified journals in these two areas by consulting SciMago for the top journals in Language and Linguistics (http://www.scimagojr.com/journalrank.php?category=1203) and in Teacher Education (http://www.scimagojr.com/journalrank.php?area=3300&category=3304). We also identified journals to include in the search based upon their aims and scope, their affiliation with relevant professional associations in applied linguistics and education, our own professional knowledge, and through suggestions from colleagues.

Our search in applied linguistics journals spanned the time period from 1991 to 2017, because 1991 was the inaugural year for the biannual International Conference on Language Teacher Education. This conference is an important marker in the start of formalized conversations about ELT. In cases when a journal did not come into existence until later than 1991, or when online searching was not available prior to a particular year, we began with a later search date (noted in Table 1). Our search in education journals spanned from 1993 to 2017, with the reasoning that the Self-Study of Teacher Education Practices (S-STEP) special interest group (SIG) in the American Educational Research Association (AERA) was founded in 1993, and so conversations about self-study in teacher education journals were likely to have more focus and develop more momentum beginning in 1993.

We searched both sets of journals for terms we identified a priori that we thought would yield ELT work that drew upon self-study methodology, as well as scholarship that we identified as working from some of the same ontological and epistemological assumptions and intentions as self-study (see complete listing in Table 1). We searched the databases Academic Search Complete, Education Source, and ERIC, using each journal as the source name and each search term indicated in Table 1. In instances when the journals we identified a priori were not represented in these databases, we searched articles on each journal's webpage for the search terms listed in Table 1.

Based upon our a priori search terms and sources, this search yielded 73 peer-reviewed articles that fit the search criteria in applied linguistics and 265 that fit the search criteria in education. We also sent out inquiries on the AERA S-STEP and TESOL TEIS (teacher education interest section) listservs to solicit suggestions for self-studies in ELT from colleagues. These queries resulted in the identification of two additional peer-reviewed studies that we categorized as examples of self-study in ELT (noted with an asterisk in Table 3). After our search returned these results, we

did a close reading of each of the articles to identify those that were self-studies or shared intentions with self-study methodology, identifying a total of 30 peer-reviewed articles in ELT that used self-study methodology or shared some intentions with self-study methodology. To be included in our final pool, studies needed to address ELT from the lens of language teaching or language teacher education. Of the 30 studies, 3 from the applied linguistics literature identified the study as drawing upon self-study methodology, and 11 from the education literature did so. We identified 13 from the applied linguistics literature and 3 from the education literature as not using self-study methodology but sharing methodological affinity with S-STEP (see Tables 2 and 3 in the appendix for summaries of the resulting studies).

Processes for Identifying Themes in the Literature

After identifying the studies through our search criteria, we read each one multiple times. In our first reading, we identified whether the work was self-study, shared some characteristics with self-study, or was neither, categorizing each study in a filterable spreadsheet. In our second reading, we identified each study's major focus, theoretical framework, and whether the study was empirical or conceptual in nature. In a third reading, we created a table in which we identified each study's research questions, theoretical framing, data sources, analytic methods, findings, and implications, as well as making note of any features that were particularly striking about the study. Next we independently explored the studies for possible coding categories, asking ourselves what the literature told us about what it meant to be doing self-study (and related work) in ELT and what those scholars who were engaged in self-study in ELT valued and investigated. We each created a variety of visual arrays, including figures, quadrants, and tables as we sought to understand the focus, patterns, and relationships among the 30 studies our search yielded. We worked in iterative cycles of coding individually and then coming together to discuss possible codes and themes in the groupings of the studies and what story they had to tell about the state of self-study in ELT. As we describe below, through our iterative process, we identified two major themes in the extant self-study literature in ELT – *identity* and *locus of the work*. Consistent with all S-STEP projects, the studies here address the intersection of the self and one's practice (Guilfoyle 1995; Korthagen 1995). We further divided our themes into subcategories that emerged through our multiple cycles of coding, and in some cases some studies were coded as situated in multiple areas of inquiry that informed the ELT knowledge base in language teaching and teacher education. In light of our research questions for this literature review, in our findings we illuminate the existing research base in S-STEP scholarship in ELT and illustrate how the themes of identity and locus of the investigation in the studies reviewed add to the knowledge base in ELT and teacher education. We also identify important areas of investigation that are missing from the extant ELT literature that utilizes self-study (or related) methodology, as well as areas of inquiry in the extant ELT literature that self-study methodology could support.

Findings

Identity

It is not surprising that identity surfaced as a common thread in multiple studies in our review, given the inextricable ties between one's linguistic, cultural, transnational, and citizenship positionings and one's identity. Indeed, questions of identity have been explored in the ELT literature for some time (e.g., Kanno and Stuart 2011; McKay and Wong 1996; Norton 2000, 2013; Peirce 1995; Varghese et al. 2005). Until recently they have focused more heavily on language *learners'* experiences of language and identity and in the last decade or so have started to devote more attention to questions of language and identity for language *teachers*, with questions of language and identity for language *teacher educators* largely unexplored. Because identity is a critical dimension of the language(s) and linguistic communities and events in which one participates, it is likely that further use of self-study methodology to support inquiry in ELT would reveal key issues that distinguish the professional and social identities of ELT educators from those in other disciplinary areas. Such investigation would likely have implications for preparation and continued professional development of ELT teachers and teacher educators. Here we focus in particular on self-study and related work in ELT with respect to language teachers and language teacher educators. In the articles we reviewed, we found that studies focused on one's professional identity, one's social identity, or the intersection between the two.

Professional Identity

Because of the limited number of studies we were able to identify in each area, we cannot make general comments about the professional identities of ELT educators. However, here we can illustrate the *types* of professional identities, identity development, and shifts in identity that are emerging in the extant literature in ELT that uses self-study or a related methodology. Under professional identity, we coded the studies we reviewed as focusing on five dimensions:

1. The *development* of one's practice as a *language teacher*
2. The identity shifts involved in transitioning from *learner of English to teacher of English*
3. The lessons learned when the *language teacher becomes a language learner*
4. The developmental trajectory of transitioning from *language teacher to language teacher educator*
5. The empathy and insights gained when a *language teacher educator returns to the classroom to be a language teacher*

In the sections that follow, we discuss the studies that we coded as related to each of these categories.

Language teacher development We identified two studies as examining the development of the language teacher (Parsaiyan et al. 2016; Yang and Bautista

2008). Although not named "self-studies" as such, both of these studies engaged reflective means to explore their work as language teachers. Parsaiyan and colleagues drew upon transcription of classroom events, the first author's journal entries and observational notes, materials from class, and students' written work to explore how her practice changed over time. Identifying their work as self-inquiry, they explored Parsaiyan's transition from a passive to an active role in creating curriculum for her Persian university-level ELLs in Iran, developing English translations of classic Persian texts for her students to use. She did so because she was dissatisfied with the prepackaged curricula of the textbooks she had been using and felt this would offer more authentic and engaging opportunities for her students. In doing so, she explored her transformation from a "spectator" to a "composer" of curriculum and identified the value of studying one's own journey of professional growth.

While the article by Parsaiyan and colleagues explored the first author's *transformation* as a language teacher, the self-inquiry article by Yang and Bautista (2008) could be described as examining Yang's *development* as a language teacher, using what the authors called reflective and arts-based inquiry. The authors explored Yang's Korean English teacher identity through the analysis of a letter about her journey to becoming an English language teacher that she wrote to Bautista. Through Yang's exploration of a variety of art forms by various artists, the authors also explored Yang's "ongoing process of self-definition" (p. 301). The authors argued that letter-writing can serve as one way to examine layered EFL (English as a foreign language) teacher identity, noting that Yang's letter revealed a disjuncture between her commitment to critical pedagogy and the contextual demands of a heavily grammar-based transmission approach to teaching English. EFL is a term used for ELT contexts in which English is not an official language. Although there has been a move in recent years to adopt the term English as an international language (EIL), EFL is still in common use.

Together, these articles shed some light on the ways in which ELT teachers have explored their growth. Additional work in this area would provide further insights for the ELT field regarding the kinds of experiences that support teacher development and how the investigation of the self can help contribute to that development. Such work might also challenge language teacher educators to consider how teachers' articulation of their own development should inform teacher education curricula.

Language learner to language teacher Two studies examined the author's transition from language learner to language teacher (Solano-Campos 2014; Tsedendamba 2016). Solano-Campos used narrative analysis to explore her transition from a learner of English to a teacher of English. She traced her journey as a Costa Rican English teacher who was recruited to work as an ESOL (English for speakers of other languages) teacher in the USA. We explain Solano-Campos' study more fully in the next section of this chapter, entitled "Social Identity as Pedagogy."

Like Solano-Campos, Tsedendamba (2016) drew upon her challenges as an ELL to inform her narrative study. At the time of the study, she had become a university-level teacher of English in Australia, after first struggling with her English language proficiency as a Mongolian graduate student in Australia. Drawing upon her own experiences, she employed narrative inquiry to explore the use of language learning

strategies (LLS) with her Australian university-level Asian ELLs to discern whether her explicit teaching of LLS to learners was as effective for her students as she had found it to be for her own learning of English. Her findings indicated the importance of LLS for three of the four participants in the study who regularly used the strategies. She also noted that in her own experience, her social engagement in English with others was key to developing fluency, and she reminded readers that ELLs need to view and use "language as social practice" (p. 292) if they are to successfully develop their English language abilities.

These two studies illustrate that the inspiration to be an ELT teacher can arise from the challenges faced in being a language learner, including prejudice against "non-native sounding" pronunciation and difficulty with academic reading and writing in English. They also illustrate that the positionalities and obstacles experienced as both language learner and teacher shape the thinking, practice, and commitments in the work of ELT teachers. Further investigation could allow for better understanding of how language learners leverage their experiences in their work as ELT teachers and how they might be supported to develop their practice over time.

Language teacher to language learner While the previous two studies explored the ways in which one's experience as a language learner might inform their practices as a language teacher, there was one study we reviewed in which the author, a teacher of English in Japan, explored how she went about learning Japanese while there (Casanave 2012). Using diary study over the period of 8 years in which she was teaching in Japan, Casanave explored her informal approach (which she identified as "dabbling") to learning Japanese and the different factors that influenced her learning over time (including health, sleep quality, noise, weather, pollution). Using her personal experiences as a language learner, Casanave argued that there are many dimensions that affect one's language learning that cannot be identified through traditional studies of language learner motivation and investment. She called for more introspective and longitudinal studies regarding language learning to inform the ways in which we teach, research, and learn language. This limited work on insights gained by the ELT teacher through being a language learner is an area where further investigation is needed. Similar to the potential contributions of the "language learner to language teacher" professional identity category above, a deeper literature base in this area of professional identity in ELT could greatly inform the field regarding how language teachers' experiential dimensions of learning language can inform their language teaching practice. It may also serve to illuminate the situations and conditions that support language learning and directly impact practice in the field. Despite calls for more critical sociocultural approaches to "good language learners" (which would take up the role of the interaction between contexts and identities in second language acquisition, e.g., Norton and Toohey 2001), much of the literature in ELT on "successful" language learners has continued to focus on more cognitive dimensions (e.g., age, first language, intrinsic motivation). However, insight from firsthand experiences (from both this section on professional identity and the one above) that are both longitudinal and concurrent with one's EL teaching might support more nuanced understanding of affective and other features that impact language learning.

Language teacher to language teacher educator/scholar We identified one study that clearly explored the transition from language teacher to language teacher educator (Contreras 2000) and one that explored the transition from language teacher to applied linguistics scholar (Canagarajah 2012). In his autoethnography, which he also called an "ethnographic self-reconstruction," Canagarajah explored challenges he faced in becoming a scholar in applied linguistics moving from the early part of his career in Sri Lanka as a university EFL teacher to his work in the USA as a professor of applied linguistics. Canagarajah never identified himself as a teacher educator, seeming to claim more affiliation with applied linguistics. Like the Solano-Campos study, Canagarajah's story cannot be understood without taking into account the ways in which the politics of ELT (geography, colonialism, race) were critical to understanding his identity. Therefore, we also explore dimensions of this study in the next category on social identity. However, the fact that Canagarajah did not identify as a language teacher educator is worth noting. We suspect that this plays a role in the lack of S-STEP in ELT: scholars often identify with their subject area expertise rather than with education.

In his "self-storying" study, Contreras (2000) told two connected stories, one about Julia, a struggling preservice EFL teacher in Venezuela whom he supervised as a new teacher educator, and one about himself. He used these stories to illustrate how, due to his lack of experience and his own previous experiences of "support" as a teacher, he viewed his role as "transmitter of prescribed knowledge" and "monitor of expected competencies" (p. 25). In doing so, he identified how he failed to support Julia, who was representative of many of the teachers he supervised who were experiencing burnout. He asserted the power of storytelling as a way for teachers and teacher educators to unpack and share the "painful" and "risky" stories they often avoid sharing (p. 25), as a way to examine and shift teacher and teacher educator practice.

Like a number of studies in the wider self-study literature that have explored the transition from teacher to teacher educator (e.g., Bullock 2007, 2009; Bullock and Ritter 2011; Dinkelman et al. 2006; Ritter 2007, 2009; Williams and Ritter 2010), these studies also explored the challenges involved in learning to be a teacher educator and scholar in one's discipline. Both studies are among those from the applied linguistics literature which we identified as sharing some of the same intentions of self-study, because they focus on the authors' personal experiences as language teachers and growing into their roles as scholars and teacher educators. Unlike the scholarship on the transition from teacher to teacher educator in the larger body of self-study work, however, the authors do not detail their data collection and analysis procedures. Instead the authors tell their stories without explanation about the sources that informed these stories nor how they came to identify points of salience in them. These studies represent some of the work in ELT that could be supported by self-study design principles to make the methods transparent, thus adding to the field's understanding of the development of language teacher educators and establishing a strand of inquiry that could be more deeply explored within ELT through the use of particular methods and data sources. Indeed, more nuanced insights about the practices, experiences, and challenges of ELT scholars and teacher

educators would help the ELT field to establish a better understanding of the knowledge base in ELT teacher education, existing pedagogies of teacher education in ELT, and the kinds of supports that ELT teacher educators and scholars need to do their work well.

Language teacher educator to language teacher Less common in the broader body of self-study literature than the transition from teacher to teacher educator is a smaller collection of studies that explore the teacher educator's return, after some time as a teacher educator, to teach in classrooms of the kinds of learners for which they prepare teacher candidates (e.g., Loughran and Northfield 1996; Peercy 2015; Pinnegar 1995; Russell 1995, 1997, 2009; Scherff and Kaplan 2006). In general, this body of work is undertaken with the intent of informing the author's ongoing practice as a teacher educator. It often serves to build new understanding and empathy on the part of the teacher educator for the kinds of experiences teacher candidates have in schools, the kinds of support they need, the ways in which their knowledge develops from their experiences of teaching, and the ways in which practice and theory can be in a dialogic relationship. We identified three such studies from among those we reviewed (Bailey et al. 1998b; Peercy 2014; Spiteri 2010).

The study by Kathi Bailey and colleagues is part of a groundbreaking 1998 special issue of *TESOL Quarterly* (one of the premiere journals in applied linguistics related to ELT) on teacher education. In keeping with the lack of attention at the time to teacher education and teacher educators in the general education literature (e.g., Korthagen et al. 2005; Lanier and Little 1986), this was the first special issue in a major applied linguistics journal to focus entirely on teacher education. In their study, Bailey and her colleagues decided to engage in joint professional development activities when Bailey left her teacher educator role in the USA to teach university-level English in Hong Kong for 1 year. All three teacher educators were teaching university EFL in Hong Kong, with Bailey and Curtis co-teaching together. As a way to engage in professional development by collaboratively reflecting on their practice, they identified three modes of inquiry. Bailey decided to journal about her practice and share her journal entries, Bailey and Curtis videotaped their teaching and the three authors later viewed and debriefed on their videos, and Nunan constructed a teaching portfolio which they all reviewed and discussed. Though they called their project "a collaborative approach to reflective teaching" (p. 546) rather than self-study, they did note that their processes could "lead to powerful professional development, especially when the data are shared with trusted peers" (p. 554), thus illustrating some shared intentions with self-study methodology. Although the authors briefly illustrated the growth in their learning, the main focus of the piece was not their practice nor transformation; rather, the piece served as a "best practices" example in the special issue to make an argument for ongoing, sustained, and self-directed professional development opportunities for teachers and teacher educators.

In her self-study, Peercy (2014) explored her attempts to unite theory and practice in her work as a teacher educator in her elementary ESOL literacy methods course both before and after her return to teaching secondary language learners for 1 year. Upon her return to the teacher education classroom, newly reminded of the multiple

moment-to-moment demands of teaching secondary learners, she was determined to support teacher candidates by providing more opportunities to experiment with and reflect upon engaging in practice before they were on their own in classrooms. However, through qualitative analysis of data sources from her methods course (e.g., course syllabi; lesson plans and journals; memos and notes; texts; assignments; rubrics; and informal and formal evaluations from students), she found that she was not teaching in ways that aligned with the needs of the preservice and early career teachers of ELLs in her course. Specifically, she found that her teaching was characterized by more opportunities to engage in *discussions about* practice rather than critical opportunities to engage *in* practice. Peercy pointed to the importance of using self-study to identify and clearly articulate pedagogies of practice-based teacher education.

Spiteri (2010) also used self-study methodology to examine how her return to the secondary classroom could inform her work as a teacher educator, so as to better understand and support the teacher candidates in her methods courses. Working in Malta, Spiteri was particularly interested in the resistance her secondary teacher candidates demonstrated about using a specific method of instruction for language learners (called communicative language teaching, or CLT). CLT is an approach to language instruction that requires significant interaction between learners, many opportunities to listen to the target language of instruction (in this case, English), and to respond (often verbally) in the target language. Thus it involves significant time in class in extended pair and group work, engaging in authentic language use. Spiteri noted that other research on the Maltese context had identified the challenges of using CLT due to "practical concerns, such as the number of learners in each class, time and syllabus demands, and particularly classroom management" (p. 131). Though CLT was officially championed throughout Malta's state secondary school curriculum and in local teacher education programs, once in the secondary classroom Spiteri found that she, too, struggled to engage her secondary English learners in CLT pedagogy. In part, this was because using pair and group work clashed with the school norms and in part because the students in her class resisted pair and group work, were disruptive, and presented significant classroom management demands. Spiteri's firsthand experience with the challenges of engaging students in CLT led her to the understanding that it is critical for university teacher education programs to forge links with schools so that the pedagogy encouraged at the university and in the school are in better alignment.

The three studies in this category of professional identity illustrate the importance of firsthand reminders of the work ELT teachers and the ways in which they challenge teacher educators in ELT to question and responsively change their practice. Further investigation into the lessons of the classroom for teacher educators could explore what kinds of school-based experiences contribute to teacher educators' deeper understanding of the experiences of teacher candidates (e.g., influence of duration, setting, responsibilities), what common challenges teacher educators face in the PK-12 setting, how they shift their teacher education practice after their return to the university ELT classroom, and what changes have the kinds of impact on teacher candidate practice that the teacher educator is seeking.

Overall, the studies we reviewed that focused on professional identity drew heavily on narrative inquiry and reflective practice frameworks to examine questions of self. They also drew upon sociocultural theory to situate themselves within a larger sociohistorical context. The studies presented a variety of issues that ELT professionals face in enacting their practice and highlighted the importance of contextual factors in their work as language teachers, learners, and teacher educators. Of key importance across them were the challenges educators faced at some point of transition and the aim to elucidate the nuances of the challenge, so as to better understand their practice and identify solutions. These studies help illustrate the difficulties and opportunities that ELT professionals face in language teaching and learning, related to their positioning as competent speakers of the language, and in particular linguistic and sociocultural teaching contexts. However, the five dimensions of professional identity we identified lacked the robustness of having multiple example studies in each category, which would allow for deeper understanding. Additionally, we found it interesting that while the perennial topic of the theory-practice gap (e.g., Borg 2010; Canagarajah 2006) emphasizes theory as an assumed deficit of teachers, there are very few studies that lament the lack of exploration of practice (self-inquiry about one's teacher education or PK-12 practice) for teacher educators. Perhaps a gap needing attention is researchers' sometimes weak knowledge of authentic language teaching settings. Another interesting "double standard" was evident in the literature's extensive conversations about the lack of preparedness of teacher candidates for diverse learners, but very few studies address teacher educators' gaps in experience in preparing teachers for linguistically diverse learners (for an exception, see Gort and Glenn 2010, discussed below) or their lack of experience working directly with diverse learners (teacher candidates or PK-12) themselves. Further study into each of these dimensions of the professional identity of ELT professionals could begin to provide a stronger foundation for understanding the various transitions that ELT professionals experience and how their experiences, strengths, and needed supports might differ from – and share similarities with – their colleagues in other disciplinary areas.

Social Identity

The other dimension of identity we found in the literature is the vital role of social identity and the ways in which sociocultural and sociopolitical contexts interact with educators' gender, race, and language in shaping their work. Nine of the studies in our collection explicitly addressed the impact of the authors' social identities on their work. We explore these next.

Social identity as pedagogy A strong strand of research on language teacher identity has developed in the ELT scholarship in the last 15 years. Particularly fertile grounds have been the ways in which this area takes up the sociopolitical nature and critiques of ELT and its history as a tool of colonialization and ongoing global economic dominance (Pennycook 2017; Varghese et al. 2005). Here, identity is conceptualized as complex, multiple, contested, in flux, and contextually negotiated (Norton 2000; Varghese et al. 2005). In order to understand teachers and their work, this scholarship asserts, "we need to have a clearer sense of who they are: the

professional, cultural, political, and individual identities which they claim or which are assigned to them" (Varghese et al. 2005, p. 22). The studies in the previous section addressed the professional aspect of identity. The nine studies we have identified as highlighting social identity explored a variety of aspects within this realm, with authors explicitly naming and exploring how the intersecting factors of bi−/multilingualism, transnationalism, gender, race, and/or motherhood are integral to their professional identities and the inquiries they pursue.

We intentionally label this group of studies as *social identity as pedagogy*, informed by Morgan's (2004) concept "teacher identity as pedagogy." Highlighting the performative nature of teaching, Morgan drew on feminist, poststructural, and postmodern theories of identity to highlight the ways in which students project onto the instructor their preconceived notions of who their instructor is. Morgan shared examples of how he used his privileged identity as a White, heterosexual, native English-speaking male to challenge the gender stereotypes of his English learning students. As we began analyzing our subset of studies of social identity as pedagogy, another telling theme emerged: unlike the privileged aspects of Morgan's identity, the bi−/multilingual, transnational, racialized and/or gendered identities of the authors here were often positioned as deficits or weaknesses in one's ELT capabilities. Although a clear message across this collection is the ways in which those identities enrich and contribute to ELT endeavors and scholarship – even suggesting that English monolingualism warrants greater examination for its detrimental effects on learners – it is telling that social identity as pedagogy is a prevalent theme for the bi−/multilingual, transnational ELT professionals of color in our overall collection of 30 articles.

We have resisted placing the studies here into subcategories based on race, gender, and bi−/multilingualism, believing that an intersectional approach to identity (Block and Corona 2016; hooks 1981) allows for richer interpretation. Instead, we provide a brief summary of each study and highlight the aspects of their identities that were integral to the study. We attempted to order the summaries in a way that allowed connections and/or overlaps with named themes when appropriate.

Mercado (1996) was the earliest self-study we found in our literature review. A teacher educator in a graduate program preparing bilingual, ESL (English as a second language), special education, and mainstream teachers, she aptly illustrated the concept of social identity as pedagogy: "I know that my experiences and identity as a Puerto Rican are a major influence on my pedagogy and research" (p. 568). Mercado framed her multi-year inquiry as a "critical reflection on lived experiences" and shared how her childhood schooling experiences as a bilingual Latina in New York City public schools directly impacted her design and analysis of the learning experiences in her methods courses. Being marked as "'exotic' or 'different'" (p. 568) when she was a student because of tracking policies that separated emergent bilinguals like Mercado from English monolingual students meant that Mercado had to traverse and negotiate multiple worlds. As a result, she was highly attuned to noticing and experiencing differences and learned how to use this awareness to navigate across multiple aspects of her life: as a person, teacher, and scholar. In turn, Mercado created situations where her teacher education students experienced

differences – particularly across language, race, ethnicity, and level of knowledge/expertise – and she engaged with them in critical dialogues to co-construct meaning and pedagogical implications. In this way, she not only drew on her social identity but put her pre- and in-service teachers in positions where their social identities were named and explored. Examples included monolingual English speakers taking 30-minute Spanish lessons so that they could better empathize with English learners and analyzing work samples of high-performing Latinx and African American students that challenged deficit, remedial approaches to these students. True to the open, collaborative spirit of self-study (e.g., Samaras and Freese 2006), Mercado made clear that she was learning from her students as they shared their analyses of their experiences. Furthermore, this learning occurred on multiple levels: the new perspectives students brought to the shared classroom, the role of difference in dialogical activities, and a deeper understanding of her own practice.

Like Mercado (1996), Souto-Manning (2006) immediately named how her social identity was intertwined with her professional identity. She wrote as an immigrant Latina raising a bilingual son while working as a bilingual school teacher in the Southeastern USA. Labeling her study a critical narrative analysis, Souto-Manning drew on critical discourse analysis (CDA), conversational analysis (CA), and auto-ethnographic methods to critique the deficit discourses toward bilingualism that permeated the national and local contexts in which she lived and worked. The project was not named as such, but the rationale, methods, analysis, and implications share the intentions and design found in self-study. As an elementary teacher, Souto-Manning noted that she was often curious as to why immigrants in the USA seemed to be so quick to abandon their heritage languages. It was not until she experienced numerous derogatory comments toward raising her son bilingually that she understood the societal pressures "to conform to the linguistic norm of speaking English" (p. 573). For example, a monolingual colleague at her school warned that her son would "end up in special ed" (p. 561) if she insisted on speaking to him in Portuguese, her first language. Souto-Manning kept a reflective journal documenting her experiences, analyzing them through both micro and macro lenses afforded by CDA and CA. Keeping the personal, the professional, and the political in constant dialogue, Souto-Manning concluded that learning multiple languages is not as difficult as contesting the local norms shaped by deficit discourses.

The challenges of bilingual, immigrant parents were also integral to the collaborative self-study conducted by Kim et al. (2018). In this study, the researchers made their identities as Korean immigrant teacher educators for US early childhood settings central to their inquiry, investigating how the intersections of their identities as immigrant mothers had an impact on their work as early childhood teacher educators and vice versa. Through grounded theory analysis of their personal journals, notes from shared conference calls between the three researchers, email correspondence and text messages between the researchers, materials from their teaching, and materials from the early childhood programs their children attended, they found that their teacher educator, immigrant, bilingual, and parent identities were deeply entwined and led them to support the inclusion of linguistically and culturally diverse practices, both in their parenting and in their work as educators.

They shared moments of ambivalence in maintaining their children's heritage language because of the effects on how they interacted with their school peers and uncomfortable situations with monolingual preschool teachers who seemed uninterested in cultural and linguistic diversity. Despite the challenges, the authors found that the interactions among their multiple roles benefitted their students, because it further strengthened their commitment to preparing preservice teachers to educationally support linguistically and culturally diverse students in validating ways.

In both Kim et al. (2018) and Souto-Manning (2006), the authors' professional, advanced level of expertise in bilingualism and education research was doubted or dismissed by White, monolingual education professionals with less training. In the next study we report here, the authors attempted to use their trying life experiences as pedagogical resources. Ates et al. (2015) designed a collaborative narrative inquiry (drawing upon Barkhuizen and Hacker 2009) to examine their experiences as TESOL teacher educators from three very different cultural, racial, and linguistic backgrounds. Their stated purpose was to explore the implications of writing and sharing their own cultural narratives for how they prepared teachers to serve culturally and linguistically diverse students in US contexts. Ates wrote from the perspective of a teacher educator born in the USA but raised in Turkey. She returned to the USA to pursue advanced graduate studies and became a US-based TESOL teacher educator. Kim, born and raised in South Korea, came to the USA for her master's and doctoral degrees, and Grigsby was born and raised in the USA by her Japanese mother and American father. For the purposes of their study, the team focused on two cultural narratives written by Ates. The first examined her first ESL teaching job in the USA and her experience teaching English in the USA as a non-native English speaker (NNES). In the second narrative, she shared her deep dismay and hurt upon hearing her TESOL advisor tell her she would "never be hired as an ESL teacher in the US" (p. 305) because of her NNES identity. Later, when Ates was offered a teaching position near the US-Mexico border, the same professor belittled the position as one that few teachers would be willing to accept. The authors concluded that their shared inquiry not only reinforced their belief that pedagogies are always imbued with one's life stories, but these stories are co-constructed by interactions with and perceptions of others. Although Ates was positioned to feel inadequate as an English instructor, the authors suggest that sharing the narrative with other bi−/multilingual colleagues who view diversity as a resource was personally and professionally affirming. The next study we report suggests that how one shares cultural narratives warrants as much attention as the writing of those narratives.

Austin (2009), a teacher educator in a graduate program that prepares bilingual and ESL teachers, used her experiences as a biracial, multilingual teacher educator to identify numerous tensions caused by discourses that shape the teacher education curriculum and programs. Labeling her project a self-study narrative, Austin critiqued what she called the popular storytelling practice in teacher education where participants – students and faculty – are encouraged to share their experiences in the name of valuing teachers' voices. However, absent the awareness of how that

activity reflects a White, female, middle-class cultural practice, certain voices and stories are privileged over others. Austin, an African American/Okinawan woman who attended US Armed Forces schools, was socialized into a communication style that was in contrast to the "personalized story-telling that has become a part of the discourse of teacher education today" (p. 47). Austin argued that teachers and teacher educators whose lives do not fit the dominant norm have to learn new rules to gain participation and acceptance. She argued that well-meaning, White feminist practices with stated aims of egalitarian communities, left unexamined, can exclude voices of difference and marginalize the life stories of the multilingual, racially, and culturally diverse professionals needed in our schools and communities.

The autoethnographies of Canagarajah (2012) and Solano-Campos (2014) continue the theme of how one's professional identities are co-constructed and contested across varying landscapes. Here, both authors, Canagarajah in Sri Lanka and Solano-Campos in Costa Rica, were trained as English language teachers in their home countries before teaching and/or pursuing advanced graduate studies in the USA. As shared in the previous section on professional identity, they analyzed their journeys from language learners to language teachers and/or to ELT scholars. In theorizing their experiences, both drew on the history of ELT as tool of colonialization and the hierarchical positioning of countries based on their status as "center" (e.g., US, UK) or "periphery" (non-English-dominant) contexts (Braine 1999; Kachru 1985; Phillipson 1992). Canagarajah, a "periphery professional" (2012, p. 262) called his study an "ethnographic self-reconstruction" (p. 258) wherein he traced his development as an ongoing negotiation of contexts in which his knowledge and pedagogies were continually questioned. He argued that the experiences of non-native English teachers can serve as valuable critiques to the profession and thus are needed to advance the field.

Solano-Campos' (2014) autoethnography centers on her experiences being recruited to teach ESOL in the USA. Similar to Canagarajah's experience, she found her professional knowledge doubted and devalued. Instead of working as an ESOL teacher, she was assigned as a math tutor to help Spanish-speaking immigrant students access the mainstream curriculum. Drawing upon sources such as photographs, newspaper clippings, journal entries, blog entries, academic writing, and an online interview, she wove a story of how her identity shifted and changed from that of an EFL, "colorblind" (p. 422) teacher in Costa Rica, to someone who in US contexts was viewed as "Latina" and "brown" (p. 428). She used her story to illustrate the shifting identities of teachers of English and the need to "provide individuals with opportunities to become critically conscious of multiple identity options" (p. 436). Indeed, analysis of her own experiences made her more critically aware of her shifting identities and the ways in which she was positioned in particular contexts. She also located her story within the larger neoliberal discourses that normalize the commodification of education and extended this to the commodification of teachers as products that can be imported and exported.

Solano-Campos (2014) and Canagarajah (2012) are reminders that "Periphery teachers can find it difficult to teach in the center" (Braine 1999, p. 83), but the experiences, expertise, and critical insights of these professionals are vital

contributions to the ELT knowledge base. Indeed, the last two studies that we describe in this "social identity as pedagogy" category highlight the ways in which bi−/multilingual, immigrant, racially diverse teacher educators help better prepare preservice teachers for linguistically diverse classrooms and schools. In Smith et al. (2016), the lead author investigated how her identity as a Black, multilingual, immigrant teacher educator affected her practice in literacy education methods courses. Warrican and Kumi-Yeboah, the second and third authors, served as critical friends (Schuck and Russell 2005). Smith's students matched the larger teacher demographics in the USA: mostly female, White, and monolingual English-speaking. Smith designed and analyzed her inquiry using two key concepts: multicultural awareness (Nieto 2000; Pedersen 2000) and multilingual awareness, which she defined as the "ability to identify and modify accordingly the ways in which one reflects on language and its use (Herdina and Jessner 2002)" (p. 108). Data included her research journal, course evaluations, videos of her teaching practice and reflections on selected clips, and comments written to students. Among her findings, Smith identified times when she had unintentionally made stereotypical assumptions about her students (e.g., that an African American student would serve as a linguistic informant on African American Vernacular English) but also moments where her multicultural awareness facilitated communication with students in classes with a diverse student population. However, she also noted that she seemed to ignore the cultural identities of her White students, thereby unintentionally reinforcing Whiteness as a neutral monolith.

Gort and Glenn's (2010) self-study investigated the tensions and moments of disjuncture that arose in the process of revising Glenn's secondary English methods course to better support the needs of bilingual/bicultural learners. It was part of a larger faculty development initiative involving several faculty members across multiple subject areas (see Gort et al. 2011) at a research university in the Northeastern USA. The role of social identities as pedagogy is positioned differently in this study, but it is still a critical aspect of the findings and implications. In the eight other studies in this category, the authors name from the outset how their linguistic, cultural, racial, ethnic, transnational, and immigrant identities motivated their inquiries and how the various aspects of these identities shaped their professional development as they prepared teachers for diverse ELT learners and settings. Here, the initial rationale for their study was to help faculty better prepare prospective teachers for the increasing linguistic diversity in K-12 schools. Glenn is described as an experienced English educator and a White, monolingual English speaker with 6 years of secondary English teaching experience and 5 years teaching at the university. Her teacher preparation paid scant attention to linguistic diversity even though the program was located in an area with high populations of Spanish-speaking students in the public schools. At the time of the study, Gort was in her fifth year directing the graduate program in bilingual/bicultural education. In her capacity as leader of the faculty study group, she served as a mentor/colleague who selected and provided the professional and academic readings. As a child she immigrated to the USA from Cuba with her family and was a bilingual Spanish-English teacher before starting her doctoral studies. In this study, she

served as Glenn's critical friend, but one that brought an advanced level of expertise and experience in bilingualism (as learner, teacher, and researcher) to the collaboration. Part of the data collection and analysis involved Glenn creating and sharing narratives from her methods class with Gort, who would respond with questions meant to probe her colleague's thinking and decision-making processes. In the other studies in this category, one's linguistic identity is a common cause for feelings of professional inadequacy. These feelings of inadequacy held true here, but unlike the others, it was Glenn, the monolingual English professor, whose expertise is cast in doubt:

> [Glenn] found herself feeling embarrassed over her lack of knowledge revealed during the process of revised course implementation; these moments of disjuncture...called into question her identity as a professional. "I was a classroom teacher for years; I have made a career out of preparing new teachers. How is it possible that I don't know all that I don't know?"... "How can I admit that I don't know and still save face in front of my students and colleagues?" (p. 75)

Gort and Glenn's project illustrates the power of trusting, collaborative relationships in self-study, but we argue that there is an added layer here: Gort was able to draw upon her firsthand experiences as an immigrant and as a teacher of bilingual learners to support Glenn's development as a teacher educator. Gort's social identity as bilingual/bicultural Latina immigrant teacher and university researcher was thus integral to the pedagogical transformation that happened in Glenn's courses.

As the 17 studies described in this larger category of identity illustrate, the multiple, intersecting aspects of teacher educators' identities – professional and social – are a critical area of focus in the extant literature in ELT that provide an important starting point for understanding the experience, practices, dilemmas, and strengths of ELT professionals. Next we turn to the other main theme we identified in the studies we selected for review: the viewpoint or location from which those engaged in ELT scholarship are reflecting.

Locus of the Work

Because of the critical impact of the sociocultural contexts in which ELT professionals practice – both in shaping practice and the ways in which knowledge of context mediates EL teacher learning (Sharkey 2004) – the locus of their work also emerged as an important theme in the ELT self-study (and related) literature. By *locus of the work*, we mean the context that served as the focal point of inquiry for the study being undertaken. We identified four loci in and about which studies engaged:

1. Teacher education coursework
2. Practicum experiences
3. Other coaching and mentoring interactions
4. Collaborative interactions of language teacher educators

As in other areas in our chapter, some studies were coded in multiple ways, which we describe in more detail in each section below.

Teacher Education Coursework

In those studies that examined the impact of teacher education coursework, we identified a further distinction as to whether they focused on preparing those teachers who were specializing in ELT or were preparing teachers who have sometimes been identified as "de facto" language teachers (e.g., Sharkey 2018) or as "mainstream" teachers. The label "mainstream" is often used in US contexts to refer to those grade-level or content-area teachers who do not have a specific role or caseload in serving ELLs and may not have specialized background in teaching ELLs. While they may often teach ELLs as part of the population of their classrooms, mainstream teachers may not have any preparation to do so. Because of the growing population of ELLs worldwide and increasing emphasis on inclusion of ELLs in classrooms with English-dominant students (e.g., Peercy and Martin-Beltrán 2012; Platt et al. 2003; Reeves 2006), many teachers are called upon to instruct ELLs in their classrooms, regardless of whether they are prepared to utilize the kinds of pedagogies needed to support ELLs' simultaneous learning of content and language, provide the specialized supports needed for making academic language comprehensible, and draw upon the culturally sustaining pedagogies that are important for marshaling the linguistic and cultural resources of ELLs and their families (e.g., López 2016; Peercy and Martin-Beltrán 2012). Given the difference in what working with these different teacher populations can mean in terms of teachers' previous experiences with and their attitudes toward fostering and engaging linguistic and cultural diversity as resources (e.g., de Jong and Harper 2005; Harper and de Jong 2004; Reeves 2006, 2009), we found it helpful to code studies in this section in a way that allowed us to distinguish between teacher education coursework intended for mainstream teachers and coursework intended for ELT teachers. In the remaining thematic groupings in this section (Practicum, Coaching/mentoring, Collaborative groups of LTEs), all studies occurred in settings focused specifically on preparing ELT teachers, and thus we did not code for ELT and mainstream teachers in those subsections. This does suggest that further investigation in these three areas regarding the preparation of mainstream teachers to work with ELLs could provide fruitful insights for supporting all teachers to teach ELLs.

For ELT Four studies in our review could be identified as examining dimensions of coursework for ELT teachers (Baurain 2010; Belz and Müller-Hartmann 2003; Mercado 1996; Peercy and Troyan 2017). In Mercado's (1996) self-study, the author explored the ongoing changes she made to a bilingual reading methods course in which bilingual, ELT, special education, and mainstream teachers enrolled. Because Mercado's own linguistic and cultural identity were important in shaping her practice, we also coded her study under social identity, described above. Here we briefly describe the study from its position as one which contributes to the extant self-study literature related to ELT instruction. Mercado discussed her attempts to engage student teachers in experiencing the same kinds of pedagogy they were urged to use with language learners, including portfolio assessment and thematic

instruction. They then used their shared experiences as learners through assignments such as creating logs of their class sessions to identify "significant and worthwhile practice" (p. 579) for use with students. It was Mercado's intent that through experiencing the pedagogy as learners themselves, the students would internalize the practices used, critically reflect on what they experienced, generate questions, and identify ways to change their practice. She also noted that she aimed to facilitate teacher learning through supporting their "learning by doing rather than by 'being told'" (p. 576), which aligns with self-study scholarship which asserts that teachers need to experience teaching in order to understand what they still need to know and the questions they want to ask (e.g., Korthagen 2011; Korthagen et al. 2001; Korthagen et al. 2006; Russell 1998, 1999). It also aligns with the oft-repeated axiom from self-study scholarship that "teaching is not telling, and learning is not listening" (e.g., Berry 2007; Bullock 2009; Loughran and Russell 2007). We see in Mercado's study some of the earliest attempts of ELT scholarship to utilize self-study as a way to understand and develop one's pedagogy as an ELT teacher educator and that her own identity and school experiences as a bilingual learner and teacher had a significant influence on her pedagogy as a teacher educator.

Belz and Müller-Hartmann (2003) used a "self-reflective case study" to explore their development as teacher learners. They examined their learning *of* tele-collaboration *through* telecollaboration to create a course that incorporated intercultural telecollaborative opportunities (e.g., synchronous chatting, email) between their US undergraduate students learning German (Belz) and German elementary and secondary teacher candidates learning to teach English to K-12 German students (Müller-Hartmann). Analyzing 135 email exchanges between the authors over the period of 9 months, they wrote and analyzed metacommentaries on their email exchanges. Identifying their collaborative work as an example of an electronically mediated intercultural teaching and learning partnership, they asserted that the adjustments they made along the way in response to the socio-institutional affordances and constraints of their teaching contexts represented their intercultural competence. Certainly, given the growth in electronically mediated communication in the time since their study, self-study has seen an explosion in the possibilities for collaborative self-studies between distant critical friends (e.g., Bullock and Ritter 2011; Fletcher and Bullock 2015; Peercy and Troyan 2017; Ragoonaden and Bullock 2014), as well as raising many questions about how teaching online courses impacts the work of the teacher educator and the learning of teacher candidates (e.g., Fletcher and Bullock 2015; Peercy et al. 2016; Selwyn 2011; Silverman and Clay 2010; Thornton 2013; Tschida and Sevier 2013). Such questions will increase as our technological capacity expands and the opportunities and challenges for using technology for teacher, student, and teacher educator learning and development develop in tandem.

Baurain (2010) utilized diary study to examine his teaching of a postgraduate course called *Literature in Language Teaching* to practicing teachers of English in Vietnam. Interested in engaging the teachers in his course as equals, reflecting on his interactions with the teachers in the course, and improving future versions of the course, Baurain kept a diary about his teaching practice for 8 months. He also drew

upon two questionnaires he administered to the students and student work in the form of portfolios and final papers. In exploring data from his diary in conjunction with other data sources, Baurain found that what teachers wanted most from the course was not to learn how to teach literature, but rather they sought general improvement in their teaching skills. These findings had an impact on his design of the course when he taught it a second time, and he incorporated more opportunities to study, discuss, and engage in pedagogy. Baurain noted that study of his practice in this way allowed him to be more cognizant of and responsive to the cultural context in which he was teaching.

The 2017 collaborative self-study by Peercy and Troyan (also discussed below in the section about collaborative groups of language teacher educators) explored the challenges Peercy experienced in developing a core practices approach for preparing teachers of ELLs, with Troyan as a critical friend. Though the scholarship in core practices has established a strong theoretical foundation (e.g., Ball and Forzani 2009; Grossman et al. 2009; McDonald et al. 2013), there is still relatively little literature that describes how to enact the use of a core practices framework in teacher education courses. Through their work together, the authors demonstrate that Peercy's understanding of how to approach instruction in her elementary literacy methods course for teachers of ELLs was part of a cycle of teacher educator learning that has not been well-investigated. Moving from existing conceptual knowledge to reflection allowed her to refine her conceptual understanding of how to enact core practices approaches with the teachers in her course and then try her pedagogical approach anew. The authors argued that there is much more to be investigated and understood regarding how teacher educators learn to engage teachers in practice-based pedagogies, particularly as many methods courses and teacher education programs take up this approach.

These studies begin to provide much-needed insight into the professional dilemmas that teacher educators in ELT settings are facing. While they highlight many of the same foci that are present in the broader self-study literature related to examining the (mis)match between actions and intentions (e.g., Vanassche and Kelchtermans 2015) and the questioning of one's pedagogical decision-making, such work remains rare in ELT scholarship. As Golombek (2015) noted:

> Recently, teacher educators in language teacher education have ... called for teacher educators to conduct self-inquiry more actively and visibly in order to examine the effect of their instructional practices and dialogic interactions on the teachers with whom they work. (p. 470)

Thus, these nascent contributions to illuminating the pedagogies involved in teacher preparation for ELT represent an important foundation for further investigation into the pedagogy in this field. Furthermore, the way in which such work might be distinct for specialists in ELT as compared to the preparation of mainstream teachers – who also teach ELLs but frequently have had less exposure to cultural and linguistic diversity – is another important question for this field. Below we identify

the studies that help to inform the field about the knowledge base related to mainstream teachers of ELLs.

For mainstream teachers Overall, five studies in our review examined dimensions of coursework for mainstream teachers of ELLs. All five identified themselves as self-studies. Two of the studies, which we focus on here, explored a variety of questions about instruction of mainstream teachers who were being prepared to work with ELLs (Galguera 2011; Wade et al. 2008). Three examined the social identities of the author(s), and they were thus explored from that lens in one of the earlier sections (Gort and Glenn 2010; Kim et al. 2018; Smith et al. 2016).

Wade et al.'s (2008) self-study explored the ways in which Wade's class of White, secondary prospective teachers engaged in online peer-led dialogues about a case study featuring ELLs. The researchers used discourse analysis of the online interactions to examine the teachers' discussions of the ESL case. It was Wade's intent that the cases would provide a context in which participants would incorporate learning from her course and other teacher education courses that were intended to support them in embracing diversity as an asset. The teachers were also expected to draw on critical reflective problem-solving skills that Wade had taught as a way to engage with the cases and identify pedagogical issues and solutions. The self-study dimension of the investigation involved audiotaped conversations between Wade and Thompson, who served as a critical friend, and examined Wade's instructional purposes and the kinds of interactions she found students were having in their discussion of the cases. The authors found some evidence of reflective problem-solving among the participants, but little of it was critical, and in some cases it demonstrated deficit thinking. The authors suggested that prospective teachers need a significant amount of support from teacher education programs to challenge deficit views and that without specific attention to integrating content from multicultural and other courses into practice, they often do not know how to implement social justice perspectives in their work as teachers. The authors concluded that teacher educators must take responsibility for engaging in pedagogy that shares responsibility for social change and does not locate it all in the teacher candidates.

Noting the dearth of scholarship that provides specifics for a shared pedagogy for preservice teacher preparation, Galguera used his self-study as an attempt to contribute to a developing understanding of what a pedagogy of teacher education for supporting ELL students' academic language development might look like. Drawing on Shulman's (1987) construct of pedagogical content knowledge, Galguera explored his approach to supporting the predominantly White, female, English-dominant preservice teachers in two sections of his methods course in their development of what he called "pedagogical language knowledge" through pedagogies intended to foster their critical language awareness. Specifically, he analyzed his teacher candidates' developing critical language awareness based upon their performance on two tasks, an extended anticipation guide in Spanish and an oral language development jigsaw in English. Drawing upon the participants' written reflections on their experiences with the two tasks and follow-up interviews with six focal teachers, he found that the teachers in his courses appreciated both exercises as a way to bring together practice and theory related to language development and teaching.

He also found that teachers' experiences with the anticipation guide in Spanish gave them empathy for what ELLs experience in class when attempting to accomplish academic tasks in a language that they do not yet know well.

Clearly, these studies situated in coursework settings for mainstream teachers demonstrate that teacher educators and teacher education programs in the USA are grappling with how to prepare those teachers without specialized knowledge in teaching linguistically and culturally diverse learners to do this important work. As the population of the world continues to diversify, this question is one that will challenge educators in many settings. Self-study of practice is an important way to illuminate both the difficulties and the solutions that educators experience and identify as the field develops further.

Practicum

Given the many critiques that arise in teacher preparation related to perceived disconnects between teachers' experiences in field placements and what they are taught in their university programs (e.g., Anderson and Herr 1999; Korthagen 2010; Korthagen et al. 2006), practicum courses are often expected to provide panaceas and are also frequently the site of thorny questions regarding how to shift the pedagogy of teacher education in ways that bridge the "theory-practice divide." The three studies in this section (Baecher and McCormack 2015; Daniel 2015; Golombek 2015) examined the work of teacher educators in the context of ELT teacher preparation in practicum settings from a variety of angles. In her self-study, Daniel (2015) presented the development of her pedagogy of empathetic, critical integration (ECI) of multiple perspectives. Overtly acknowledging that there can be mismatched expectations and values between teacher education classrooms and mentor teacher classrooms, Daniel explored how to support the US K-12 ESOL teacher candidates with whom she worked to become culturally responsive practitioners. One way she aimed to do so was by supporting their ability to appreciate (often differing) university- and school-based perspectives about teaching as they engaged in their field placements. Drawing upon data from her syllabus, lesson plans, lesson materials (e.g., PowerPoints), as well as reflective memos and course evaluations, Daniel found that developing her pedagogy of ECIs helped to assuage the theory-practice gap that teacher candidates experienced. She concluded by emphasizing the importance of teacher educators being more responsive to the demanding balancing act teacher candidates experience and helping teacher candidates identify ways to know and be more responsive to their ELL students through culturally responsive pedagogy.

In a study that shared intentions with self-study, Baecher and McCormack (2015) used conversation analysis to examine how post-observation conferences (POCs) between Baecher (in her role as university supervisor) and two US PK-12 ESOL teachers enrolled in Baecher's TESOL master's program differed when only Baecher had observed the lesson (in person) versus when the lesson was videotaped and both the supervisor and preservice teacher viewed the videotape prior to debriefing. Drawing upon one in-person and one videotaped observation per teacher and the related POCs, the authors found that the use of video significantly changed the

dynamic of the supervisor-preservice teacher relationship in POCs, making them more democratic in terms of both quantity and quality of supervisor and teacher participation. They suggested that incorporating regular use of video in lesson observations transforms the supervision experience because it allows teachers to observe and evaluate their own performance. They also noted that university supervisors need training in conducting POCs and that one mode of professional development for supervisors could include recording and listening to their POC sessions so that they can better understand the nature of their interactions in POC sessions. Given the interest from self-study scholars in the ways in which teachers are mentored in the field (e.g., Crasborn et al. 2011; Fayne 2007; Korthagen et al. 2013), both Daniel's and Baecher and McCormack's studies offer timely suggestions for how teacher educators can examine and transform their practice to connect fieldwork and teacher education experiences in ways that may support teacher candidate growth.

Another article that shared many of self-study's intentions was Golombek's (2015) "self-inquiry." In this study, she also delved into questions about shifting her practice in ways that would be more responsive to teacher candidates who were in their field placements. She examined the "emotional dissonance" (p. 471) she experienced in her interactions with Rose, a teaching intern whose journal responses annoyed her because Golombek felt they were not very reflective nor honest. Golombek noted the tension she felt, knowing she should not be annoyed but instead should use the responses to leverage her support of Rose. Golombek found that exploration of her response to Rose's journals changed her practical activity as a teacher educator, encouraging her to be more explicit with interns about journal writing and to question the ways in which she supported them. Golombek argued that it is important to make the narratives of teacher educators' self-inquiry public, so that this local knowledge can be used by other teacher educators as a way to reframe and recontextualize their own practice. Interestingly, Golombek's study connects to our double-helix metaphor and points to the critical contribution S-STEP could make to the scholarship of teacher education within the applied linguistics strand of ELT. Her call for making self-inquiry public is one that has been foundational to self-study methodology since its inception (e.g., Korthagen and Lunenberg 2004; Samaras and Freese 2006) and is indeed a shift that would advance scholarship and pedagogy in ELT.

All of the studies in this section point to the challenging terrain in which ELT teacher educators find themselves when trying to help teachers negotiate the worlds in which they are taught and those in which they teach and to bring them into conversation with one another. Teacher educators identify the challenges of doing so and some of the pedagogies which they have begun to use to support their work. Further study into the work of ELT teacher educators in practicum settings would provide important insights regarding the current practices of teacher educators who aim to bring together practice and theory, the challenges in doing such work, and the kinds of questions, data sources, and methodological stances that need further development for exploring persistent questions about supporting ELT teacher candidates in bringing together experiential and propositional knowledge.

Coaching/Mentoring

We also identified four studies that in many ways were related to the locus of the practicum but also involved teacher educators working with already practicing teachers as they engaged in additional shared professional development (Artigliere and Baecher 2016; Capitelli 2015; Miller 2003; Tidwell et al. 2011). Three of these studies identified themselves as using self-study methodology (Artigliere and Baecher 2016; Capitelli 2015; Tidwell et al. 2011), while Miller identified her work as drawing upon Exploratory Practice (e.g., Allwright 2005), a practitioner research framework from the ELT literature that was developed to draw teachers more directly into investigations of their practice.

In her self-study, Capitelli (2015) explored feeling overly authoritative in her role facilitating a teacher inquiry group. Remembering the critical role of a teacher inquiry group in which she participated in her early years as a Spanish bilingual elementary school teacher and now working as a teacher educator, she developed an inquiry group for teachers who had recently graduated from her teacher education program. Her participants, all US PK-12 teachers of ELLs in their first or second year teaching, at times demonstrated what she found to be misconceptions or problematic views regarding ELL students and ways to teach them. She described her dilemma of allowing space for inquiry while also directing teachers toward well-founded pedagogical understandings of how to work with ELLs and highlighted the challenge of supporting teacher inquiry in a non-authoritative way. By illuminating the challenges that teacher educators face particularly with supporting new practicing teachers, Capitelli pointed to issues to be considered for developing a pedagogy of teacher education during teacher induction and the early years of teaching.

Miller (2003) also examined how to balance questions of authority and support as she documented how she went about her work as a "fellow explorer" (p. 207) consulting with two Brazilian teachers of English regarding their practice. Wanting to avoid a knowledge transmission approach to her work as a consultant and to engage in more shared critical conversations, Miller aimed for the teachers and herself to examine their participation in and their reflections on the collaborative process itself. Her goal was that they would jointly explore how their collaboration impacted the practice of all three educators. Miller found that the use of Exploratory Practice, with its focus on developing research questions that are relevant to teachers' practice and reflection that encourages the integration of research and pedagogy (see also Allwright 2005), served as a useful frame for consulting with and fostering teacher learning. She also found that it supported her own reflection as consultant and teacher educator.

The collaborative self-study by Artigliere and Baecher (2016) explored Artigliere's work as a coach in three different kinds of dyads (as an instructional coach for colleagues in his building, as a supervisor of student teachers, and as a mentor teacher), examining how his different kinds of mentoring relationships impacted his work as a coach. Specifically, they explored how the feedback that Artigliere gave to colleagues differed depending on his coaching role, as well as what remained consistent in his approach to feedback. With Baecher as a critical

friend, the authors examined the various ways Artigliere's roles were designed to support novice ESOL teachers. The authors drew on the coaching journal that Artigliere kept to reflect on his work with each teacher, lesson materials, transcripts of debriefing conversations from three cycles of observation with each of the teachers, and transcripts of weekly audio-recorded conversations between Artigliere and Baecher. The authors found that Artigliere used different kinds of feedback depending on his role and that some of the challenges teachers were facing were beyond his own experiences and expertise. They concluded that the roles of supervisor, mentor teacher, and coach each are complex and require specialized knowledge. Teacher educators themselves need sufficient preparation and support to engage in these various roles.

The collaborative self-study by Tidwell et al. (2011) explored how self-study was used as a frame for teacher inquiry by teachers in an Iowa elementary school starting a dual language education program. Two teacher educators and researchers (Tidwell and Smith) worked together with first- and second-grade Spanish dual language immersion teachers (Estrada and Garza, respectively) and a bilingual teacher and director for the school's dual language program (Wymore) as the school began to develop its dual language program and professional learning opportunities for teachers. Initially, Tidwell and Smith were involved in developing and delivering a more traditional professional development (PD) model to the teachers in the school, in which they drew upon the research base in bilingual education, including curriculum integration, thematic planning, and cognitively demanding instructional practice, and conducted professional development sessions for the school faculty. Tidwell, Smith, and Wymore also encouraged teachers to engage in ongoing conversations about their practice. Teachers did so, meeting in grade-level teams to examine the effectiveness and usefulness of their practice. Based upon feedback from the teachers about how useful they found their collaborative conversations and a new statewide PD model that asked teachers to develop their own PD plans and goals, Tidwell and colleagues decided to shift their PD model to a more individualized professional learning approach. Using the interests of the teachers as the focus of professional change, the team decided to use self-study as a way to frame teachers' professional development plans. The authors found that teachers highly valued the opportunities to identify their own PD focus and that the frame of self-study enabled them to focus on specific issues and experience meaningful results. Significant also was that their own data became the focus of their PD, rather than decontextualized data from an outside "expert." This personalized focus allowed teachers to better understand their practice and identify areas for future exploration and development.

Because the importance of continued opportunities for teacher learning throughout their careers and the challenges of teacher induction are well-known, this area of investigation is crucial, and further self-study investigation in coaching and mentoring of practicing teachers engaged in work with ELLs can provide critical insights. An even deeper understanding of the kinds of challenges that teacher educators experience in fostering teacher development across their professional lifespans, as well as the pedagogies that have been developed for successfully doing so, is critical to support teacher growth and retention.

Collaborative Interactions of LTEs

While much of the teacher education literature in the last two decades has demonstrated that collaborative interactions of teachers can provide critically important sites for their learning (e.g., Grossman et al. 2001; Hawley and Valli 1999; Little 1987, 2002; Peercy et al. 2015a, b; Putnam and Borko 2000), much less studied are the professional learning opportunities that come from the collaborative engagement of teacher educators around questions of practice. In this final subcategory related to the locus of the work in the ELT research base, we identified four studies as related to the importance of collaborative groups for language teacher educators (Bailey et al. 1998a, b; Gort and Glenn 2010; Peercy and Troyan 2017).

An early example of teacher educator professional development through collaboration from the ELT literature came from the 1998 special issue of *TESOL Quarterly* that we described above. Like Kathi Bailey and colleagues, Francis Bailey and his colleagues did not identify their work as self-study. However, this piece focused on the opportunities for growth of ELT teacher educators who were teaching courses, supervising teachers, and in charge of administering ELT teacher education programs. This study clearly aligned with many of the intentions and the design (e.g., LaBoskey 2004) of self-study and even drew upon some of the early work from self-study scholarship (e.g., Kremer-Hayon and Zuzovsky 1995; Russell and Korthagen 1995) to highlight the then-recent shifts in the literature demonstrating teacher educators reflecting on their own practice and the still-common issue of teacher educators generally developing their pedagogy through trial and error (e.g., Goodwin et al. 2014). F. Bailey and colleagues (also known as the Language Teacher Educators Collaborative, or LTEC) aimed to "convey the power and value of a collaborative conversation among a small group of teacher educators who meet regularly to discuss practices" (1998a, p. 537). They illustrated the kinds of conversations in which they engaged and asserted that, over time, their collaborative conversations provided opportunities to build trusting relationships and question their pedagogy.

While K. Bailey and colleagues (1998b) focused on their pedagogy as language teachers (discussed above under professional identity), they, too, noted that their collaboration with trusted peers had an important impact on their perspectives as teacher educators. Drawing upon their experiences, they noted that sustained, ongoing, self-directed professional development is critical for both teachers and teacher educators.

The other two studies in this category, both self-studies, were also discussed above in other subsections (Gort and Glenn 2010; Peercy and Troyan 2017). In both studies, while the improvements of the authors' methods courses were focal to the study, it was also clear how important the collegial interactions of Gort and Troyan were as critical friends for Glenn and Peercy's examinations of their existing practice, course redesign, and eventual change in practice. We urge further research into and opportunities for teacher educators' collaborative investigation of their pedagogy as a way to deepen the ELT knowledge base, making more transparent the pedagogies of teacher education in ELT and the kinds of collaborative interactions that support their development.

Lessons Learned from the ELT Research Base

The ELT self-study research base shows great potential for further internationalizing the use and recognition of self-study methodology, as numerous studies in this chapter were undertaken in countries outside of the typical self-study "strongholds" (i.e., Canada, Australia, the USA, the Netherlands, and New Zealand), including Iran, Korea, Japan, Vietnam, Venezuela, Costa Rica, and Malta. The research base examined here further shows promise in efforts to help push forward the wider scholarship in self-study to diversify the language, racial identities, and other social identities of those utilizing self-study, in addition to the questions examined, as evidenced by the number of studies here that addressed questions of bi- and multilingualism, as well as transnationalism.

The identities of those undertaking self-study in ELT have ranged from language learner to language teacher to language teacher educator, with the liminal spaces in the transitions between these identities and the attempts to systematically explore one's own learning and practice revealing important growth and development. These studies revealed the complexity of the identities of ELT practitioner-scholars, as well as the empathy and insights gained through introspective analyses.

The studies that explored a particular setting for the work of teacher education and teacher educators illustrated a growing body of literature on coursework for both those teachers specializing in teaching ELLs and those "mainstream" teachers who teach ELLs alongside English-dominant students. In the work in practicum settings and on coaching or mentoring, thus far there has only been research conducted on courses related to teaching ESOL specialists. Given the growing number of ELLs worldwide, and the increasing need for teachers to have preparation in teaching ELLs, it is important to better understand the pedagogy of teacher education for preparing all teachers of ELLs in settings other than just methods courses – something a robust body of self-study literature could help to inform. This is tied to the work of collaborative groups for language teacher educators, for which there was evidence of only two studies (Bailey et al. 1998a; Peercy and Troyan 2017), though K. Bailey and colleagues (1998b) and Gort and Glenn (2010) did also illustrate teacher educators learning from colleagues through their collaboration. The development of teacher educators who prepare both ELT teachers and mainstream teachers to teach ELLs and their pedagogies of teacher education for doing so need much greater illumination (Peercy and Troyan 2017). For at least a decade, the teacher education literature has recognized gaps in the ways teacher education for teachers of ELLs occurs, noting that often mainstream teachers receive little to no preparation in this area (e.g., Lucas and Grinberg 2008; Lucas et al. 2008). Furthermore, teacher education faculty who specialize in ELT and their "content-area" colleagues often remain in their own silos, reifying teacher education programs that do not intertwine the study of language and content (e.g., Athanases and de Oliveira 2011; Lucas 2011). Gort and Glenn's self-study is representative of an area in need of much greater development in the literature: collaborative engagement in self-study by a teacher educator with expertise in preparing teachers of ELLs with a colleague who has content-area expertise. Greater numbers of self-studies that

explore the learning of and development of pedagogies by teacher educators who prepare "mainstream" teachers and those who prepare ELT teachers have the potential to inform a transformation of teacher education in ways that are responsive to ELLs' content and language needs *and* resources. Further opportunities for teacher educators to come together collaboratively, and to use collaborative self-study to illuminate their pedagogical questions, challenges, and solutions, will also help to inform the pedagogy of teacher education for preparing all teachers of ELLs.

Another area where many of these studies shine much-needed light is on the pedagogy of teacher education for preparing teachers of linguistically, culturally, and racially diverse learners, as well as the doubts and challenges these educators face in doing so in the absence of agreed-upon pedagogies for this work. For instance, Galguera (2011) illustrated two of the learning tasks he used to raise teachers' pedagogical language knowledge (an extended anticipation guide and an oral language development jigsaw activity); Wade et al. (2008) demonstrated the use of online discussion forums in which teacher candidates explored cases together; Belz and Müller-Hartmann's (2003) students engaged in synchronous chatting and emailing; Peercy and Troyan (2017) grappled with how to involve teacher candidates in the enactment and analysis of particular core practices for teaching language learners; Gort and Glenn (2010) detailed Glenn's incorporation of more bilingual/bicultural characters and authors in her English/language arts methods course; and Ates et al. (2015) explored the development and use of cultural narratives generated by English language learners to inspire the importance of culturally responsive teaching. Additional self-study work by teacher educators who are preparing teachers for work with ELLs would be of great value to the field to identify those practices that are part of a repertoire for ELT teacher preparation. Building upon those studies that detail pedagogical practices, studies that begin to link the pedagogy of ELT teacher preparation with teacher practice and teacher practice with ELL student outcomes would be of tremendous value to the field, as we are ever more called upon to understand the value and impact of teacher education.

Advancing Self-Study Research in ELT

A weakness we identified in many of the studies we reviewed – both studies that shared some affinity with self-study and some that identified as self-studies – was the need for more detailed reporting of data collection methods, data sources, and analytic processes used. If self-study is to gain a strong foothold in ELT and maintain the momentum it continues to gain in terms of being respected in the wider field, this work must adhere to the rigorous reporting of data collection and analysis procedures in which self-study research has a strong foundation. While there were some strong examples in the studies we reviewed, there were also those that did not provide enough (or any) detail about the methods used to convince us as readers of the validity and trustworthiness of the accounts. Such rigor is critical for advancing the field, enhancing self-study methodology as valuable work, and increasing the

possibility for others to understand the methods used and contribute in substantive ways to a particular line of inquiry.

We also found that a number of the studies in our pool did not, in our estimation, "move beyond the story" (Loughran 2010) of the individual educator, in order to connect the personally important findings from one's study to larger implications for the field and/or programmatic and philosophical coherence within and across the particular teacher education program of the author(s). Broader connections from individual findings to the larger field will help to establish a much-needed knowledge base for teacher education in ELT, responding to recent calls for "an empirical basis that justifies the practices of [ELT] teacher education" (Johnson 2015, p. 516). The expansion of this body of research could also contribute to stronger implications for practice.

If we consider LaBoskey's (2004) categories for research design in self-study, another criterion that was not met by several of these studies was that of interaction with others; many studies lacked critical colleagues or other voices to question and interrogate the findings, and some did not explain the roles of critical friends or other authors in the work. Self-study methodology affords opportunities for systematic and sustained investigation of the self in relation to other people and contexts through the use of a variety of research frameworks and the leveraging of a variety of data sources and analytic techniques. Therefore, we see much potential for the contributions that self-study methodology can make in galvanizing and serving as an organizing force for the "chains of inquiry" (Zeichner 2007) in ELT. We see particular promise for self-study methodology to support ELT research in investigating questions about the self that have risen up around investigations of identity, emotion, power, agency, citizenship, and the politics of migration.

We feel strongly that greater attention to rigor in ELT scholarship that shares methodological intentions with self-study and greater awareness of the potential of self-study as powerful methodology will help ELT scholarship to examine questions that are of key importance to advancing our field. Furthermore, our review illustrates that there would be power in raising cross-disciplinary awareness of the questions and findings from the two key disciplinary areas that underpin ELT, applied linguistics, and education. These hybrid conversations could inform the knowledge base in ELT by mobilizing inquiry about teacher educator pedagogy and identity that has thus far occurred in largely separate discourse communities.

For instance, as Golombek's (2015) study illustrates, language teacher educators unfamiliar with S-STEP but accepting of its premise of self-inquiry would benefit from a deeper understanding of the methodology. They would find a thriving research community accepting of their research goals and eager to support their development within S-STEP. As noted earlier in this chapter, a growing, vibrant strand of scholarship within ELT focuses on language teacher identity (LTI), as witnessed by several recent special topic issues in the leading ELT journals (e.g., Varghese et al. 2016; De Costa and Norton 2017). Editors of these volumes have called for greater attention to LTI within language teacher education programs, arguing for LTI as an analytical and pedagogical tool for understanding teacher development. However, they do not name language teacher *educator* identities as integral to this work. We wonder if by lacking an S-STEP perspective, LTI is in

danger of slipping into an objectification of language teachers. Interestingly, Brian Morgan, who coined the term "teacher identity as pedagogy" (2004), names language teacher education programs (that is, the curricula, assignments, and criteria for successful completion) and the professional organizations that create performance standards as identity-forming sites that warrant critical examination for their potential domesticating effects on teacher learners (Morgan 2016). However, he leaves unnamed how we might pursue such endeavors. We cannot help but see how S-STEP is integral to such work. Perhaps it is Morgan's (2016) call that links the two themes of our chapter – identity and locus of work – and addresses one of the primary purposes of our review: to illustrate to those unfamiliar with S-STEP how it can support particular areas of investigation in ELT.

Limitations in Our Approach

We recognize that there are trade-offs and limitations to the ways in which we chose to search the literature. By limiting our search to peer-reviewed journals, identified a priori, and using a priori search terms, we undoubtedly missed some studies. Certainly, our wide reading to write this chapter revealed a number of important books, book chapters, and conference proceedings that we did not include here. By limiting our search to the a priori journals and search terms, we also did not use ancestral searches (Atkinson et al. 2014) to identify additional worthy work. As with any review, it must be bounded somewhere, and we believe that the venues and terms we identified for the searches yielded a good picture of the state of the field. We also searched only English-medium academic journals. There are a number of applied linguistics journals that address ELT research but publish the studies in the language of the country of production. This limitation has implications for the call to further internationalize self-study.

Another limitation in our approach is present in the ways in which we chose to group and interpret the literature. While our current thematic groupings allowed us to see areas of contribution that the ELT literature has made in self-study (and related) research and to note the gaps in ELT self-study literature on professional and social identity and the loci of inquiry where the studies focused, our groupings also necessarily obscured other relationships and possible interpretations of the state of the field. At times there were studies in different thematic categories that had common threads, and examination across those studies in different groupings would likely also reveal strengths and opportunities in the research base.

Conclusion

Returning to our metaphor of the double helix, there is yet to be significant and meaningful interaction between the literature in applied linguistics and the scholarship in teacher education, which has limited the opportunities for S-STEP to have an impact in ELT scholarship. The common questions emerging across both fields about

pedagogy and identity in ELT contexts open up possibilities to bring more use of self-study methodology to ELT scholarship. Areas in much need of investigation in ELT include pedagogies of teacher education in ELT, questions of social and professional identities of teacher educators, and challenges in preparing mainstream teachers and teacher educators for an increasingly diverse world; all of these areas provide opportunities for those scholars committed to being "base pairs" to increase the impact of self-study in ELT inquiry. This means bringing increased awareness of self-study and its possibilities to scholarship in applied linguistics and enhancing the understanding of pedagogies related to linguistic, cultural, racial, and ethnic diversity in the self-study scholarship in ways that foster opportunities for self-study to inform a more inclusive, pluralistic, and mobile world.

Self-Study in Mathematics Teacher Education

Sandy Schuck and Robyn Brandenburg

Contents

Abstract

Self-study of teacher education practices is aimed at improvement of teacher education. Given the need identified in the literature for reform in mathematics education, self-study serves an important role in supporting teacher educators to reflect on and enhance their practice. This chapter analyzes the literature concerning self-study in this area. It identifies and discusses the range of articles, chapters, and conference proceedings that consider the self-study of teacher education practices

in mathematics education. The chapter begins with an overview of existing issues discussed in mathematics education research and then moves to an examination of the contributions of self-study to resolving such issues. The chapter provides an analysis of the processes used to identify self-studies in this area. The value of self-study in mathematics teacher education is articulated. Four themes are considered: challenging beliefs, pedagogical approaches and methods, collaboration, and mathematics educators' journeys. Studies are grouped under these themes, and their contributions to the themes are identified. Approaches used by the authors are discussed, and limitations of the studies are noted. Suggestions for future self-study research in mathematics teacher education are provided.

Introduction

This chapter of the Handbook concerns self-studies of teacher education in mathematics education. The previous Handbook (Loughran et al. 2004) provided an extensive analysis of the research in self-study of teacher education and was the first such compilation of research in the area of self-study. However, there was a gap in the topics covered in that Handbook as no mention was made of some of the discipline areas in which self-study was occurring. This chapter addresses that omission in the case of mathematics education.

The key task of this chapter is to both provide an analysis of what self-study has contributed to mathematics education and to pose questions about future directions that self-study in the area of mathematics education might take. While self-study as a field is becoming a mature area of research, its contributions need to be constantly assessed to ensure that they are adding to knowledge in the field and are changing and fostering teacher education.

The field of mathematics education has many challenges, mainly concerned with increasing engagement, uptake of mathematics at senior levels of school, and university and mathematical capacity of both teachers and students (Thomson et al. 2013; Watt et al. 2017). Teacher education has a major role to play in ameliorating these challenges and in providing confident and competent teachers of mathematics both at a primary (or elementary) level and at higher levels. Clearly, self-study in mathematics teacher education has an important role to play here given the focus on improvement of practice that is central to such studies (LaBoskey 2004). Self-study in mathematics teacher education incorporates investigation of our own practice as teacher educators and the clarification of some evidence-based teaching principles which can then contribute to others' practices in the area. It covers investigation of practices that address the particular challenges that exist in mathematics education as described above and includes the study of mathematics teaching at the primary, secondary, and tertiary level.

Those educators who do contribute to self-study research in mathematics teacher education are contributing to the field by thinking about their teaching and their students' learning in new and powerful ways (Loughran 2011). Central to these studies are the dual concerns about improving student teachers' pedagogical content knowledge (PCK) and about improving students' subject content knowledge (SCK) (Shulman 1986). Further development of these concepts includes the importance of mathematical knowledge for teaching (MKT) (Ball et al. 2008). While attempts to improve mathematics teaching and enhance student teachers' PCK and MKT have been prevalent over the last few decades, self-studies that focus on such improvement have not been as prevalent. This chapter will examine the studies that have occurred in self-study of mathematics teacher education and will consider the central themes on which the studies focus and also consider what we can learn from these studies that will enhance mathematics education. We will also look at the possible constraints of self-study research studies and how self-study in mathematics teacher education might develop and progress in the future.

The areas identified in the literature review center around a number of themes. These themes are:

- The location of schooling/education – primary, secondary, teacher education, or tertiary mathematics.
- The pedagogical approaches used in the self-study, such as role-playing, use of metaphors, use of critical incidents, and differentiated learning.
- A focus on collaboration or individual learning.
- The journey of the teacher educators as they learnt how to enhance their teaching and their students' learning.

This chapter reviews all studies in self-study of mathematics education by considering each theme and the papers that fit into that theme. It then discusses the overall contributions of all these papers and identifies the limitations and constraints that are highlighted in these studies with respect to self-study methodologies and the contribution of such studies to the improvement of mathematics teacher education. The chapter will identify the gaps in the literature, that is, those areas of mathematics education which do not appear to have self-studies incorporated. Finally, the chapter will discuss ways that self-studies in mathematics education should develop and progress to ensure ongoing enhancement and growth in this area.

The next section starts by explaining what literature was reviewed, how studies were chosen, and why we chose particular dates for this investigation.

Literature Review

Description of the Self-Study Publication Identification Process

This literature review examined publications for the period 1995–2016. We first identified published articles concerning self-study in mathematics education in the self-study journal *Studying Teacher Education*, the collection of Castle Conference

Proceedings, and the chapters from an edited book reporting mathematics education in the Self-Study series (Springer) and then added other papers that were uncovered in a search for key terms in refereed journals.

The keywords used when searching in the journal *Studying Teacher Education*, the journal that specifically publishes self-studies in teacher education, were maths teacher education, mathematics teacher education, and teacher educators in mathematics. Related terms such as self-study were not required as the journal only publishes articles if they concern self-study.

In other journals as well as in other searches, the keywords were self-study in teacher education, self-study in mathematics teacher education, mathematics teacher education and self-study, mathematics and self-study, and teacher educators in mathematics self-study. We also used keywords self-study and geometry/statistics/algebra/calculus – only one paper was found from these keywords.

For the purpose of this literature review and subsequent analysis, book chapters, conference papers, and journal articles were selected and included in this chapter if they met the following criteria:

1. Self-study of mathematics teaching practice and research was the primary focus of the research undertaken.
2. The journal articles, conference papers, and book chapters were full papers and peer reviewed.

Following this selection process, a total of 33 outputs were identified, and this total comprised 17 journal articles, 1 edited book, 12 book chapters, and 3 conference papers. Of the 17 journal articles, 12 were published in the *Studying Teacher Education: A journal of self-study of Teacher Education Practices*; all of the book chapters were published in the edited book, *What Counts in Teaching Mathematics: Adding value to self and content* (2011), and the three conference papers were presented in the proceedings of the International Conference on Self-Study of Teacher Education Practices (also known as the Castle Conference).

The following table, Fig. 1, identifies the Mathematics Education – Self-Study Publications by Year (1995–2016). Of the 17 journal articles published during this time, the most journal articles published in 1 year were four articles in 2006. All of the 11 book chapters were published in 2011, and no outputs were recorded for the 1996–2001 period.

The themes that were identified include:

1. Challenging beliefs
2. Pedagogical approaches and methods
3. Collaboration
4. Mathematics educators' journeys

These themes were not exclusive, and many articles appeared in more than one theme. Figure 2 highlights the number of articles that related to each theme.
Fig. 1 Mathematics Education – self-study publications by year (1995–2016)

The dominant theme identified as a result of the tally process was the reference to pedagogical approaches and methods (19), followed by challenging beliefs (13), collaborative (9), and mathematics educators' journey (4).

Theme 1: Challenging Beliefs

The theme of challenging beliefs appears throughout the broader self-study literature and is also dominant in the mathematics education literature. This section considers self-studies which examine the challenging of beliefs of both student teachers and of teacher educators as they strive to engage their student teachers in different views concerning mathematics education and mathematics itself. In this chapter, we restrict our analysis to challenging of beliefs about mathematics, mathematics teaching, and mathematics teacher education. One of the goals of mathematics teacher educators, identified in the general mathematics education research literature, has long been to challenge preservice teachers' (PSTs) beliefs about mathematics and mathematics education. For over two decades, the challenging of PSTs' beliefs has enjoyed a dominant place in the general mathematics education literature (Cady and Rearden 2007; Schuck 2009; Brandenburg 2008). The reason for this dominance has been the widespread belief by many primary school teachers and some secondary school teachers of mathematics that mathematics is procedural, noncreative, and a set of unrelated skills and techniques. Consequently, many mathematics teacher educators believe that it is their task to challenge their student teachers' beliefs about mathematics and mathematics education (Cady and Rearden 2007; Schuck 2009; Brandenburg 2008).
Fig. 2 Chart of theme and tally

The self-study articles under discussion for this theme discuss the tensions and contradictions that exist for teacher educators when they work at creating a vision of mathematics as creative and dynamic and as a human endeavor. At the same time, they have to be careful not to downgrade the cognitive aspect of the subject and for the need for both content knowledge and pedagogical content knowledge.

All the self-study articles discussed in this section highlighted the importance of collaboration, and a number also noted the temptation to dismiss the cognitive demands of the content matter in the effort to motivate their students to enjoy the study of mathematics and mathematics pedagogy. The articles also referred to the general literature on self-study and applied self-study principles to their analysis of the challenging of beliefs.

In this section, we analyze the tensions and challenges that teacher educators experience in their teaching of mathematics and their teaching of mathematics pedagogy to their students. We also consider the challenges to beliefs that the PSTs experience. The methods that the teacher educators employ to make their beliefs explicit or to help their students become aware of their beliefs are articulated. Finally, we investigate what self-study practitioners can learn from these analyses.

The sub-themes that cover the different aspects of challenging beliefs are:

1) The need to challenge student teachers' and practicing teachers' beliefs about mathematics
2) Methods used by teacher educators to challenge these beliefs
3) The alignment of teacher educators' beliefs about mathematics and mathematics education with their practice
4) Methods used by teacher educators to challenge their own beliefs

Challenging Student Teacher and Practicing Teachers' Beliefs

The general mathematics education literature shows that primary level student teachers often come to teaching with preconceived ideas about the nature of mathematics and mathematics education (Schuck 2011; Southwell et al. 2004). The acknowledgment that these beliefs are often inhibitors of and barriers to the learning of mathematics and to the adoption of suitable pedagogies for teaching mathematics (Schuck 2011) has led many self-study researchers to consider how they can unsettle these beliefs and help student teachers to become aware of the debilitating nature of these beliefs in their self-studies (Pereira 2005; Prescott 2011; Schuck 2002).

Most of the 11 self-study articles on challenging beliefs concerned teacher educators' self-studies in which they considered their practices and evaluated whether or not they were disrupting the student teachers' beliefs (Betts 2011; Brandenburg 2011; Pereira 2005, 2011; Prescott 2011; Schuck 2002). One question asked was "how can PSTs learn about teaching through their own experiences rather than mine?" (Brandenburg 2011, p. 77). We enlarge on these studies below.

Secondary level student teachers often approach the teaching of mathematics with a love for the subject but with little understanding of how students learn and how to effectively engage them in mathematics learning (Prescott 2011). However, supporting student teachers to develop pedagogical knowledge on its own is insufficient to respond to this issue. Student teachers also need to know ways of effectively teaching mathematical content. Pedagogical content knowledge (PCK) (Shulman 1986) is a term that is often used to denote this area of knowledge. Shulman's work on PCK was extended by Ball et al. (2008) through the construct of mathematical knowledge for teaching (MKT). As noted by Pereira (2011, p. 146), "teacher knowledge is a complex concept that goes beyond traditional distinctions between content and methods." Learning involves beliefs, attitudes, and cognitive processes. A better understanding of the mathematics does not necessarily imply that the teaching will be more effective (Pereira 2011).

For both primary and secondary student teachers, it becomes apparent that a need exists to challenge their understanding of what mathematics is. Pereira (2005) suggested that we need to move students from a restricted view of the power and beauty of mathematics to a view that involves a greater understanding of mathematics and its place in our society and cultures. The ways that we can shift students' thinking are outlined in the next section.

Some of the authors of articles on self-study in mathematics education also considered the beliefs of practicing teachers (Betts 2011; Pereira 2011). Betts (2011) writes about how the construct of MKT created some dilemmas in his work with teachers: it highlighted the deficiency of teachers' understandings, which presented him with difficulties in working with teachers in a trusting and respectful environment. He noted that growth in MKT was inextricably bound up with the teachers' beliefs about teaching among other things and offered a critique of MKT that indicates the complexity of the concept in practice.

Finally, Pereira (2011) writes about his work with practicing middle school teachers and notes that for many of them, mathematics was "an unrelated collection of skills, techniques and verbalizations" (p. 149). He saw it as his task to challenge these beliefs and assist the teachers to see themselves as "learners of mathematics . . . with mathematical habits of mind . . ." (p. 149). His methods for doing so are discussed in the next section.

Methods to Challenge Student Teachers' Views of Mathematics and Mathematics Education

There are only four self-studies that focused on how to challenge student teachers' views. Some of the methods proposed by teacher educators as ways they have found useful to challenge student teachers' beliefs are discussed here. Pereira (2005, 2011) used autobiography and journaling for this purpose. He encouraged PSTs to express their thoughts, feelings, and attitudes toward learning mathematics in his classes. Students found the process cathartic and also understood that they needed to change the way they learned mathematics before they could change the way they needed to teach mathematics.

Another method similar to this one was used by Schuck (2002). In her doctoral work, she asked primary student teachers to act as researchers and pose questions to each other about their attitudes to mathematics and mathematics teaching. Working in this grounded way, PSTs indicated the issues that they felt were important for their learning and teaching of mathematics and gained insights into how others viewed the same issues. These insights helped the PSTs to challenge their existing beliefs.

The use of roundtable reflective inquiry sessions was another method used to challenge student teachers' beliefs. The sessions enabled students to reflect on critical incidents in their mathematics teaching, and this helped students to challenge their own beliefs in ways that engaged them and were meaningful for them (Brandenburg 2011).

The Alignment of Teacher Educators' Beliefs with Their Practice

Most of the articles and chapters discussing beliefs in the self-study of mathematics education practice area were focused on the need for teacher educators to challenge their own beliefs and practices. The process of self-study was a useful vehicle for doing so. Words such as tensions, challenges, contradictions, and disruptions emerged from their self-studies (Alderton 2008; Gordon 2011; Pereira 2005, 2011; Schuck 2011). At the other end of the spectrum, words such as transformation, reframing, "collective wisdom," and opportunities (Alderton 2008; Gordon 2011; Lovin et al. 2012; Sanchez et al. 2010; Schuck 2002, 2011) arose in the studies.

Each of the authors who had written about beliefs became aware through their self-studies of their practice that their pedagogies were not necessarily aligning with their beliefs (Alderton 2008; Betts 2011; Brandenburg 2011; Gordon 2011; Lovin et al. 2012; Pereira 2005, 2011; Sanchez et al. 2010; Schuck 2002, 2011). Their self-studies all began with a desire to improve practice, went through an "awakening" stage in which they saw the misalignment of their practice and beliefs, and then

embarked on an active modification of practice to better align their beliefs and practices.

For some of the teacher educators, the self-studies were conducted as they learned how to be mathematics teacher educators, often while they were involved in graduate studies (Betts 2011; Lovin et al. 2012; Sanchez et al. 2010). The others were all experienced teacher educators seeking to improve their practice or as Schuck (2011, p. 61) put it, "resist complacency." While all were focused on enhancing the learning of their students about mathematics and the teaching of mathematics, they often found that PSTs seemed to want far more instrumentalist support for their teaching and that a dilemma arose for the teacher educators. On the one hand, teacher educators sought to support PSTs in ways that aligned with their teacher educator beliefs, which saw mathematics as a human endeavor, and on the other hand, they wanted the teaching of mathematics to occur in ways that emphasized MKT. They sought to promote engagement in mathematics content as well as promote its value in society.

The next section discusses some of the methods that teacher educators used to become aware of the dilemmas, tensions, and contradictions in their own practice.

Methods to Challenge Teacher Educators' Practices

The value of having a critical friend is emphasized in the self-study literature (Loughran and Northfield 1996; Schuck and Russell 2005). A critical friend is one who provokes, critiques, and provides an alternative viewpoint (Costa and Kallick 1993). Given the need to "reframe" or challenge existing beliefs in self-study, the critical friend plays an important role in encouraging such reframing to occur. The fourth area where studies focused was on critical friendships. Schuck (2011) noted how having a critical friend from a different discipline area enabled her to resist complacency. Her critical friend provided a perspective that could be viewed as an outsider's, and this viewpoint caused her to pause and reflect on the reasons for her actions in teaching PSTs. Her "unspoken assumptions" (2011, p. 63) were challenged and new insights were gained.

Others found that their self-study aims of challenging PSTs' beliefs about mathematics had the unexpected outcomes of also challenging their beliefs (Betts 2011; Brandenburg 2011; Pereira 2011). As they reflected on the processes that they put in place for their students, they found that their assumptions were also being challenged. They embarked on reflexive approaches which Boler (1999, pp. 176–177) terms "the pedagogy of discomfort." By challenging their thinking about their practice, and allowing themselves to be discomforted by the contradictions they identified in their teaching, these authors became aware of ways that their practices needed to change so that their beliefs and practices better aligned.

One way of challenging teaching practices was proposed by Gordon (2011) who noted that her deep understanding of theories of learning proposed by Vygotsky and Leont'ev alerted her to the fact that she was not able to convince her students of the value of studying statistics but that students' experiences of its purposes and functions and the means of achieving their goals would influence their ongoing cognitive activity with statistics. Her insights from learning theories were that she

was not the sole possessor of the knowledge. The "incongruities" (p. 138) in her practice and her subsequent reflection led to her assuming a greater stance of watchfulness over her practice.

Finally, a group of mathematics teacher educators (Lovin et al. 2012; Sanchez et al. 2010) set about interrogating their personal beliefs and ensured that their core beliefs were made more visible and held up for scrutiny as a way of challenging their beliefs. The authors made use of a community of learners, a topic that will be further explored in theme 3 on collaboration. The "collective witnessing" (Alderton 2008) ensured that different perspectives informed their practice.

Summary

Challenging beliefs is a central part of self-study. Mathematics teacher educators contributing studies to this section discussed the incongruities, tensions, and questions that they identified when they embarked on self-studies of their practices. They became aware through these studies that often their practice did not align with their beliefs. They sought ways of identifying the dissonances in their practices and of enhancing their teaching and they used their self-study research insights to gain an understanding of how to challenge their beliefs. Many of them noted that their self-studies had raised more questions than they had answered. Nevertheless, the insights they had gained had placed them on journeys of improved practice and provided them with greater understanding of how to better support their students. Methods used to challenge beliefs were collective discussions, use of critical friends, and using learning theories to illuminate ways to work with students and reflective practice.

The other aspect of challenging beliefs discussed in this section concerned the challenging of student teachers' beliefs. Teacher educators used a variety of methods to challenge their student teachers' views of mathematics and mathematics education. Journals, reflective roundtables, role-playing, and acting as researchers were some of the methods used (Brandenburg 2011; Leaman and Flanagan 2013: Schuck 1997).

Theme 2: Pedagogical Approaches and Methods

The dominant theme represented in the collation of self-study outputs was the focus on pedagogical approaches for teaching mathematics. This theme – pedagogical approaches and methods – exemplifies the ways in which the combination of research, self-study of practice, and teacher inquiry combines to enhance the mathematical and the pedagogical content knowledge so that learning improves. While the teaching and learning strategies individually may not be unique (including peer feedback/discussion, personal reflective journaling, student work samples, online oral feedback, and teacher candidate surveys), when presented as combination of approaches, and underpinned by self-study, reflection and inquiry powerful outcomes are achieved. As Schuck and Pereira (2011) question, "What sort of pedagogical approaches are needed to change the way mathematics is perceived?" (p. 3).

The mathematics self-study research for this theme was conducted across the spectrum of learning and teaching environments, including primary, secondary, and tertiary settings. Of the total, 19 of the 33 focused on pedagogical approaches and the ways in which mathematics was improved as a result of studying mathematics practice and implementing approaches to assist student and teacher learning. As was commonly noted, students and teacher educators experienced anxiety and varying degrees of confidence when teaching and learning mathematics, and oftentimes, at least initially, the classrooms were teacher-driven and resembled "what [teachers] had experienced . . . as a student" (Thomas and Monroe 2006, p. 170). As Goodell (2011) suggests, teachers that do not embrace constructivism as a theory of learning tend to "use very traditional expository pedagogies" (p. 111). One of the underpinning questions addressed throughout the articles was the requirement for students and teacher educators to know *what good mathematics teaching is* and the belief that there is immense power in sharing in the teaching of others. In this way, higher-order thinking skills can be identified and encouraged.

The role of theory was highlighted throughout the self-studies, and the importance of a theoretical lens or underpinning affected the conduct of the mathematical self-studies. Activity theory, constructivist theory, variation theory, and inquiry and narrative approaches were identified. The importance of an inquiry stance was highlighted as an important approach in mathematics teaching and learning and defined by Marin (2014) as "rooted in constructivist theories, which suggest that people learn best when they are actively engaged with subject matter" (p. 21). In many cases, it was the combination of particular theories, approaches, and practices that combined to create successful learning outcomes.

The sub-themes included in this pedagogical approaches and methods theme include:

1) The use of critical incidents.
2) Planning and implementing student-centered problem-based mathematics lessons.
3) The role of questioning and discourse as a pedagogical approach.
4) Role-playing and metaphor.

Critical Incidents as a Pedagogical Approach to Teaching Mathematics

A number of articles focused on the role of critical incidents in learning and teaching mathematics. Critical incidents that have influenced pedagogical approaches have also been described as events, workshops, specific learning, and teaching videos and personal mathematics methods courses. Through identifying and examining critical incidents in practice, teachers and students became aware of the power of examining assumptions about mathematics. For example, McGlynn-Stewart (2010) reports on her desire to engage her mathematics students in effective, problem-based mathematics enquiry in multiple settings and develop confidence in understanding and teaching mathematics. A key incident occurred as the pre-service teachers completed a test, and it was noted that they appeared "depressed, desperate and defeated" as they left the class, and the "marks were very low, including several failures" (p. 181).

As a result, her confidence in her belief in her ability to effectively teach mathematics plummeted. Following her discussion with a colleague, she resolved to try to understand the various perspectives and discussed the assumptions about the test with the pre-service teachers, only to discover that "they were so worried about the math content in the K-3 curriculum that they assumed that the test would consist of solving K-3 level math problems. They did not come prepared to write about theory or pedagogy" (p. 181). The resolution was that their "mutual surprise and disappointment arose from our differing assumptions" and that they could then repair their "bruised relationship" (p. 181). Identifying and discussing critical incidents were powerful ways to understand more deeply mathematical teaching experiences, although as Goodell (2011) states, few pre-service teachers' responses were truly meta-cognitive (p. 118).

Planning and Implementing Student-Centered Problem-Based Mathematics Lessons

Students often enter mathematics courses at university level with varying levels of competence, confidence, and sophistication with regard to mathematical content knowledge and pedagogical content knowledge, and the self-study research presented within this theme highlights the importance of assisting students and teachers to develop confidence and their critical eye or "professional seeing" (Bragg 2015). Of critical significance when encouraging mathematical "professional seeing" is the role of learner engagement and the ways in which teachers direct, redirect, reflect, discuss, and combine individual and collaborative group work. A focus on these areas of pedagogy has led to measured improvements in student learning (Bragg 2015; McGlynn-Stewart 2010; Nicol 2011).

A common pedagogical approach identified throughout the self-study research was a focus on encouraging students to develop, plan, and implement a series of mathematics lessons. The emphasis was the tailoring of the content and approaches to meet the needs of the students they taught in schools, and in doing so, pre-service teachers develop confidence and see themselves as "real math teachers" (McGlynn-Stewart 2010, p. 183).

Another student-centered problem-based strategy study is the initiation and evaluation of tasks that encouraged students – and teacher educators – to enhance their knowledge, understanding, and pedagogy. As Bragg (2015) suggests, "Effective tasks focus students' interest on critical features by helping them to develop the necessary critical eye for discernment, by presenting experiences that challenge common naïve understandings, and by engaging with the language that is needed to express newly refined understandings" (p. 295). An example of an assessment task used to develop understandings is for the students to take a photographic image and to write three open-ended mathematics questions about the image for particular levels and purposes. Thomas and Monroe (2006) further develop the concept of open-ended problem-solving as a pedagogical approach to ultimately engage students and increase interaction during mathematical classes. Approaches that mitigated dissatisfaction with learning included reading specific classroom scenarios and watching videos as groups as pre-service teachers

experienced common scenarios, and the discussions allowed all pre-service teachers to contribute. An example of an extension of video problem-solving included pre-service teachers initially completing problems solved by students, followed by pre-service teachers solving them in the way students might solve the problem. The approaches were then discussed with peers to identify various strategies. The video clip was then shown, and pre-service teachers were required to document children's thinking and, in doing so, become a "resource for pedagogical decision-making" (Nicol 2011, p. 48).

The importance of an inquiry stance was highlighted as a key approach in mathematics teaching and learning and defined by Marin (2014) as "rooted in constructivist theories, which suggest that people learn best when they are actively engaged with subject matter" (p. 21). An example cited in the literature was Nicol's use of variation theory to develop problem-solving.

The Role of Questioning and Discourse as a Pedagogical Approach

While much has been researched about the impact of discourse and questioning in learning about teaching mathematics, major outcomes of the self-study research within this theme focus on the ways in which teacher educators respond to, and engage with, students in more effective ways. Many researchers discovered that the students they were teaching were asking similar questions to the ones they were asking, "Why didn't I learn math like this in elementary school?" and while keeping this in mind, asking the question, "If I could go back and be a pre-service teacher again, what would I want to know about teaching and learning?" (Marin 2014, p. 27). In doing so, and sharing objectives, it was suggested that the request for "tips and tricks" shortcuts and thereby the balance between student wants and needs were addressed specifically. Researchers (Goodell 2011; Marin 2014) stated that rather than responding with statements that commonly close down conversations, they identify and grasp opportunities to expand and develop thoughts. Examples of these questions included: "Why might you think that?"; "How do you know?"; "Can you prove that?". Extending this notion of categories of questions that reveal responses that are more deeply considered, Goodell (2011) also suggests a focus on the oral and written feedback provided to pre-service teachers as a crucial method to encourage deeper level and higher-order thinking.

Role-Playing and Metaphor

One study (Leaman and Flanagan 2013) used an effective pedagogical approach of role-play whereby pre-service teachers and the teacher educator assumed the identity of fifth grade students. Participating in structured role-play enabled all participants to examine their often firmly held assumptions and to explicitly unpack these assumptions by way of a "pause button." This was pressed during specifically scripted roles for students with disabilities and allows for explicit pedagogical thinking to be made explicit and videotaped for post-viewing and discussion.

Yet another pedagogical approach was the use of metaphor for learning about teaching including the construction of metaphors to describe mathematical concepts and for use as hypothesis testing (Gordon 2011, pp. 138–139). The research focus

for Gordon involved implementing activities in her statistics classes whereby students linked the use and understanding of statistics to everyday life, and to do this, she required students to construct metaphors to describe statistical concepts. She reflects on one student's response to the following request – "think of a metaphor for a 95% confidence interval for a population mean" (2011, p. 138). The "trawling for fish" metaphor offered by the student was initially accepted by Gordon as she highlighted that the "95% was not associated by the whereabouts of the fish but with the ability of the net to capture the fish" (p. 138). Following one of the class member's feedback, *I hate fishing*! the remainder of the class agreed, and the metaphor was deemed "unpopular and unusable." This interaction prompted her to challenge her own beliefs more deeply and was a "jolt to . . . self-complacency." Gordon highlights that using metaphor can reveal much more than what is expected when teaching mathematics content that can be difficult for some students to understand. Discussions relating to student metaphor surfaces both student and teacher beliefs and understandings and enhances mathematics teaching and learning.

The main aim expressed within this theme was to improve self and others using a purposeful study of mathematical practice and as Marin clearly stated, "Self-study became my vehicle for examining myself in my new role and understanding the teacher candidates' experiences in my methods courses" (Marin 2014, p. 20). While it was an explicit objective to assist pre-service teachers in their learning, the teacher educators' "own development [was] inseparable from theirs" (Gordon 2011, p. 142).

The ongoing interaction between the pre-service teachers, the teacher educators, and critical friends underpinned successful mathematical pedagogical outcomes. The five sub-themes identified within the overall theme of pedagogical approaches – the use of critical incidents, planning and implementing student-centered problem-based mathematics lessons, critical friends and collaborators as learning and teaching partners, the role of questioning and discourse as a pedagogical approach, and the integration of structured role-playing and the use of metaphor – highlight the importance of being attentive to reflective practice, gathering data as evidence, and maintaining and encouraging an inquiry approach as mathematics teacher educators.

Theme 3: Collaboration

This section considers what collaboration brings to self-study and discusses the collaborative self-studies done by mathematics educators. Twelve of the 33 self-studies discussed collaboration. In some cases, the teacher educators form a collaborative community in which they share and challenge each other's practices and beliefs. In other studies, critical friends are central to the self-study process. In these studies, the collaboration is between the teacher educator and a critical friend. There are also examples of collaborations between student teachers and the teacher educators, united in their efforts to enhance their mathematical pedagogies.

In the self-study literature, collaboration is noted as being central to the endeavor of improving practice (Hamilton and Pinnegar 2013). The latter notes that dialogue and interactivity are essential characteristics for self-study. Although

the term "self-study" appears to center on one person and their own self, in fact, for a self-study to be effective, it is usual to involve others in the study. This involvement allows for other perspectives, a challenging of set viewpoints, and a discussion regarding improvement in practice.

One common way for self-study practitioners to collaborate is through the use of critical friends. As discussed in theme 1, a critical friend is one who acts as a mirror to the practitioner, who raises questions about practice, and who offers constructive feedback. Trust is essential in a critical friendship (Schuck and Segal 2002). Critical friendships are in themselves challenging. Questions of how critical and how honest to be arise (Schuck and Segal 2002). Issues of power imbalance may also make the relationship difficult (Schuck and Russell 2005). However, the benefits of getting an honest appraisal of practice, which seeks to challenge beliefs and helps support improvement of practice, usually outweigh the difficulties.

In the self-study literature we have analyzed for this chapter, collaborators and critical friends were identified as essential to the success of most of the self-studies focused on learning and teaching mathematics. The constitution of the collaborative groups varies (including combinations of elementary and secondary level mathematics teacher educators, graduate teachers, and teachers) as does the frequency of meetings. However, in all the publications, the ultimate aim is that of support, questioning, refining, and revisioning mathematics pedagogy through self-study research. The most common objective identified was a desire to gain insights into the researcher's own practice so that they could improve the learning opportunities provided for the pre-service teachers. As McGlynn-Stewart (2010) suggests, "having a critical friend with whom to plan, reflect and problem-solve was crucial to my understanding of my teaching situation and to my learning. Through [my critical friend's] emotional and practical support, I gained new insights into my teaching and was able to learn and grow from my dilemmas of practice" (p. 184). Bragg (2015) liaised with her fellow mathematics educators to design and refine her tasks, as did Thomas (Thomas and Monroe 2006) with his colleague, Monroe. It also became apparent that in secondary teaching contexts, opportunities to work with critical friends and colleagues were more limited than in elementary teaching contexts as the culture, structure, and approach to mathematics education are generally less conducive to collaboration (Goodell 2011) and, as a result, the opportunities needed to be created and embraced.

The papers and chapters discussed in this theme all concern collaboration in mathematics self-studies of practice. In the edited volume on self-study in mathematics (Schuck and Pereira 2011), one section of the book is devoted to collaboration in self-study with four chapters discussing this aspect of self-study (Betts 2011; Guðjónsdóttir and Kristinsdóttir 2011; Nicol 2011; Schuck 2011). Six articles on collaboration in self-study in this discipline area are published in the self-study journal, Studying Teacher Education (Bragg 2015; Leaman and Flanagan 2013: Lovin et al. 2012; McGlynn-Stewart 2010; Pereira 2005; Thomas and Monroe 2006). Another two articles on collaborations in mathematics self-study are found in the Proceedings of the Self-Study of Teacher Education Practices Conference (Kristinsdóttir 2010; Sanchez et al. 2010).

The articles and chapters can be divided into three groups, each group concerned with one of the following themes:

1. Collaboration through learning communities (Bragg 2015; Guðjónsdóttir and Kristinsdóttir 2011; Nicol 2011; Lovin et al. 2012; Leaman and Flanagan 2013; Kristinsdóttir 2010; Sanchez et al. 2010).
2. Critical friendships (McGlynn-Stewart 2010; Nicol 2011; Schuck 2011; Thomas and Monroe 2006).
3. Collaborations between teacher educators and student teachers or practicing teachers (Betts 2011; Pereira 2005).

Collaboration Through Learning Communities

Working with others in a community of learners is a well-documented way of learning collaboratively about practice (Hsu and Sharma 2008; Levine 2010; MacDonald 2008). In self-studies, teacher educators working with other teacher educators in a learning community are regarded as an important way to challenge practice, question, and reframe pedagogies and engage in discussion about how to improve practice (Bodone et al. 2004). Bodone et al. (2004) suggest that new ways of collaboration should be considered. One of the authors writing about this theme of collaboration through learning communities in mathematics education is Nicol (2011). She notes that it is useful to consider three models of collaborative self-study: a cross-disciplinary or multiparty collaborative self-study (Bodone et al. 2004), a concept-based collaborative self-study, and a critical collaborative self-study (Nicol 2011, pp. 46–47). All of these involve teacher educators working together in groups, of varying sizes. The first model includes collaborative communities who may not all be from the same discipline area, but who share a common interest in improving their practice. The second model involves mathematics teacher educators who work together to improve student learning of a particular mathematical topic. They collaboratively develop their practice, trial it in the classroom, and then return to the community to discuss and improve their practice. The final model, critical collaborative self-study, involves teacher educators working together within one class. An example of this type of collaboration is seen in the article by Leaman and Flanagan (2013). Of course, the collaboration may be a blend of these models, a hybrid collaborative space. Nicol's chapter on her collaboration fits into the latter form, as it "is located in the spaces between concept-based collaborative self-study and critical collaborative self-study research" (p. 47). The publication describes how Nicol worked with other teacher educators in a community comprising elementary and secondary level teacher educators, graduate students, and teachers, who met every 4 to 6 weeks to investigate collaboratively how to create pedagogical experiences for their PSTs to develop skills of questioning, listening, and responding, skills that Nicol suggests are central to mathematics teaching (p. 47). The potential of variation theory is examined in the chapter, that is, the offering of a phenomenon in ways that are varied to help students' gain deeper understanding of the phenomenon. Her work examines how working collaboratively, the group developed understanding of how to implement variation theory in their teaching so as to better understand

PSTs' understandings. The learning community found their collaborative work using variation theory was helpful in their design of pedagogical experiences for their students. The way that variation can support pedagogical task design is also taken up by Bragg (2015) in her study in which she varied tasks and discussed the results with colleagues. Like Nicol, she found that variation was an important concept in mathematical pedagogies and that use of variation strengthened her pedagogical designs. Her collaboration within a community allowed her to refine her teaching practices using variation.

Another form of collaboration discussed in this theme is one in which team teaching takes place. In the example above, Nicol and her learning community collaborated outside of their classrooms, but implemented their insights in their individual lessons prior to discussing what had occurred in the community. Gudjonsdottir and Kristinsdottir (2011) describe their self-study in team teaching a mathematics education course for graduate teachers. They collaboratively designed, developed, and implemented the course. In the team teaching, they took shared responsibility for the content and assessment and participated together in all lessons. The authors describe how their mutual respect and varied backgrounds allowed them to gain different perspectives of what was happening in the classroom. The trust that existed between them was emphasized as a key factor that provided an incubator for their subsequent learning. Importantly, they also ensured that the research included their teacher learners as partners in learning about practice.

Collaborations that grew out of long-standing relationships as graduate teachers are discussed by Lovin et al. (2012) and Sanchez et al. (2010). The aims for their community were largely organic, developing as they worked together in the community of practice. The initial purpose of the community was to understand the beliefs that they brought to teacher education in mathematics. However, it soon became clear that identifying important points for discussion and investigation supported their self-studies' aims to improve their practice.

The learning communities in all these publications were clearly helpful in providing opportunities for teacher educators to explore and question their beliefs and develop their practices both in specific topics and in pedagogical tasks and team teaching. The next theme considers the role of the critical friend.

Critical Friendships

Critical friendships are regarded as extremely valuable in the self-study literature. Critical friends hold a light to our practice in ways that are often difficult for us to do on our own (Russell 2002). Further, a major aim of self-study is for us to critique existing practices and to consider ways of reframing those. A critical friend is essential to execute this aim successfully (Loughran and Northfield 1996). The task of a critical friend is both to support and challenge us. This challenging of our practices can be discomforting, but it provides the impetus to reframe them. Sometimes critical friends set each other tasks to focus on particular aspects of practice; at other times, the brief is to simply share the thoughts that enter the critical friend's mind as he or she observes the practices occurring in the classroom.

Critical friends can be from the same discipline area or from different ones (see, e.g., Schuck 2011); they can be colleagues and peers (Pressick-Kilborn and Te Riele 2008), or they can be at different stages of their careers (Schuck and Russell 2005). Each of these contexts can be challenging, and it is essential that the self-study researcher and their critical friend have frank discussions about their differences and similarities and how these might facilitate or challenge the relationship.

In her chapter on critical friendship, Schuck (2011) describes her work with a colleague from a different discipline. She deliberately chose to work with a non-mathematics educator so that her complacency could be challenged by an "outsider." Schuck sought to disrupt her practices in mathematics education, which had developed over almost two decades. She felt that someone who is not a mathematics educator might challenge the assumptions that she and other mathematics educators might share. What became apparent to Schuck through this process was the impact that the reform movement in mathematics teaching had had on her teaching. Working from a base of knowledge about the obstacles experienced by student primary school teachers and steeped in the efforts to change and diminish those obstacles, Schuck felt her practice was self-explanatory. She was doing what she was doing to be true to the reform movement. However, to her critical friend, unfamiliar with the literature and discussion regarding the mathematics reform movement, these practices and their underlying assumptions needed to be made clearer, so too, for her students. The critical friendship helped her to lay bare her assumptions in her mathematics classes.

Similarly to Schuck, McGlynn-Stewart (2010) was challenged by the need to assuage student primary teachers' fears and beliefs about mathematics. Her article discusses how a critical friend helped her to do so. Her fear and struggles to become an academic teaching mathematics were mirrored in the fears and struggles of her students to become teachers of mathematics. McGlynn-Stewart learned about her practices while striving to understand her students' experiences. During this journey, she was highly disconcerted to find that her students were performing badly in a test. This damaged her confidence and she sought advice from her critical friend. The simple but powerful advice her critical friend provided helped her to improve her confidence and practice. It consisted of checking both her and her students' assumptions. McGlynn-Steward learned to check in with her students at regular intervals to lay bare both her assumptions and theirs and to discuss how to get those assumptions closer to each other. The critical incident of this test helped to show her how important a critical friend was to improving her practice.

As noted above, Nicol (2011) termed the phrase *critical collaborative self-study* (Nicol 2011, p. 47), to describe collaboration with more than one critical friend. Nicol suggests that in this model, teacher educators work collaboratively in the same classroom and act as critical friends in this process while team teaching. Finally, Thomas and Monroe (2006) used Thomas' research for a masters' degree as an opportunity to record his journey as a mathematics educator with Monroe, his research adviser, acting as his critical friend. Thomas documents his efforts to improve his practice as a mathematics teacher and notes the difficulties involved in actually finding models of good practice to help guide his efforts. His critical friend and mentor, Monroe, assisted him in reframing his practice. As Thomas notes.

"I believe that my understanding of teaching and learning can be attributed to the opportunity I have had to examine my own practice through intensive self-study with the support of a mentor" (Thomas and Monroe 2006, p. 180). Since completing the master's degree, he has become a principal who supports his teachers in much the same way he was supported by Monroe.

These publications clearly indicate the value of a critical friend for each of the authors' self-studies. They helped the author to challenge their assumptions, reframe their thinking about practice, and change their teaching of mathematics or mathematics teacher education.

Collaborations Between Teacher Educators and Student Teachers or Practicing Teachers

A different sort of collaboration from most of the ones discussed in Sections 2.4.1 and 2.4.2 is a collaboration between the teacher educator and their student teachers, who might be either PSTs or practicing teachers. Three of the publications dealing with collaboration discuss contexts in which collaboration of this sort occurs. Betts (2011) discusses his learning as a mentor in a collaborative environment with practicing teachers. He finds that the collaborative nature of his work with teachers involves some tensions and ambiguities in his mentoring. Betts identifies three different ways of mentoring based on work by Young et al. (2005). These authors identify three mentoring patterns – responsive, interactive, and directive. Betts describes how he tries to work in a space which is a balance of responsive and interactive, by asking teachers to plan the direction of their project on enhancing their mathematics teaching (the responsive aspect) and by positioning himself as a learner alongside them (the interactive aspect). However, this positioning placed him in a dilemma as teachers positioned him as the expert. Their expectations of him in this role made it difficult for him to resist being directive. Betts writes about how mentoring when striving to work collaboratively can be complex. While wishing to support teachers, he also found it necessary to be critical and to be a learner himself. These roles were not supported by the expectations and understandings of the teachers. Betts uses this experience to learn about his practice both as a mathematics educator and as a mentor and concludes that if working with teachers, educators must accept that the role will be challenging and ambiguous.

A different collaboration is seen in the one that Pereira (2005) discusses in his article. In working with PSTs and practicing teachers on changing attitudes and beliefs about mathematics and its teaching, he used autobiographies to get students to express their perspectives and emotions about learning mathematics. He used these autobiographies to guide his students to learn differently. He notes that before they can teach differently, they must learn to learn differently. However, when Pereira engaged in self-study of his practices, he noticed that seldom brought his own experiences as a learner into the discussion. He did not talk about the emotional experiences he had as a learner and teacher and yet wanted his students to do so. And so Pereira joined with his students in a collaboration to write his own biography and use this to express his emotions and perspectives. This exercise, usually done only

by his students, had the power to unlock the dilemmas and tensions he experienced as well.

Summary

The articles written about collaboration all emphasize the need to include it in self-study. Without the ability to work with others, it seems that the self-study can be confined and self-serving. The need for others to challenge the practice, yet provide a safe space to share concerns, is highlighted in most of the articles and chapters. Words such as trust, challenge, and reframe are used repeatedly. These are critical verbs in the pursuit of effective self-study.

The different types of collaboration identified by Nicol (2011) are seen in these publications. Some collaborations involve educators working with critical friends who are "outsiders" (Schuck 2011) so that they can challenge their assumptions. Others involve working with a critical friend in the same discipline area, but possibly of differing experience and seniority (Thomas and Monroe 2006). Others work in a community of learners where each supports the others (Lovin et al. 2012; Sanchez et al. 2010). But whatever the type of collaboration and irrespective of who the participants in the collaboration were, the value of the collaboration was not in doubt in any of these publications.

Theme 4: Mathematics Teacher Educator's Journey Using Self-Study of Practice

This section identifies, describes, and examines the teacher educators' mathematical journeys as they research their self-study of teaching practice in their unique learning and teaching contexts. The self-study research presented in this section reveals the ways in which mathematics teacher educators identified the ways in which their own experiences as learners of mathematics had impacted their teaching practice. Following the transition phase of teacher to teacher educator, researchers reveal the desire to move away from a traditional, transmission approach to teaching mathematics to one that addresses student needs, and collecting data related to this journey using self-study enabled the change in practice to be monitored and evaluated.

Motivations and Common Characteristics

Researching mathematical teaching through self-study and monitoring the learning and teaching journey were a key objective in five publications (5/33 total). The five publications are indicative of the focus of each of the self-studies, and titles include *Being and Becoming a Maths Teacher Educator, How did we do?, Self-study of a teachers' journey,* and *Becoming a Teacher Educator.* The dominant motivation expressed in each of these self-studies was to improve practice and their students' practice, with the hope that the new knowledge and understandings would also be informative for other mathematics teacher educators and contribute more broadly to mathematics reform.

Researchers of these self-studies were motivated by modifying, refining, or recreating a mathematics course or curriculum and, in the majority of cases, identified important research goals and questions. In essence, a "meaning-based" approach to mathematics pedagogy was the objective so that mathematics would be made meaningful. The identified goals and questions included: "How have differing locations and cultural contexts influenced my understandings of being and becoming a mathematics teacher?" (Monroe 2013); "Why are so many students not getting it [mathematics sense making and understanding?" (Thomas and Monroe 2006); "What can I learn about mathematics teacher education and about myself as a teacher educator through self-study of my transition to teacher educator" and "How can inquiry frame a mathematics methods course for pre-service elementary teachers?" (Marin 2014); and "What can be learned about teaching for understanding through reflecting on critical incidents?" and "How do pre-service teachers' beliefs about teaching mathematics, as expressed through their written personal philosophies of teaching evolve?" (Goodell 2011, p. 113).

A dominant narrative was the transition into mathematics teacher education with extensive teaching experience and knowledge of teaching and teacher education and introduced by way of a narrative describing the prompt and/or the research context. An example described by Monroe included the narrative of clearing of an attic, revealing "mounds of data" with the question posed "where should I pick up the fabric of my practice as an entry for self-study?" (Monroe 2013, p. 97). Self-study of practice became a vehicle to monitor a transition from the way the author was taught to new ways of teaching and in some cases move away from a focus on a didactic, transmission approach based on rote learning to one that was inquiry-focused, student-driven with the "promotion of understanding" (Monroe 2013, p. 98) and curiosity. As Thomas and Monroe (2006) suggest, "I had to change my role as teacher by 180 degrees, from a dispenser of knowledge to a facilitator of student learning" (p. 173). In this way self-study acted as a disruptor and enabled mathematics teacher educators to examine practices, gather data, and measure outcomes related to teacher and student learning. The successful strategies included providing worthwhile tasks and appropriate interactions based on discussion, discourse, and questioning.

Self-Learning and Professional Development

To establish learning environments that encourage understanding and mathematical sense making, teacher educators must know their content, be responsive to educational and cultural contexts, and be prepared to extend their own professional development. A frequent recognition and acknowledgment was the desire to know more; to seek further information, skills, approaches, and strategies; and to participate in self-development courses and experiences. An important factor was the initial identification of the problem and the ways in which it could be solved. Researchers expressed doubts about their own competence and raised identified vulnerabilities –"I continued to have strong doubts about my effectiveness in teaching mathematics" (Thomas and Monroe 2006, p. 172). Similarly, Monroe (2013) highlights a salient example whereby she states that she suffered a crisis of

professional confidence when required to teach native students in Montana suggesting, "I wondered what I had to offer in the form of professional development in mathematics." She then researched the available literature and sought out new knowledge, insights, and frameworks. Much of self-study research demands further learning and self-development. It is through this further research that practices, learning styles, culturally appropriate programs, and environmental conditions that support resiliency can be adapted and modified according to the cultural context (Monroe 2013, p. 103).

A central aspect identified in the transition from teacher to teacher educator was the imperative role that self-study research played as a means to uncover and "work through tensions" that were experienced throughout the process (Marin 2014, p. 27). Teacher educator researchers, using self-study, identified the tensions that revealed the sometimes deep and disturbing questions that had previously failed to surface, especially during times of transition for one context to another. It was the structured, focused research that enabled the responses to be addressed and in doing so, inform understandings and practices.

The Mathematics Self-Study Journey: Challenges

The self-study mathematics journey provided numerous challenges, and more often than not, these challenges underpinned key new learning. Researchers implemented changes to curriculum and courses following considered research, and yet the anticipated success did not always ensue. As Goodell (2011) reveals, for example, even with structured and weekly classroom discussions, the impact on pre-service teachers' philosophies and beliefs is minimal, and this limited impact is influenced even more if mentors and teachers also held traditional views about mathematics pedagogy and philosophy. The data indicated that for reform to be successful and integrated in mathematics education then it will be incremental, challenging and must be multifaceted. As Monroe states, "the pace of change" must be noted, and there is the need to "celebrate small steps" in an often "conservative quagmire" (Monroe 2013, p. 101). The distinction between changing practice and improving practice was identified and examined. Implementing change on a permanent basis is more difficult than improving practice as it demands a change in one's paradigmatic assumptions (Brookfield 1995) whereby assumptions represent "who we are," and it is the paradigmatic assumptions that are the hardest to uncover as they are the "basic axioms we use to order the world into fundamental categories" and are "examined critically only after a great resistance to doing so, and it takes a considerable amount of contrary evidence and disconfirming experience to change them" (p. 3).

While reflective practice through self-study research was viewed as critical, it was also noted that effective reflective practice in mathematics education was more difficult than anticipated. While it was acknowledged that reflective practice and reflective writing enabled the researcher to "remember fragments of experience . . .through the lens of self-study [to help] confirm the trustworthiness of experience of . . . earlier experience" (Monroe 2013, p. 101), it was also described as a task that many pre-service teachers and teacher educators are unable and/or unwilling to do.

Reform-Based Learning Environments Need to Be Time-Generous

Mathematics teacher educators identified the impact of time on overall learning and stated that within an often crowded curriculum, to be "time-generous" was a luxury to be focused on and aimed for. As Thomas and Monroe (2006) state, "I presented mathematics to students at an incomprehensibly fast rate – a two page spread every day, whether or not the students understood" (p. 170). The realization that completing exercises in the textbook might be one measure of achievement and the knowledge that students did not always understand and make sense of the concepts were confronting.

A central learning identified within the learning journeys was the insight that for deep learning to take place, and mathematical sense to be made, teacher educators needed to slow down, take time, and share stories with others and through being "Time-generous yet focused in encouraging mathematics discourse, elements of a cultural discourse pattern [could be] honored while learning was enhanced" (Monroe 2013, p. 105).

Summary

A conclusion that is identified in each of the self-study research publications is the importance of the journey (rather than the destination) and the ongoing commitment to further study practice and challenge beliefs. In this sense, mathematics teacher educators are constantly in the process of becoming. "This journey continues to feature cycles of reflection and growth, and along the way I have discovered that the destination is not really an end at all, but rather a series of new steps to help me to continue to learn and grow as a teacher" (Thomas and Monroe 2006, p. 179). Each highlights the nonlinear journey, the "messiness," the ongoing need to refine and adapt, and the range of tensions that mathematics teacher educators constantly struggled with, including their own identity and the often lack of shared goals and objectives. As Marin (2014) suggests, as a result of her learning journey, "Self-study was a powerful experience for me … Today, the exploration of one's own practice is not commonplace in higher education. This self-study suggests to me that reflection, inquiry and self-study of teaching practices should be the norm, not the exception, in schools of education" (p. 33).

A number of studies referred to LaBoskey's (2004) characteristics of self-study that included all or a number of the following: self-initiated and self-focused, improvement aimed, multiple (and primarily qualitative) methods of data gathering, interactive at various stages of the self-study process as a means of assessing the trustworthiness of the data, and the public sharing of new learning to assist other teacher educators. Interactivity was most often represented by connecting with the teacher educator researcher's peers and colleagues.

Implications and Insights About Mathematics Teacher Education from the Self-Studies

This section considers the gaps and silences in the mathematics teacher education self-study literature. It then discusses the general principles that appeared to be common to most of the studies and concludes with an analysis of the major points and the significance of this self-study literature.

Gaps and Silences

How could the learning presented in the mathematics self-study of practice be adopted and appropriated by others in the broader mathematics education community and how could the findings subsequently be transferred into various contexts? A principal aim therefore is to respond to the question, *How can I use this study's findings to improve my practice?* (Loughran 2006).

In this section, we differentiate between gaps and silences and consider what topics fit into these two areas. When noting "gaps" in the literature, we mean that there is little or no research in the area, and this provides guidance for recommendations for future research. When discussing "silences," we are suggesting that some topics in the literature are articulated from particular viewpoints and do not seem to consider certain aspects or characteristics that a reader would expect to see in the discussion.

We first deal with the gaps in the literature. In reviewing the articles in this chapter, we categorized them into different themes. However, some themes that concern important educational topics were not present in this literature. The areas of pedagogical content knowledge (PCK) and mathematical knowledge for teaching (MKT), while regarded as important topics in the general mathematics education literature, were only discussed by two of the self-study authors, Pereira (2011) and Betts (2011) (Pereira and Betts). Given the centrality of these concepts in teaching mathematics, this omission was surprising. Future self-study work should focus on these constructs and ways in which teacher educators might focus on both developing these constructs with their student teachers and studying their own MKT.

Another topic which did not feature at all in the literature examined was that of early childhood. This leads to a question about preparation of early childhood teachers. Who is charged with supporting such teachers and are they getting support in mathematics education? If so, are these teacher educators engaged in self-study and improvement of practice?

In this era of technology-enhanced learning, it was surprising to note that none of the authors embarked on self-studies of the use of technologies in their mathematics teaching. Again, this raises the question of whether teacher educators are using technology in their teaching but not conducting self-studies on this topic or whether they are not engaged in technology use in mathematics teacher education. Either way, this is an important topic, and future research should investigate practices in technology-enhanced mathematics teacher education.

Assessment is one of the topics that many student teachers are concerned about. They often struggle with assessing in authentic ways and with using assessment to guide further teaching. So teacher educators have a clear duty to support their students in this area. However, none of the studies we identified discussed self-study in the area of assessment in mathematics education.

We note too that most of the self-studies in mathematics education appear to be quite narrow in focus, focusing on improvement in practice but not giving much consideration to notions of gender, race, and class that might be part of the teaching and learning of mathematics. Given the importance of these constructs, this is perhaps surprising.

The final topic in which there was no literature concerned ethics in teaching. While this is unlikely to be a topic on which teacher educators will focus in a context-free way, there was no mention of concerns about ethical teaching in any of the self-studies. We suggested that ethical teaching is added to the set of principles underpinning self-studies.

We now move on to the question of silences: particular aspects of the literature that appear to be important parts of the topic but do not get mentioned in research. We focus on one such silence: the impact of self-studies. While all the publications discussed ways of improving practice, they were all focused on the authors' quests to improve their own practice, but few publications considered the wider impact of the self-study and its contribution to knowledge about teaching. The challenge in self-study is to broaden its impact. Every self-study should include discussions on how the author's learning could be adopted and appropriated by others in the mathematics education community. They should all include questions about how the findings can be transferred to other studies. And from the reader's viewpoint, we should aim to raise the question: How can I use this study's findings to improve my practice? (a reference to Loughran's (2006) challenge to teacher educators to enact different practice).

General Principles Underpinning the Studies

As noted above, all the studies centered on the process of challenging and reframing teacher education practice. Some of the other principles of these self-studies are listed below:

– Most studies noted the importance of collaboration.
– All studies exhibited Barnes' (1998) three characteristics of self-study: openness, collaboration, and reframing.
– All studies exhibited a certain vulnerability and readiness to lay oneself open for critique.
– Critical friendships often played an important role in the self-study.
– The ultimate aim in all studies was to enhance student teachers' learning and teaching of maths.

The studies exhibited a range of ways in which data were collected. Findings were data driven, and most studies were qualitative in approach. It is likely that the themes used (challenging beliefs, pedagogical approaches, collaboration, the journey) would probably be similar in other self-studies, irrespective of discipline area. There were no particular mathematical themes that arose in the studies, and in fact, the mathematics themes were secondary and, in some cases, almost invisible.

Some observations arising from the above points concern the type of methodology used. As noted, this was generally qualitative and often anecdotal. This suggests, perhaps, that there is a need to vary and broaden the research methodologies to include quantitative methodologies or mixed methods. This

variation in methodologies might enhance the rigor of the research in mathematics education self-studies and also help to broaden the scope.

Another way to strengthen the studies could be by leveraging the value of critical friendships. Perhaps critical friends could have complementary research skills – this would strengthen the impact and reach of the studies. Teacher educators should consider inviting colleagues with complementary methodological skills to join in their self-studies.

There is also a need to broaden the literature used in self-studies, and here, we look to editors of self-study publications. While in the past, the emphasis has been on highlighting other self-studies in literature reviews, we believe the field is now sufficiently mature to open to a broader literature. This avoids risks of being insular and expands horizons. It increases the value and significance by being of value to a greater audience.

Significance of the Studies

The synthesis of studies has provided insights into the nature of self-study research that has been conducted in the area of mathematics teacher education and has discussed the outcomes and the impact of these self-studies. The review identified what can be learned from these studies.

We also note the value and contribution to the field of producing edited volumes in the area. The 2011 edited book (Schuck and Pereira 2011) boosted the self-studies in area of mathematics education and was a stimulus for research in maths education. So it was a powerful product.

Finally, we note that there are few studies on self-study of teacher education practice in mathematics education. We raise the question of why that is so? While it is true that self-studies focus on practice rather than on disciplines, disciplines are a central part of any research focus on practice.

Conclusions and Recommendations

We conclude by recommending the following research agenda in self-study of mathematics teacher education that is suggested by the gaps in the above literature together with the findings of the studies:

– Expand the nature of methodologies used.
– Address the gaps and silences that were not addressed.
– Drill deeper into the mathematical content so that PCK is highlighted.
– Invite colleagues from broader mathematical disciplines to join the self-study.

Self-study in mathematics education is included in the Handbook for the first time in this edition. It is timely as there is much emphasis on increasing engagement and uptake in mathematics at school. An emphasis on how best to prepare student

teachers in this area is therefore critical. Analysis of self-studies that are striving to do just that helps to identify the critical points for improving practice. It also allows future directions to be informed by what has been done.

S-STEP in Physical Education Teacher Education

30

Tim Fletcher and Alan Ovens

Contents

Abstract

In this chapter we review the literature on S-STEP in physical education teacher education (PETE) and its related fields, such as coach education. The review consisted of 43 materials, which were allocated to one of three major themes: becoming a teacher educator, pedagogies of teacher education (such as

problematizing PETE practice, pedagogical innovations in PETE), and teachers studying their practices in schools. Despite a relatively slow uptake of S-STEP methodology in physical education teacher education (PETE), there is a growing presence of S-STEP research in the field. The research reviewed showed how PETE researchers have drawn from and built upon insights generated by S-STEP researchers conducting their work in other subject areas, such as science and literacy. Several themes in the PETE literature suggest that this work can contribute to a broader understanding of the complex and problematic nature of teacher education practice and thus help solidify and enrich the base of knowledge about teaching teachers. Although there are several promising avenues pursued by PETE researchers, we identify several areas ripe for investigation in the future.

Introduction

The field of physical education teacher education (PETE) has been quite slow to take up self-study of teacher education practice (S-STEP) as a rigorous form of practitioner research. Prior to the mid-2000s, examples of self-study in physical education and youth sport settings tended to reflect institutional evaluations, where the self was framed as an institution (e.g., a specific program) rather than an individual. The work of Metzler and colleagues at Georgia State University (GSU) (Metzler and Blankenship 2000, 2008) represents this type of approach. Their work offered a deep and rigorous examination of the PETE program at GSU, considering the overall program foci, the outcomes for teacher candidates, and the ways in which the many layers of their teacher education program were assessed. While this type of self-study research is valuable and makes important contributions to the literature, it is distinct from the approach to self-study of practice taken in this book where the inquiry gives voice to the individuals working with learners and who have an intimate knowledge of the practices they are engaged in. The self-directed and self-initiated nature of S-STEP is one of its hallmarks, and we focus specifically on these inquiries in the chapter. Other examples could also be found of physical education teacher educators conducting S-STEP research (e.g., Brubaker and Ovens 2012; Hopper and Sanford 2004; Kosnik et al. 2011; Garbett and Ovens 2012); however, their focus was on teacher education in a broad sense rather than on PETE. This is not to identify this focus as a limitation, but the large target audience for that work meant that many of its main points did not reach PE teacher educators or identify outcomes for those working in PETE.

Despite the presence of S-STEP in the broader field of educational research since the mid-1990s, it was not until after 2010 that there appeared more than an isolated example of how physical education teachers (PE teachers) and teacher educators were using S-STEP to engage in systematic inquiry into their practice. Since that

time, there have been two edited collections of S-STEP work in PETE, including empirical pieces and conceptual commentaries (Ovens and Fletcher 2014a, 2015). Of note, leading PETE researchers Mary O'Sullivan (2014) and Richard Tinning (2014) identified the promise of S-STEP to further the research and practice agendas of PETE, particularly concerning how to educate teachers for the realities of contemporary schools. Specifically, O'Sullivan (2014) noted:

> PETE research is not developing at a pace to match the challenges faced by teacher educators in school or in higher education institutions in helping the next generation of teachers learn to teach or in supporting and facilitating them as lifelong learners. (p. 169)

She went on to identify S-STEP as providing a way "to encourage a greater focus on PETE research and the preparation of physical education teacher educators in an increasingly complex and challenging educational environment" (p. 169). Importantly, O'Sullivan (2014) commented on the value of S-STEP at a time when research in PETE was in a state of decline in the overall field.

Following the initial edited collections published in 2014–2015 and strong advocacy by senior leaders in PETE, there has been a sustained and growing presence of S-STEP in the PETE literature. In particular, S-STEP has been identified as a powerful form of professional learning for PE teachers and teacher educators that carry the potential for the processes and outcomes of that learning to be shared, debated, and critiqued (Attard 2014). It comes at an opportune moment then to conduct a thorough review and analysis of the use of S-STEP in PETE, to understand the current "state of the art" (Vanassche and Kelchtermans 2015). We extend this review into PETE-related fields, such as outdoor/adventure education and sport coaching. The reason for this is there are common threads in some of the content and many of the pedagogies used across these fields. Although there are differences between physical education, outdoor education, and sport, there is substantial overlap in their research, practice, and policy orientations (Cassidy et al. 2008). For example, several key journals in the field (such as *physical education and sport pedagogy*) include work in physical education, outdoor education, and sport coaching.

The chapter has three main sections. In the first section of this chapter, we identify some traditions in PETE that may signal early advocacy of and for the *idea* of S-STEP, such as the promotion of inquiry-oriented forms of teacher education and advocacy for action research and reflective teaching (e.g., Kirk 1986; Tinning 1987). In the second section, we provide a traditional literature review, analyzing 43 pieces of PETE research where S-STEP was used. We conclude the chapter by considering potential futures for S-STEP in PETE and related fields.

Traditions of Self-Focused Research in PETE

While the genealogy of S-STEP methodology should be mapped back to the work of teacher educators in the early 1990s, the conditions that enabled it to become adopted by PE researchers in the past decade can be traced back to the fervent

debates shaping PETE that stretch back to the early 1980s. In brief, through the 1960s and 1970s, there was a move to research, organize, and expand the knowledge base of the field of physical education and sport into a number of subdisciplines, such as the sociology of sport, exercise physiology, biomechanics, and sport/exercise psychology. While such development broadened the field and its associated knowledge base, there were also rising concerns that such developments privileged empirical-analytic forms of research (research based a "technical" interest in manipulation and control) and marginalized critical social science (based on an emancipatory interest related to political and moral ends) (McKay et al. 1990). In particular, there was a growing critique from those more closely aligned with humanistic and socio-critical orientations regarding the overly technocratic and one-dimensional definitions of the body, movement, professional practice, and effective teaching (e.g., Kirk 1986; Lawson 1984; McKay et al. 1990). These concerns led PE researchers to challenge the orthodoxy of research practices based on the natural science approach (for more detail on these debates and concerns, we recommend the excellent papers by Carr (1985), Hellison (1988), Kirk (1989), Schempp (1987), Siedentop (1987, 1989), and Sparkes (1989, 1991, 1993)).

In this early work, scholars critiqued the assumptions, ideas, and practices associated with a positivistic logic that framed much of the conventional research in PE and sport at the time. In brief (and in a way that is possibly over simplified), those following positivistic paradigms believed that teaching was governed by a set of laws or natural rules that could be distilled through research and then be learnt, practiced, and mastered through teacher education. The critique of positivistic approaches to research in the field has continued with the growing influence of gender and cultural studies, as well as the contribution from poststructuralism and postmodernism. As a result, there has been an increased awareness and discussion of the ways culture, language, subjectivity, politics, ideology, power, and narrative, all, in complex ways, permeate research activity and mediate the processes of learning to teach (e.g., Bain 1995; Faulkner and Finlay 2002; Fernandez-Balboa 1997; Kerry and Armour 2000; Nilges 2001; Sparkes 1993, 1995, 2002).

In terms of research practice, the debates in the 1980s also focused on principles for conducting inquiry (i.e., in a participatory, democratic, and empowering manner) and an awareness of how knowledge is mediated by power relations, unable to be separated from values and embedded in context (Carr and Kemmis 1986; Carspecken 1996). Such debates also led to a growing advocacy for a politically aware, inquiry-oriented approach to PETE (Kirk 1986; Tinning 1985) that could transcend the perceived inadequacies of other models of teacher education and also enable a critical pedagogy capable of connecting teaching with its ethical, political, and moral roots. An example of this critique is provided by Tinning (1993):

> . . . research methods or pedagogies which do not problematise (at least) the dominant power relations in educational research and in teacher education; which give no voice to some participants; which do not attempt to understand participant subjectivities; which do not consider the institutional structures impacting on the cultural practices of teacher education

and schooling; and which fail to negotiate a curriculum or research agenda which is relevant and meaningful to all participants are, in my view, inconsistent with the assumptions underpinning the social reconstructivist project. (pp. 23–24)

Such advocacy, particularly when it was framed within an inquiry-oriented conception of teacher education (Kirk 1986), led to two specific philosophical developments in PETE. The first was the active promotion of reflective teaching. In reflective teaching, the individual supposedly reflects on lived experience and then interprets and generalizes this experience to develop understanding and meaning from the events that have happened. The development of reflective teachers through PETE became a significant focus, with a range of books promoting reflection (e.g., Hellison and Templin 1991), research projects on how best to develop reflective teachers (e.g., Placek and Smyth 1995; Tsangaridou and O'Sullivan 1995), and even a conference where the central question of the conference charter was "How can we train [PE] teachers to be reflective teachers?" (Paré 1995). The optimism shared in the value of reflection was built on the work of a range of scholars stretching back to John Dewey and the pragmatist's belief in the centrality of experience to learning. In particular, the work of Donald Schön (1983) offered an alternative to propositional or scientific constructions of knowledge that had traditionally been associated with the professions and added an intellectual gravitas to the concept of reflective practice.

However, while there has been broad interest in reflection, there was also much contention and unpredictability in the results of encouraging reflective activity. There were questions about how, when, where, and why reflection should take place. For example, O'Sullivan et al. (1992) argued that PE teachers were essentially pragmatists, which led to reflection becoming an individualistic process that lacked any understanding or appreciation of the wider social and structural influences on schooling and teaching. Similarly, Ovens and Tinning (2009) argued that reflection is a practice that is enacted rather than acquired and highly dependent on the culture and community one is situated in. As a consequence, while the core tenets of reflection – that it recognizes the practitioner as the historian of their own lived experience and that it provides the means for practitioners to subject their actions to critique, challenge, and transformation – form a core component of the work of many in PETE, self-study methodology provides a means through which these tenets may be enacted in a structured and rigorous way (Ovens and Fletcher 2014b).

The second major development was action research. For those working in PETE, action research was seen as an methodology that was led by individuals committed to addressing issues and problems emerging from their own practice (Kirk 1986). In particular, those working within a critical social science orientation saw action research as centrally concerned with the concept of emancipation and the ability for the practitioner to participate in setting the research agenda and transforming the material and ideological conditions which constrain practice (Tinning 1992). However, as pointed out by Tinning (1992), when action research has been used in

PETE, it has often been misunderstood and misdirected. He argues that the episte-mological assumptions underpinning various forms of action research have led to varying interpretations on how action research is actually enacted in practice with teachers. Similarly, Casey et al. (2018) suggest that one of the major criticisms of the action research project is that educational administrators rather than the teachers themselves often dictate its focus. For example, school administrators might say "teachers will conduct their action research projects on assessment this year" despite teachers themselves identifying other more pressing issues based on their needs and those of their students. This does not mean it is unnecessary to improve the technical skills of teaching. Rather, Tinning (1992) cautioned that the emphasis on the technical skills of teaching needed to be recognized as symptomatic of the widespread acceptance of technocratic rationality as the dominant logic of profes-sional practice within physical education (see Bain 1990). For those enacting action research within an inquiry-oriented approach, action research needs to be underpinned by a commitment to emancipation and empowering the practitioner researcher to critique and transform the material and ideological conditions that constrain their attempts to change educational practice (Tinning 1987). The premise that action research aims to improve educational practice through the active partic-ipation of educators in dialogue aligns closely with the characteristics of self-study (self-focused, improvement-aimed, dialogic, and interactive). Further, both are used to create an understanding of practice and to identify the strategic actions that may transform those practices.

While concepts like inquiry-oriented teacher education, action research, reflective thinking, social consciousness, and a disposition for social justice in PETE have been closely linked with the desire to engender critical citizenship, there have also been concerns raised about the inability to render such an orientation in effective pedagogical practice (Ovens 2016). In other words, as Tinning (2002) points out, there has been a long history of advocating for these ideas but few examples of how to effectively enact them in practice. In this respect, this may be why S-STEP methodology holds some promise for the PE teacher educator since the ideas central to practice would be submitted to critical self-inquiry and critique of the claims being made. S-STEP embraces a reflective disposition to the self-practice relationship and to systematically pursuing inquiry with a critical edge and a certain openness to public disclosure and the generation of debate. Mindful of his earlier critiques of action research, Tinning (2014) made the following confession upon learning about S-STEP in PETE:

> Personally, I have found my engagement with self-study both illuminating and refreshing. It took me back to the agenda of my action research 'days', but it also took me beyond those days by providing me with new insights into better apprehending the complex nature of how to better enact a critical pedagogy of teacher education. (p. 164)

With this historical background of the roots and traditions of S-STEP in PETE laid out, in the following sections, we review examples of empirical self-studies carried out by researchers in PE.

Review of the Literature: S-STEP in PETE

In this section of the chapter, we provide the results of a systematic review of S-STEP in PETE and several closely related fields. The main questions driving our review are: How has S-STEP been used in the fields of PETE, outdoor/adventure education, and sport coaching? How has S-STEP contributed to and advanced knowledge in those fields?

Five databases were used in our initial search: SPORTDiscus, Education Source, Web of Science Complete, ERIC, and Google Scholar. Our search was limited to empirical (data-based research) pieces written in English. Because many S-STEP examples are published in edited books and conference proceedings (e.g., those from the Castle conference), we included those types of sources in addition to peer-reviewed journal articles. Where there were instances of a chapter or conference paper being expanded into a peer-reviewed journal article (which may have thus involved some repetition or replication), we analyzed the peer-reviewed article only. While we recognize the significant and rich body of advocacy pieces or conceptual research exploring S-STEP in PETE (see, e.g., Brown 2011; O'Sullivan 2014; Ovens and Fletcher 2014b; Tinning 2014), our main focus was to synthesize the empirical evidence currently available to support the philosophical and conceptual arguments proposed put forth. This enables us to make conclusions about what has been done and what has yet to be done in the field. While we may make reference to conceptual pieces from time to time, those pieces were not subject to analysis. The temporal scope of the review was 1998–2017. We chose 1998 as the lower boundary because of the edited publication *Reconceptualizing teaching practice: Self-study in teacher education* by Hamilton (1998), which represented one of the earliest collections of S-STEP-focused research that aligned with the view of S-STEP we adopt here.

Our first set of search terms was straightforward: "self-study," "physical education," and "health and physical education." Following a preliminary scan of the results, we arrived at the following results from each database: SPORTDiscus (18 potential matches from 143 results); Education Source (26 potential matches from 349 results); Web of Science Complete (20 potential matches from 39 results), ERIC (23 potential matches from 25 results), and Google Scholar (41 potential matches from 258 results). We scanned and compared the results of the 5 databases to arrive at an initial pool of 40 sources. We realized that the search terms may have been too narrow to include S-STEP research conducted in outdoor education and sports coaching, so we repeated the search replacing "physical education" with "outdoor education" and "coaching," respectively. These searches revealed some new results; however, on closer inspection, the term "coaching" was used in a different context, primarily to refer to instructional or executive coaching (e.g., Drake 2016; Loughran and Brubaker 2015). Thus, no new results were added to our original search. Because many of the original results did not include book chapters, proceedings from the Castle conference, or examples we were personally familiar with, in the second stage of the review, we conducted manual searches of edited S-STEP collections from the Springer series *Self-study of teaching and teacher education*

practice, Castle conference proceedings, and other selected sources. This search yielded 23 additional matches. The entire process yielded 63 sources that met our initial inclusion criteria. Analysis of those sources led to the identification of several outliers and sources that may have alluded to self-study without it being used in the research design. Thus, 43 studies were included in the final review.

The major findings of the 43 sources were coded, compared, and compiled into a preliminary framework with categories organized around common themes that were prevalent in the reviewed literature and which reflected work that has been done more broadly in research on teacher education practice. Our initial categories were at various times expanded, collapsed, and modified throughout the review. The final three categories that frame the structure of the review are becoming a teacher educator; pedagogies of teacher education (e.g., problematizing PETE practice; pedagogical innovations in PETE); and teachers studying their practices in schools. Our approach to organizing the chapter can be considered as one way to view or analyze the S-STEP in PETE literature. At the same time, we acknowledge that the themes we have generated are not necessarily separate or distinct entities; that is, there may be some overlap where some studies reviewed met criteria that represented multiple themes. In these instances, we independently identified what we felt was the strongest thematic fit and offered a more coherent reading of patterns and chains of inquiry identified in the category.

Becoming a Teacher Educator

Adding to a solid base of research on the experiences of those who are continually in the process of "becoming" a teacher educator (see a review by Williams et al. 2012), several members of the PETE community have similarly followed this line of inquiry using S-STEP methodology (Baker 2015; Casey and Fletcher 2012, 2017; Fletcher et al. 2012; Fletcher and Casey 2014; MacPhail 2011, 2014; Ovens 2016; Richards and Ressler 2016; Tannehill 2016). What serves as a dominant feature of PETE research of this nature is the use of occupational socialization as the theoretical framework guiding the S-STEP inquiries and their analyses. Broadly speaking, occupational socialization theory highlights the ways teacher educators' personal and career paths are merged, shaping their biographies and influencing their beliefs and actions related to teacher education practice (McEvoy et al. 2015). Prior to the development and more widespread uptake of S-STEP in PETE, there were several early examples of this type of work that provided insights into the organizational socialization of women who were taking up PETE positions in higher education (Dodds 2005; Williamson 1993). For example, Williamson (1993) studied five female faculty members who were taking their first positions as PE teacher educators in research-oriented universities in the United States, focusing on how they learn their role and understand the expectations associated with it. Dodds (2005) focused more closely on mentoring experienced by women during their careers, particularly in the early stages. While both of these studies were important in drawing attention to

the transitional experiences of teacher educators in PE, their work looked at all aspects of a faculty member's work: research, teaching, and service. Although not explicitly using S-STEP methodology, Williamson (1993) and Dodds (2005) included some elements of S-STEP and other related forms of practitioner inquiry (e.g., multiple qualitative methods and interactivity) but lacked the focus on the improvement of teacher education practice and the development of pedagogies of PETE that S-STEP is geared toward. It is within this gap that several PETE researchers such as MacPhail (2011), Casey and Fletcher (2012), Fletcher and Casey (2014), and Richards and Ressler (2016) have explicitly situated their S-STEP work, examining their experiences of "becoming" teacher educators.

Teachers to Teacher Educators

One of the key foci of this body of work in the broader S-STEP literature has been the challenges of unpacking successful school teaching practices and identifying central features of developing a pedagogy of teacher education. The self-studies of Casey and Fletcher (2012) and Fletcher and Casey (2014) support the general position that effective pedagogies in school and higher education are distinct. While one can inform the other, they are not interchangeable. In both studies the authors used data from reflective journals that were focused on their experiences and the struggles they faced in understanding their practices as they made the transition from PE teachers to teacher educators. One of the authors, Ashley Casey, had been widely recognized for his innovative approaches to secondary PE teaching, advocating for and expressing the ways a model-based approach (Casey 2014; Metzler 2011) offered a means to radical and sustained curricular change in PE. However, in Casey and Fletcher (2012) and Fletcher and Casey (2014), he described the frustration and uncertainty he faced in attempting to enact these practices in the university setting. Some reasons for this included the difficulty in articulating the decisions behind his teaching *while he was teaching* and the mostly conservative pedagogical culture of the university in which he worked. In contrast, the other author, Tim Fletcher, came to realize the ineffectiveness of his school teaching practice, which he described as traditional and teacher-centered (Fletcher 2012) and which Lortie (1975) or Lawson (1983) would suggest represents a conservative or "custodial" orientation to teaching. In his transition to teacher educator, he tried to begin from a clean slate, committing to a student-centered approach embedded more explicitly in the contexts of learning to teach. His confusion in becoming a teacher educator came from enacting innovative PE practices in the higher education setting with adults, without experiencing what the practices were like when working with young people in schools. When innovative PE practices have not been tried or tested by the teacher educator in the realities of contemporary schools, this may influence a more idealized perspective of teaching practices (Fletcher and Casey 2014). In these studies, occupational socialization theory and S-STEP methodology helped show how the implicit and explicit organizational culture of teacher education programs could

either promote or stifle innovative teacher education practices, particularly in the ways in which new teacher educators are provided with opportunities to learn about innovative approaches to the pedagogies of teacher education.

Taken together, Casey and Fletcher's use of S-STEP methodology allowed them to offer the insights they gained from their experiences as a foundational but provisional exemplar for others making the transition into the role of PE teacher educator. A limitation of this work is the lack of focus on the identities of the teacher educators. Although the identities of participants are embedded in occupational socialization theory, other theories of self and identity (e.g., Bourdieu 1990; Jenkins 2014) could offer new and important insights into the same data sets, to help interrogate the ways a new professional label (teacher to teacher educator) shapes the experiences and practices of practitioners (see, e.g., Ovens et al. 2016). Their work has been built upon by others in PETE, particularly by some who are advocating for greater attention to be paid to the work of PE teacher educators and those who may be identified as early career teacher educators (Alfrey et al. 2017; Hordvik et al. 2017; McEvoy et al. 2015; Richards and Ressler 2016).

Researchers to Teacher Educators

There are several other examples from the PETE literature that veer from much of the broader body of work concerning the transition to teacher educator (MacPhail 2011, 2014; Richards and Ressler 2016, 2017). Specifically, new insights have been offered into the experiences of some who were becoming teacher educators because they had *not* had previous experiences as school PE teachers; that is, they were making the transition from doctoral student and/or researcher to teacher educator. For example, MacPhail (2011, 2014) described how the processes of organizational socialization during her induction into PE in higher education led to an explicit understanding that a higher value was placed on research over teaching in the organizational culture in which she worked. MacPhail (2011) suggested that those who made the hiring decisions at her first institution assumed that her strong research background as a doctoral student (and research associate) qualified her to be a successful teacher of teachers, despite having little experience teaching PE in schools nor having any preparation or professional education about how to teach at a university. MacPhail (2011, 2014) used S-STEP and situated learning theory (Lave and Wenger 1991) to explain how the lack of experience and professional preparation, in addition to the lack of value given to teaching at her university, led her to feel isolated, underprepared, and disconnected from authentic and meaningful PETE practices. Upon moving to a different institution where teaching teachers and the development of pedagogies of teacher education was given greater value and emphasis, she participated in specific professional learning experiences geared toward exploring teaching teachers. In particular, her involvement in a community of practice that had as one defined goal the improvement of PE teacher education practice led her to consider and articulate the ways in which she could better meet her students' needs. A key insight from this research was that even

in a research-intensive university culture (which was the case in both institutions where MacPhail worked), teacher educators and their work could still be given priority and emphasis, particularly when it was geared toward providing students with high quality and meaningful experiences of learning how to teach. Further, MacPhail's novel use of situated learning and communities of practice theories offered a new lens to the study of the transition to PE teacher educator.

Richards and Ressler (2016, 2017) similarly used S-STEP to help one of the authors, Kevin Richards, consider his identities, and improve his practices as a teacher educator who did not have K-12 teaching experience prior to being offered a 1-year role as a visiting assistant professor in the United States. Guided by occupational socialization and role theories, the authors generated data in reflective journal entries and recorded their conversations as critical friends, as well as interviewing Richards's students in focus groups and collecting exit slip data. Their research is a particularly strong exemplar for S-STEP researchers considering research design that aligns with LaBoskey's (2004) elements for quality S-STEP designs, leading them to make several pedagogical and methodological insights from their work. Another aspect of this work that makes it particularly strong is the way in which the authors' honesty and vulnerability are made clear to readers. For example, due to his lack of PE teaching experience in schools, Richards struggled with a feeling of "imposter syndrome" in terms of his identity and practice as a teacher educator. This stands in contrast to many new faculty members who struggle to reconcile an identity as a researcher, despite almost all having at least 3–4 years of experience conducting doctoral research. These feelings had implications for how Richards made plans and justified decisions about the PETE course with both his students and colleagues. Importantly, the attention paid to the self-in-practice revealed insights beyond the practices themselves, highlighting the intrapersonal and emotional tensions experienced by new teacher educators and how these shape and guide their work.

Richards and Ressler's (2016) work also offers important methodological lessons, particularly from the perspective of engaging in critical friendship. Specifically, they note the challenges new faculty members can face in identifying a suitable critical friend when that person may be a colleague who can inform discussions and decisions about the new teacher educator's career advancement. It is worth quoting Richards and Ressler (2016, p. 293) at length to emphasize the lessons they learned about being intentional in selecting critical friends in S-STEP research:

> . . . [It is important to have] a critical friend who can be trusted with your insecurities and failures can help you to uncover elements of your practices that you may not see on your own. This relationship must involve mutual vulnerability and the comfort of opening up to someone else. We have found, however, that this can be challenging at times, particularly because academia encourages self-promotion and individual achievement. Nevertheless, you need to feel comfortable hanging out your proverbial dirty laundry for your critical friend to see. If you begin censoring journal writing and withholding in critical friend conversations the entire process is undermined. Early in our relationship we had a pivotal conversation in which Kevin told James that he was not going to hold back and that his

journal would cover sensitive topics such as frustrations with colleagues in the department. We placed trust in one another knowing that Kevin's journal and our discussions would need to remain confidential in the same way that data from any study are confidential.

While the value of critical friendship is shared widely in the S-STEP literature, less is discussed about how to go about selecting and working with critical friends. As Richards and Ressler (2016) identify, the S-STEP process can lose its value for practice and knowledge generation when the parties in the critical friendship do not trust one another and/or do not feel comfortable working through the problematic, the confusing, the frustrating, and the emotional aspects of teaching teachers. Some recommend establishing critical friendships with colleagues at different institutions who do not participate in departmental discussions about personnel (Fletcher et al. 2012), but Richards and Ressler (2016) and MacPhail (2011, 2014) document ways to develop and maintain fruitful critical friendships or communities of practice within a department. This includes establishing rules and boundaries, setting common goals to pursue, and working according to the tacit rules of personal and professional relationships that most people would abide by in their daily lives.

Becoming a Teacher Educator as a Career-Long Process

In a retrospective self-study that was presented as part of the Scholar's Address to the Physical Education Special Interest Group of the British Educational Research Association, Tannehill (2016) used the image of a salmon swimming upriver as a metaphor for her teaching to represent her learning and practice over an extensive career as a PE teacher educator. Methodologically, Tannehill (2016) positions her research as a self-study; however, we think it might be considered closer to an autoethnography in that it examines her self-in-culture (the culture being PETE) rather than her self-in-practice per se. However, there remain several elements of quality S-STEP, including a clear and explicit focus on the self and conceptualizing validation as a process based in trustworthiness. For instance, Tannehill's commitment to making her private understandings of PETE practice public is demonstrated through her feeling a duty of care to share what she has learned about being a PE teacher educator throughout her career, including that one is always in the process of "becoming" a teacher educator. Sharing the insights and understandings generated through self-studies is a key moral principle upon which the S-STEP is founded, and in this way, Tannehill's (2016) research certainly captures the spirit and intent of strong S-STEP research.

A similar approach was taken by Ovens (2016), who described ways in which his practice has been informed by the pursuit of democratic ideals through critical theorizing of PE practice. Through conducting self-studies of his practice in several PETE contexts (the practicum, coursework, and so on which are reviewed later in this chapter), he identified ways S-STEP has provided a frame for how he engages pre-service teachers in PETE practice, stating:

> Disturbing practice in this way provides a criticality to my practice that enables an embodied and experiential means for student teachers to examine the origins, purposes and consequences of educational actions and the political, economic, and social contexts that give rise to them. Such change emerges from a growing understanding of these issues in response to personal and professional transitions experienced over my career. (p. 132)

In addition to articulating several principles that have guided the practice and the value of being involved in a PETE community of practice and self-studies, the feelings described by Tannehill (2016) and Ovens (2016) respectively capture the crucial need for S-STEP researchers to turn the inward focus of their inquiries outward to enable learning and knowledge generation across a field of study (Zeichner 2007).

In recognizing that many accounts of the career-long socializing experiences of PE teacher educators and academics had been retrospective accounts from senior researchers who were well established in the field and in their respective institutions (e.g., Cutforth 2013; Kirk 2014; Lawson 2009; Tannehill 2016), Casey and Fletcher (2017) sought to describe their lived experiences in the transition from early- to mid-career PE teacher educators using S-STEP. They suggested that there was a distinct lack of work focused on the socializing experiences of academics in situ, stating:

> That most accounts of organisational socialisation—the last and longest of the socialisation stages (Lortie 1975)—have been provided by senior academics suggests a degree of risk in sharing the doubts, uncertainties, confusion or points of contention in the work of academics. (Casey and Fletcher 2017, p. 109)

In a departure from other research that has explicitly used S-STEP in PETE, Casey and Fletcher (2017) describe their research as self-study *of practice* (in contrast to *teacher education* practice) where the practice being examined is that of an academic worker, including teaching, research, and service. That is, their research did not focus specifically and solely on teacher education practice but included the practices involved in teaching, conducting research, and serving academic, local, and global communities. As with their other work, their main data source was reflective journal entries and diaries focused on their lived experiences as teacher educators. They identified several challenges in the ongoing organizational phase of their socialization and critiqued the structures and practices of academic work in the contexts of neoliberal higher education, particularly in disrupting the status quo. For example, they suggested that their institutions encouraged and rewarded research that veered away from the authors' preferred personal inquiries into their PETE teaching practices and the experiences of their students, favoring instead work that attracted large-scale external funding (e.g., those that considered randomized controlled trials of obesity interventions in the context of PE). The self-in-practice, when discussed in terms of the practice of an academic worker, was thus revealed as being full of internal tensions, frustrations, and disappointments. Notably this had implications for conducting research and generating knowledge of PETE practice and also for the extent to which they were willing and able to commit extensive time and energy into innovative pedagogical practice.

Baker (2015) took a different approach to the examples presented above, showing how her processes of becoming a teacher educator changed along with the content she was teaching in her PETE classes. Specifically, engaged in memory work (creating vignettes and drawing from written reflections and artifacts from her teaching), Baker (2015) described her mostly negative socializing experiences in dance – an important content area within PE – and how those experiences shaped the ways she engaged with dance content and pedagogy. As someone who did not readily identify with the label of "dancer" or "dance educator," Baker (2015) described the challenges in coming to terms with content that she did not, at first, feel comfortable with or passionate about. S-STEP helped Baker focus more clearly on her students' experiences of learning to teach dance rather than her own, which led her to acknowledge the importance of providing students with opportunities to reflect on and critique their experiences of several content areas, and identify not only what they felt comfortable and uncomfortable with but also why. This enabled the teacher educator and students to identify shared experiences of comfort and discomfort and engage in these as co-learners.

In summary, S-STEP has been used as a powerful methodological tool by teacher educator researchers in PETE to help develop insights and deepen understandings of the transitory processes involved in becoming a PE teacher educator across the span of one's career. Much of the research conducted has used occupational socialization as a theoretical framework to guide the research design and interpretation. In particular, the research has revealed the challenges in developing and enacting successful and innovative PETE practices in light of the ongoing socialization of PE teacher educators. This applies to those who come with and without backgrounds as school-based PE teachers. Although these insights have been generative for the PETE community, they serve as a foundation only, and there is much scope for this work to be built on, critiqued, and extended by other PE teacher educator researchers, particularly in the struggles with identification that many teacher educators experience during any period of transition. Furthermore, given the predominance of occupational socialization as a theoretical frame, there are many opportunities for PE teacher educator researchers to draw from and use different and innovative theoretical frameworks to provide new and diverse interpretations into the career-long process of becoming PE teacher educators.

Pedagogies of Teacher Education

In their review on the state of the art in S-STEP research, Vanassche and Kelchtermans (2015) recognize that an important outcome from the S-STEP field has been the development "of an explicit pedagogy of teacher education and the growth in practice that follows" from that research (p. 509). Indeed, this was the thrust of several arguments made by Loughran (2006, 2013) who challenged teacher educators to commit to problematizing and better understanding pedagogy both in a broad sense and in specific respect to teacher education practice. We identified 24 pieces from the PETE literature where teacher educators had used

S-STEP to enable insights and construct their own understandings of the development of their personal pedagogies of PE teacher education practice. This area had, by far, the largest pool of S-STEP in PETE research. The subsequent sharing of these insights and understandings has thus been generative to helping the PETE field come to better shared understandings of the complex nature of PETE practice.

Problematizing PETE Practice

Many examples of S-STEP in PETE demonstrate how teacher educators have used S-STEP to interrogate and problematize taken-for-granted assumptions about teaching and teacher education practice (Brown 2014; Bruce 2013; Flory and Walton-Fisette 2015; North 2017; Ovens 2014). This line of inquiry has led researchers to delve into the reasons that underpin their pedagogical decisions in PETE, often at the subconscious level. For example, Brown's (2014) research revealed his underlying desire for control in the classroom – a revelation that came as a surprise to him and stood in contrast to his fundamental beliefs about teaching and teacher education practice. As with many S-STEP investigations, the role of interactivity (in the form of sharing written reflections with a critical friend) was central in Brown's (2014) research, triggering Brown to engage in reframing the ways he enacted his beliefs *in* practice. As Brown (2014) acknowledged, the questions offered by the critical friend were at times uncomfortable and challenging but proved crucial for this reframing to occur and subsequently enable deeper understandings of the complexity of teacher education practice.

The problematizing of students engaging in peer teaching – a commonly used strategy in teacher education – was the focus of research conducted by Ovens (2014). Part of the significance of this work is that it showcases how Ovens built on previous self-studies he had conducted where the outcomes of peer teaching were mostly positive (Ovens and Garbett 2008). In Ovens (2014), S-STEP was used to demonstrate how he enacted criticality in his PETE practice using peer teaching. Though there were many positives identified about peer teaching – particularly the way it shifted the focus of lessons away from the teacher educator and onto the preservice teachers – several dilemmas were also exposed. In particular, relational elements among pre-service teachers in the class revealed a power dynamic that left some vulnerable to overly critical peer feedback that was not reflective of the type of authentic teaching-learning experience that Ovens (2014) was trying to foster. S-STEP thus disrupted Ovens's (2014) assumptions about the value of peer teaching, leading to a more considered appreciation of the biographies pre-service teachers bring with them to the teacher education classroom and the relationships among students.

Not only was Ovens's (2014) research interesting in its own right, the ways he problematized peer teaching directly informed one of the outcomes reported in a study by Fletcher et al. (2016a). Their work highlighted the value in drawing from multiple layers of interactivity in self-studies, using data from a critical friend and meta-critical friend, peer observers, pre-service teachers, and the literature.

Of relevance to this discussion is that the findings from Ovens's (2014) work were used by one of the teacher educator researchers to question the decision to use peer teaching by another of the authors. This led to a dialogue between the two teacher educator researchers (in the context of a critical friendship) where they shared written reflections and engaged in conversations that were recorded where they further problematized peer teaching, identifying pros and cons and strengths and weaknesses. Importantly, Fletcher et al. (2016a) also drew from interview data generated by pre-service teachers who were in their classes. This proved to be somewhat of a tipping point, as the pre-service teachers overwhelmingly found peer teaching valuable, identifying the importance of collaborating with peers, sourcing and modifying activity ideas, and receiving feedback to inform reflection. While Fletcher et al. (2016a) did not arrive at a definitive answer about the value of peer teaching, their research demonstrates how S-STEP could be used to enable deeper considerations of pedagogy and potentially alter teacher educators' thinking about strategies and practices they have relied on for years, often without any substantive evidence to support pedagogical decisions to use or not.

The idea of problematizing one's practice has been the foundation of Chris North's (2015, 2016, 2017) S-STEP research, which has been conducted in the context of outdoor education – a closely related but somewhat distinct field from PE. His research is one of the few bodies of work in the broader field of PETE that represents the chains of inquiry Zeichner (2007) urged S-STEP researchers to pursue, and it serves as a strong example of the integration of LaBoskey's (2004) characteristics of S-STEP design. In the first piece of his S-STEP research, North (2015) used vignettes and reflective journal entries to acknowledge the romantic association he had with the environment as an outdoor educator, relishing being outside, whether in the rain, for example, or elsewhere in the wilderness. He also conducted interviews with pre-service teachers to interrogate his assumptions about the role of the environment in outdoor education. Like North, some pre-service teachers also enjoyed opportunities to be outside of the regular teacher education setting, suggesting that bad weather did not bother them or that being made to be uncomfortable through being cold or lacking sleep, for example, led to more powerful learning about their experience. In addition, being outdoors offered many creative and powerful *teaching* opportunities due to the different circumstances in which learners were placed. However, North (2015) also found that others felt marginalized in these settings for various reasons. For example, some pre-service teachers he interviewed found the experience triggered memories and emotions they experienced during earthquakes that occurred in Christchurch, New Zealand, in 2010–2011. One student noted that having lost her house in the earthquake meant she was living in similar conditions to those on the outdoor education trip – a point which North used to challenge the way he took for granted his relatively comfortable lifestyle outside of teaching in a way that some of his students could not.

In a different self-study but with similar overall outcomes, North (2017) described the assumptions he made about his positioning around the classroom in an outdoor education course. In a fascinating and rich account where North (2017) drew from interviews with students and a critical friend, he explained how his

students' responses and learning in that course conflicted strongly with his interpretations of their experience, which led him to swing between the extremes of infatuation and disillusionment with his teacher education practice. This had implications for how North (2017) came to understand and interpret positions of power and authority in the classroom, concluding that he had overestimated the role that his physical positioning had on disrupting power structures in learning and teaching. Consequently, this led him to reconsider his approaches and acknowledge the importance of seeking and understanding pre-service teachers' perspectives in shaping his pedagogy of teacher education.

This body of work demonstrates ways in which PE teacher educators have used S-STEP to critique and interrogate various aspects of their own practice and that of PE practitioners in a broader sense. Through these examinations, deepened understandings of PE and PETE practice have been developed in a way that reflects a commitment to not just "doing" PETE practice but "being" or "living" it. Importantly, the authors who carried out this research see their work as forming part of a broader agenda to improve our understanding of PETE practice. While each stands alone as a strong exemplar of S-STEP research, they also make strong connections to past, present, and future studies to make a clear indication of the contribution to the field.

Enacting Critical Pedagogies of PETE

PETE has a strong, though relatively short (since about 1990), record of research that carries an explicit social justice agenda, which some claim is a key tenet of strong S-STEP research (LaBoskey 2015). To this end, several researchers have used S-STEP to explore their enactment of critical pedagogies in the PETE classroom. At times, these practices have led students to take on principles of social justice in their own teaching (Flory and Walton-Fisette 2015), while in others, students have strongly resisted critical pedagogies and the approaches advocated by teacher educators (Cameron 2014). A common thread in these types of self-studies is the desire to enact a democratic ideal *with* those learning to teach PE and with the students whom they will teach (Enright et al. 2017; Ovens 2016).

A particularly complex aspect of this work has been noted in the ways teacher educators translate their personal beliefs into practice. Although many align themselves with socially critical agendas, S-STEP research has led some to reconsider how they do this and the reasons why. Bruce (2013, 2014, 2015), for example, describes how a collaborative S-STEP project where she engaged with a critical friend led her to experience a shift in the ways she conceptualized knowing and learning, particularly in moving from a critical perspective to one she described as postcritical. Importantly, Bruce (2013) did not claim to identify any solutions from her S-STEP work, but she explained how she became comfortable with the messiness, the confusion, and the uncertainty that her inquiry exposed. One example was offered where she encouraged students to confront their own prejudices; a task that some welcomed and emerged transformed, while others rejected it, not wanting to

experience discomfort (Bruce 2015). A practical and pedagogical implication of this work was the difficulty in (but importance of) teacher educators leaving situations and teaching "moments" unfinished and unsolved. This meant that both teacher educator and students could dwell on their learning beyond the classroom without seeking a correct answer or a solution to a problem.

Similarly, Cameron (2014) described her experiences as a new PE teacher educator developing and enacting critical pedagogies as part of her PETE practice. Cameron described her excitement in planning a new course where she could develop pre-service teachers' critical orientations and aim to disrupt dominant power structures within PE, PETE, and society more broadly. In a type of critical friendship, Cameron (2014) engaged with several senior PETE scholars whose socially critical work informed some of the views she was developing. However, many of her students showed strong resistance to this approach, to the point where this resistance made others in the class feel uncomfortable and unsafe. While Cameron (2014) described her approach as "having the best of intentions" (p. 102), she acknowledged a failure to adequately consider the perspectives of her students in shaping the course so that it could have become a meeting in the middle. In a compelling case of self-awareness, Cameron (2014) realized that in forcing students to engage with what she thought was best for students to learn, she was in many ways enacting top-down approaches she strongly advocated against – S-STEP thus disrupted any notions of self-justification for her practices she may have held. Importantly, this did not result in Cameron (2014) doing away with her principled position but did lead her to more intentionally seek students' input and advocating for a "gentler" approach to integrating challenging concepts and pedagogies into the PETE curriculum.

Pursuing democratic ideals has been a focus of several PE teacher educators – a point made in the brief review of Ovens (2016) previously. The privileging of student voice and "flipping" of positions of authority in the classroom are seen as a particularly promising way to promote democratic agendas, and both were taken up by Enright et al. (2017). The PE teacher educators "sought to position pre-service teachers as pedagogical consultants who would design feedback strategies, gather feedback with faculty and co-construct physical education teacher education (PETE) curricula" (p. 459). Much like the intent of Ovens (2016), engaging students in the design of PETE curricula and enactment of PETE practice was seen as a way for them to "critique and transform their own educational experiences" (p. 459). Enright et al. (2017) described their work simultaneously as a participatory action research project *and* a self-study, representing the hybrid "mongrel" nature of S-STEP inquiries (Bullough Jr. and Pinnegar 2001). Their approach contained several instances where the teacher educators made conscious turns to self in order to better understand their assumptions, beliefs, practices, and the influence these qualities had on others in the pedagogical relationship, a hallmark of S-STEP design. Moreover, the ways in which the teacher educator researchers made themselves vulnerable in their practices, creating avenues for negotiation and exposing moments of contradiction and uncertainty, are highlights of the work of Enright et al. (2017) and reveal

how challenging and "risky" the enactment of critical pedagogies in PETE can be for teacher educators and students.

In what might be described as a more modest approach to critical pedagogy or enacting democratic processes, Mead and Gilson (2017) examined ways in which captains of a high school boys' basketball team learned about leadership through the coach's mentoring. The first author was the coach of the team and documented the processes of mentoring he engaged in with the captains of the team. He gathered artifacts and made memos, which were analyzed throughout the process. Much like Enright et al. (2017), one of the main themes concerned the challenging process but positive outcomes from providing learners with greater and more explicit chances to have their voices heard in the teaching-learning process. Mead and Gilson's (2017) self-study stands out because it is one of the first in the sports coaching literature where S-STEP methodology has been used. The authors position their work among some of the foundational S-STEP literature (e.g., LaBoskey 2004; Samaras and Freese 2009) and highlight the ways their research serves as a springboard to generate further discussion and debate among members of the sports coaching community.

While the above research represents a base of S-STEP research in PETE with a democratic or social justice agenda, there is more scope to extend this work that invites newer questions and investigations carried out in a diverse set of contexts. For example, there is much to be learned from S-STEP inquiries that consider the traditionally gendered nature of physical activity and sport and the ways that is implicated in PE and PETE practice and the identities of those enacting those practices. Moreover, much could be gained from the experiences of PE teacher educators who represent visible minorities in a field that is largely white and able. These are but two general areas where S-STEP scholarship could reveal new and important insights about PETE practice for today's schools and teacher education programs.

Pedagogical Innovations in Teaching and Teacher Education

It may be argued that PETE is currently in a "grand period" of innovation, with new conceptual frameworks, pedagogical models, and teacher education practices being thrust into the limelight. Some of this has been spurred by Kirk's (2010) vision of the future of physical education, where he hypothesized that unless PE and PETE engage in radical reform and innovation, then it is likely that the subject area will remain the same or become extinct.

One approach to reform that Kirk (2010) advocated was for model-based practice, where teachers select an appropriate pedagogical model to use depending on the outcomes they want students to achieve and the contexts in which they are teaching. Generic pedagogical models that may be familiar to readers from other subject areas include cooperative learning (Slavin 1980) and peer teaching (Foot et al. 1990). Commonly used PE-specific models that have been in use since the 1980s and 1990s

include sport education (Siedentop 1994), game-centered approaches (Bunker and Thorpe 1982), and *Teaching Personal and Social Responsibility* (Hellison 2011). It is interesting to observe that many more have been developed in the last decade including health-based physical education (Haerens et al. 2011), the easy-play model (Lu and Steele 2014), function-to-flow (Lloyd 2015), adventure in the curriculum (Williams and Wainwright 2016), activist approaches for working with boys and girls in physical education (Luguetti et al. 2017; Oliver and Kirk 2015), and the Practising Model (Barker et al. 2017).

These innovations have led PE teacher educators to examine their practices of teaching about teaching, with the focus of inquiry being their enactment of certain pedagogical models in PETE classes. As explained earlier, Fletcher and Casey's (2014) use of S-STEP helped them understand the challenges of enacting pedagogical innovations in teacher education, identifying tensions in (a) transferring model-based approaches to the higher education setting and (b) enacting innovations in higher education without having the benefit of seeing the innovation enacted in schools. Hordvik et al. (2017) took a similar approach, using S-STEP to examine Hordvik's enactment of sport education.

In both examples, the teacher educators explained the complexity of articulating, unpacking, and modeling the "how," "what," and "why" of pedagogical models to pre-service teachers (Fletcher and Casey 2014; Hordvik et al. 2017). In particular, the "why" proved to be especially difficult to describe *in* the moments of teaching about PE teaching. Because it is not something that teachers have to do for school pupils, teacher educators who have taught using models in schools found difficulty in transferring these practices to higher education. In addition, teacher educators for whom using models was a new approach to teaching experienced high degrees of uncertainty and doubt, often asking themselves: "Am I doing this right?" (Hordvik et al. 2017, p. 237).

Hordvik et al.'s (2017) work is a shining example of S-STEP research that responds to Zeichner's (2007) critique of the field and his call to develop chains of inquiry. While explicitly focused on the self-in-practice, Hordvik et al. (2017) gathered self-generated data (reflective journal entries, course artifacts) as well as data from students (through interviews) to demonstrate ways in which his insights both converged and diverged from those described by Fletcher and Casey (2014). It is clear from both of these studies that teacher educators face a complex set of challenges in unpacking pedagogical decisions while teaching about and through pedagogical models in PETE. Developing and adopting pedagogical innovations in teacher education require significant commitments from teacher educators in terms of time and energy needed to develop the requisite pedagogical content knowledge but also in emotional terms where they are open to new ways of learning in ways that are similar to those they ask of pre-service teachers.

In a new development, Bowles (2016) used S-STEP to document and examine his experiences of implementing a game-centered approach into his coaching of a women's Gaelic football team. He found that one of the main challenges was related to players' socializing experiences of sports coaching, of which "traditional approaches" were a main feature. For example, it took players a long time and

some discomfort in coming to terms with an approach to coaching that was so different from what they had experienced before, despite its established effectiveness (Harvey and Jarrett 2014). Bowles noted the challenges he faced in deciding to listen to players and work with their demands (and revert to a traditional approach) and staying the course with the innovative game-centered approach that held promise for his practice *and* his players' game understanding and performance. Such research shows the promise of self-study for coaches, coach educators, and other professionals in fields related to PE, particularly sports coaching.

While the above examples provide insights and deeper understandings of the challenges experienced by PE teacher educators in enacting existing model-based approaches, S-STEP has also been used as a key mechanism in creating and developing new pedagogical innovations in PETE. For example, Ovens (2012) employed self-study to examine his use of lesson study as a pedagogical innovation for 35 senior PETE students who were coordinating an outdoor education camp for 60 first-year PETE students. Ovens felt that in the past, the senior fourth-year students were adept at supervising a camp activity but lacked in their abilities to think through the activity, responding to situations as they arose or using reflection in action to make sound pedagogical decisions. Specifically, "lesson study was introduced as a way of structuring how [. . .] fourth-year students taught the individual camp activity. For the 35 fourth-year students involved, this meant self-selecting into one of eight groups to research, design, prepare and teach one of the camp activities" (Ovens 2012, p. 200). Ovens described a tension he faced in helping fourth-year students learn to analyze pedagogical situations and having first-year students experience sound outdoor activities. For example, while fourth-year students were encouraged to focus on pedagogy through specifying learning objectives clearly, gathering evidence, considering alternatives, and modifying tasks accordingly, staff members of the outdoor camp were more concerned with having first-year students experience the outdoor activities. As a result of the latter approach, the fourth-year students were placed in situations where they were learning to teach by transmission and not through authentic inquiry.

Déirdre Ní Chróinín, Tim Fletcher, and Mary O'Sullivan (Fletcher et al. 2016b; Ní Chróinín et al. 2015, 2016, 2018) have used S-STEP in a longitudinal research project that has looked at the development of an approach to PETE practice that prioritizes the promotion of meaningful experiences. Once the idea of teaching teachers how to systematically and intentionally promote meaningful PE experiences was identified as the focus of the research and vision for their practice, their S-STEP inquiry progressed from identifying and developing general pedagogies (e.g., student-centered approaches) and specific strategies (e.g., small group formations) in the first year (Ní Chróinín et al. 2015) to refining approaches in the second year and third years (Ní Chróinín et al. 2018). Sources of interactivity included critical friendship and meta-critical friendship – an approach where an arm's length expert in the field provided support on the S-STEP design and the enactment of the pedagogical approaches (Fletcher et al. 2016b; Ní Chróinín et al. 2016) – and student data from interviews and exit slips (Ní Chróinín et al. 2018). This research is an example of ways S-STEP can be "scaled up" (Metzler 2014; O'Sullivan 2014) to

inform broader research questions and projects while still remaining a centerpiece of the overall inquiry.

PE teacher educators have used S-STEP to examine the ways in which their identities, values, and practices intersect. In doing so, these teacher educator researchers have taken considerable personal and professional risks by exposing their confusion and uncertainties about the complex nature of PETE practice and the difficulties associated with making one's tacit knowledge explicit. In accordance with key tenets of S-STEP, researchers in PETE have demonstrated a commitment to examining the self-in-practice by making themselves vulnerable, stepping out of their pedagogical comfort zones, and consistently revisiting or reframing their beliefs and values.

Fletcher (2016) articulated several principles that guided his PETE practice, based on social constructivist theories of learning. He took an innovative approach by synthesizing key findings from six individual and collaborative several self-studies he had conducted. Fletcher (2016) built on the principles of teacher education practice expressed by other S-STEP researchers, identifying (1) the importance of developing relationships and sense of community in the teacher education classroom (Crowe and Berry 2007; Loughran 2006; Russell and Bullock 2013); (2) the need for teacher educators to unpack, reframe, and share the decisions that inform their modeling of teaching practice (Loughran 2006; Russell and Bullock 2013); and (3) ways in which the interplay and interpretation of teacher educators' and teacher candidates' identities shape teacher education practice (Bullough Jr. 1997). In addition to contributing to collective understandings of teacher education practice generally, Fletcher (2016) was also able to make these understandings relevant to those in the PETE field. Importantly, like others who have shared their principles of practice, the principles are not considered to be "correct" and/or "true." Rather, they are considered provisional and grounded in the contexts in which they were developed. The main purpose of sharing principles of practice is therefore to provide a platform for critique and to generate discussion and dialogue among others in the PETE community about their relevance and meaningfulness across contexts (Tinning 2014).

The Processes of Communities of PE Teacher Educators

Though many of the examples of S-STEP research described previously have been conducted as collaborative self-studies, several PE teacher educator researchers have used S-STEP to investigate the ways in which groups of teacher educators function as communities of learners. In this way, S-STEP provided a methodology that could be used to examine the professional learning of PE teacher educators. For example, Tannehill et al. (2015) used collaborative self-study to examine their practices in the PETE program at the University of Limerick in Ireland. Along with more traditional S-STEP methods such as generating reflective journal entries and engaging in interviews, the members of the group gathered an innovative range of artifacts to use as data including timelines that captured significant moments in their respective journeys of becoming PE teacher educators, metaphors that represented how each

member saw themselves as an PE teacher educator, and a "web of engagement" (p. 303) that showed the scholarly relationships between each of the members. Analysis of data showed how S-STEP helped members of the group identify tensions and dilemmas in their interactions related to PETE research and practice. The dialogue offered by S-STEP through ongoing reflection enhanced the ways group members interrogated their beliefs *and* their practices in the PETE program. As well as identifying areas of difference, they also identified shared interests and passions, which helped them to create a shared vision for their PETE practice. Within this vision was the acknowledgment of the individuals who taught and learned in the program. As Tannehill et al. (2015) stated:

> Through understanding ourselves we can come to understand who we are as a group as we recognise our individuality, acknowledge our achievements and non-achievements. We can work more freely while safely questioning how we look at things differently and compromise and change to make a coherent program. In making our implicit beliefs explicit we strengthen who we are and what we do in the development of teachers and the conduct of research that will hopefully result in positive impact on children and youth through physical education. (p. 308)

A similar approach to collaborative self-study was taken by Jess et al. (2016) who examined their *Developmental Physical Education Group* (DPEG) as an existing community of PE teacher educators at the University of Edinburgh in Scotland. Two members of the DPEG team conducted individual and focus group interviews with other members, with a focus on how they had used and come to understand the ways in which complexity thinking was informing their practice(s). Jess et al. (2016) describe complexity thinking as a view that "is based on the belief that complex systems are self-organizing and emergent phenomena that differ from the more traditional modernist view of systems as complicated pre-programmed entities focused on linear processes and certain outcomes" (p. 102). Importantly, the DPEG team's use of complexity thinking has provided them with a particular understanding of the learning process, one that embraces guiding principles such as self-organization, emergence, unpredictability, and nonlinearity.

The focus on complexity thinking to help the DPEG members interpret their PETE practice is a matter that stands out from Jess et al.'s (2016) work. In particular, complexity thinking and theory provided group members with a shared language which not only helped them identify common areas of understanding (e.g., the principle of self-organization, p. 105) or salient moments in the group process, it also helped them articulate their tacit knowledge of practice and of learning, which had before been hard to pin down and describe. Importantly, their use of complexity theory helped frame perspectives on student learning in PE and also on *teacher learning.*

The examination of teacher learning using S-STEP in PE has not been restricted to teacher educators' considerations of teacher learning (particularly pre-service teacher learning); many teachers have themselves used self-study to examine their professional learning. In the following and final section of this review, we consider ways self-study has been used to examine the practices of PE teachers.

Teachers Studying Their Practices in Schools

The use of S-STEP to examine teacher learning has occurred in what we expect as the reverse of many other subject areas. That is, examples of PE teachers taking up S-STEP to examine their learning and practice in schools occurred before much of the S-STEP work conducted by PE teacher educators. We found nine examples of S-STEP research conducted by PE teachers in schools.

Attard was one of the first PE teacher scholars to explicitly identify self-study methodology as a helpful tool to examine teaching practice (Attard 2008; Attard and Armour 2005, 2006). Much of his self-study research was conducted, while he worked as a teacher of PE and graduate student in Malta, and due to its lengthy process (data were gathered over a 30-month continuous period), when taken together Attard's research represents one of the deepest accounts of how self-study can be used to examine and in some ways reframe teacher professional learning and professional practice. A main focus of his research was being attentive to the challenges of implementing a new syllabus while engaging in collaborative professional learning with colleagues (Attard and Armour 2005, 2006). Attard (2007, 2012) particularly advocates for the power of writing as research method *and* as a tool for professional learning. Through his self-studies, Attard (2014) identifies outcomes similar to those identified by many teacher educators. He explains: "through experiencing self-study, I have come to believe that the most important aspect of teacher learning is the examination of one's own tacit understandings and taken-for-granted assumptions" (p. 31). This statement captures the essence of self-study of practice research – that one must necessarily consider the intertwined influence of one's self and one's practice.

The contrasts in perspectives regarding implementation of a new syllabus also provided the focus for JeongAe You's (2011) self-study of her practices as a national curriculum writer in South Korea. She was inspired to conduct her research based on tensions identified by insiders and outsiders to the curriculum writing process. You (2011) described her work as a "self-study conducted in the narrative inquiry tradition" (p. 87), meaning that specific attention and value were given to her personal experiences, which were documented in meetings, formal curriculum materials, and personal journals. Using self-study helped You (2011) identify several obstacles she encountered as chairperson of the revised South Korean national PE curriculum. These obstacles were personal (related to gender), environmental (related to the marginalization of PE), professional (related to her desire to advocate for innovative and radical reforms), and institutional (related to the authority aligned with her position as chairperson).

Burne's (2017) study represents the growing interest in teachers using self-study methodology to frame their postgraduate studies in a way that connects to their practice as teachers. Reflecting a growing imperative in teaching globally, Burne sets out to explore the use of digital technologies in teaching PE with a specific focus on how developing an understanding of and confidence when using digital technologies could impact upon his pedagogy as a PE teacher. Framed around hunting and reframing the assumptions that underpinned his interest in digital technologies, he

proceeded through a chronological journey that included engaging with the literature on teaching with digital technologies, engaging with a course to become more proficient with the digital technologies, observing teachers in order to see digital technology in action, and teaching a series of PE lessons that incorporated digital technology. At each step in the journey, he was able to generate a range of data that reflected his evolving and deepening understanding of using digital technologies to enhance student learning in PE. Core to this was the insight that digital technology was unlikely, in itself, to make a PE teacher more effective and can even have a detrimental effect when used in unconsidered ways. However, when teachers grow their knowledge, capability, and confidence with digital technologies, this can act as a catalyst for PE teachers to shift their pedagogy toward a more student-centered approach that addresses the needs of twenty-first-century learners. Burne (2017) concludes that it is not the technology that will make the difference, it is the teacher's pedagogical approach supported by the technology that will.

Casey (2012) also published several examples of self-study research on his practices as a PE teacher, prior to his beginning role as a teacher educator. In that particular study, Casey looked at the ways self-study enabled him to attend to pedagogical and curricular change in his practice – something that was self-driven but that he came to acknowledge was influenced by "extra-individual" conditions, such as students, colleagues, and institutions. Much like Attard, Casey's main data source was written in reflective journals, which he generated on an almost daily basis over a number of years. One of the main features of a personal written journal and its content *as a data source* is that it allows the teacher researcher to identify what the focus of the inquiry is: it is self-initiated and self-focused (LaBoskey 2004).

These works show the hybridity of self-study research – or what might be described as principled pragmatism. For example, along with labeling their work as self-study, each author also used the following descriptors: autoethnographic (Attard and Armour 2005), critical reflection (Attard and Armour 2006), narrative inquiry (You 2011), narrative writing (Attard 2012), and insider-action research (Casey 2012). This is not to suggest that the examples are not self-studies. For example, there is evidence of several key characteristics of self-study in these works. These characteristics may include community, stance, and desire (Ovens and Fletcher 2014a) or self-direction, improvement orientation, and interactivity (LaBoskey 2004). Crucially, all focus explicitly on the self-in-practice, and there are clear instances where each author turns to self and explores the relationships between self, practice, context, and subject matter. One interesting feature is that much of Attard's and Casey's work did not include critical friendship (or similar) or other sources of interactivity frequently used by S-STEP researchers. Casey, in particular, relied on his students' voices to help him cast doubt on and dig deeply into certain aspects of his practices, while Attard interacted mostly with colleagues implementing the new syllabus that was the focus of his inquiries. Perhaps this also suggests that it may not be the mode of inquiry used or the specific audience that is most important – it is the commitment to systematically and critically examine one's identities and practices that is crucial if a practitioner seeks to better understand her or his own practice and thus more strongly and positively influence student learning.

Conclusions

The survey of self-study research covered in this chapter highlights the rich diversity of approaches that have been used to explore the edges of self in the moments of practice in PETE. A major development in the ways S-STEP research is engaged with in PETE has been the explicit alignment of their work with foundational ideas and texts in S-STEP: for example, LaBoskey's (2004) guidelines for quality in S-STEP design or Ovens and Fletcher's (2014b) S-STEP characteristics of community, stance, and desire. The notion of community as a major characteristic of S-STEP (Ovens and Fletcher 2014b) was particularly notable in the development of the UK-Ireland Self-Study Research Network at the British Educational Research Association Physical Education Special Interest Group Meeting in 2015, where S-STEP was used as *the* platform to develop national and international research collaborations around PETE practices.

The increase in the intentional framing of research as S-STEP has thus allowed PE teacher educator researchers to make chains of inquiry (Zeichner 2007) by connecting to and building on the previous self-study work of others in the PE community. This has allowed for the identification of sustained problems of PE practice (such as enacting model-based and critical pedagogies) as well as the generation of new research questions and agendas, both large scale and small scale (see, e.g., Jess et al. 2016, Ní Chróinín et al. 2018).

Because of the multiple versions of PETE and what it means and entails, there are opportunities to spread beyond the practice of teaching future teachers. For example, S-STEP research is being conducted by teacher educators in areas that may have their own disciplinary traditions similar to but distinct from PE, such as outdoor education (North 2015, 2016), dance (Baker 2015), sports coaching and coach education (Bowles 2016; Mead and Gilson 2017), and health education (Cameron 2014).

Regardless of the particular field or subfield in which S-STEP research is being conducted, the strength of such research lies not just in being able to provide a means for the PETE practitioner to subject their practice to rigorous inquiry but also in celebrating the myriad ways that physical educators are studying their practices in order to improve the learning outcomes for their students. In our edited collection (Ovens and Fletcher 2014a), we suggest that self-study offers more than a set of techniques, or an exercise in reflection, or form of professional development, or application of theory, or generation of evidence. Rather, what self-study contributes to research on PETE is an ability to sense, feel, think, and act with imagination in order to open up more useful interpretive possibilities for informed action in teacher education (and education practice more broadly). Self-studies may appear to provide subjective snap shots of reflexive, personalized accounts of the humanness involved in teaching PE, particularly in the way that authors often share their feelings, assumptions, aspirations, difficulties, and interactions in their attempts to improve personally and professionally. However, it is through sharing the experiences and interpretations of the experiences that PETE researchers can better understand what can work in teaching, how it works, and why it works. An ultimate aim of S-STEP

work is that it may provoke the reader to question their own understandings of practice. If the purpose of scholarship is to provide a platform for knowledge creation and debate, then self-study is not invoked as a form of inquiry seeking more accurate understandings of a finished reality but rather a powerful means for finding ways to initiate a more meaningful interaction with the self as producer, reproducer, and product of PETE practice.

Self-Study of Science Teaching and Science Teacher Education Practices

31

Considering and Contesting Knowledge and Authority

Shawn Michael Bullock

Contents

Abstract

The intersections between self-study methodology and science education research, broadly considered, are often tacit. In this chapter, I hope to complicate these conversations by contesting the kinds of disciplinary boundaries invoked between science education and self-study. I begin by highlighting some epistemological and ontological barriers that tend to exist in a variety of literatures. I then use three ideas in self-study that have arisen from science teacher educators to analyze and reflect on the nature of knowledge as framed by different disciplinary traditions. The concepts of the *authority of experience*, *tensions*, and *self-study as professional development* will thus guide our historical and conceptual analysis of self-study and science teaching and science teacher education, with a view to reducing the tacit and explicit boundaries that have often existed in considerations of this work. I conclude with an appeal to acknowledging the different ways of knowing about science education, science teaching and

learning, and science teacher education so that conversations across disciplines might be more productive.

Introduction

The intersections between self-study methodology and science education research, broadly considered, are often tacit. A search for self-study and science education reveals relatively few results, particularly if one requires that the self-study methods and methodology involved need to be grounded in the approaches reviewed and analyzed in this handbook. There are fewer examples still when one examines the intersections between science education research conducted within the disciplines of science, as opposed to science education more generally. Indeed, it is not difficult to imagine questions and stereotypes that might immediately be raised by particular communities within self-study, science education, and discipline-based science education when considering each other's work.

In this chapter, I hope to complicate these conversations by contesting the kinds of disciplinary boundaries invoked between science education and self-study. In particular, I will begin by arguing that the debates about the nature of knowledge within curriculum studies help to shed light on the tensions within and between debates in science education research, self-study methodology research, and teacher education more generally. I will then invoke a particular lens from curriculum theory to consider alongside debates in the literature. The bulk of the chapter will focus on three significant conceptualizations of self-study that have arisen from science teacher educators who, while speaking to a broad audience in both self-study methodology and in educational research more generally, have grounded the development of their ideas within their experiences of science teaching and science teacher education. The concepts of the *authority of experience*, *tensions*, and *self-study as professional development* will thus guide our historical and conceptual analysis of self-study and science teaching and science teacher education, with a view to reducing the tacit and explicit boundaries that have often existed in considerations of this work.

The Role of Disciplinary Knowledge in Educational Research

One key debate in the field of curriculum studies that seems to show no signs of dissipating is the debate around the importance of disciplinary knowledge in education. Michael Young (1971), for example, argued that knowledge was socially constructed and thus struggles over what was represented in the school curriculum are, in fact, an expression of power relations in society. His work was influential both

because he was a student of leading sociologist Basil Bernstein and because his work appeared alongside that of Bourdieu and Bernstein at a time when sociologists were raising questions about organizational features of schooling (e.g., which subjects were taught in school and how these subjects might be managed). In the same influential tome, he further argued that *any* form of institutionalized knowledge, school curricula included, can be critiqued from the perspective of analyzing the tensions between "official" and "unofficial" forms of knowledge and that differences between said forms of knowledge exist only because certain kinds of knowledge are valued by the powerful.

Significantly, Young ([2010](#)) later completely changed his mind and now advocates for a return to more traditional forms of knowledge in school and away from a more skills or outcome-based approach to learning that was, largely, enthusiastically espoused by his many followers after his influential 1971 tome. Young now argues that theoretical and everyday concepts are radically different and that there are inherently different types of knowledge that can be categorized beyond power relations, stating: "It is important to distinguish between the *curriculum* as the conditions for acquiring new knowledge and *pedagogy*, which refers to the activities of teaching and learning involved in the processes of transmission and acquisition" (p. 18). Put another way, Young argued that schools exist, in part, because society believes that there are some specialized forms of knowledge that are not easily obtained just via experiences in the world. Recalling Loughran's ([2006](#)) dissection and critique of the concept of a *pedagogy* of teacher education, one can see that the debate exemplified in Young's writings on the role of knowledge in school curricula exists, albeit in slightly different forms, within the teacher education literature more broadly and the self-study literature more specifically. Knowledge of teaching teachers and knowledge of the *pedagogy* of teaching teachers are different kinds of knowledge. Indeed, researchers such as Pinnegar and Hamilton ([2009](#)) have long made the argument that knowledge of the pedagogy of teaching teachers, particularly that which is gained through self-study methodology, is oriented from a moral commitment that reflects an ontological rather than an epistemological commitment.

Similarly, it is not difficult to make a conceptual leap from Young's ([1971](#)) critique of the school curricula and contemporary tensions that exist in science education, teacher education, and the self-study of science teaching and science teacher education. There is considerable research in science education that is conducted by scientists and reported in scientific journals; one might call these discipline-based education research (DBER). Such research often carries more import with scientists, policy-makers, and science teachers because those who work in the natural sciences tend to occupy a higher status than those who work in the social sciences, particularly in education. Thus the power of the higher status of "knowledge" about teaching science from science professors affords them a stronger voice in the literature. Carl Wieman, for example, lends a particular kind of authority to research in science education because of his status as a Nobel Laureate. He was the subject of an article in the eminent journal *Science* – notable both for its status and its tendency to avoid citations to educational research literature – in which he is quoted as saying "The way that most research universities across North America

teach science to undergraduates is worse than ineffective...it's unscientific" (Mervis 2013, p. 292). Writing for *Issues in Science and Technology*, Wieman (2012) himself begins with the assertion:

> The current approach to STEM education is built on the assumption that students come to school with different brains and that education is the process of immersing these brains in knowledge, facts, and procedures, which those brains then absorb to varying degrees. The extent of absorption is largely determined by the inherent talent and interest of the brain. Thus, those with STEM "talent" will succeed, usually easily, whereas the others have no hope. Research advances in cognitive psychology, brain physiology, and classroom practices are painting a very different picture of how learning works. (p. 25)

Wieman (2012) then goes on to highlight some research from psychology and its implications for teaching before discussing the "shortcomings" of the current system, beginning with "the typical teacher starts out with a very weak idea of what it means to think like a scientist of engineer" (p. 28) before opining about why educational reform is hard. Unsurprisingly, one of the targets is the "low standards" in teacher "training" programs, which "attract students with the greatest antipathy toward math and science" (p. 32). A paucity of references, none from educational research journals, are found to support a few of the claims made in the chapter. Putting aside the veracity of the cited claims about the problems of science education, the difficult rhetoric of asserting that teachers need to "think like scientists and engineers" to do their jobs well, the unacknowledged focus exclusively on contexts in the USA, and the lack of congruence between arguing for a "scientific" approach to science education while ignoring a significant body of literature in education – and that is a lot to put aside – one is inexorably left with the problem of someone with significant scientific credibility in the natural sciences dismissing, by virtue of omission at the minimum, the efforts of those who teach future science teachers. Science teacher educators are not at all mentioned. Presumably, we are complicit in the unnamed but pervasive "low quality" (p. 32) teacher preparation programs that he is concerned about. As Labaree (2005) noted, we are most certainly on the margins of disciplinary importance.

It might be considered a rather easy rhetorical device to use the sweeping generalizations of a Nobel Laureate to call attention to the problem of authority in science education, but I would argue that the relationship between discipline-based science education research and science education research has similarities to the relationship between teacher education research and self-study research. Many self-study researchers have opined, particularly at the beginning of the field, that it was difficult to publish self-study research within mainstream teacher education research journals (Arizona Group 1996). Kitchen (2008) had the temerity to examine the effects of the tenure and review system on his scholarship in self-study education. Much effort has been made to articulate the rigor and relevance of self-study and to push back against the general tendency to consider research that makes particular claims about generalizability as the gold standard of research on how we might teach teachers. Indeed, I would argue that one significant contribution of self-study research is that it has helped to locate the importance of research on and by teacher

educators – a group whom, as Labaree (2005) has noted, are a group that make difficult practices look easy.

Science Education, Self-Study, and the Precarity of Disciplinary Knowledge

It is against this backdrop of the tension of knowledge, particularly disciplinary knowledge of the school curriculum, that I wish to situate this chapter on science education and self-study methodology. A handbook chapter is naturally a time to take stock of the field and to suggest new avenues for future research and, perhaps, to offer new critical lenses on work that has been done in the past. Unfortunately, there is a relative paucity of literature that explicitly focuses on science education and self-study, so much so that it makes unpacking themes and suggesting new directions a challenge – particularly given that I co-edited a volume on self-study in science education in 2012 (Bullock and Russell 2012). I hope that the ensuing years would have seen more self-study researchers explicitly focus on science education, in particular the ways in which particular pedagogical approaches used in science education methods courses might be understood using the lenses afforded by self-study. I would also argue that the global climate crisis, in which we are all implicated, gives new warrant for the importance and relevance of issues of knowledge, identity, and practice in the formation of new science teachers.

Regardless, the idea of constructing a more traditional review chapter exploring issues and themes that have emerged from the intersections of self-study and science education seemed problematic to me early in the process of thinking about this chapter. After some further consideration of both my own entry into self-study and those self-study methodologists that might at least partially identify with science education, I realized that perhaps a different framing was in order. Perhaps a part of the challenge lies in the fact that many of us who identify, in one form or another, as science education researchers who do self-study tend to separate the fields, somewhat. It is not uncommon to find self-study researchers in several disciplines that have parallel publishing pathways – in this case, one pathway for science education research and one for self-study. Furthermore, people such as Tom Russell, John Loughran, and Amanda Berry – long-standing and heavily cited self-study researchers – tend to focus more on connecting their self-study work to more general problems of teacher education and developing self-study methodology further.

This is not to say that self-study of science education, as understood via the lenses offered by this handbook, is not undertaken. For example, Wiebke and Park Rogers (2014) examined the transition from being a science teacher to a teacher educator alongside how one might teach lesson sequencing to preservice teachers via self-study methodology. Trumbull (1998) examined the interactions between her teacher candidates' personal histories before entering a teacher education program and their developing selves as science teachers within host school contexts. Garbett (2011) used self-study methodology to investigate the ways in which using a peer-teaching approach in her science teacher education course might support her belief in

constructivist approaches to teaching about teaching science. Goodnough (2005) investigated constructivist themes in her pedagogy of science teaching as well, choosing problem-based learning as a key intervention in her teaching. Russell (2012) provides a helpful review of a collection of chapters that explore intersections between science education, science teaching, professional development, and self-study.

Although an atypical intersection between science and self-study methodology, Clarke, Erickson, Collins, and Phelan (2005) used complexity science as a way of considering cohorts within teacher education programs, concluding in part that:

> Our commitment to self-study is an essential aspect of a recursive process of doing, thinking about what was done, making adjustments, and doing again. In this way, we adapt to emergent circumstances and participate in the emergence of the practice itself. Hence we argue that the perspective on learning phenomena and practices offered by complexity science represents a new and important theoretical frame that complements the many approaches for studying learning and teaching practices. (Clarke et al., p. 175)

Although complexity science has not caught on broadly as a lens for interpreting conclusions drawn from self-study, there are a set of physical education teacher educators who work in self-study methodology that have explored complexity science-based thinking in significant ways (e.g., Ovens et al. 2013). This is perhaps not surprising given that Fletcher (2012) pointed out the many similarities facing future science teachers and future physical education teachers, including both teacher-related factors (i.e., prior experiences of the subject as students and content knowledge) and institutional factors (i.e., the relative place of the subjects relative to subjects such as literacy and numeracy at the elementary school level).

It is also important to recognize that there is research that makes use of various kinds of self-study methods and/or self-study methodology published in more typical science education journals. Akerson, Pongsanon, Weiland, and Nargund-Joshi (2014) used research journals, video-recorded lessons, and samples of student work to examine the ways in which their professional identities as elementary teachers developed alongside their developing understandings on how to teach concepts related to the nature of science (NOS). They argued that one significant purpose to their self-study was to learn about themselves as teachers, citing some self-study methodology chapters from the first edition of this handbook but, curiously, no works by self-study researchers who had written about intersections between science teaching, science teacher education, or self-study. Jones and Eick (2007) considered the ways in which they collaborated with local elementary school teachers within an inquiry-based curriculum in middle school. They concluded that the efforts of their science education students who worked alongside elementary teachers were highly appreciated and that future work might focus more clearly on how disparate content backgrounds might be productively used to further strengthen partnerships between university-based teacher educators, teacher candidates, and local teachers. Curiously, again, there was no mention of any sort of self-study research, as defined within this handbook and related literature. In

contrast, Faikhamata and Clarke (2013) explicitly used literature from self-study methodology to analyze how teacher educators might enhance their own pedagogical content knowledge in order to work more effectively with preservice teachers. They highlighted the tensions that exist between what they call subject-specific (i.e., science) and domain-specific (i.e., biology, chemistry, or physics) pedagogies, highlighting that the ways in which those who majored in biology, chemistry, or physics before becoming teachers might engage with general pedagogical approaches to science teaching in different ways.

Alongside mainstream self-study research and mainstream science education research, I might have decided to examine any one of a number of works by well-known scientists that contain, with mixed results, some of the methodological markers of self-study. Certainly, curriculum work by Nobel Laureates concerned about the education of future science teachers can be considered to have some of the moral imperative that Pinnegar and Hamilton (2009) highlight as being so essential to self-study work. Similarly, one can find examples of action research and autoethnography in science education, conducted by teacher educators, that might be positioned as self-study.

Ultimately, though, this approach felt somewhat hollow after I considered LaBoskey's (2004) assertion that self-study work needs to be self-initiated and self-focused. It is difficult to make the case that work using more casual definitions of self-study meets these criteria, in my view, as the desired outcome is often something other than a more nuanced understanding of personal practice of teaching teachers. It is often, at best, aimed to cause alarm at the poor quality of undergraduate science teaching and, in many cases, advocate for a particular intervention that seems to be created in the belief that interventions in teaching can be considered independently of those who teach science and science education. Frustrated, I decided that the paucity of literature to review demanded a different question: Why is it that self-study of science teacher education has encouraged so many science teacher educators to focus more on general problems of teacher education, to make the connections that Zeichner (2016) charged were lacking, and to develop self-study methodology more generally?

To respond to this question, this chapter will consider the history of some of the major ideas in self-study methodology that seem to have developed in the crucible of science teacher education classrooms. Exclusion from this chapter does not indicate that a particular piece of research is not within the umbrella of self-study and science education, only that it did not represent a particular trajectory of the development of an idea about self-study methodology. I have not attempted to catalog a complete history of intersections between self-study and science education. Rather, I will use a heuristic from curriculum studies as a tool for thinking about self-study and science education. Christou and DeLuca conceived of five threats to curriculum studies: jargon, contemporaneity, grandiosity, discursive balkanization, and methodological insufficiency. Briefly, these threats refer to the tendencies in curriculum studies to introduce new terms to claim academic territory, to claim that ideas are new and without intellectual history, and to claim that ideas are likely to have sweeping

changes across a plethora of fields and areas of inquiry. Additionally, Christou and DeLuca noted the tendency to fracture curricular discussions in increasingly specific, niche groupings, and that the warranted assertions (Dewey 1938) for claims made are not clearly articulated.

My hypothesis is that those who engage in self-study of science teacher education often move to less discipline-specific work in self-study because the questions they have explored in science teacher education classrooms have led them to concerns about teacher education that might be framed in the way that Christou and DeLuca (2013) have framed the threats to curriculum studies. Crucially, as we shall see, a consideration of the history of three crucial ideas that had their genesis in self-study of science teacher education, Munby and Russell's (1994) *authority of experience*, Berry's (2004, 2007a, b) *tensions*, and Loughran's (2014) *self-study as professional development* for teacher educators, offers important ways forward to the critiques of education research more generally. In so doing, I will demonstrate how 3 ideas from self-study of science teacher education, combined with 5 lenses of a critique of curriculum studies, go a long way to responding to debates about knowledge and pedagogy in education more generally and, in particular, research on teacher education.

The Authority of Experience

Hugh Munby and Tom Russell are both well-cited scholars of science education who spent a lot of time developing and expanding on work by Donald Schön (1983). Additionally, Russell was one of the founders of what came to be known as self-study methodology and has been an extraordinarily active member of the community ever since. Munby and Russell developed the concept of the *authority of experience* within the crucible of Russell's physics curriculum methods course during a 1-year bachelor of education (and teacher certification) program at Queen's University. Significantly, Russell had just completed 1 year of teaching one secondary school physics course, and, at the time of his research with physics teacher candidates, he had agreed to repeat the arrangement with the local secondary school. Unsurprisingly, this arrangement added to Russell's credibility as a teacher educator from the perspective of his students, one "not otherwise granted to professors of education" (p. 89). In this way, a significant and somewhat atypical context for learning about learning to teach was created: a teacher educator (Russell) was set up to conduct a self-study of his practice teaching future teachers while simultaneously teaching the same disciplinary subject (physics) at a local secondary school. As Munby and Russell (1994) noted, "The linkage between school and university programs through Tom's simultaneous teaching in both contexts created an additional and unusual opportunity to explore Schön's perspective on the development of professional knowledge" (p. 87) – a perspective that Munby and Russell had been exploring for some years already before this self-study (e.g., Munby 1989; Munby and Russell 1989, 1990; Russell 1987). It is also noteworthy that although this paper

was published shortly after the formation of the self-study methodology special interest group (SIG) of the American Educational Research Association (AERA) – and thus the unofficial genesis of the formalization of self-study of teaching and teacher education practices as methodology – it does not overtly label itself as a self-study. Munby, the first author, was labeled as a "researcher partner, [who] served as listening post and occasional observer throughout" (p. 87). Although Munby was not labeled as a critical friend as in Costa and Kallick (1993) or Schuck and Russell (2005), one does wonder about the extent to which the co-construction of knowledge about teaching teachers between Munby and Russell, both within this article and elsewhere, might be labeled nowadays as collaborative self-study, critical friendship, or some combination therein.

The core data for this article came from interviews from teacher candidates in Russell's physics curriculum methods class. A wide variety of comments from teachers are presented, and the authors argue that the data reveal, in the main, that teacher candidates find the new ways of learning that are expected of them in teacher education programs remarkably difficult. Munby and Russell (1994) highlighted that teacher candidates are particularly focused on the importance of "practice" teaching in their school placements and "predictable references to technical, mechanical, and more concrete matters which we take to be polite requests for more *tell us how we are supposed to teach*" (p. 88, emphasis original). Additionally, Munby and Russell underscored that even the initially popular idea of observing a teacher educator teach in a local physics classroom was tempered by the challenges teacher candidates experienced in asking meaningful questions about what they were observing. Perhaps most puzzling was the seemingly bimodal nature of the responses: some teacher candidates wanted far more direct information about how to teach, and others wondered why their peers seemed so-called focused on best practices.

The significant contribution made by Munby and Russell (1994) was their decision to use the concept of authority to shed light on the puzzling yet familiar nature of teacher candidates' responses to Russell's teaching efforts. They began with the premise that "the authority within teacher education courses is likely to be no different from that previously experienced; it is the authority of the text and the person at the front" (p. 92). Munby and Russell then argued that teacher education draws upon a different kind of authority, that of the authority of experience, and that one might productively use the authority to understand the tensions inherent in thinking about teacher education:

> We use the term *authority of experience* because of our concern that students never master learning from experience during preservice [teacher education] programs in a way that gives them direct access to the nature of the authority of experience ... [if] learning from experience has its own epistemology, then our concern is that learning from experience is never clearly contrasted with learning that can be expressed and conveyed in propositions ... In their many years of schooling preservice teachers have seen two basic concepts of authority at work: the authority of reason and the authority of position ... Unfortunately, school's preoccupation with the authority of reason and of position can cause teachers and students to ignore a type of authority lying at the heart of action and performance: the authority of experience. (p. 92)

The concept of the *authority of experience* not only suggested an explanation for the difficulties teacher candidates had in making sense of Russell's unwillingness to adopt an approach to teaching grounded in sharing best practices, it also highlights some of the reasons teachers find it challenging to make the transition to teacher educator:

> The explanatory potential of the authority of experience is evident in the predicament of experienced teachers appointed to faculties and colleges of education. Their knowledge-in-action [gained as schoolteachers] gives them the authority of experience. But the circumstances of telling their [preservice teachers] about teaching unavoidably commits them to the authority of being in charge, and their [preservice teachers] are automatically placed under authority. The authority of experience gets transformed into the authority that says, *I know because I have been there, and so you should listen*. The authority of experience simply does note transfer because it resides in having the experience. This [conclusion] coincides with Schön's view that knowledge-in-action cannot be transformed into propositions . . . Experience in the role of teacher is what is new and exciting for preservice teachers, but their opportunities to learn the authority of that experience are hampered in a fundamental way by their being subject to observation by cooperating teachers and by representatives of the university. Those observers are in positions of authority with respect to [preservice] teachers . . . Thus the potential of the practicum to be a forum for beginning to understand and interpret the authority of experience is restricted and undermined. (Munby and Russell, pp. 92–93)

There is indeed a lot to unpack in these comments; one of the most salient messages may be that teacher education programs do not pay sufficient attention to teaching preservice teachers how to attend to, and learn from, the new types of learning required of them. In this particular study, for example, Munby and Russell highlighted some of the more obvious signals to teacher candidates that teacher education is different from other forms of university-based education: a pass/fail grading system, a requirement to spend significant amounts of time in local schools and to be assessed by nonuniversity personnel (associate/mentor teachers), and a more holistic approach to curricular requirements for coursework are all likely to be rather unfamiliar. The idea that teacher candidates might be struggling with learning how to learn because the nature of authority within their educational context has changed is one of the most esoteric ideas imaginable for beginning teachers, yet it may be absolutely critical to helping them to understand and interpret their own experiences.

The concept of the *authority of experience* has become a crucial touchstone within self-study methodology as well. Pinnegar (1998) argued that the authority of experience formed the warrant for self-study methodology – the justification for how those who use the methodology can make claims. In the first edition of this handbook, Samaras, Hicks, and Garvey Berger (2004) situated those working Schön's ideas, including the concept of the authority of experience offered by Munby and Russell (1994), as being foundational to the development of what they termed "personal history self-study." The connection was made particularly strong because of the connections between personal reflections (engaging in the self) and actions taken. Richardson (1996), writing in the second edition of the handbook

of teacher education research, highlighted the value of teacher educators such as Russell exploring his practices and beliefs about teaching teachers within the contexts of school and universities. She also foreshadowed the growth of the burgeoning self-study methodology SIG within AERA. Again writing in the first edition of this handbook, Berry (2004) used the authority of experience as a way of thinking about practical knowledge, "a form of knowledge gained through experience [that is] personal, context-bound, and includes implicit knowing, that is, a kind of knowledge that is embedded within action that cannot be separated from that action" (p. 1305). In particular, Berry called attention to the concept of the authority of experience for thinking about the hierarchy between "traditional theoretical" knowledge and "the status of knowledge derived through personal experience" (p. 1305).

A couple of years after Munby and Russell (1994) appeared, Abell, Bryan, and Anderson (1998) examined the framing positions of elementary preservice science teachers with respect to their self-identities as science teachers, the ways in which they analyzed video case studies, and the ways in which they problematized emergent issues in science classrooms. The conclusion of the paper is one of the early clear articulations of the importance of Munby and Russell's (1994) work:

> Furthermore, we believe that it is the responsibility of science teacher educators to help preservice teachers recognize the validity of experience in shaping their theories. We want them to be able to learn from their experiences in the virtual world and in the real world of the classroom, and regard their experience as a source of authority (Munby and Russell 1994). We believe that the authority of experience, derived through reflection in and on practice, will be meaningful and useful to them as teachers. (Abell et al. 1998, p. 507)

In this way, we can see how ideas developed from an early self-study of teacher education practices conducted by two science teacher educators were first presented in a more general teacher education literature before then being taken up within a major, well-regarded, journal specifically focused on science teaching and learning.

Tensions in Teaching About Teaching

Amanda Berry's use of *tensions* as a heuristic for thinking about knowledge gained from self-study of teacher education practices has emerged as a popular way for other self-study researchers to consider the results of investigation into their own practice. Berry is a significant contributor to self-study methodology and science education research and, like Russell, comes from a background as a science teacher. In a chapter in a previous edition of this handbook, an article, and a book (Berry 2004, 2007a, b), she explained that tensions offered a way of thinking about problems of practice she encountered as a biology teacher educator. By using two extremes of an idea, she was able to "to capture the sense of conflicting purpose and ambiguity held within each" (2007b, p. 120). Berry was also careful to point out that the named tensions interacted within and with each other, "as interconnections

between tensions become apparent, new knowledge of practice is brought to light" (p. 120). The six tensions reported were:

1. *Telling and growth.* This tension is embedded in teacher educators' learning how to balance their desire to tell prospective teachers about teaching and providing opportunities for prospective teachers to learn about teaching for themselves.
2. *Confidence and uncertainty.* This is a tension experienced by teacher educators as they move away from the confidence of established approaches to teaching to explore new, more uncertain approaches to teacher education.
3. *Action and intent.* This tension arises from discrepancies between goals that teacher educators set out to achieve in their teaching and the ways in which these goals can be inadvertently undermined by the actions chosen to attain them.
4. *Safety and challenge* (named by Korthagen 2001, p. 75). This tension comes from teacher educators engaging students in forms of pedagogy intended to challenge and confront thinking about teaching and learning and pushing students beyond the climate of safety necessary for learning to take place.
5. *Valuing and reconstructing experience.* This tension is embedded in the teacher educator's role of helping prospective teachers recognize the value of personal experience in learning to teach, yet at the same time, helping them to see that there is more to teaching than simply acquiring experience.
6. *Planning and being responsive.* This tension emerges from difficulties associated with implementing a predetermined curriculum and responding to learning opportunities that arise within the context of practice. (Berry 2007b, p. 120)

Berry's study was partially motivated by what would eventually come to be known as the literature on becoming a teacher educator, a significant subgenre of self-study methodological literature that has been present from the early days of the field (e.g., Arizona Group 1996) right through to the present day (e.g., DeMink-Carthew et al. 2017; see Williams, Ritter, and Bullock (2012) for a helpful review of the first 20 years of this kind of literature). Berry (2007b) expressed dissatisfaction with what she referred to as a "pedagogy of presentation" approach because she realized that she could not "transfer [her] ideas and experiences into the minds of prospective teachers and expect them to enact [her] approach in their own practice" (p. 118). Put another way, Berry realized that she was struggling with what Munby and Russell (1994) referred to as the authority of experience. Like most teacher educators, she found it difficult to overcome the gap in experience that existed between her and her biology teacher candidates.

Berry (2007a, b) employed an extensive data set including interviews, video recordings of each class, assignments from her students, email correspondence, field notes, collegial observation, and a personal research journal. The study is noteworthy for, among other things, its precision in the use of methods and of the transition between data and the use of tensions as a conceptual frame. Berry (2007b) provided some explanation within her text as to both the initial and enduring appeals of using tensions to make sense of the complicated work of teacher educators:

> The notion of tensions offered a useful way of describing teacher educators' experiences of their practice (including my own). It captured well the feelings of internal turmoil experienced by teacher educators as they found themselves pulled in different directions by

competing pedagogical demands in their work and the difficulties they experienced as they learnt to recognize and manage these demands. Tensions have, for the most part, grown out of teacher educators' attempts to match goals for prospective teachers' learning with the needs and concerns expressed by prospective teachers for their own learning. (pp. 119–120)

The fundamental difficulty that beginning teacher educators have in reconciling their vision of teaching teachers with the reality of what they are able to accomplish is similar to the disconnect experienced by new teachers, who often struggle with the discrepancy between their intended and enacted practices (Hammerness 2008).

Berry's (2007b) use of tensions enabled her to analyze carefully the relationship between and challenges posed to the nature of knowledge used by teacher educators. More specifically, she draws from Korthagen and Kessels' (1999) considerations of *episteme* and *phronesis* to highlight the role of tensions in developing both *phronesis*, defined as "the development of personal perceptions while trying to act to improve one's own teacher education practices" (p. 131) and *phronesis* from *episteme*, defined as "the results of personal efforts to take research-based findings and enact them in personal practice" (p. 131). Korthagen and Kessels' (1999) considerations of *episteme* and *phronesis* from a reading of Aristotle are not without debate, but Berry's link between their ideas and a use of tensions as a framing device has resonated both with self-study researchers more generally and with self-study researchers interested in science education.

One useful example of Berry's work as a framing device is Wiebke and Park Rogers' (2014) exploration of Wiebke's transition from science teacher to science teacher educator. In particular, they focused on the development of a process for teaching future elementary school science teachers how to construct a lesson sequence. Grounded in the concept of pedagogical content knowledge (PCK), first generally articulated by Shulman (1986, 1987) but strongly represented within the corpus of science education research, the authors view self-study as a way of "developing [their] PCK for teaching elementary science teachers" (Wiebke and Park Rogers, p. 223). The authors used a version of critical friendship, somewhat undefined, to analyze collaborative journal entries using the lenses offered by Berry's aforementioned six tensions. Wiebke stated that the tension between *telling and growth* was most significant, whereas interactions with Park Rogers helped both to realize that telling and growth was augmented by the tensions between *confidence and uncertainty* and *planning and being responsive*. These comments underscore Berry's original assertion that tensions are a heuristic tool and that said tensions interact with one another and thus should not be considered as isolated concepts.

As with Munby and Russell's (1994) work, Berry's (2004, 2007a, b) analysis resonates with teacher education researchers outside of the sphere of science education. Goodwin et al. (2014), for example, cite Berry (2007b) as an example of the importance of developing mentoring opportunities for new teacher educators given the difficult transition from teacher to doctoral student to teacher educator, notably using the terms *tensions* and *conflicts* and citing other self-study work by Dinkelman et al. (2006). Margolin (2011) cites Berry's work when describing self-study as "a unique form of research that is responsive to the demands of the practice context"

(p. 10). In both cases, and in many others, we see that work done within the crucible of a science teacher education classroom by a science teacher educator engaged with self-study methodology produced a useful research tool. Berry (2004) commented on the importance of these sorts of contributions from self-study work:

> One of the major challenges for the self-study of teacher education practices continues to involve finding ways to remain true to itself in communicating the particularities of experience while, at the same time, drawing out generalisable knowledge that can be widely available to others. (p. 1328)

It would appear that her use of tensions as an heuristic met, in many ways, the requirements to produce more generalizable knowledge about teaching future teachers, the transition from teacher to teacher educator, and the professional development of teacher educators. This last point will be taken up more fulsomely in the following section with a consideration of an article by John Loughran, one of the most widely cited self-study authors and another science teacher educator.

Self-Study as Professional Development

The unique demands placed on teacher educators have been recognized for some time within the broader teacher education literature. David Labaree, for example, has consistently highlighted the ways in which teacher educators are often marginalized both within their own institutions and within broader societal concerns. Labaree (2005) argued that teacher educators engage in "a difficult practice that looks easy" (p. 188), in part because of the apprenticeship of observation (Lortie 1975) that makes most adults feel as though they have a unique insight into the work of teachers and, in part, because the invisible "second layer of expertise that is distinct to the teacher and teacher educator—the knowledge about how to teach particular subjects to particular students" (p. 189).

Compounding these issues is the fact that many teacher educators begin their professional lives as teachers and that the transition from teacher to teacher educator is anything but straightforward (Bullock 2009; Dinkelman et al. 2006; Williams et al. 2012) and, as Berry (2004) noted, often relies on past successful practices as a teacher in order to develop an initial framing position as a teacher educator. Loughran (2014) takes on not only the issues around the transition to teacher education (regardless of past professional history) but also the nature of teacher education and the importance of researching teacher education practices. Although neither explicitly framed as the self-study of a science teacher educator, nor published in a journal devoted either to science education or self-study, Loughran (2014) merits inclusion in this chapter because he introduces self-study as a way to develop professionally as a teacher educator – and he does so from a significant amount of research exploring intersections between science education and self-study.

John Loughran is also a highly cited and well-published figure in self-study methodology and science education. Along with Russell, he is an inaugural editor of the flagship journal, *Studying Teacher Education* (Berry is now one of the coeditors of this journal, along with Julian Kitchen). Like Russell and Berry, Loughran comes from a science teaching background. Loughran (2014) begins by highlighting some of the challenges in becoming a teacher educator by citing literature from both within and outside of self-study. It is common, for example, to cite lack of support for the transition to teacher education as a problem facing new teacher educators. In responding to comments from Berry (2013) about the necessity of having independent space to construct knowledge of practice, Loughran comments:

> Developing professionally carries expectations of a need for teacher educators to be able to conceptualize and enact their own professional learning in ways that require careful planning and thoughtful actions. To do that requires understanding the nature of teacher education in ways that are supported by genuinely reflecting on, and responding to, the needs, demands, and expectations of teaching about teaching within the academy. (p. 273)

Loughran resists the temptation to then argue for "upskilling staff to perform in new ways," instead arguing that teacher educators need to have space to engage in ongoing professional development (p. 273). In particular, he argues that developing a *pedagogy* of teacher education is more important than developing more traditional ideas surrounding knowledge of a teacher education curriculum. Crucially, he argues that the construction of a pedagogy of teacher education is something that needs to be shared with the preservice teacher education students in one's classroom:

> The nature of a teacher educator's knowledge and practice of teaching teaching can easily be misunderstood and/or misrepresented. Knowledge and practice of teaching teaching requires much more than the simple delivery of information about teaching, or sharing tips and tricks that have been "picked up" or accumulated through school teaching experience (which itself harks back to issues associated with a teacher educator's transitionary issues in moving from school to university). Teaching teaching is about thoughtfully engaging with practice beyond the technical; it is about using the cauldron of practice to expose pedagogy (especially one's own) to scrutiny. (p. 275)

Loughran's comments reflect a consideration of the ideas explored in the two previous sections of this chapter. In the first instance, they can be seen as a way of responding to Munby and Russell's concern about the authority of experience; a teacher educator who exposes their own teaching to scrutiny in their classroom is making a concerted attempt to address the disconnect between the experiences of teacher educator and preservice teachers. Berry's work on tensions articulates some of the fears, uncertainties, and challenges that might result from this difficult work.

In the third part of the article, Loughran (2014) introduces self-study of teacher education practices as an established, and useful, way of describing, interpreting, and analyzing one's practice as a teacher educator. He highlights both the importance of self-study for challenging assumptions about one's practice by citing Bullough and

Pinnegar (2001) and the importance of moving beyond personal stories of practice with a link to earlier work (Loughran, 2010). Anticipating some of the potential concerns about making one's practice visible for public scrutiny in the name of professional development, Loughran (2014) commented:

> The expectations of quality self-study could be viewed as disconcerting but for many teacher educators it has meant that they have begun to see new opportunities for ways in which to research teaching and learning about teaching. In so doing, they have been able to not only learn more about their own practice but also, by focusing more attention on the learning about teaching perspective, better understand the relationship between teaching and learning in substantive ways. As a consequence, their inquiries have highlighted the role of reframing (Schön 1983), the taken-for-granted in their practice to become more informed and knowledgeable about teacher education more generally, their teaching about teaching more specifically, and the learning about teaching by their students of teaching more fundamentally. (p. 278)

Here again, we see Loughran making links to ideas explored in earlier sections. Like Munby and Russell (1994), he sees a significant role for Schön's (1983) perspectives on the development of professional knowledge. Like Berry (2004, 2007a, b), he acknowledges that the process of learning to teach teachers is both ongoing and likely to be fraught with a certain amount of tension.

Loughran's (2014) central thesis is that teacher educators must have both an opportunity to examine and analyze their practices in meaningful ways and an opportunity to situate such analyses within scholarship. He acknowledges that professionally developing as a teacher educator is not only of relevance to beginning teacher educators; it is also a crucial feature of being a teacher educator. The complexity and messiness of making one's practice visible was framed as being both necessary and fraught over an extended period.

Thus Loughran's (2014) assertion that self-study should be considered as a form of professional development goes far beyond what Berry might have referred to as tips and tricks for teacher educators. An examination of the reference list for his article reveals a significant number of references either to work done at the intersections of science education and self-study or to authors who have routinely identified, at least partially, as science teacher educators. Like Munby and Russell and Berry, Loughran's work was soon picked up within the larger sphere of educational research. In an attempt to conceptualize the nature of a desirable research disposition for teacher educators, for example, Tack and Vanderlinde (2014) pick up on Loughran's suggestion that teacher educators view their careers in terms of a research journal. Patton and Parker (2017) quoted Loughran at the beginning of their article to lend credence to the idea of professional development of teacher educators being a "touchstone" for learning as and becoming a teacher educator, before frequently using ideas advanced in Loughran's article as a foundation for exploring how physical education teacher educators engaged in communities of practice. Finally, Ping et al. (2018) used Loughran's (2014) definition comments about the knowledge and skills required to professionally develop as a teacher educator in order to conduct a systematic review of the literature on the professional learning of teacher educators for a major journal. Significantly, they concluded in part:

Many of the professional activities reported on in our review study are closely related to the teacher educators' own practice. For example, doing practice-oriented research, especially self-studies conducted both individually and collectively, usually starts from the practical issues or concerns that teacher educators face in their daily teaching practice. Some reasons exist for self-study research being one of the activities most referred to in the reviewed articles. Internationally, a large network of teacher educators strongly promotes this kind of research, organizing its own conferences and having its 'own' peer-reviewed journal 'Studying Teacher Education'. Self-study provides an efficient approach for teacher educators to explore the why of their routines in their everyday teaching practices and places inquiry at the center of learning and teaching about teaching. (Ping et al. 2018, p. 102)

Future Directions for Exploring Self-Study and Science Education

This chapter began by arguing that the debates about the nature of knowledge within curriculum studies help to shed light on the tensions within and between debates in science education research, self-study methodology research, and teacher education more generally. In part, I suggested that the intersections between science teaching, science teacher education, and self-study span a number of different disciplines, methodologies, and traditions and that academic hierarchies and warrants for "who" should be listened to in debates about science teaching and learning play out in any consideration of science education and self-study. Put simply: the so-called discipline-based educational research in science tends to have little to do with science education research, and science education research tends to exist rather separately from self-study of science teaching and science education research.

I also introduced Christou and DeLuca's (2013) critique of curriculum studies more broadly as a framing device to think about issues raised in the chapter. They articulated five concerns facing curriculum studies: jargon, contemporaneity, grandiosity, discursive balkanization, and methodological insufficiency. I would make a strong argument to suggest that the current situation of disconnect in science education can be understood, at least in part, through these lenses. Each field risks falling into jargon (e.g., what is a critical friend, anyways?), contemporaneity (e.g., the natural sciences' keen interest on the most recent studies), and grandiosity (easily found in any discipline, I would argue). The most serious shortcoming is the discursive balkanization that exists between discipline-based educational research in science, science education research, and self-study of science teaching and science education research. There are rare instances of overlap. Likely the critique of methodological insufficiency could be used by each group to criticize the other two, with accusations of either being too self-focused (and questionably generalizable) or not self-focused enough (and thus too instrumentalist) being leveled.

In selecting Munby and Russell (1994), Berry (2004, 2007a, b), and Loughran (2014), I have attempted to demonstrate the ways in which research done in the crucible of science teacher education and self-study methodology might help us break away from the trends of discursive balkanization and methodological

insufficiency. Each study introduces a concept that has demonstrably broken free from the confines of the self-study of science teacher education to move not only into the frame of self-study methodology more generally but educational research writ large. Each problematized our understanding of the nature of knowledge for teaching and for teaching teachers. Munby and Russell built on Schön's work to call attention to the relationship between authority, knowledge, and experience of teaching teachers. Berry named the complexity and competition between the kinds of knowledge one uses for teaching teachers and the difficult standard one holds oneself to when enacting a pedagogy of teacher education grounded in theory. Loughran pushed us to consider that self-study methodology provides not only a way of navigating the transition into becoming a teacher educator but also a way of making continued professional development via scholarly practice the fundamental work of any teacher educator.

There have been some promising examples of self-study of science teaching and teacher education that have attempted to break down barriers of disciplinary knowledge and methodological allegiances. Many have been cited throughout this chapter, but I encourage the reader to examine some of the following work as well to understand how we might move forward more collaboratively in self-study. Santau (2012), for example, provides a fascinating account of how she became a science teacher educator after having worked in a laboratory. Her self-study is a potent reminder of the preconceived ideas that laboratory scientists might have about science educators and vice versa. In particular, Santau highlights the ways in which her doctoral program in science education did and did not help her make the transition from laboratory science to teacher education, concluding in part that "A series of assumptions appears to drive the path of a doctoral student who enters academia and who is, by default, expected to teach teacher candidates without explicit attention to preparation for the role of teacher educator" (pp. 61–62). Osmond and Goodnough (2011) explored just-in-time teaching (JiTT) within the context of a science education methods course, in work that will likely appeal to many discipline-based science educators given the popularity of JiTT approaches in undergraduate coursework in science. Osmond commented that the approach both strengthened her understanding of preservice teachers' assumptions about scientific concepts and her own pedagogical content knowledge (PCK), a popularly researched concept in science education more generally. Nageotte and Buck (2019) used critical friendship to understand dialogic approaches to teaching science in higher education and, in a poignant comment, suggested that "the challenge of silence" (p. 16) is a critical challenge for new science instructors to negotiate in their work with students. Like the work of Munby and Russell, Berry, and Loughran cited earlier, these self-studies of science teacher education offer ideas useful to the specialist in science teaching or in science teacher education, as well as the generalist audience across disciplines. I suggest that future work in self-study and science education readily identifies itself as embracing traditions from both sets of research, in order to help future researchers make connections between the disciplines.

It has been clear since the beginning of the self-study of teaching and teacher education practices that there is no one right way to conduct self-study research,

although there is a particular kind of coherence. Writing in the closing chapter of an edited volume on self-study and science teacher education, Russell (2012) made the following comment:

> To conduct a self-study of one's teaching practices is to give oneself reason, seeking out the sense in one's existing practices and in the responses of our students to those practices. As we seek to understand more fully our practices and what our students make of them, it is almost inevitable that puzzles and uncertainties will arise, and these often lead to a reflective turn. (p. 199)

In closing, I would like to push Russell's comments a bit further. In the next decade, I hope that those who work in discipline-based educational research within the sciences, in mainstream science education research, and at the intersections of self-study and science education will find ways to share their puzzles and uncertainties outside of traditional boundaries. Doing so will require an acknowledgment of different ways of knowing and different warrants for how we come to know about science education, science teaching and learning, and science teacher education. Given the challenges that our planet currently faces, I would argue that Pinnegar and Hamilton's (2009) comments about the moral commitment of self-study researchers should exceed existing discursive balkanizations and, hopefully, allow us to find ways to speak with one another more directly.

Abstract

In this chapter we present a review of self-study research with a social studies education connection. We reviewed 60 published works in two phases of analysis. First, we read the literature through an open interpretive approach looking for patterns and themes that could provide insights into the body of research as a whole. We then reviewed the literature through two frames – the notion of transformation and the construct of teaching for democracy. Initially we found that the body of social studies-situated self-studies included: (1) a strong presence of scholars and publishing outlets located in the United States; (2) few studies that provide a rich and robust connection of the study to both social studies education and self-study; (3) studies providing insight into the complex and nuanced innerworkings of the social studies education endeavor; (4) a trend toward collaborations with science education scholars; (5) a variety of ways that individuals engaged in self-study; and (6) a variety of ways to collaborate. We also found evidence of a focus on teaching for transformation and democratic living. We provide three recommendations: (1) that social studies focused self-studies be situated more strongly in social studies education literature, (2) that we expand the questions that social studies focused self-study scholars ask, and (3) that the field engage in conversations about what qualities should be seen in social studies focused self-study.

Introduction

Where do we go from here? asked Dr. Martin Luther King Jr. in 1967 (Martin Luther King, Jr., Research and Education Institute 2019). Though his purposes and aims for the Civil Rights Movement in the United States were far greater than those of a handbook chapter, the question resonates with us as social studies educators because of fundamental connections between the civic and transformative goals and objectives of the Civil Rights Movement and the civic and transformative goals and mission of social studies education. Though how and what we teach may differ (Evans 2004), the field as a whole has an ultimate purpose of citizenship education (Barr et al. 1977). Self-study researchers also seek transformation through the study of their teaching practices. They seek to improve their teaching and value social justice (LaBoskey 2004). In both fields, we want to teach beyond learning content by developing the skills and attitudes necessary to foster a well-educated, civically competent, and civil citizenry that teaches for justice for all. Thus we ask: Where do we go from here?

In this chapter the term social studies is used. This term, which is employed throughout the United States, refers to a multitude of disciplines that study humans in their social world (e.g., history, political science, geography, sociology).

The National Council for Social Studies (NCSS) has defined social studies since 1992 as:

> the integrated study of the social sciences and humanities to promote civic competence. Within the school program, social studies provides coordinated, systematic study drawing upon such disciplines as anthropology, archaeology, economics, geography, history, law, philosophy, political science, psychology, religion, and sociology, as well as appropriate content from the humanities, mathematics, and natural sciences. The primary purpose of social studies is to help young people make informed and reasoned decisions for the public good as citizens of a culturally diverse, democratic society in an interdependent world. (NCSS 2010)

Social studies is a term used by some outside the United States but not all. In Australia the same subjects mentioned by NCSS appear as Humanities and Social Sciences. Although the name is different, the purpose remains similar – to "provide a broad understanding of the world in which we live, and how people can participate as active and informed citizens with high-level skills needed for the 21st century" – still essentially preparing for citizenship (Australian Curriculum and Assessment Reporting Authority 2016). The United Kingdom includes similar focus through the subjects of citizenship, geography, and history (Department of Education 2014). What the United States, Australia, and others share through the teaching of subjects that fall under the name social studies is a focus on citizenship. For the purpose of this chapter, social studies is defined as a field of study in schools which uses disciplines in social science and history in the preparation of citizens to understand the inner workings of the social world around them.

Self-study is a genre of qualitative research that can be considered one form of practitioner inquiry. Self-study began with teacher educators wanting both to transform teacher education and to understand how teacher educators team. Self-study existed as a formalized field for over 20 years, first as self-study of teacher education practices, moving into the study of teaching and teacher educator practices, and recently beginning to include professional practices beyond teaching. Self-study research is theoretically grounded in many areas as explored by LaBoskey (2004). Our understanding of self-study included many of the areas she explores but is captured well by understanding that self-study for us rests strongly on the joining of feminist values with Deweyan pragmatism and democratic goals to disrupt barriers between knower and known and research and researched, develop knowledge and understanding of practice, solve problems, and improve practice all from an insider perspective.

As you approach reading this chapter, there are at least three ways to use this chapter. First, you can read it to explore what self-study research has been done in social studies contexts and develop a broad base of knowledge of what these works tell us. Second, you could use this chapter to introduce yourself to those who have been conducting self-studies as social studies educators. Third, you

can read this chapter to consider what areas need more work and find areas where you can explore, connect with, and build upon as a self-study social studies scholar.

The chapter begins with the methodological approach to the review. This will help you understand the processes we engaged in to find, choose, and analyze the literature. We then provide a set of initial findings that help provide insight into the works reviewed in a range of general ways including, for example, publishing patterns, theoretical grounding, and approaches to the studies. We then provide a set of findings related to how the works contribute to understanding, how to transform and improve schooling and society for all, and/or how they promote a robust democratic way of life. These two ways of looking at the literature, both with a wide, general lens and then a specific lens, help give various views on the body as a whole. You can then read a discussion of where our field is and then move on to where we think social studies focused self-study can push boundaries and expand.

Methodological Approach to the Literature Review

Self-study research has been occurring in the broader teacher education community since at least the beginning of the1990s and became formalized in 1994 with the creation of the Self-Study of Teacher Education Practice Special Interest Group within the American Educational Research Association (Loughran 2004). After its creation, Zeichner (1999) recognized self-study as a new form of research with great promise for understanding teaching and teacher education. Although some social studies teacher education scholars engaged in self-study for many years (e.g., Dinkelman 2003; Johnston 2006; Johnston et al. 2002), a strong tie between self-study and social studies has taken time to develop. More recently, the use of self-study to focus specifically on social studies teaching and teacher education has begun. In Crowe (2010a), nine different self-studies, foundational information (Crowe and Dinkelman 2010) and conceptual arguments (Powell 2010) for self-study in social studies education are presented. The number of self-studies with a strong tie to social studies education remains limited, and a thorough review may offer additional guidance to those new to this endeavor.

In considering the power of self-study research to provide insight into the nature of teaching and teacher education, Zeichner (2007) called for self-study work to better situate itself within larger research programs and for us to begin to look across self-studies to better understand what can be learned from within a field. In this chapter, we begin to work toward this second portion of Zeichner's call, searching for a sense of what knowledge is embedded across social studies specific self-study work.

We consider our review systematic in the manner that the *Review of Educational Research's* explained as acceptable forms of review: "integrative reviews, theoretical reviews, methodological reviews, and historical reviews" (as cited by Kennedy 2007, p. 139). Kennedy describes a type of systematic method that does not

necessarily ask the type of question that a meta-analysis may but where the review includes clear criteria, provides boundaries to the literature, and is helpful for readers to gain a deeper insight into what work has been conducted, especially for those beginning to read within a field. Key here is a thorough, transparent methodology for the review of the literature.

We entered this endeavor with two research questions in mind:

- What does the body of self-study research in social studies education tell us about what we have studied as self-study social studies scholars of teaching and teacher education?
- What are the strengths and limitations of the work so far?

Search Process

We used six approaches to search for research that used self-study as the methodology within the social studies education context.

- *Database search*: Exploring five databases, Academic Search Complete, Academic Search Premier, Education Full Text, Education Research Complete, and ERIC, with combinations of social studies, self-study, and teacher education.
- *Social studies education journals*: Searching four major journals in social studies education that publish research – *Theory and Research in Social Education*, *The Social Studies*, *Social Studies Research and Practice*, and *The Journal of Social Studies Research* looking for any published items that refer to the term "self-study" ($n = 41$). If one of these articles was not self-study research itself but identified a piece of self-study work in their writing, we also gathered that source to review ($n = 7$).
- *Studying Teacher Education (STE)*: Examining the flagship self-study journal for articles that referenced social studies, social sciences, history, economics, government, civics, citizenship, geography, psychology, or sociology ($n = 39$).
- *Castle Conference Proceedings*: Reviewing all proceedings from the International Conference on Self-Study of Teacher Education Practices for the term social studies ($n = 43$).
- *Social studies education research handbooks*: Reading the chapters of the two most recent social studies education research handbooks (Levstik and Tyson 2008; Manfra and Bolick 2017) that included reviews of social studies practitioner-based research for references to works they deemed self-study.
- *Database search*: An additional search of all databases our university subscribes to, which added databases such as Humanities International Complete, JSTOR Journals, and PsycINFO as well as the catalog of books for OhioLINK. We searched using the terms social studies, history, civics, political science, social science, social education, economics, geography, psychology, and sociology, with self-study to try to locate pieces that referred to subject matter considered a part of social studies but that may have been overlooked. If a new piece was

identified, the journal it was in was then searched for the combination of social studies and self-study ($n = 6$). Several chapters that were social studies and self-study also appeared ($n = 14$).

Once compiled we revisited all areas before finalizing this chapter to make sure we included the most up-to-date references. This expansive search brought in far more scholarship than merely self-study research in a social studies context. Inclusion and exclusion criteria helped us select the studies to be reviewed.

Selection Process

From the articles, chapters, conference proceedings, and books gathered, the following inclusion and exclusion criteria were applied to finalize the pool of research. To be included all four inclusion criteria must have been met and no exclusion criteria met.

Inclusion Criteria

- The item must be research.
- The item must be self-study research, as defined in some manner by the author. For example, the research was published in a self-study journal, book, or conference proceedings, the author used self-study literature to frame the research methods, and/or the author called the study, methodology, or methods self-study.
- The item must be social studies as defined in some manner by the author. For example, the work was published in a social studies education journal or book, the author used social studies literature to contextualize the piece, or the study was conducted within a social studies educational setting (i.e., a teacher educator teaching future social studies teachers, a history/social science professor teaching history/social sciences students, teachers' self-studies of their teaching in a social studies context).
- The item was written in English. Although this limits the chapter because it only focuses on works published in one language, as authors we could only feel confident reading and analyzing such works. As well, most works found were in English language sources. We want to acknowledge that there are social studies scholars beginning to publish self-study work in other languages though (Japanese for example, see Kim and Hirotane 2018).

Exclusion Criteria

- Theoretical or conceptual works were excluded from the literature review (e.g., Dinkelman 2000 & 2003).
- Works that identify self-study as part of accreditation were excluded.
- Works that define self-study as students or teachers learning on their own were excluded.

Analysis

With detailed criteria and a wide range of places to search, it would seem easy to find self-study work with a social studies focus. However that was not the case. To begin, 170 items that included self-study and social studies in some form that appeared to be research written in English were gathered. Works that we already knew were literature reviews that referred to social studies and self-study were not included in this initial group. We then applied the criteria. Upon examination of each item, we found some that appeared as research in the search (such as Dinkelman 2003) were actually not or appeared to have a social studies context but when examined closely, did not (such as Young and Erickson 2010). Other works included the term "self-study" in the literature review by referring to another piece of research (e.g., Journell 2008 for an example) or as part of an implication in the conclusion (e.g., Castro 2013). These were quickly eliminated since the study that the publication was based on was not described as a self-study by the author(s). After all inclusion and exclusion criteria were applied, 60 research articles, book chapters, and chapters in proceedings were included for further review. Our review ended with items in 2018.

We chose two approaches to analyze the literature. First we read and applied an open interpretive frame looking for patterns and themes that emerged by looking at the research as a whole. The benefit of coming at the literature without any a priori assumptions or categories was that we were likely to see connections and relationships we might miss if we were looking through a particular lens. As we began to see patterns and themes, we took those and looked across all the works with some specific areas in mind such as was the work completed alone or collaboratively, how was the work framed, what literature was the study connected to, what was the purpose of the study, what type of self-study was it, and what was the key focus or focal areas for the study. This produced the section titled initial findings below.

Since this is particularly a review of social studies work, we chose to apply two lenses after the initial analysis: one transformative and the other democratic. These lenses helped to specifically look for ways that self-study research might or might not be enabling, describing, or revealing transformative or democratic social studies practices. We think that self-study can play an important role in being transformative for social studies education but also for making it more democratic. These are also key areas that we think social studies as a subject can offer both theoretical and active civic support within the educational community and in society more broadly. Therefore, we wanted to determine if and in what ways these might be underlying currents in the studies that exist thus far.

Initial Findings

An initial read of the literature proved interesting. We organized the patterns and themes that emerged into six findings that reveal several opportunities for growth within the field. We found that the literature (1) reflected a strong presence of scholars and publishing outlets located in the United States; (2) included few studies

that provide a rich and robust connection of the study to both social studies education and self-study; (3) showed that these self-studies provide insight into the complex and nuanced innerworkings of the social studies education endeavor; (4) included a trend toward interdisciplinarity; (5) highlighted a value for variety of ways that individuals engaged in self-study; and (6) represented four types of collaboration signaling a value for collaboration in the field. Many studies could be categorized under more than one of these findings, but for readability and accessibility, we chose to succinctly explain each area and provide illustrative examples rather than include every citation that could relate to every finding.

A US-Centric Field

It is interesting to understand both where and when work that is self-study research with some social studies context has been published. Castle proceedings show the earliest works in 2000 and contain the most with 16. In informal conversations over the years, many of those who are both self-study and social studies scholars have expressed a sense that self-study is not published in social studies journals and a superficial look seems to counter that with 13 items in social studies journals. However, upon a deeper examination, the leading social studies research journal, *Theory and Research in Social Education*, has only published three works by authors who identify the research as self-study (Kirkwood-Tucker 2004; Ritter 2010a; Sevier 2005). Considering self-study has a history of more than 20 years, and this journal publishes four issues a year with roughly four research articles per issue; the feeling that self-study is not published in social studies seems justifiable. *Social Studies Research and Practice* and *The Social Studies* have each published five pieces between 2005 and 2018. Social studies researchers have found equal success in journals outside of self-study and social studies ($n = 9$) and with *Studying Teacher Education* ($n = 9$). Ten book chapters were published, nine of those in an edited collection of self-study work (Crowe 2010a). From 2000 to 2018, each year between one and five items have been published except one. In 2010 the most items were published yet at 16, including an edited volume with 9 research-based self-studies (see Crowe 2010a).

The United States is strongly represented in both the location of the publications and the location of the authors. Almost all of the book chapters and journal articles were published by authors or in publications primarily associated with the United States. Nine journal articles were published in *Studying Teacher Education*, which has had editors from Australia and Canada and whose reviewers are international. The chapters in the proceedings for the Castle Conference ($n = 16$) can be considered international since the conference is in England and draws authors from many countries typically across five continents. The social studies authors, however, overwhelmingly represent US contexts. Two of the book chapters were authored by individuals outside of the United States (Australia (Tudball 2010) and Canada (Farr Darling 2010)), and one chapter in the 2006 Castle proceedings by Berry and

Crowe had one individual author from Australia and one from the United States. However, the US context in Berry and Crowe (2006) was the social studies context.

There were 79 distinct authors included in the 60 pieces reviewed. Of the 60 pieces, 32 were authored collaboratively (2 or more people), and 28 were authored alone. Seventeen of the 32 collaborations involved groups of 3 or more. Of the 32 pieces authored by groups, there were 27 combinations of authors. Although single-authored, evidence in at least three of those studies show that the study occurred while the author was part of a collaborative self-study research group (Hostetler 2010, 2012; Johnston 2000). These findings reflect the value of collaboration within self-study that was reported in the first handbook through LaBoskey's chapter (2004) and was evidenced throughout the *Handbook* by the numerous places that collaboration appears.

A Dearth of Studies with a Strong Theoretical Grounding in Both Social Studies and Self-Study Literature

In looking across our work as a field, it is clear that social studies teacher educators are not consistently grounding our social studies self-studies in both social studies literature and self-study literature. Many studies have a strong grounding in one field or the other. At times, self-study literature or social studies literature is not cited. It is important to explain that the authors discussed in this section did not set out to explicitly influence the fields of social studies education or self-study. Rather, we are reporting a trend in what we saw when looking across a body of literature, most of which we had read at some point and considered social studies focused self-study. Many of the studies were coded as having minimal to no social studies theoretical grounding. At times authors did not ground their work in the methodological literature of self-study or related self-study literature. It is important to note that though studies may not be grounded in one or both areas, this does not mean that the works are atheoretical or lacking a strong tie to literature. For example, Cuenca (2010) grounds his study quite strongly in teacher education literature. It is contextualized and situated very well within teacher education, just not social studies education. This is a thoughtful piece of self-study scholarship by a social studies educator that adds to our understanding of how a new university supervisor who is just from his life as a teacher in secondary schools experiences supervision of preservice teachers. However, without the theoretical grounding in social studies or deliberate connection to the field of social studies, the findings do not add to what it means to be a social studies university supervisor as they could.

Within the literature, we found studies where one of the authors was in a social studies context (one of the inclusion criteria), but the study is not about the social studies portion of that context (e.g., Berry and Crowe 2006; Coia and Taylor 2004; Cuenca 2010; Dinkelman et al. 2006a, b). For example, Coia and Taylor study their enactment of authority in their teaching, and Dinkelman and colleagues explore the transition from teacher to teacher educator. Others are in a social studies context

that is more a focus of the study, but the authors do not to situate the study in or relate the findings to social studies literature. Crowe et al. (2010) clearly demonstrate they are engaging in self-study within their social studies program and about their practice as social studies educators, but the study is situated in a broader teacher education and self-study methodology context. Studies like this can add a great deal to social studies education conversations, and as we move forward in future studies, a clear and stronger connection to social studies education is important.

At times, a study is reported as a self-study by the author who clearly is including their teaching as a part of the study, but no self-study literature appears in the methods and methodology sections. This can be seen in Kirkwood-Tucker's (2004) exploration of the use of simulation in teaching. The author had three research goals, and one was specifically about exploring her "own global teaching practices in exposing students to pressing global issues voiced before the United Nations General Assembly" (p. 58). Though the methods chosen are grounded in well-accepted qualitative literature without the connections to self-study methodological literature, social studies scholars are not learning about the methodology of self-study.

Teaching Social Studies Teachers Is a Complex Endeavor Across Multiple Spaces

Loughran (2005) posited that self-study was "a meaningful way for uncovering important facets of the knowledge of practice." A way by which "teacher educators might then begin to capture, unpack and portray the complexities of teaching and learning about teaching in ways that might lead to deeper understandings of practice" (p. 13). Social studies scholar Adler (2008) explained that self-study research enables us to bring forth the implicit theories of social studies teacher educators and subject those beliefs to close scrutiny, careful analysis, and reflection (pp. 332–333). Essentially, self-study research provides insights into the complexity of our endeavor as social studies teacher educators. Social studies educators who engage in self-study demonstrate that social studies teacher education is not something that merely occurs in the social studies methods course. Studies thus far tend to show the complexity of teacher education in one of four spaces of social studies education: supporting and supervising preservice social studies teachers while in fieldwork, teaching and learning in social studies methods courses and social studies education programs, and learning in social studies teacher education graduate programs.

There are a number of social studies self-studies that occur within the context of supporting and supervising preservice social studies teachers (e.g., Cude et al. 2016; Cuenca 2010; Cuenca et al. 2011; Hartwick and Johnson 2008; Ritter et al. 2007; Trout 2008, 2010, 2012). Trout's (2010) self-study research deeply explores the individual relationship between a preservice social studies teacher and a supervisor through the frame of care theory (Noddings 2003). Trout (2012) continues this research by exploring the author's capacity to "think about the relationships I have with teacher candidates and how our interactions may affect their development as

beginning professionals" (p. 125). While the author did not characterize herself as a "teacher in the usual sense of the word," she did identify as an "educator" in her supervisory role. Similarly, Cuenca et al.' (2011) self-study research focuses on university supervisor/teacher educator and student teacher interactions and suggests creating a "third space" to provide more depth for university supervisors/teacher educators to engage in relevant conversation and thinking in teacher education. These expansions of our notion of what constitutes social studies teacher education, via self-study, reveal the complexity of our work.

Many studies focus on the social studies methods course context in some manner (e.g., Christou and Bullock 2014; DeWitt and Freie 2005; Dinkelman 2010; Dinkelman et al. 2012; Journell and Webb 2013; Lang 2010; Meuwissen 2005; Ritter 2010b). Much of this research focuses on the pedagogy enacted in these spaces by teacher educators and/or students. Logan and Butler's (2013) collaborative self-study explores their practice and pedagogical choices in the context of a methods course. Preston-Grimes's (2010) self-study focused on her teaching practice in an elementary social studies methods course and found that "through a study of 'self in teaching,' I have changed *how I teach* in light of increasing demands" (p. 189, emphasis in original). DeWitt and Freie's (2005) study occurred in the context of a social studies methods class, and they aimed to improve their practice in future versions of the course. Lang's (2010) self-study sought to improve the "skills for bringing issues of diversity and democracy to the forefront in the context of the social studies curriculum methods course" (p. 71). As the author explained, "I wanted to explore how I could better teach preservice teachers that understanding points of view and perspective taking are crucial in the diverse social studies classroom" (p. 75). Tschida and Sevier (2013) used dialogic conversations to explore their experiences, issues, and challenges they faced with an elementary social studies methods course they taught for the first time in an online format. Tudball (2010) focused on internationalizing the curriculum in her social studies education course in Australia.

Some self-studies focused on aspects of the social studies program as a whole rather than a practice in an individual course. Crowe et al. (2010) explored how three professors sought to analyze, question, and improve their social studies teacher education program. They reported the experience of the growth and implementation of their overall vision for the program. Cronenberg et al. (2016) used self-study to examine their teaching and experience across the program as they began to use a standardized, high-stakes performance assessment. They used narrative methods to explore their experiences with this performance assessment to understand impacts on their teaching and the program. They found that despite their efforts, their teaching shifted from a focus on learning about teaching to learning the rubrics of the standardized assessment. They also went from being optimistic about the potential of this performance assessment to being quite skeptical as to whether it consistently and accurately assesses their students' ability to teach rather than their ability to write and follow directions.

Authors also unpacked the complexity of teacher education while engaged in graduate education. Within this is a substantial thread of research that uses self-study

to explore the process of becoming a social studies teacher educator (Hostetler 2010, 2012; Levicky 2014; McAnulty and Cuenca 2014; Ritter 2006, 2007, 2009). Some of the earliest works in this area were by Ritter (2006, 2007, 2009). Ritter (2006) found three areas of difficulty in the transition from classroom teacher to teacher educator. Ritter's (2007) study explored how graduate coursework contributes to the development of identity, practice, and understanding of being a reflective teacher educator. Following this study, Ritter (2009) employed self-study to analyze the development of a teacher educator's vision and showed an example of graduate school experience as an influence on teacher beliefs, pedagogy, and practice. Levicky (2014) contributes to this body of research by sharing a focus on the evolution of his beliefs and identity as a social studies teacher becoming a social studies teacher educator while influenced by the ideas of counterculture of the 1960s and 1970s. Hostetler's (2010) self-study of the graduate school experience adds to this area. Unlike other work on becoming a social studies teacher educator, Hostetler's study highlights the use of self-study as a teacher in a secondary school. This work provides insight into the use of self-study as a means to analyze and situate a teacher's beliefs, theory, and practice in an ongoing and evolving manner throughout graduate school. Through the studies we begin to see nuances and complexities among beliefs and values as a social studies educator and one's practices and learning.

Interdisciplinarity

The studies reviewed show scholars engaging in interdisciplinary ways with teacher educators from science and math. Collaborations with a science teacher educator were common (see Berry and Crowe 2006; Christou and Bullock 2014; Kirkwood-Tucker and Bleicher 2003; Johnston 2000; Johnston et al. 2002; Johnston-Parsons et al. 2007; Journell and Webb 2013; Lang and Siry 2008). Johnston (2000) studied with a science teacher educator and shared what they learned about meeting the needs of preservice teachers of color when teaching about social justice and equity. Kirkwood-Tucker and Bleicher (2003) share a self-study centered on traditional social studies content, global issues, through their team teaching of an elementary social studies and science methods course. Journell and Webb (2013), a social studies and a science teacher educator, studied their experiences teaching subject matter methods courses that included students pursuing licensure through a 4-year program and alternatively licensed students together. Lang and Siry's (2008) self-study explored how their teaching in social studies and science methods courses fostered "strategies, orientations, and structures that help us to more effectively engage preservice teachers in using inquiry-oriented pedagogy and understanding diversity" (p. 213). Araujo, Uribe Florez, and Goenaga Ruiz de Zuazu (2017) brought math and social studies together. They created a math and social studies day at a local elementary school where their students could teach an integrated math and social studies lesson. They studied this process, which included the preparation of their preservice teachers. Their reporting exposes the opportunities and drawbacks

to the process. Partnering with colleagues from other disciplines and engaging with content not traditionally considered part of the social studies reflect the already interdisciplinary nature of social studies education and the propensity of social studies educators to cross-disciplinary borders.

Varied Approaches to Self-Study

How self-study research was enacted had similarities, like the use of qualitative methods of data collection and generation. However, the variations provide greater insight into the many ways that social studies teacher educators engaged with self-study. We present individual and collaborative approaches along with the variations within those.

Individual approaches: Studies varied from a deep focus on internal aspects of the self as a social studies educator to an exploration of the self within one's practice to an examination of actions and practices. It is most helpful to consider this as a continuum. Farr Darling (2010) engages in a personal history self-study that explores her experience and that of her grandmother within the larger historical context. Through the story of their experiences, she allows readers to see how her experiences connect and relate to her practices as a social studies educator.

Other authors focused on the changes of their beliefs and knowledge as they are in graduate school. Hostetler (2010) reported on outcomes of a self-study into one's teaching beliefs and practices and how engaging in self-study led to empowerment as a classroom teacher of social studies (Hostetler 2012). Ritter (2010a) investigated the transition from K-12 classroom teacher to teacher educator; analyzed the assumptions of the "skills, expertise, and knowledge" needed to be a teacher educator; and explored the process of becoming a teacher educator.

Some look at the experience of teaching and learning as a teacher educator. Kessler (2006) studied the experience of returning to the high school classroom to obtain National Board Certification in Adolescence and Young Adulthood/Social Studies-History. The author highlights the interplay between this process and improving the teaching and learning in the social studies methods course. Hawley's 2010 study explored the connection between planning and teaching social studies education courses, both undergraduate and graduate teachers, and the author's continued refinement of his rationale for teaching social studies. Ritter (2012) examined his use of modeling in his elementary level social studies methods course. He shared in the article how four types of modeling appeared in his teaching.

Collaborative approaches: Thirty-one of the reviewed studies were collaboratively created, and over half of those were groups of three or more. Collaboration took on at least four forms across the literature: (1) scholars who specifically situated their own work as a critical friendship; (2) scholars who worked together on a project or study with one research goal or the same research question(s); (3) those who engaged as a collaborative, supporting one another but conducting their own self-study with separate foci; and (4) those who used self-study to study a collaborative process.

A critical friendship is a common form of collaboration in self-study, for example, Berry and Crowe (2006). Logan and Butler's (2013) study is an example of critical friendship within collaborative self-study. The authors undertook a self-study as critical friends as they taught elementary social studies methods courses for the first time. Similar to Logan and Butler, Christou engaged in a critical friendship when teaching a new course. In Christou and Bullock's study (2014), Bullock acted as Christou's critical friend but did not teach the same course like Logan and Butler did. Both studies provide insights into the process of learning to teach a new course and into the experience of a critical friend partnership.

A second type of collaborative self-study occurred when authors were working toward one research goal or the same research question(s). Dinkelman et al. (2006) undertook a collaborative inquiry around the research question: "What does collaborative inquiry into shared instruction of a social studies student teaching seminar reveal about how beginning and experienced teacher educators make pedagogical choices and draw on standards to support them?" (p. 280). They described a give-and-take in their practice between their "commitment to a critical democratic conception of social studies teacher education" and the resistance of the preservice teachers they taught (p. 280). Hawley et al. (2012) explored their individual teaching rationales as a group. Their self-study collective helped them delve into their teaching practice "to explore the influence of their unarticulated beliefs about teaching and learning" (Hawley et al. 2012, p. 155).

A third type of collaboration also appeared, self-study collaboratives where the participants supported one another but were engaged in studies of their own practices (e.g., Hawley et al. 2010a, b, 2012; Hostetler et al. 2012, 2013; Ritter et al. 2007, 2008). Examples of this type of collaboration include the findings of a self-study among teacher educators and preservice teachers that explored how taking an inquiry stance through self-study contributed to learning about teaching practices (Hostetler et al. 2012, 2013); the work of a self-study collective to support graduate students in their individual social studies self-studies (Hawley et al. 2010a); and the collaborative self-study of three beginning teacher educators who "...found that collaborative self-study provided a useful framework for considering their pedagogical reasoning and decision making as they encouraged student teachers to engage in rationale-based practice" (Ritter et al. 2007, p. 341). Hostetler et al. (2012) exemplify this conception through their focus on "self-study and inquiry work" (p. 165) in a collaborative as a means to create space for supporting preservice teachers. This study found the self-study collaborative to be a supportive, reflective group that helped nurture the developing beliefs and attitudes of preservice teachers. Those who participated in these studies were part of the same teacher education program. Collaborative self-study seemed to have become part of the teacher education program, though not in formalized or required ways.

A fourth type of collaboration included the use of self-study to examine a collaborative process. Cude et al. (2016), Hawley et al. (2010b), and Dinkelman et al. (2012) exemplify this. Cude and colleagues engaged in a collaboration to better understand their teaching and better prepare the students they taught. One of the purposes of their study was to learn "what contributed to a successful collaborative,

interdisciplinary partnership" (p. 23). From this they found that the success of a collaborative depended on "ongoing communication, shared vision, and goodwill" (p. 23). Hawley et al. (2010b) described a self-study collaborative as a means to collectively and individually explore the depths of social studies education, practice, teaching, and learning. In their work, the graduate students shared both how they experienced the collaborative and what they gained. Dinkelman et al. (2012), former doctoral students, sought to understand the influence a collaborative seminar from their graduate education had on the doctoral students' development as scholars and teacher educators. The group found ways that experiences with a collaborative process in graduate school stayed with them especially the value of collaboration as a scholar and as a teacher educator.

Social Studies Focused Self-Study for Transformation and Democratic Living

As social studies educators, we chose two lenses to view body of self-study by social studies educators. These lenses reflect two interrelated themes that appear often in social studies education: teaching for transformation (Dewey 1916) and teaching for democracy (see Dewey 1916; Barr et al. 1977; Parker 2003; Westheimer and Kahne 2004). We chose to look at the social studies self-studies through a transformative lens because we believe that social studies can and should play an important role in transforming schooling and society to be more just and equitable for all. In social studies, themes that relate to the notion of transforming society such as social justice, improving students' lives, and improving society have permeated social studies conversations since its early days (Evans 2004). Improvement and equity are also important values appearing in self-study literature (LaBoskey 2004). We chose to look at the literature through a democratic lens because of the influence of Dewey (1916) and teaching toward democracy as a way of life on social studies education, notably seen in Parker (2003). As well, social studies is often viewed as an important subject to learn to be a member of a democratic society, as stated in the NCSS (2010) purpose for social studies education. The notions of transformation and democratic are interrelated. Shulte (2004) posited a connection between transforming as a teacher educator and creating a democratic classroom where one engages in "more socially just teaching" (p. 712). We found that many studies could be described in both ways; we present select ones to highlight each theme.

Transforming and Improving Schooling and Society for All

As we reviewed and analyzed the self-study research in social studies education, we found the notion of teaching for transformation. We found authors who explored teacher education with intentions of transformation and other who found ways that self-study facilitates transformation. These can inform and instruct efforts to improve social studies teacher education programs.

Some authors explicitly wrote about transformative intentions. Hartwick and Johnson (2008) collaborated to understand how one of them experienced being a supervisor of preservice teachers while attempting to enact principles of transformational multiculturalism. Araujo, Uribe Florez, and Goenaga Ruiz de Zuazu (2017) held a commitment to transformative multicultural social studies. Their study focused on their preservice teachers' teaching as they prepared and taught an integrated social studies and mathematics lesson in the context of transformative multicultural social studies.

Sevier (2005) studied his own practice as he recommitted to his theoretical influences of culturally relevant and transformative pedagogy. He found four ways that he enacted these two commitments in his teaching as he intentionally focused his actions. Sevier argues that the revised practices led not only to the enactment of transformative pedagogy but also to the transformation of preservice teachers' understandings of equity in US schooling. Sevier's work highlights a teacher educator trying to make change for society by changing teaching.

A fundamental purpose of self-study is improvement of practice (LaBoskey 2004), which itself can be seen as transformation. Some authors' work allowed readers access to the process of transformation. Self-study afforded Hostetler et al. (2012) the opportunity to transform as a social studies teacher. The author began to express democratic values and engage in practices as a social studies teacher to model these – for example, listening across differences. As well, the process created a sense of empowerment as a social studies teacher that had not been experienced before.

Lang and Siry (2008) also reported changes to their teaching practices while they studied their practices. They share that they changed as educators while trying to teach preservice teachers to be teachers in diverse classrooms. They also found that their preservice teachers changed. The preservice teacher began to understand the need to explore "multiples interpretations of evidence," which, Lang and Siry argue, leads to transformation for all those engaged in the teaching and learning relationship (p. 216).

Johnston's (2000) research was grounded in a social studies methods course for graduate students in an elementary-level teacher education program. This collaborative self-study of two teacher educators' practice, as related to issues of equity and diversity with students of color, suggested that spending time and actively listening to their students from different cultural groups were valuable for the author's growth as a teacher educator. These experiences helped the author develop deeper understandings of the preservice teachers' experiences and made the author more cautious and critical when determining if their social justice teaching was effective.

Teaching for Democracy! Promoting a Robust Democratic Way of Life

Curricular choices in social studies can support democratic education. As well, how we teach social studies can provide opportunities for students to engage in activities that help them build skills and attitudes needed to engage in a democracy.

In reviewing the literature, we were pleased that the theme of teaching for democracy emerged before we began the focused analysis. Teaching for democracy showed up clearly in how authors framed their work and their studies highlight curricular and pedagogical choices that support teaching for democratic life.

Several teacher educators focused their studies on teaching for social justice and diversity, while others examined their efforts to engage in culturally relevant pedagogy. Some authors explored how they enacted specific methods to promote democratic ideals. Still other scholars sought to understand how their practices aligned with their values for democratic education. An (2016) studied the experience of teaching elementary social studies preservice teachers from a social justice framework while also preparing them for and guiding them through completing a standardized, high-stakes national performance assessment. The author studied a practice that many teacher educators were using but through a social studies lens. The author's findings and discussion show a social studies educator modelling teaching within a social justice framework.

Johnston led several studies with a clear social justice focus. Johnston et al. (2002) continued the work from Johnston (2000). They studied the experience of the teacher educators' practice of actively engaging their students from different cultural groups as cultural informants. This group included one of the preservice teachers who had informed the Johnston (2000) study, who was a teacher by that point. They shared what they each learned and then reframed and critically analyzed their research findings by using five theoretical lenses. Johnston-Parsons et al. (2007) continued this process and amplified the voices of students of color within their teacher education program. They continued to develop their own understandings of social justice and diversity.

Lang (2010) wanted to teach preservice elementary social studies teachers that "social studies is to produce a democratic citizenry that understands the social justice issues fundamental to democratic institutions within the United States" (p. 76). Lang studied the use of Praxis Inquiry and the Praxis Inquiry Protocol to support pre-service elementary teachers in their learning to be teachers of future citizens in a diverse society. Lang and Siry (2008) sought to understand how they engage their preservice teachers with issues and topics of diversity in society in the science and social studies methods courses. They sought to improve their preservice teachers' ability to understand and engage with diverse cultural backgrounds to become better teachers of children.

Others studied their practices as culturally relevant teacher educators. Sevier (2005) documented and explored the experience of trying to be a culturally relevant teacher educator. Martell's (2015) work is an extended self-study of a social studies teacher's practice and role of culturally relevant instruction over years of teaching high school in different settings then while transitioning to teacher education.

Some authors focused their attention on teaching for democracy through teaching methods. Reidel and Salinas (2011) examined "the ways in which the validity of honoring and exploring emotions within the context of classroom-based discussions was articulated and enacted by the first author and students responses to this focus." Pereira (2000) provides insight into pivotal moments across her life and their

connection to current positions on discussion and the teaching of controversial issues. Kirkwood-Tucker (2004) explored United Nations (UN) simulations as a method to teach global issues and citizenship in a graduate social studies teacher education course attended by both in-service and preservice.

Other authors framed their work around tensions in their teaching. Erickson and Young (2008) sought to align their teaching practices with Goodlad et al.'s (2004) vision for education in a democracy. Erickson and Young studied their and their students' experiences as they worked to resolve the tensions between their teaching practices and these commitments. Lowenstein (2010) explored the multifaceted tensions in teaching for citizenship education in a social studies methods course. The study documents the journey the author experienced that helped him create a safe place in the social studies methods course where rich, authentic deliberation and discussion of different perspectives could occur. The author began to question whether his practices of discussion and debate and focus on social justice actually created an unsafe space for some students. Lowenstein described the move to making academic service-learning the focus of the methods course and the outcome.

Ritter et al. (2011) wondered if their practices as university supervisors aligned with their democratic beliefs. To do this, the authors used characteristics of an independent self, a dominant cultural norm that the authors state, "can detract from more inclusive, and potentially more powerful, forms of democratic teaching and learning" (p. 33) to examine their written feedback. They found ways that their feedback did seem to reinforce this ideal and in turn would limit the understandings their preservice teachers' would need that would lead them toward "Parker's (2003) advanced conception of democratic citizenship education" (p. 35).

Discussion

What Does Social Studies Focused Self-Study Bring to the Broader Social Studies and Self-Study Communities

Many social studies education scholars have taken up the question of the purpose of social studies teaching and learning (e.g., see Counts 1932; Parker 2003; Ross 2014). The answer to what we are teaching social studies for is generally democratic education and preparing citizens. Though the field may agree on a citizenship purpose, social studies teachers and teacher educators still must decide what type of citizen they are trying to prepare through their practice. The type of citizen can vary. Westheimer and Kahne (2004), for example, provide three types of citizen. Each type of citizen has implications for choices of content and teaching methods. Self-study can help us, as social studies educators, understand our decisions and better align our intents with our actions.

The turn toward self is an important aspect of self-study. By turning toward the self in social studies focused self-study, researchers have an opportunity to occupy the multiple

roles of teacher, citizen, researcher, and activist. Through these roles we can consider complex critical conceptions of contrasting micro perspectives (self/citizen/practice) and macro environments (society/civics/democratic action) in our research both theoretically and within a number of educational (K-12 practitioner classroom and teacher educator courses) and community (varied spaces for learners and citizens) contexts.

Social studies focused research simultaneously allows us to turn inward and turn outward, changing the outside (larger society) by changing from the inside (teaching practices). As self-study seeks to turn inward via the self, the social studies supports us turning outward in our practice via democratic and citizenship education. A social studies focus can help a self-study scholar move between turning inward, toward our individual learning environments and the students, and turning outward, to society and strengthening democracy. In doing this, our studies can both endeavor to innovate and inspire a new generation of learners while teaching them to be active, engaged citizens. Engaging our preservice teachers in social studies focused self-study can help them improve as teachers of citizens while also becoming more active and engaged citizens themselves. For example, teaching controversy (Hess 2009) and teaching social issues (Evans and Saxe 2007) are two areas explored within the larger social studies education community that offers insights and frames for self-study research. By encouraging social studies educators to take the turn to self and examine an alignment of personal commitment to teaching controversy, we can simultaneously improve our ability to teach controversy, learn about controversy, and learn to engage with controversy in the public realm.

Social studies focused self-study can explore inquiry-based teaching methods and practices that are innovative, diverse, and engaging while considering the larger implications these practices have for democratic living. These self-studies can help us understand and explore authentic assessments that offer the opportunity to create learning connections that apply beyond the walls of the classroom to society and problems at large. Through such studies, we might endeavor to reimagine learning environments that engage our most substantial intrinsic and extrinsic motivations; demand our all in pursuing our best thinking, talents, efforts, and applications; and require respect for multiple ideas in sharing and discussing our individually and communally held moral and ethical values toward a more inclusive and equitable society. As well, this work can help us negotiate the undertaking of living in a world together and writing about how we taught, thought, and did so with our students, professional colleagues, and fellow citizens.

The deconstruction of self as a teacher of social studies in and of itself may help others see into how values influence who we are as educators. This extends beyond social studies education and can help others think about how they teach. Values such as democracy, voice, and deliberation that are core in social studies education are strongly tied to self-study and though our work may be situated in a social studies context the findings may apply far more broadly. In this regard self-study and social studies colleagues can use social studies focused self-study to create new knowledge and practice in the borderlands (Giroux 2005) of the two research communities.

What Should the Field of Social Studies Expect from a Social Studies Focused Self-Study?

As we read the studies and began to discuss them, we struggled with the idea of how much social studies is needed for the piece to be called a social studies focused self-study.

Our broad inclusion criteria in section "Selection Process," identified as social studies because of context, led to the inclusion of research pieces that were only connected to social studies because one of the authors happened to be teaching in a social studies setting. Though the research may be located in a social studies context, the work may not be grounded in social studies literature or connect the findings to social studies. We found that studies could be placed on a spectrum from very little social studies connection (i.e., the context is social studies) to very detailed and consistent social studies connection (i.e., the context is social studies, and the study is clearly tied to the scholarly social studies literature – from the topic through the findings).

A piece written by one of this chapter's authors provides an instructive example of the end of the spectrum with the least tie to social studies (Berry and Crowe 2006). It is clearly a self-study, but the authors do not delve into the nuances of social studies teacher education, the principles of practice of teaching social studies teachers, or how a critical friendship as a social studies educator might be different or similar to that of a science educator. Instead it is an example of a self-study in teacher education where at least one author happened to be engaging in self-study in a social studies context. When considering the literature, topic, and findings of the study, it is clearly a study of teacher education, not social studies teacher education. These and others like this add to the teacher education literature, but they caused us to wonder whether or not a study that occurs in a social studies context warrants the description, social studies focused self-study. An's (2016) work is an example of a study on the end of the spectrum with a high level of detailed and consistent connection to social studies. In this case, the study is grounded in a social studies-related theoretical framework, social justice. The social justice frame comes through in the findings and discussion as well. Additionally, the study is aimed toward a social studies teacher education audience. Many studies fell along the spectrum between the two ends. We are not establishing a spectrum to place one's study on but rather using the visual of a spectrum to illustrate the range and present a question that as a field we must consider: Where do we draw a line to say a self-study is contributing to social studies teaching and teacher education knowledge?

Just as we grappled with the idea of how much social studies connection is needed, we struggled with what qualifies as engaging in self-study. Self-study has grown greatly since LaBoskey's guidance in the first handbook in 2004. For example, the construct of "the turn to self" is now used as a criteria for reviews of self-study work and often given in feedback as an area to emphasize. Though always present in some form since the beginning, it has emerged as another

characteristic of self-study research. In the studies reviewed, there was a range of connection to self-study in the methods and methodology sections. Some authors identified their work as self-study (e.g., DeWitt and Freie 2005) or published in a self-study journal or conference proceeding but provided little to no methodological literature related to self-study, while others have robust and detailed methodological ties to self-study (e.g., Ritter 2010a). As well, many did not connect their work to the larger body of self-study (e.g., Martell 2015), while others are beginning to connect their self-study to other self-studies (e.g., Logan and Butler 2013). From all of this, the question we are left with is: What needs to be included in social studies focused self-study to be called self-study?

All of the reviewed sources were identified as self-study in some way. But what about work that was not identified as self-study. From personal experiences we know that some published studies were part of larger self-study endeavors but the published works do not explicitly name the work as self-study or did not publish as self-study venues. Except for personal communications, we would never know about these studies. Without clear self-study references, the work can never be understood as contributing to the broader self-study community. Some of our own work does this. As an example, Crowe (2004) and Crowe and Wilen (2003) are articles from studies in social studies education that are not explained as self-study but are research conducted in the author's social studies education courses. Crowe is a self-study scholar. Since it is the work of one of us, we know that self-study methodology has been a great influence on the author, even if the publications themselves do not reflect that. Does this matter as we continue to engage in research?

Issues About the Field that Arose Within the Literature

A concern that arises when a set of literature is so small is that the work generally represents a small group of scholars. This is true here as well. Likewise, there are many connections among these authors. As you may have noticed from the lists of authors cited in the research, names show up often and repeatedly. Also, several of the repeated names are connected in some way. For example, Crowe and Hawley are colleagues at the same institution; Dinkelman advised Butler, Cuenca, Hawley, Powell, and Ritter during their doctoral work; and Crowe and Hawley advised both Hostetler and Levicky. These names are represented throughout various chapters and articles, both alone and among collaborations. By leveraging these long-standing relationships, this interconnected group can be advantageous to social studies teacher educators who are interested in self-study allowing new scholars to quickly become acquainted with many others in this research community. Someone new to self-study in social studies need only meet one member in the group to connect with a support system of scholars as they engage in their inquiry. However, we must be careful of the disadvantages of a small group: becoming insular, ceasing to challenge one another, or being perceived by others as an unwelcoming group because of the familiarity of those within the group. Examining the authorship of the self-study

work reviewed, it is clear that others have become interested and engaged in self-study through the years. Several of these who become interested in self-study connected with a member of this smaller group and were supported by the community as described. We hope this continues. Yet, we must always be cautious to maintain openness and not allow long-standing relationships in the community to push others away.

We are troubled by the limited diversity of race, ethnicity, and, as previously shared, geographic region of the social studies teacher educators publishing self-study, as well as the limited variety of publication outlets. For example, almost all of the authors are from the United States. A lack of diversity like this can limit the questions we pursue, the capacity of our inquiries to engage and challenge one another, and the overall depth and breadth of the knowledge base we build. What does that mean for our work when our research is dominated by scholars from a single nation? Whose voices and perspectives are we missing? What forms of knowledge and experiences of teaching social studies and teaching social studies teachers are lost when social studies focused self-study has not spread far beyond the political borders of one nation-state?

The small number of scholars in the group also brings up concerns about supporting scholars to continue to engage in social studies focused self-study. Making sure our work has an influence in both areas – self-study research and social studies education – might seem difficult. As well, it could seem like our research would have a larger impact in a larger teacher education forum. This may push some to move to publish studies more germane to a larger teacher education audience and to situate social studies in a secondary position in their work, or not at all. In making this choice, the potential for limiting the influence within the social studies community becomes at risk. At the same time, someone may choose to focus on the social studies aspect of their research and, in the process, lose the connection to other self-study literature stunting the expansion of self-study.

Pushing Beyond the Current State

Over the years, we have been excited every time we see another self-study shared by a social studies educator. Despite seeing the numbers of items increase, social studies focused self-study is still in its early stages of development. What is encouraging is that we are poised to chart the path ahead. So, this is where we are. And, in reverence to Dr. King and the importance of teaching for a democratic life, social justice, and transformation, we ask ourselves and our social studies education colleagues: Where do we go from here to have the impact we want? We recommend (1) that social studies focused self-studies be situated more strongly in social studies education literature, (2) that we expand the questions that social studies focused self-study scholars ask, and (3) that the field engage in conversations about what qualities should be seen in social studies focused self-study.

First, we saw many works by social studies teacher educators that are clearly focused on teacher education while not specifically contextualized in the social studies. We propose that social studies scholars who engage in self-study further develop the social studies connections in their self-study work to enhance and expand the knowledge of practice in social studies teacher education. We suggest that those of us who engage in this work delve into conversations about what makes a self-study a social studies focused self-study, how we can use social studies focused self-studies to better inform our practices, and how we can frame and publish works that highlight the connection to social studies.

Second, we saw a limited number of scholars engaging in social studies focused self-study. We call to our social studies education colleagues, those only starting in the field, those social studies colleagues who are also self-study scholars, and those engaged in a wide variety of types of research besides self-study to engage in social studies focused self-study. We need a wide variety of people representing many experiences and perspectives engaging in social studies focused self-study to further develop the knowledge base and to have a greater impact on teaching for democratic life. If our perspectives are not diverse, our impact will be limited. We want to encourage scholars to find ways to push and question the teaching and learning in our field in ways that only self-study can. With studies that do this, we gain a richer, more complex understanding of social studies teaching and social studies teacher education. To make systematic and transformational change that innovates social studies teacher education, we need to know more about ourselves and what we do. We need a robust body of knowledge about what it means to be, grow, learn, and change as a social studies educator in addition to our strong body of work that studies K-12 student and preservice teacher learning. We have a solid foundation, but conversations should continue so we can further develop our understandings and improve our teaching. As a start, we should explore how, as social studies teacher educators, we conceptualize democracy and teach preservice teachers to teach for a democratic life.

Third, we found a wide variety of detail regarding the methods and methodology used. We recommend that to have a stronger knowledge base and to help others use our work that members of the field engage in conversations about the methods and methodology involved in good social studies focused self-study. We ask that self-study and social studies education scholars discuss: the qualities of a good social studies focused self-study; how to build on one another's work to better understand social studies teacher education; and ways to support one another in engaging in this work.

As social studies teacher educators, we are responsible for preparing future teachers to educate the youth of our citizenry. We have a responsibility to push for changes, to uncover issues, and to rattle the systems that exist. That is what transformative teacher educators and researchers do to better their fields. That is what citizens do to make a better democracy. That is what social studies is about – creating good citizens. Therefore, as good scholarly citizens, we should model this. We believe that social studies focused self-study is an excellent way to do this.

Technology Teacher Educators

33

The Role of Self-Study in Supporting Digital Age Technology Teacher Education

Candace Figg and Kamini Jaipal-Jamani

Contents

Abstract

Technology teacher educators – those teacher educators who teach courses in teacher education programs focused on the pedagogy of how to teach with technology – are a small community, with a teacher education program counting itself privileged if they have one technology teacher educator on faculty offering stand-alone technology pedagogy courses. However, technology teacher educators have knowledge that is essential for shaping the digital landscape and promoting technology-enhanced teaching in both preservice teachers and fellow teacher educators. The purpose of this chapter is to provide a description of how research, specifically self-study research, informs our current understanding of the problems of practice of technology teacher educators. As well, it is within the

scope of this chapter to identify any gaps in self-study research that could contribute to our understanding of how technology teacher educators not only promote the knowledge about how to teach with technology but illuminate those problems of practice for technology teacher educators that are distinctly different from the examples in the self-study literature of how teacher educators build their own knowledge about how to teach with technology. Therefore, the chapter will present a review of the literature that describes best practices for building knowledge for teaching with technology appropriate for preservice teaching and illuminates the problems of practice experienced by technology teacher educators, with examples of teacher educators and their experiences. New directions for self-study research to support technology teacher educators so their stories are shared are also discussed.

Introduction

Teaching in the digital learning landscape of today is complicated. With buzz words – like tech-enabled learning, tech-enhanced teaching, online learning environments, blended learning, makerspaces, and flipped classrooms – being touted throughout the current teaching profession, we find that technology often leads to a shift in the way we teach, the resources we use in our teaching practices, and even how we think about teaching and learning (Howell and O'Donnell 2017). A recent review of the digital learning climate in Canada suggested that the goal of education in the twenty-first century around the world was "to prepare all learners to succeed in an ever-changing, technology-driven, and globally connected world by providing the means to develop the skills, competencies, and knowledge they need to succeed today and into the future" (Howell and O'Donnell 2017, p. 7). With such a lofty purpose for those teaching in teacher education programs, it is no wonder that there is a need to prepare future teachers with the same expectations in mind to facilitate their success in preparing these digital learners.

And yet, not every preservice teacher education program includes a stand-alone technology course as part of the program requirement – technology methods courses are relatively new additions to the overall subject area methods courses required in teacher education programs (Niess 2012). The field of educational technology is a young discipline, so the theoretical foundational understandings and scope of general content that should be included in such a course are currently being reframed by research. Additionally, there are no specific curriculum guides to content for these technology courses such as would be found in the "content subject" curriculum courses of science, mathematics, literacy, or social sciences. Compounded by the pervasive and ubiquitous nature of technologies in our daily living environments, the

ever-increasing availability of new and different technologies, and the rapid pace with which technologies change, the description of that "technology course content" has been, and will continue to be, difficult to establish and is generally described vaguely as a course that will provide students with an introduction to teaching with technology.

Therefore, the quality of instruction related to digital learning environments and technologically enhanced teaching in programs that do provide technology methods courses is reliant upon the background experiences, technical skill, and pedagogical expertise of the technology teacher educator to design and implement a quality course that promotes growth in knowledge about how to teach with technology. In other words, not just any teacher educator will be able to serve as the technology teacher educator as may have been past practice. Successful technology teacher educators have a knowledge base that, when shared through research methods such as self-study, provides descriptions of how to promote that knowledge base, not just within technology methods classes to preservice teachers but also to their fellow colleagues who are teaching technology in the subject areas.

The purpose of self-study research is to promote improvement in teaching practices from studying specific problems of individual practices (Lassonde et al. 2009). This type of study is rigorous, with a specific focus on how to make individual teaching practice better, and uses qualitative methods such as interviews, questionnaires, reflections, reflective journals, and experiences in communities of practice to inform that teaching practice. Shulman even described research "that renders one's own practice as the problem for investigation" as being "at the heart of what we mean by professing or profession" (Shulman 2000, p. 11). Yet, as teacher educators who are also researchers, when we share the study of these problems of practice, we often describe how the findings will result in an alteration to a course or a program or participant, rather than how the application of these findings will change *us* and our personal teaching practices. This ability to not only reflect upon our teaching practice but also articulate change in our own practices is an important teaching mindset necessary to promote digital pedagogy (such as the pedagogical understandings for promoting the development of future-ready skills within ourselves and our students) and knowledge-building in others (through sharing examples of what worked or models that were effective).

Therefore, the question "How do I build the knowledge preservice teachers need to teach with technology so that they engage students in digital learning?" has been the burning question at the heart of every technology teacher educator for at least the last 25 years when computers and the Internet became more available to schools. A second question becomes "How do technology teacher educators support colleagues and teacher education programs in the current use of technology for pedagogy so that knowledge about teaching with technology is made relevant to the content we are teaching?". Both of these questions indicate that there is specific knowledge, Technological Pedagogical and Content Knowledge (often identified by the acronym, TPACK), that is developed as teachers learn to teach with technologies. Self-study has a role to play in sharing different perspectives on how technology teacher educators promote the knowledge of how to teach with technology and how that

teaching changes with new technologies and technology-enabled learning environments.

The purpose of this chapter is to provide a description of how research, specifically self-study research, informs our current understanding of the problems of practice of technology teacher educators. As well, it is within the scope of this chapter to identify any gaps in self-study research that could contribute to our understanding of how technology teacher educators not only promote the knowledge about how to teach with technology but illuminate those problems of practice for technology teacher educators that are distinctly different from the examples in the self-study literature of how teacher educators build their own knowledge about how to teach with technology. Thus, we will introduce you to Technological Pedagogical and Content Knowledge (TPACK), or the knowledge teachers need to teach with technology, in the next section of this chapter, followed by an overview of the current research-based directions that inform technology teacher educators as they design and implement technology courses that support the growth of TPACK knowledge in preservice teachers. Section "Literature Review: Problems of Practice for Promoting Digital Teaching": will describe the literature review, including the methods used to answer the two research questions: (1) What teaching strategies or interventions are currently considered best practices for incorporation into preservice technology methods courses between 2013 and 2018? and (2) What are the problems of practice experienced by technology teacher educators? This section will describe the themes that emerged from the literature review to answer these questions and present examples of self-study research that share narratives of how teacher educators build their knowledge about teaching with technology. Section "Gaps in the Literature" identifies the gaps in the literature, and we conclude the chapter with a discussion about next directions for self-study research to support technology teacher educators.

What Knowledge Do Teachers Need to Teach with Technology?

Between the approximate years of 1985 to 2005, technology teacher educators focused the content of technology courses on building technical skills (see Bull and Bell 2006; Schrum 2005). Preservice teachers were taught how to use sets of tools in their "computer" course so that they would be able to integrate those technologies into their everyday teaching practices and engage students in using those technologies for learning. The educational technology field expected that all teachers would embrace teaching with technology – computers and the Internet would infuse every classroom, or as Koehler and Mishra (2005a) wrote, "It was assumed that teachers who can demonstrate proficiency with software and hardware will be able to incorporate technology successfully into their teaching" (p. 94).

Unfortunately, this did not happen – teachers were not integrating these technologies into their daily teaching practices or instructional activities. Expensive computers sat unused in the back corners of classrooms, while the information readily available "at your fingertips" through the Internet was seldom consulted (Paige et al.

2004; Schrum 2005). In 2005, editors of journals in instructional technology technology field held a national summit to discuss effective uses of technology in teaching and teacher education to make recommendations for research directions that would "accelerate the meaningful impact of digital technologies in education for the 21st century" (Bull and Bell 2006, p. 302). Schrum (2005) explained that the concern of journal editors for research over the past 20 years had focused on the question "Is a technology-based method better than a non-technology-based one?" (p. 219), and the findings about technology-enabled instruction were not advancing the meaningful use of digital technologies for student learning and resulting in "the technological capacity available to schools exceed[ing] our ability to use it effectively to enhance learning" (p. 220).

The fascination of the educational/instructional technology field with how to use the tool appeared to be only one piece of a knowledge base required for teachers to engage in and successfully teach with technology (Koehler and Mishra 2005a; Schrum 2005). Koehler and Mishra (2005a) argued that standards established to provide guidance in building teacher knowledge about how to teach with technology, such as the International Society for Technology in Education (ISTE) national standards or NCATE accreditation standards, explained "*what* teachers need to know," but not "*how* they are supposed to learn it" (p. 94). They further argued that traditional methods of workshops and courses did not promote the deep understanding that was needed by a teacher to transform their practice. They proposed that teachers engage in learning about technologically enhanced instructional design by *doing* that type of lesson design, which incorporates:

> challenging problems that reflect real-world complexity. The problems should be authentic and ill-structure[d]; that is, they should not have one predetermined, foregone solution but rather be open to multiple interpretations and multiple "right answers." Students should engage in actively working on solving the problem over an extended period of time in collaborative groups to reflect the social nature of learning. (p. 96)

Mishra and Koehler (2006) proposed a framework describing the knowledge that enabled a teacher to engage in technologically enhanced teaching in technology-enabled learning environments, called Technological Pedagogical and Content Knowledge (TPACK). This framework emphasized the development of "rich connections between technology, the subject matter (content), and the means of teaching it (the pedagogy)" (Koehler and Mishra 2005a, p. 95) in collaborative professional learning contexts and was based on Shulman's (1986, 1987) theory of teacher knowledge, where teacher knowledge encompasses a number of categories of knowledge specific to the act of teaching (e.g., pedagogical content knowledge, knowledge of learners and their characteristics, and knowledge of educational contexts). The TPACK framework extends Shulman's model by presenting the following pairs of knowledge intersections in relation to technology: technological content knowledge (TCK); technological pedagogical knowledge (TPK); and the intersection of technology, pedagogy, and content (TPCK), called Technological Pedagogical and Content Knowledge (TPCK or TPACK) (Fig. 1). The knowledge

Fig. 1 Technological
Pedagogical and Content
Knowledge (TPACK).

tpack.org)
required for successful technology-enhanced teaching (TPACK) is situated within
pedagogical content knowledge (PCK), which relates to "that special amalgam of
content and pedagogy that is uniquely the province of teachers, their own special
form of professional understanding" (Shulman 1987, p. 8).

Mishra and the Deep-Play Research Group (2018) further explained that:

> TPACK suggests that expert teachers have a specialized brand of knowledge, i.e., a blend of
> technological, pedagogical, and content knowledge. Thus, it is the interaction between
> knowing a technology, knowing about pedagogy, and understanding a subject matter that
> makes for effective teaching with technology (Mishra and Koehler 2008). TPACK shatters
> this myth of technology as being "chrono-centric" and asks only that we focus on "what can
> your technology do for your content and what is the best way to do it?" The TPACK
> framework emphasizes the importance of teacher creativity in repurposing technology tools
> to make them fit pedagogical and disciplinary- learning goals. (p. 12)

Other voices in the field explain this connection with content and preservice
teacher preparation:

> Devising a 21st century skills curriculum requires more than paying lip service to content
> knowledge. Outlining the skills in detail and merely urging that content be taught, too, is a
> recipe for failure. We must plan to teach skills in the context of particular content knowledge
> and to treat both as equally important. (Rotherham and Willingham 2009, p. 19)

With such a strong focus on content-centric instruction and learning goals, TPACK
has become the theoretical framework that guides how we think about preparing
preservice teachers (Figg and Jaipal 2009; Jaipal and Figg 2010b) – specifically

teaching that promotes the development of pedagogical knowledge necessary to teach content using technologies (Jaipal-Jamani and Figg 2015; Angeli and Valanides 2009).

More than 1600 publications have been based on the TPACK/TPCK framework over the 15 or so years since the introduction of the idea that teachers with TPACK – this knowledge about how technology can be meaningfully integrated into classroom learning experiences – design and implement successful technology-enhanced learning experiences for digital age students, and they do so by effectively identifying the affordances and constraints of technologies for application to instructional purposes and content (Harris and Phillips 2018). Several reviews of literature of those publications (e.g., Chai et al. 2013; Gur and Karamete 2015; Polly et al. 2010; Rosenberg and Koehler 2015; Tondeur et al. 2012; Voogt et al. 2013; Willermark 2018; Wu 2013) present the general themes held within that body of work, and although the focus and scope of each of these reviews differs, together they present the overall general findings of what we currently understand about TPACK and its impact on "the practice of teachers, professional development providers, administrators, and other stakeholders invested in meaningful educational uses of technology" (Harris and Phillips 2018).

TPACK and Teacher Education

We have selected five specific reviews to share that exemplify key themes from this body of research that are particularly salient for technology teacher educators seeking to answer the question regarding what knowledge best prepares preservice teachers to teach with technology in their initial teaching experiences.

Gur and Karamete (2015) analyzed 115 papers from 2001 to 2015 and concurred with other reviews and critiques of the TPACK framework that the framework is vague and broad and the constructs are ill-defined (Voogt et al. 2013; Cox and Graham 2009; Graham 2011). However, their review suggests that the framework is useful as it does identify areas of teacher knowledge that, if combined with innovation adoption models (such as the concerns-based adoption model suggested by Hall and Hord 2014, or SAMR as described by Hamilton et al. 2016), could provide teacher educators with opportunities to identify gaps in knowledge of preservice teachers, allowing planning for continuous support of TPACK development throughout education programs. Gur and Karamete also shared the important idea from Lee and Tsai (2010) and Lee et al. (2006), that interventions normally produced positive outcomes with a noted increase in self-efficacy and preservice teachers' willingness to use ICT with exposure to technology-enhanced teaching experiences. However, Gur and Karamete further reiterated the caution from Angeli and Valanides (2009) that just increasing the proficiency of each of the seven TPACK knowledge constructs does not automatically result in overall TPACK knowledge. Overall TPACK knowledge grows over time with continued experiences and multiple examples of each construct, but gaining proficiency in one area, such as TK

(technical knowledge), does not increase TPACK knowledge alone; therefore, skill instruction alone does not result in TPACK.

Chai et al.'s (2013) examination of 74 papers from 2003 to 2011 highlighted that 54 of these papers reported on the use of technology in various subject domain areas rather than in the technology methods classrooms, with 41% of those studies in the science, mathematics, and engineering classrooms. This finding reinforces the content-centricity of TPACK knowledge. However, to foster TPACK development, the authors suggested that the TPACK framework must also take into account contextual factors, such as the availability of technological solutions, the pedagogical skill of the instructor, or the technological skill of the student. Most importantly, studies showed that most interventions had positive results – exposure to technological instruction often resulted in TPACK growth.

Tondeur et al. (2012) identified 19 qualitative studies published between 2001 and 2009 in which the focus was to prepare preservice teachers to integrate technology into their daily instructional practices. Strategies that were effective for fostering the growth of TPACK were identified, including the practical use of technology within authentic, instructional experiences, with scaffolded technical experiences. Other successful strategies contributed by this review were the use of collaborative learning activities with peers and using reflective discussions and writing activities about appropriate use and role of technology in instruction.

The findings from the analysis and review by Voogt et al. (2013) of 55 journal articles and 1 book chapter published from 2005 to 2011 illuminated the practical use of TPACK in promoting the growth of TPACK knowledge in preservice teachers and expanded the information from the previous reviews. First, their review described the development of the concept in the research and the criticism of TPACK as a theoretical framework similar to the other reviews; however, they noted that, in working with teachers, "TPACK is an intuitive and easy-to-communicate concept" (p. 118) and suggested that this knowledge base should be developed for specific subject area domains. They provided the example of Harris et al. (2009) and Harris et al. (2010a), who developed activity types, those sets of "classroom activities and interactions that have characteristic roles for participants, rules, patterns of behaviour, and unrecognizable materials and discursive practices related to them" (Harris et al. 2009, p. 404). The activity types were developed per subject domain and presented in a taxonomy of content-based activities to help preservice teachers (and in-service teachers new to teaching with technology) to plan lessons enhanced with technology. Preservice teachers used the taxonomy to develop a personal knowledge repertoire of learning activity frameworks that they felt worked well with their instructional styles and combined these activity frameworks to create lessons, units, or learning opportunities (Joyce et al. 2004). For preservice teachers, this is foundational knowledge for successful technology-enhanced lesson planning.

Another specific contribution of Voogt et al.'s (2013) review was to identify additional specific strategies that foster TPACK knowledge growth. Overall, those strategies included modeling of technology-enhanced lesson design or teaching in a technology-rich learning environment; enactment of technology-enhanced lessons,

either through microteaching or during field experiences; or designing technologically enhanced lessons. As well, there was an overall understanding about teaching with technology suggested by Niess (2011) that included four central components:

> an overarching concept about the purposes for incorporating technology in teaching a particular subject; knowledge of students' understanding, thinking and learning with technology in that subject; knowledge of curriculum; and curriculum materials in a particular subject that integrated technology in learning and teaching, and knowledge of instructional strategies and representations for teaching and learning that particular topic with technology. (Voogt et al., p. 118)

And finally, Voogt et al.'s analysis highlighted that numerous studies focused on how to evaluate the growth of TPACK in preservice teachers. Of note is that, in this review, the predominant method currently in use were self-report surveys (e.g., Schmidt et al. 2009a), which often reflect increased confidence rather than actual increased knowledge in practice (Lawless and Pellegrino 2007). Other methods also being investigated included performance or design-based tasks evaluated with scales (Angeli and Valanides 2009; Kramarski and Michalsky 2010), rubrics (Harris et al. 2010a), and observational rubrics (Bowers and Stephens 2011).

Willermark (2018) reviewed 107 peer-reviewed journal articles published from 2011 to 2016 to supplement many of the earlier review studies, intent on illuminating the different approaches that have been used to identify teacher TPACK, mostly to "determine the impact of interventions and professional development programs or to descriptively characterize the current state of teacher knowledge (e.g., Herring et al. 2016; Koehler et al. 2014)" (p. 318). Of specific interest to technology teacher educators is Willermark's analysis of the emerging discussion of *TPACK as knowledge* that is "something that the teacher possesses, such as concepts, rules, and procedures" or *TPACK as competence* that is "an inextricable facet of teacher action itself, which must continuously be mastered" (p. 318). Willermark further explained that "knowledge and competence are closely connected, and competent acting requires basic, general, and theoretical knowledge as well as practical experience" (p. 318). Willermark continued that, if a teacher (either preservice or in-service) was evaluated, most research either required the teacher to self-report to complete the evaluation or the performance was marked/observed/evaluated in a teaching activity. As teaching usually comprises actions of planning, implementing, and evaluating, teachers who were self-reporting may have been reporting on their knowledge about planning, implementing, and evaluating teaching with technology without the advantage of the classroom teaching experience. Willermark notes that "gaps have been shown to occur between self-reporting and performance in practice, between displayed knowledge and application of such knowledge, and between performance exercises and typical behavior" (p. 339) and recommended a combination of methods for future research.

In summary, and to put the research in perspective of this review, in the brief 15 plus years that technology teacher educators have researched and explored how to best initiate the process of helping preservice teachers grow their TPACK – this

knowledge about how technology can be meaningfully integrated into classroom learning experiences – so that their initial teaching experiences in the digital learning environments of today's classrooms are successful and productive, we have learned the following from the empirical research:

1. The modeling of technology-enhanced learning experiences in the context of subject content areas is influential in promoting technology-enhanced teaching effectiveness (Gur and Karamete 2015; Chai et al. 2013; Tondeur et al. 2012; Voogt et al. 2013).
2. Modeling is important, and the type of modeling matters – modeling just-in-time technical training during a lesson demonstrates how to scaffold technology within a lesson to achieve a learning goal without having the technology distract from that learning experience (Tondeur et al. 2012; Voogt et al. 2013).
3. Engaging in pedagogical reasoning during the technology-enabled learning experience with the instructor promotes growth in understanding how to teach with technologies (Chai et al. 2013).
4. Competency in one of the domains alone will not result in transformation of practice. All domains must be represented. For example, skill competency and acquisition of technical skills alone will not promote teaching with technology (Gur and Karamete 2015).
5. The connections to content subject areas are important and are supported by examples of technology-enhanced activities that can be used effectively in that area (Voogt et al. 2013).
6. Collaborative/peer learning and authentic technology-enhanced learning experiences are effective (Tondeur et al. 2012).
7. Another effective strategy for growing TPACK knowledge is providing opportunities for preservice teachers to design and teach technology-enhanced lessons (Tondeur et al. 2012; Voogt et al. 2013; Willermark 2018).
8. Measurement of TPACK should include opportunities for multiple forms of assessments, both for research (self-report, performance assessments) and for information for preservice teachers' understanding of how their TPACK knowledge and competence is growing (CBAM or SAMR inventories) (Gur and Karamete 2015; Willermark 2018).

Literature Review: Problems of Practice for Promoting Digital Teaching

From the general reviews of the TPACK literature, we have learned that promoting the growth of TPACK knowledge is a process of authentic, pedagogical, content-centric experiences. Strategies noted as being most effective were (1) having opportunities to design lesson plans; (2) teaching a technology-enhanced activity, either in a microteaching or field experience; and (3) having opportunities to participate in technology-enhanced instruction to see modeling of how to teach in an authentic, problem-based, collaborative learning experience, and

(4) incorporating demonstrations of teaching the technical skills using "just-in-time" methods so that the focus was on the learning goals and not the tool.

As a technology teacher educator (first author) of how to promote TPACK in preservice teaching for nearly 20 years, along with a science teacher educator (second author) who has researched TPACK for the last 20 years, these are strategies that we have long embraced; however, the constraints of a university course embedded within a unique teacher education program – the context within which preservice teachers are engaged in their technological learning experiences – are influencing the extent to which we are able to incorporate some of the best practices into course design and delivery. Technology teacher educators work constantly to infuse new ideas, technologies, and the pedagogies that enhance those technologies into our courses, and we are continuously seeking to learn what interventions have been successful in other programs, albeit with the understanding that we must adapt for our own students, programs, and contexts. Therefore, the research questions that are the basis of the following literature review are:

- What teaching strategies or interventions are currently considered best practices for incorporation into preservice technology methods courses between 2013 and 2018?
- What are the problems of practice experienced by technology teacher educators?

Methods

An extensive query of our library databases, including robust academic databases such as ERIC, Academic Search Complete, Sage Journals Online, and Scholars Portal, plus a query of Google Scholar and specific searches of journals such as *Studying Teacher Education*, *Journal of Teacher Education*, and the *Canadian Journal of Education*, was conducted using the search terms *tpack*, *self-study*, *best practices to develop tpack*, *technology preservice courses*, *preservice teacher education*, and *technology teacher education*. The resulting list of 48 self-studies was reviewed for the discussion of a strategy or intervention and/or redesign of a technology preservice course and how those changes informed teaching practice. Reviews of abstracts and initial readings of articles discussing the experiences of in-service teachers or graduate instructors were removed, as the research question seeks information regarding preservice teaching experiences only. As well, articles describing interventions or strategies applied entirely in alternate settings were also removed from consideration, including courses applied only in field experiences or courses applied in the online environment – unless the self-study clearly articulated how the author's TPACK knowledge had grown through the experience. This resulted in nine articles that highlighted the changes in teaching practices of teacher educators related to growing TPACK knowledge and teaching with technology; however, there were no articles related to technology teacher educators and technology methods courses in a teacher education program. So, to answer the research question about "what are the problems of practice of technology teacher educators"

and having extensively searched the sources for self-study, we knew the self-study literature would only be able to describe the problems of practice of teacher educators when those problems of practice involved building TPACK and learning to teach with technology.

The specialized nature of this query – the search for research about technology teacher educators – meant that we required a specialized database; therefore, we restricted the next search to one database. The *LearnTechLib: The Learning and Technology Library* was chosen for the specialized search because this database indexes conference papers and dissertations from the leading technology teacher education conferences and organizations as well as journal articles from the leading international educational technology journals. Aware that in the educational/instructional technology field most of the research is empirical, and searching for ethnography or even narrative stories of lived experiences would show few and far between results, we accepted that the outcome of our next search would be more empirically based.

The process for the search was repeated. One hundred four articles published between the years of 2013 and 2018 emerged using the same search terms: *tpack*, *self-study*, *best practices to develop tpack*, *technology preservice courses*, *preservice teacher education*, and *technology teacher education*. These articles were reviewed for the following: discussion of a strategy or intervention or redesign of a technology preservice course. Once again, articles discussing in-service teachers or graduate teaching were removed. Articles describing interventions or strategies applied entirely in alternate settings were also removed including technology courses applied only in field experiences. However, in this review, articles that examined the use of field experiences as part of a technology methods course were included. Online technology courses were also excluded as most teacher education programs are face-to-face to emulate classroom teaching; however, articles that described blended components and online modules within face-to-face courses were included. Fifty articles remained and were included for the purposes of the final thematic review. Only 2 articles out of the 104 articles described themselves as self-study and are included in our review. 56% (or 28) of the articles described interventions or strategies used in subject area courses, indicating the strong connection between content and TPACK; however, those articles are not reviewed or included here as they were not self-studies and were more focused on researching the content taught or providing research on an intervention.

Of note is that, in addition to the themes of course design and effective strategies or interventions for promoting the growth of TPACK knowledge, 3 other overall themes were evident across these 104 articles: (1) effective evaluation of the growth of preservice teachers' TPACK as the result of an intervention, (2) programmatic influences on preservice teachers' TPACK development, and (3) more illumination of and discussion around the TPACK framework.

First, although assessment of TPACK growth and development is central to how a technology teacher educator might make decisions to foster that growth and development, the lack of clear definition of the constructs of the TPACK framework and often overlapping components have made measurement of such growth a

complex and problematic issue (Cox and Graham 2009; Graham 2011). As well, this is a fast-growing and constantly emerging area of research, which makes this stream of research outside of the scope of the research question for this review. As noticed in the earlier reviews of literature described in the previous section, assessment instruments were developed (e.g., the survey instrument developed by Schmidt et al. 2009b and rubrics by Harris et al. 2010a) which have been useful for some purposes to date, and a new focus on measuring preservice teachers' *intention* to implement (as seen in Perkmen et al. 2016) may serve to be a promising method for providing some manner of describing changes and growth in knowledge and attitudes.

Additionally, 11 articles specifically sought to describe ways in which teacher education programs could support preservice teachers throughout their program experiences, such as preparing teacher educators and program leaders who are able to inspire and lead TPACK change (e.g., Carpenter et al. 2016; Herring et al. 2013) or examining how standards and teacher educator competencies are related to and enhance preservice teachers' TPACK (i.e., DeSantis 2016; Foulger et al. 2017). Other articles described how to support the development of preservice teachers' TPACK by organizing the delivery of technology experiences by embedding instructional strategies throughout and across the experiences of the teacher education program (see Brenner and Brill 2013; Mouza et al. 2017a) or making that area of knowledge the responsibility of a single stand-alone technology course, with recommendations that a combination would be the best solution going forward (Elwood and Savenye 2015).

Next, 14 articles tackled the continuing debate about how we define or illuminate the complex TPACK framework. Some sought to flesh out the connections between PCK and TPACK (Phillips et al. 2017), specifically pedagogical reasoning and action (PR + A) and technology (Harris and Phillips 2018); others examined how TPACK could be distributed and dynamic (Di Blas and Paolini 2016), which offers new and intriguing insights on future research. The use of the TPACK framework with other frameworks, such as the Stages of Concern (Marich and Greenhow 2016) and the Universal Design for Learning (Harris et al. 2018), was also investigated with positive results and recommendations for how these different frameworks can work side by side. TPACK and its relationship to critical and computational thinking were discussed, with early recommendations for increased emphasis on problem-based learning (Henderson 2013), and activities that promote thinking "from *consumers* to *creators*" (Mouza et al. 2017b, p. 74) through programming tools were also presented.

Promoting TPACK Growth: Best Practices for Technology Teacher Educators 2013–2018

The remaining 22 articles were relevant to our research question, "What teaching strategies or interventions are currently considered best practices for incorporation into preservice technology methods courses between 2013 and 2018?", and present

us with several patterns or themes for the current understandings of what technology teacher educators can view as best practices for fostering preservice teachers' TPACK knowledge growth.

Using Design to Foster TPACK

As demonstrated in earlier reviews, one effective practice to foster TPACK development being used in technology courses today is providing preservice teachers with opportunities to design technology-enhanced lessons, a strategy originally described by Koehler and Mishra (2005a, b) as the *Learning Technology by Design* approach. Prior to the introduction of the TPACK framework, the stand-alone technology course typically consisted of an introduction of several types of teacher productivity tools and computer software that a teacher might encounter in their work (including word processing, gradebooks, presentation tools, spreadsheets, the Internet), with some pedagogical information about their affordances and constraints for use in the classroom (Mouza et al. 2014). However, as many researchers of the time noted (e.g., Kay 2006; Jaipal and Figg 2010a; Niess 2012), there was no transfer between the development of technical skill knowledge and how to use that knowledge in technology-enhanced teaching. The learning-by-design approach (as described by Mishra et al. 2010) uses "rich pedagogical, technological and content problems" (Mouza et al. 2014, p. 208) as the basis for collaborative group work in which preservice teachers find technological solutions to those problems.

In addition to designing lessons and analyzing lesson designs for appropriate use of technology to enhance the lesson, Lloyd (2013) had shown how the TPACK framework could be used as an effective tool for analyzing the knowledge preservice teachers were using to select appropriate learning objects for use in specific teaching contexts and justifying their choices. The language expressed in their reflections demonstrated their solid grasp of the technological pedagogical knowledge (TPK) required for that task. Other researchers, such as Angeli and Valanides (2009) and Graham et al. (2012), provided design-based tasks and sought evidence of TPACK within those tasks through criteria scoring or thematic mapping of constructs.

The more current research studies have investigated expanding and enhancing knowledge gained through creation and analysis of technology-enhanced lesson designs by implementing those designs in microteaching or field experiences and reflecting upon those experiences. For example, Mouza et al. (2014) describe how the preservice teachers in their technology course were also engaged in a 3-week teaching placement during the course and were therefore able to make a strong theory to practice connection through assignments such as a technology resources inventory of resources available to preservice teachers at the teaching site, the design of a technology-enhanced lesson, and ability to teach and reflect upon that lesson. The ability of the associate teacher to model and support the preservice teacher in the modeling of technology-enhanced teaching was also conducive to the development of the preservice teachers' TPACK; however, the "major strength of the integrated approach was the opportunity it provided preservice teachers to design, enact and reflect upon the implementation of a technology-integrated lesson in a real classroom" (p. 219).

As well, the TPACK framework became the basis of the TPACK game – a learning activity developed at the National Technology Leadership Summit's annual gathering in 2007 (Richardson 2010). The TPACK game has been used as a method for introducing the framework and the idea that pedagogy, content, and technology must be considered in the planning of a technology-enhanced activity. Baran et al. (2014) used case study to describe how even an introductory exposure to understanding the TPACK framework supports the design of technology-enhanced activities.

Another successful strategy that further expands the effectiveness of promoting TPACK through the design of technology-enhanced lessons is the use of design teams, adding the collaborative component to the process. For example, Johnson (2014) employed design teams as a strategy in a technology course to examine the effects of the approach on preservice teachers' TPACK compared to the traditional individual approach. Findings from the study demonstrated that, although both instructional strategies promoted TPACK growth in preservice teachers, those preservice teachers who had participated in the collaborative design teams approach showed more improved TPACK as evidenced in written lesson plans. Stansberry (2015) described the redesign of a technology course to include peer teaching teams who not only designed technology-enhanced lessons but taught those lessons as part of a peer teaching team. Findings from this qualitative study revealed that students were able to meet their own learning goals, addressed teaching with technology differently and more professionally at the end of the course than they did at the beginning, and were able to articulate new learning goals for building their knowledge about technology-enhanced teaching at the end of the course.

For those technology teacher educators with programmatic constraints that would never allow access to field work or for those who have their course embedded in a collaboratively designed program where heavy lesson designing in subject area methods coursework make lesson designing within the technology course redundant, studies about effectiveness of activity types and blended learning modules for fostering TPACK growth offer a method for incorporating lesson design strategies in the technology methods course. For example, Harris and Hofer (2016) describe how their taxonomies of TPACK-based learning activity types, categorized by subject areas, are used to select and sequence technology-enhanced activities to create a lesson plan, or project, or series of lessons for combining into a unit. The support provided by the taxonomies promotes deep learning of the planning process and enhances TPACK through the decision-making processes. Hofer and Harris (2016) then offered the learning activity types (LATs) as a set of eight brief, developmental video-based modules in an online format and as open educational resources. The modules guide exploration of the LATs through the selection and analysis processes, with suggestions and considerations. Mourlam and Bleecker (2017) investigated the use of the effectiveness of these LAT short courses in promoting TPACK in preservice teachers by including the completion of these eight modules to the requirements for course assignments. Findings from the study indicated that preservice teacher knowledge about "their ability to combine instructional strategies and technology, select technologies that were compatible with curriculum goals and

instructional strategies, as well as fit content, instructional strategies, and technology strongly together within the lesson plan" (p. 2408) were increased, indicating TPACK growth. Both the use of the LAT taxonomies and the online short courses would prove beneficial ways to incorporate lesson designing strategies in technology courses.

Strategies that Work for Fostering TPACK

Although we acknowledge that the learning-by-design approach continues to be a successful form of promoting the growth of TPACK knowledge in preservice teachers, two other strategies also contribute to the knowledge-building process and are noted in the research: modeling and pedagogical reasoning discussions.

The importance of modeling of technology-enhanced teaching for preservice teachers within actual teaching must not be underestimated (Brenner and Brill 2013; Crowe 2004; Mouza et al. 2014), and even though the quality of that modeling might be constrained by resources, skill, or availability, the willingness of faculty teacher educators, the associate teacher overseeing preservice teaching, and even fellow preservice teachers to engage in modeling technology-enhanced teaching provide a learning environment for risk-taking and experimenting (Mouza et al. 2014), thus promoting the growth mindset that is part of teaching in a digital society (Partnership for 21st Century Learning 2007).

As well, current research has suggested that this mentoring and coaching need not merely take place in face-to-face environments. Several articles addressed how this form of distance modeling support might occur such as within field experiences supported by coaching through flipped environments described in Bruciati and Lizano-DiMare (2016). Additionally, Dorner and Kumar (2017) successfully implemented an online collaborative mentoring program that supported learning about how to teach with technology; however, their research had words of caution for developing this type of program in that providing mentoring and coaching in the online environment requires attention to different issues, namely:

> that effective online communications and transparency in the role of the mentor should be an integral part of the instructional design of online collaborative mentoring. Further, the instructional design should be informed by a thorough investigation of participants' technology skills and technology self-efficacy, and a needs analysis of the level and types of guidance expected by mentees based on their previous experiences and existing expertise. A comprehensive picture of mentees' anticipations, prior knowledge, and skills will enable course designers and mentors to design online mentoring experiences that meet expectations and respond to mentees' actual needs. (p. 296)

White and Geer (2013) investigated a video project developed by the Education Services Australia for the Teaching Teachers for the Future (TTF) based on TPACK in which a series of:

> modules were designed for pre-service teachers as professional learning packages that demonstrated the interrelated content, pedagogy and technology knowledge used in Mathematics, Science, History and English. The online modules incorporated videos of teachers

and their students using ICT in the classroom, lesson plans, useful ideas for incorporating ICT as well as text that described the interaction of the teacher, the students and the technology. (p. 124)

Their qualitative research demonstrated that the preservice teachers valued the modeling of technology-enhanced lessons in a video format where they could learn at their own pace, could access the materials online at their own convenience, and were able to see how "things worked in real classrooms" (p. 131).

A second strategy that also emerged throughout the TPACK literature about technology teacher educators as contributing to building TPACK knowledge is the use of discussion and reflective writing to engage pedagogical reasoning around decision-making. Figg and Jaipal (2013) described a workshop strategy that engaged preservice teachers in a technology-enhanced learning activity followed by a pedagogical dialogue in which the preservice teachers are engaged in a discussion and collaborative reflections in thinking about the activity type, how the activity could be adapted for other content areas, how the activity could be adapted using other technologies, and, most importantly, what preparation would the instructor need to ensure happened prior to the lesson for a smooth implementation. Later in the workshop, how to teach just the skills needed to replicate the learning activity is taught, with a follow-up opportunity for the preservice teachers to design a lesson activity using that technology that they might teach in their own classroom. The final sharing of these activities results in an additional pedagogical dialogue and reflection.

An additional and developing research area is the exploration of preservice teachers' instructional design processes to highlight their pedagogical reasoning and any relationships or connections between instructional design and pedagogical reasoning. Preservice teachers in three universities in three countries, who are already familiar with TPACK and have experience with technology-enhanced teaching, will be participating in the study by sharing aloud with the researcher their instructional design process, with the goal of highlighting pedagogical reasoning during specific instructional design tasks (Trevisan and De Rossi 2018). As this research is in progress, the research team is hopeful that new insights into pedagogical reasoning that grows out of or is supported by instructional design will emerge.

Using Problem-Based or Authentic Learning to Foster TPACK

Technology courses are grounded in authentic or problem-based learning and have been since the work of Jonassen and Reeves (1996) proposed viewing technology as cognitive tools. Initial investigations of innovative new problem-based structures and learning environments are beginning to make their way into the research literature. Mouza et al. (2014) described how their technology courses not only infused hands-on activities with a variety of technology tools but also required preservice teachers to design and teach a technology-enhanced lesson in their course-embedded field experience creating an authentic and applicable learning experience. Dreon and Shettel (2016) described an authentic learning field experience that was part of their technology course, in which the preservice teachers first

served as instructional designers of learning objects for flipped classroom activities and later taught lessons prior to and after the flipped learning object to students in the schools, providing relevant and meaningful learning experiences for preservice teachers. As well, alternative methods for structuring the problems have been investigated. For example, Beaudin (2016) describes the use of structural gamification, or "the application of game-elements to propel a learner through content with no alteration or changes to the content itself. The content does not become gamelike, only the structure around the content" (p. 1132), to set up a problem-based authentic learning experience for preservice teachers, to motivate, and to engage them in content learning. Likewise, Figg and Jaipal-Jamani (2015a, b) describe how structural gamification was implemented to provide background knowledge and flipped learning experiences to support in-class learning activities in a technology methods course. Findings from the qualitative data, surveys, and student-created artifacts were evidence of growth in TPACK knowledge and student engagement. Conference presentations, such as those regarding the use of genius hour (Downes and Figg 2017) and makerspaces (Figg et al. 2018) as inquiry-based projects to structure or support technology courses, are other examples of research investigations emerging as explorations of how these structures can be used to engage creativity as well as problem-based learning in the technology course.

Self-Study in Promoting Teacher Knowledge for Teaching with Technology

Although our review of the self-study literature revealed that technology teacher educators have yet to share their stories of problems of practice to a great degree, there are examples of teacher educators who are openly contributing their problems of practice to our understanding of how TPACK knowledge is developed by teacher educators. It is the narrative quality of self-study, the eliciting of stories of experiences, that are especially useful for teacher educators investigating how teachers learn to teach with technology in online and technology-enabled environments; after all, we have learned from the literature on adoption of innovations that the majority of teachers engage in using innovations, such as digital technologies, through the successful examples of peers – the innovators and early adopters suggested by Rogers (1995) and Harris (1998). Reading stories of the lived experiences of these innovators and early adopters as they sought to design online courses or the understandings gained from adding a new technology to their teaching practice are significant contributions to the literature on the knowledge we need to teach with technology. However, many of these self-study reflective stories end up on a blog post (see Bal 2018), or some other form of social media, and the contribution that could have been made to our overall understandings of how to teach with technology stop there. Hence, the value of self-study research by technology teacher educators is the purposeful sharing of the study of technology-enhanced teaching practices using rigorous data collection and analysis to illuminate these problems of practice.

Bullock and Sator ([2018](#)) suggest methods as diverse as "portfolios that track development, journaling one's personal history, action-research through lived experiences, collective self-study, as well as arts-informed and memory-work self-study" (p. 60). These same methods are also the basis of evidence in other forms of research, such as action research, participatory research, or design-based research. Parsons and Hjalmarson ([2017](#)) describe the difference between design-based research and self-study as the focus of the research, so that "Design research examines the design, implementation and study of a product or process in an educational setting. Self-study focuses also on the designer of the innovation and the personal learning that influences teaching decisions" (p. 332). Feldman et al. ([2004](#)) distinguish action research from self-study as follows: "Traditional action research has a technical orientation toward research that relies on a 'how-to' approach and does not make problematic the nature and context of teachers' work" (pp. 948–949). They go on to state that self-study methodology is distinguished by "the type of practice in which the researcher is engaged – teacher education – and the preferred method of inquiry – narrative" (Feldman et al. [2004](#), p. 949). Feldman et al. assert that self-study methodology is characterized by three features:

A focus on the self.
The experience of teacher educators acts as a resource for research.
It involves being critical of the self in relation to researcher and teacher educator roles.

LaBoskey ([2004](#)) adds that self-study research may also be viewed in terms of five characteristics in which the research is (1) self-initiated and focused, (2) improvement aimed, (3) and interactive; (4) includes multiple, mainly qualitative, methods; and (5) defines validity as a process based on trustworthiness.

The Use of Self-Study to Explore Integrating Technologies into Instruction

Bullock tells of his experiences teaching with blogs and videos (Bullock [2013a](#), [b](#)) in narratives that highlight the "use of self-study as a vehicle for exploring digital technologies" and the professional learning about pedagogy that emerges from those experiences, which are echoed in qualitative research elsewhere (see Jaipal-Jamani and Figg [2015](#); Jaipal and Figg 2009); yet the narrative component is appealing to teacher educators who are contemplating the same teaching experience. Bullock's ([2013a](#)) description of his exploration of blogs to support teacher candidates in the field clearly illustrates how blogs, as a collaborative form of multimodal reflection, may be useful in providing a forum for preservice teachers to discuss and share experiences from their field experiences that have promoted their growth as a professional and, at the same time, provide the instructor with an opportunity to continue and enrich the instructor/student relationship at a distance during pivotal professional experiences. These revelations about how and for what purpose the use of blogs in instruction is successful support the understanding required for teachers

wanting to use this technology but unsure of how to approach the integration process.

Likewise, Bullock (2013b) describes first experiences using video reflections with preservice teachers. The instructional task in the study required preservice teachers to self-select a technology new to them, which they were to master and create a lesson design in which they use this technology. Reflections were recorded in video clips and shared with the instructor. These reflections revealed that the preservice teachers demonstrated mastery of the tool selected and how to use the tool, but pedagogically, there was little or no transfer to understanding about how to teach with the tool from the activity. Even though preservice teachers did not translate what they were learning about the tool into valuable pedagogical knowledge as expected from the task, the video reflections provided clues about the type of task that might promote a transfer from "learning the tool" to "teaching with the tool." These findings support the themes from the TPACK literature (as reviewed above) that highlight that the act of simply learning or teaching a tool does not result in technology-enhanced teaching; however, the narrative format of the self-study findings provided contextual evidence about teaching practices that are often difficult to elicit from more empirical forms of research.

Consider the descriptions from Bullock and Sator (2018) of incorporating makerspaces into their courses. They describe their intention to create learning spaces that are authentic, safe, and peaceful spaces, and they identify specific principles of maker pedagogy, "namely: (ethically) hack, adapt, design, and create" (p. 68). These are key concepts about how to use makerspaces for learning. Especially poignant within this article are the descriptions of the dialogues and discussions about how the researchers decided to embody those principles within their own teaching within a makerspace, leading to understanding of better practices for teaching within the makerspace environment. The language provided by the authors around how these principles supported successful integration of makerspaces into meaningful learning experiences conveys practice-based knowledge not often found in more empirical research findings.

The Use of Self-Study to Inform Teaching in Online and Blended Environments

Stories, especially those about teaching online, further provide useful insights into challenges that are often inherent in teaching in these technology-enabled environments that differ from those encountered for face-to-face interactions; these stories also share solutions to those challenges (Parsons and Hjalmarson 2017; Turner 2011). The stories often highlight technical issues, such as how to support learners in using the tools for learning, but, more importantly, share pedagogical issues, such as facilitation, roles of participants and instructor, adaptations of face-to-face interactivity into online environments, and the design process. Stories such as these enable other educators to make connections to their own teaching practice.

Ham and Davey (2005), for instance, describe their experiences working with communication activities in which email and discussion board tools are integrated. Their findings demonstrate how proactive facilitation of communication activities in

the online environment often determine the difference between meaningful interactions or an isolated experience that is perceived as less than satisfactory. They also clearly make connections for how that facilitation between student-teacher might occur so that student-student interactions are encouraged, including providing a list of best practices for teaching and communicating in this learning environment. For one who has taught online for over 20 years and supported others in learning to teach online effectively, the simple recommendations described by Ham and Davey as lessons learned are valuable to any novice teacher hoping to successfully navigate teaching in the online environment for the first time. These insights, such as (1) teaching online takes more time than face-to-face situations to moderate and sustain discussion and interaction, (2) establishing interpersonal relationships in the online environment requires a focused effort from the instructor and additional time to ensure connections are made, and (3) building activities into the instruction that explains how to use the online tools as part of the course and never assuming that students will know how to use the tools for learning, are lessons usually learned in less than successful online teaching experiences.

The considerations found in self-study by teacher educators who are sharing stories of what they learned from teaching in an online environment not only include best practices for engaging and communicating with the online student but also highlight the significance of reflective practices for informing and supporting the design and implementation of an online course. For example, Donnelly (2006) shared how she struggled with incorporating an experiential model of learning (providing students with opportunities in each module for a concrete experience, reflective observation, abstraction, and active experimentation) in her online course while effectively providing a model of best practices for students regarding the design, implementation, and use of technologies for learning. The study findings explained how reflection around issues related to the online environment were identified and then resolved, thereby promoting a rigorous online learning experience for students. The examples of how students in this study learned how to select and use a variety of learning technologies to enhance student learning while integrating and evaluating those learning technologies in the context of their own subject areas provided a realistic story of how to incorporate theories of learning as the basis and foundation of design of learning experiences for an online course.

Parsons and Hjalmarson (2017) also highlighted the critical aspect of their role as designer and instructor-designer of an online learning environment and provide useful insights into three key design characteristics of online course development: "focusing on systems of learning and teaching, designing pedagogical tools and products, and using iterative processes" (p. 331). Their study examined how "developing discipline-based knowledge and skills to support literacy/math teaching and learning within a school-based leadership model" led "to foster[ing] communities of practice and student engagement" (p. 338) and led to great personal understanding of how to successfully design synchronous online learning environments as well as how their design of the use of technological tools could both support and engage students in the online environment.

Turner (2011) highlights another inevitable task that online teachers face – adapting a distance course for an alternative technology medium – and realizing that this task required creative thinking about (1) knowledge issues, what knowledge was needed for a successful transition from a synchronous face-to-face environment to an asynchronous distance environment; (2) design issues, what decisions needed to be made about design choices to better fit the distance environment; and (3) change issues, what would the instructor need to learn in order to implement the course as designed. She further identified a step-by-step transition process that could be used to support others in such a task. The transition process utilized thoughtful reflection of the redesign process on four critical areas of transitional knowledge:

- *Student Knowledge*: Knowledge known by students who had taken courses delivered by distance technology.
- *Technical Knowledge*: Knowledge known by technology experts and instructional designers.
- *Experiential Knowledge*: Knowledge known by instructors with experience using virtual multi-user technology.
- *Reflective Knowledge*: Knowledge known by the researcher and reflected upon during the change process (Turner 2011, p. 8).

Although most of the self-studies share stories of teaching in the online environment, and the issues related to those environments, Sanagavarapu (2018) tells of first experiences with learning how to teach in a flipped classroom environment. He then shared six criteria for success that were the result of his self-reflection on his experiences: (1) use a holistic framework for planning, (2) build in intentional scaffolding, (3) ensure equity and access, (4) address and manage the change, (5) seek institutional support, and (6) remember that time is an important resource. Additionally, Sanagavarapu suggests that being realistic and persistent as well as being open to new opportunities and a changing identity allows one to move forward and make changes in teaching practice worth doing. Many of these contributions echo those found in the findings of the self-studies that describe experiences and lessons learned in fully online learning environments.

The Use of Collaborative Self-Study to Promote Teaching with Technology in Subject Area Courses

A unique self-study highlights how the TPACK framework might be used in self-study to enhance understanding of how TPACK emerges and develops through the act of teaching with technologies (Fransson and Holmberg 2012). These researchers "used the conceptual framework of TPACK to visualize and analyze [their] own prerequisites, understanding, and actions when using technology to support learning. In other words, [they] analyzed [their] own PCK [Pedagogical Content Knowledge], TCK, and TPK and how these aspects of TPACK (and thus [their] own TPACK) might evolve during the design and realization of the course" (p. 197). Their findings highlighted the overlap and connectedness of each of the components of TPACK

knowledge and how their personal study of building professional knowledge was contributing to their overall ability to teach with technologies.

There are a few studies beginning to emerge in the SSTEP literature that are addressing the important question about how technology specialists, including technology teacher educators, are working with colleagues in faculties to ensure the promotion of TPACK in higher education faculty. For example, Kosnik et al. (2017) describe their collaborative experiences as two literacy teacher educators working with a knowledgeable other during their first experiences of slowly integrating digital technologies, such as wikis, into their teaching practices. Their story eloquently describes their process of risk-taking that is inherent to growth in teaching practice through positive collaborative engagement with colleagues. Likewise, the study by Jaipal-Jamani et al. 2015a describes three literacy teacher educators (the latter three authors) working with two technology mentors to integrate digital technologies into their own teaching practices first and then how that helped them gain confidence to serve as digital mentors for other faculty members. The stories shared by the collaborators highlighted four strategies used by the technology mentors that supported their ability to easily integrate digital technologies into their teaching practices: modeling of the technology in a learning activity, just-in-time technical instruction, pedagogical discussion, and support in designing a learning activity. They then used those same strategies to design and teach technology-enhanced activities to their own students and later taught workshops to faculty colleagues. Together, these two self-studies highlight ways in which the collaborative support from the faculty community enhanced their confidence to change teaching practice.

Although this extensive review of literature only resulted in a total of 11 self-study articles highlighting teacher educators' stories of learning to teach with technology, the SSTEP literature does contain multiple examples of teacher educators and their experiences incorporating specific technologies into their teaching practices, additional descriptions of how teaching with technology led to changes in their personal teaching practice, and even how digital technologies have changed the way teacher educators conduct research – such as the stories we see in *Being Self-Study Researchers in a Digital World* (Garbett and Ovens 2017). By limiting the review to technology courses or technology teacher educators – the focus of the research questions – many of the articles that may have come to light could have been excluded. However, self-study narratives, such as these, illustrate the potential of self-study research findings to inform and promote changes to the teaching practices of teacher educators and are especially effective for informing teaching practices that include technology.

In summary, other themes that emerged from self-studies of teacher educators solving problems of practice that contribute to the growth of TPACK knowledge included the common motivation of remaining relevant to students as an impetus for integrating technology into teaching practice as well as the resulting frustration that teacher educators often experience from the lack of knowledge and expertise when using the new technology in teaching. The narratives often describe the apprehension with the risk-taking that is required to attempt to use a new technology within

their teaching practice and the innovative strategies created to overcome these frustrations and challenges. Most, if not all, of these self-studies provide guidance for the reader, such as providing a summary of best practices learned from the journey or next steps in the growth process. We anticipate that most of the chapters in this section on self-study across subject disciplines will highlight the influence of technology upon teacher educators in those disciplines and provide further examples of how teacher educators respond to the pervasive influence of the use of technology across teacher education (Howell and O'Donnell 2017).

Gaps in the Literature

As indicated by this review, the area of self-study of technology teacher educators is a new and emerging area of research. Self-studies by technology teacher educators are rare in the literature, partly due to formative stages of the discipline as a teaching subject domain and partly due to the ever-present change in the field. As well, technology teacher educators – those teacher educators who teach courses in teacher education programs focused on the pedagogy of how to teach with technology – are a small community, with a teacher education program counting itself privileged if they have one technology teacher educator on faculty offering stand-alone technology pedagogy courses.

Understanding how technology teacher educators foster the development of TPACK and the decisions made about "what works" to promote technology-enhanced teaching in preservice teachers to prepare them for their initial teaching experiences can be gleaned from literature reviews of qualitative, design-based, action, and quantitative research literature. However, the stories and narratives of technology teacher educators that describe those decisions, the findings and best practices that result from the rigor of self-studies that describe the trials and errors from the technology classrooms, and the lessons learned, are minimal in the self-study literature. Although this can be attributed to the more focused research on promoting TPACK in preservice teachers in subject matter domains rather than in sharing what they, the experts, are also learning about how to promote TPACK in the technology classroom, the question still remains – what are the problems of practice for technology teacher educators?

How do technology teacher educators make decisions about what should be included in our stand-alone technology courses? Technology teacher educators understand that content for a technology methods course is one of those problems of practice. The field of technology covers such a large knowledge base of technologies, pedagogies, and technical skill requirements that support teaching one content area, much less teaching multiple subject content areas, that selecting appropriate content that grows TPACK within the structure of a short one-term technology methods course is a challenge. Even within the literature reviewed for this chapter, descriptions of what technology teacher educators are doing for content within the technology courses are seldom included. There are descriptions of assignments

(Mouza et al. 2014; Jin et al. 2015) and problem-based activities (Dreon and Shettel 2016), but the perplexing question about content for these courses is infrequently tackled. The narratives and stories from these contexts would provide valuable information and examples for other technology teacher educators struggling with questions such as how to select the types of tools introduced in technology courses, how to determine what background technology knowledge is most important to be shared with preservice teachers, as well as seeking indications of the types of learning activities that promote the attitudes and beliefs that lead to a growth mindset needed for teaching in a digital society. Recommendations for future research directions in self-study for technology teacher educators are simply to get those stories shared. Finger and Finger (2013) called for the urgent need "for research which acknowledges the importance of teacher stories to assist in our understanding of what TPACK looks like in practice" (p. 31), but this is not just the TPACK of the preservice teachers but of the technology teacher educators as well. The expertise that rests buried between the lines of the other research formats is rarely shared, and when they are shared, they are shared most often in the chance meeting of colleagues over coffee or, informally, at conference social events or summits. Yet, the voices of these innovators and early adopters could provide much guidance, not only for other early adopters but for those with little or no experience with technology-enhanced teaching.

A second area that is highlighted by the literature review is the issue related to the difficulty of assessing TPACK – how do we measure the growth of TPACK knowledge in preservice teachers? Do we need to measure the growth or assume that TPACK is always growing? Do we instead research or measure the effectiveness of interventions to promote specific knowledge components of TPACK, or intent to teach with technology, as proposed by Perkmen et al. (2016)? Do we focus on pedagogical reasoning as more important as a measure of TPACK (Chai et al. 2013; Trevisan and De Rossi 2018)? Most of the research in this area is quantitative, and yet, the findings from self-study reflections of the technology teacher educator may be more indicative of what is most effective.

Additionally, the literature review also highlighted how the growth of TPACK knowledge is closely tied to the interaction of content knowledge and technological knowledge. An important area for self-study researchers would be to research how technology teacher educators coordinate what is taught in the technology methods course with the technologically enhanced content that colleagues in the program are teaching in the subject area methods courses so that the preservice teachers are experiencing a well-rounded exposure to how to teach with technology in the content areas. The narrative stories of programs where the faculty are engaging in the process work to make such a coordinated program a reality (such as seen in Lindsey et al. 2016) would be especially informative to other teacher education programs, and the technology teacher educator's understanding of what is contributing to the success of such a program would not only be a pivotal but could present perspectives of actions to promote improvement. We would also recommend that within a self-study of a technology teacher educator, it would be especially important

to include what personal knowledge about teaching practice, or teaching with technology, or reflection on teaching preservice teachers, was gained from this experience – in other words, how did the experience result in personal TPACK growth for the technology teacher educator in the self-study?

A separate, but similar, topic for research would include the self-study of how technology teacher educators work with colleagues in the faculty to ensure that they, too, are growing their TPACK knowledge. Descriptions of strategies, successful mentoring techniques, types of administrative support required for success, and motivational aspects of achieving growth are all appropriate findings that could inform other technology teacher educators who are often faced with the same tasks, as are tech-savvy teacher educators. The literature review did highlight two collaborative self-studies (Jaipal-Jamani et al. 2015b; Kosnik et al. 2017) that illustrated how small collaborative groups were successful in promoting TPACK in teacher educators – other stories are needed to enhance our understanding of this powerful method of TPACK knowledge-building.

And finally, and arguably most importantly, what are technology teacher educators learning about teaching with technology that informs their own teaching practices in a digital classroom? Experienced technology teacher educators already possess TPACK – they understand how to use technology and have a highly developed pedagogical knowledge of how to design technologically enabled learning environments. Their practice is not informed by stories from teacher educators who describe how they had to learn how to work with the tool technically, how to figure out a learning activity that was appropriate for that tool, and then how to pedagogically use the tool effectively during instruction (which faculty who teach in subject areas do). Technology teacher educators' practice will be informed by other technology teacher educators sharing how changes made in their technology classrooms influenced their teaching practice. For example, coding in the classroom, makerspaces, genius hour/inquiry-based learning, robotics, and artificial intelligence are all examples of newer technology-enabled learning environments that could be utilized for teaching. In our experiences, it is the technology teacher educators who will be the first ones engaged in overcoming the technical issues of the technologies, ironing out how these environments will work seamlessly in instructional situations, and determining situations in which teachers will be successful in integrating these into teacher education classroom instruction. We would also expect any best practices for working in this new environment or with these new technologies to be shared as well. These are rich and robust areas of self-study research for technology teacher educators.

Next Steps

Given the rapid rate of change of technology, it is naive to assume that the tools we have today will remain static. Clearly this has implications for how we think about deploying these tools in the classrooms and how we train teachers to use these tools for pedagogical purposes. This is what brings teacher creativity to the forefront, since teachers have to be

prepared to utilize tools they may have never experienced before in their classrooms. This idea lies at the heart of the TPACK framework as well. (Mishra and Henriksen 2018, p. 2)

As Mousa et al (2014) suggest, the technology does not remain static. We would also suggest that the learning environments that we prefer for technology-enhanced teaching do not remain static. Change is the only constant in the classroom of the technology teacher educator. Self-study research is one of the few forms of research that documents the change process that often occurs quickly in the technology classroom, specifically as it is aligned with personal teaching beliefs and goals. Such research would support and enhance our ability to encourage and promote quality teaching with technology, so the need for the research is real and immediate, and this review illustrates the complete gap in this type of research being done.

There is an opportunity for scholars to engage in robust research agendas to close this gap and encourage the development of a forum for conversations about problems of practice of technology teacher educators that does not currently exist. Therefore, we would like to suggest that our next steps as self-study researchers are twofold. First, we must advocate for this type of self-study research. Our self-study interest groups at the national research conferences are the Self-Study of Teacher Education Practices SIG of the *American Educational Research Association (AERA)* and the Self-Study of Teacher Education Practices (SSTEP) SIG of the *Canadian Association for Teacher Education (CATE)*, a constituent association of the *Canadian Society for the Study of Education (CSSE)*. We recommend attending the SIG meetings and presenting at the conferences and sharing the results of this literature review and inviting young scholars and teacher educators to submit their self-study research to journals such as *Studying Teacher Education* or *Journal of Teacher Education*. We would also invite interested senior scholars to join with us as volunteers to serve as editors or "readers" to pre-read submissions, much as we do for our graduate students, to promote more rigorous publications on these topics.

Secondly, we need to advocate for technology teacher educators to become engaged in self-study research and provide the narratives and much-needed stories of decisions made during their problems of practice. In order to do this, we also need senior self-study scholars to step forward as advocates and volunteers to attend and present at conferences, specifically by attending the special interest groups meetings, such as the special interest group, the Technology as an Agent of Change in Teaching and Learning (TACTL) SIG of the *American Educational Research Association (AERA)*, and the Technology and Teacher Education (TATE) SIG meeting of the *Canadian Association for Teacher Education (CATE)*, a constituent association of the *Canadian Society for the Study of Education (CSSE)*. Then, we also recommend presenting and visiting with the TPACK SIG members at the *Society for Information Technology and Teacher Education (SITE)* which is a unique organization focused on the integration of instructional technologies into teacher education programs. These are the venues where technology teacher educators most often present their research and congregate to learn from the community about best practices, innovations, and advancements in ideas.

Conclusion

The field is wide open. There are opportunities for the development of new special interest groups within our research associations. There are opportunities for new streams of communities of engagement in the self-study research of problems of practice for technology teacher educators; there are opportunities for new advocates and senior scholars alike. We call upon our self-study colleagues to pick up the baton and make this happen. The need for this research is real and imperative.

The capacity for self-study research to contribute to the knowledge base of how to make decisions to improve our technology-enhanced teaching practice cannot be underestimated. Although self-study is informative for other content areas and teaching practices, self-study literature about how technology teacher educators changed their teaching practice with technology and innovative teaching practices and structures has been shown to serve as exemplars of decision-making for future technology educators. Reflecting, reading, and learning from the self-study literature shared by these knowledgeable others, innovators, and early adopters prepare us to enact those decisions we make for our own teaching practices.

This fifth part of the *International Handbook of Self-Study of Teaching and Teacher Education Practices* extends self-study beyond the educator in the classroom. The chapters in this part move beyond teacher education in three ways. First, several chapters offer perspectives on the challenges of enacting self-study as an epistemology of practice. Second, other chapters widen the lens to consider elements of teacher education beyond the university classroom, such as the practicum, portfolios, leadership, and programs as a whole. Third, other chapters widen the scope of self-study to fields beyond teacher education, such as teaching and higher education. Overall, this part challenges the self-study community to consider how it can increase the impact of its work by simultaneously thinking and acting locally and globally to improve education.

Self-Study in Teacher Education and Beyond

34

Julian Kitchen

Contents

Abstract

In self-study, teacher educators typically write about their experiences working with teacher candidates in university classrooms. Most studies are modest in scale and directed at improving their personal professional practice within their institutional context. These inquiries, by also addressing issues of more general concern, contribute to a wider discourse on enhancing teacher education practices and policies. While the findings are not generalizable, articles and chapters offer insights that might be transferable to other practitioners engaged in similar pursuits. This introduction to Section 5, "Self-Study in Teacher Education and Beyond," while recognizing the importance of such work, challenges S-STEP practitioners to look beyond individual studies of practice to the bigger theoretical, methodological, and practical questions that should engage the field in the 2020s and beyond. After introducing the other nine chapters in this section, the author reviews the history of S-STEP as a vehicle for improving practice and teacher education. Then, as many of the chapters deal with elements of teacher

education beyond the university classroom, teacher educators are urged to consider ways in which they might use self-study to inquire into the wider teacher candidate experience in their institutions. The third theme is widening the scope of self-study to fields beyond teacher education. Finally, Schwab's commonplaces are used to frame a discussion of future directions for self-study as a curriculum-making approach.

When we think of self-study, we typically imagine teacher educators writing about their experiences working with teacher candidates in university classrooms. Most studies are modest in scale and directed at improving their personal professional practice within their institutional context. These inquiries, by also addressing issues of more general concern, contribute to a wider discourse on enhancing teacher education practices and policies. While the findings are not generalizable, articles and chapters offer insights that might be transferable to other practitioners engaged in similar pursuits. The focus on teacher educators understanding themselves and their practice in context is what drew me and many others to the S-STEP community of research and practice. This focus has validated and enriched our individual and collective work, but is it enough?

S-STEP has been praised by Zeichner (2007) for adding "dignity to the important yet universally undervalued work of those faculty and staff who educate a nation's teachers" and contributing to "many improvements in the quality of teacher education programs" (p. 37). Zeichner and others would like to see more generalizable and verifiable findings that can be replicated and implemented on a large scale to improve practice overall. Indeed in AERA's *Studying Teacher Education* (Cochran-Smith and Zeichner 2005), self-studies were not considered because they could not could be readily transferred to other settings, which they deem crucial to building a knowledge base in teacher education. While Craig (2009) is very supportive of self-study, she does suggest that we could increase the impact and trustworthiness of our accounts by being more explicit in naming knowledge contributions of our studies in relation to educational policy, history, and "'conceptual containers' that could hold big ideas central to the field" (p. 31).

Zeichner's larger concern is that, as teacher educators, we need to focus more on approaches and structures that support the effective preparation of teachers for our increasingly diverse and changing schools. Zeichner and Conklin (2005) make a case for research that helps identify program structures that are particularly effective in preparing teachers, especially in the face of politically driven challenges to conventional programs. While I have written mainly about teacher educator identity and effective practices through self-study and complementary practitioner

inquiry methods, I have come to share Zeichner's concerns. Writing handbook chapters on teacher education programs while leading my college of education's program renewal process prompted me to widen my gaze beyond my own work. As the program chair responsible for doubling the length of the teacher education program at Brock University in response to government directives, I asked deep questions about the conception and structure of our program (Kitchen and Sharma 2017). As the lead author of a study of teacher education in Ontario, I noticed that conceptions and structures varied widely and were often not well articulated (Kitchen and Petrarca 2015). As the lead author of an international handbook chapter on approaches to teacher education, I became increasingly aware of the limited impact of improved courses in the absence of program vision and coherence (Kitchen and Petrarca 2016). This led me to edit a book on teacher education programs in Ontario as a means of increasing public knowledge about the conceptions and structures of the new programs (Petrarca and Kitchen 2017) and to study integrated and cohesive exemplary programs in my other chapters in this section of the handbook.

These experiences, which have widen my lens as a teacher educator, guide my exploration of self-study in teacher education and beyond in this introductory chapter. While the daily work of teacher educators is at its core, self-study is ultimately about much more. The founders of the S-STEP special interest group in 1993, to use the language of environmentalism, thought globally while acting locally. S-STEP rejected epistemological and ontological approaches that were prevalent in the academy, drawing strength from the perspectives of Schön (1987), Connelly and Clandinin (1988), Schwab (1971), and others who challenged technical-rational models of teacher education. The best way to solve these problems was to situate their work in the context of their own classrooms. But they also raised many important issues, some of which may get taken for granted as we plug away teaching our courses and writing our studies. They engaged with big ideas about the nature of knowledge and applied these in studies of their practice at the outset and when the first handbook was published in 2004.

The publication of this second international handbook is an opportunity to look beyond individual studies of practice to the bigger theoretical, methodological, and practical questions that should engage the field in the 2020s and beyond. After introducing the other nine chapters in this section, I review the history of S-STEP as a vehicle for improving our practices and the entire teacher education enterprise. Then, as many of the chapters deal with elements of teacher education beyond the university classroom (e.g., practicum, portfolios, and program structure), I invite teacher educators to consider ways in which they might use self-study to inquire into the wider teacher candidate experience in their institutions and disseminate such inquiries within our community. The third theme is widening the scope of self-study to fields beyond teacher education. Can self-study contribute to practitioner research in teaching, higher education, and the professions? Finally, Schwab's (1971) commonplaces are used to frame a discussion of future directions for self-study as a curriculum-making approach.

An Overview of the Chapters in This Section

▶ Chapter 35, "Advancing an Epistemology of Practice for Research in Self-Study of Teacher Education Practices" by Andrea Martin and Tom Russell illustrates the value of both good theory and good practice. Their insights on the epistemology of practice are based on rigorous thinking, careful reading, and, most importantly, deep insights into the experiences of teacher candidates in their practicum course. This chapter illustrates that good theory is highly practical, lived experience is critical to good theory, and theory and practice are both strengthened when they come together through reflection in and on practice. Martin and Russell draw our attention to philosophical questions while, like the other chapters in this section, offering practical insights into improving teacher education practices within the contexts in which we work alongside teacher candidates. Tom Russell was one of the founding members of S-STEP in 1993. Russell (2004) argued that "our growing awareness of the importance of *self* in teacher education" was "not only necessary but also inevitable" (p. 1192), given the failure of the technical-rational model to serve the needs of practitioners. Russell, working with Hugh Munby, made important contributions to the application of reflective practice in education (Munby and Russell 1993, 1998) and understanding the authority of teaching in the preparation of teachers (Munby and Russell 1992, 1994). Together with Andrea Martin, they also wrote an influential and often-cited handbook chapter on teachers' knowledge (Munby et al. 2001). This work led Russell to more closely inquire through self-study into his own practice as a physics teacher educator (Russell 1995b; Russell and Bullock 1999), the practicum (Russell 2017), and the experiences of teacher candidates in his classes (Russell 1995a) through self-study. Martin too has written extensively about the epistemology of practice (Russell and Martin 2017), reconceptualizing a teacher education program (Martin 2007) and her teacher education experiences supporting learning during the practicum (Martin 2017).

It is useful to bring these ideas to our reading of subsequent chapters in this section on specific areas of teacher education such as the teaching of the foundations of education, practicum, portfolios, and exemplary programs.

▶ Chapter 36, "Intimate Conversations" by Michael Pitblado and Theodore Christou examines the place of educational foundations in teacher education and in S-STEP. The authors make a strong case for the cluster of courses "typically involving history, philosophy, and sociology of education, along with educational psychology" (p. 1) as places in which foundational theory and knowledge may be introduced and then integrated into teacher education. When I took such courses in the 1980s, they were interesting courses in terms of the traditional epistemology of the university, but seemed far removed from the epistemology of practice advocated by Martin and Russell. Building on Christou's (2009) previous work on the demise of the history of education, as well as their experiences teaching foundations of education, Pitblado and Christou demonstrate that such courses can be spaces that allow for "intimate conversations" between theory and practice, biography and history, and educational foundations and social justice. In doing so, they survey the modest number of self-studies on educational and social foundations to

demonstrate the richness possible when such courses are made relevant by engaged and inspired teacher educators. This chapter contributes to the theme of this section by shedding light on an under-researched area in the self-study of teacher education practices. Also, in the context of Martin and Russell's examination of epistemology, this chapter suggests that the critical skills and "complicated conversations" introduced in such courses can help elevate teacher education from training to education that helps new teachers think deeply about the challenges of education and schooling. Whether one agrees that educational foundations should continue to hold distinct places within the teacher education curriculum or holds that such courses should give way to practical courses related to pedagogy, inclusion, or social justice, Pitblado and Christou's survey of self-studies on educational foundations and strategies for making such courses more relevant offers much food for thought. Read alongside Martin and Russell's chapter on epistemology of practice, this chapter suggests that educational foundations could be a site for the integration of theory, practice, and reflection.

The epistemology of practice, according to Martin and Russell, involves learning from experience. In teacher education, this makes the practicum a particularly important space for learning, one that teacher candidates typically view as the most useful part of their preparation. The practicum has been widely studied from a variety of perspectives, but it is surprisingly under-researched in teacher education generally and within the self-study inquiry community. Diana Petrarca and Shirley van Nuland, in ▶ Chap. 37, "Initial Teacher Education Practicum 2.0," note that there has been little new work done since Beck et al. (2004) in the first self-study handbook suggested that a self-study approach could improve learning for teacher candidates, supervising teachers, faculty, and practicum supervisors. This leads them to organize their "reboot" of Beck and colleagues' chapter around two key questions: (1) Why is the practicum still a less-explored area in the S-STEP community? and (2) How can we facilitate an S-STEP approach to practicum? They, like Beck's team, adopt a constructivist perspective to learning that is largely consistent with Martin and Russell's approach to critical reflection in the practice setting. Petrarca and van Nuland embrace the complexity of practicum as an ideal location for self-studies that recognize and welcome complexity, interconnectedness, and situated learning. They also acknowledge the challenges and impediments to such work. Exemplary programs, such as the ones explored in a subsequent chapter by me, are noted for strong connections between course and practicum experiences. While the conditions identified by Beck et al. for fostering a self-study approach to the practicum exist in such programs, they are less common elsewhere. The examples from self-study and other research on the practicum, offered by Petrarca and Nuland, illustrate the present state of practicum research in our field. In the final portion of their paper, the authors offer suggestions for a research agenda for self-study practitioners interested in better understanding the practicum. As practical experiences in the field are critical to the education of teacher candidates, especially to the connections they make between propositional and practical knowledge about teaching, can we as a community seriously study teacher education without attending more to the practicum? Martin (2017) and Russell (2017) would say no, which is why they have recently focused

their efforts on understanding practicum experiences and enhancing university-school connections for their teacher candidates. Petrarca and van Nuland, by focusing squarely on the practicum, offer teacher educators deeper understanding and a path forward, so that the next edition of this handbook will not need to have a chapter focused on the lack of practicum research in self-study.

When Kitchen and Petrarca (2016) reviewed the teacher education literature for exemplars of effective practice, we found that the best programs "employ portfolios as a culminating *thesis* through which teacher candidates' theory and practice, ideally through reflection-on-action processes (Schön 1987), are captured" (p. 162). We suggested that most programs would benefit from using reflective processes, structures, and tools – such as a structured, standards-based digital portfolio – on an ongoing manner to foster teacher candidate learning. Portfolios attend to the complexities of practice identified by Martin and Russell by helping teacher candidates analyze both theory and practice in order to integrate their learning into a set of skills and dispositions that enable them to respond effectively to the uncertainty, ambiguity, and wonder of teaching and learning. Kevin O'Connor, Gladys Sterenberg, and Norman Vaughan bring deep theoretical and practical knowledge of portfolios to ▶ Chap. 38, "Portfolio and Self-Study." In their chapter, it is noted that portfolios have been widely accepted in self-study as a teaching practice to facilitate reflective learning and that programmatic portfolios can contribute to an epistemology of practice. The main benefit of portfolios, including the e-portfolios they employ at Mount Royal University, is that teacher candidates effectively integrate theory and practice by systematically charting and critically reflecting on their development. Interestingly, drawing on Munby and Russell (1994), the authors argue that this practice diminishes the problematic tendency to give primacy to the status quo in schools or their own school experiences. Indeed, to use Russell and Martin's language, teachers learn to thoughtfully navigate the tensions between the propositional knowledge of the university and the craft knowledge of schools as they develop and live out their professional knowledge. The chapter draws extensively on self-studies on portfolios, as well as the authors' experiences employing portfolios as an ongoing and culminating assignment in their highly integrated program. The ability to do this is in no small measure due to working in a small teacher education program with a focus on teaching over research, something I discuss in the next chapter. Readers of this chapter would do well to consider how you might work collaboratively with colleagues to employ portfolios as a means toward the epistemology of practice in your programs and how you might inquire into this integrative program-wide approach using S-STEP methodology.

In ▶ Chap. 39, "Pedagogy of Teacher Education in Exemplary Programs," I propose that self-studies and other practitioner research by teacher educators in programs identified in the literature as innovative and exemplary offer insights into how self-study can contribute to the development of effective teacher education at the program and institutional levels. In particular, this chapter draws attention to connections between self-study and teacher education reform by drawing on the rich research and richer practice in three exemplary programs: Bank Street College

of Education, Mills College School of Education, and the Mid-Town Option at OISE/University of Toronto. The contributions of practitioner research in these programs, which include many recognizable self-study practitioners, are organized around five themes: theory, practice, reflection, integration, and influence beyond the program. The survey of these programs reveals that "no element in an exemplary program is an island, that each is dependent on and interconnected with other elements. The examination of theory reveals ways to make knowledge and pedagogy meaningful as theory, and in relation to practice and reflection." Key to all three programs is the integration of vision and practices across courses and fieldwork by highly collaborative and deeply engaged teacher educators. Such integration is difficult, but these exemplars offer us possibilities as we envision integrated programs guided by an epistemology of practice. I conclude by challenging teacher educators to turn our attention as practitioners and scholars to the integration of various elements at the program level as a means to improving student learning, schools, and communities at a time when education is critical to living in a diverse and changing world.

If colleges of education are to become effective in preparing teachers, it will be due in no small measure to teacher educator leaders who attend to the complexities of preparing teachers and encourage teacher faculty to engage fully in teaching and studying their practice. As S-STEP has developed as a discourse and practice community, a growing number of our members have assumed leadership responsibilities. This was made evident by the publication of *Inside the Role of the Dean: International Perspectives on Leading in Higher Education*, edited by active S-STEP members Clift et al. (2015). Valerie Allison and Laurie Ramirez, in ▶ Chap. 40, "Role of Self-Study in Navigating Teacher Educator Administrators' Responsibilities," examine the leadership and self-study literature, as well as their own experiences as teacher educator leaders, to inquire into how self-study informs how deans, department chair, program director, and other leaders go about their work. They review the work of prominent S-STEP members who have written self-studies and other accounts of their work as deans. These studies offer insights into both the complexities of leading change and the challenges of bringing self-study approaches to positions of responsibility. More significantly, they have delved more deeply into lower-level administrators, such as program directors, who take on program leadership roles for a period of time, often in addition to teaching duties. While this chapter offers useful definitions and terms for framing discussion, the most engaging sections are those that describe and make sense of the stories of people, themselves included, who navigate these roles and responsibilities. While some of the stories focus on frustrations, the tone is largely hopeful. This is thanks to sections that offer insights into how self-study understandings prepare leaders, how they balance their lives and work, and how critical friendships support them in this important work. Allison and Ramirez invite us "to transform the perception and practice of teacher educator administration" by developing "a more sophisticated understanding of the various roles within teacher educator administration and develop a body of work that can serve to guide new administrators, enhance leadership practices, and promote positive change within

teacher education, the academy, and beyond to the work of teachers and schools in society."

Before looking beyond teacher education to self-study in other fields, it is useful to return to big questions about our roles as teacher educators. Jason Ritter and Mike Hayler consider "the challenges of impact in self-study in teacher education" in ▶ Chap. 41, "Challenges in Engaging in Self-Study Within Teacher Education Contexts." The authors "see the challenges as very real and inevitably multilayered because the work of teacher education is itself multilayered" and teacher educators are conferred limited status in academe. The specific multilayered challenges identified by these two established self-study teacher educators include vulnerability, the messiness of practice, academic expectations, and the norms of schools. These concerns echo the fears of the founders of S-STEP 25 years ago as they risked tenure or academic legitimacy by courageously studying their practice (Loughran 2004). The chapter is grounded in a deep understanding of the literature, but it is their personal accounts that add emotional weight to the argument. Ritter and Hayler, like their predecessors, conclude that self-study is worth the risk as it improves the quality of teacher education practice and the quality of the experience of being a teacher educator. Their review of the literature reminds us that self-study is important work that contributes to the improvement of teaching, learning, and society. Ritter recalls a collaborative self-study on field instruction that led to reforms that better prepared teacher candidates for the practicum. Hayler's worries as a teacher educator in an institution that offered mainly precarious employment to those not engaged in traditional research did not prevent him from continuing to study his practice. Building on Ritter and Hayler's stories and insights, I would add that self-studies that go beyond the safety of our classrooms to the wider teacher education program through an epistemology of practice, practicum, portfolios, and integration across a program are particularly challenging and deserving of our courage and commitment.

The final two chapters look beyond teacher education to possibilities for self-study in schools and higher education. Self-study has much to offer teachers, college and university instructors, and other professions, yet our insights into improving practice and methodologies for inquiring into practice have not spread to these groups that are equally in need of our inquiry approach. The limited transfer to teachers in elementary and secondary schools is particularly disappointing as the title of both editions of the handbook include the words "self-study of teaching and teacher education practice," and Samaras and Freese (2006) wrote an excellent *Self-Study of Teaching Primer*.

▶ Chapter 42, "Self-Study in Elementary and Secondary Teaching," by Jack Whitehead, Jacqueline Delong, Marie Huxtable, Liz Campbell, Cathy Griffin, and Joy Mounter, functions as a review of self-study as an approach to inquiry in schools by a team of experienced school-based educators. Simultaneously, these educator-scholars draw on their experiences to explore Living Theory as an approach teachers (and teacher educators) can employ as they "continuously research their practice to improve their educational influences in their own learning and in the learning of their students and contribute to the evolution of an educational knowledge base." Living

Theory is a form of self-study research that generates evidence-based explanations of educational influence to teachers who then draw on these explanatory principles as they engage in their professional practice as teachers and school administrators. This chapter is rich in reflection and research by the team of authors, who illustrate how Living Theory has improved their teaching, student learning, and the knowledge base of teaching. As befits the title, the emphasis in this chapter is "on practicing educators and their professional development and gaining academic recognition for the embodied knowledges of master and doctor educators." Hopefully this chapter, read in conjunction with other chapters, will inspire more teachers to engage in the self-study of teaching practices.

▶ Chapter 43, "Polyvocal Self-Study in Transdisciplinary Higher Education Communities" by Anastasia P. Samaras and Kathleen Pithouse-Morgan, extends the reach of self-study into higher education more broadly. Samaras, who earlier served as a bridge-builder to teachers with the *Self-Study of Teaching Primer*, has quietly and effectively built bridges with other professors in other disciplines and colleagues across borders. Similarly, Kathleen Pithouse-Morgan has built bridges with colleagues in South Africa across departments, universities, and, perhaps more significantly, cultures only recently united after the official end of apartheid; she also brings a strong commitment to arts-based methods of representation in research. Transdisciplinary self-study "offers a broader inclusiveness to practitioners from multiple fields of professional expertise and from diverse disciplinary backgrounds" inside and outside of teacher education, as well as dialogue among practitioners from multiple fields of experience and diverse disciplinary backgrounds as a means to reciprocal and innovative learning and research. *Polyvocal* refers to multiple voices, voices in dialogue and multiple form of representation (such as poetry) in professional learning. As leading ambassadors in this transdisciplinary and polyvocal movement, Samaras and Pithouse-Morgan describe how they have facilitated and participated in transdisciplinary self-study communities in the United States and South Africa. They provide a strong conceptual grounding for this work, before shifting to showing rather than telling. As Whitehead and his colleagues did in the previous chapter, Samaras and Pithouse-Morgan illustrate their approach with excellent examples. At the heart of the chapter are two exemplars outlined in considerable detail. These exemplars are then revisited with the lens of explaining the design elements so that readers can then facilitate and enact polyvocal self-study in transdisciplinary higher education communities. Hopefully, this work will be taken up in more and more institutions of higher learning. Perhaps, many teacher educators will join Samaras and Pithouse-Morgan as ambassadors ready to facilitate and enact such dialogue with a view to improving education beyond our own discipline.

Improving Practice: Looking Back, Looking Forward

The central purpose of self-study has always been to improve teaching and teacher education through the engagement of teacher educators as practitioners and scholars of their practice within their particular settings. In his history of S-STEP,

Loughran (2004) recalls that the aim was "to better understand the problematic worlds of teaching and learning" (p. 9) with a view to better serving the teacher candidates in their classes. The impetus for the founding of S-STEP was a 1992 American Educational Research Association conference session at which the Arizona Group (which included Mary Lynn Hamilton and Stefinee Pinnegar) "publicly articulated, and honestly portrayed their personal and professional struggles in interactions with their students as they endeavored to enhance their learning about teaching" (Loughran 2004, p. 14). This session by four emerging academics who were worried about their future careers resonated with more established professors who were struggling with similar questions. Fred Korthagen, as the discussant of the session, made connections to reflective practice. Tom Russell, who was also present, was questioning the taken-for-granted assumptions of teacher education; Russell continues to challenge our assumptions and epistemologies in ▶ Chap. 35, "Advancing an Epistemology of Practice for Research in Self-Study of Teacher Education Practices" with Andrea Martin in this section. Over the next few years, as the S-STEP special interest group was established, Jack Whitehead (who was already writing about Living Theory, employed in his chapter with colleagues in this section), Jerry Allender, Jean Clandinin, John Loughran, and others were drawn to what became self-study. S-STEP grew into an open discourse community "characterized by a need to understand the context of a given self-study and to us" (Loughran 2004, p. 18), rather than a closed community bounded by predefined methods. The theoretical underpinnings are multiple (see ▶ Chap. 1, "S-STTEP: Standing on a Threshold of Opportunity"), and the methods and methodologies varied, often hybrids adapted to confront the tensions of practice. This continues to be the case today, as is evident from the self-studies reviews in ▶ Chaps. 16, "The Role of Self-Study in Teaching and Teacher Education for Social Justice," and ▶ 26, "Self-Study Within and Across Disciplines." The chapters in ▶ "Self-Study in Teacher Education and Beyond" too are guided by commitment to improving practice, with an emphasis on widening the scope of our practice and scholarship.

This generation and sharing of knowledge by practitioners has intellectual roots in epistemology and ontology and empirical roots in the critique of teacher education programs. Hamilton (2004) examines how self-study arose from questions concerning the nature of knowledge that led to a deeper appreciation, in some corners of the academy, of the experiences, stories, reflections, and pedagogical knowledge and contextual understanding of teacher educators. Munby and Russell offer insights into reflective practice (1993, 1998) and the authority of experience (1992, 1994) in teacher preparation, which Russell subsequently connects to self-study in other works (e.g., Russell 2004). As there are multiple ways of knowing, self-study researchers accept their subjectivity rather than worry "about a level of objectivity beyond self" (Hamilton 2004, p. 410); they also let the reader assess the validity of the interpretation for themselves based on their experience.

Korthagen and Lunenberg (2004) link self-study to teacher education reform. By identifying the limitations of conventional approaches to policy leaders, the Holmes Group's (1986) report opened the door to major reform efforts, particularly in North America (Fullan 1993; Darling-Hammond and Sykes 1999). Russell et al.

(2001) articulate one of the central understandings that emerged from teacher education reform efforts during this era:

> The inability of traditional programs to prepare beginning teachers with more than an imitative understanding of their role emerges, in large part, from the lack of explicit connections between the actions of teachers and the pedagogical theories that inform practice. (p. 42)

Korthagen and Lunenberg view self-study as a response to the recognition that the curricula of conventional teacher education programs consisted largely of "isolated courses in which theory was presented without much connection to practice" (p. 429), leading to fragmentation in both coursework and practice. This disruption created space for innovative teacher educators to experiment with alternative program structures. Michael Fullan (1993), as dean of education at the University of Toronto, encouraged experimental alternative programs that involved the likes of Clandinin (1995) and Beck and Kosnik (2006) in teacher education research and reform. Several waves of teacher education in the years that followed have led to improvements in teacher education (Kosnik et al. 2016). From its inception, Korthagen and Lunenberg (2004) suggest, self-study was intended to improve one's own practice, help improve teacher education within one's institution, and offer collective gains within a wider community of teacher educators. They also remind us that self-study must keep an eye on both inward discussions within our discourse community and outward dialogue with others involved in teacher education, who often speak the language of validity, theory, and generalizability.

Returning to the environmentalism metaphor, the goal of acting locally based on global thinking is to prompt global action to save our planet. So too the long-term goal of self-study should be the improvement of teacher education approaches in programs nationally and internationally. Our local improvements to courses have helped teacher candidates (as artisanal purveyors of produce have improved some people's diet and reduced pesticide use). Our local program innovations have made our institutions more responsive (as recycling efforts have diverted much waste from landfill). Our scholarship has raised awareness of effective practices in the wider educational community, inspiring others to replicate our approaches (as green parties have raised political awareness of the environment). But how big an impact are we having on the educational system? Martin and Russell's deeply philosophical chapter, grounded in their practice, suggests that teacher education has not changed fundamentally for teacher candidates, even in programs with active self-study practitioners. They suggest that much more needs to be done if we are to successfully wrestle with the fundamental knowledge questions that took Russell to the meeting at which S-STEP was conceived. Their intent, and mine in framing their work in political terms, is not to be negative. The intent is to spur us to further action lest we become complacent in the safety of our successful S-STEP community. A companion piece to Martin and Russell's is the chapter by Ritter and Hayler on the challenges of engaging in self-study. They ultimately conclude that self-study, by offering a "versatile and inclusive methodology with which to approach…

unpredictable, messy and complex work," offers "a sense of agency" to teacher educators seeking to change the world.

All chapters in this section, like many others in this handbook, are concerned with improving practice, enhancing programs and changing the world. Many of the chapters do this by considering the teacher candidate experience across a program.

From Practice to Program: A Focus on the Teacher Candidate Experience

> Self-knowledge, in the end, is not important. As means it is all important... 'Looking in' must take its place as shedding light on what is out there. 'Looking in' must make for a better professional landscape. (Clandinin and Connelly 2004, p. 597)

As self-study has roots in the teacher education reform movement, Renee Clift (2004) argues, our collective work should extend beyond individual practice with teacher candidates to understanding program impact and deriving common understandings that might be used in our institutions and other teacher education settings. As Korthagen and Lunenberg (2004) suggest, effectively wielding influence or power can have a beneficial impact on program design and the teacher candidate experience. Clift, drawing on exemplars of program-level self-studies, makes a strong case for self-studies that go beyond course-based inquiry to improving key program elements and "continuous self-study with an entire program" (p. 1360).

Since Clift's chapter appeared, a growing number of case studies have been published on exemplary teacher education programs, some of which include faculty engaged in self-study. Darling-Hammond (2006) proposes that the key to improving schooling is understanding "what strong preparation for teachers looks like and can do, and to undertake the policy changes needed to ensure that all teachers can have access to such preparation" (p. xii). Darling-Hammond (2006) and Beck and Kosnik (2006) have written books that consider what makes highly regarded programs successful at a time when many reform efforts flounder. As I report in ▶ Chap. 39, "Pedagogy of Teacher Education in Exemplary Programs," important attributes include shared vision, faculty members committed to the shared vision, academic rigor, and integrated approaches to learning across all university and field-based elements of the program. This entails doing multiple things well simultaneously, not attending to one element at a time as can happen in individual self-studies.

Traditionally, teacher education programs begin with theory and coursework, with practicum placements serving as a culminating event (Darling-Hammond and Hammerness 2005). Increasingly, practice teaching is recognized as "a bridge between theory and practice... and the place where pre-service teachers develop a personal teaching competence" (White and Forgasz 2016, p. 231). The evidence now suggests that teacher candidates "who have some experience with teaching

when they encounter coursework are more prepared to make sense of the ideas, theories, and concepts that are addressed in their academic work" (Darling-Hammond and Hammerness 2005, p. 401). Going deeper, Martin and Russell in their chapter note, "Learning from practicum experiences is unique and different and often hard to put into words: it is tacit, it is quite personal, it is emotional and immediate." Most teacher education programs, however, are not designed to respond to critical moments that may not square with teacher candidates' propositional knowledge. Nor are most faculties involved in supporting learning during the practicum. While teacher candidates are generally asked to reflect on their field experience, little meaningful connection is made between theory presented in university classes and experiences in the context of practice in schools (Darling-Hammond and Hammerness 2005). Furthermore, only limited work is done in large programs to ensure formative feedback, good modeling, graduated responsibility, and effective mentoring. Yet we know from the research reviewed in Petrarca and van Nuland's chapter on the practicum that, while no easy task, stronger theory-practice connections are possible through thoughtful program design. The three exemplary programs in Kitchen's chapter serve as models of the integrated design that is possible when the practicum and an epistemology of practice are given due consideration in program design. White and Forgasz (2016) conclude their review of practicum research by proposing that "school-based and university-based teacher educators working together" might lead to a "convergence of theory and practice and collectively produce teachers better prepared for our complex teaching profession" (p. 260). Petrarca and van Nuland make a strong case for self-study as an approach well suited to inquiring into the complexities of practice teaching and finding ways to make meaningful connections across program elements. The three exemplary programs in Kitchen's chapter serve as models of the integrated design that is possible when the practicum and an epistemology of practice are given due consideration in program design.

An integrative assessment tool in teacher education is the teaching portfolio, which is explained and examined in detail by O'Connor, Sterenberg, and Vaughan in ▶ Chap. 38, "Portfolio and Self-Study." Portfolios vary widely in form, function, and degree of depth. Proponents of portfolios identify three possible purposes: reflecting on growth and learning, demonstrating learning, and aiding in employment (Darling-Hammond and Hammerness 2005). While all three are viable reasons for using portfolios, the most promising use is to foster growth and learning by making connections across personal experiences, theory, and practice. Although portfolios have become nearly ubiquitous, there is little research in most cases, and there is suspicion that the level of analysis and reflection is low (Lyons and Freidus 2004). There is evidence, however, that rigorous approaches to portfolios across a program can help teachers identify their beliefs and capacities, understand students in the classroom better, and make connections between theory and practice (Darling-Hammond and Hammerness 2005). Such approaches, however, are time-consuming and require commitment by teacher candidates, individual teacher educators, and the program as a whole. The success of such portfolios is evident in the

three exemplars in Kitchen's chapter. Teacher educators committed to self-study are particularly suited to a reflective portfolio approach, as they engage in reflection, appreciate the complexities of learning to teach, and are committed to improving teaching and learning through their own inquiries. O'Connor, Sterenberg, and Vaughan offer guidance to self-study practitioners considering portfolios as a practice and as a line of inquiry. They draw on self-studies of portfolios to make their case and also share their experiences within a college of education that uses portfolios across courses and the practicum.

A focus on the teacher candidate experience is most exemplified by the examples of Bank Street College and Mills College in Kitchen's, ► Chap. 39, "Pedagogy of Teacher Education in Exemplary Programs." The self-studies and other practitioner research from these programs illustrate that teacher educators can pull the elements of effective professional practice together by collectively following a strong vision and committing to cohesion and integration across the program. Key in these cases, as well as Mid-Town Option, is faculty commitment to visiting teacher candidates in the field, alongside thoughtful pedagogy of teacher education and reflection on their own practice. Yet how prepared are faculty to engage at this level? The demands of graduate teaching and research are among the distractions to intense commitment to the whole teacher candidate experience. A shared vision enacted in teacher education pedagogy is critical to such cohesive programs (Kitchen and Petrarca 2016), so everyone needs to be part of it, including foundation instructors, who too often are on the periphery of teacher education. Pitblado and Christou's philosophy and history professors could have a role to play in helping teacher candidates understand more fully their program's core values, which are then enacted in other courses, in the field, and through portfolios.

Leadership is about much more than managing people and addressing the day-to-day operational tasks within an organization. In teacher education, effective leadership involves putting the teacher candidate experience at the center. An understanding of the issues in teacher education, the ability to identify priorities, and lived experience as a teacher educator all contribute to leadership in preparing teachers. Self-study practitioners seem particularly suited to such tasks and should be encouraged and supported in taking on program and college leadership. Alison and Ramirez offer valuable insights into teacher educator leaders, particularly at the program level. As many of the challenges (e.g., lack of vision, fragmentation, and disconnection) and opportunities (e.g., connections across courses, portfolios, connections to the field) currently facing teacher education are at the program level, teacher educator leaders

can have a beneficial impact on program design and the teacher candidate experience. And what could be better than leaders interested in improving key program elements and "continuous self-study with an entire program" (Clift 2004, p. 1360). For this reason, we need to read about and learn from their experiences and inquiries.

In ► Chap. 41, "Challenges in Engaging in Self-Study within Teacher Education Contexts," Ritter and Hayler write:

Self-study gives insight to the challenges and expectations of the teacher education enterprise, and to the place of scholarship as a key element of the profession where the teacher education classroom and the academy come together. Importantly, the methodological underpinnings of S-STEP can serve to gently encourage self-study practitioners to pursue the sort of teacher educators that they want to be.

Taking this a step further, these insights can gently encourage teacher educator leaders (formal and informal) to pursue teacher education program designs that enrich the whole teacher candidate experience.

Moving Beyond Teacher Education: Widening the Scope of S-STEP

The conception and methods of self-study have potential to be of value well beyond the field of teacher education. Two chapters in this section consider the application of self-study to other fields, notably teaching and higher education. The titles of both editions of this handbook include the term *teaching*, yet only one chapter in each explicitly deals with teaching in elementary and secondary contexts. The other chapters deal primarily with the teacher education context and cite example studies of teacher education. Why is it that self-study has not expanded more beyond its original context? Does self-study have the potential to contribute to the improvement of practice in other fields?

Practitioner inquiry is relatively new as a form of research respected in the academic educational literature. Zeichner and Noffke (2001) note that their chapter on practitioner research in the fourth edition of the *Handbook of Research on Teaching* "marked the first time that practitioner research had been included in the handbook" (p. 298). The delay was because academics "viewed it as a form of professional development for practitioners" (p. 298) rather than a form of educational knowledge based on rigorous research methodologies. The increased respect for practitioner inquiry that led to their chapter suggests that "the conception of teachers is merely consumers of educational research is changing to one of teachers as producers and mediators of educational knowledge" (p. 299). Zeichner and Noffke identify five traditions of practitioner research in education: action research, teacher-as-researcher in the United Kingdom and Australia, North American teacher research, self-study research, and participatory research. Action research is recognized as the longest standing and most influential in educational practice, if not in academia. Most of these traditions are characterized as practical, reflective, and emancipatory orientations. S-STEP as a hybrid approach is informed by other practitioner inquiry traditions, with action research being an important stream within self-study (Feldman et al. 2004), but does not appear to have a significant impact on research by teachers.

In "Self-Study in Elementary and Secondary Teaching: A Living Theory Approach," Austin and Senese make a strong case for the self-study of teaching.

They suggest that self-study "incorporates elements of both teacher research and action research" while moving "beyond the immediate surface" to the "underlying values" of teachers. They allude to Living Theory, central to the teaching chapter in this section by Whitehead et al., in suggesting that this can lead to greater reflection and scrutiny regarding beliefs, assumptions, and ideologies. Yet this chapter did not inspire a plethora of teacher self-studies, let alone a stream of teachers employing a self-study approach. Austin and Senese stumbled onto self-study in their graduate programs, but clearly not enough have stumbled onto it or transferred it to the school setting. Samaras and Freese (2006) also embraced the challenge of promoting self-study to teachers through their *Self-Study of Teaching Practices Primer*. This primer, written in language accessible to teachers, outlines the self-study approach, connects it to teaching, provides templates for formal self-study, and offers examples of self-study in action. Their illustrations make it evident that the authors use self-study both in their own inquiries into practice and as an inquiry strategy for teacher candidates to puzzle over their experiences in school settings.

Whitehead and his colleagues in this section of the handbook draw on teacher stories of transformation through Living Theory and self-study to make another solid case for the self-study of teaching. Each of the co-authors writes about how these stories influenced them as teachers and/or administrators. Mounter discusses how she embraced self-study as a personal form of professional development that added to her self-knowledge and led to collaboration with peers in England. Huxtable reflects on how these approaches helped her to engage in productive dialogue with teachers. DeLong mentions her work as a Canadian school district administrator who promoted action research and self-study among teachers in her school district. The multiple collections of practitioner research she edited suggest that this work had a powerful impact locally. Campbell and Griffin, working in nearby districts, were drawn into similar networks inspired by DeLong's initiative. Whitehead, who has been promoting practitioner knowledge and living theory approaches as part of professional development since the 1970s, continues to work with a wide variety of teachers to encourage professional development and harness teacher knowledge.

Evidently, neither a chapter buried in a handbook for teacher educators nor a primer for teachers has been a big enough influence to draw significant numbers of teachers to this approach. The chapter by Whitehead and his associates suggests that there may be many pockets of success that are largely invisible to those of us in the teacher education community. Unfortunately, self-study lacks the teacher networks, how-to guides for practitioners, and prominence in teacher education classes of action research (Feldman et al. 2004), even though it appears more accessible and adaptable than the prescribed format research formulas of action research.

Will the self-study of teaching ever become as influential as action research in schools? I think it will not *unless* we as a self-study community make more of an effort to promote it in our university classes and in academic and professional

publications. The main organizational body, the Self-Study of Teacher Education Practices Special Interest Group within the American Educational Research Association, consists mainly of academics, and so it is not well positioned to promote teacher research in school settings. The dedicated journal, *Studying Teacher Education: A Journal of Teacher Education Practices*, welcomes self-studies by teachers, but few are published, and the title's use of *teacher education* may further discourage submissions. There are a wide range of edited volumes on self-study, but most focus on teacher education and/or are edited by teacher educators. Perhaps it is time for individuals as well as the leadership to do more to encourage self-studies in teaching and, in other areas, including higher education beyond colleges of education.

Anastasia Samaras has played a leading role in widening the conversation about self-study within colleges of education, in teaching (Samaras and Freese 2006), and in higher education (Pithouse-Morgan and Samaras 2015). The chapter in this section by Pithouse-Morgan and Samaras can serve as a good rationale, primer, and facilitator guide to professionals expanding the reach of self-study in the academy. There is an interest in studying teaching within higher education, something that is promoted by the centers in each university dedicated to improving the pedagogical skills of professors, sessional instructors, and teaching assistants. Boyer's (1990) advocacy for the *scholarship of teaching* has inspired a good number of university instructors to make this a strand in their scholarship alongside the scholarship of integration and application. While this work is not cited by Samaras and Pithouse-Morgan in their chapter, they are clearly tapping into similar sentiments in their outreach beyond their colleges of education. The strategies they offer could help other teacher educators interested in widening the self-study conversation to include colleagues in other disciplines within the university or other professional groups, such as medical and social service professions. These exemplars would also help in the promotion of such work. It is likely that such academically inclined professionals would welcome a practitioner research tradition that respects professional knowledge and agency. Some of these groups have been receptive to reflective practice, narrative research, and action research and publish in international, interdisciplinary, refereed journals connected to these professional and academic research traditions. A promising development has been the emergence of self-study in the field of English language teaching, thanks to the efforts of Megan Madigan Peercy and Judy Sharkey (2018). In ▶ Chaps. 28, "Self-Study and English Language Teaching," from ▶ 16, "The Role of Self-Study in Teaching and Teacher Education for Social Justice," of this handbook, this cross-pollination, according to Peercy and Sharkey in their chapter, "means bringing increased awareness of self-study and its possibilities to scholarship in applied linguistics, and enhancing the understanding of pedagogies related to linguistic, cultural, racial, and ethnic diversity in the self-study scholarship in ways that foster opportunities for self-study to inform a more inclusive, pluralistic, and mobile world." Hopefully, the work of these trailbrazers can inspire others to build bridges to related fields of practice!

Deepening Understanding Through Schwab's Commonplaces

The publication of an international handbook is an opportunity for a community practice of scholars and practitioners to reflect deeply and critically on their own work and the state of their field. Editing and writing an introduction to this section, "Self-study in Teacher Education and Beyond," has raised many questions about the self-study of teacher education practices. This chapter and other handbook chapters I have written in recent years have inspired me to ask bigger questions about teacher education and self-study. As is evident from the critical review of the field and chapters in this section, I am asking "So what?" and, in particular, "How can we as teacher educators engaged in self-study improve teacher education and education beyond colleges of education?"

Joseph Schwab's (1973) conceptualization of *curriculum making* may offer us some direction. The curriculum field, Schwab declared, was moribund for failing to connect students with knowledge. Drawing on Aristotle, Schwab recognized that curriculum was constituted both a course of study and, more importantly, the course of one's life. He shared Dewey's (1938) belief that education proceeds from the individual in his/her social context, and he also shared his suspicion that modern educational systems often deny the "organic connection between education and personal experience" (Dewey 1938, p. 25). Schwab identified four commonplaces (1971) to be considered in curriculum making: the learner, teacher, subject, and milieu. A fifth commonplace, curriculum-making, is critical to understanding the complex interplay among the learner, teacher, subject, and milieu commonplaces. As Null (2008) writes:

> The curriculum making commonplace. . . is crucial because it puts all of the other commonplaces in their perspective. It also puts them in motion toward the end of serving the public good. (p. 486)

Schwab's deliberative approach – a vision of curriculum as practical, eclectic, and informed by experience – "revolutionized the field of curriculum" (Craig and Ross 2008, p. 285) by contributing to "the humanization of educational inquiry" (Eisner 1984, p. 24). In addition, Schwab's conceptualization laid the intellectual groundwork for Schön's (1987) reflective practice, Connelly and Clandinin's (1988) personal practical knowledge of teachers, and, ultimately, S-STEP as a practical and practitioner-focused field of inquiry (Samaras and Freese 2006). Reid (2006), who identifies deliberative inquiry as one of the four important traditions in the curriculum field, writes that deliberative approaches such as self-study, unlike the radical tradition, balance critique with respect for the positive contributions of the other traditions. They do so recognizing the messiness of experience and by placing the process of deliberation over the certainty of technical-rational systems or critical theories.

Our inquiry community has deepened and enriched understandings of teacher education over the past quarter-century. Self-study research has made significant contributions to understanding the teacher commonplace in teacher education,

thanks to the many inquiries into teacher educator identity and how this is informing teacher education practice. Significant contributions have also been made to the subject-matter commonplace, particularly from inquiries drawing on the action research tradition. Most self-studies are rich in contextual detail regarding the actual milieus in which teacher education is delivered. They are also concerned with attending to the learner and to place, with data on the experiences of teacher candidates guiding both scholarly findings and practical application of the lessons learned. Finally, self-studies are improvement-driven, seeking a positive impact on teacher candidate learning.

Yet I think we would be wise to ask questions concerning the degree to which we connect our growing knowledge base about ourselves and our practices with teacher candidates' experiences of teacher education programs. Martin and Russell's critical consideration of the epistemology of practice provides insights into this challenge. Other chapters in this section suggest that self-study needs to consider more fully teacher candidates' experience across academic courses, practicum, and other program dimensions. We increasingly know how to deliver effective courses, but the chapters on practicum and portfolios suggest that looking through a curriculum-making lens can help us better wrestle with teacher candidate experiences of theory, practice, and reflection. The chapter on exemplary programs offers illustrations of effective integration of these elements when teacher educators band together as curriculum makers to make their programs unified and coherent. While the chapters on teaching and higher education suggest that self-studies, regardless of the commonplace used, can have a positive impact on student learning in other fields, they too would benefit from a curriculum-making orientation.

Conclusion

The self-study of teacher education practices has come a long way from its inception in the early 1990s and since the publication of the first *International Handbook of Self-Study of Teaching and Teacher Education Practices* in 2004. We need to take time to acknowledge the tremendous work of our forebearers. We also need to commend ourselves for our ongoing work as a *community* of *practice and scholarship*. I think of the reconcepualizations of the field in "Section 1: Foundations of Self-Study." I think of the further refinement of methods and methodologies in Section 2. I think of the puzzling and experimentation evident in cutting-edge work in "Section 3: Self-Study and Teaching and Teacher education for Social Justice." I think of the deepening understandings of self-study across subject disciplines in Section 4 and the efforts to extend teacher education across cultures and languages in the ambitious work of authors in Section 6.

At the same time, we need to take stock of the ways in which we as a self-study community can work toward improving education at all levels – teaching, teacher education, community-based, and higher education. Our goal is to improve practice *and* programs.

Abstract

Our goal in this chapter is to advance the claim that our understanding of teacher educators' learning from the experience of practice (self-study) can be enriched considerably by adding a second epistemology, an epistemology of practice, that complements the traditional epistemology of the university. Self-study research will benefit considerably from a methodology for verification of knowledge that is learned from experience and for connecting such knowledge to the propositional knowledge embraced by the university. As teacher educators who study our own practices, we believe that the theory-practice tension cannot and will not be resolved until teacher educators recognize the potential of an epistemology of practice and act accordingly. Then self-study reports can consider and explore not only the espoused background and conceptual analysis of their teaching but also the unique nature of their theories-in-use and their learning from experience. If a preservice teacher education program has not identified, addressed, and nurtured the unique features of learning from experience, particularly in the practicum, then most new teachers and teacher educators are unlikely to develop on their own the skills of verifying what is being learned from experience and then linking it to theory. As teacher educators study their own practices, we urge them to incorporate the insights to be gained from an epistemology of practice.

Introduction

In this chapter we present, explore, and advance an epistemology of practice as a sometimes poorly understood and little recognized aspect of self-study research and the development of teachers' and teacher educators' professional knowledge. In our view, understanding teachers' and teacher educators' learning from the experience of classroom practice is more difficult than is suggested by the familiar assumption that theory is first learned and then applied. The complexity of our argument calls for a complex introduction. Reports of self-study of teacher education practices research should include accounts of the complexity to which Jackson refers in the following statement:

> Examples of the complexity of the teacher's decisions . . . illustrate an inevitable quality of the teacher's work, a quality that places severe limits on the usefulness of a highly rational model for describing what the teacher does. Given the complexity of his work, the teacher must learn to tolerate a high degree of uncertainty and ambiguity. He must be content with doing not what he *knows* is right, but what he *thinks* or *feels* is the most appropriate action in a particular situation. (Jackson 1968, p. 167, emphasis in original)

Like teachers, we as teacher educators confront a "high degree of uncertainty and ambiguity" in our work. When we engage in self-study, we are studying our own learning from experience.

Although not trained as philosophers, we need to introduce the philosophical topic of epistemology prior to describing the two epistemologies that are the focus of this chapter:

> Epistemology is an area of philosophy concerned with the nature and justification of human knowledge. A growing area of interest . . . is that of personal epistemological development and epistemological beliefs: how individuals come to know, the theories and beliefs they hold about knowing, and the manner in which such epistemological premises are a part of and an influence on the cognitive processes of thinking and reasoning. (Hofer and Pintrich 1997, p. 88)

The first epistemology we consider is the familiar way of knowing captured in propositions and logical argument, with research findings guided by accepted methodologies. This is the fundamental, traditional epistemology of the university and published research. In this chapter we advance a second epistemology, an epistemology of practice that considers what and how we learn from professional experience, sometimes referred to as craft knowledge (Grimmett and MacKinnon 1992) or the wisdom of practice. We framed teachers' knowledge in the following way in 2001:

> There is a tension between the academy of research and the professional field of teaching, especially when these two solitudes are as tenuously linked as they are in both preservice and inservice teacher education. There is a tension in the teaching profession between teachers' development, understanding and use of practical knowledge, and the generally acceptable understanding that knowledge is propositional. For example, teachers know that there is much more to their knowledge than knowing the subject matter to be taught. (Munby et al. 2001, p. 900)

We hasten to add that we do *not* see these two epistemologies as mutually exclusive. Our goal in this chapter is to advance the claim that self-study of teacher education practices, in which teacher educators are learning from experience, can be enriched by recognizing an epistemology of practice. Throughout this chapter, when we refer to teachers' knowledge, we are also referring to teacher educators' knowledge.

We find it somewhat ironic that attention to teachers' practical knowledge has drifted in and out of focus over time, as the university tends to consider practical knowledge to be simple and unproblematic.

> The evidence is that we in teacher education still proceed as if [teachers' knowledge] were simple: "We tell our students and they go out and teach," seems to sum it aptly. But the field of teachers' knowledge has developed immeasurably since the publication of the third edition of the *Handbook of Research on Teaching* (Wittrock 1986), and understandings of epistemology, especially about the epistemology of practice, have also matured. . . Research on teachers' knowledge and teacher education does not always keep pace with these developments. Indeed, the academy still seems to be experiencing difficulties in assimilating an adequate understanding of craft or practical knowledge. (Munby et al. 2001, p. 900)

Perhaps the academy's difficulties in accepting practical knowledge as worthy of further research help to explain the drift in and out of focus over time. As quoted at the outset, in *Life in Classrooms*, we see Jackson directing attention to practical knowledge in 1968. Then in 1983, Schön's *The Reflective Practitioner* made

extensive use of the term "epistemology of practice," but many in teacher education seemed to attend only to the idea of reflection. In 2001, our work with Munby in the chapter on "Teachers' knowledge and how it develops" in the *Handbook of Research in Teaching* (4th ed.) relied heavily on the idea of an epistemology of practice. In 2018, in this chapter, we find ourselves applying that concept to self-study of teacher education practices. Here is part of our argument in 2001:

> The growth of attention to epistemological issues in teacher education is accompanied by work that focuses on predicaments within the circumstances of teacher education. Feiman-Nemser's (1990) account of the traditional models and arrangements of teacher education and their history is balanced by Ginsburg and Clift's (1990) more sociological account, which revisits some of the themes of the earlier review by Lanier and Little (1986). Teacher educators are found to honor the maxim, "Do as I say and not as I do," and the delivery of teacher education is cast as course-work intensive, with inadequate time for reflection and with an emphasis on the teacher as technician and consumer of propositional knowledge rather than reflective practitioner. (Munby et al. 2001, p. 893)

Teacher educators and researchers understand that classroom learning and practicum experience are uniquely different, but it is typically difficult for them to respond adequately to the reality that there are some aspects of teaching that their students can only learn through practice:

> For teacher education and teacher education research, the irony of teaching is at first epistemological. To the uninitiated, teaching unfolds as sets of skills but, to the initiated, teaching depends on, is grounded in, and constitutes knowledge. The character of this knowledge poses the irony for teacher education: the knowledge is in part practical and that part can only be learned in practice, the very setting over which teacher educators have little direct control. And unaccountably, some teacher education research verges on duplicity in this irony: calls for instructors to have their students teach in a fashion consistent with constructivist accounts of learning are not typically accompanied by clear calls for these instructors to acknowledge anything about how their students will construct their own views of teaching. Constructivism in teacher education seems to apply only to school-age learners and not to the preparation of their teachers. (Munby et al. 2001, pp. 895–896)

Self-study of teacher education practices research focuses on the practice of the teacher educator. While teacher educators "have little direct control" over teacher candidates' experiences of practice in schools, we like to believe that we have some measure of control over our own teaching practices. In self-study research, we seek to better understand our own practices in order to improve the quality of learning in the teacher education classroom and in the teacher education program.

Having set the stage with purpose and context, we continue by recalling Schön's (1983) critique of technical rationality, which we see as the familiar and traditional epistemology, the epistemology of the university and its academic researchers. Traditional epistemology calls for an accepted methodology used to analyze data to achieve warranted conclusions. Schön argued for the significance of an epistemology of practice in which a process termed reflection-in-action begins with reframing triggered by surprise or uncertainty and concludes with new actions to be tested in the real world of professional practice.

Guided by Schön's (1983, 1987) argument for an epistemology grounded in reflective practice and accepting his (1995) argument that the traditional episte-mology of the university can be characterized as technical rationality, we suggest that an epistemology of practice is particularly relevant to research in self-study of teacher education practices. In self-study research, the teacher educator seeks to learn from experience, typically by listening both to oneself and to one's students. The teacher educator seeks to understand personal assumptions about the effects of teaching practices on those who are learning to teach and also seeks to identify and enact changes in practice to improve the quality of teacher candidate learning.

In this chapter we argue that self-study of teacher education practices is a meta-cognitive and reflective practice conducted by teacher educators learning from expe-rience. We begin by illustrating with examples of learning from experience in published self-studies to set a context for the argument that follows. This is followed by discussion of some of the challenges inherent in learning to teach. We then introduce the topics of learning from experience and the authority of experience and move on to address the importance of interpreting self-study research within an epistemology of practice as well as within the traditional epistemology of the univer-sity. We draw additional illustrations from teacher candidates' accounts of learning from experience, as we identify important parallels between the professional learning of teacher candidates and that of teacher educators. We also consider learning from experience in terms of voice, trustworthiness, and metacognition. We conclude with insights about self-study research arising from preparing this analysis.

Illustrations of Teacher Educators Learning from the Experience of Self-Study

We here present three examples of teacher educators conducting self-studies of their teacher education practices and learning from those experiences. Each example has a unique focus, and this illustrates the range of topics that can serve as a focus for self-study. While these are not the reader's own experiences, they are experiences with which many teacher educators will be able to identify and imagine conducting and learning from a similar analysis. Because our focus is on learning from experi-ence, it seems important to begin with examples of such learning.

Learning from the Transition from Teacher to Teacher Educator

Todd Dinkelman conducted a self-study with Jason Margolis and Karl Sikkenga as Jason and Karl made the transition from the role of teacher to the role of teacher educator. Their self-study documented the ways that learning by doing (or learning from experience) was an important part of their role transitions:

> Reflection emerged as a new and critical element here, beyond mere activity in teacher education. Both Jason and Karl found opportunities to reflect upon their practice at the

university that were unavailable to them as teachers in schools. Karl noted that the development of his knowledge base was an "ongoing work in progress" (Interview, November 3). "If I didn't have this concept of reflection," he later noted, "then it would be harder to draw on those experiences [as a high school teacher]" (Interview, May 25). Jason also connected practice and the opportunity to consider it, noting that his basis for knowledge is drawn from his teaching experience and "mostly from the act of teaching and the reflection upon it" (Journal, March 30). Karl claimed that he was "acquiring [knowledge] in part by seeking it . . . and by using my own experiences" (Interview, November 3), concluding finally that "I doubt, therefore I am" (Interview, May 25). Both Jason and Karl asserted that they learned by doing, as they always had as classroom teachers. (Dinkelman et al. 2006, p. 122)

It was in practice that Jason and Karl met the challenges of their transition head-on, and it was in practice that the boundaries separating teaching from teaching teachers began to emerge. Here Karl and Jason identified issues, planned strategies, and acted as they encountered numerous problems that challenged them to reconsider what it meant to assume their new identities as teacher educators. The crucial role played by these puzzling moments, born of direct experience, calls for setting them apart to highlight their contributions to the story of the development of two teacher educators. (p. 124)

Learning to Understand the Process of Teaching About Teaching

Amanda Berry's (2007) self-study emphasized the importance of understanding one's teacher education practices as part of the process of improving those practices. Many teacher educators have responded positively to her account of tensions associated with teaching. Berry's learning from experience emphasizes the unique nature of teaching about teaching:

Researching one's personal practice as a teacher educator is an important means of better understanding and improving the relationship between teaching and learning about teaching. As a practitioner-researcher, I have been able to reframe my knowledge of practice as tensions to be managed. This act assists in formalizing the teacher educator experience and, in the process, provides a language for articulating and sharing more fine-grained understandings of the problematic nature of teacher education practices. As the study of my practice has progressed, I have come to recognize important differences between conceptual shifts in understanding practice as a teacher educator and concrete shifts in enacting these changed understandings. Taking changed thinking into practice does not automatically change how one acts. Throughout the process of acquiring and examining experiences of teaching about teaching, I was developing new levels of understanding about my practice and learning to articulate my knowledge in new ways. As part of this process I needed time to understand my practice, to recognize the need for change, and then whether or not to alter my behavior. (Berry, p. 132)

Learning from Analysis of Program Impact on Beginning Teachers

Clare Kosnik and Clive Beck (2008) studied program impact and from that experience learned that some of the material in their program may be beyond what the

beginning teachers are ready and able to learn. Their self-study helped them to identify a "focused, coherent pedagogy" as a priority goal for those completing their teacher education program:

> We believe that lack of clearly developed priorities is a major problem in teacher education. This leads us to try to cover so much material that student teachers and new teachers are unable to develop a focused, coherent pedagogy. This research has helped us to see that, regardless of the length of a course, it is impossible to cover everything. We wish to develop an approach to teacher education that focuses on topics and concepts that are appropriate for preservice students and beginning teachers, rather than ones that are beyond their abilities. Accordingly, we see a need to identify priorities, give them prominence, and provide considerable opportunity for students to understand, assess, modify and make connections. Teachers should emerge from their preparation program with an integrated set of pedagogical pursuits that, to the extent possible for a new teacher, they can name, understand, own, and enact. (Kosnik and Beck 2008, p. 127)

These three excerpts from reports of self-study research share a number of interesting features. The first report considered two individuals making the transition from teacher to teacher educator – a move that some may see as straightforward and unproblematic, while we see it as complex and demanding careful and deliberate attention. Significant terms include *reflection*, *in practice*, *puzzling moments*, *direct experience*, and *learned by doing*. The second report considered unique features of teaching about teaching, using terms such as *tensions*, *problematic nature*, *understanding practice*, and *need for change*. The third considered the long-term impact of program practices and used terms such as *identify priorities*, *make connections*, and *focused, coherent pedagogy*.

Notice that the learning from experience in each of these three accounts resides *in* the experiences of these teacher educators. Their experiences are personal and cannot be transferred to others. Their accounts of their learning may inspire others to undertake similar self-studies, but the knowledge they gained resides at least partially within their experiences. This reminds us that knowledge gained from experience has a significant tacit dimension.

These three self-studies illustrate teacher educators making some of their tacit knowledge explicit. In the first report, for Jason and Karl, "it was in practice that the boundaries separating teaching from teacher teachers began to emerge" (Dinkelman et al. 2006, p. 124). In the second report, Berry (2007) stated "I have been able to reframe my knowledge of practice as tensions to be managed" (p. 132). In the third report, Kosnik and Beck (2008) drew the conclusion that in teacher preparation "it is impossible to cover everything" (p. 127). They also concluded that topics for teacher candidates should be appropriate "rather than ones that are beyond their abilities" (p. 127).

These conclusions suggest that the real issue may be that some topics in teacher education are beyond the existing experiences of those learning to teach. Tacit knowledge can be elusive; self-study can propel the effort to make the tacit at least somewhat explicit. Tacit professional knowledge is embedded in our teacher education practices; self-study can remind us that it is there – elusive but demanding

our deliberate attention. We suggest that these self-study reports would be even more valuable were they to include discussion of these tacit features of professional learning, features that become more apparent from the perspective of an epistemology of practice.

The Challenges Inherent in Learning to Teach

Teacher education asks those learning to teach to learn in two very different contexts – university classrooms and school practicum placements – usually without exploring and explaining the differences and how two quite different modes of learning can productively interact. Teacher candidates enter a program of teacher education believing in a single epistemology: first theory is learned (in university classrooms) and then applied in practice (in schools). Their apprenticeship of observation (Lortie 1975) as students in schools has provided few, if any, insights into how teachers learn from experiences of teaching. They and their teacher educators speak all too easily of a gap between theory and practice; occasionally, a few teacher educators have forthrightly challenged this perspective, but this view has gained little traction:

> The theory-into-practice conception of ITE [initial teacher education] that dominated the twentieth century is fundamentally flawed and needs to be replaced. The notion that student teachers should learn good theoretical ideas in universities, and then put them into practice in schools, is flawed in many ways but most obviously in that it is based on quite false conceptions of the nature of teaching expertise and of how such expertise is developed. . . . It is a conception of ITE that has scandalously, if less obviously, neglected the expertise of experienced teachers. (Hagger and McIntyre 2006, p. 158)

Typically, teacher educators do little to address the theory-practice divide (Vick 2006). In the words of Leinhardt et al. (1995), "the task before us, then, is to enable learners to make universal, formal, and explicit knowledge that often remains situational, intuitive, and tacit; and to transform universal, formal, explicit knowledge for use *in situ*" (p. 403, emphasis in original). If we replace *learners* with *teachers*, we see that the same task faces teacher educators doing self-study research.

We turn next to conclusions drawn decades ago by Feiman-Nemser and Buchmann (1987) in a discussion of the educative aspects of the student teaching practicum. They begin by noting that teacher candidates must learn from interaction with students over time: "Prospective teachers are in a position to start learning from teaching, under guidance, and to see that some of the knowledge they need is 'local': It can only be derived from interactions with particular students over time" (p. 256). They also emphasize the importance of how teacher candidates learn in practicum classrooms with support from teacher educators who understand the nature of learning from experience:

> Student teaching is teacher education when intending teachers are moved toward a practical understanding of the central tasks of teaching; when their dispositions and skills to extend and probe student learning are strengthened; when they learn to question what they see,

believe and do; when they see the limits of justifying their decisions and actions in terms of "neat ideas" or classroom control; and when they see experience as a beginning rather than a culminating point in their learning. Meeting these conditions depends on teacher educators' perceiving and acting on the central tasks of teacher preparation.

By themselves, student teachers can rarely see beyond what they want or need to do or what the classroom setting requires. . . . Teacher educators must be actively present in student teaching to give prospective teachers a concrete sense of pedagogical thinking and acting. (p. 272)

We acknowledge and applaud the point that teacher candidates need active support to move beyond the immediacy of the classroom, where they are learning how to think like a teacher rather than like a student, as they do in university classrooms:

For student teaching to be teacher education, it must go beyond survival or extend[ing] practice in the outward forms of teaching to sort out appropriate from inappropriate lessons of experience. Well-meaning praises from cooperating teachers, coupled with a focus on management, fixes the attention of student teachers in the wrong direction. University supervisors . . . must act in concert with cooperating [mentor] teachers to make student teaching an occasion for teacher education. (p. 272)

An important parallel argument can be made when moving from teacher candidates becoming teachers to teachers becoming teacher educators. What intrigues us is that these authors point so clearly to the unique and different nature of learning from experience, yet they do not extend the argument to address the issue of different epistemologies that should complement each other.

Similar points have been raised by others, and they too stopped short of identifying the challenge as an epistemological one. Kessels and Korthagen (1996) argued that the knowledge a teacher candidate requires is not only in his or her experience but also perceptual and subjective:

The knowledge a student needs is perceptual rather than conceptual. Therefore it is necessarily internal to the student, it is in the student's experience instead of outside it in some external, conceptual form. It is thoroughly subjective. . . . And so there is nothing or little to transmit, only a great deal to explore. And the task of the teacher educator is to help the student teacher explore and refine his or her perceptions. This asks for well-organized arrangements in which student teachers get the opportunity to reflect systematically on the details of their practical experiences, under the guidance of the teacher educator—both in group seminars and in individual supervision. (p. 21)

They also point to the importance of carefully planned ways to guide teacher candidates in identifying what they have learned from practical experience.

Bryan and Abell (1999) emphasized the significance of experience in learning to teach and also identified some problematic assumptions in traditional program structures:

The heart of knowing how to teach cannot be learned from coursework alone. The construction of professional knowledge requires experience. . . . Experience influences the frames

that teachers employ in identifying problems of practice, in approaching those problems and implementing solutions, and in making sense of the outcomes of their actions. (pp. 121–122)

[This] case implicitly underscores the fallacy of certain assumptions underlying traditional teacher education programs: (a) that propositional knowledge from course readings and lectures can be translated directly into practice, and (b) that prospective teachers develop professional knowledge before experience rather than in conjunction with experience. Teacher educators are challenged to coach prospective teachers to purposefully and systematically inquire into their own practices, encouraging them to make such inquiry a habit. (p. 136)

Bryan and Abell conclude that "the genesis of the process of developing professional knowledge should be seen as inherent in experience" (p. 136). "A preeminent goal of science teacher education should be to help prospective teachers challenge and refine their ideas about teaching and learning science and learn how to learn from experience" (p. 137). Similarly, we believe that a preeminent goal for the new teacher educator is learning how to learn from teaching in the context of helping others learn to teach. The experienced teacher educator must consistently ask, "Am I still learning from experience?" "Am I teaching my students how to learn from experience?"

Professional Knowledge-in-Action Is Tacit, for Both Teachers and Teacher Educators

In our efforts to better understand that a second epistemology is essential for teacher education, it is helpful to recall Schön's (1995) account of the tacit nature of professional knowledge gained from experience:

When we go about the spontaneous, intuitive performance of the actions of everyday life, we show ourselves to be knowledgeable in a special way. Often we cannot say what we know. When we try to describe it we find ourselves at a loss, or we produce descriptions that are obviously inappropriate. Our knowing is ordinarily tacit, implicit in our patterns of action . . . It seems right to say that *our knowledge is in our action*. And similarly, the workaday life of the professional practitioner reveals, in its recognitions, judgments, and skills, a pattern of tacit knowing-in-action. (p. 29) . . . . I submit that such knowing-in-action makes up the great bulk of what we know how to do in everyday and in professional life. (p. 30, emphasis added)

Developing knowledge-in-action, which is tacit rather than explicit, requires those learning to teach to recognize the unfamiliar authority that can only be gained through experience as a reflective practitioner. Self-study that seeks improved teacher education practices may similarly benefit from recognition that knowledge-in-action is tacit and that the authority of experience is different from the authority of research findings.

Having introduced the tacit nature of knowing-in-action and the idea that what is learned from experience conveys a type of authority, we illustrate the significance of

these ideas for a teacher candidate who took a metacognitive turn as he came to terms with how he was learning to teach:

> The time between my first and second field placements gave me an ample opportunity to reflect on my experiences and determine exactly what I had learned, if anything at all. I believe it was during this time that I began to develop a more sophisticated understanding of what it is to teach. . . The result was ultimately a radical shift in my thinking about teaching and learning by putting the needs of learners front and centre. (Harrison 2014, p. 3)

> My professional development did not really commence until I understood that no one was going to tell me how to teach, and for that matter, it was not even possible to do so. . . . One avenue for improving practice is for teachers to monitor their own experiences and to use them as a source of knowledge about teaching. Munby and Russell (1994) point out that this "authority of experience" is something beginning teachers must learn to trust in order to develop as professionals. (p. 5)

We see this as an unusual perspective; most teacher candidates we have taught do not achieve such deep insights and understanding of their development. There is a clear link between accepting that being told how to teach does not automatically translate into changed practices and acknowledging that one must learn to trust the authority of experience.

Similar understandings are important for the self-study teacher educator, who is familiar with teaching as learning from experience but who may not have considered that aspect of learning to teach. Most teacher educators are well trained in research methodology, which is grounded in technical rationality. When engaged in research studying personal practices as a teacher educator, they typically have not considered the significance of working with and moving between two epistemologies – technical rationality and the less familiar epistemology of practice and learning from experience.

The Importance of Learning from Experience

If the teacher educators cited above were learning from their own teaching experiences using self-study methodologies, what does it mean to say that one is learning from experience? How is learning from experience different from the much more familiar learning from textbooks, research reports, and lectures? In self-study we are working to understand and develop our *tacit* knowledge (Polanyi 1966), not just to apply our research knowledge. Learning from experience is quite different from the classroom world of learning in school or university. One of the earliest arguments calling attention to different modes of professional learning and to learning in and from experience came in Schön's (1983) analysis of "how professionals think in action." As he introduced the concept of reflection-in-action as a way of knowing, he drew a contrast between technical experts (confident in their certainty) and those professionals (willing to admit uncertainty) who are reflective about their practice:

Because professionalism is still mainly identified with technical expertise, reflection-in-action is not generally accepted—even by those who do it—as a legitimate form of professional knowing. Many practitioners, locked into a view of themselves as technical experts, find nothing in the world of practice to occasion reflection. . . . Others, more inclined toward and adept at reflection-in-action, nevertheless feel profoundly uneasy because they cannot say what they know how to do, cannot justify its quality or rigor. (p. 69)

Here we are reminded that tacit knowledge is truly different in kind from the propositional knowledge associated with technical rationality. We see self-study of teacher education practices as research that strives to make tacit knowledge explicit. This process is enhanced by realizing that this does not need to be done within the confines of the traditional academic epistemology. Recognizing an epistemology of practice seems essential for understanding what a teacher educator is learning from experience using self-study methodology.

Understanding the Authority of Experience

In a discussion of learning from experience, we also need to consider the authority that is gained when experience has been analyzed for assumptions and implications for future practice. Munby and Russell (1994) introduced the concept of authority of experience in the context of individuals learning to teach:

In their many years of schooling preservice teachers have seen two basic concepts of authority at work: the authority of reason, and the authority of position. While the goal of education can be cast in terms of establishing knowledge claims on the authority of reason, there are times when claims are seen to rest on the teacher's authority of position (Russell 1983). Preservice teachers are poised to move from being subject to their own teachers' authority of position to taking charge and, as students turned teachers, assuming authority of position over those they teach.

Unfortunately, school's preoccupation with the authority of reason and of position can cause teachers and students to ignore a type of authority lying at the heart of action and performance: the authority of experience. (p. 92)

As beginning teachers acquire teaching experience, the authority that can come from experience may be challenged by the authority of position held by those with considerably more experience. The same may be true for the beginning teacher educator who is moving from the role of teacher to the role of teacher educator:

Once on the job, the beginning teacher readily acquires experience but still may not come to understand the process of learning from experience or to recognize fully the authority of experience. There is a competing authority in long and short conversations with other teachers in the school, conversations expressing perspectives and practices shared by many teachers in the school. This competing authority may restrict the ability of the beginning teacher to listen to personal experience, including responses of students. Other teachers' practical knowledge has an obvious authority of experience but it is expressed in words and propositions most readily associated with authority of position, in this instance the position of having more experience. (p. 93)

School makes us all (beginning teacher or teacher educator, experienced teacher or teacher educator) familiar with the authority of reason and the authority of position. A teacher is an authority (based on reason) in authority (based on position) (Peters 1966, pp. 258–265), and we only confer the authority of position on individuals who have shown that they possess the authority of reason as well as the knowledge they are expected to teach. In the real world of teaching in a school classroom, learning from experience gradually develops one's authority of experience, but how that authority of experience develops is only poorly understood until one recognizes it as involving a second epistemology that depends on a professional learning process such as reflection-in-action:

> We use the term *authority of experience* because of our concern that students never master learning from experience during preservice programs in a way that gives them direct access to the nature of the authority of experience. If Schön is correct that there is a knowledge-in-action that cannot be fully expressed in propositions and that learning from experience has its own epistemology, then our concern is that learning from experience is never clearly contrasted with learning that can be expressed and conveyed in propositions. (Munby and Russell 1994, p. 92)

As those learning to teach move back and forth between university and practicum, they alternate between two different worlds that involve quite different types of authority:

> Prospective teachers have been accustomed to the two traditional forms of authority: the authority of position, and the authority of argument (reason and evidence). Part of the significance of an epistemology of practice is the implicit credence it affords to experience itself, a feature of student teaching that underlies its significance to students in teacher education. This switch to a different authority, the authority of experience (Munby and Russell 1994), may well represent the power needed for changes in beliefs. . . . As teacher educators, we seem to express what Whitehead (1995) calls a living contradiction: by requiring our students to have field experience, we espouse its significance, but we have tended to give more time, emphasis, priority and status to on-campus courses within programs of preservice teacher education. (Munby et al. 2001, pp. 896–897)

Self-study of teacher education practices involves similar challenges for the teacher educator, as the authority of experience interacts with the authority of reason (teacher education research) and position (the views of colleagues with more and different experience).

Self-Study Research and the Epistemology of Practice

While the world of teacher education seemed to accept eagerly Schön's (1983) use of the word *reflection*, it seemed to pay little or no attention to his argument about the epistemological characteristics of reflective practice and their significant differences when contrasted with the dominant epistemology of the university, which he characterized as *technical rationality*. Schön (1995) developed his points further in one of his final publications. In the following passage, he emphasizes how different the

analysis of teaching and learning are from the familiar characteristics of traditional scientific or quantitative research or technical rationality:

> For any problem of interest to teaching and learning, insofar as it arises and is studied in the actual contexts of practice, one cannot establish true control groups, create random assignments, eliminate potentially confounding phenomena, or, in general, meet the standards of normal-science rigor. Hence, there can be no such thing as a "scholarship of teaching" *unless we can change the rules that govern what counts both as legitimate knowledge and as appropriately rigorous research into teaching and learning.* (Schön 1995, p. 34, emphasis added)

Schön has argued for an epistemological alternative to technical rationality. One of the goals of this chapter is to link that epistemological alternative (reflection-in-action) to the learning from experience that arises from self-study of teacher education practices. The following excerpts from his argument remind us of the range of challenges associated with broad acceptance of research in self-study of teacher education practices.

> The new scholarship cannot achieve legitimacy within an institution exclusively dedicated to technical rationality—the epistemology around which the modern research university was originally established and which still underlies its key institutions. The new forms of scholarship . . . proceed through design inquiry, in the Deweyan sense. They are infused with a tacit knowing that their practitioners usually cannot describe (at least without observation and reflection devoted to that purpose), and they are inimical to the conditions of control and distance that are essential to technical rationality. (p. 34)

As he continued, Schön appeared to suggest that research on teaching and learning, including self-study, requires an epistemology of practice that is unique and different from the epistemology of technical rationality:

> The epistemology appropriate to the new scholarship must make room for the practitioner's reflection in and on action. It must account for and legitimize not only the use of knowledge produced in the academy, but the practitioner's generation of actionable knowledge in the form of models or prototypes that can be carried over, by reflective transfer, to new practice situations. The new scholarship calls for an epistemology of reflective practice. . . . But in the modern research university and other institutions of higher education influenced by it, reflective practice in general, and action research in particular, are bound to be caught up in a battle with the prevailing epistemology of technical rationality. (Schön 1995, p. 34)

Both self-study research and learning to teach require an individual to move back and forth between the knowledge captured in propositions and the knowledge that resides in action. As an alternative to the battle that Schön suggests, it may be more productive to acknowledge that we are working in two different epistemologies and need to develop productive strategies for benefitting from both as we improve our professional learning. Because teachers, teacher educators, and preservice teachers have all acquired tacit knowledge through years of observing their own teachers, teacher education may be the professional field that must be most attentive to the tensions between two ways of knowing. Having mastered technical rationality by

succeeding as a student, those who elect to prepare to teach meet the uniqueness of learning from experience in their practicum placements, only to move into the work of the teacher (or, later, the teacher educator) where further professional learning may be almost exclusively from experience. If the preservice teacher education program has not identified and explored the unique features of learning from experience, then teachers seem unlikely to develop on their own the skills of verifying what is being learned from experience. Self-study research attempts to provide a methodology for verification of knowledge gained from experience and for connecting such knowledge with knowledge grounded in technical rationality.

Reflective Practice Reframed in Terms of Learning from Experience

Having considered a range of writing about teachers' knowledge (Munby et al. 2001), learning from experience (Darling-Hammond 2006; Loughran 2006; Mezirow 1997; Schön 1983, 1995), and the authority that uniquely derives from experience (Munby and Russell 1994), we now submit that teacher education and self-study of teacher education practices can benefit from reframing learning from experience in terms of an epistemology of practice that is different from the traditional epistemology of the university, providing important alternative perspectives.

Our most recent research studying our own practices as practicum supervisors (Martin 2017; Russell 2017) focused on improving the quality of professional learning in the preservice practicum and has led us to approach teacher candidate learning from the perspective of an epistemology of practice. The traditional epistemology of the university focuses on propositional knowledge, typically with minimal attention to the tacit knowledge acquired from experience. The preservice practicum is unique for most teacher candidates, particularly in the sense that the practicum may be the first time they have been asked to acquire professional knowledge from first-hand experience rather than from books and the teaching experiences of others.

As teacher educators, we struggle with this issue only to conclude that the theory-practice tension cannot and will not be resolved until teacher educators recognize and address the need for two epistemologies that speak not only to the theoretical background for teaching but also to the unique nature of learning from experience in the preservice practicum. Teaching experience is acquired by investing time in the context of professional action; learning from experience demands reflection-in-action as an alternative frame of reference for personal learning. *Reflection* is an everyday word; *reflection-in-action* is a significant new perspective on learning from experience.

To begin to develop the skills required for reflection-in-action, teacher candidates must become more aware of their own thinking and their underlying assumptions, particularly in moments of puzzling, surprising, and unexpected responses from their students. These are the learning opportunities that call for reflection-in-action to

better understand what one did and what one might do differently. To learn how to think like a teacher, teacher candidates need the metacognitive understanding of what it means to be a teacher and how teachers learn from experience. We submit that teacher candidates deserve no less than a significant reframing of the learning experiences in a teacher education program, in order to comprehend the unique nature of learning from experience as a professional. This presents unfamiliar challenges for the teacher educator and the teacher education program. The teacher educator who initiates self-study of personal practices of teacher education will also encounter the gaps between the epistemology of the academy and the epistemology of learning from experience that must be developed for teacher candidates. The challenge to teacher educators grows larger in light of the fact that they themselves may never have considered an epistemology of practice.

The Need for an Epistemology of Practice in Teacher Education

We recently explored the concept of an epistemology of practice (Russell and Martin 2017) by considering Raelin's (2007) work in the field of management studies, work that reminded us that an epistemology of practice is not exclusive to the profession of teaching. However, an epistemology of practice seems particularly relevant to learning to teach because students acquire so much unexamined observational knowledge of teaching before they begin a teacher education program. Raelin's words speak clearly to Harrison's account of his reinterpretation of his learning from experience as he moved beyond academic epistemology to embrace a new way of knowing.

> The dominant empiricist epistemology governing our educational enterprises in higher education . . . leads us to separate theory and practice in an aspiration to define the best conceptual models to map external reality. (p. 496)
>
> Academic epistemology, interpreted as knowing in advance of practice, can lead to "haste in wanting to know." An epistemology of practice espouses as much intellectual quietness as the staccato of questions and answers. Practitioners take in experience and reflect on the lessons available in front of their eyes. They compare their experience to existing theory and determine its applicability. If experience is not conjunctive with theory, ongoing reflection with others can produce new theory. The reflective stance suggested above can apply just as readily within the practice setting as the classroom. (p. 506)

Many teacher educators have embraced the term *reflection* but may not recall that Schön's (1983) unique contribution was richer and more complex than looking back on experience. Schön described the concept of reflection-in-action in terms of the powerful learning that can occur in moments of surprise and uncertainty:

> The process of reflection-in-action begins when a spontaneous performance is interrupted by surprise. Surprise triggers reflection directed both to the surprising outcome and to the knowing-in-action that led to it. It is as though the performer asked himself, "What is this?" and at the same time "What understandings and strategies of mine have led me to produce this?" The performer restructures his understanding of the situation . . . It is what

a good teacher does as she tries to make sense of a pupil's puzzling question, seeking to discover, in the midst of classroom discussion, just how the pupil understands the problem at hand. (Schön 1995, p. 30)

Reflection-in-action is often triggered by puzzling and unexpected moments of practice (Russell 2017) that may be ignored by those unprepared to venture into an unfamiliar epistemology. Reflection-in-action and reflection-on-action can initiate and sustain self-study of teacher education practices when the teacher educator listens to better understand the learning of the teacher candidate.

Illustrations of the Potential of an Epistemology of Practice

We now present three accounts of teacher candidates writing about learning from experience. It seems widely recognized that those learning to teach regard their practicum experiences as the most powerful elements of their preservice program. The following accounts are dramatic and compelling, in part because they provide insights into teacher candidates who are coming to terms with the unique nature of learning from professional experience. These teacher candidates had taken a meta-cognitive turn with respect to their own learning; they were thinking explicitly about how their thoughts about teaching and learning were changing.

Practicum experiences typically follow education classes intended to help teacher candidates prepare for the role of teacher. Practicum experiences are their first encounter with professional learning of a different kind – learning from their own experiences rather than from someone else's authority of experience. Learning from practicum experiences is unique and different and often hard to put into words; it is often tacit, it is quite personal, and it is emotional and immediate.

> I have already started my second week of practicum and I am now currently teaching 50 percent in the classroom. I now realize what you mean by reflecting in-action and adapting my practice as necessary. I have also come to understand what it means to think like a teacher. Immersing myself in the field of education through my practicum has given me more knowledge and experience in teaching than I have accumulated in my academic experience thus far. My past week has been filled with new realizations, struggles, and learning opportunities. Every day in school has revealed to me how different learning about the theory of teaching and actually teaching can truly be. I have started to grasp the subtle complexities that are sometimes overlooked in university courses, such as the importance of classroom management and teaching a class with a wide range of cognitive abilities. Furthermore, it has become clear to me the necessity of towing the line of being authoritative and not authoritarian when creating relationships, and how essential task design is to the success of your lesson and, more importantly, your students. (A. Rafih, November 14, 2017, "personal communication").

Here we are listening to an individual in only the second week of an extended practicum placement. The differences between two learning contexts are becoming more apparent.

To emphasize further the significance of an epistemology of practice for someone learning to teach, we offer an example from a teacher candidate writing about his practicum experience. This account illustrates what Schön termed *reframing* in response to a surprising event. A dramatic change in thinking followed by a new course of action that paid huge dividends has all the reflective practice elements of reflection-in-action and reframing.

It's Friday now [in my Grade 10 science class] and things have not significantly improved since Wednesday. I've been trying to remember all the little things, but it's a lot to break out of my way of thinking. I'm teaching ionic bonding, and today's lesson is naming ionic compounds/write formulae from names—difficult because it requires an explicit understanding of electric charge. I'm still not feeling super confident in front of the class. I'm teaching and things are still confusing for the students; many cry out in protest. None of these things are the point. What is about to happen is probably the most critical incident of my entire practicum. One of my students, always vocal and gregarious, but often times pushing the line when it came to respecting authority, asks me to come over. He then says that he is a fairly observant guy, and he noticed I kept glancing over at Mr. J [my mentor teacher] while I taught. He asked me why I did that, or if I even noticed. I gave a polite response, but was surprised that I had not been aware of all the faces watching me while I'd been doing it, nor had I realized what sprang to me in that instant why I had been doing it. Clearly, things weren't going as well as I wanted them to. I kept looking over at Mr. J for some sort of look of reassurance that I wasn't making a complete mockery of myself up there. But that insecurity, that need for approval was noticeable and was detrimental to the students. As much as I wanted to care for their needs, my first instinct was to find a way for my own needs to be met. This moment had a profound impact on me. It showed me how easily the smallest, unconscious things can be scrutinized when you are teaching, but that was insignificant [compared] to what it caused me to do. I realized that if I wanted to gain control over the class, to teach for the students instead of myself, I had to shrug off my insecurities, I had to believe in myself as a teacher, and I had to tackle the class with more focus and purpose than naturally comes from me. I managed to put myself aside, not worry about approval, and actually learn. That class turned around, and I've never felt more confident than I did in front of that class by the end of week 4. The students, who I knew were just pushing to see how far they could cross the line, learned to respect me, work with me. I developed a rapport that didn't come easily but became strong. (Courtin 2017)

The point of this long passage is to emphasize the unique nature of learning from experience and the dramatic differences between the learning described and the learning that happens in university classrooms. We have come to recognize these as epistemological differences. The literature and data provided here illustrate the influences on our thinking as we move further toward the position that teacher education needs an epistemology of practice that operates in conjunction with the familiar academic epistemology.

In 2013 a teacher candidate presented us with a richly metacognitive account of his experiences as an individual in the throes of learning to teach. In our experiences as teacher educators, this is a unique and unusual account of learning from experience, both in education classes and in practicum classrooms. Notice how the author moves between those two contexts of learning, and notice how he is gaining authority as he better understands his experiences in both contexts. Again, it is an

extended passage that provides illustrations of what is possible in terms of making explicit one's learning from experience.

> The following is a metacognitive analysis of my personal and teaching habits as well as my mind frames regarding how students learn. It is intended to provide deeper insight into my development over the past two months, as my analyses of my own teaching and learning have led me to discover some of the profound lessons that all teachers should know. Firstly, I learned that teachers need to have their cake and eat it too. Secondly, I realized that rewards can actually hurt students.
> During my first practicum I really embraced active learning (Knight 2004). I did lots of POEs [Predict-Observe-Explain] and I incorporated several PEEL [Project for Enhancing Effective Learning; www.peelweb.org] procedures into my lesson plans. Sadly, when I got back to classes at Queen's I couldn't say how much my students had actually learned. That insight was very disorienting. What grounded me again was a connection to Hattie's (2012) description of how a "passionate, inspired teacher" (p. 24) plans lessons: by focusing on the learning that needs to happen before thinking about how to conduct the lesson.
> Accordingly, for my next practicum I consulted the Science curriculum document (Ontario Ministry of Education 2008) to find the expectations that I would be responsible for teaching. Then I focused on having "the mind frame to foster intellectual demand, challenge, and learning" (Hattie 2012, p. 35). And ... it worked! Students learned Relativity well. I became a focused, determined, exhausted teacher. With all my focus on the learning, I had lost sight of the various methods of teaching. Still I had made tremendous strides towards connecting with the students. As Alfie Kohn would put it, I had begun "working with" students, rather than "doing to" students. Pedagogically, however, I was a one-trick pony: talking and then helping the students solve problems.
> To address my methodlessness, I revisited the PEEL procedures and discovered a whole new world of pedagogical insights. No longer was this just a database of different teaching methods; it was a tool box with various procedures to fix learning problems. Then Ian Mitchell [a leader of PEEL] showed me the menu option where I can browse the procedures according to learning requirements. Now I know that I need to have a wide repertoire of teaching methods so that I can better facilitate the *learning* that needs to happen. Another, more academic, way of putting it would be: I need to develop my technological pedagogical content knowledge (Mishra and Koehler 2006). Yet another, more creative, way of putting it would be: I need to have my cake and eat it too.
> The idea of "working with" students aligned seamlessly with Ian Mitchell's talk about sharing intellectual control with students. This idea also extends beyond teaching content, even though it has content-learning implications ... implications that I have felt, myself, when I was given trust and decision-making power over my own learning. The most important effect was on *how* I learn. Under such conditions, not only was my learning more enjoyable, but also the intrinsic value was amplified by the fact that I wanted the learning that I had decided to pursue to be valid. I want my students to have that kind of enjoyment-the pleasure of finding things out.
> Rather than appealing to their hedonistic faculties with bribes and threats (I mean positive reinforcement and inevitable consequences), now I realize that the curriculum may not always afford me much latitude regarding content. However, I'm sure that if I can present any content as an interesting problem, then students can have choices by being given autonomy over how to solve the problem. That way they can learn more than what's on the page; they can learn why it's worth being on the page in the first place....
> As a teacher, I need to remember why I love physics and math. If I don't see the value in what I'm teaching, then my students *never* will. We may get through the curriculum, but what a pointless endeavor it would be! I know that I can't teach everything to students, nor can I expect them to like everything that I like. Also, I need to give them freedom to decide where

they see potential value. Nevertheless, I am a leader in the classroom and my attitude towards what they are learning will affect their interest as well as the value they place in the subject. So, if I can focus on the learning as well as on how to teach, afford students the respect and choices necessary to encourage vulnerability and risk-taking, and also set an example for the kind of person I want students to be, then I can discover more ways of helping students learn. (M. Brown, 12 February 2013, "personal communication", emphasis in original)

There are several reasons for providing these three accounts from teacher candidates rather than teacher educators. These accounts illustrate (perhaps to doubtful teacher educators) that teacher candidates can take a metacognitive turn and benefit from the identification of reflective practice as a second perspective on their learning to teach. These accounts also reveal many parallels to the initial self-study accounts of teacher educators learning from experience. The teacher candidates needed teacher educators who would provide the opportunity and the invitation to write about their learning from experience and to listen and respond to their accounts of studying and interpreting their practices in schools.

To us, these accounts are unusual, presenting insights and understanding that many teacher candidates do not achieve. The authors of these accounts have begun to recognize an epistemology of practice, even though they are not familiar with the term. The following passage suggests that those learning to teach are likely to approach their practicum experiences solely in terms of the traditional epistemology of the university, lacking a frame for understanding all that they have learned tacitly by observation:

One need have little more than a rudimentary grasp of the difference between the concepts of behavior and action to understand the appeal of school experience to teacher education candidates. As many have noted, intending teachers' prior experience of teaching is severely restricted. Although they have observed thousands of hours of teaching behavior, they have not been privy to the profound and extensive knowledge and thinking that underlies this behavior. As with any good performance, good teaching looks easy.... Teaching is so commonplace that successful, proficient, even artful teaching can be its own undoing.... Good teaching in the eyes of those taught unwittingly reinforces this view of teaching, and its manifestations suggest strongly that, if some of its students should wish to become teachers, then all they need do is attend a teacher education program, acquire the skills, and then practice them. Certification and good teaching will follow. (Munby et al. 2001, p. 895)

More generally, "the atheoretical nature of field experience that has existed for many years can be attributed partly to the imposition of a scientific research paradigm on situations that are not compatible with the methods, purposes, philosophy, epistemology, or assumptions of the paradigm" (Guyton and McIntyre 1990, p. 529).

Voice and Metacognition in Learning from Experience

Richert (1992) made explicit some connections between voice and reflective practice while also advocating that teacher education programs need to create opportunities for voices to be heard as an integral part of learning to teach:

> Voice is a vehicle for reflective practice which results in ongoing learning in teaching. Knowing how to speak, including how to frame questions, how to grapple with answers, how to identify problems and focus on solutions, how to use theory to inform practice, and so on is as important as knowing what to speak about. Programs of teacher education must have a structured expectation of voice; they must provide ample opportunity and a safe and supportive environment for the voiced conversations to be exercised. (p. 192)

Voice lends credence to experience. In an epistemology of practice, it is essential to listen to one's own voice and also to the voices of one's students. Voice authorizes experience (Cook-Sather 2002). While voice tends to have little significance in an epistemology of technical rationality, we have come to see it as central to an epistemology of reflective practice.

The three teacher candidates whom we have quoted display early indications of reflective practice and a willingness to engage the differences that can be summarized as two different modes of learning. While they do not speak of epistemologies, their recognition of a new and different mode of learning is initiating a metacognitive turn as they try to understand what is unique and different about professional learning constructed from first-hand experience.

This is a tension felt in every teacher education program, this is a tension that the self-study researcher experiences, and this is a tension that teacher educators can endeavor to acknowledge and address. If the epistemology so valued by the university is the only one recognized by the teacher educator, the teacher candidate trying to come to terms with an epistemology of practice may be confused, even disappointed and, ultimately, frustrated. If the teacher educator recognizes and accepts the potential of two epistemologies, then assisting teacher candidates in learning to move between two epistemologies to the benefit of teacher candidates necessarily becomes a fundamental goal.

Trustworthiness in the Context of Dual Epistemologies

A self-study of teacher education practices demands consideration of the trustworthiness of the argument and its conclusions. We concur with LaBoskey's (2004) identification of trustworthiness as an essential characteristic of research in self-study of teacher education practices, a characteristic in which one redefines "validity as trustworthiness, meaning that the field is advanced by the construction, testing, sharing, and re-testing of exemplars of teaching practice" (p. 851). Trustworthiness is typically addressed in terms of credibility, transferability, dependability, and confirmability (Shenton 2004), and these can be recognized as derivative from characteristics of quantitative research. Recognizing and incorporating an epistemology of practice amplify and give new dimensions to the significance of trustworthiness. Mishler's (1990) account of trustworthiness serves as a convenient starting point:

> I propose to redefine validation as the process(es) through which we make claims for and evaluate the "trustworthiness" of reported observations, interpretations, and generalizations. The essential criterion for such judgments is the degree to which we can rely on the concepts,

methods, and inferences of a study, or tradition of inquiry, as the basis for our own theorizing and empirical research. If our overall assessment of a study's trustworthiness is high enough for us to act on it, we are granting the findings a sufficient degree of validity to invest our own time and energy, and to put at risk our reputations as competent investigators. (p. 419)

Incorporating an epistemology of practice highlights the importance of personal theorizing and writing oneself into the context of a report of self-study. The account of traditional academic research by Ham and Kane (2004) is also relevant to our consideration of trustworthiness:

Traditionally in academic research, something is more or less true insofar as it is more or less convincing to those competent to know. And those competent to know make such judgments not only on the coherence of the argument put or the face validity of the knowledge claimed—how consistent or inconsistent it may be with what is deemed to be already known—but also on the bases of the credibility, validity, trustworthiness or authenticity of the methods used, and the reflexivity of its representation. In the academy at least, a legitimation of a study as research is still largely a legitimation of method. The epistemological baby not yet apparently thrown out with the positivist bath water is that quality control of the product we know as research, even in all forms of qualitative research, is still as much about validating how something came to be known as it is about validating what is claimed to be known. (Ham and Kane 2004, p. 118)

An epistemology of practice provides a richer and more complex perspective about "what has come to be known" as well as "how something came to be known" than is typically available when working solely in terms of the traditional epistemology of the university.

Metacognition and Learning from Experience as Elements of an Epistemology of Practice

An article by Gunstone and Northfield (1994) suggests to us that they were studying their own teacher education practices before self-study was formally recognized as such. They foreshadowed the issues of metacognition and learning from experience when they elaborated seven principles that they saw as "fundamental to approaches to the promotion of metacognition and conceptual change." They intended these principles "to provide direction for actual classroom practice in the pre-service programme" (p. 534):

(i) Learners have a dual agenda in teacher education programmes—learning the content being taught, and learning about pedagogy by example. Put another way, all teachers in teacher education programmes are models. This modelling must be positive, and student teachers should be metacognitively informed in their learning from this modelling. This requires, inter alia, teachers discussing their pedagogies with student teachers and linking these with their pedagogical purposes, and, whenever appropriate, teachers using the pedagogies argued to be important for student teachers to embrace.

(ii) Student teachers need ideas (from broad philosophies to specific new teaching/learning strategies) about teaching/learning/roles of learners and teachers in order to have an informed basis for the evaluation and possible reconstruction of existing ideas and beliefs. These new ideas must be advanced in ways which show that the teachers value the ideas.

(iii) Conditions which encourage intellectual risk taking by student teachers must be provided. Trust and support are needed when student teachers are trying to acknowledge and restructure existing views, and trying to understand and evaluate new views. This risk taking is needed both during the university-based component of the programme and during periods of teaching practice. One dimension of the origins of the risk taking is that often experience precedes understanding (Guskey 1986) when learning to teach.

(iv) A genuine understanding of the content that the student teacher will teach is a necessary component of a student teacher's ability to conceptualize and implement alternative pedagogies. Hence an understanding is needed by teacher educators of the conceptual areas of the content student teachers will teach for which student teachers hold alternative conceptions, and of the detail of these alternative conceptions. This allows the teacher to use contexts which involve real conceptual learning for the student teachers as vehicles for the exploration of pedagogies.

(v) Discipline content, as discussed in (iv), is a significant context for change of ideas and beliefs about teaching/learning/roles. That is, some content is more appropriate for effecting informed conceptual change about pedagogies.

(vi) The teacher (of pupils or student teachers) is central to enhanced metacognition and conceptual change. Put another way, a necessary consequence of our embracing of constructivist perspectives on learning is that we must accept that our ideas cannot be handed directly to others; they must construct their own understandings of these ideas, whether they are our student teachers or other teacher educators.

(vii) Many of the above issues require, as a minimum condition, a genuinely collegial approach. This is not only collegiality between teachers, but between teachers and student teachers, and between student teachers themselves. In addition, the collegiality provides safeguards against perceptions that seeing learning as the learner's responsibility is to believe that all learning is relativistic, that any outcomes are acceptable. (Gunstone and Northfield 1994, pp. 534–535)

In these seven principles, we see many points that suggest the need to foster an epistemology of practice, and this is a responsibility of the teacher educator. As point (vi) indicates, teacher educators must develop the metacognitive skills that commonly have not been developed in their students' previous studies. Teacher educators must clearly value the ideas they present to teacher candidates, and they must encourage and support taking risks in the practice setting. Teacher educators must understand the alternative misconceptions of their disciplines that their students may hold and how fostering conceptual change is closely linked to pedagogy. Teacher candidates "must construct their own understandings," and we as teacher educators must "accept that our ideas cannot be handed directly to others" (p. 534). Finally, Gunstone and Northfield challenge us as teacher educators to enact the seven principles in a genuinely collegial context.

Actionable Theory from Reflection-in-Action and Reflection-on-Action

What Gunstone and Northfield have done is set out seven principles of actionable theory for the teacher educator. We take the term *actionable theory* from Schön's (1995) argument calling for "a new institutional epistemology" (p. 34):

> In Lewin's work [on action research], we find the idea that a practitioner's reflection on knowing- and reflection-in-action can give rise to actionable theory. Such verbally explicit theory, derived from and invented in particular situations of practice, can be generalized to other situations, not as covering laws but through what I call "reflective transfer," that is, by carrying them over into new situations where they may be put to work and tested, and found to be valid and interesting, but where they may also be reinvented. (p. 31)

Revisiting our own roles as teacher educators, we suggest that those learning to teach are not rejecting theory but seeking actionable theory and such theory must be constructed in teacher education classrooms guided by teacher educators who understand reflective practice, metacognition, and an epistemology of practice. While technical rationality sees theory as rigorous and reflective practice prides itself on relevance, Schön (1983, p. 42) was suggesting that that familiar tension (between the "high, hard ground" of theory and the "swampy lowlands" of practice) calls us to develop an epistemology of practice:

> The study of reflection-in-action is critically important. The dilemma of rigor or relevance may be dissolved if we can develop an epistemology of practice which places technical problem-solving within a broader context of reflective inquiry, shows how reflection-in-action may be rigorous in its own right, and links the art of practice in uncertainty and uniqueness to the scientist's art of research. We may thereby increase the legitimacy of reflection-in-action and encourage its broader, deeper, and more rigorous use. (p. 69)

Schön (1987) repeated the call for research on reflection-in-action when he considered the nature of a reflective practicum:

> Creation of a reflective practicum calls for kinds of research new to most professional schools: research on the reflection-in-action characteristic of competent practitioners, especially in the indeterminate zones of practice, and research on coaching and on learning by doing. Otherwise, . . . their efforts to create a reflective practicum may only produce a new version of a dual curriculum in which classroom teaching and practicum have no discernible relation to each other. (p. 171)

Thus those who engage in self-study of their classroom teaching are reminded that the implications of a new epistemology must also be considered in the context of the practicum placements for those learning to teach.

Throughout this chapter, we have focused on reflection-*in*-action but do not wish to suggest that we are ignoring reflection-*on*-action as an important process in the development of professional knowledge by teachers and by teacher educators. Munby (1989) captured our position in the following:

> We do not read Schön to be claiming that reflection-in-action is the sole source of professional knowledge, although it represents the process by which one can learn from experience. Reflection-on-action is powerful, and professionals undoubtedly use the knowledge of technical rationality in their work too. Schön's contribution is the language he gives us to recognize and so attend to an element of "learning from experience" that can easily be overlooked. (p. 34)

Munby (1989) concluded his article with four questions directed to our understanding of the work of teachers. We cite those questions by substituting *teacher*

[*educator*]s for *teachers* to indicate that we must pose similar questions to the work of teacher educators and must consider these questions as we conduct self-studies of teacher education practices:

1. What predisposes some teacher[educator]s to be more open than others to reframing puzzles that arise in their own work, and how does this predisposition change with experience? How do dominant metaphors restrict or contribute to such reflection-in-action and change?
2. What experiences strengthen teacher[educator]s' abilities to make sense of their own teaching and to utilize theoretical knowledge?
3. What features of professional practice make it puzzling to a teacher[educator]? Then, what generates changes and modifications in teacher[educator]s' practices? And what changes in language accompany changes in teaching?
4. What is the role of language (especially metaphors) in the development of professional knowledge as teacher[educator]s change their practices? How do metaphors evolve as teacher[educator]s gain experience with their teaching?

When we recognize an epistemology of practice, we acknowledge the importance of questions such as these in self-study research.

Insights from the Experience of Constructing This Argument

Constructing this chapter has reminded us of the need for and importance of revisiting Schön's (1983, 1987) work to better understand the implications of admitting a second epistemology into the analysis of professional practice by teacher candidates, teachers, and teacher educators. The following passage provokes powerful reconsideration of the relationship between coursework and practicum in a teacher education program:

> Introduction [of a reflective practicum] would reverse the usual figure/ground relationship between academic course work and practicum. In the normative curriculum, a practicum comes last, almost as an afterthought. Its espoused function is to provide an opportunity for practice in applying the theories and techniques taught in the courses that make up the core of the curriculum. But a reflective practicum would bring learning by doing into the core. . . . A reflective practicum demands intensity and duration far beyond the normal requirements of a course. . . . The work of a reflective practicum takes a long time. Indeed, nothing is so indicative of progress in the acquisition of artistry as the student's discovery of the *time* it takes – time to live through the initial shocks of confusion and mystery, unlearn initial expectations, and begin to master the practice of the practicum; time to live though the learning cycles involved in any designlike task; and time to shift repeatedly back and forth between reflection on and in action. (Schön 1987, pp. 310–311, emphasis in original)

We note that the teacher turned teacher educator typically has no preparatory practicum because of the implicit assumption that someone who has teaching experience understands all that is required to help beginners learn to teach. This reminded us that teacher educators must be vigilant in challenging their assumptions about their preparation to teach teacher candidates.

It has taken us considerable time to incorporate the various points we present here and to give them shape and significance in relation to each other. As we write, we learn from the experience of writing – again reminding us that learning resides *in* the experience and that making the learning explicit takes time and deliberate effort. As in the reflective practicum, we have had many moments of confusion and uncertainty about our practice as writers. Perseverance and tenacity have generated new insights into self-study research and new expectations of important ingredients of a productive report of self-study of teacher education practices, such as the following:

- A productive account of self-study research should attend to both epistemologies and show evidence of moving back and forth between the two.
- Learning from experience is easily taken for granted; it requires a different epistemological stance that needs the methodological features derived from technical rationality – credibility, transferability, dependability, and confirmability (Shenton 2004).
- What we learn in a self-study is *in* the self-study experiences of reflection-*in*-action; what we report in a self-study is learning from experience, in reflection-*on*-action.
- Preparation of self-study reports for conference presentations and publication requires that the guidance of an epistemology of learning from experience be blended productively with the rigor required by an epistemology of technical rationality.
- Self-study is not formulaic. It is not following a recipe developed by others; self-study helps to generate new practices in the practice moment, in action that is guided by a personal sense of previous teaching practices and of what improvement might look like.
- The importance of rich description of the organizational context in which a self-study occurs must be recognized.
- When teacher educators conduct a self-study of their own teaching practices, their learning from experience helps them to understand what their students need to learn to do in moving between and drawing insights from two epistemologies rather than one.
- Self-study reports should strive to include the voices of the researcher, the critical friend, and those learning to teach. Self-study is not a solitary undertaking limited to the voice of the researcher.
- In an epistemology of practice, voice plays a significant role – the voice of the researcher (here, the teacher educator) and the voices of those who are taught (here, the teacher candidate learning to teach).
- As tacit and taken-for-granted assumptions are identified and modified in the context of teacher education practices, learning from experience in self-study can and should be transformative.

Serendipitously, this analysis has proven to be a self-study as we reconsidered our personal teacher education practices in light of what we were writing. Now we must ask ourselves, "What will we do differently to move the insights captured

here into our own practices?" We will be more direct and explicit about learning from experience and the profound differences between two ways of learning and knowing – theory, texts, and lectures on the one hand and personal professional experience on the other. We will guide our students in challenging their own assumptions and help them to see the benefits of doing so – how challenging assumptions can lead to changed practices. Seeing benefits is not automatic; we must always acknowledge that reflective practice is about embracing the puzzles, uncertainties, and surprises of practice and model that understanding as we teach and study our own practices further (Russell, 2018). We will introduce the perspective of two ways of knowing and learning and explain how that perspective has enabled us to develop our professional practices as teacher educators. Although the focus on technical rationality in the typical culture of the university may mask the need for these strategies, the teacher educator/self-study researcher does work in a world of dual epistemologies and must help those learning to teach to do the same.

Conclusion

Our goal in this chapter has been to advance the claim that our understanding of teachers' and teacher educators' learning from the experience of practice can be enriched considerably by adding a second epistemology, an epistemology of practice. Self-study research uses a methodology for verification of knowledge gained from experience and for connecting such knowledge to the propositional knowledge embraced by the university. As teacher educators who study our own practices, we believe that the theory-practice tension cannot and will not be resolved until teacher educators recognize the potential of an epistemology of practice and act accordingly. Then self-study reports can consider and explore not only the background and conceptual analysis of their teaching but also the unique nature of learning from experience. If a preservice teacher education program has not identified, addressed, and nurtured the unique features of learning from experience, particularly in the practicum, then most new teachers are unlikely to develop on their own the skills of verifying what is being learned from experience and linking it to theory. Similarly, as teacher educators study their own practices, we strongly recommend that they incorporate the insights to be gained from an epistemology of practice.

Self-Study and Educational Foundations

Michael Pitblado and Theodore Michael Christou

Contents

Abstract

This chapter examines the relationship and interaction between self-study methodologies in teacher education and foundations of education courses. These courses commonly consider the history and philosophy of education, as well as sociology and, on occasion, psychology of education. There is relatively little self-study scholarship pertaining to the foundations, and extant work focuses primarily on philosophy, history, and social justice work. A prescient theme in the literature is the necessity of relating "theory" to "practice." Educational philosophy and history, as examples, may appear to be removed from the practical realities of classroom work for teacher candidates, but they can offer possibilities for the examination of how teacher educator and teacher candidates think about, understand, and act in their everyday practice. Foundations courses and self-study are both rooted in biographical, reflective, and mindful practices within teacher education and beyond.

Introduction

Educational foundations are defined here as a cluster of courses, typically involving history, philosophy, and sociology of education, along with educational psychology (Christou and Bullock 2014). Courses dedicated to educational foundations in teacher preparation programs are fighting to survive. The discipline has been under attack for many years (Butin 2004; Liston et al. 2009). Principally, there is criticism of "contemporary practices in foundations of education for their persistently inadequate integration of foundational theory and knowledge into teacher education programs" (Tozer et al. 1990, p. 296). In a special issue of *Educational Studies*, several educational foundations scholars took stock of the field and explored the decline of educational foundations in teacher education. The entries in the special issue make it abundantly clear that educational foundations have been marginalized in teacher education (Dottin et al. 2005), leading Butin (2005) to raise the existential question: "Does social foundations of education [as a course] matter? What do prospective teachers gain, if anything, from taking a social foundations course?" (p. 214). Teacher candidates, too, tend to be among the most vociferous critics of educational foundations courses. Teacher candidates demand the practical lessons and on-the-job training through classroom practica. When in their university classrooms, they expect to be handed ready-made classroom strategies and lesson plans (Goodlad 1990; Johnston 1994). Often, they believe they already know how to teach (Bullough 1989) and are therefore exceptionally critical of their professional preparation. For the majority of them, the answer to Butin's question is a no-brainer.

Research also shows that once preservice teachers become in-service teachers, they continue to identify historical and philosophical foundations of education as "the least significant coursework requirements vis-à-vis their present job tasks" (Butin 2005, p. 217 citing Public Agenda 2000). In these desperate times, the defenders and champions of educational foundations have their work cut out for them. To make matters worse, there is a dearth of research that focuses on educational foundations courses and their value to preservice teacher education (Diem and Helfenbein 2008).

Christou explored the marginalization of foundations courses in teacher education curricula as a personal campaign (Christou 2009, 2010). He examined five factors that contributed to the demise of history's foundational role in teacher education. The first concerned an accountability shift in teacher education, which, due in part to shortened programs and congested curricula, funding being tied to outcome measures, and increasing rationalization and centralization of decisions, represents a relatively recent, sometimes tacit, requirement that disciplines prove meritorious of space in teacher education (Bales 2006; Bredo 2005).

The second factor concerned the methods and means of instruction in educational history, which all too frequently depends upon textbooks treating educational foundations and academic articles; there is no literature supporting hope that there has been any dramatic change in the teaching resources used in instruction, which is profoundly problematic due to the often superficial and sometimes banal treatment of educational history that textbooks employ. The third factor postulated that the transfer of teacher education in Ontario from normal schools and teachers' colleges to faculties of education in universities carried forward "a tradition of training candidates for the practical realities of the classroom" (Christou 2009, p. 572), by concentrating upon initiation into appropriate methods and strategies for classroom teaching. This tradition is in essence antithetical to the purposes of educational history, which largely concern reflection on the inevitability of change rather than training for extant circumstances, and the examination of educationists as instruments of change via the exploration of past contexts.

Historian Herbert Kliebard (1995) explained this reflection by arguing that educational history's purpose pertains less to the curriculum design, lesson planning, and classroom administration as it does to the habit of deliberative and critical reflective inquiry into educational contexts:

> It is the habit of holding up the taken-for-granted world to critical scrutiny, something that usually can be accomplished more easily in a historical context than in a contemporary one. Ideas and practices that seem so normal and natural in a contemporary setting often take on a certain strangeness when viewed in a historical setting, and that strangeness often permits us to see those ideas and practices in a different light. (Kliebard 1995, p. 195)

Kliebard's position follows from that of Emile Durkheim (1977), who held out the promise that studying the history of education would teach them neither to revel in the past nor to be seduced by whatever is new or technological. Durkheim depicted educational history as an antidote to narrow and technical training of teachers, which he described as "simply instructing our future teachers in how to apply a number of sound recipes" (Durkheim 1977, p. 8). History of education, alternatively, was a means of leading future teachers "away from the prejudices both of neophobia and neophilia: and this is the beginning of wisdom" (Durkheim 1977, p. 9). The study of educational history demonstrates that pedagogical change may not be linear and progressive, nor may it be predictable, but it is unavoidable.

The fourth factor concerning the marginalization of history implicates the involvement of government and the Ontario College of Teachers in the certification and regulation of education faculties in an emphasis upon standardization and control of what subjects teacher candidates will study. Not only do the mandatory courses teacher education programs must include crowd out the traditional foundations subjects, including history, they leave less room for the study of historical parallels and narratives that challenge contemporary educational practices as well as any sense of their inevitability and permanency. The fifth and final factor discussed concerned the yoking of educational history in "foundations" courses with disciplines including philosophy, sociology, and psychology of education. Each of these areas has a different disciplinary structure, various means of

understanding, and distinct questions it concerns; the blurring of borders between these disciplines led to the dissolving of each area of study as a distinct subject, conflating different means and methods of studying education. History, as a foundations subject:

> Became disconnected both from the curriculum as an independent discipline and from the concerns of its 'parent' discipline [history]. This latter disconnect undermines the very aims of historical inquiry by requiring that it concentrate on contemporary issues and debates rather than on the past for its own sake. With the emergence of postmodern critiques of power and knowledge bases, the foundations model (and with it, each of the humanities and social science topics involved) was interrogated and attacked. Why did foundations courses focus heavily on the ideas an texts inherited from 'dead European white men'? Where were the female, international, and minority voices in the foundations syllabus? (Christou 2009, p. 573)

The plight of history as a marginalized subject in contemporary teacher education curricula has been the plight of each foundations subject, particularly sociology and philosophy. Some of the postmodern critiques were particularly valid; in particular, the matter of including multiethnic, multicultural, and multigendered voices will be treated later in this paper in the argument that stories need to be central to the exploration of history.

While self-study scholars do not normally link their work to curriculum theory in any explicit fashion, we found resonance between self-study and William Pinar's framing of the curriculum field. Pinar describes curriculum as a complicated conversation. "While not necessarily its outcome," he explains, "*understanding* is the *raison d'être* of the curriculum. Understanding is directed to the present—including our fantasies of the future—as it is informed by the past" (Pinar 2014, p. 4). Teaching teacher candidates for understanding gets further complicated when the instructor embarks on a self-study of his or her experiences teaching educational foundations. There is so much at stake. The risks are enormous to make one's own pedagogical decision-making vulnerable to criticism in a classroom environment whereby the majority of the students in the room have predetermined the course useless.

Introducing conversation as a metaphor for curriculum theory, Pinar (2004) states, "curriculum becomes a complicated, that is, multiply referenced, conversation in which interlocutors are speaking not only among themselves but to those not present, not only historical figures and unnamed peoples and places they may be studying, but to politicians and parents alive and dead, not to mention to the selves they have been, are in the process of becoming, and someday may become" (p. 43). Pinar (1974, 1994, 2004) further advanced the notion of *currere* as a method. It can be understood as a methodology for engaging systematically in curriculum conversations within a framework that involves an element of self-study. Four steps delineate the method of *currere*; it is (1) regressive, (2) progressive, (3) analytical, and (4) synthetical (Pinar et al. 1995). The first step involves study of one's personal experiences within the social and systemic contexts in which one was immersed. Thus, "the method of *currere* reconceptualizes curriculum from course objectives to complicated conversation. It is conversation with oneself (as a 'private'

person) and with others threaded through academic knowledge, an ongoing project of self-understanding in which one becomes mobilized for engagement in the world" (Pinar 2012, p. 47). In this way, curriculum as conversation and *currere* as a methodology is a dialectic process that creates a dialectic between the personal and the public, the historical and the contemporary, and the theoretical and the lived experience. Although we do not conflate *currere* with self-study here, we do note that both entail retrospective reflection on phenomenological aspects of life and learning. We will return briefly to *currere* later in this chapter by suggesting that it shares a methodological concern with self-study, particularly with regard to its focus on biography.

The broadsides leveled against educational foundations are built on flawed assumptions and preconception. But what if there was a body of empirical evidence to make informed decisions on the pros and cons of offering educational foundations courses in teacher education programs? What if we had evidence produced by reflective teacher educators actively engaged in educational foundations courses? Can self-study research help to fill this void? Can self-study challenge the critiques with evidence proving the relevance and value of the discipline? Conducting self-study in this cauldron of skepticism leads not only to complicated conversations but to what educational foundations scholar Robert V. Bullough Jr. describes as "intimate conversations." Within these intimate conversations, much can be revealed about the character and value of the field of educational foundations which can help in the fight to keep the discipline alive. To better understand its current state of insecurity and how self-study can assist, we must first consider its history. "The best way to understand the distinctive contribution that social foundations can make to professional preparation [of teachers]," according to Tozer and Miretzsky (2005), "is to examine the historical origins of social foundations instruction" (p. 5). How can this history help us understand the current marginalization of the field? With its history considered, we can then turn our attention to the small body of self-study literature conducted in educational foundations courses and explore how those "intimate conversations" contribute to the field.

Historical Roots of Educational Foundations

There is no simple logic line to guide any attempt to establish the historical roots of educational foundations in teacher preparation. Butin (2005) explains that, "The history of social foundations seems to be one of eclecticism. No singular text, no definitive methodology, no 'best practice' formations are to be found. The lack of a foundation within foundations in fact seems to be a foundational theme" (pp. xiii–xiv). The first sign of emergent versions of educational foundations in North America can be traced back to the very first teacher preparation programs in the United States during the late nineteenth century (Warren 1998, p. 119). According to Wagoner (1976), they "began out of necessity, as a way to provide substance to an emerging [teaching] profession" (p. 2). Without a developed body of knowledge, the field's creators had to borrow liberally from existing bodies of

knowledge (Wagoner 1976). According to Tozer and Miretzsky (2005), during the first decades of the twentieth century, teacher candidates took one of two types of foundations courses: (a) a single-discipline course from the social sciences or the humanities or (b) an introduction to the practice of teaching that focused on the "fundamentals" or "basics" of teaching without examining the relationship of education and society through any particular disciplinary lens (p. 5).

Vast changes to the structure of the Teachers College at Columbia University in the 1930s ushered in a new era for educational foundations. Within the reorganization, educational foundations was afforded a stand-alone division encompassing the history of education, philosophy of education, educational sociology, educational economics, comparative education, and part of educational psychology (Gibson 2002). Shortly thereafter, a group of distinguished educational thinkers – including William Heard Kilpatrick, Harold Rugg, John L. Childs, and George S. Counts, among others – began meeting regularly to discuss trends in modern society (Gibson 2002, p. 5). This radical shift to formally institutionalize educational foundations at Columbia is widely considered to be the birth of the discipline and the informal roundtable considered to be the first educational foundations course (McCarthy 2006).

From the beginning, the discussion group was incorporated a variety of disciplinary perspectives. The course aimed to provide "a critical, cross-disciplinary study of education, including schooling, as a cultural process grounded in social institutions, processes, and ideals that characterize particular cultures" (Tozer and Miretzky 2005, p. 7). They analyzed educational problems and discussed "what kind of future was most promising for the country and what role education could have in creating that future" (McCarthy 2006, p. 137). The topics for discussion broadened to include a "focus on psychology, curriculum making, teaching and the role of arts in education" (McCarthy 2006, p. 137). As the discussion group morphed into a formal course, it soon became prerequisite for all students attending the Teachers College. Other institutions of higher learning offering teacher preparation programs took note of the Teachers College institutional inclusion of educational foundations and soon followed suit (Beadie 1996; Gibson 2002).

The early period of educational foundations, between its inception in the 1930s through the mid-1950s, was not without challenges. Many faculty members across the Columbia University campus viewed Teachers College faculty as "neither academic nor as professional" and Teachers College's curriculum as "devoid of scholarship and generally worthless" (Gibson 2002). This period was also significant for the Progressive Education Movement. As a result, social reconstructionists and functionalists tended to dominate the early years of thinking about educational foundations (Gibson 2002).

By the early 1950s, however, progressive education came under attacked which, according to Gibson (2002), "tipped the scales in favor of the disciplinary critics in Foundations" (p. 162). The next decade or more was characterized by the field's shift back toward the academic disciplines (Cohen 1976). With the Cold War space race heating up with the Sputnik launch in 1957 and the National Defense and Education Act of 1958, it was alleged a more rigorous curriculum was needed to

compete (McCarthy 2006). To do so, "there was widespread belief that the study and practice of education could only be improved if it were firmly rooted in some discipline, the legitimacy of which was rarely recognizable and generally not questioned by scholars in the traditional disciplines" (Johanningmeier 1991, p. 18). In 1963, for example, Conant agitated for the end of educational foundations courses, claiming educational foundations faculty were ill-prepared and incapable of teaching in the disciplines (Gibson 2002). Conant believed educational foundations courses were not only useless, but they ruined the reputations of education departments (Gibson 2002, p. 164).

By 1968, the trend toward bringing the humanities in closer harmony with the social sciences ushered in a new era for education foundations. Graduate students trained in the social sciences disciplines had turned their attention to studying education, and, as a consequence, many ended finding homes in faculties of education. This helped to transform educational foundations departments into departments of philosophy and the social sciences (Shields 1968). For the rest of the twentieth century, there was a renewed interest in the cross-disciplinary approach, which galvanized around the newly established American Educational Studies Association. Educational foundations scholars now had new avenues to publish. In response to a growing "competency-based evaluation movement in education" (Council of Learned Societies in Education 1996) that began in the mid-1970s, the American Educational Studies Association adopted the *Standards for Academic and Professional Instruction in Foundations of Education, Educational Studies, and Educational Policy Studies*.

With the help of the National Council for Accreditation of Teacher Education (NCATE), the American Educational Studies Association began distributing these standards to all teacher education institutions (Gibson 2002). They established the important role of the humanities and social sciences in preparing teachers. This marked the beginning of the field being embroiled in the debates in the United States regarding teacher accreditation. Within these disputes, educational foundations advocates ensured that preparation in educational foundations was a requirement in accreditation frameworks (Dottin et al. 2005). At the turn of the century, this became increasingly difficult in the American context as the "No Child Left Behind" policy in 2001 exacerbated the issue by requiring all public school teachers of core academic subjects be "highly qualified." The US Department of Education defined "highly qualified" as requiring full state certification, opening up a debate over the "relevance and viability" of traditional teacher education programs as the only pathway to full certification (Butin 2005, p. 216).

The move toward deregulation of teacher accreditation, led by conservative organizations like the American Enterprise Institute and the Thomas B. Fordham Foundation, argues that teacher preparation programs "are ineffective and cumbersome, thereby providing ineffectual education to individuals within them and creating steep hurdles to otherwise qualified individuals attempting to enter the teaching field" (Butin 2005, p. 216). Standing in opposition to the deregulation movement have been teacher education organizations such as NCATE and the American Association of Colleges for Teacher Education who argue that improving

teacher quality requires strong and reasonable regulation of teacher preparation programs (Butin 2005, p. 216). During the "No Child Left Behind" era, it was exceedingly difficult to demonstrate the relevance of educational foundations in teacher education programs with its explicit emphasis on "scientifically based research" as a means to discredit education research that constructed and contested established definitions (Butin 2005, p. 218). The political rhetoric and the attempts to isolate and minimize the role of educational foundations courses in teacher preparation programs have not abated in the years since "No Child Left Behind" was scrapped in 2015. In this highly politicized context, educational foundations in teacher education program consistently finds itself in the crosshairs and on the defensive. Some of the most significant contributions to the literature in the recent years that make persuasive claims for the value and importance of the discipline in preparing future teachers employ robust self-study methodology. An assesment of these studies can highlight the close relationship between self-study and educational foundations and the benefits they offer both instructors and teacher candidates.

Self-Studies in Educational Foundations

Assaults on educational foundations have not been confined to political arenas. Many teacher educators, too, have added their voices to the chorus of criticism. In the late 1980s, for example, Edgar Stones (1989) argued that educational foundations had become irrelevant to teacher education. He believed that teachers of foundations courses failed to make the link between theory and practice and blindly hoped that these links would be made "later when the students had been in school for a few years" (p. 5). Responses to these attacks, as Wilson et al. (2001) observed, have generally failed to produce the empirical data needed to make the case for the vitality of foundations courses. This is where the growing body of self-study literature in the field of foundations of education in teacher preparation programs can be on immense service. While foundations faculty may lament the vanishing position of educational foundations in teacher preparations programs, teacher candidates have every right "to challenge their professors to make a compelling case for the worth of their offerings" (Bullough 2008, p. 6). The following review of recent self-studies illustrates the high quality of research efforts that – from different perspectives and research foci – reveal how self-studies can help arm the defenders of educational foundations with evidence-informed data.

Because so many teacher candidates notoriously categorize their experience in educational foundations courses as one of their least favorite and least relevant during their teacher preparation programs (Butin 2007; Carter 2008; Lewis 2013; Morrison 2007; Swain 2013), choosing to conduct a rigorous self-study in such a course necessitates a generous amount of courage on the part of the instructor. Laying one's pedagogy bare to constructive criticism in such circumstances takes courage. The potential payoffs, however, as the reviewed studies below reveal, are worth the risk. It is precisely that inherent vulnerability in self-study methodology that creates space for "intimate conversations" (Bullough 2008, p. 14)

to emerge and from which we can glean significant insights into the character, value, and potential of social foundations of education courses.

The discussion of the literature below is organized around three broad themes where self-studies in educational foundations have made significant contributions: theory and practice, biography and history, and social justice education.

Intimate Conversations Between Theory and Practice

It was John Dewey's stated position that "theory is the most practical of all things" (1929, p. 17). From his perspective, theory is a matter of broadening one's outlook, of "widening the range of attention beyond nearby purpose and desire [which] eventually results in the creation of wider and farther-reaching purposes" (Dewey 1929, p. 17). For teacher candidates, the link between theory and practice is not self-evident, making courses like foundations of education courses sources of frustration. To be useful, "theory must prove its worth in how students understand and think about their practice, how they think about themselves as teachers, about schooling, pupils, and learning. In short, it must impact how they see the world they inhabit" (Bullough 2008, p. 6).

In their collaborative self-study, Bullock and Christou (2009) aimed to better understand the usefulness of theory by exploring what they termed the "radical middle" between theory and practice in teacher education. Both had left professional employment as classroom teachers to pursue doctoral studies in aspects of teacher education and were graduate teaching fellows in the Bachelor of Education (BEd) program at their institution when they conducted their study. Bullock taught a course focused on practicum supervision, while Christou taught a philosophy of education lecture. One grounded in practice, and the other, at best, can be deemed theoretical. While teaching in very different contexts within the BEd program, they both sought to help teacher candidates challenge the familiar rhetoric surrounding theory and practice and to interrogate their own assumptions about theory and practice in teacher education. At the outset, they confronted a familiar problem. "Our candidates," they observed, "had a seemingly insatiable desire for the practical at the expense of the theoretical" (p. 76). Believing the perceived gap between theory and practice as false and misleading, Bullock and Christou proposed a reconceptualization of the relationship where "there is theory in practice and practice within theory" (p. 76), the "radical middle" as they described it. Such an approach recognizes that teaching is inherently problematic. Their belief is that a linear, cause-and-effect understanding of theory and practice contributes little to a teacher candidate's understanding of teaching as a problematic endeavor. Thus, Bullock and Christou aimed to "help candidates make explicit the connections between information and personal understanding, between learning experiences and the deliberate pedagogical strategies that support them. Such purposeful intertwining of theory with practice has the potential to provide models for the learners in classrooms where a disciplined analysis of the nature of teaching and learning is both possible and desirable" (p. 77). By engaging in a collaborative

self-study, therefore, they "sought ways in which to analyze and challenge the theory-into-practice assumptions underpinning our teacher education program" (p. 76).

Over the course of the 2007–2008 academic year, Bullock and Christou met regularly to "discuss areas of mutual interest in teacher education and to help each other think about the problems of practice that we encountered as we taught in the preservice program" (p. 75). Each meeting lasted approximately 90 minutes and was informal in nature, allowing for organic discussions "guided by our shared interest in the philosophical implications of the familiar debate between theory and practice" (p. 76). This was augmented by each researcher recording the ideas explored during these meetings as well as their reflections on their respective teaching experiences in journals. As a guide for their discussions, they adopted Berry's (2007) notion of tension in teacher education. In her experience, "teacher educators regularly experienced particular tensions as they attempted to manage complex and conflicting pedagogical and personal demands within their work as teachers of prospective teachers" (Berry 2007, p. 119). For Bullock and Christou, both at the beginning of their careers as teacher educators, becoming a teacher educator was not only a process of reconstructing a professional identity and learning to listen to teacher candidates but also a process of learning to navigate tensions in professional learning. This notion of tension in learning to teach teachers was instructive as they developed new professional roles as teacher educators (p. 78). The collaborative self-study process provided "considerable emotional and intellectual support" (p. 83) as they navigated this process. They explained that self-study helped them "to find the courage to challenge and disrupt our own prevailing assumptions concerning the roles of theory and practice in teacher education" (p. 83).

For the purposes of this paper, Christou's experiences teaching the philosophy of education to preservice teacher candidates are particularly significant. In the BEd program at his institution, teacher candidates encountered the philosophy of education in a nine-class over 3-week module, rather than a full course. Thrust upon an auditorium stage in front of 450 teacher candidates who were, perhaps, less than enthused to be there, Christou questioned whether teaching and learning was possible in such "a hornets' nest of discontent and unease" (p. 79). Nevertheless, Christou set out to convince his teacher candidates that teaching "is a deeply ethical, moral, and personal activity. Each moment of deliberation – and there are many each day – is philosophy enacted. There is nothing more pedagogically practical, in other words, than philosophy. It is enactive, growing and reactive rather than passive, abstract, and merely discursive" (p. 80).

To make this case, Christou refused to teach the philosophy of education by simply lecturing. A set of talks beginning with Plato and ending with postmodernism would be ineffectual and ineffective. It would reinforce the notion that philosophy is content to be read rather than a way of living in the world. Rather, he challenged his teacher candidates to construct their own philosophy of education statements that were purposeful, personal, and meaningful – a pedagogical risk Christou credits the collaborative self-study helped motivate him to take (p. 83). Christou highlights a number of critical problems of practice that emerged from this

assignment and his reflections on teaching this module. For example, the dearth of instruction time hindered the teacher candidates' ability to effectively reflect on their own experiences as learners and to engage with the theoretical. The philosophy of education statement assignment began with Christou asking his teacher candidates to create a life map as an attempt to engage teacher candidates in "conversations about their prior assumptions about teaching and learning, while also encouraging them to construct theory from practical experiences" (p. 87).

It became clear immediately that the deadline for the life maps needed to be extended. The teacher candidates needed the time and space to engage with their own histories, and by granting the time, Christou reports the depth and success of the assignment were greatly enhanced. Additionally, Christou challenged the teacher candidates to dissect well-worn educational slogans such as "No Child Left Behind." This proved more difficult for the teacher candidates than Christou anticipated. Their frustration, however, was telling. As Christou explains, "if pedagogical choices were easy to make... there would be no need for philosophy, reflection, or deliberation" (p. 82). While awkward in the auditorium, this revelation reinforced Bullock and Christou's central premise that the dichotomy between theory and practice is a false one. By endeavoring to untangle educational tropes, Christou gave the teacher candidates an opportunity "to see that dichotomous scenarios are not the stuff of actual lived experience."

"Philosophy is not abstract and distilled; it is messy, experiential, and contingent" (p. 82). For his specific portion of the collaborative self-study, Christou concluded that "all teachers are educational philosophers and all abstracted principles are only as useful as the next situation in which they would be tried. The separation of educational theory and practice is impractical because it does not account for the enactive and reflective necessities of actual pedagogical practice" (p. 83).

Within the context of collaborative self-study, Bullock and Christou's attempts to find a radical middle ground between theory and practice in their respective pedagogies were met with some successes. They confirmed their initial assumption that "teaching is a fluid, dynamic process that takes many forms" (p. 87). Their collaborative self-study allowed them to share their personal narratives of learning to teach preservice teachers and illustrate the value of using theory or practice as a starting point that can help us "recognize and deal explicitly with the whole of teaching, to make listening to teacher candidates a priority, and to continue on the journey to locate the radical middle between theory and practice."

Similar to Bullock and Christou (2009), Breck and Krim (2012) conducted a self-study of their experiences teaching foundations of educations to two different cohorts in a Masters of Arts in Teaching (MAT) certification program. Wrestling with the complicated relationship between theory and practice is at the heart of their study. They asked: "How can we best teach foundational concepts with a practice-based approach" (p. 290)? This self-study represented their first attempt at the foundations components of the MAT program. Therefore, Breck and Krim were interested in examining the new teaching experience in a systematic way through self-study, setting out "to re-examine our own theories regarding the theory/practice divide as a means for personal and professional growth" (p. 290). Unlike Bullock

and Christou (2009), however, Breck and Krim (2012) prioritized the practical over the theoretical.

Their orientation from the outset of their study was grounded in Ball and Forzani's (2009) notion that practice ought to be the core curriculum of teacher education, shifting "from a focus on what teachers know and believe to a greater focus on what teachers do" (p. 503). Their understanding of educational theory also differed from that put forward by Bullock and Christou (2009). Whereas the latter scholars represented theory and practice as two mutually dependent elements of a single whole that is teaching and learning, Breck and Krim adopted a practice-based approach to teacher education whereby connections to theory are made only when the theory is in direct service of classroom practice. Nevertheless, Breck and Krim saw their role as teacher educators to be that of "facilitators or coaches guiding teacher candidates as they weave, or reconstruct, the theories developed throughout our program into a professional identity with a belief system that guides their practice" (p. 290). Like Christou's philosophy of education statement assignment, Breck and Krim focused their instructional approach to foundations of education on the autobiographies of teacher candidates, believing in Beijaard et al. (2000) argument that "teachers' perceptions of their own professional identity affect their efficacy and professional development as well as their ability and willingness to cope with educational change and to implement innovations in their own teaching practice" (p. 750).

After sharing their own autobiographical contexts as the researchers, grounded in Nieto's (2010) premise that we first need to "understand and accept [our] own diversity and delve into [our] own identities before [we can] learn about and from [our] students" (p. 157), Breck and Krim explicated their self-study methodology. "We wanted a process," Breck and Krim explained, "that would allow us to conduct our classes with as little impact on our teaching as possible while at the same time rigorously examining our practice" (p. 292). Thus, they chose self-study as their methodology citing Pinnegar and Hamilton (2010) who see inquiry into self-study of teaching and teacher education practices as an approach that bridges the gap between theory and practice. For Breck and Krim, this meant investigating the degree of success in implementing their stated practice-based orientation to foundations coursework.

Using student work as feedback, they aimed to gain an accurate perspective of their teaching practice as they navigated their educational foundations course (p. 292). To validate their study, they employed a critical friend model (McNiff and Whitehead 2010; Samaras 2011) by sharing each other's data analysis and conclusions and by "challenging the other's findings against current theoretical and empirical research" (p. 292). The study was conducted over 3 semesters and included 20 middle school teacher candidates as participants. For data sources, Breck and Krim collected the teacher candidates' work samples.

Despite teaching different cohorts, Breck and Krim planned the course together, selected common texts, and constructed assignments which would serve the dual purpose of addressing the course concepts and providing appropriate data sources to answer their research question (p. 293). By course planning collectively, Breck and

Krim were able to work with common conceptions of educational foundations. Meeting regularly throughout the study to share anecdotal findings as well as to formally discuss their understandings of the teacher candidates' learning processes and work at the end of each semester, Breck and Krim's study became a "recursive act that [required] revisiting earlier steps, reexamining [our] data, and reassessing [our] preliminary interpretations based on incoming data" (p. 198). After repeated discussions of each other's findings, including debates about their significance, the two researchers came to shared conclusions.

They found that at the beginning of the process, the teacher candidates were reluctant to engage with educational foundations, making limited associations with the disciplines "as they related to their personal experiences, as they connected to their future classrooms in a general manner, or in terms of specific teaching behaviors" (p. 299). These responses led Breck and Krim to believe that their teacher candidates were beginning to make the personal connections to theory but: "For us," they explained, "the realization that our data collected within the fall program assignment showed candidates making very limited connections between foundational theories and practice resulted in a complete reworking of the spring TWS assignment" (p. 299). They added probing questions about the impact of sociocultural realities on their students' learning experiences which helped to elicit new themes depicting the relationship between the context in which teacher candidates found themselves placed and the foundational theories they had examined during the previous summer.

Breck and Krim highlighted the limitations of their inquiry. They explained:

> Ironically, as middle-level educators, we were always cautioning potential teachers not to assume that children who were at a more advanced stage in their physical development were also at that same advanced stage in their cognitive development. We proceeded to make a similar faulty assumption about the development of our own candidates. Just because our candidates had the educational and life experiences to allow them to provide evidence that they grasped concepts as they pertained to educational foundations did not necessarily mean that they were more adept than their undergraduate counterparts in understanding how these concepts would impact their practice. (p. 300)

Pedagogically, Breck and Krim came to understand that they needed to provide appropriate scaffolding but also meaningful and extensive modeling of what connecting context to learning needs would look like. The most striking revelation for the researchers did not relate to the teacher candidates' learning, it concerned their own teaching of the foundations; this, they accredited to conducting the self-study.

Breck and Krim reported that there was often dissonance between the educational theories they taught and the pedagogical choices they made. At times, the educational theories under consideration were reenforced by their practice, while at other times, they came to new understandings about their thinking about their teacher candidates. For example, Breck and Krim admit to assuming that their teacher candidates would be able to readily transfer new knowledge from the course into classroom practice. These unexpected findings from their self-study echo Lovin

et al.'s (2012) insistence that "self-studies remind us to look not only for consistencies but also for apparent inconsistencies between our practices and our belief" (p. 53). As Breck and Krim discovered, the inconsistencies revealed in their self-study proved a rich opportunity for growth in their teaching practice (p. 300).

Exploring the nexus between theory and practice in the context of their educational foundations course also proved revelatory. "While we both considered ourselves to be practiced-based when it came to the content methods we had traditionally taught, we had not, in all the hours (and there were many) we spent planning, actually asked ourselves, what practice-based foundations would look like in a foundation course" (p. 301). Upon reflection, the two researchers understood that they need to be more specific in what they want from their teacher candidates in an educational foundations course. They explained that they "needed to do more 'homework' concerning making connections between foundations and field assignments" (p. 301). Thus, they concluded that good practice in teaching educational foundations requires the effective modeling of specific examples of how context impacts instruction during class sessions but also "in field placements, seeking out cooperating teachers who effectively develop instruction with context in mind as well" (p. 301). The self-study experience for Breck and Krim produced deeper meaning on how, through the process of studying educational foundations, to help guide teacher candidates in the development of their own professional identities as future educators. While studying their own practice to determine if they could connect context to practice for their teacher candidates, they "discovered the need for us to connect the context of who our candidates are, as master's level, career-changing adults, with how we develop learning experiences for them" (p. 302).

Roosevelt (2011) conducted a self-study to demonstrate the richness of such an approach by reporting "on the ways in which a foundations course at a small urban college has used an introduction to educational ends to prompt teacher candidates to identify, reflect upon, and analyze their own personal and professional values" (p. 546). She did so in response to recent critics of educational foundations (Liston et al. 2009; Mueller 2006; Murrow 2008) who criticized the field of educational foundations for being too narrowly taught and limited to the current orthodoxy of constructivist pedagogy; Roosevelt argued that the self-conscious articulation of values that an educational foundations course encourages can affect teacher candidates' reflective practice in useful ways. She conducted her self-study in a mandatory, two-credit introduction to the philosophical foundations of education course where her approach was not only to introduce teacher candidates to the traditions that the progressivist, constructivist, student-centered orthodoxy evolved from but also to encourage teacher candidates to actively and reflectively connect such theories to daily classroom practice.

Roosevelt conducted her self-study at an institution that primarily services marginalized urban teacher candidates and has a built-in purpose-centered educational model requiring teacher candidates to engage in fieldwork every semester and to relate academic theories to their fieldwork practice in a systematic and purposeful way. Even in an educational environment that prioritizes classroom practice or performance-based teacher training, Roosevelt stressed that "reflective study of

educational aims is an achievable goal" (p. 547). At her institution, the teacher candidates' abilities to demonstrate connections between theory and practice are assessed through the completion of a project report of the candidates' selected topic and how they planned, implemented, evaluated, and reflected on the data they generated. Their projects were related to a curriculum dimension the institution labels values and ethics, one of five core curricular dimensions that anchor the teacher education program (the others being purpose, self and others, systems, and skills). It is within the values and ethics dimension where teacher candidates are introduced to educational philosophy. By conducting a qualitative self-study based on the written project reports of teacher candidates in the values and ethics dimension, Roosevelt aimed to lend her voice to the chorus championing a continued place in teacher education programs.

Roosevelt's approach to teaching educational foundations was rooted in history and philosophy texts that are canonized within the Western tradition. Nevertheless, like the other foundations instructions discussed above, Roosevelt prioritized connecting theoretical ideas with her teacher candidates' own lived experiences and values with foundational concepts, rather than simply focusing the exercise on deconstructing dense philosophical texts. She carefully selected short, accessible excerpts of key readings collected in Gerald L. Gutek's (2001) *Historical and Philosophical Foundations of Education: Selected Readings*. To provoke debate among her teacher candidates about basic epistemological questions, for example, Roosevelt introduced Plato and John Locke. The teacher candidates wrestled with the competing pulls of idealism and empiricism, spiritualism and materialism, and nature and nurture. Roosevelt explained that while some teacher candidates enter the program with strong spiritual commitments leaning toward the proto-religious elements in Plato while others arrived with lived experiences and observations that aligned more with a materialist epistemology of how children learn, what was interesting was how the teacher candidates from either side began to change their positions after reflection.

The learning that resulted from engagement with excerpts of Jean-Jacques Rousseau's *Emile* was similarly productive. This engagement concentrated on questions about the aims and ends of education as presented in the text, which is part novel and part philosophical treatise. According to Rousseau, we have to choose whether our aim is to educate a person for the sake of self-development or for the sake of society's needs.

Teacher candidates confronting this question had deep, yet sometimes uncomfortable, discussions about education as a means to nurture both individual freedoms and civic responsibilities. Roosevelt observed her teacher candidates' initial unease with Rousseau's argument dissipate with greater discussion, yet they remained frustrated when seeking to reconcile Rousseau's apparent child-centered pedagogical beliefs with their actual observations of pedagogy in schools. The teacher candidates reported how it was painfully obvious how difficult it was for teachers to put Rousseauian theory into practice.

Readings from John Dewey including *My Pedagogic Creed* and excerpts from *Democracy and Education* appeared to be accessible to most teacher candidates. Roosevelt speculated that the popularity of Dewey is due, at least in part, to teacher

candidates' ability to see connections between Dewey's philosophy and the purpose-centered educational model that they had themselves experienced. Education, seen as a social experience, was recognizable. Even so, Roosevelt noted Dewey did not resonate equally with everyone, but engagement with his writing helped teacher candidates to reflect on their own experiences. Roosevelt explained that one teacher candidate asked herself if she would really follow Dewey's principles once she became a teacher. "When I attended my elementary school we did not have cooperative learning. Learning was an individual process. The sharing of ideas, thoughts, and opinions felt almost like cheating," she wrote. Recognizing the complex and often messy relationship between theory and practice, this teacher candidate found growth as a teacher. Roosevelt speculated that "it is very possible that [this teacher candidate's] reflections on Dewey helped [her] become aware of her own values as an educator" (p. 558).

Roosevelt's self-study of teaching foundations persuaded her of the benefits of engaging teacher candidates with the philosophical vision of thinkers such as Plato, Locke, Rousseau, Mann, Washington, Du Bois, and Dewey. We note that the authors examined in educational foundations, including the course considered by Roosevelt, is largely male and part of the Western canon. Roosevelt does note that her teacher candidates' written reflections illustrated their need for "larger conceptual frameworks that provide perspectives for their choices" (p. 559). Engaging with the texts of Jane Roland Martin, Nel Noddings, and Mary McLeod Bethune – to name only a few important educational philosophers not fitting within the categorical structure noted above – would facilitate the aim of broadening the landscape of foundations work. Responding to Liston et al.'s (2009) assertion that "part of being a professional educator is figuring out which ends you desire" (p. 110), Roosevelt concluded that the study of educational foundations can enable teacher candidates to become more reflective and ultimately more effective teachers by crossing the theory-practice divide.

What appears to be vital in the success of foundations courses is the instructors' and teacher candidates' work to connect to philosophical, theoretical, and historical ideas to their lived experiences. One might argue that there is nothing more practical than these three sets of concepts. Why do schools look the way they do? How ought they to look? How did they get this way in the first place? These questions, seminal to foundations scholarship and teaching when it is at its very best, are shared with the work of self-study. Each concentrates on deliberate and thoughtful action, informed by and involved with ongoing reflective and contemplative habits of mind.

Intimate Conversations Between Biography and History

In "Teaching and Reconsidering the Social Foundations of Education: A Self-Study" (2008), Bullough offered a lucid and persuasive argument for the value of foundations courses by focusing on the importance of linking teacher candidate life experiences with the literature and ideas in the history and philosophy of education.

He began from a standpoint that teacher candidates need to encounter and experience "associative and interpretive uses of knowledge" in order for them "to recognize their transformative power for teaching" (pp. 6–7). By bringing biography and history into an intimate conversation in his social foundations course, Bullough hoped his teacher candidates would be able to connect more deeply to the course content and thus recognize how such knowledge could influence their classroom practice by challenging how they think and what issues they think about. "When biography and history, understood broadly, are linked," according to Bullough, "relevance follows and perspectives are broadened. One begins to see not only that we are not alone, but also that we have a stake in understanding the history of the issues that we confront and how that history shapes sight" (p. 7). The challenge, therefore, for foundations courses and the focus of Bullough's self-study is how to successfully bring the biographies of teacher candidates together with the history of education in a way that allows for the exploration and illumination of both.

It is, perhaps, in Bullough's work that we see most apparently the link between self-study in teacher education and *currere* in curriculum theorizing as methods. As noted earlier, any linkages are not made explicit in the literature of either curriculum theory or self-study, yet both involve a concentrated study on autobiography. This is true etymologically, as autobiographical work, derived from its Greek roots, entails writing about one's own life experience. This writing is meant to be ongoing and recursive but also the subject of examination with the aim of informing the way one thinks about the world, thinks in the world, and lives in the world.

Bullough applied self-study methodology while teaching a diverse group of 17 secondary teacher candidates in his educational foundations course at Brigham Young University. The choice to focus his study on his own experiences as well as those of this teacher candidates throughout the foundations course was grounded in a conceptual framework rooted in Cook-Sather (2002) and Palmer (1998), who hypothesized that "the most practical thing we can achieve in any kind of work is insight into what is happening inside us as we do it" (p. 5). As such, Bullough carefully considered his role as instructor with express purpose of shedding the role of expert. Instead, he saw his role more as discussion leader "charged with creating conditions whereby students could share stories of their past, make linkages between and among stories, and contextualize those stories within the wider foundational literature on schooling and teaching that we would read" (p. 8). In this sense, Bullough aimed to bridge biography and history together in a "constant conversation" (p. 8). This collaborative approach to running the course left the instructor vulnerable. "I realized," Bullough admitted, "that I was inviting students to criticize my practice, just as I invited them to study and criticize their own practice as students. The risk was obvious, but I thought there would be no other way of seeing if the course succeeded and if training assumptions softened over our time together" (p. 8).

For his data, Bullough collected both instructor and teacher candidate diaries throughout the process of instruction as well as a diary summary at the end of the course. "Diary entries were to be based on their thoughts about the day, what they did before, during, or after class to make the experience more interesting, engaging, or

challenging, including opportunities that were missed by me or by the students to make our time together more meaningful or enjoyable" (p. 8). Diaries were kept anonymous to create a "community of truth," meaning teacher candidates could write freely and honestly in their diaries without fear of reprisals from the professor.

In their diaries, teacher candidates were asked to make connections between assigned readings and their own lived experiences as a means to help them interpret the issues presented in the course. Of the three principle texts that grounded the course, Bullough specifically chose Parker Palmer's *The Courage to Teach* (1998), "because of [Parker's] orientation toward the personal aspects of teaching and the inner struggles of teachers" (p. 7). Bullough hoped the topics raised in *The Courage to Teach* would connect to the teacher candidates' experiences of schooling.

Approximately 234 diary entries were collected from teacher candidate diaries, excluding Bullough's own diary and the final summaries. Teacher candidates were required to write an education-related life history which would be used to identify common student issues and to explore why they were held in common. When teacher candidates shared their work with each other, questions of equality and justice and the public purposes of education quickly emerged as themes from these life histories. On three occasions during the term, Bullough allowed for full class discussions about issues arising from the diaries. Together, the diaries and summaries were analyzed for emergent themes, and special attention was paid to noting changes in a teacher candidate's views over the course of the term. Through his analysis, Bullough isolated four central themes that emerged from the data set: teacher education is a waste of time and foundational studies are even worse; the strength of training assumptions; thinking about biography and schooling – a few changed perceptions; and I am responsible for my learning.

Unsurprisingly, Bullough noted that his teacher candidates began the course with "strong and mostly negative feelings about the value of teacher education generally and of educational foundations specifically" (p. 9). They were not shy about expressing their desire to learn about practical aspects of teaching and learning. Some even admitted they were irritated for having to take the foundations course at all. It was clear from the diaries that most of the teacher candidates already thought of themselves as teachers. Many confessed that courses like Bullough's were merely hoops they were forced to jump through before attaining official teacher certification. In the earliest entries, several teacher candidates prejudged the course, "unconvinced they would encounter anything worth learning" (p. 10). As a consequence, they readily admitted they had no intention of putting much energy or effort into the class. Bullough concluded that it was clear his teacher candidates were not initially convinced of the value in what they were doing. However, Bullough noted a turning point in some diaries following a class discussion arising from a reading in *The Courage to Teach* about subjects that students fear. It led to deep considerations of personal experiences with classroom anxieties and the pressure to attain good grades. Steering the conversation back to their own burgeoning pedagogies, Bullough witnessed his teacher candidates beginning to see connections between institutional organization, purposes embedded in established practice, and their experiences within that institution (p. 10).

The second theme emerging from Bullough's data was recognition that teacher candidates had a deep desire for training and practical classroom strategies. While some teacher candidates began seeing the value to their growth as teachers of reflecting on their own lived experiences in schooling, others remained stubbornly determined to stick to their demands for the practical. Bullough lamented that such steadfast inflexibility impeded teacher candidates' engagement and risk-taking. It also, however, forced Bullough into recognizing a hard truth: that slipping into monologue – even if by accident simply because he was excited to share his ideas about a particular topic that was interesting to him – might not aid in his teacher candidates' learning. Some wrote in their diaries that, while they were committed to getting something out of the class, they simply did not have the same concerns that Bullough did.

As trust grew in the course – between teacher candidates and instructor, as well as between fellow teacher candidates – Bullough discovered the third theme emerging: a change in teacher candidate approaches to biography. Early reluctance to thinking carefully about self, about one's values, or about the wider social contexts as connected with learning to teach gave way to a progressively richer quality of teacher candidate diary entries. Bullough noted "signs that they were beginning to think more seriously about their beliefs, involvement in learning, and the context of schooling" (p. 12). From feeling touched by something Dewey had written, to challenging one's very understanding of democracy, to getting fired up about contemporary problems in the education system, the diaries revealed a gradual deepening of engagement with foundations issues. To his great satisfaction, Bullough could see from the heartfelt and sometimes passionate diary entries a letting down of their guard and an increasing willingness for taking intellectual risks. Guarded, Bullough maintained that vocationalism and individualism remained blinding for most, but, as the course progressed, foundations were helping them see that teacher education programs were about more than functionalist and instrumentalist aims.

The final theme emerging from data proved a critical lesson for both Bullough and his teacher candidates. Bullough realized that the responsibility to make the social foundations course valuable and meaningful must be shared by both the instructor and the teacher candidates. Where Bullough witnessed this pattern was in the increasing quality of class discussion throughout the term. Bullough noted an improved willingness to listen carefully to other's views and to explore those views in the quest for connections. The diary entries corroborated these observations. According to Bullough, the discussions improved not only because he became slightly more adept in facilitating those interactions as he grew to know the teacher candidates better but also because they were increasingly more inclined to take ownership of their learning. The final class of the term was dedicated to discussing this very issue at length. "The class," to Bullough's delight, "had become more the [teacher candidates'] and less mine" (p. 13).

For Bullough, the self-study process laid bare his vulnerabilities as an instructor, but it was the courage to make his pedagogy vulnerable that encouraged his teacher candidates to do the same with their own educational biographies and, ultimately,

their own learning within the foundations course. "This self-study," he concluded, "helps confirm that the real challenge for foundations of education to become relevant involves bringing biography and history into intimate conversation" (p. 14). By attending to biography, teacher candidates are afforded the space to push beyond the limits of classroom practice. Reflecting on their own interactions with schools, they began to think more critically and powerfully about contexts of practice, to better appreciate how these contexts take shape and how they change. "By comparing and contrasting school experiences, teacher [candidates] may be helped to recognize the limitations of their own views of the world and may confront some of the limitations inherent in training models of learning to teach" (p. 14). Bullough's study illustrates that if, in social foundations courses, we elicit personal stories of teacher candidates' prior schooling and bring knowledge to bear on that experience, "learning to teach becomes a matter of learning *how* to think better about teaching and learning. Thinking deeply, linking biography and history to behold oneself, one's pupils, and teaching and learning more richly and broadly, is the proper aim of educational foundations" (p. 14).

Intimate Conversations Between Educational Foundations and Social Justice

In "Articulating the Purpose of a Social Foundations of Education Course through Instructor Self-Interviews," Philip (2013) presents a vision for the foundations that is rooted in social justice education. The context for Philip's study is a relatively small teacher education program in a very large research university that has a strong focus on social justice. It makes explicit that the educational foundations course must be rooted in the exploration of social justice education and the preparation of teachers for careers teaching in urban schools. The course, which is mandatory, allows teacher candidates to grapple deeply with the historical and contemporary factors that have shaped and which continue to shape educational inequity and injustice in our society. For Philip, this context offered a worrying paradox: his teacher candidates often stated that "they feel that the course played an important role in getting them to struggle with the relations of power that shape education, but they have also stated that they are left with a feeling of uncertainty with respect to how they might address these issues as a teacher" (p. 204). This paradox highlights how intimate the conversation can be between educational foundations and social justice issues, a fact that only reinforces Philip's understanding of the purpose of educational foundations as a means to deeply engage teacher candidates with what it means to teach in a democratic society (p. 204).

In his efforts to explore this intimate conversation and the inherent nuances, complexities, and tensions in educational foundations, Philip developed a novel self-interviewing method adapted to self-study methodology. The method came from Keightley et al. (2012), who suggested that self-interviews can augment the traditional interview process by allowing the interviewee additional time and reflective space to respond to guiding prompts.

As the interviewer, Philip relied on his "knowledge of practice" (Cochran-Smith and Lytle 1999; Loughran 2006) to shape iterative prompts that built on his personal experiences teaching educational foundations over several years, beginning with the widest possible question: "What is the purpose of social foundations and how do you communicate it to your students" (p. 206)? As the interviewee, Philip explored his previous course materials for evidence to answer the question which then produced additional, more specific questions, which he recorded in a separate interviewer notebook. With each new question or prompt, Philip as interviewee was able to reimmerse himself in the course materials, artifacts, and written responses. The process took several days, allowing Philip to question, refine, abandon, rediscover, and generate new understandings of the purpose of educational foundations and his own pedagogical orientations to the discipline. For Philip, this method permitted him the space to comb through previous course syllabi, planning notes, presentation slides, course readings, assignments, personal journals, and teacher candidate course evaluations.

Philip included his teacher candidates in the research process by representing his initial beliefs regarding the purpose of educational foundations and a letter addressed to his teacher candidates. This address was an assigned reading for the final week of the course and helped to guide their reflective activities for the final day of class (p. 209). As part of the self-study, the teacher candidates' feedback on the letter allowed Philip to reflect the degree to which the letter worked to construct a sense of purpose for his educational foundations course. His teacher candidates were "'interactive' partners from the perspective that their struggle with the purpose of [educational] foundations over the years provided a 'primary data source' and the responses written by this particular class of [teacher candidates] to my letter offered an 'interpretation check' for my findings" (p. 216; LaBoskey 2004, pp. 847–848). Here, Philip framed the teacher as "critical friends" in his self-study (Samaras 2011).

Philip's unique self-study process enriched his own pedagogy and illuminated for him and his teacher candidates the complex nature of many arguments central to social foundations including (a) the historical, social, political, and economic processes that have shaped education; (b) how schooling reproduces existing relations of power; (c) how the complexities of power that permeate society play out in each classroom and school; (d) how classrooms and schools provide powerful sites to contest the status quo; and (e) how contradictions in classrooms, schools, communities, and society can drive transformation (p. 210). The study offers an exemplar of how foundations classrooms can integrate the needs and interests of the individual with the civic and social responsibilities that one bears in a democratic society. Self-study enriched the course planning and delivery, once again dissolving the division between educational theory and practice.

Similarly, Brian Sevier (2005) studied his experiences teaching an educational foundations course to better understand the relationship between his personal beliefs about socially just forms of pedagogy and his teaching practice. Over the course of single semester, Sevier conducted a self-study during a required course for all teacher candidates pursuing teacher certification at his university entitled "School, Culture, and Society." From his teacher candidates, he collected the results from two

anonymous questionnaires, completed coursework including journals and short papers where teacher candidates were invited to critique the course as well as their own lived experiences in K-12 education. Sevier also coded and analyzed the transcripts from videotaped class meetings as well as his own personal teaching journal.

Sevier deemed his educational foundations course to be the perfect environment for a study into culturally relevant and transformative pedagogy because the course is meant to allow preservice teachers the opportunity to investigate, analyze, and expose dominant assumptions about education in the United States. In particular, they are challenged to recognize and identify inequalities in schooling and society and to start thinking about ways they can, as future teachers, confront those inequalities. This lofty goal presents logistical problems, none more challenging than the limited time allotted for instruction – the instructor met with teacher candidates once a week for 15 weeks. Sevier, therefore, favored depth of inquiry and reflection rather than breadth, focusing the course specifically on the relationship between social class and schooling.

Sevier makes three broad arguments. The first posits that understanding teachers as transformative intellectuals is the best way for preparing preservice teachers to work for social justice within schools. He situates this position within a conceptual framework combining cultural relevance and transformative pedagogy theory. Pointing to Gloria Ladson-Billings (2001) who describes culturally relevant teaching as aiming "to empower students to critically examine society and to work for social change" (p. 202), Sevier argues the classroom then "becomes a place where teachers allow students' diverse cultural experiences to reveal the negative effects of the dominant culture. This process, in turn, leads to collective and emancipatory action" (p. 350). He also builds on the work of Stanley Aronowitz and Henry Giroux (1993) and other critical pedagogy theorists who consider teachers as transformative intellectuals who create classrooms "where students simultaneously participate in the examination of social injustices and in the struggle to overcome them" (Sevier 2005, p. 351).

To help the teacher candidates in his educational foundations course move in this direction, Sevier discovered that it is necessary to invite them to reflect on their own histories with K-12 education and how they experienced inequalities in school life, which he presents as his second key finding. Teacher educators need to continually interrogate the effect of their personal experiences and histories on their classroom practice. Sevier's self-study revealed how important it is for teacher educators to "find the means to not only convince [teacher candidates] of the realities of schooling inequities but also to enable them to begin to think of themselves as agents of change" (2005, p. 349).

Finally, Sevier argues that teacher educators must "genuinely seek to use teacher education to provide models of the socially aware practices we hope our students will undertake" (p. 349). This is perhaps Sevier's strongest argument but the most difficult to achieve. Modeling culturally relevant pedagogy is the key. Through trial and error in his self-study, Sevier worked toward authentically modeling how teachers can and should assume civic responsibility.

For the teacher candidates, the course challenged them to think critically about the generally unqualified acceptance of the equality of public schools and move toward a more nuanced view of the reality of K-12 education in American society with historical precedents and contemporary relevance. For Sevier, the self-study experience illustrated his own growth as a teacher. "My journey," he reports, "represents a movement from a pedagogical position where student blame justified ineffective teaching to a more critical/reflective stance that enabled me to begin to conceive of ways to make this course relevant and purposeful" (pp. 372–372).

The self-study process allowed Sevier to recognize the split between his theoretical beliefs about teaching and his practice in the foundations course and channel his teacher candidates' personal histories in order to successfully model culturally relevant and transformative practices. He was then able to draw three key conclusions. The application of rigorous self-study methods to the delivery of an educational foundations course led Sevier to believe that "the changes in [his] instructional practices will help students to begin to understand the privileges inherent in their educational histories, to comprehend the (often) harsh realities of public schools, *and* to realize that there are groups and individuals dedicated to working for change" (p. 372).

Conclusion

In isolation, each of the aforementioned self-studies makes unique and significant contributions to our understanding of the nuances of educational foundations courses in teacher education programs. What binds them together is a tacit argument for the critical role the field plays in the development of new teachers. By providing empirical data through self-study methods, these studies bolster the argument that a reflective grounding in educational foundations prepares future teachers with far more than mere classroom training and thus deserves a prominent place in teacher preparation programs. These self-studies represent an additional bulwark against those critical of the field by helping to build a body of empirical literature revealing the purpose and positive benefits of educational foundations courses in teacher education programs.

Educational foundations courses are critical in the development of future teachers if value in teacher education programs is placed on education rather than mere training. "To be trained is to be able to perform actions that assure a predictable outcome. To be educated is to be able to find and test meaning—to think—a about the ill-defined problems of teaching in ways that enable productive problem solution or evasion" (Bullough 2008, p. 6). Foundations scholars have often, if not always, found themselves under pressure to defend their disciplines or demonstrate their value to teacher education, often in terms antithetical to the core of their disciplines. "The case for foundations," according to Bullough (2008), "hinges on education, not training, and therefore a different argument for relevance is required" (p. 6). Since the time of their formal inception at Teachers College in the 1930s, the foundations have been able to help teacher candidates "make informed and ethical

choices within their educational practice" and "to understand the consequences of their actions as educators" (Tozer and Butts 2011, p. 4). For many, the belief that "teachers should be intellectually and pragmatically engaged in the continual formation of a democratic society" (Philip 2013, p. 203) remains a pillar upon which teacher preparation programs are built, and educational foundations courses are the cornerstone of that groundwork.

If education, rather than training, is the goal of teacher preparation; if we are to encourage teacher candidates to think critically about themselves as teachers and about the school systems they aim to enter; if we want teacher candidates to think about, not merely read, John Dewey, Lev Vygotsky, or Paolo Freire; and if we want to produce reflective classroom practitioners that can problem-solve and effectively orientate themselves in the present and future – defined by historical consciousness (Seixas 2015) – then we must continue to agitate for the inclusion of rigorous education in the social foundations of the teaching profession. The self-studies discussed in this paper are critical arrows in the quiver. They arm us with the empirical evidence that bolsters the case for relevancy and legitimacy. But we need more. Self-studies can open up a diversity of important and vital intimate conversations within the field of educational foundations in teacher preparation.

Abstract

Self-study of teacher education practices (S-STEP) within practicum contexts is still an underrepresented area of research. This chapter revisits and builds upon the practicum-focused chapter from the first volume of this international handbook exploring mainly why the practicum is still a less explored area in the S-STEP community, followed by how teacher educators/researchers facilitate an S-STEP approach to practicum. The exploration begins by examining the challenges of using S-STEP, reviewing the conditions necessary to facilitate S-STEP

in practicum settings, and providing arguments that these conditions are difficult to achieve by initial teacher education programs in general. The traditional nature of practicum and university settings, the general lack of support for initial teacher education programs within universities, the absence of the university instructor, and the pressure of a climate of criticism and conflicting demands that schools face all contribute to the challenges related to conducting S-STEP in a practicum setting. Lastly, the chapter offers suggestions that may enhance a self-study approach to practicum, where the involvement of university instructors features prominently.

Keywords

Self-study · Teacher education · Practicum · Teacher educators · Learning-to-teach process

Introduction

The "practicum" or "in-school experience" (Crocker and Dibbon 2008, p. 32) component of initial teacher education (ITE) programs plays a critical role in the learning-to-teach process of teacher candidates. This in-school experience component usually includes opportunities for teacher candidates to become part of a classroom and school community where they "typically engage in observation and teaching under the guidance and supervision of the classroom teacher, the associate teacher" (Petrarca 2010, p. 31). We realize these initial and rudimentary descriptions of the practicum within ITE programs are quite simplistic; however, they are used merely to establish, in basic terms, a common language as we begin the chapter. As the chapter progresses, we unpack the practicum by providing a deeper description of various models, as well as an overview of the goals and desired elements of practicum experiences. Throughout, we acknowledge the complexities and challenges, along with the potential of the practicum to shape teacher candidate learning both positively and negatively. We accept the premise that in general self-study of teacher education practices (S-STEP) terms, "The potential of the self-study of teacher education has been recognized in the literature over the last decade, pointing to its key role in understanding and challenging teacher education programs, processes and practices" (Flores 2016, p. 215) including its role in enhancing practicum experiences as teacher candidates learn to teach.

This chapter builds upon the work of Beck et al. (2004) from the *International Handbook of Self-Study of Teaching and Teacher Education Practices* (2004). In *The Preservice Practicum: Learning Through Self-Study in a Professional Setting*, they argued that "a self-study approach has the potential to significantly enhance the preservice practicum" (p. 1259). They suggested that a self-study approach to practicum could cultivate a learning environment for *all* individuals involved in the practicum, including associate teachers (also referred to as mentor, host, or cooperating teachers in the literature), university faculty, practicum supervisors, staff, and teacher candidates.

Upon examining Beck et al.'s (2004) arguments via post-2004 literature related to S-STEP and practica, we realized immediately that there still exists a lack of self-study of teacher educators within the practicum context. For example, up until a special issue of *Studying Teacher Education* edited by Thomas (2017a), Thomas (2017a) found that very few studies in the S-STEP literature focused upon teacher educators learning in practicum. Educators recognize that the practicum is integral to teacher education; it has been studied from the perspectives of "teacher candidates, associate or cooperating teachers and supervisors. However, few self-studies have focused on teacher educator learning from examining the practicum experience, apart from Bullock (2012) and Cuenca (2010)" (Thomas 2017a, p. 123).

We also realized that certain factors identified by Beck et al. as challenges to preventing S-STEP from occurring within the practicum still exist despite the potential of self-study to be "the single most significant development ever in the field of teacher education research" (Zeichner 1999, p. 8). Given the immense potential of self-study (Zeichner 2007; Flores 2016), we explore in this chapter why there is still a lack of S-STEP on practicum.

The underlying questions guiding this exploration and analysis of the literature for this chapter, then, are twofold:

1. Given the potential of self-study to enhance teacher education, why is the practicum still a less explored area in the S-STEP community?
2. How can we, as teacher educators/researchers, facilitate an S-STEP approach to practicum?

We explore these questions by first providing a brief and broad overview of the dimensions of self-study, followed by a description of constructivist position of learning. Next, the challenges identified by Beck et al. (2004) 15 years ago that hinder the implementation of S-STEP in practica, as well as the conditions necessary for taking a self-study approach within the practicum, are revisited. Finally, recent examples from the S-STEP and other literature on teacher education regarding how to support and augment S-STEP are considered.

Part 1: Why Self-Study in Teacher Education?

What Is Self-Study?

Pithouse et al. (2009) noted that defining self-study in teacher education is not an easy task. Self-study has been explained as a "study *of* the self and [a] study *by* the self" (Beck et al. 2004 p. 1250) and "the object and instrument of research" (Mena and Russell 2017, p. 107), to understand practice and to develop greater perceptions and improvements (Mena and Russell 2017). While approaches to self-study diverge (Berry and Loughran 2002; Tidwell 2002; Bass et al. 2002; Vanassche and Kelchtermans 2015), one constant remains: "the emphasis is on placing teacher educators' knowledge and practice at the center of their academic work" (Loughran and Russell 2002, p. i).

In their systematic review of the self-study literature between 1990 and 2012, Vanassche and Kelchtermans (2015) found that research methods applied in the field of self-study vary broadly. For example, research methods within an S-STEP framework may include interviewing, personal experiences, participatory approach, communities of practice, arts-based inquiry, and co/autoethnography (Lassonde et al. 2009) to name a few. The underlying purpose of self-study, however, centers on "articulating and refining one's professional expertise and understanding of teacher education practices" (Vanassche and Kelchertmans 2015, p. 516).

Loughran (2004), a long-time proponent of self-study, succinctly captures the potential opportunities of engaging in self-study:

> . . . [it] allows teachers and teacher educators to maintain a focus on their teaching and their students' learning – both high priorities. At the same time, self-study also offers opportunities to improve teacher education through an application of the learning about teaching practice. (p. 31)

Research characteristics include the use of qualitative methods, the use of collaborative interactions as central role, and an authentication "based on trustworthiness" (Vanassche and Kelchertmans 2015, p. 508). They support Clandinin and Connelly (2004) in that self-study research results in changes in the self "where change is least likely, but most apt to occur" (p. 520) and a further result of "having an impact on the field of teacher education practice and scholarship" (p. 520). Vanassche and Kelchtermans (2015) continue that, additionally, researchers must show how their self-study findings connect with public issues and concerns.

Beck et al. (2004) identified the five main components of self-study as (1) personal involvement, personal narrative, and building on the past; (2) inquiry, critical, and constructivist; (3) inclusive and equitable; (4) collaborative and communal; and (5) experiential and practical (pp. 1261–1264). The work of Samaras and Freese (2006) have determined five "central characteristics of self-study: 1) situated inquiry; 2) process; 3) knowledge; 4) multiple in theoretical stance, method and purpose; and 5) paradoxical individual and collective, personal and interpersonal, and private and public" (Samaras 2010, p. 70). Mena and Russell (2017) identified five commonalities for self-study approaches not unlike those noted by Beck et al. (2004): "1) initiated and focused by the individual studying personal practice; 2) aimed at improvement and development of new knowledge of practice; 3) undertaken interactively and in collaboration with others; 4) using multiple research methods; and 5) demonstrating methodological rigor and trustworthiness" (p. 107). As seen in the varying characteristics outlined above by different authors, there still exists cohesion within each grouping and among the three examples.

Why Take a Self-Study Approach to Practicum?

Given the objectives of self-study as described above, perhaps we need to reframe the question as, *why would we not take a self-study approach to practicum*? As the

emphasis of self-study is on understanding the self and practice, for improvement and development purposes (Mena and Russell 2017), the practicum – a complex and multifaceted element of ITE programs – seems like a ripe breeding ground for self-study to flourish. To set the stage to investigate this question, we now explore the complexity of the practicum in greater detail by first reviewing a constructivist perspective on learning and the "learning-to-teach" process in order to contextualize the learning in practicum.

Part 2: What Is Learning in Teacher Education?

What Is Learning?

Beck et al. (2004) positioned their chapter within a "personal-constructivist-collaborative" (p. 1261) perspective, rejecting the "technical-transmission" approach, whereby individuals merely apply knowledge cultivated in university to a professional context. We too position ourselves and this chapter within the constructivist learning perspective, described by Jonassen et al. (2000), as "an ontology, epistemology, and phenomenology that is built on a sense of individual and social responsibility, a recognition of the variety and dynamic nature of beliefs, a commitment to self-determination, and the perspective that understanding is what learners seek" (p. 107). Knowledge is seen as complex, dynamic, and not an entity to be transmitted but, rather, as constructed and enhanced when constructed with others. Jonassen et al.'s (2000) description of learning as "meaning making (i.e., meaningful learning) involves willful, intentional, active, conscious, constructive practice that includes reciprocal intention—action—reflection cycles" (Jonassen et al. 2000, p. 111) aligns well with a self-study approach to practicum.

While self-study as a distinct research field evolved from teacher inquiry, reflective practice, and action research, it is unique due its emphasis on the self, which differentiates S-STEP from these related yet distinct research methodologies (Samaras and Freese 2009). Samaras and Freese (2009) eloquently describe the subtleties of a self-study approach that differentiate it from other methodologies and connect to constructivist principles:

> Another important difference is that self-study focuses on improvement on both the personal and professional levels. Self-study builds on the personal processes of reflection and inquiry, and takes these processes and makes them open to public critique. Self-study is not done in isolation, but rather requires collaboration for building new understandings through dialogue and validation of findings. Self-study research requires openness and vulnerability since the focus is on the self. And finally, self-study is designed to lead to the reframing and reconceptualizing of the role of the teacher. (p. 5)

Jonassen et al. (2000) show that interconnectedness of intentional and active reflective practice is required for learning to occur. When coupled with revisiting and reframing perceptions from previous experiences, prominent learning occurs. These features, intentional and active reflective, are found in the self-study process
(as illustrated in Fig. 1). Figure 1 also reflects how Martin and Russell (▶ Chap. 35, "Advancing an Epistemology of Practice for Research in Self-Study of Teacher Education Practices") describe S-STEP in an earlier chapter of this volume. They suggest that S-STEP is a "metacognitive and reflective practice conducted by teacher educators learning from experience" (p. unknown). The metacognitive and reflective process implies intentional and cyclical actions by teacher educators participating in self-study, to think about their own thinking or awareness. From a constructivist perspective, the ultimate and underlying goal of intentional reflective practice is meaning making (Jonassen et al. 2000), and within a self-study approach to practicum, the ultimate and underlying goal of the cyclical and intentional reflective practice is meaning making within the practicum – critical for teacher candidate growth. These features are found in the self-study process.

Russell (2017) stresses the importance of taking a metacognitive approach within the professional learning context: "Without metacognitive supports, there is a danger that practice could plateau as candidates continue to work within familiar and unexamined frames of understanding" (p. 197). The considerable overlap of a constructivist perspective on learning processes with an S-STEP approach to practicum furthers the argument that a self-study approach to practicum enhances the learning process within the practicum experience for everyone involved. This is not easy, however, as we will demonstrate in subsequent sections of this chapter. To situate S-STEP and learning within the practicum, we now describe the learning-to-teach process to appreciate fully the complexity and multifaceted nature of practicum, which contribute to the challenges related to taking a self-study approach to practicum.

Learning-to-Teach Process

Teaching is often regarded as less-than-complex or as a simple transfer of knowledge from an expert to a novice (Labaree 2000); however, the process of learning to teach begins when prospective teachers enter schools and classrooms as young students and remains a complex and lifelong endeavor.

The learning-to-teach process begins at the onset of one's formal schooling experiences (Lortie 1975). Teacher candidates who enter ITE programs bring with them thousands of hours observing their teachers from the student perspective, a phenomenon coined by Lortie (1975) as the "apprenticeship of

observation" (p. 69). This apprenticeship, however, is not truly an apprenticeship, as:

> Teachers are not explicitly trying to teach students how to be teachers. Teachers try to teach a curriculum that may include both subject-matter content and cultural socialization skills, but they are unlikely to include any explicit lessons about pedagogy. Thus the effects of the apprenticeship of observation are an unintentional yet powerful by-product of mass schooling. (Bullock 2011, p. 16)

For example, students may not be aware of the hours teachers spend in planning instructional experiences or assessing student work behind the scenes. Students are not privy to the numerous decisions teachers make on a daily and ongoing basis ranging from how to frame particular questions or how to prevent or manage disruptions or any of the other many, tacit decisions teachers make routinely (Lortie 1975).

Initial Teacher Education Programs

Much has been written about the "best" ways in which prospective teachers are *educated* to teach ranging from programs with a high practice orientation to more theoretical (Kitchen and Petrarca 2016). Feiman-Nemser (2001) identified "central tasks of learning to teach" (p. 1050) at various stages of the formal teacher career trajectory, including initial teacher education, induction for new teachers, and professional development. Along this continuum, Feiman-Nemser (2001) identified several *tasks* as central to the learning-to-teach process within the ITE program stage of journey. She suggested that during ITE programs, teacher candidates should have opportunities to:

- Examine their personal beliefs about visions of teaching and learning.
- Develop an understanding of content areas (in subjects), learners, learning, and diversity-related issues.
- Develop a "beginning repertoire" (p. 1018) specific to teaching and learning.
- Develop "the tools and dispositions to study teaching" (p. 1050).

Darling-Hammond and Baratz-Snowden (2007) summarize the complexities of the learning-to-teach process, in their framework for learning to teach:

> . . .new teachers learn best in a community which enables them to develop a vision for their practice; knowledge about teaching, learning, and children; dispositions about how to use this knowledge; practices that allow them to act on their intentions and beliefs; and tools that support their efforts. (p. 120)

As highlighted by both Feiman-Nemser (2001) and Darling-Hammond (2006), learning about teaching is an ongoing and complex process that requires both the disposition and the means to examine personal practices, understandings, and beliefs. These are all key facets of self-study (Loughran and Russell 2002), in which knowledge and practice sit at the center of our academic work.

Practicum

While we began the chapter by describing practicum as the "in-school experience" (Crocker and Dibbon 2008, p. 32), we realize this is a simple and one-dimensional portrayal of what is truly a critical, complex, and multifaceted component of ITE programs.

The concept of an ITE practicum may seem straightforward to an outsider; teacher educators recognize that it is fraught with complexities and conundrums that have the potential to shape teacher candidate learning both positively and negatively. Berry (2007) acknowledges that "teacher educators who engage in the self-study of their practices recognize teacher education as an enterprise that is fundamentally problematic by virtue of the complexity and ambiguity of its various demands" (p. 15). Some of these complexities and demands of ITE programs weave through the challenges identified to suggest that it hampers a self-study approach in the practicum (Beck et al. 2004). In *theory*, the practicum experience might *typically* provide opportunities for teacher candidates to continue to broaden their learning about planning, instruction, assessment, learners, learning, being part of a school community, professionalism, and reflective practice within a classroom and school environment. The diverse manner in which these practicum opportunities are organized, valued, and implemented around the globe contributes to the complexity of practicum and to the conduciveness of taking an S-STEP approach. In their examination of international teacher education programs, Kitchen and Petrarca (2016) positioned approaches to teacher education along a three-pronged continuum of theory, reflection, and practice, noting how depending on the orientation of the ITE program, practicum goals, requirements, and structure will vary greatly:

> Theoretical and behavioural oriented teacher educators may envision the practicum as a laboratory in which one can apply facts, rules, theory, and procedures. Others may view practicum settings as dynamic and presume that facts, rules, and procedures cannot be applied without the development of phronesis. (p. 143)

Such disparity in practica contributes to the multifaceted and complex nature of practicum, which may or may not support the essence of S-STEP – an analysis of self and personal practice (Kitchen and Russell 2012). The diversity in practicum goals found in ITE programs may contribute to the multifaceted and complex nature of practicum which may or may not support the essence of S-STEP – analysis of self and personal practice (Kitchen and Russell 2012).

For example, in a literature review of empirical studies focused on practicum within initial teacher education programs, Cohen et al. (2013) identified 4 broad goals of the practicum within the 113 studies analyzed. They found that the largest grouping of practicum goals in the literature related to the development of teacher candidates' professional abilities (i.e., developing specific instructional strategies and content and pedagogical knowledge), followed by learning about the school environment. The third broad cluster of goals of practicum related to learning about the role of the teacher and learning in general. It is ironic, in that in an era where education systems around the globe are called upon to build "21st century skills"

(Milton 2015) such as creativity and innovation, critical thinking and problem-solving, communication, and collaboration, this was not highly reflected in the literature review. For instance, Cohen et al. (2013) found only 10 studies of the 113 examined that described the goal of practicum as fostering personal growth of the teacher candidate, referencing goals related to critical thinking, problem-solving, interpersonal communication, and self-assessment. The final broad cluster of practicum goals centered on having a positive impact on the school, whereby six of the studies within their literature review identified goals such as providing leadership in particular areas or enhancing student achievement.

Lastly, we cannot ignore the situational influences on ITE programs. "Different educational arrangements for practicum learning are formed by different historical, political and organizational processes in different national settings" (Mattsson et al. 2011, p. 1), and as such, Mattsson et al. (2011) suggest that various models of organizing the practicum learning exist. They also submit that "practicum is often left to chance and that there is a need for improved models, principles and practices to ensure that preservice teacher learning during practicum is supported" (p. x).

By focusing on the notion of *learning within the practicum*, Mattsson et al. (2011) differentiate between models on how practica are organized and models for "certain ways of organizing practicum learning" (p. 9). They identified nine general models to organize practicum learning but stress that these models could also be combined in a variety of ways beyond what is stated below:

1) Master-apprentice model (novice learning from a master).
2) Laboratory model (practicum occurs in a university-created school where teacher candidates work with excellent teachers).
3) Partnership model (careful selection of partner schools/teachers).
4) Community development model (rural settings where teacher candidates help improve schools/teachers by contributing new ideas and pedagogies).
5) Integrated model (shared responsibility by university and communities for teacher education).
6) Case-based model (similar to practices within field of medicine, teacher candidates experience and analyze authentic cases via research, theory, experience).
7) Platform model (flexible framework based on teacher candidates' needs and interest).
8) Community of practice model (teacher candidates work within a "culture of inquiry" and "social praxis").
9) Research and development model (collaborations between universities and communities to enhance research and school improvement) (p. 8–9).

Rorrison (2008), however, argues that while the practicum holds potential for learning, "many learning opportunities are wasted. It seems evident that the practicum is often a time of tension, frustration, misinformation, confrontation, acquiescence and poor communication" (p. 10). Self-study, by its very nature, could be another model for *organizing practicum learning*, and by framing the

practicum in this manner, the self-study approach supports understanding the self and practice, for improvement and development purposes (Mena and Russell 2017), part of which is the intent of the practicum experience.

This approach, however, is demanding as we illustrate in the next section. Before we explore the challenges to implementing a self-study approach in the practicum, we believe it is first necessary to consider the general problems of the "learning-to-teach" process from a broader perspective, some of which may also contribute to and are consistent with general problems of implementing self-study.

Problems of Learning to Teach

Unfortunately, perhaps due to the power of the apprenticeship of observation (Lortie 1975), teaching is often regarded as an easy profession. After decades of working as educators, teacher educators, and researchers, we agree with Darling-Hammond's (2006) position regarding the complexity of teaching:

> Teaching may be even more complex than law, medicine, or engineering. Rather than serving one client at a time, teachers work with groups of twenty-five to thirty at once, each with unique needs and proclivities. Teachers must balance these variables, along with a multitude of sometimes competing goals, and negotiate the demands of the content matter along with individual and group needs. They must draw on many kinds of knowledge – of learning and development, social contexts and culture, language and expression, curriculum and teaching – and integrate what they know to create engaging tasks and solve learning problems for a range of students who learn differently. (pp. 34–35)

Teacher candidates enter ITE programs with their own conceptions of teaching and learning, and suddenly, they are confronted with ideas that do not conform to their conceptions of what teaching is. Many of their ideas (and resultant misconceptions) come from early school experiences where they may have idealized a teacher who may have been attentive to them or guided them at a critical time in their lives, which focused more on teacher personality (Darling-Hammond and Baratz-Snowden 2007). While these experiences are real to their memories, curricular changes, societal changes, and governmental demands have moved beyond their memories which challenge their conceptions. In addition, these teacher candidates may be influenced by teacher parents or immediate circle of seasoned teachers who developed their ideas and received their teacher education a generation or two earlier, when the demands of teaching were different. Teacher candidates, listening to "teaching stories" in their developmental years, are influenced by these and believe these experiences to be true and factual to them in their current teacher education. These preconceptions need to be challenged.

Darling-Hammond and Baratz-Snowden (2007) identified three problems associated with learning to teach: misconceptions about teaching, the problem of enactment, and the problem of complexity. Misconceptions about teaching came into being due to some experiences teacher candidates had as students: some never experienced "purposefully organized experiences with carefully staged supports"

(Darling-Hammond and Baratz-Snowden 2007) so critical to student learning. Others are not aware of the important role of home and community in the lives of students. They believe that a teacher transmits the knowledge and acts as a cheerleader for students, rather than guiding student learning. Unless these misconceptions are dispatched, teacher candidates will carry out these unproductive teaching practices without learning and adopting more beneficial methods. The professional role of a teacher requires a wide variety of skills and an array of strategies to put teaching into action many of which must be used concurrently. This "problem of enactment" (Darling-Hammond and Baratz-Snowden 2007, p. 117) can be addressed "when well-supervised practicum and student-teaching experiences precede or are conducted jointly with coursework" (p. 117), so that teacher candidates "are better able to connect theoretical learning to practice," are "more comfortable and confident in learning to teach, and more able to enact what they are learning in ways that are effective for students" (p. 118). To ensure effective enactment, teacher candidates must see teaching practices modeled to analyze "how, when, and why they work" (p. 118). Skillful coaching from more expert practitioners, experimenting, and reflecting on practice are strongly supported by Darling-Hammond and Baratz-Snowden (2007).

Teaching is complex. Long gone are the days when teachers expounded on a topic. Now, student success occurs when "teachers develop the diagnostic and instructional skills . . . for students who require different approaches or additional supports" (p. 119). With the multiple goals of teachers, the many diverse students, and the required integration of knowledge, "teachers need to learn to analyze what is going on in the classroom and to make sound decisions about curriculum, instruction, assessment, and classroom management in light of the particular students they teach" (p. 119). This is not an easy task especially when one considers today's students and teaching requirements. We next consider the challenges related to not only implementing a self-study approach within the practicum but also to the practicum in general.

Part 3: Self-Study and Practicum

What Are the Challenges to a Self-Study Approach in Practicum?

In their systematic review of the S-STEP literature, Vanassche and Kelchtermans (2015) identified four broad themes that teacher educators typically explored within the self-study literature: (1) pedagogical interventions; (2) disparities between their beliefs about and actual teaching practices; (3) instructional practices related to social justice; and (4) practice within theoretical or philosophical context. There appears to be a distinct absence of a self-study approach within a practicum perspective. Since the practicum plays such a critical role in teacher candidate learning within ITE programs, we are obligated to our teacher candidates – and to their future students – to learn more about how to optimize their practicum *learning*

experience. Self-study is a logical way to do this, although it also complicated and challenging at the same time.

Beck et al. (2004) suggested the traditional nature of practicum and university settings, the pressure to please associate teachers, the absence of university course instructors from the practicum, the pressure of a climate of criticism and control, and the lack of support for preservice education within the university as key challenges thwarting a self-study approach to practicum. We revisit and reframe these challenges within today's context.

Traditional Nature of Practicum and University Settings

Russell (2017) stresses the centrality of the theory/practice divide as a challenge within the practicum, "The tension between the traditional epistemology of the university and the epistemology of learning from practicum experience seems to come to the forefront in every teacher education program and is a particularly significant issue for the faculty supervisor" (p. 201). Beck et al. (2004) also suggested that ITE-on-campus programs usually reflect a technical-transmission approach where "theory is to be learned on the university campus and then applied during the practicum" (p. 1264). Within the practicum setting context, Beck et al. (2004) also describe the traditional nature of practicum settings specific to the selection and preparation of associate teachers. The selection process is often centralized within school boards; universities have little access to reaching out to or inviting and/or selecting associate teachers who model exemplary practices. Typically, associate teachers are selected on availability rather than skill as teachers and mentors. Although the selection process varies among school boards and universities, for the most part, the selection process described in 2004 is typically still the case, almost 15 years later.

After her review of a series of S-STEP papers focusing on S-STEP and the practicum, Pinnegar (2017) captures the messiness of the technical-transmission approach, stressing the complexity and multifaceted nature of the learning-to-teach process, including practicum we described earlier in the chapter:

> My fundamental learning from reading these articles focused on the intractable ***conundrums*** (intricate and difficult problems) of teacher education and teacher educators. The fundamental conundrum is navigating the theory/practice divide. This conundrum is made more difficult when we recognize the other conundrums uncovered as one reads across the set of articles. These include the problematics of structure, the press of experience, the knowledge dilemma, and the complexities of relationship. (p. 211)

Such problematics, specifically the complexities of relationship, feature prominently in the subsequent challenge regarding teacher candidate positioning.

Teacher Candidate Positioning

In 2004, Beck et al. suggested that "student teachers are under considerable pressure to satisfy their mentor teachers, who may be practicing a technical-transmission approach" (p. 1265). Where these associate or mentor teachers conduct, "part or all

of the practicum evaluation ... [they] strongly influence the future employment prospects of student teachers" (p. 1265).

Fast-forward almost 15 years and what Beck et al. (2004) described as the pressure to please associate teachers above still exists. We agree that while teacher candidates do feel compelled to please their associate teachers, the challenge to taking a self-study approach in the practicum encompasses a wider scope of which the pressure to please associate teachers is just one element. We believe such pressure is a portion of the teacher candidates' broader positioning with the practicum. Teacher candidates are often parachuted into a classroom that is ultimately under the associate teachers' control. Mackinnon (2017) reminds us of the "perennial issues associated with learning in a practice environment where teacher candidates can experience vulnerability and uncertainty, where they can be subject to an unequal distribution of power from many sides" (p. 232). Depending on the associate teachers' practices and beliefs, teacher candidates may feel obliged to implement their associate teachers' classroom routines and instructional practices, which at times may not be aligned with the on-campus course work.

In her practicum-based self-study, Thomas (2017b) found, "The Mentor teachers are not always well-informed about current university programs, and not always respectful of what student teachers are taught there, which puts these students in awkward positions sometimes of having to take sides" (p. 173). Mackinnon (2017) echoes this sentiment in describing how teacher candidates "may feel caught between the schools that support their practicums and the universities where most of their courses and seminars are held" (p. 232). Both researchers determined that teacher candidates may experience less-than-ideal positioning.

Bullock (2017) refers to "the tensions teacher candidates feel in experiencing the practicum as a site of performance rather than a site of learning" (p. 179) as *power and performance*. He discovered in his self-study that even in situations where teacher candidates experienced a successful practicum, teacher candidates considered the practicum more of an opportunity to impress the associate teacher who usually provides a final report or job reference given the power differential between associate teacher and teacher candidate.

Lack of Support for Preservice Education Within the University

We now examine specific examples within the overarching challenge of lack of support for preservice teacher education within the university. Specifically, we consider traditional workload models for faculty, the misunderstood nature of ITE programs, lack of faculty in the practicum, and resource deficiencies.

Typically university systems value impact factors, publishing in top-tier journals, obtaining funding, and citations more than teaching and service, which are often inextricably linked in ITE programs. As a result, professional programs such as ITE programs do not fit neatly within the university priorities. Most comprehensive universities hold tightly to the 40% teaching, 40% research, and 20% service expectations of tenured and tenure-track faculty. Given the oftentimes, inseparable teaching/service/research work of ITE program faculty, the deeply embedded

university models for faculty expectations do not usually support or benefit ITE program faculty and the teacher candidates with whom such faculty work. We now provide specific examples of the general lack of support for preservice teacher education programs within the university.

Similar to Beck et al.'s (2004) observations, tenured and tenure-track professors who teach and research teacher education *still* typically do not supervise teacher candidates in the practicum for various reasons but usually due to limitations related to the workload. For example, some universities might consider practicum supervision as a form of "service" within a faculty member's teaching, research, and service requirements rather than part of teaching workload. This could also mean that the faculty member would still be required to teach a full complement of courses, conduct research, and supervise teacher candidates in the field – in addition to other service components that other faculties/schools within the university may not require. It is not uncommon for ITE programs to liaison with organizations external to the university such as ministries of education, teacher federations, accreditation bodies, and other local teacher stakeholder groups. Teacher candidate supervision is extremely time intensive requiring the supervisor to communicate with teacher candidates, the practicum coordinator/director, and associate teachers on a regular basis. In addition, the university supervisor must visit school sites, observe lessons, provide teacher candidates with feedback, write reports, and follow up as necessary. If a teacher candidate is struggling, then the time commitment increases significantly. Based on traditional distributions of workload, the university values service to the university much less than teaching and learning as seen in the 40%, 40%, and 20% allocations to teaching, research, and service, respectively. In some instances, depending on the university, supervision of teacher candidates might be considered part of the "teaching" allocation of workload; however, this supervision is usually not the norm.

The resulting shortage of university course instructors who actually spend time in the practicum with the teacher candidates discourages S-STEP from occurring in the practicum. Beck et al. (2004) noted that ITE programs typically rely on retired school administrators or teachers to serve as faculty advisors to teacher candidates while in the field. This limits an S-STEP approach to practicum from occurring since many of these part-time or nontenured/tenure-track course instructors do not participate in research activities. In addition this practice (hiring these course instructors) often prevents the cohesion and coherence needed within the ITE program. For example, in our own ITE program experiences, we have observed the model of teacher candidate supervision where there were not enough faculty-based program instructors either willing or available for field supervision, and external retired school administrators and teachers filled this necessary gap. Although attempts were made by the ITE program coordinators to share course and program philosophies and content with the hired university supervisors, year after year, we would hear some frustrations from our teacher candidates regarding the inconsistencies regarding the activities and the expectations from the field supervisors. While some supervisors would make concerted efforts to understand the underlying constructs that guided the ITE program course work, others did not, and in a few instances, the occasional rogue university supervisor would make

demands on the teacher candidates that did not reflect the pedagogies, foci, and underlying vision of the ITE program. In such instances the university supervisors lacked clarity of the ITE program on-campus courses; however, ITE program instructors might also lack clarity regarding the practicum learning experiences.

Since the 2004 edition of this handbook on self-study, few studies within the S-STEP body of research focus on teacher educator learning within the practicum context (Thomas 2017a; Vanassche and Kelchertmans 2015). For various reasons as described in the previous section, the lack of support for preservice teacher education within the university may be one reason for the noticeable absence of tenured/tenure-track faculty in the practicum. In other instances, faculty roles and responsibilities within the university shift. For example, Bullock (2017) describes, "Although I once had considerable involvement in the practicum as a doctoral student with responsibilities for practicum supervision, each of my subsequent academic positions have found me further and further removed from the complexities of practicum supervision" (p. 181). As a result what could be strong contributions to the body of teacher education literature made by the self-study community are lacking.

A reduction of resources is another example of the lack of support for preservice teacher education, as seen in the targeted cuts affecting Ontario's ITE programs. The majority of the authors in *Initial Teacher Education in Ontario: The First Year of Four-Semester Teacher Education Programs* (Petrarca and Kitchen 2017) stated that a key challenge in implementing the new Bachelor of Education program in Ontario, Canada, in 2015 was financial in nature. With reduced provincial funding and with student admissions, financial constraints often prevented release time for associate teachers to work with universities in order to foster collaborative partnerships. Associate teachers may have varying levels of commitment or experience in implementing their role, and the ITE program must provide supports in this case for university partners. Petrarca (2014) noted that this is not always an easy task. Although the literature has documented the benefits of providing informal and formal supports for associate teachers (Broad and Tessaro 2010; Beck and Kosnik 2000; Darling-Hammond 2006; Levine 2006), "a lack of resources, including time, finances, willingness, and human capacity often prevent pre-service teacher educators from providing these critical partners with support and opportunities to learn about the important associate teacher role (Beck and Kosnik 2000; Coulon 2000; Hastings and Squires 2002; Kahn 2001; Kent 2001; Ramanathan and Wilkins-Canter 1997; Veenman et al. 2001)" (Petrarca 2014, p. 2).

Pressure in a Climate of Criticism and Conflicting Demands

Implementing self-study within practicum is challenging in a climate of criticism and conflicting demands by government and the general public. In 2004, Beck et al. described the pressures teachers and schools face in general resulting in more of a technical-transmission approach to teaching and learning. To this day teachers and schools still face criticism since generally the public wants ways of teaching that are familiar to them. Although the government and public want problem-solving, critical thinking, and twenty-first century skills "taught" in schools, they still demand higher scores on standardized tests; these tests often reflect a technical-transmission

approach to teaching. The multiple and oftentimes conflicting demands placed on classroom teachers create additional tensions within their own practice. Alice Pitt (2011) summarized such challenges for initial teacher programs and teacher candidates:

> 21st-century teaching means pressing even harder against the strong tides of tradition that painstakingly built the schools where our future teachers formed their own understanding of what school is like. The dilemma for pre-service programs is to prepare future teachers for schools as they currently exist while also enlarging their vision about what schools and public education might, should, or will become. (para. 2 & 3)

Thomas (2017b) found that classroom teachers are "already very busy and stressed" (p. 173) and ultimately "responsible for the pupils in the class and answerable to parents and the administration, so they get frustrated with student teachers who struggle" (p. 173). Ideally, we would want associate teachers to participate in S-STEP activities in the practicum; however, is it a realistic consideration given the busyness of classroom teachers?

We have identified some of the challenges to implementing a self-study approach to practicum and now revisit some conditions identified by Beck et al. (2004) to support an S-STEP approach to practicum.

What Is Necessary for Fostering a Self-Study Approach in the Practicum?

Beck et al. (2004) identified the importance of the following four conditions for a self-study approach within the practicum to occur: (1) practicum and campus program integration, (2) satisfactory practicum settings, (3) appropriate practicum activities, and (4) support for teacher candidates (Beck et al. 2004, p. 1266) which will be considered with conditions and examples from the S-STEP and non-S-STEP literature post-2004 that support our colleagues' arguments.

Integration of the Campus Program and Practicum

Beck et al. (2004) recommended several approaches as potentially helpful in facilitating the integration of campus programs and practica. Such approaches included building strong school/university partnerships; assignments that connect course work and practicum; university instructors engaged within the practicum; a cohort and faculty team structure; having the practicum spread throughout the program; and an overarching philosophy of teaching and learning that underpins the program including the practicum. We believe that if several key conditions are in place, the other elements that facilitate the integration of the on-campus and practicum settings will follow. We specifically focus then on an overarching philosophy of teaching and learning, building partnerships, and having university instructors involved in the practicum.

Beck et al. ([2004](#)) suggested that ITE programs with an *overarching philosophy of teaching and learning* that serves as the foundation for ITE program activities could also contribute to enhance integration of the on-campus and practicum programs. Consistent with findings of exemplary ITE programs that have a strong vision of teaching and learning that grounds all aspects of their work (Darling-Hammond and Baratz-Snowden [2007](#)), Petrarca and Kitchen ([2017](#)) note:

> A vision, a description of how an organization envisions "its ideal future goal" (Kopaneva and Sias [2015](#), p. 359), plays a crucial role in guiding the actions of an organization towards its desired goal. Feiman-Nemser ([2001](#)) asserts that "a guiding vision of the kind of teacher the program is trying to prepare" (p. 1023) is the foundation for coherent ITE programs. According to Darling-Hammond ([2006](#)), in her study of exemplary ITE programs, a characteristic of effective ITE programs is a "clear vision of good teaching [that] permeates all course-work and clinical experience." (Darling-Hammond [2006](#), p. 46) (p. 23)

Leslie et al. ([2017](#)) described their attempts at increasing coherence and integration between courses and practicum settings by cultivating a "cohesive vision of teaching across faculty, teacher candidates and associate teachers" (p. 100) via an associate teacher professional development project. The project enhanced relationships between the university and school partners and provided support and opportunities for associate teachers to reflect on their role in working with teacher candidates. One associate teacher from this projected commented:

> When we take the time to step back and really think about what we're doing and to offer some strategies and some tools and things like we're doing in the workshops, I think it gives associates some time to really reflect on how they're doing in their role. They wouldn't be able to do that otherwise. Nobody has time to do that in their daily lives and jobs. I think it really attaches an importance to the role that it deserves and that would otherwise maybe go unnoticed. (p. 101)

An overarching vision that includes elements of self-study in teacher education such as those described by LaBoskey ([2004](#)) – improvement, reframing thinking, transformation, and collaborative interactions with colleagues to further knowledge and research – might promote an S-STEP mindset among teacher educators, teacher candidates, and school partners. The previous comment from the associate teacher demonstrates that by making a focused and concerted effort at fostering a cohesive vision throughout the ITE program including school partners, there exists greater potential for building strong school/university partnerships.

Building strong school/university partnerships is one foundational element that contributes to the development of other facets of integration of campus programs and practica, as suggested by Beck et al. ([2004](#)). In exemplary ITE programs, Darling-Hammond ([2006](#)) also found tight connections between courses and between course and practicum experiences, much like Beck et al. ([2004](#)) described as circumstances that would contribute to the integration of on-campus and practicum, thereby enhancing an S-STEP approach to the practicum. While there are several strategies for building strong school/university partnerships, we believe

this condition hinges upon the active participation of university instructors in the practicum.

To build close collaborations between the university and school partners, it is necessary that *university instructors* [are] *engaged within the practicum setting*. In his examination and analysis of university-based ITE programs in the United States, Levine (2006) identified that within exemplary ITE programs, each established "a close connection between the teacher education program and the schools in which students teach, including ongoing collaboration between academic and clinical faculties" (p. 81) even though the "model" programs varied in structure, size, funding, and location. For the tight connections between courses and practicum experiences to flourish, we believe it is essential to have instructors who actually instruct the courses engage in the practicum experience to facilitate the partnership building, integration, and coherence.

Beck et al. (2004) further suggested that assignments connecting course work and practicum, having a cohort and faculty team structure, and having the practicum spread throughout the program could contribute to a more integrated ITE program in general. These activities are easier to achieve if university instructors are engaged with the practicum; these instructors can help teacher candidates make explicit connections to course work and also provide associate teachers with support and information regarding the on-campus component of the program. University instructors involved in practicum would provide more program coherence within ITE as compared to hiring retired school administrators, teachers, or graduate students who only supervise teacher candidates in the field.

The following realization by Thomas (2017b) regarding her previous assumptions about teacher candidate learning brings to light the challenges preventing a self-study approach from occurring in the practicum, as well as the need for more integrated partnerships and involvement by university faculty in the practicum:

> My initial assumption was that students would be able to make links on their own between the theories that we teach in university classrooms and the real-life situations that they would find while on practicum. I assumed that it would be clear to them what they should do in order to facilitate learning and also what to do when things did not work out as expected, based on the information I provided in my classes. I also assumed that mentor teachers and supervisors understood what university-based teacher educators were attempting to explain to student teachers and that they would be able to magically make the links between the two realities. In laying bare these assumptions, I have come to realise that I have understood little about how student teachers actually learn to teach within our programs. I have discovered that much about what has been frustrating to me in the past, such as students claiming that university courses are irrelevant, that they do not learn anything useful when taking them, and that university professors are not connected to reality, can be explained by my lack of understanding about the way student teachers experienced the practicum. (p. 170-171)

One example of increasing supports for teacher candidates and enhancing communication with associate teachers is Brock University's coupling of a foundational education course with the practicum:

> Being able to refer to what [teacher candidates] had learned in the course aided faculty advisors in helping teacher candidates reflect on their challenges during the internship. This

faculty advisor model, also employed in the elementary program, facilitates a trust and growth model of learning for teacher candidate. (Kitchen and Sharma 2017, p. 84)

Over several years of collecting case study data via his collaborative self-study, Bullock (2017) and his team posited that a difficult practicum is sometimes framed as something to survive rather than a situation that can be remedied; that teacher candidates prefer to have frequent, actionable feedback on lessons that they had a significant role in creating and enacting; and that candidates need to feel that their practicum experience has an appropriate amount of autonomy (p. 190). Based on the above hypotheses, Bullock (2017) suggests that the quality of teacher candidate learning within the practicum context is largely dependent on the quality of the relationship with the associate teacher. This stresses both the importance of the practicum setting and the activities that occur within the practicum experience. Bullock (2017) astutely notes, "Given the importance of the practicum for teacher candidates; I ignore – even tacitly – action-at-at-distance forces such as the relationship with cooperating teachers at my own peril" (p. 190).

In their meta-analysis of 2001 to 2013 literature related to teacher candidate supervision, Burns et al. (2016) identify a framework of tasks and practices for consideration when supervising teacher candidates to enhance their learning within the practicum. One of the five key tasks emerging through the meta-analysis focused on the need for "engaging in inquiry or self-study and innovation to enhance supervision" (p. 419). The authors' analysis reveals that self-study (using various methods) within the practicum context supports the growth and learning of the university supervisor and thereby their students' learning:

> Within self-study, supervisors ask questions about practice, engage in reflective writing, audiotaping/videotaping and transcribing conferences with PSTs [Preservice Teachers], write cases, highlight tensions between espoused platform and platform in use, reflect on personal biography (i.e., past experiences, culture, etc.), identify patterns in supervisory beliefs and practices, and present self-study findings with other supervisors. Engaging in self-study can strengthen supervisory practices. Supervisors can grow in their ability to attend to ethical dilemmas related to their supervisory practice, coach PST reflectivity (Montecinos et al. 2002) and address issues of coherence. (Beck and Kosnik 2002) (Burns et al. 2016, p. 419)

The integration of the on-campus and practicum components of initial teacher education is complex and, we believe, the cornerstone to achieving an S-STEP approach to practicum. If, for example, the strategies discussed in this section were applied to the practicum, then the additional conditions such as satisfactory practicum settings, appropriate practicum activities, and support for teacher candidates (Beck et al. 2004) would more than likely emerge as a result of the tight coherence and integration between the on-campus program and the practicum settings. In order for this integration to occur, all teacher educators must commit the time and energy to the demands of the practicum and the connections with schools, to increase the likelihood of self-study to occur in this under-investigated area of research.

While these integrated components are needed to achieve S-STEP, they are not sufficient. In the next section, we identify additional conditions necessary for fostering a self-study approach in the practicum.

Satisfactory Practicum Settings

Dillon's (2017) integrated practice-and-theory approach to teacher candidates' learning processes, described in his self-study, placed his teacher candidates' experiences at the "centre of the curriculum by focusing on their developing questions, challenges and issues through socio-constructivist discussions of their emerging practices" (p. 145). He concluded that associate teachers have much more influence over teacher candidate learning than his course. "I learned that the greatest influence on candidates' development by far – and virtually the sole influence – is their mentor teacher. This influence is for better or for worse" (p. 158). Echoing this sentiment, Bullock (2017) admits: "It has taken me an embarrassingly long time to realize that, although I am no longer at the forefront of candidates' practicum learning, the spectre of candidates' relationships with their cooperating teachers looms large in my course" (p. 190). This response is not surprising since teacher candidates regard the practicum as the most important component of initial teacher education programs (e.g., Darling-Hammond and Baratz-Snowden 2007; Wideen and Holborn 1990; Wilen and Hawthorne 1975; Russell 2017; Martin 2017). Kitchen and Petrarca (2016) suggest:

> This is a testament to "the apprenticeship of observation" (Lortie 1975), the notion that individuals enter teaching after thousands of hours as students observing teachers. At the same time, as Lortie (1975) also noted, practice without propositional knowledge and deep understanding also leads to misconceptions, most notably of teachers as performers and experts. From this narrow "observational and non-analytical perspective view of practice" teaching falsely "appears to be simple action, guided either by custom (this is the way teaching is done) or by nature (this is the kind of person I am)." (Labaree 2000, p. 232) (p. 144)

Given the overwhelming influence the associate teacher has over the teacher candidate, it is imperative to provide satisfactory practicum settings for teacher candidates. Beck et al. (2004) suggest that satisfactory practicum settings are also a condition that would enhance an S-STEP approach to practicum. Satisfactory practicum settings involve the careful selection and professional development of partnered schools and associate teachers to optimize the learning environment for all involved in the practicum. Again, on the surface, this may seem simple enough, however, developing these settings can be extremely challenging, as described by Darling-Hammond (2006) in her examination of exemplary ITE programs:

> Developing sites where state-of-the-art practice is the norm is a critical element of strong teacher education, and it has been one of most difficult. Quite often, if novices are to see and emulate high-quality practice, especially in schools serving the neediest students, it is necessary not only to seek out individual cooperating teachers but also to develop the quality of the schools so that prospective teachers can learn productively. Such school development is also needed to create settings where advances in knowledge and practice can occur. (p. 309)

Seeking out preferred and suitable associate teachers and schools can be demanding for several reasons. Depending on the school boards, various processes are in place that sometimes prevent ITE programs from reaching out directly to potential schools and

associate teachers. In some instances, the selection process is centralized, whereby rather than requesting individual schools for associate teachers and partnerships, the sometimes competing ITE programs must make such requests through the local district school board. This process certainly makes developing and sustaining strong partnerships between ITE programs and local schools time-consuming and taxing.

In their report for the National Academy of Education, Darling-Hammond and Baratz-Snowden (2007) captured the disparities regarding the role of the associate teacher within practicum settings:

> But the student-teaching or internship experience varies dramatically both within and across programs, depending on how cooperating teachers are recruited and what the expectations are for both the novice and cooperating teacher. The length varies from less than eight weeks to more than thirty weeks, the extent and quality of modeling and guidance from minimal to extensive, and the clarity regarding practices desired from obscure to well defined. (p.123)

In her self-study, Thomas (2017b) confronted her assumptions about what her teacher candidates learned during practicum and discovered that, according to her students, "not all mentor teachers are positive and encouraging" (p.173). The university-based supervisors she interviewed had visited many schools and had seen many practices; they agreed that some practicum settings did not necessarily reflect an environment conducive to teacher candidate learning. Thomas (2017b) summarized the university-based supervisors' comments on settings that were "not necessarily professional. The learning that takes place on practicum is very dependent on the context, and there are many different contexts, some of which are not conducive to learning to be a professional" (p.173).

While these environments are not always conducive to a positive growth in teacher candidates, they are valuable to these future teachers in demonstrating what behaviors and attitudes are not desirable in teachers. A self-study approach to practicum with this experience of teacher candidates, while difficult for teacher educators, would be possible and especially warranted. Examining one's response to the discussion that occurs with the topic of "learning to be a professional" can be telling. If anything, what Thomas's experiences demonstrate is the need for this practice and the need for research on practice.

Appropriate Practicum Activities

Closely related to having satisfactory practicum settings in which an S-STEP approach can occur is what actually happens during the practicum itself. As noted above, teacher candidates need to be exposed to exemplary practice by teachers who can articulate their practice in their classrooms and schools and successfully help the neediest students (Darling-Hammond 2006). As suggested in the previous section, the practicum is largely under the associate teacher's control. Although associate teachers are typically provided with guidelines and suggestions for implementing their role, they may or may not adhere to the suggestions, underscoring the importance of the school/associate teacher selection process discussed. The role of the associate teacher is multifaceted, however, as described by the types of activities that ideally occur within a practicum setting:

> Typically, the ideal has been a placement in which student teachers are supported by purposeful coaching from an expert cooperating teacher in the same teaching field who offers modeling, co-planning, frequent feedback, repeated opportunities to practice, and reflection upon practice while the student teacher gradually takes on more responsibility. (Darling-Hammond et al. 2005, p. 409)

This type of placement reflects the "extensive and intensely supervised clinical work" (Darling-Hammond 2006, p. 300) found in exemplary ITE programs, which also included "tight coherence and integration among courses and between course work and clinical work in schools" (p. 300).

Dillon (2017) observed that university supervisors had little influence on teacher candidates' teaching development as noted in this passage:

> In addition, candidates report that university supervisors do not influence the development of their practice (too few visits, too narrow a focus when visiting). However, candidates want to impress the supervisors – who submit final grades for practicum – in order to get a good evaluation. So they work hard to develop special lessons for the occasional supervisor visits, lessons that are far from their typical teaching. When I did my unofficial observation visits with research participants, i.e. with no official evaluation report, I often saw very ordinary and uninspiring lessons for which candidates usually apologized by saying that that was how much teaching had to be. (p. 158)

Dillon's observation demonstrates the need for helping teacher candidates in reframing their learning and teaching approaches and reinforces the need for careful selection and development of associate teachers and partnered schools so that all parties involved in the practicum experiences can facilitate such framing and reframing discussions – clearly an important practicum activity that is often absent from practicum experiences.

Dillon (2017) also found that in order for teacher candidates to reframe their teaching, they required explicit assistance to make connections between course topics/discussions and their practice. This occurred as a result of the debriefing process after observing teacher candidates teach lessons during practicum, they tended to experience difficulty in analyzing the rationale for successful implementation of a lesson. Dillon (2017) found that at times, there was little carry-over from previous course work or class discussions.

We emphasize again the integration of the practicum, and on-campus program serves as the cornerstone for strengthening an S-STEP approach to practicum. For example, if an integrated approach existed, the enormous value teacher candidates place on the practicum (over course work) (Dillon 2017; Russell 2017) might shift to a more holistic appreciation of the learning-to-teach process. Rather than seeing the tacit (or not so tacit) divide of the perceived theory-on-campus-and-practice-in-practicum ideas, approach, and conceptions, perhaps a more fluid interplay of practice and theory could develop, potentially fostering a newfound appreciation for both.

Teacher Candidate Support

Beck et al. (2004) stressed the importance of teacher candidate support within the practicum especially within an S-STEP approach. They suggested multiple forms coming from fellow students, associate teachers, university staff, and

formative assessments. "Support of student teachers in the practicum and their growth as reflective practitioners are best served by an approach to student teacher evaluation that involves collaboration between university faculty and mentor teachers" (p. 1286).

In his informal and formal experiences working with and observing teacher candidates as a practicum supervisor, Russell (2017) provides personal insights specific to supporting teacher candidates, including the importance of developing individual relationships with his teacher candidates prior to the actual practicum experience:

> Having increased my attention to developing one-on-one relationships before the practicum begins, I was struck by the powerful payoff in terms of candidates' seeing value in my supervisory visits and in the trust they show in their messages to me about their practicum experiences. Insights gained during practicum supervision have been extended by invitations in the following year to observe students informally in local practicum placements. Focusing on improving the quality of professional learning in the practicum and on the possibilities of developing an epistemology of practice has the potential to generate a new set of goals for both formal and informal practicum supervision. (p. 207)

Later he questions a faculty supervisor's major challenges: "Can the teacher candidate who is just beginning to acquire firsthand experiences of teaching be supported in learning to identify, evaluate and ultimately trust what is being learned from experience?" (p. 295). The answer may lie in the support that teacher candidates receive from one another. After encouraging his supervisees to observe one another teach lessons for the purpose of follow-up discussion, Russell (2017) noted that peers provided one another with "a different type of feedback at the right level" (p. 196). By observing one another, teacher candidates also reviewed their own practices, stressing the benefits of support from fellow students as suggested by Beck et al. (2004).

Similarly, in her exploration of how incorporating a listening perspective might improve practicum learning, Martin (2017) highlighted the importance of relationship building with teacher candidates as seen in the following excerpt:

> As I worked through the "take-aways" after reexamining my journal entries and other data sources, I began to see where I could actively construct spaces and push harder at ensuring that candidates' voices were authorized, that their pedagogical voice was heard, and that caring and trusting relationships received the attention they merited and were allowed to flourish. I have also recognized the importance of explicitly modeling relationship-building and explicitly deconstructing what it entails, not taking for granted that candidates will "see it and get it." (p. 140)

This addresses two pieces – the explicitness needed to help teacher candidates make connections and the need for that type of listening to happen in the practicum either by university supervisors, university members who engage in practicum, or associate teachers. Dillon (2017) also discovered in his self-study that teacher candidates required help connecting the dots.

Thomas (2017b) not only learned more about how teacher candidates learn within the practicum experience but also realized the complexities, limitations, and

opportunities embedded within the practicum, which ultimately helped her reframe her instructional role in helping her students "examine and interpret their practicum as a learning experience" (p. 165). By engaging in the practicum via a self-study approach, Thomas (2017b) discovered a greater appreciation of the practicum from a whole program perspective and examined her own relationship with the practicum to best help her students learn from their experiences. She further discovered that teacher candidates required additional time and explicit support to analyze and fully understand their learning.

Conclusion and Next Steps

At the beginning of this chapter, we wondered:

1. Given the potential of self-study to enhance teacher education, why is the practicum still a less explored area in the S-STEP community?
2. How can we, as teacher educators/researchers, facilitate an S-STEP approach to practicum?

Although we are still pondering these questions, we have also gained some insights and additional questions regarding our wonderings. We now summarize our conclusions, ruminations, and queries.

Why Is the Practicum Still a Less Explored Area in the S-STEP Community?

Using Beck et al.'s (2004) practicum-focused chapter from the first volume of this international handbook as a guide, we explored our guiding questions by (1) examining the challenges of using S-STEP; (2) reviewing the conditions necessary to facilitate S-STEP in practicum settings; and (3) providing arguments that these conditions are difficult to achieve by ITE programs in general. The traditional nature of practicum and university settings, the general lack of support for initial teacher education programs within universities, the absence of the university instructor, and the pressure of a climate of criticism and conflicting demands that schools face all contribute to the challenges related to conducting S-STEP in a practicum setting. From a conceptual position, Pinnegar (2017) identified the theory/practice divide as the fundamental conundrum to an S-STEP approach to practicum; however, she acknowledged the related challenges such as "structure, the press of experience, the knowledge dilemma, and the complexities of relationship" (p.215) that add to the complexity of the broader problem.

We wonder, however, if the theory/practice conundrum reflects a "chicken and egg" scenario where the "divide" is really the result of the most prominent issue to the scarcity of self-study within the practicum – *the lack of teacher educators working in practicum settings*. Is it the theory/practice divide that contributes to the

lack of teacher educators working with teacher candidates in the practicum, or does the lack of teacher educator presence contribute to the theory/practice divide? Could the other identified necessary elements such as appropriate practicum activities, teacher candidate supports, and even satisfactory practicum settings flourish by increasing the presence of the university instructors within the practicum and by conducting self-studies in the practicum settings?

Earlier we suggested that the integration of the campus and practicum programs served as the cornerstone to achieving an S-STEP approach to practicum and that if such integration existed, the other necessary conditions for an S-STEP approach might have a greater opportunity to develop. We realize now that any attempt at successful integration truly hinges on the university instructors taking an active role in practicum. By taking an active role in practicum, there exists a greater likelihood of establishing the cohesion and coherence among courses and practicum – a common component shared among exemplary teacher education programs (Beck et al. 2004; Darling-Hammond 2006; Levine 2006). Cohesion and coherence are also paramount for approaching a practicum via a self-study approach. Relationship building between universities and school partners is critical as is cultivating a relationship between university supervisors and teacher candidates (Dillon 2017; Russell 2017). This, however, requires a commitment on the part of teacher educators to undertake a role to foster such relationships. By not being a part of practicum, are teacher educators reinforcing the notion of a theory/practice divide? What is holding teacher educators back from exploring a hotbed for integrated learning opportunities?

Self-study opportunities within practicum exist; however, many tenure-track and tenured faculty members devote the weeks when teacher candidates are off campus and in practicum to work on other research projects. Do these faculty members choose not to work with teacher candidates in the field because of the organizational constraints described earlier? Do these faculty members see their research and instruction as isolated events from the practicum experience? Dillon (2017) suggests "Indeed, it would be rare to find a teacher education instructor who has any awareness of what candidates actually do with the content of his or her course during practicum" (p.161). Alternatively, perhaps university instructors see the practicum as a never-ending complex phenomenon where they exert little influence. Given the incredible importance and value teacher candidates ascribe to practicum, it does not benefit teacher candidate learning for teacher educators to overlook its existence. As Bullock (2017) astutely notes, "Given the importance of the practicum for teacher candidates; I ignore – even tacitly – action-at-a-distance forces such as the relationship with cooperating teachers at my own peril" (p. 190). Investigating potential self-study opportunities within practicum may be an interesting research problem to consider for S-STEP researchers.

Another interesting and potential S-STEP research question related to practicum is the theory/practice conundrum: do initial teacher education programs by virtue of their structure and organization foster and promote the theory/practice divide? In their literature review of 113 empirical studies focused on practicum within initial teacher education programs, Cohen et al. (2013) grouped various functions of

practicum into 4 broad rationales for practicum. The authors identified the largest grouping of practicum rationales as reflecting a "professional training ground" (Cohen et al. 2013, p. 354), where the practicum served as "a reasonable proxy of future workplaces for preservice teachers" (p. 354) and an extension of ITE programs but within the field where prospective teachers would eventually enter. The practicum provides opportunities for teacher candidates to apply research and theory to practice (Cohen et al. 2013) perhaps reinforcing implicit beliefs about the theory/practice divide underlying initial teacher education programs.

We hope this chapter demonstrates that practicum is not a simple construct. Knowledge building is also complex (Jonassen et al. 2000); and coupled, meaning making within the practicum is multifarious; however, *self-study helps teacher educators navigate their learning so that in turn, they are better equipped to help their students navigate their own learning*. We now consider how teacher educators/researchers might facilitate an S-STEP approach to practicum.

Where Do We Go from Here?

If the fundamental purpose of S-STEP is for "individuals to study and better understand their practice" (Loughran 2004, p. 9), then it seems logical that the practicum would serve as an excellent environment for all individuals involved in the experience. Nevertheless, as seen in this chapter, the conditions that would enhance such an approach can be challenging to achieve. A key player in fostering an S-STEP approach to practicum is the university instructor. How might the S-STEP community further expand its breadth and depth within a practicum context? As seen by our colleagues in this chapter, there exist many opportunities for greater understanding of how we might help our students navigate their learning while in our programs. Our suggested next steps include additional queries that teacher educators engaging in S-STEP (or not) might consider for future research.

So why is there still a gap in S-STEP literature specific to practicum? By not focusing or even possibly considering the practicum as a space for S-STEP, do some teacher educators/researchers tacitly (or not so tacitly) subscribe to the theory/practice divide? Do the topics that teacher educators research lend themselves to the practicum experience? Given the tremendous value teacher candidates place on the practicum (often over the course work), we wonder why we would *not* consider the space where our students extend their learning with their associate teachers. How might teacher educators begin to integrate their specific areas of research within the practicum context? How might the topics identified as the key areas of exploration within S-STEP literature as identified by Vanassche and Kletchtermans (2015) extend into the practicum for additional exploration?

For example, how might a teacher educator exploring a pedagogical intervention via S-STEP expand the intervention into the practicum experience? How might teacher educators studying mathematics instructional practice via self-study enhance their learning and their students' learning by inching into the practicum context? How might instructional practices related to social justice trickle into the practicum

context? We intentionally used words such as "inch" and "trickle" to denote the small steps that can be taken to situate S-STEP within the practicum – a context teacher candidates value tremendously and at times at odds with what we do on campus. Even if we are unable to enter the practicum space directly, perhaps we might explore like Bullock (2017) the "the presence of unseen cooperating teachers" (p.181) in our courses.

Darling-Hammond and Baratz-Snowden (2007) suggested elements of successful practica identified in exemplary ITE programs include clear goals and standards that guide teacher candidate practice; repeated opportunities for teacher candidates to practice and make connections between course work and practicum experiences; ongoing formative feedback; modeling of sound practice where expert "teachers make their thinking visible" (p. 124); ongoing coaching; a gradual increase in responsibility for classroom life; and "structured opportunities to reflect on practice with an eye toward improving it" (p. 124). This is certainly a tall order for classroom teachers who host teacher candidates in their classrooms and who are already extremely busy individuals with increasing responsibilities and pressures from governing bodies, their administration, their parents, their students, and the public. Nonetheless, the associate teacher holds a tremendous power in the associate teacher/teacher candidate relationship, and as such, we need to consider ways to capitalize on the classroom teacher's influence, by perhaps reframing their roles as teacher educators in the field or as Forgasz (2017) suggests school-based teacher educators. Clift (2017) also strongly advocates for our field-based colleagues – our associate teachers – to be part of the S-STEP process, as their voices are "noticeably absent" (p. 225) in the limited number of studies that focus on practicum. An integrated approach where university-based and school-based teacher educators (Forgasz 2017) work alongside teacher candidates might facilitate the development of practicum settings that optimize teacher candidate learning. By participating in practicum activities, faculty members not only work with teacher candidates but they work also with classroom teachers who host their students. This creates a space for discussion, learning, and sharing among the triad. In order for this to occur, however, we must consider the organizational constraints preventing teacher educators from working with the practicum.

To establish, grow, and maintain partnerships between practicum and university settings, we require supports from the university. It is easy to attribute the traditional nature of university settings and the lack of support for preservice teacher education programs within the university as reasons for not participating in S-STEP research in practicum. It is much more challenging and exhausting to engage in workload negotiations with administrators or defend the categories (i.e., service, teaching, research, or all of the above) within which working in a practicum setting with associate teachers and teacher candidates sits. In our busy lives as academics, it is certainly easy to toss our hands up in the air and continue to not explore S-STEP within the practicum. How might we resist complacency with the status quo? Depending on the level of faculty member's experience and rank, resisting and taking on the organizational constraints preventing access to practicum may not always be possible. Small and persistent attempts to explore approaches to work

around the limiting factors specific to our higher education institutions might eventually result in changes in how we "do" teacher education. How do we explore approaches to navigate the omnipresent systems preventing easier access to practicum?

By engaging in self-study, teacher educators are able to focus on both their teaching practice and teacher candidate learning (Loughran 2004). By engaging in self-study in the practicum, as seen in examples throughout this chapter, teacher educators gain a deeper understanding of the complexities teacher candidates face within a practicum setting. By gaining a deeper understanding of the complexities teacher candidates face within a practicum setting, teacher educators engage in willful and intentional meaning making (Jonassen et al.'s 2000) via what Kitchen and Russell (2012) described as the essence of S-STEP – analysis of self and personal practice. Outcomes of such analyses of self and personal practice yield contributions not only to the teacher educator researcher's practice but also to the S-STEP community and to the broader teacher education research. We conclude by once again reframing our initial question regarding the noticeable absence of S-STEP research within the practicum context: *why would we not take a self-study approach to practicum?*

Portfolio and Self-Study

An Epistemology of Practice

Introduction

The use of portfolios as a method of documenting learning is a widely accepted and long-standing practice within S-STEP (Lyons and Freidus 2004). Much of the prevailing literature is focused on how portfolios can be used as a teaching practice to facilitate reflective inquiry and formative assessments of learning (Lyons et al. 2013).

Self-study researchers have explored the challenges and benefits of using portfolios in their teaching practice (Bullock and Christou 2009; Dillon 2017; Fuentealba and Russell 2016). A focus on linking theory and practice has emerged as a generative possibility when using portfolios with students. However, few S-STEP investigations consider how portfolios as a programmatic pedagogy can help teacher educators refine their teaching practices to support teacher candidates' connections between theory and practice. We claim that this extension of earlier research on the use of portfolios can contribute to an epistemology of practice (Raelin 2007).

In this chapter, we present a theoretical framework that responds to the call of Lyons and Freidus (2004) for the development of an epistemology of practice as we interrogate how programmatic e-portfolios can provide the structure for reflection on, and integration of, transformative pedagogies. As an example of our own learning, we offer a description of our self-study investigation into the impact of programmatic portfolios on teacher candidates' experiences of linking theory and practice. We conclude with an enhanced call for S-STEP research into practicum.

Background Context

Throughout the development of self-study of teacher education practices (S-STEP), researchers within the community have recognized the value of portfolios as reflective tools. In the inaugural S-STEP Conference at Herstmonceux Castle,

researchers used their own professional portfolios to learn more about instructional development (Wilcox 1996), the portfolios of their teacher candidates to provide insight into experiences and successes (Johnson and Allen 1996; Haley-Oliphant 1996), course portfolios to document personal educational theories (Gipe 1996), and programmatic assessment portfolios to study the implementation impact on faculty, teacher candidates, and program development (Johnson et al. 1996). Indeed, in the first edition of the *International Handbook of Self-Study of Teaching and Teacher Education Practices* (Loughran et al. 2004), Lyons and Freidus (2004) claimed that reflective portfolio inquiry through self-study could legitimate the practitioner as researcher. Through an analysis of three cases, they concluded that the reflective portfolio process scaffolded self-study, privileged practitioner investigations, and contributed to the validity of self-study. They called for a new epistemology of practice and argued that portfolio inquiry could contribute to the validation of practitioner knowledge of teacher educators.

Since 1994, self-study has become established as a valid methodology for teacher educators (Garbett and Ovens 2016), and the use of portfolios has become more widespread within S-STEP as a way of collecting data through student reflections. Self-study researchers have used portfolios as data to assess the impact of a problem-based intervention (Aubusson et al. 2010), to interrogate how students reflect on critical situations (Geursen et al. 2010), to assist students in making their learning visible (Hamlin and Weisner Bryant 2007), to document shifts in professional and personal identities (Kim and Greene 2011), and to support student development of respect and empathy (Kitchen 2005). Much of the literature is focused on how portfolios can be used as a teaching practice to facilitate reflective inquiry and formative assessments of learning (Lyons et al. 2013).

Consistent with research that links the use of portfolios to becoming reflective practitioners, teacher educators have also incorporated portfolios as course assignments. In her self-study, Kosnik (2005) challenged the use of standardized tests within teacher education by proposing the implementation of a teaching portfolio with embedded assessments and studied the impact of national policies on her work as a teacher educator. Olafson et al. (2007) and Donnelly (2006) studied the use of portfolios as assignments within their teaching practice. In the current era in the United States of America, Kelly (2018) has engaged in a self-study on how she has encouraged critical reflection on a state-mandated use of standardized portfolio assessments. What was introduced as a teaching practice to support formative student reflection has been extended to include high-stakes assessments.

More recently, portfolios have been used as sources of data that contribute to trustworthiness, rigor, criticality, and credibility. Some self-study researchers have used their pre-tenure and promotion portfolios as data to study their learning in academia as they document their shifting identities and challenges in negotiating institutional requirements (Butler 2016; East et al. 2010; Garbett 2013; Loughran 2010). Other researchers have created teaching portfolios to help them document and analyze their experiences in transitioning from teacher to teacher educator (Hamilton 2018), their teaching interventions and impacts on student learning (Hill and MacDonald 2016), and their creation of representations of teaching stories

through interactions with critical friends (Bass et al. 2002). Samaras (2011a, b) writes extensively about the use of a Critical Friends Portfolio as a S-STEP method for collecting data to be shared with critical friends. She suggests that this method helps researchers document and provide evidence of the transparency and validation of the data collection and analysis of insights emerging within the subjective stance of the researcher and the objective stance of critical friends. Clearly, the use of portfolios as a method of documenting learning is an accepted practice within S-STEP.

Self-study researchers have explored the challenges and benefits of using portfolios in their teaching practice. A focus on linking theory and practice has emerged as a generative possibility when using portfolios with students. Bullock and Christou (2009) challenge the use of philosophy of education statements included in portfolios as they attempt to disrupt the perceived dichotomy of theory and practice. Dillon (2017) examines his successful and unsuccessful attempts to link practice and theory through the use of a professional teaching portfolio. Fuentealba and Russell (2016) identify the problem that portfolios are often a collection of materials that do not include any detailed analysis, thus not meeting the purpose for integrating theory and practice.

Research investigating the impact of using portfolios in S-STEP and using portfolios as sources of data in S-STEP suggests that portfolios as a teaching practice is ubiquitous. However, few S-STEP investigations consider how portfolios as a programmatic pedagogy can help teacher educators refine their teaching practices to support teacher candidates' connections between theory and practice. We claim that this extension of earlier research on the use of portfolios can contribute to an epistemology of practice.

In this chapter, we present a theoretical framework that responds to the call of Lyons and Freidus (2004) for the development of an epistemology of practice as we interrogate how programmatic e-portfolios can provide the structure for reflection on, and integration of, transformative pedagogies. As an example of our own learning, we offer a description of our self-study investigation into the impact of programmatic portfolios on teacher candidates' experiences of linking theory and practice. We conclude with an enhanced call for S-STEP research into practicum.

Theoretical Framework

Within the field of teacher education, it is widely accepted that the development of teacher candidates' professional practice is of critical importance yet, as teacher educators, we struggle in our understanding of practice and we are limited in how to support its development and specifically its relationship to teacher candidates' learning through teacher education programs. It is through these gaps of understanding how teacher candidates' develop during practicum experiences that suggest we have more work to do so that education coursework (theory) has more influence on their actual execution (practice) as classroom teachers. We begin with addressing the traditional problematic of teacher candidates tending to be socialized into the

status quo of school practice or to simply reproduce their own school experiences (Munby and Russell 1994).

In this chapter, we will attempt to demonstrate how portfolios can assist teacher candidates and their faculty in supporting a more unified approach to theory and practice. This integration (theory-practice) will support increased learning opportunities based on better theory informed by better practice. We make the case that having the teacher candidates systematically chart their development through portfolios can lead to a continuous learning loop that then informs innovative and emerging practice (Raelin 2007).

Theory and Practice Tensions

Teacher education programs tend to be ineffective (Segall 2002). That is, teacher candidates tend not to use the research-based guidelines offered to them in their courses when they subsequently engage in their practicum placements (Clift and Brady 2005). Instead, they tend either to be socialized into typical practices of school or to teach as they were taught themselves, due to the powerful influence of their "apprenticeship of observation" (Lortie 1975) as students in school. The evidence is long-standing (Zeichner and Tabatchnik 1981) and widespread (Clift and Brady 2005; Wideen et al. 1998). The only exceptions to this general trend appear to be programs that can provide a high degree of congruence between the content of course work and the models provided by mentor teachers in their practice (Beck and Kosnik 2001; Darling-Hammond 2006). We believe one approach that can have a significant impact merging the theoretical perspectives of the university with the practical experiences in the schools is through the longitudinal development of the professional portfolio.

Reforms to teacher education have called for extensive practical experience for teacher candidates, and many of these calls have advocated for strong school-university partnerships as a means for providing these. Clinical schools (The Carnegie Forum on Education and the Economy 1986), professional development schools (Holmes Group 1986), and partner schools (Goodlad 1988) are proposed ways of increasing reciprocal collaboration in order to connect theory and practice (Teitel 1998, p. 85). Yet despite these long-standing calls for more extensive and enhanced practical experiences for teacher candidates, recent proposals reiterate the same need. Korthagen et al.'s (2006) development of fundamental principles for reforming teacher education programs begins by highlighting the significance of experience in a program. Darling-Hammond's (2006) conclusions about the nature of effective teacher education programs include as a major component "extensive and intensely supervised clinical work integrated with course work using pedagogies that link theory and practice" (p. 300).

As teacher educators, we feel very fortunate to be active practitioners in a field that has shown a recent interest and special focus on the examination of effective teacher education programs. Research conducted by both Darling-Hammond (2006) and Beck and Kosnik et al. (2006) have yielded considerable insight into the "how"

of better preparing teacher candidates for the changing field of education. These two studies identify some strikingly common themes: an essential need for partnerships between participating communities of practice that support social constructivism; a learning environment that is supportive and representative of all the complex areas of education and is achieved through experiential-, inquiry-, and place-based initiatives that support teacher candidates to take risks and develop a critical and responsive pedagogy; and the need for a deliberate and extensive integration of both curriculum and pedagogy as it relates to the areas of theory and practice in teacher education programs. Since our 4-year teacher education program is in the midst of implementation, we are uniquely positioned to do this research. We are developing our program intentionally around this theoretical framework. Specifically, we are examining how to enact transformative pedagogies, such as professional portfolios, focused on theory-and-practice integration by attending to relationships and critical pedagogy and are investigating the impact of such pedagogies with teacher educators, teacher candidates, and beginning teachers.

Epistemology of Practice

In this chapter, we investigate how one transformative pedagogy (Mezirow and Associates 1991, 1995, 1997, 2000) – the professional teaching portfolio – can be enacted by both the teacher candidate and teacher educator within an epistemology of practice (Raelin 2007) based on reflection (Dewey 1938) that supports a realistic approach to teacher education (Korthagen 2001). The primary questions we attempt to address as teacher educators are: What unique features of the professional portfolio contribute or dissuade an integrated theory-and-practice experience for teacher candidates and teacher educators? This question will be addressed through two sub-questions: (1) What are our barriers and strategic approaches to merging theory and practice through the development of a professional portfolio? (2) In what ways can we support the use of professional portfolios to inform realistic experiences for our teacher candidates?

As teacher educators involved in a new 4-year Bachelor of Education program, we are interested in the possibilities of an alternative approach to teacher education based on principles of relational, place-based teacher education that prepares teacher candidates for the complex and ever-changing educational environment. This chapter draws on programmatic research over the past 5 years and investigates realistic experiences of teacher candidates in field experiences, practicum experiences, and beginning teacher experiences.

We have taught within traditional "theory-to-practice" (Carlson 1999) teacher education programs at other institutions and, like most other educators (Wideen et al. 1998), face the challenge – and frustration – of trying to have an impact on the later teaching practice of our teacher candidates (Dillon and O'Connor 2010) or to foster what Argyris and Schön (1974) call *double-loop* learning, vis-à-vis the powerful impact that practicum experiences have on teacher candidates and beginning teachers. We believe that one of the reasons for this lack of integration of theory

and practice is that theoretical/campus-based courses and school-based teacher candidate teaching tend to be completely divided into different time periods, different staff, and different places (Dillon and O'Connor 2010) and "as a consequence, our students quite appropriately divide their professional education into two unrelated parts as they are expected effectively to change discourses and cross culturally determined borders in order to learn" (Rosean and Florio-Ruane 2008, p. 712). Such conclusions have prompted us to investigate alternate approaches to teacher education that foster and unpack realistic experiences (Korthagen 2001) among teacher candidates in order to help them move beyond these typical limitations in their development as teachers.

Korthagen (2001) proposes a *realistic* approach to teacher education that starts not with theory but rather with practical problems faced by teacher candidates. This approach is based on experiential learning and the promotion of reflection on teacher candidates' teaching experiences through a constructivist learning process where "the student develops his or her knowledge in a process of reflection on practical situations, which creates a concern and a personal need for learning" (p. 15). The role of the teacher educator is not to impart theory as guidance to teacher candidates, but rather to foster *phronesis* using teacher candidates' practical experience as the base. *Phronesis* refers to a kind of practical wisdom that is concerned with the important specifics of particular situations as a way not only of understanding them well but of deciding how to respond to them well. The intent of a realistic approach to teacher education is to transform experience into knowledge (Kolb 1984) that reflects the social, political, and cultural reality of the educational context (Kincheloe 2003). We believe this is best addressed by investigating the complexities of theory-practice interrelationships.

Theory-and-Practice Integration

The primary focus of our research investigates the unique features of a realistic approach that contribute or dissuade an integrated theory-and-practice experience for teacher candidates. The common use of the terms "theory" and "practice" in teacher education contributes to the notion that they are mutually exclusive. However, we believe that they are inseparable. All teacher candidates have developed some kind of theory about all aspects of their experience, and all practice is driven by those theoretical guidelines. The distinction between theory and practice in teacher education seems to highlight a disconnection between the abstract guidelines offered for teaching in teacher education courses and teacher candidates' experience of the insufficiency of these guidelines when encountering the complexity of the classroom. What we seek to investigate are the relationships of theory-to-practice, practice-to-theory, and theory-and-practice.

Schön's (1987) reflective practice theoretical stance of knowing-in-action informs his proposal that the practicum should be at the heart of teacher education programs (Dillon et al. 2013). Knowing-in-action refers to teacher candidates' intuitive wisdom that allows them to adjust their practice to the unfolding complexities of

the classroom environment. Reflection (in this case, through a professional portfolio) becomes an integral part of a realistic experience of teacher education as teacher candidates begin to articulate their practical knowledge. Schön suggests that a reflective practicum depends on the quality of interaction between mentor teachers, teacher educators, and teacher candidates and among teacher candidates. This is enhanced by extensive opportunities for dialogue and reflection, while teacher candidates are engaged in extensive practicum experiences. When addressing the need for theory-and-practice integration, experiential opportunities become significant.

Reflection on Experience

A key principle in the theory-practice integration process is experiential learning, an opportunity and support for teacher candidates to reflect upon, or learn from, their immersion in experience. In our teacher education program, the development of a professional teaching portfolio serves as a teaching and integrating device for each term's experience and learning. It is designed to help teacher candidates' reflect on their experience in school and, as such, its development both shapes and reflects the development of teacher candidates' professional teaching competencies. For this reason, teacher candidates are strongly encouraged to address the Alberta Ministry of Education's competencies of knowledge, skills, and attributes (KSAs) (Alberta Education 1997) in developing their portfolio. Several means of support are available during the 4-year program for teacher candidates' portfolio development. One is background and orientation information available early to teacher candidates by means of weekly tasks and background readings that allow teacher candidates to work independently and that can lead eventually toward a completed portfolio. This structure is one provided by instructors in the teacher candidate's first year of the program in order to help teacher candidates get started on a large, complex, and usually brand-new task. Teacher candidates are welcome to "lean" on this structure as long as necessary or helpful, but they are encouraged to break away from it and create their own vision and organization for their portfolio as soon as they are able (usually during the second half of the 1st year). Access to this information can also provide support to mentoring teachers in their mentorship role. The other kind of support for teacher candidates is ongoing discussion and exchange during the program designed to help them build their knowledge together through dialogue. One central component of this support is a weekly in-school seminar with teacher candidates 1-day per week held on a regional basis in a participating school, thus bringing together teacher candidates' groups from several schools. The seminar sessions are designed to support teacher candidates' development of professional competencies and professional portfolios. The seminars focus on a particular topic/ issue based on developmental issues which they are encountering during the term. The approach to each topic is built around a problem-posing pedagogy designed to foster socio-constructivist and self-reflective learning in the group and to carry over to individual teacher candidates' ongoing work on their portfolios. Teacher

candidates are encouraged to bring to the seminar key examples from their classroom work and major questions with which they are struggling. Following the seminar, teacher candidates write a comprehensive, yet brief, articulation of what they have learned about that topic as well as possible artifacts to collect from their work to complement their written statement, which they submit for feedback to their supervisor/instructor and mentor teacher. In addition, the faculty practicum coordinator sends group e-mail messages to mentor teachers and supervisors to support key points and questions that may arise in the seminars and to suggest key points to focus on in daily follow-up work. These last steps are means of sharing the teacher educator's traditional role with mentor teachers and adjunct supervisors. Teacher candidates follow up by conducting regular self-assessments of key aspects of their development (thus sharing in the traditional evaluation role of cooperating teachers and supervisors as they share their self-assessments with those mentors). In sum, teacher candidates receive continual feedback on their teaching development and their portfolio development from mentor teachers and faculty supervisors during the program, in other words, an integrated team approach to teacher candidate development and assessment.

Experiential and Place-Based Education

Experiential education is the process of learning by doing that begins with the learner engaging in direct experience followed by reflection (Dewey 1915; Tyler 1949). In our context, it places major importance on the knowledge of teacher candidates derived from a good deal of experiential learning (Dewey 1938). By immersing themselves in direct experience, teacher candidates make discoveries and experiment with knowledge themselves instead of exclusively hearing or reading about the experiences of others (Kolb and Lewis 1986). Teacher candidates also reflect on their experiences through in-school seminars and portfolios, with the goal of developing new skills, new attitudes, and new theories or ways of thinking. They test and refine that knowledge in socio-constructivist interaction with each other and with mentor teachers and teacher educators who accompany them in their learning (Kraft and Sakofs 1988). This process of experiential learning is a continuous process alternating between action in experience and opportunities to reflect upon that experience to make sense of it and then returning to action to further test out and modify emerging hypotheses, followed by further reflection upon the new experience, and so on. Dewey (1915) sees learning as a dialectic process between experience on the one hand and concepts, observations, and action on the other.

Place-based education is an approach to teaching that is grounded in the context of community (Raffan 1995; Theobald and Curtiss 2000). It emerges from the particular attributes of a place. The content is specific to the geography, ecology, sociology, politics, and other dynamics of that place (Woodhouse and Knapp 2000). It provides a purpose to the knowledge and reasoning taught in schools, it offers a contextual framework for much of the curriculum by giving meaning to the studies, and it engages teacher candidates in the conditions of their own realities.

In the context of our program, place-based education integrates teacher candidates' professional community (practice) and targeted course work (theory). Through this integrated process, supported by the professional portfolio, teacher candidates make connections to their schooling.

Interconnected with experiential learning, critical pedagogy also supports a realistic approach to teacher education as it seeks to provide teacher candidates with opportunities to transform experience into knowledge that in turn informs their practice as they engage in double-loop learning (Argyris and Schon 1974; Ashby 1952; Mezirow 1991, 1995, 1997). However, the literature on critical pedagogy suggests that the learning of new complex practice involves a good deal of unlearning and relearning and takes a good deal of time and support (Gruenewald 2003; McLaren 2003). Another dimension of our program includes the implementation of transformative pedagogies based on critical pedagogy (Kincheloe and Steinberg 1998).

Transformative Pedagogies

Munby and Russell (1994) coin the phrase *authority of experience* because of their "concern that students never master learning from experience during preservice programs in a way that gives them direct access to the nature of the authority of experience" (p. 92). They present a challenge to teacher educators:

> The basic tension in teacher education derives for us from preservice students wanting to move from being under authority to being in authority, without appreciating the potential that the authority of experience can give to their learning to teach. The challenge for teacher education is to help new teachers recognize and identify the place and function of the authority of experience. (p. 94)

In response to this challenge (Korthagen 2001; Schön 1983, 1987, 1995), this chapter focuses on the use of portfolios in complement with other transformative pedagogies (e.g., extended integrated practicum, in-school seminars, and semester integrated courses) implemented in our department's new teacher education program that is based on the authority of experience. Specifically, we describe preliminary S-STEP research results based on our and our teacher candidates' experiences of portfolios in the context of these transformative pedagogies involving integration, inquiry, and community.

Portfolios in Teacher Education

It is our claim that portfolios can add to the body of research that effectively informs professional programs, such as the field of teacher education. Research is a fundamental component to improving the teacher education field: (1) pedagogy will develop if the faculty engage in research (research-based teaching), (2) research can improve the quality of learning for teacher candidates (research-based learning),

(3) professional practice is improved by teachers who are cognisant of their work being informed by research-based knowledge (research-based practice), and (4) the field of teacher education has a responsibility to inform and advance the knowledge basis through research (research-based knowledge production) (Heggen et al. 2010). A portfolio usually refers to a collection of evidence that is gathered together to show a person's learning journey over time and to demonstrate their abilities (Butler 2006). Portfolios can be specific to a particular discipline or very broadly encompass a person's lifelong learning. Many different kinds of evidence can be used in a portfolio: samples of writing, both finished and unfinished; photographs; videos; research projects; observations and evaluations from mentor teachers; and reflective thinking about all of these. These reflections on the pieces of evidence, the reasons they were chosen, and what the portfolio creator learned from them are the key aspects to a portfolio (Abrami and Barrett 2005; Klenowski et al. 2006; Loughran and Corrigan 1995; Smith and Tillema 2003; Wade and Yarbrough 1996). Those compiling portfolios are active participants in their own learning (Wade et al. 2005). Kimball (2005) goes further, arguing that "neither collection nor selection [of pieces to be incorporated into a portfolio] are worthwhile learning tasks without a basis in reflection. Reflection undergirds the entire pedagogy of portfolios" (p. 451). Two other key elements to portfolios are that they measure learning and development over time (Barrett 2000; Challis 2005) and that it is the process of constructing a portfolio, rather than the end product, that is where the learning takes place (Smith and Tillema 2003).

Electronic portfolios, or e-portfolios, have been emerging in education since the birth of the personal computer, making the first appearance on desktop computers, moving to publishing in optical media (CD and DVD discs), and eventually on the Internet in a variety of formats (Barrett 2011). E-portfolios can be developed for many different purposes: for learning, for professional development, for assessment, or for job applications and promotions. They can also be created for different audiences: for teachers, for mentors, for employers, or for the individual creator. Zeichner and Wray (2001) suggest that there are three different types of portfolios. These are a "learning portfolio," which documents a teacher candidate's learning over time; a "credential portfolio," which is used for registration or certification purposes; and a "showcase portfolio," which teacher candidates can use when applying for employment positions. While a learning or a credential portfolio contains examples of "less than perfect" work as well as the finished product, a showcase portfolio serves only to display a teacher candidate's best pieces of work. Similarly, Abrami and Barrett (2005) identify three different types of portfolio, though the purposes of each are slightly different from those described by Zeichner and Wray. For Abrami and Barrett, the portfolio types are a "process portfolio," or a collection of work showing a learning journey; a "showcase portfolio," which is used to show achievements either at study or in the workplace; and an "assessment portfolio" prepared specifically for assessment or evaluative purposes.

If used to their full potential, portfolios have a number of benefits for teacher candidates. Portfolios help to focus teacher candidate thinking (Wade and Yarbrough 1996), provide a means to translate theory into practice (Hauge 2006), and, most

importantly, document a learner's progress over time (Abrami and Barrett 2005; Challis 2005; Smith and Tillema 2003). They can enhance teacher candidates' communication and organizational skills, are a way of identifying and recognizing prior learning, and lead to new learning outcomes (Brown 2002). Through the process of portfolio construction, teacher candidates can gain a broader sense of what they are learning (Young 2002). They can see their learning unfolding (Darling 2001), acquire an awareness of their accomplishments, and come to understand how their learning takes place (Brown 2002).

A variety of challenges arise with the use of portfolios as an approach to assessment, some of which are mitigated by the shift to an electronic environment and some of which have been compounded. A lack of well-defined guidelines and a clear structure (Smith and Tillema 2003) and a lack of examples of past portfolios (Darling 2001) can lead to student confusion and anxiety about the scope, nature, and value of the task (Darling 2001; Wade and Yarbrough 1996). Finding a balance between student-driven construction that can lead to superficial reflections and limited evidence and overprescribed guidelines that can lead to teacher candidates lacking ownership and therefore resenting their portfolios is difficult (Zeichner and Wray 2001). Teacher candidates need guidance and support throughout the portfolio process (Smith and Tillema 2003), which involves time on the part of faculty members and mentor teachers (Wade and Yarbrough 1996). Darling (2001) indicates that teacher candidates often have limited academic experience with writing reflective pieces. The ways in which such feedback is given, and how that (sometimes critical) feedback becomes acceptable to teacher candidates, are also problematic (Smith and Tillema 2003). There is an inherent conflict between the goals of teacher candidates and the goals of their teachers in constructing portfolios. Teacher candidates "are understandably most concerned about the uses of their portfolios as aids in gaining employment while...educators are most concerned about using portfolios to promote professional development and to make assessments" (Zeichner and Wray 2001, p. 618). Concerns have also been expressed over the difficulty of assessing portfolios. Smith and Tillema (2003) see a lack of match between assessment criteria and the goals of an academic program or what competencies teacher candidates are expected to develop. They also see a tension between the measurement of standards and capturing development and reflection. The danger is that learning and reflection will get lost in the drive to measure competency.

The literature on the types of e-portfolios and the benefits and challenges of using e-portfolios has informed our own S-STEP investigation. Much of this literature focuses on specific course implementations and the teacher candidates' professional learning through reflection. However, research is emerging that links the use of e-portfolios across multiple courses within a program in order to foster theory and practice links. Drawing on Russell and Martin's (2016) statement that there is "no connective tissues holding things together within or across the different phases of learning to teach" (p. 1049), Hopper et al. (2016) argue that e-portfolios provide a vehicle to better integrate theory and practice. They conclude that through the use of e-portfolios, teacher candidates changed their perspectives on teaching as they shifted toward a stronger professional identity, teacher candidates showed a common

commitment to a professional learning community, and teacher candidates were able to integrate school and university learning experiences.

Like Hopper et al. (2016), we were concerned about how our teacher candidates were experiencing tensions between theory and practice. We wondered how creating a programmatic e-portfolios might help us bridge this divide in a way that would help transform the typical limitations of the development of teacher candidates' teaching practice. This chapter is informed by our experiences in implementing and refining our B. Ed. program. The S-STEP example that follows presents findings based on teacher educators' and teacher candidates' experiences of one of our transformative pedagogies: portfolios.

Mount Royal University Bachelor of Education Program

This example is extracted from a longitudinal programmatic qualitative study that investigates the impact of transformative pedagogies on teacher educators, mentor teachers, and teacher candidates. Central to the research is the exploration of how transformative pedagogies provide sustained realistic experiences throughout the varied phases of learning to teach that include campus courses, field studies, practicum, and integrated school-based courses. In this self-study, we addressed two questions: (1) What are our barriers and strategic approaches to merging theory and practice through the development of a professional portfolio? (2) In what ways can we support the use of professional portfolios to inform realistic experiences for our teacher candidates?

The context of our self-study was Mount Royal University, a 4-year undergraduate institution located in Calgary, Alberta, Canada (http://www.mtroyal.ca/). In the fall of 2011, the University launched a new Bachelor of Education (B.Ed.) program, a 4-year direct entry B.Ed. degree, with an emphasis on connecting theory with practice through the programmatic incorporation of the following transformative pedagogies:

- **Professional learning plan** (e-portfolios): Teacher candidates begin an electronic professional learning plan in the first year of the program and add artifacts and reflections in each year of the program. This program level portfolio provides an integrated platform for student learning throughout the degree and invites metacognition regarding professional growth. Teacher candidates reflect upon their progress toward the five major program competencies:
  – Professional responsibilities
  – Planning for learning
  – Facilitating learning
  – Classroom environment
  – Assessment
- **Cohort placements and in-school seminars**: Teacher candidates in practicum (and where possible in field experience) are placed in cohorts of four to six teacher

candidates at each school. The cohort placements support the programmatic feature of in-school seminars. This structure has several benefits:

- Teacher candidates build a learning community and support network in their school.
- Teacher candidates capture immediate correlations between the theory and its application to their own practice and experience.
- Teachers better understand the unique features of the university program and the evaluation process.
- Teachers become engaged partners in the postsecondary education of the teacher candidates.
- Faculty are better able to visit every week to engage in weekly seminar discussions and build relationships with school personnel.

- **Cross-curricular course integration**: Teacher candidates are required to demonstrate the integration of outcomes from multiple subjects in their planning. Specific semesters are designed to focus on such integration (e.g., Language Arts/Music/Assessment in year 2, STEAM semester in year 3, Social Studies/Aboriginal Education in year 4).
- **Community partnerships**: Teacher candidates plan and support learning at various sites including Ann and Sandy Cross Conservation Area, Tim Horton Children's Ranch, Telus Spark, and Calgary Reads.
- **Extended, integrated practicum and school partnerships**: Courses are taught in schools for teacher candidates in the final practicum semester. This follows a Professional Development School model. Cohorts from four to six schools gather together at one school each week.
- **Faculty practicum supervision in schools**: All full-time faculty members supervise practicum in schools. This practice has been forefront from the inception of the degree. Full-time faculty are ideally positioned to build partnerships with schools, to intervene in challenging situations, and to bring awareness of the program vision and structure. Most contract faculty who are practicum supervisors are also instructors in courses so they have a strong understanding of the program and teacher candidates' course experiences. Schools repeatedly praise the regular presence and responsiveness of faculty members.
- **Peer mentorship**: Teacher candidates are encouraged to provide peer mentorship to each other during practicum and field experiences. Teacher candidates in year 2 are peer mentors for teacher candidates in year 1.
- **Inquiry**: Teacher candidates in their final practicum engage in a capstone inquiry in their school (EDUC 4201). This is either a curriculum inquiry with their practicum classes or an inquiry into some aspect of professional practice.
- **Reflective journals**: Teacher candidates write journal reflections in courses throughout each year of the program and include these in their professional learning plans.
- **Indigenous ways of knowing**: Place-based experiential learning opportunities take place with our Indigenous partners such as the Tsuu T'ina, Stoney Nakoda, and Siksika Nations.

These transformative pedagogies seek to avoid the traditional separation and gap between theory and practice by not disintegrating them in the first place. They create a hybrid structure and organization that integrates "course work" and "student teaching," by blending and overlapping traditionally separate roles of "instructor," "supervisor," and "mentor teacher" and by integrating all work in the program toward supporting teacher candidates' development of professional teaching competencies through both immersion in experience and reflection on that experience, particularly through the development of a professional teaching portfolio as an integrating device.

E-portfolios are used in our teacher education program as a "spine" or "backbone" to support and integrate the other transformative pedagogies throughout the entire 4 years of the B. Ed. program. We have observed that local school boards have also developed an e-portfolio process in order to foster and encourage deeper modes of learning (Habanero 2015). They refer to these e-portfolios as online learning plans that allow students to take ownership of the documentation and goal setting for their own growth and development throughout their kindergarten to grade 12 educational journeys. We use the term professional learning plan for our e-portfolio process, which focuses on helping teacher candidates to document and articulate professional growth and development related to our B.Ed. program competencies: planning, facilitation, assessment, environment, and professional responsibilities. This e-portfolio is the space for teacher candidates to develop and communicate self-understanding and create learning goals and strategies that will allow them to be most successful in their future teaching practice (Johnsen 2012).

The teacher candidates use digital applications such as *Google Sites* to create their professional learning plans, which consist of the key components described in Table 1.

The methods we used to address the research questions were consistent with our focus on studying our professional practice (Bullough and Pinnegar 2001; Hamilton

Table 1 Key components of the professional learning plan

Page	Description
Home	Introduction and overview to personal teaching goals and aspirations
Resume	Documenting personal experience related to the K to 6 teaching profession
Teaching evaluations	Evaluations by mentor teachers from K to 6 school placement and practicum experiences
Teaching philosophy	Ongoing development of a personal teaching philosophy
Journal	Link to course and practicum journals in Google Docs
Course reflections	A brief summary of the courses that teacher candidates have taken at MRU. These include a link to the MRU course description and key "learning take-aways" from each course
Teaching competency	Planning, facilitation, assessment, environment, professional roles, and responsibilities with related artifacts, reflections, goals, and strategies

1998; Kitchen and Russell 2012; Kosnik et al. 2006; Loughran 2004; Loughran and Russell 2002; Pinnegar 1998; Tidwell et al. 2009). Adhering to principles of self-study design (Dinkelman 2003; LaBoskey 2004), our research was self-initiated, focused on inquiry into our practice, collaborative, aimed at improvement of our practice, and centered on multiple and primarily qualitative means of inquiry. Our self-study was focused on improvement on both the personal and professional levels (Samaras and Freese 2009) and required honesty and vulnerability as we reframed our roles as course instructors, practicum supervisors, and program designers.

LaBoskey (2004) and Fletcher et al. (2016) claim that multiple perspectives from colleagues, students, or texts provide more comprehensive answers to S-STEP research questions related to the enactment of pedagogical practices. Data sources for examining our professional practice include transcripts of 10 individual interviews with teacher candidates for each of the 4 years of the study and 53 teacher candidate portfolios examined over the same period of time (2013–2017). Data sources for investigating our personal experiences were meeting notes of our bimonthly collaborative research conversations, emails that were exchanged during this time, and individual reflections about our experiences. Multiple data sources provided trustworthiness. Data was first coded individually across these sites according to emerging themes that related to our research questions (Strauss 1987). We then reviewed our analysis, collaboratively adjusted the codes, and wrote findings together.

Results indicate that teacher candidates used the programmatic portfolio to review their professional growth as demonstrated by this comment: "I love the idea of the portfolio because it helps us keep track of all of the stuff we are learning and how we are changing, which sometimes it just gets lost. You have a lot going on in these four years" (GA2, March 26, 2014). Our results are consistent with research conducted by other faculty members within our department who reported that teacher candidates identified the e-portfolio as an overarching practice that organizes learning artifacts to facilitate reflection, that documents professional growth over time, that includes journaling in each education course, and that demonstrates the interactions with peer mentors through collaboration (Vaughan et al. 2017). Indeed, enacting programmatic e-portfolios impacted the learning of department members not involved in the self-study and prompted more widespread adoption of the transformative pedagogy:

> The surprising prevalence of reflective comments related to "interconnections" has led the faculty to a new focus for our portfolio research–the emergence of professional identity. Rather than simply analyzing how the teacher candidates are self-assessing, we are now analyzing portfolios with an aim to discern how professional identity emerges throughout the degree program. (Nickel 2013, p. 77)

While it was evident that many faculty members were able to integrate e-portfolios in order to encourage teacher candidate growth, some themes emerging in the data suggested that this differed throughout the various learning experiences and teacher candidates expressed some frustration when the artifacts were seen as external to their learning process:

We did a lot of on our portfolio last semester and this semester we were doing a little bit, but I feel that little bit we are adding in I don't get to explain it, so even having just an in-class, just a five-minute quick, 'This is where I put it in my portfolio' – because my portfolio now looks crazy because I added so much last semester, so many certificates, so many different artifacts. I only have to add a few things this semester and I am like, 'You won't even find them, I will have to write a page description on where to get to them because I have to sort through my portfolio! But having that opportunity to explain yourself, I like that better because you can often just do an excerpt from an artifact, right? You can say, 'Oh, this is a paragraph that really spoke to me,' but then you write that in there. It is hard to write about your emotions, or why, or your passion, or why you put that in. (GC13, March 26, 2015)

For some profs it was like, "Okay, we are all doing it," and sometimes we went months without talking about them, so it was kind of hard to . . . I felt like I was always doing catch-up with them, that it wasn't . . . it was more an, "Okay, I got to tick the boxes," versus wanting to spend time to really develop it. (GC6, April 25, 2017)

Our own learning as teacher educators was evident in the ways that we responded to comments from teacher candidates. One of us incorporated the explicit use of e-portfolios in the on-campus course as teacher candidates were provided opportunities to set goals based on the course outcomes and reflect on their professional learning in relation to these goals. Thus, one teacher educator was able to see the value in shifting from a "scrapbooking approach" to a reflective goal-setting approach. Each of us also noted that we were prompting teacher candidates to attend to previous reflective writing in order to recursively link theory and practice across their experiences within the program.

Conclusion

Transformative pedagogies (Cranton 2006; Mezirow 1991, 1995, 1997; Mezirow and Associates 2000) are those initiatives that contribute to double-loop learning where teacher candidates integrate emerging theories of education with their developing practical wisdom. We have made the claim that the portfolio is a key transformative pedagogy of our B. Ed. program's attempt to address the theory-practice divide. However, one significant barrier that our S-STEP research reveals is the need for our faculty to better embed portfolios/PLPs as a sustainable transformative pedagogy that supports the integration of theory and practice throughout the entire 4-year program, the touchstone that grounds our development as educators, instead of a sporadic teaching and learning strategy that is often seen as a "scrapbook" of related experiences. This leads to our second research question in how "we, as teacher educators, best support the use of professional portfolios for our teacher candidates." Our S-STEP research findings have informed the development of a transformative programmatic portfolio/PLP framework that we intend to implement going forward. It includes the following four areas of implementation:

• Designated e-portfolio course/in-service for each semester of the 4-year B. Ed. program.

- A focus on goal-setting versus scrapbooking approach.
- Faculty provide more opportunities for peer mentorship support.
- Introduce strategic initiatives that allow for mentor teacher involvement.

Finally, we conclude this chapter with an enhanced call for S-STEP research into practicum. These S-STEP findings provide insight into how college and university teacher preparation programs can support transformative theory-and-practice links through the use of portfolios. This is significant in an era where we need a synthesis of theory and practice if we are to prepare thoughtful practitioners of education. What is being called for is an epistemology of practice that "appreciates the wisdom of learning in the midst of action itself" (Raelin 2007, p. 513). It is our claim that S-STEP practicum research into portfolios provided us with a more dynamic process of facilitating learning. Research infused with learning, teacher educators, and teacher candidates need not revert back to formulaic theories and far-removed practical processes but instead through collaboration have the potential to create new frameworks to uncover, understand, and respond to emerging problems and ways of knowing.

Pedagogy of Teacher Education in Exemplary Programs

39

Julian Kitchen

Contents

Abstract

The self-study of teacher education practices (S-STEP) plays an important role in improving practices and enhancing pre-service teacher education. While enhancing one's practice and improving program components are important, there is a need for greater understanding of programs as a whole and, particularly, how theory, practice, and reflection are enacted in them. Much can be learned from teacher education programs – generally cohorts, small programs, and professional development schools – that are identified as innovative and exemplary in the

education literature. Three exemplary approaches recognized in the education literature are introduced – the Mid-Town Option at the University of Toronto, Bank Street School of Education, and Mills College – and their exemplary qualities highlighted. Research studies, particularly self-studies, are examined to offer insights into the programs and into the role of S-STEP in enhancing practice across these programs. Five themes that emerge from this review are identified in the hope that they can help self-study practitioner-researchers contribute to the enhancement of teacher education programs locally and around the globe.

Self-study · Teacher education · Exemplary teacher education · Practicum · Reflection · Integration

Introduction

The self-study of teacher education practices (S-STEP) plays an important role in helping teacher educators improve their practices and enhance preservice teacher learning. Accounts of teacher educators in classrooms and field placements offer complex understandings of the pedagogy of teacher education (Loughran 2006) through a combination of rich contextual detail and critical analysis of experience in local contexts. S-STEP also has an important role to play in understanding and improving teacher education programs. As a community of self-study practitioners, we have amassed "a collection of qualitative, often complex, descriptions of teacher education goals and practices" (Clift 2004, p. 1362). While local stories by teacher educators no doubt improve our practices, Clift (2004) challenges us to "go beyond a course or a field setting" by asking "questions that can only be answered across time and contexts" (p. 1362). In the conclusion to the *International Handbook of Teacher Education,* Hamilton and Loughran (2016) see merit in generalizations from big data yet emphasize the value of local stories that particularize the breadth of teacher education.

I know that studying and improving my own teacher education practices, while beneficial to the preservice teachers in my classes, have only a small impact on the university's program. I am aware that my university's program, and most others, do not consistently weave together important program components to forge excellence in the initial preparation of teachers. As the project leader in the redesign of the program in my institution (Kitchen and Sharma 2017), I am particularly mindful of the challenges of program reform in large colleges of education. As a researcher who has conducted studies of teacher education programs in Ontario (Kitchen and Petrarca 2016; Petrarca and Kitchen 2017), I am increasingly interested in improving programs, not just individual program components. Writing an international handbook chapter titled "Approaches to Teacher Education" (Kitchen and Petrarca 2015) impressed on me the urgency of teacher education program reform and the value of learning from exemplary programs, particularly programs regarded as exemplary for their integration of theory, practice, and reflection.

There are many teacher education programs – generally cohorts, small programs, and professional development schools – that are identified as innovative and exemplary in the education literature (e.g., Howey and Zimpher 1989; Beck and Kosnik 2006; Darling-Hammond 2006). Many of these programs have strong practitioner inquiry traditions, including S-STEP. What do these programs reveal about exemplary teacher education practices? How are self-study and related approaches to teacher education employed in these contexts? What can we learn by examining self-studies and other practitioner inquiries from these sites?

This chapter begins with a review of the literature on approaches to teacher education, with a particular focus on exemplary program elements and exemplary integrated programs. Three exemplary approaches recognized in the education literature are introduced – the Mid-Town Option at the University of Toronto, Bank Street School of Education, and Mills College – and their exemplary qualities highlighted. Research studies, particularly self-studies-related approaches to teacher educator practitioner inquiry, are examined to offer insights into the programs and into the role of S-STEP in enhancing practice across these programs. Five themes that emerge from this review are identified in the hope that they can help self-study practitioner-researchers contribute to the enhancement of teacher education programs locally and around the globe.

Part 1: Why Study the Pedagogy of Teacher Education in Exemplary Programs?

Why Self-Study and Teacher Education Reform Are Connected

In the 1980s, teacher education was profoundly disrupted. The self-study of teacher education practices is largely the product of these disruptions, which are represented here by two events. First, Donald Schön (1983) challenged the model of technical rationality, which views curriculum as a regular course of study or training. The resulting paradigm shift led many teacher educators to reflect on themselves and their practices. Second, *Tomorrow's Teacher* (Holmes Group 1986) identified serious limitations to conventional approaches to teacher education, prompting calls for sweeping program reforms. While the S-STEP community largely focuses on investigating "question[s] of practice... that are individually important" (Pinnegar and Russell 1995, p. 6), we have always been concerned with questions "of broader interest to the teacher education community" (p. 6).

Russell (2004), in tracing the development of S-STEP, argues that "our growing awareness of the importance of *self* in teacher education" was "not only necessary but also inevitable" (p. 1192) given the failure of the technical rational model to serve the needs of practitioners. The model of technical rationality assumes that research knowledge can be applied to practical problems with little reference to people or context. Schön was one of many scholars in the early 1980s who challenged this understanding of a knowledge base for professionals. Inspired by Dewey, Schön emphasized the role of the individual practitioner in making sense of the "complexity, uncertainty, instability, uniqueness and value-conflict" (p. 39)

within a particular professional situation. This Deweyan conception of teacher knowledge as proceeding from the individual in his/her context, guides teacher educators toward reflective practice in order to become more responsive to "the situations in which interaction takes place" (Dewey 1938, p. 45). The name of our special interest group (SIG) within the American Educational Research Association reflects the preoccupation at that time with teacher educator's identity and the improvement of practice. As researchers, the founding members were deeply concerned with questioning taken-for-granted knowledge, understanding experience, developing criteria for rigor, and building community among teacher educators from diverse research and teaching traditions (Loughran 2004). Understanding oneself and one's particular practice setting, as opposed to insularity, is an important step toward better understanding "the problematic worlds of teaching and learning" (Loughran 2004, p. 9) and being "informative, accessible and useable to others" (p. 31).

While large-scale teacher education reform efforts – inspired by the Holmes Group (1986), Sarason (1990), Goodlad (1991), Fullan (1993), and others – informed the discussions of the self-study community, its main impact was at programmatic and leadership levels. Colleges of education over the last 30 years have attempted to adapt their programs to better meet the needs of preservice teachers (e.g., Fullan 1993; Darling-Hammond and Sykes 1999; Darling-Hammond and Bransford 2005) within the constraints of their university programs. Zeichner's "The New Scholarship in Teacher Education" (1999) both drew attention to the resistance to change within many teacher education programs and identified five important categories of "work in the new scholarship of teacher education" (1999, p. 11). One of the new categories Zeichner identified as important was self-study.

As a graduate student in the early 1990s, I recall inquiring into my identity as a teacher – mainly through narrative inquiry (Connelly and Clandinin 1988, 1990) – and learning to respect the knowledge of teachers as curriculum makers (Clandinin and Connelly 1992), alongside studying the education reform literature. Over time, self-study and narrative inquiry seemed to focus on practice in context more than discussions of policy and program leadership; certainly, I as teacher educator narrowed my focus to practice (e.g., Kitchen 2005a, b and Kitchen and Bellini 2012) and to other areas of educational research. The work of the S-STEP community over the past 25 years, as a result, has contributed enormously to understanding the nature and impact of teacher education. Although many self-study researchers elicit feedback from critical friends in other institutions, most have not explicitly heeded the call of the AERA Panel on Research and Teacher Education (Zeichner 2005) for more generalizable research across programs. Indeed, we should continue to attend to improving our own practices and to "give more attention to ontology (practice and its improvement)" (Pinnegar and Hamilton 2009, p. 50) than to epistemology. Now, as an established community, we should also expand our engagement in program improvement, both within our own institutions and across colleges of education nationally and internationally. As a teacher educator with 20 years of experience, issues of policy and program structure now interest me greatly. Writing chapters on teacher education programs (Kitchen and Petrarca 2016,

2017), along with Diana Petrarca, revealed "how little we knew about teacher education our own province. It motivated us to collect more information and led us to identify an effective way to understand how programs actually worked: tapping into the scholarly and practical expertise of teacher educators" (Kitchen and Petrarca 2017, p. 352). The resulting edited volume, *Initial Teacher Education in Ontario: The First Year of Four-Semester Teacher Education Programs* (Petrarca and Kitchen 2017), reinforced for me the importance of learning from self-studies by teacher educators working in exemplary programs as a means to improving teacher education locally and globally.

Why Exemplary Teacher Education Programs Should Be Studied

There is much debate about the effectiveness of teacher education practices and programs. Given the lack of conclusive data in favor of particular models (Zeichner and Conklin 2008), we should acknowledge "a variety of effective pathways into teaching and a variety of elements of effective teacher education programs" (p. 285). Most conventional programs (Kitchen and Petrarca 2016), whether post-baccalaureate or combined with an undergraduate degree, possess similar structural features, offer a wide variety of pedagogies (many of them effective), and employ teacher educators with the knowledge and experience to teach their courses. There has also been a growth in hybrid programs and pathways that draw on multiple sources of expertise and experience (The Teacher Educator 2011). As quality varies widely within and across programs, we "need to move beyond the surface structural features of teacher education programs in order to understand the key elements of program effectiveness" (Zeichner and Conklin 2008, p. 271).

In *Preparing Teachers for a Changing World*, Darling-Hammond and Bransford (2005) present a framework for understanding teaching and learning that highlights three general areas of knowledge and skill – learners and their development, subject matter and curriculum, and pedagogy – all programs must address. These overlapping areas are framed within conceptions of teaching as a profession and learning in a democracy. As Feiman-Nemser highlights (2001), programs typically have weak relationships between courses and field experiences, offer fragmented pedagogy, limited subject matter knowledge, lack teacher educators who practice what they preach, fail to link theory to practice, and do not "cultivate habits of analysis and reflection through focused observation, child analysis, analysis of cases, microteaching, and other laboratory experiences" (p. 1020).

Kitchen and Petrarca (2015) employ a framework for considering three main orientations within teacher education programs incorporate: (a) practice, (b) theory, and (c) reflection. The term theory is used broadly to refer to the content of teacher education courses, including subject matter, pedagogy, human development, foundations of education, and the social context of education. Reflection refers to the complex, active, and intentional meaning-making activities, rather than "everything that, as we say, is 'in our heads' or that 'goes through our minds'" (Dewey 1933, p. 2). Approaches to teacher education may exemplify high engagement with a

single element or may attempt to *cover* all areas. Teacher educators, as Kosnik and Beck (2011) observe, "often try to do too much" by covering "the waterfront in almost every subject," and, thus, preservice teachers "are inundated with so much information that they have a difficult time organizing it both conceptually and physically" (p. 2). It is difficult to be effective in all three given the extent and depth required for mastery of practice, theory, and reflection.

Exemplary programs, such as those identified in collections of case studies by Howey and Zimpher (1989), Darling-Hammond (2006), and Beck and Kosnik (2006), are more effective in addressing these challenges. Darling-Hammond et al. (2005) is convinced that key to improving schooling is understanding "what strong preparation for teachers looks like and can do, and to undertake the policy changes needed to ensure that all teachers can have access to such preparation" (p. xi). Important attributes of such programs include shared visions, faculty members committed to the shared vision, academic rigor, and integrated/interdisciplinary approaches to curriculum (Howey and Zimpher 1989). Most are integrated programs that simultaneously address key elements in coherent ways which can make a positive difference (Feiman-Nemser 2001). As Kosnik and Beck (2009) argue:

> Learning to teach is a difficult and never-ending task; but a pre-service program that is prioritized, integrated and connected to practice – and that embodies its own priorities – can significantly enhance teachers' effectiveness in their initial years and beyond. (p. 11)

Darling-Hammond in *Powerful Teacher Education* and Beck and Kosnik in *Innovations in Teacher Education* identify themes that emerged from their research into seven exemplary programs. Darling-Hammond (2006) devotes chapters to the knowledge base, developing and assessing teaching, clinical experience, managing the dialectic between students and subject, equity, reaching all students, and institutional challenges. Beck and Kosnik (2006) offer chapters on integration, fostering inquiry, building community, inclusion, influence beyond the program, and researching the program. For the purpose of this chapter, I combine these with the three orientations in Kitchen and Petrarca (2015):

1. Theory
2. Practice
3. Reflection
4. Integration
5. Influence Beyond the Program

While building community – a characteristic identified by Kosnik and Beck – is critical to developing and sustaining exemplary programs, it has been infused into the discussion the main five themes.

Integrated teacher education necessitates the development of a pedagogy of teacher education through which teacher educators understand teaching and learning about teaching (Loughran 2006). It requires teacher educators who purposefully examine the complex interplay between elements both within courses and across a

program. As Loughran (2006) wrote, teaching about teaching goes beyond modelling to:

> Unpacking teaching in ways that give students access to pedagogical reasoning, uncertainties and dilemmas of practice . . . to make clear how the teaching approach purposefully encourages learning and how learning influences teaching in action . . . (p. 6)

Part 2: Exemplary Teacher Education Programs

The three exemplars reviewed in this chapter have been lauded as exemplary in the education literature. These exemplars all integrate theory, practice, and reflection. They also actively in self-study and, more broadly, practitioner inquiry in order to improve practice and contribute to the wider educational discourse.

Mid-Town Option, Ontario Institute for Studies in Education, University of Toronto

The first exemplar, the Mid-Town Option (1989–2015), was a small model teacher education program (a cohort of 60–70 preservice teachers) nested within a large college of education with over 1,000 preservice teachers, a large graduate program, and a strong educational research tradition. Clare Kosnik and Clive Beck, tenured faculty committed to teacher education, seized an opportunity to establish pockets of innovation in preservice teacher education (Fullan 1993) by creating this option focused on preservice teacher inquiry and practitioner research by teacher educators. Thanks to their efforts, Mid-Town has been lauded as an exemplary program, contributed substantially to self-study and practitioner inquiry, and contributed to Kosnik and Beck's identification of priorities in teacher education (Kosnik and Beck 2009, 2011). Mid-Town ended in 2015 as, in response to a provincial shift from 1-year to 2-year initial teacher education (Petrarca and Kitchen 2017), OISE repositioned itself as an all-graduate faculty of education and Kosnik left the cohort to become the director of OISE's Institute for Child Study.

Mid-Town was 1 of 9 cohorts within the 600-student elementary B.Ed. program. It was led by a faculty team of two coordinators (seconded from school districts) and supported by two tenured professors and several part-time instructors. OISE's teacher education programs, according to McDougall et al. (2017):

> are delivered in cohorts where groups of teacher candidates learn together for much of their program, a design strongly supported in the teacher education research. Strong School-University partnerships support the quality of student experience, increase the sense of community, and allow us to be more responsive to student needs (Schulz 2005). The cohort learning experience also models in action the kind of professional learning community found in "best practice" schools. (p. 157)

The inquiry philosophy of Mid-Town is evident from its vision statement which states that preservice teachers are "respected as thoughtful professionals... [and] encouraged to see themselves as having a central role in schooling" (Beck and Kosnik 2006, p. 55). This vision places action research by preservice teachers at the center of the program. According to Beck and Kosnik (2006):

> The whole program has to have a strong inquiry emphasis so students come to understand in depth what the approach is and feel supported in pursuing it in both the campus program and the practicum. This in turn requires that certain conditions be in place: a supportive program, an integrated program emphasizing inquiry throughout, connections between theory and practice, and a nonauthoritarian approach. (p. 55)

The small faculty team was able to integrate theory, practice, and reflection by teaching across courses and supporting preservice teachers in field placements. With a core faculty team, according to Beck and Kosnik (2006), "greater program coherence can be achieved, community building can be coordinated, and students can identify with a group of instructors" (p. 78). The two professors, along with the coordinators, ensured adherence to this philosophy over many years. They also nurtured a community dimension, both within the cohort's supportive learning environment and through carefully selected partner schools in Toronto's ethnically and racially diverse urban core. Research into the program has both influenced the larger elementary teacher education program at OISE and contributed a substantive body of teacher education research through, on, and by cohort instructors.

Mills College School of Education

The Mills College School of Education in Oakland, California, is highly regarded for a preservice Master of Arts in Education that prepares preservice teachers . . .. It is a Teachers for Tomorrow's Schools recognized program that combines a teaching credential with an M.A. According to its website, the program prepares:

> professional, reflective, collaborative, and visionary teachers who are committed to improving K–12 education in urban schools. Through the careful integration of research, theory, and practice, our programs include simultaneous course work and classroom teaching grounded in our core principles. In a highly collaborative community of dedicated professionals, students gain the knowledge, ethical frameworks, and a supportive network of colleagues to grapple with the social, moral, and political dilemmas of teaching practice. (Mills College n.d.)

The preservice Master of Arts in Education at Mills College is a small program consisting of 60 preservice teachers in its 1-year *credential program* at the elementary or secondary level. After completing the teaching credential, "most students continue to study full- or part-time for up to 4 years to complete the M.A." (Beck and Kosnik 2006, p. 77). Being a small program, Mills College is able to focus on developing a coherent program that integrates theory, practice, and reflection. The

program is guided by core principles: teaching as a moral endeavor; collegiality; reflection and inquiry; teaching as political; learning as constructivist and developmental; and commitment to both subject matter and professional knowledge (Beck and Kosnik 2006). These core principles are made explicit from the beginning of the program and used to reinforce a Mills College sense of identity. These principles, along with the small size of the program (60 preservice teachers), enable the college to easily shift from functioning as a program-wide learning community to working in smaller groups based on subject disciplines, field experience groups, and clusters of student teachers in schools. A distinguishing feature is its commitment to community building; according to its co-directors, the program is guided by a belief in teaching as relational and commitment fostering and modelling community in preservice classes. This is reinforced by a faculty team approach in which tenure-track and contract faculty meet together regularly to collaborate working in a small building designed to meet the program's needs (Beck and Kosnik 2006).

Practice teaching is given considerable attention. Care is taken to avoid overwhelming preservice teachers and to closely monitor progress and individualize support. A weekly 2-h teaching seminar scaffolds field experiences. Also, faculty work closely with carefully selected supervising teachers who have undergone training in effective mentoring. Dave Donohue, an instructor, highlighted the "intensity of this program" (Beck and Kosnik 2006, p. 92) that inspires students and faculty to give it their best.

The program's commitment to community and social justice is also evident in its outreach efforts, including lesson study groups for teachers, involvement in federally funded programs for low-income youth, and Mills Teacher Scholars' initiative that supports inquiry by classroom teachers (Mills College n.d.). Faculty have also contributed to practitioner research, most notably significant work in self-study.

Bank Street College of Education

> Bank Street is recognized as the gold standard in progressive education. The two main programmatic divisions are the School for Children, which educates children from nursery through grade 8, and the Graduate School, which prepares adults to teach and work in schools all over the world. Teachers with Bank Street degrees are in demand. The combination of the Graduate School and the School for Children in the same setting creates a unique synergy between children and teachers. (Bank Street School, n.d.)

Bank Street is highly regarded in New York City and recognized in both Darling-Hammond (2006) and Beck and Kosnik's (2006) books on exemplary teacher education programs. The range of teacher education programs prepares "graduate students to become teachers; learning, literacy, and curriculum specialists; and museum educators, among a range of career pathways" (Bank Street School, n.d.). Common to all is "the orientation that a deep understanding of human development – informed by observation, experience, research, and theory – is essential to thoughtful practice with infants, children, adolescents, and their families" (Bank Street School, n.d.).

While there are a variety of smaller programs, most are enrolled in programs combining special education with general education. This elementary master's program can take from 1 to 4 years, with most completing in 2 years. Typically 40 students are enrolled in the core field experience year of advisement, student teaching, and coursework and approximately 60 when other programs are included. During the day, teacher candidates serve as interns and student teachers working alongside classroom teachers up to 3 days a week; during the evening, they take classes in foundational studies, child development, and a range of other subjects. Direct experience and guided study are combined with intensive reflection on practice.

One defining characteristic of the college is its lifelong partnership with the Bank Street School for Children, an independent kindergarten to grade 8 school founded in 1916 as a laboratory school for progressive and innovative curriculum. The school, guided by the same principles and approaches to teaching and learning as the college of education, serves as a model school for Bank Street preservice teachers. This is reinforced by partnerships with schools committed to the Bank Street philosophy and carefully selected supervising teachers who model its approach.

Bank Street College of Education has long been guided by a coherent philosophy of teaching and teacher education. Founder Lucy Sprague Mitchell envisioned a collaborative environment for student learning, educational research, and teacher preparation. Barbara Biber (1973; 2015) wrote:

> At the base is a three-part concept of a competent teacher: first, an extensive reservoir of knowledge and specific skills for the teaching task, based on psychodynamic concepts of learning and growth in childhood; second, capacity for meaningful communication and relationship with adults and children of varying backgrounds and life-styles, and third, enough personal insight, maturity and resilience to make the currents and cross-currents of emotion contribute to a quality of depth in the learning climate.

Theory, practice, and reflection are systematically developed and carefully integrated, guided both by the Bank Street tradition and current teacher education research. A key integrative feature is conference groups, led by a teaching faculty, in which teacher candidates support each other as they apply their college classroom to practice teaching in the field. Modelled on Bank Street's approach to classroom interactions that combine the cognitive and affective, conference groups probe deeply into the cognitive and emotional work of student teaching.

Also, there are strong links to the community of supervising teachers, who are carefully selected and nurtured; many are graduates of the program. This community is led by faculty members who are deeply engaged in all facets of the program model community in relations with other faculty. Almost all these faculty members have extensive classroom teaching experience. Judy Leipzig, a former elementary preservice director, notes that faculty in each cluster of courses create a "culture of collaboration" because they are "a small, intimate group of faculty who for many years engaged with each other in a way that is not necessarily typical" (Beck and Kosnik 2006, p. 33). Darling-Hammond and Lit (2015) report that the program is highly regarded and local education leaders draw on the expertise of Bank Street faculty and graduates.

Part 3: Self-Study in Exemplary Teacher Education Programs

Labaree (2010) described "teaching is an enormously difficult job that looks easy" (p. 228). Also, the "role of teacher is more complex today than ever before, requiring an unprecedented range of knowledge, skills and experiences" (Crocker and Dibbon 2008, p. 109). Knowledge (often referred to as theory), skills (application in practice settings), and experiences (understood through teacher reflection) are both distinct and overlapping. Effective initial teacher education programs integrate these elements (Kitchen and Petrarca 2015) to prepare beginning teachers to respond to the opportunities and challenges they face educating students in classrooms and schools. Exemplary programs, such as those highlighted in this chapter, are particularly effective in addressing and integrating these elements while also building community and influencing teacher education within their institutions, in schools, and through contributions to research.

Theory

Good practice requires theory and good theory requires a knowledge of practice (Carr 1995). Thus, teaching practice needs to be theorized and theory needs to be illustrated through practical examples. The initial preparation of teachers, and the move toward teacher expertise, involves the development of a body of professional knowledge, attitudes, and practices "firmly grounded in educational theory and research" (Carr and Kemmis 1986, p. 9). While the theory-practice divide has been a long-standing and contentious issue in teacher education, there is little doubt that foundational knowledge – such as psychology and sociology – and subject knowledge and pedagogy are essential to effective teaching. There is concern, however, that such knowledge is not presented in a manner that is useful in practice contexts. As Kosnik and Beck (2009) observe, too often these courses tend to teach about knowledge and strategies in isolation rather than in ways that can be enacted in context. Teacher educators, according to Kosnik and Beck (2011), "need to be explicit about priorities and connections, not leaving so much for student teachers and beginning teachers to figure out on their own" (p. 3). Exemplary programs, such as those examined in this chapter, respond effectively to the critical challenge of making foundational and methods courses meaningful for teacher candidates in the context (Grossman et al. 2009) of their program and practice in schools. Studies of practice, including self-studies from such programs, are windows into effective practices that are program-wide and integrate theory with practice and reflection.

Conventional wisdom claims that teacher education is too theory-oriented. The teachers in Kosnik and Beck's (2009) longitudinal study of beginning teachers constructively challenged this common stereotype: "many felt the theory presented in their pre-service programs was not explained clearly enough: they were often unable to understand what was being said" (p. 5). Teacher candidates need more theoretical clarity and depth along with closer connections to practical teaching and learning situations, rather than less theory. New teachers need a growing knowledge

base to meet the demands of a diverse and changing world, but the kinds of knowledge, skills, and commitments need to be carefully selected to address the practical needs of teachers as adaptive experts (Bransford et al. 2005). The approaches and examples in this section address the genuine critiques of theory in teacher education. The challenge is great, particularly for high enrollment programs in large universities, but it is one that must be acknowledged and embraced if teacher education is to thrive in tumultuous times.

Mid-Town Option

Teacher educators, particularly academic faculty in universities, are primarily concerned with the delivery of their own courses. Reading self-studies by teacher educators in exemplary programs is helpful both in improving practice and developing strategies for inquiring into their own practice. The instructors in the Mid-Town option have written chapters and articles that address these concerns while also maintaining strong research profiles. Clive Beck (2017), for example, reflects on his transition to teacher education from educational philosophy. Beck offers eight recommendations – based on his experiences in Mid-Town, study of exemplary programs, and interviews with teachers – and describes how he incorporates each into his own classes on equity and diversity. A self-study by doctoral student and sessional instructor, Monica McGlynn-Stewart (2010), illustrates how one member of the team adapted her practice in mathematics education by attending to the concerns of teacher candidates. With the support of Beck and Kosnik, she listened closely to their concerns, responding with opportunities to relearn primary math concepts in a collaborative environment and apply them in primary school settings. McGlynn-Stewart also reflected on critical incidents to improve her practice as she developed into a "real" math teacher educator.

Clare Kosnik recounts her shift from a novice teacher educator offering practical strategies and resources based on her experience as a classroom teacher to one who now draws on constructivism to better balance theory and practice in her literacy course (Kosnik and Menna 2013). Kosnik and Menna then examine how they prioritize topics and frame the course around a *big question*. In the course of the chapter, they also illustrate how the program vision, Kosnik and Beck's research on literacy and literacy teacher education, and the collection of data from current teacher candidates inform their decision-making about integrating digital technologies into literacy preparation. Along the way, insights are offered into effective strategies and, more importantly, how they problem-solve the huge challenge of adding digital literacies into an already crowded 36-h literacy course. In a related work, Rowsell et al. (2008) probe into other facets of teaching multiliteracies in teacher education.

One reason for the success of the Mid-Town Option is its faculty members' use of practitioner inquiry to understand and respond to the concerns of teacher candidates. Through interviews with teacher educators and their students over 3 years, Kosnik and Beck (2008) were able to identify the priorities of the instructors and how instruction was viewed by the recipients. An interesting finding was that the systematic coverage of major topics often made courses unfocused with insufficient links between classes. For example, "Clare's course had evolved somewhat

haphazardly...and although she received strong course evaluation, she felt it had become too much of a grab-bag" (p. 121). From this self-study, Kosnik and Beck learned the importance of maintaining balance and providing depth in response to classroom priorities; in turn, these insights informed their book on priorities in teacher education (Kosnik and Beck 2008). This learning was reinforced in a follow-up self-study (Kosnik et al. 2009) on how the feedback from teacher candidates caused prompted them to refine program planning and vision. Similarly, Beck and Kosnik studied the role of teacher educators in developing community within the cohort, then offered recommendations to guide their work and that of their readers. Today, an important component of Kosnik and Beck's large-scale longitudinal study of literacy teacher education continues to be the self-study of the practices of themselves and their colleagues.

While the self-study community relies heavily on critical friends for trustworthiness, the Mid-Town team draws heavily on ongoing and current data from teacher candidates on their experience of the program. Their work is a reminder that critical friendship, while helpful, is not always as illuminating as teacher candidate voices. Beck and Kosnik (2002b), like Kosnik et al. (2009) on literacy, used data sets collected from teacher candidates to grapple with the challenges of making theory and course work relevant and practical for teacher candidates. In this study, they interview nine students twice during the 1-year program on the impact of the coursework on their professional preparation to be teachers. While not a self-study, it certainly amounts to a review of the success of their practices and serves to improve practice in the future. This study illustrates the positive impact of clear theory and goals, offering skills and resources and consolidating learning, as well as the power of well-designed courses in which teacher educators model effective constructivist practice and provide ongoing support.

While Kosnik, Beck, and Goodwin (2016) view teacher education as generally good, they also see room for considerable improvement based on lessons to be learned from effective programs. Beck and Kosnik (2002b), as a result of various studies of their own program, along with subsequent research on exemplary programs (Beck and Kosnik 2006), suggest that smaller colleges of education or cohorts within larger programs are more effective than large-scale conventional programs. Whereas large-scale teacher education programs are limited in their responsiveness to teacher candidate needs (Kitchen and Petrarca 2016), the research from the Mid-Town Option demonstrates that greater responsiveness in course delivery is possible in cohorts run by dedicated teacher educators. The smaller colleges of Bank Street and Mills College demonstrate what is possible when such a commitment is shared across a college.

Bank Street

The academic program at the Bank Street College of Education is guided by a long-established and tightly focused commitment to preparing teachers to be able to link theory to practice through inquiry and reflection. The carefully selected faculty and preservice teachers share a vision centered on Deweyan child development approach, a whole child focus, engagement in active learning, commitment to equity

and inclusion, collaboration, and inquiry into educational issues (Beck and Kosnik 2006). The foundation courses offer philosophical perspectives guided by Deweyan principles and by professional responsibility to educate for democracy, inclusion, and social justice. Darling-Hammond (2006) describes these courses as raising important issues relevant to working in diverse New York schools; she mentions visits to Montessori and Waldorf schools as examples of making the theoretical practical. Similarly, the sequence of child development courses, intellectually rigorous and guided by a whole child approach, incorporates case studies and strategies for understanding problems and possible interventions through observation and recording behavior (Darling-Hammond 2006). Teaching these courses is demanding and intensive as instructors offer considerable individualized attention thinking together with preservice teachers about theory in ways that involve reflection on experience and application to practice contexts (Beck and Kosnik 2006). Integration across program components is reinforced through a capstone integrative master's project actively supervised by faculty members. Helen Freidus, a teacher educator, identifies conference groups, the weekly seminar that accompanies the year of fieldwork, in all Bank Street programs, as "an integrating experience" (Beck and Kosnik 2006, p. 43) for teacher candidates.

One of the lessons to be learned from the success of Bank Street is the importance of a possessing and enacting a coherent vision. The teacher education program has long been guided by five key principles:

1. Education is a vehicle for creating and promoting social justice and encouraging participation in democratic processes.
2. The teacher has a deep knowledge of subject matter areas and is actively engaged in learning through formal study, direct observation, and participation.
3. Understanding children's learning and development in the context of family, community, and culture is needed for teaching.
4. The teacher continues to grow as a person and as a professional.
5. Teaching requires a philosophy of education – a view of learning and the learner, knowledge and knowing – which informs all elements of teaching (Nager and Shapiro 2007, p. 9).

This conception of teaching and learning fostered at Bank Street is known as the "developmental-interaction approach." The curriculum encourages student-centered projects, interdisciplinary, arts integration, and constructivism. The classroom is regarded as a space that "strengthens the child's competence to deal effectively with the environment; encourage the development of autonomy and the construction of a sense of self; promote the integration of functions – that is, thought and feeling, feeling and action – and stimulate individuality and vigorous, creative response" (Nager and Shapiro 2000, p. 22). According to Linda Darling-Hammond's team (Darling-Hammond and Lit 2015; Horng et al. 2015) who reviewed the program and surveyed graduates, the course work is viewed as meaningful, practical, and authentic, and graduates feel well prepared across the curriculum (and particularly Language Arts). The reports offer a third-hand perspective on theory within an exemplary program which can be internally coherent and connected integrated with practice and reflection.

As most faculty focus on their teaching or on specific areas of curriculum and practice in schools, publications on practitioner inquiry generally, and self-study in particular, are limited. Helen Freidus is the most prominent Bank Street teacher educator in narrative inquiry, reflective practice, and self-study. Her practical studies of her practice offer a window into theory, practice, reflection, and the integration of the three at Bank Street. In "Finding Passion in Teaching and Learning," Freidus (2010) employs narrative case study to examine an innovative collaboration between Bank Street and the American Museum of Natural History designed to demonstrate integration of reading and writing skills into the science and social studies curriculum. She reports that participants "gained a deeper understanding of theoretical concepts, learned how to embed skills instruction into meaning-rich curriculum, and come to understand importance of curriculum and instruction that build on children's knowledge and interests, their language strengths, and their curiosity" (p. 81). In "Insights into Self-Guided Professional Development," Freidus et al. (2009) conducted a narrative self-study in which Freidus guided recent graduates through a process of mutual mentoring in order to improve learning in their classrooms. This work largely built on the habits of mind developed in the Bank Street program – questioning, analyzing, inquiring into student learning, and reflecting – in order to sustain inquiry in an era of high-stakes testing.

Although Bank Street is a well-established institution with robust established practices, Freidus (in Lyons et al. 2013) writes:

> Faculty have been encouraged and challenged to find ways of melding a tradition of inquiry with the tools of the twenty-first century, ways to create community across cyberspace, and ways to deepen reflection both face-to-face and at a distance. (p. 171)

In a self-study case account, Freidus describes her efforts to blend online teaching with her traditional classroom and inquires into the effectiveness of her efforts, particularly modifications to an important clinical project. She describes the assignment, which replaces written accounts with video clips of sessions. To her surprise, or relief, "participants were able to name and critique the instructional pedagogy they observed their forum-mates implement across diverse contexts" (Lyons et al. 2013, p. 172) and offer peers insightful critical observations and suggestions. From this, Freidus learned that "the gift of time occurring in asynchronous courses facilitates the social construction of knowledge" (p. 173) while the use of video offers "a new and authentic window into the process of teacher cognition" (p. 173). This study illustrates Bank Street teacher educators working through a pedagogical challenge through thoughtful practice and rigorous inquiry. It also shows how they explicitly navigate the challenges of teaching content in ways that are closely aligned with reflection and practice. Finally, this account of Freidus grappling with illustrates that technological innovation can enhance even exemplary teacher education courses and programs.

The importance of linking theory to reflection and practice is highlighted in a case study of the reading and literacy program (Freidus 2002b). Although teacher candidates were happy with the curriculum courses, they came "from academic cultures

and/or disciplines in which they have been carefully taught to separate their personal and professional voices, to evaluate and critique within a narrow set of guidelines" (p. 84). Awareness of dispositions from prior learning reinforced the need to disrupt this "banking model" through dialogic processes in courses and advisement groups related to field experiences. As the reading and literacy instructors in this small program both possess theoretical and clinical backgrounds and are actively engaged in advisement and field experience, they are well positioned to integrate reflection and practice into theory courses and reinforce reflection on theory in practical contexts. Freidus (2002b) argues, based on responses from faculty, that "the culture of practice pushes faculty to rethink the theorists they teach, the pedagogies through which they teach, and the examples they use to make the theory come to life. At its best, the process is dynamic for both students and faculty" (p. 84). While many teacher educators both teach courses and supervise field experiences, few are as actively engaged in both with the same students over a period of time. It is the faculty culture, as much as the structures, that make Bank Street exemplary in its delivery of theory and curriculum.

Mills College

The faculty in Mills College's Teacher Education Program are dedicated to teaching, teacher education, and social justice. They have thought deeply about teaching as principled practice and how to enact it in classrooms in which students learn. The depth and practicality of their conception are evident in Kroll et al.'s (2005) *Teaching as Principled Practice: Managing Complexity for Social Justice*, in which Mills faculty examine various facets of teaching from moral considerations to reflection to collaboration to power. In this book, they articulate the philosophy that guides the course work and other facet of the program at Mills College. The book, however, mostly concerned with how these principles can be brought to the classroom by teachers in schools. While several chapters draw on examples from teacher education, only one chapter (Kroll 2005) focuses on teacher education.

The chapter on teacher education begins with a description of teacher candidates playing the board game *Clue*. The constructivist purpose of the activity is for them to understand the tasks in the game and how elementary students play such games. According to Kroll et al. (2005):

> This activity simulated, in many ways, what teachers have to do all the time: analyze what the lesson they are teaching requires students to understand and, at the same time, make sense of what the students are actually doing with the lesson. (p. 58)

She then explains how constructivism can inform our university teaching. Kroll goes on to discuss what teachers need to know about constructivism and developmental theory in order to make sound decisions in fostering learning through the subjects in the curriculum.

In a practical manner, Kroll highlights the basic tenets of constructivist and developmental theory. She proposes that by "participating in adult versions of Piagetian and school-learning tasks," we can "begin to develop questioning

techniques and ways of thinking about children's learning" (p. 63) that foster growth. While the activity is important, so too is the subsequent analysis of the results and the conclusions developed about student learning. This chapter brings to life the activity and the rigor of the intellectual and reflective inquiry that follows. It offers a glimpse of what is possible when constructivism is enacted, rather than preached, by teacher educators in an exemplary and tightly focused program. A similar approach is employed in Galura's (2005) chapter on power and authority raise awareness of how minoritized youth experience language learning.

An important element of coursework is the development of assignments that are critical and practical. A theme issue of *Studying Teacher Education* was devoted to how Mills College's students (who had completed the teacher certification program and were working on their graduate degree while teaching) employed self-study to improve the learning of their students. In the editorial, LaBoskey (2015) notes the authenticity and rigor of the studies and the value of self-study as a tool for integrating learning and improving teaching in classrooms. Also, LaBoskey and Richert (2015) describe the rationale and design of the assignment. This includes how they build in the five characteristics of self-study identified by LaBoskey (2004). LaBoskey and Richert (2015), drawing on the work of their students, note that self-study helped energize the participants as they grappled with major issues arising from teaching in urban contexts. As they reflect on their own practices, LaBoskey and Richert also raise questions about joy, rigor, and potential cultural biases that might be rooted. They also consider how to refine the self-study for teachers both as part of the program and for the professional development of practicing teachers. While special issue confirmed their sense of the viability of self-study with teacher candidates and teachers, LaBoskey and Richert (2015) conclude by critiquing their practices, setting goals for future projects, and systematically documenting their instruction to "better pinpoint the specific strengths, weaknesses and omissions of [their] practice" (p. 178).

Many teacher education programs express commitment to equity and social justice. Mills College goes much further with this principle underlying all facets of the program and relationships with urban schools in the Oakland area. Mills College, like Kosnik and Beck at Mid-Town, is interested in understanding the impact of the program on teacher candidates and graduates. LaBoskey (2012), in order to "examine understand and improve [her] conceptualization and enactment of social justice teacher education" (p. 229), gathered information from six graduates on how their teaching years later was informed by her classes. Through their conversations, she realized that her concern about moving beyond nuts-and-bolts management and fun activities created the impression that these were problematic; she reconsidered some of her signature line and areas of emphasis in order to send clearer, more positive messages. As part of the same study, a critical friend helped LaBoskey examine elements of her teaching in classes, leading to further refinements in the terms she employed. It is interesting and inspiring to read a master teacher educator agonize over relatively minor refinements in order to enhance already exemplary practices.

Practice

The shift from practice-oriented normal schools to more theory-oriented education colleges led to "the apparent separation between theory and practice in many programs" (Darling-Hammond 2006, p. 152) with courses that ignored the realities of teaching and field placements that dismissed theory. This perceived gap has prompted some critics to cast doubt on the theoretical components of teacher education and propose limited roles for universities (Kitchen and Petrarca 2016). Neoliberal advocates of deregulation and choice go so far as to "work around" universities through alternative certification. Clearly, there is a need for conventional teacher education programs to become more practice-oriented through exposure authentic classroom experiences and stronger links with schools. Indeed, as Feiman-Nemser (2001) states, "Teacher candidates need opportunities to test the theories, use the knowledge, see and try out the practices advocated by the academy" through "[o]bservation, apprenticeship, guided practice, knowledge application, and inquiry" (p. 1024). Conventional teacher education programs that challenge the simplistic visions of teaching developed by teacher candidates during their lifetime apprenticeship of observation (Lortie 1975) through a grounding in practice tend to be rated highly (Boyd et al. 2009). The best programs also address the challenges of enactment – e.g., how to present clearly, manage behavior, weigh dilemmas, plan, make quick decisions – and complexity by carefully balancing theory, practice, and reflection (Darling-Hammond 2006).

Research by teacher educators in exemplary programs illustrate the challenges of integrating practice into teacher education and offer guidance to practitioners and programs interested in successfully addressing these challenges in order to meet the needs of teachers. The teacher educators in these studies "resist the tendency . . . to view ourselves primarily as theorists in specialist areas, leaving practice to be addressed by others or figured out on their own" (Kosnik and Beck 2009, p. 9). Instead, they thoughtfully design clinical experiences that help candidates understand the contexts in which students learn (Kosnik and Beck 2011). In their study of exemplary social constructivist programs, Beck and Kosnik (2006) identify five ways in which these colleges made the practical dimension highly effective. First, they spread field experiences through the program (e.g., 3 days a week at Bank Street) and interspersed student teaching over several blocks. Second, they carefully selected mentors and provided them with professional development (e.g., workshops and interactions with faculty visiting schools). Third, they developed partnerships with a small group of school partners and cohorts of teacher candidates to enhance the university presence and increase collaboration with mentors and visits with candidates. Fourth, they have course instructors who serve as clinical supervisors to create opportunities to link theory to field experiences; Mills College, for example, has foundations and curriculum faculty supervise as well as engage in professional development and research with partner schools. Finally, meetings, seminars, and assignments link the university to schools on an ongoing basis. Clearly, the research from these exemplary programs illustrates both how teacher educators can attend to practice and how programs can organize programs to enact practice-oriented reforms.

Mid-Town

Field experiences in schools are acknowledged to be critical to effective teacher education experiences. At the same time, there is a tendency to blame associate teachers for not approaching their work in the way we would like as teacher educators. Often associate teachers see themselves as supporting "real-world" practice (initiation model) rather than as partners in supporting teacher education in integrating theory with practice (critical intervention model) (Beck and Kosnik 2000). Beck and Kosnik (2000), as part of a broader commitment to studying their program for both instructional and research purposes, sought to understand the perspectives of associate teachers on supervision. They interviewed 20 associate teachers while also collecting teacher candidate perceptions through surveys and reflective writings and inquiring into the roles of tenured and contract teacher educators in the program. This led them to discover that most associate teachers were satisfied with their involvement, even though it could be time-consuming and demanding. They were also appreciative of personal relationships with faculty, which validated the engagement by faculty in supervision. On the other hand, based on discrepancies between teacher candidate and associate teacher perceptions, they found that more could be done to build rapport and supportive environments. As Beck and Kosnik were interested in deepening associate teacher involvement in the teacher education cohort community, they inquired about their interest in becoming more involved, engaging in action research and being part of a professional development school only to find that there was minimal interest. They did conclude, however, that more could be done to improve the flow of information so that associate teachers were aware of the goals of the program and could align their planning with the program's goals. In a follow-up study on professors involved in practica, Beck and Kosnik (2002b) noted the positive effects on partnership, teacher candidate experiences in the field, professor's ability to connect theory to practice, and their understanding of schools. In many ways, the University of Toronto experience with associate teachers is more helpful to larger programs as they do not have the opportunity to cherry-pick a few select partner schools. While Mills and Bank Street field experiences point to the ideal of strong partnerships based on shared commitments, the work of Beck and Kosnik illustrate that there is much that can be done by engaged faculty to make conventional programs better connected to partners in the field.

The inquiry of Beck and Kosnik on practice extends beyond studying their own teaching and cohort to better understanding field experiences more generally. While their curiosity began with their own program, the insights on teacher candidate perceptions of student teaching in Beck and Kosnik (2002a) are much broader, including the need for associate teachers to offer emotional support, peer relationships, feedback, and modelling. Because they know the teacher candidates and associate teachers in their program well, they are able to offer rich illustrations and offer deep insights into the implications for teacher educators attempting to make the experiences positive and constructive. Also, by understanding the whole process, rather than only their own courses, they were also able to improve their own practices as course instructors.

Self-study is viewed by Beck et al. (2004) as being well-suited to studying and improving field experiences as self-study-oriented practitioners disposed to personal, constructivist, and collaborative dispositions. In "The Preservice Practicum: Learning through Self-Study in a Professional Setting," they argue that this allows us to see the connections between theory and practice, as well as vomit to the necessary relationship building with teacher candidates, cooperating teachers, and schools.

Mills College

Mills College is both conscientious in assuring good field experience placements and committed to finding ones in which teacher candidates can live out the program's commitment to constructivism, reflection, and social justice. In order to assure "an extended and artful clinical relationship" (Clark 2002, p. 79) between the core principles taught in the courses and enactment in practice, significant time is given to practice teaching. In the first year of the 2-year program, both elementary and secondary teacher candidates attend their field schools in the morning all year (different placements each semester), followed by afternoon classes at the college. Faculty advisors, mainly part-time, support them through weekly meeting in a teaching seminar, observations every other week, reading their weekly journals, and meetings with carefully chosen cooperating teachers (LaBoskey and Richert 2002).

A study by LaBoskey and Richert (2002) highlights both the commitment necessary for exemplary practice-oriented teacher education and the challenge to seamlessly integrating practice with theory and reflection. The study focuses on the experiences of two teacher candidates chosen to represent challenging issues for the program. Both enjoyed a successful placement and one less successful, which prompt LaBoskey and Richert to learn lessons to maximize their impact of the placements and program on all teacher candidates. They identify four dimensions of placements render "learning contexts for teaching" (p. 26): nested learning (constructivist learning contexts for children), blending principles (opportunities to construct knowledge based on their understandings), safety (in taking risks pedagogically), and a reflective focus. Safety was particularly important, especially as it overlapped with other dimensions:

> Student teachers need to feel safe if they are to move beyond the *recognition* of program principles into the process of *reflecting* on them, *enacting* them in their teaching, and *embracing* some construction of them in their own practice. (LaBoskey and Richert pp. 27–28)

The study reinforced the importance of well-designed coursework in making connections between theory and practice, as both participants regularly spoke of these connections in their journals. It also highlighted the vitally important role of faculty advisors in building bridges to theory, supporting teacher candidates in the field and finding compatible placements. While the results were largely positive, it is evident that the authors will not be satisfied until all placements are good. They also wonder if teacher candidates might be better served if more full-time faculty were involved in field supervision, something that occurs at Bank Street.

While Mills College is small and specialized enough to be selective in its placements, all teacher educators can learn from its commitment to intensive yet critical practice teaching experiences, and attention to integration with other elements of the program, and openness to inquiring into what constitutes exemplary placements.

Bank Street

The teacher education at Bank Street School is highly regarded for rich, supervised field experiences, according to surveys conducted with graduates and educators in the community by Horng et al. (2015). This research indicates that, at 720 days, the Bank Street field experiences are considerably longer than in the colleges of education used as comparators (120 days on average). While the duration of the field experiences no doubt contributes to its regard, what distinguishes Bank Street is the quality of the supervisors who regularly observe, offer constructive feedback, and provide individualized mentoring (Darling-Hammond and Lit 2015). Teacher candidates praise "the enduring value and importance of the structure of advisement/ supervision at Bank Street" (Freidus 2002b). According to Darling-Hammond and Lit (2015):

> Bank Street teacher preparation programs all rely on the integration of coursework and clinical experiences in schools. Prospective teachers work in classrooms for extended periods of time as student teachers... Most prospective teachers spend a year or more in the classroom as part of their program. All prospective teachers also engage in Bank Street's intensive advisement experience. Advisement entails regular classroom observations and individual meetings with a faculty advisor to support professional learning and growth, as well as a weekly collaborative conference group with a faculty advisor and small group of graduate student peers. (p. 17)

While practical experiences are valued, it is "the length of advisement – a full year of supervised fieldwork experience – and the fact that students work with a single advisor/supervisor over the course of that year" (Freidus 2002b, p. 82) that have been identified as unique program strengths. "The year-long relationship provides time for advisors/supervisors to build a safe context in which assessment and instruction can be intrinsically linked," according to Freidus (2002b, p. 83). This "gift of time" helps advisors "identify the personal and experiential strengths that the fieldwork students" and "shaper their feedback to mesh with the personal style, knowledge base and classroom realities that the fieldwork student brings and encounters" (Freidus 2002b, p. 83).

From teacher candidates who participated in her self-study, Freidus (2002b) "found that the multiple roles faculty members play help to minimize the traditional institutional schism between knowledge of the field and academic knowledge" (p. 83), as faculty advisors saw how social, cultural, and economic forces impacted classroom realities. "Thus the structures of Bank Street do much to mitigate against the perceived dichotomy of theory and practice that is so often and so properly criticized" (p. 83), Freidus (2002b) notes, and teacher candidates "recognize and value the resources that faculty offer" (p. 83).

The approach to student teaching, which includes practice conference groups, is another key feature of Bank Street's successful integrated program. Clark (2002) identifies Bank Street is special for expanding the traditional trio of student teacher, supervisor and cooperating teacher to include groups of students meeting weekly with a faculty advisor who also sees them in the field. Student teaching takes place at Bank Street School for Children and carefully selected school sites with teachers who model the program's philosophy and practice. A conference group, consisting of five to seven preservice teachers working with a faculty member, is a key course for to integrating theory, practice and reflection, all faculty participate and, according to Beck and Kosnik (2006), "advisors work hard to help the students understand the Bank Street philosophy and apply it to their teaching" (p. 28). Freidus describes teaching this course as "extremely labor intensive and extremely extensive" (Beck and Kosnik 2006, p. 50) and useful in keeping faculty connected to preservice teacher experiences and the field of practice. Furthermore, Darling-Hammond and Macdonald (2000) suggest that the "involvement of directors in teaching, advisement, and supervision keeps them cognizant of the field and of the kinds of placements where students exemplary teaching" (p. 19). While similar models are employed in programs such as Mid-Town and Mills, the closeness of these bonds remains unique.

Bank Street, like Mid-Town and Mills College, offers exemplary student teaching because faculty actively collect data from teacher candidates and partners for purposes of program improvement. In "Teacher Education Faculty as Supervisors/ Advisors/Facilitators: Playing Multiple Roles in the Construction of Field Work Experiences," Freidus (2002a) studies the field placement through a combination of alumnae surveys, course feedback, field notes by supervisors, and conference group conversations. She identifies multiple roles played by supervisors including drawing on teacher candidate knowledge, helping them reframe knowledge, scaffolding, and negotiating relationships with cooperating teachers. Overall, Freidus (2002a) found that together "these roles lead to the development of a consistent, cohesive support system" (p. 75). While the structure of the field experiences is sound, success "depends on the ability of the advisor/supervisor/facilitator to scaffold the teacher's learning in ways that enable interpretation and reinterpretation that draws on the leaner's experience and developing understanding if other perspectives" (p. 75). Bank Street, as a small and highly regarded college, is able to find and support full-time faculty who serve as bridges between practice and the rest of the program and inquire into practice in order to be "more conscious and systemic" (p. 75).

Reflection

Dewey (1933) describes reflective thinking as "[a]ctive, persistent, and careful consideration of any belief or supposed form of knowledge in the light of the grounds that support it and the further conclusions to which it tends" (p. 6). The emergence of reflection-oriented teacher education stems from both dissatisfaction with conventional approaches and Schön's (1987) work on reflective practitioners.

"Intentionality, activity, and reflection are essential to meaningful learning, especially in complex and new domains," according to Jonassen et al. (2000, p. 111). Meaningful learning can occur when practitioners engage in cycles of reflection that include deliberate and active processes.

While programs typically foster opportunities to reflect, few make explicit the *need for* and *value of* reflection to prospective teachers (Loughran 2002) or engage in intentional processes that weave theory and practice together (Redman and Rodrigues 2014). "Simply being encouraged to reflect is likely to be as meaningful as a lecture on cooperative group work," according to Loughran (2002, p. 33). On the other hand, a characteristic of exemplary integrated programs is the structuring of reflective practices that serve to differentiate between *poiesis* or making-action and *praxis* or doing-action by theory and action toward *informed action* (Carr and Kemmis 1986). As is evident from research in these exemplary programs, a reflective orientation engages teacher candidates in "a puzzling, curious, or perplexing situation" (Loughran 2002, p. 33) for which neat and tidy solutions are unavailable (Schön 1987):

> Because the unique case falls outside the categories of existing theory and technique, the practitioner cannot treat it as an instrumental problem to be solved by applying one of the rules in her store of professional knowledge. (p. 5)

Developing reflection, as a way of *being* for teachers rather than just a technique, requires engagement both in practice and university settings.

Bank Street

Reflection and reflective inquiry are essential elements of the Bank Street teacher education experience (Nager and Shapiro 2000). As Freidus writes, "Through reflection, teachers become metacognitively aware and critically conscious," and through reflective inquiry" new learning occurs and learners may be transformed" (Lyons, et al., p. 170). Freidus, in collaboration with Nona Lyons, is a leading proponent of reflective inquiry and the use of reflective portfolios generally (e.g., Freidus 1998) and within the self-study community (Lyons and Freidus 2004).

Freidus describes the use of reflective portfolios at Bank Street through her experiences and the portfolios of two teacher candidates in a self-study case in "The Reflective Portfolio in Self-Study" (Lyons and Freidus 2004). An exit requirement in the graduate program is the completion of an integrated project. One of the options is independently working on a reflective portfolio under the guidance of a faculty member. Teacher candidates choosing portfolios "document their understanding of a common area within a discipline" and through deliberations and research "frame and reframe [their] understanding of teaching and learning" (p. 1093). Portfolios feature accounts of teaching experiences, explanations grounded in theory, and setting goals for professional growth. The five to six artifacts (e.g., text, pictures, charts, videos) and accompanying analysis and reflection in the portfolio must demonstrate competency in four domains; process requirements include individual, dyadic, and group discussion and collaboration. Each participant

"reported that the portfolio process had afforded her a fuller – visceral as well as cognitive – understanding of inquiry learning and authentic assessment tools and processes" (p. 1099).

At first Freidus observed teacher candidates struggle with the challenges of reflective inquiry. Then, by working through the process with peer and faculty support, they "honed their skills at and willingness to critically review and modify their practice on an ongoing basis" (p. 1100). This integration of theory, practice, and reflection, which proved valuable to teacher candidates, also had a positive impact on the cooperating teachers who witness portfolio presentations. This self-study helped Freidus validate the use of reflective portfolios at Bank Street since 1991 and "gather new evidence to support [her] belief in constructivist pedagogy" (p. 1100).

Bank Street was also an early adopter of digital portfolios, which are discussed in Lyons and Freidus (2004) and developed further in Lyons et al. (2013). Lyons and Freidus (2004) note that being "caught in the morass of mechanical difficulties, reflection and self-study do not flourish" (p. 1101). Increased technical support at Bank Street, along with faculty support and involvement, helped candidates develop their technical skills and resulted in richer, more authentic portfolios. In her 2013 case, after another decade working with digital reflections, Freidus was reassured that digital portfolios were compatible with the constructivist perspectives at Bank Street and had many advantages over other form, so long as faculty facilitators played an active and critical role in "leading them to new knowledge and under-standings" (Lyons et al. 2013, p. 173). These studies of reflective inquiry at Bank Street confirm the value of reflection in teacher education yet also highlight the importance of faculty in supporting and integrating meaningful learning through reflection. This is consistent with Zeichner and Wray (2001) who, in response to concerns about the nature and quality of reflection in conventional programs, identified the importance of carefully framing reflective portfolios to enhance teacher candidate learning.

Mills College

Reflection is crucial to the constructivist approach at Mills College. The program "invites[s] and encourages[s] students to construct their own knowledge of teaching and to reflect on their own learning as well as their students' learning" (Kroll and LaBoskey 1996, p. 70). This reflective work takes place both in class and in the field and is particularly integrative as Mills teacher candidates are in schools in the morning and in class later the same day.

Kroll and LaBoskey (1996) identify reflective writing, particularly dialogue journals between teacher candidates, as perhaps the most important aspect of the program. Donahue (2005) describes in rich detail a number of the strategies Mills College has found to be effective in promoting reflection that is critical, practical, and aligned to program features and principles. Kroll and LaBoskey (1996) describe dialogue journals in which teacher candidates write at least twice weekly on questions raised by course work and field experiences. Supervisors then respond in-depth seeking to validate observations and learning, help them step back to see the problem clearly, and redefine the problem in order to arrive at solutions. This overview is

supported by two examples from their supervision that demonstrate that reflection is particularly deep when guided by supervisors who know the program well and maximize opportunities for reinforcement and integration. Similarly, LaBoskey and Richet's examination of the field experience illustrates that dialogue journals offer supervisors rich data for supporting teacher candidates in placements. Their participants "stress[ed] the important role their supervisors played in their ability to reflect" (p. 29) and for improving supervision and field experiences.

The reflective component of the Mills program is also closely linked to theory and course work. Kroll et al. (2005) identifies autobiography as "the beginning of a framework for continued development in understanding the literacy learning process" (p. 71). From this, as developmental and pedagogical knowledge and insights are added through course work, teacher candidates "continually reconstruct [their] ideas about the learning of literacy" (p. 71). Two reasons why it is important to engage in "adult" versions of activities, rather than imitate children, is that it helps them better understand their own learning processes and it becomes part of their own understanding of learning and teaching. Through such metacognition, teacher candidates better understand and empathize with student learners. If constructivism is to be about learning rather than teaching, it is important that teacher candidates come to know through reflection on their own experiences and practices. Kroll, through her account, brings to life how this might be simultaneously developed in theory and reflection.

Integration

A consistent theme in teacher education research is the conceptual and structural fragmentation common in many programs. Darling-Hammond and Hammerness (2005), for example, critique collections of unrelated courses lacking a common vision, connections across courses, or meaningful links to reflection or practice. Darling-Hammond (2006) identified three problems in learning to teach that she considered best solved through integration: (1) unlearning conceptions of teaching learned through the *apprenticeship of observation* (Lortie 1975); (2) challenges in learning to enact theory in practice contexts; and (3) confronting the multiple and complex academic and social goals in real time in classrooms.

It is easy to include theory, practice, and reflection – and most teacher education programs (Kitchen and Petrarca 2016). Kosnik and Beck (2011) make the case that teacher educators "often try to do too much" by covering "the waterfront in almost every subject" and, thus, "[s]tudent teachers are inundated with so much information that they have a difficult time organizing it both conceptually and physically" (p. 2). Certainly, it is hard to do each well. It is extremely challenging, however, to tightly integrate these at a high level in order to prepare teachers to be adaptive experts. As Feiman-Nemser highlighted (Feiman-Nemser 2001), they often have weak relationships between courses and field experiences, offer fragmented pedagogy, limited subject matter knowledge, lack teacher educators who practice what they preach, fail to link theory to practice, and do not "cultivate habits of analysis and reflection

through focused observation, child analysis, analysis of cases, microteaching, and other laboratory experiences" (p. 1020). All the elements may be present, but more rigor needs to be applied to selection, placement, and integration of the elements. More consideration needs to be given to the growing professional consensus and research evidence "on *teacher learning* and teacher education to suggest some strategies that may help new teachers learn this material more effectively" (Darling-Hammond and Bransford 2005, p. viii).

Teacher educators "do much good work and we must acknowledge and build on that foundation" (Kosnik et al. 2016, p. 267), yet it is important to acknowledge areas for growth. While most teacher education programs include theory, practice, and reflection, few do all of them well let alone integrate them into a cohesive whole (Kitchen and Petrarca 2016). As adaptive expertise can occur only when teacher candidates draw on purposeful clinical experience, apply theory to practice, and reflect on their professional experiences to address the learning needs of the students they serve and the communities in which they live (Bransford et al. 2005), we have much to learn from exemplary constructivist teacher education programs such as Mid-Town Mills and Bank Street. The integrated teacher education approaches in exemplary programs offer ways to make conventional teacher education more rigorous and meaningful. Research, including self-studies, from teacher educators in these programs offers guidance to others striving to enhance teacher education in their own institutions. Integrated teacher education is challenging as it extends beyond assembling all the necessary elements to carefully weaving them together so that the elements inform each other in deep and meaningful ways.

As the integrative nature of the Mid-Town, Bank Street, and Mills College is evident from the examples offered in the sections on theory, practice, and reflection above, this section is organized around the five strategies for building and sustaining integrated teacher education identified by Beck and Kosnik (2006) in *Innovations in Teacher Education.* Integrated teacher education is challenging as it extends beyond assembling all the necessary elements to carefully weaving them together so that the elements inform each other in deep and meaningful ways. The integrated teacher education approaches in these exemplary programs offer ways to make conventional teacher education more rigorous and meaningful. Research, including self-studies, from teacher educators in these programs offers guidance to others striving to enhance teacher education in their own institutions.

A Shared, Explicit Vision of Teaching and Learning

The first strategy is a shared, explicit philosophy of teaching and learning that is precise, concise, and fixed. This should be reinforced by "careful selection of students, appointment of suitable faculty, and institutional support" (p. 104). A clear, coherent thoughtful vision, according to Levine's (2006) study of exemplary programs, is necessary but not sufficient. The vision must also be enacted through carefully structured curricula and cohesive field experiences that apply theory to practice. Similarly, Darling-Hammond (2006) highlighted coherence and integration, as exemplified in extensive, well-supervised clinical experience linked to courses that employed pedagogies that link theory and practice.

The program at Bank Street has maintained "a long established pattern for integrating theory and practice" (Biber, 1973; 2015) since its inception. The master's program is centered on the mastery of developmental theory, teaching strategies, and meaningful field experiences. Five key principles explicitly guide all elements of the program. The core courses are all based on Deweyan principles of child development and active engagement, with the content reinforced through constructivist pedagogy. According to Darling-Hammond (2006), this program exemplifies "a careful combination of experience, reflection, and study" achieved through "the careful construction of settings for learning in which learners can move back and forth between 'book learning' and firsthand experience" (p. 50). Similarly, Mills College's six principles provide a set of lenses to help focus on a shared goal (Kroll et al. 2005), which guides the course work as well as the reflective journals and the carefully selected placements in urban school settings. The teacher candidate self-studies examined by LaBoskey and Richert (2015) demonstrate draw on these principles in making sense of teaching and learning. While Mid-Town is guided by similar principles, this option nested with a large preservice program at the University of Toronto faces greater challenges in enacting a shared, explicit vision. Fortunately, the teacher education program structure allows each option latitude to have its own focus. While selecting Mid-Town from a range of thematic and geographic options, they are less to be committed to the vision. Yet, thanks to the vision of Kosnik and Beck, and their determination to select course instructors aligned with their vision, Mid-Town is an island of social constructivism within a highly diverse conventional college of education.

A Collaborative Faculty Team

The second strategy is a collaborative faculty team that shares commitments to the philosophy and is committed to taking time and effort to collaborate. This requires the integration of contract faculty, full-time teacher educators, and other professors involved in the program. Integrated teacher education necessitates the development of a pedagogy of teacher education through which teacher educators understand teaching and learning about teaching (Loughran 2006). It requires teacher educators who purposefully examine the complex interplay between elements both within courses and across a program.

The faculty teams at Mills College and Bank Street College are carefully selected to fit with the philosophies of their respective small, specialized colleges of education. The chapters in *Teaching as Principled Practice* by Kroll and her Mills College colleagues (2005) illustrate the power of faculty members working together based on a common philosophy. Similarly, Freidus (2002a, b) explains how Bank Street faculty, committed to the core principles and aware of each other's course work, collaborate in order to support and reinforce each other's efforts in class, in supervision groups, and in the field. Indeed, faculty are so committed to program integration that they are also involved in time-consuming field placement and supervision. At Mills College, LaBoskey and Richert (2002), part-time instructors and faculty advisors, are committed to the program principle; nonetheless the authors wish that more full-time faculty were able to supervise field placements, as that would strengthen program cohesion. Mid-Town is less able to ensure that faculty

share a common vision, but Kosnik and Beck had significant input into the selection of the full-time cohort leaders and the course instructors selected to teach course sections for their teacher candidates; they also taught courses in the program and, unlike most faculty, supervised field placements.

An Integrated Campus Program

The third strategy is explicit attention to integrating the campus program so that students can more easily make connections within courses and across courses. Teacher candidates are more likely to make these connections in a program which there is explicit attention to integration within courses and across courses.

Attention was given in all three exemplary programs to such integration. Faculty in Mid-Town regularly consulted with teacher candidates to check on their understanding and build stronger connections across the program. Most notably, Kosnik and Beck (2008) identified a need for courses with a coherent vision, connections between topics, links with other courses, and connections to practice. At Mills College, reflection was emphasized both within course (e.g., Donahue 2005; Kroll 2005) and within the practice teaching groups (LaBoskey and Richert 2002), with faculty members playing important roles as guides and critical friends.

The most tightly integrated program appears to be Bank Street College. Course instructors met regularly to ensure they were approaching the material in similar ways, and there is much communication across course from a faculty hired for their commitment to a progressive, child-centered philosophy (Beck and Kosnik 2006). In particular, according to Judy Leipzig, "The Study of Children in Diverse and Inclusive Settings through Observation and Recording" is "one of our central integrating courses" (Beck and Kosnik 2006, p. 36), and its emphasis on child development is reinforced in other courses, the culminating project, and the field advisement groups.

Freidus (2002b), based on her insider role and research, found that:

> the multiple roles faculty members play help to minimize the traditional institutional schism between knowledge of the field and academic knowledge... This makes it possible for advisors to help students to construct bridges between their course work and their field experience. They are able to support what Schön (1983) calls reflection-in-action, while also facilitating students' ability to make links between the practice of the moment and the theory that underlies this practice. Moreover, the process is recursive. Since teaching faculty are also field advisors, they are less likely to sustain a traditional ivy tower stance. (p. 83)

It is also due to an institutional culture in which faculty members, individually and collectively, focus on "teaching students how to develop and blend the skills of observation, reflection, and systematic instruction" (Freidus 2002b, p. 84) and in which faculty give priority to recalibrating their practice to maintain this balance in changing times.

Connecting the Campus Program and the Field Experience

The fourth strategy is connecting the campus program to field experiences through interspersing student teaching with courses, carefully selecting mentor teachers,

establishing close partnerships with schools, and involving instructors in clinical supervision.

This is especially well done at Mills College, where teacher candidates are in schools every morning and take classes later each day. This constant interplay between classroom experiences and theory learned in courses assures strong theory-practice connections and ongoing reflection on one's own pedagogical stance. This is reinforced through constructivist tasks within courses (Kroll 2005) and the dialogue journals with faculty advisors (LaBoskey and Richert 2002).

At Bank Street, long placements in carefully selected partner schools and the involvement of faculty in advisement and field supervision make for strong connections. Mid-Town is bound by the parameters of the wider program in terms of practice teaching block duration, but faculty members have made a special effort to partner with local schools committed to similar principles and visit teacher candidates in schools in order to strengthen connections.

Modelling an Integrative Approach to Life and Learning

Fifth strategy is to model an integrated approach to life and learning in the program. All three programs model caring relationships among faculty, with teacher candidates, and with partner schools. This is accomplished with relative ease at Bank Street and Mills College, as they are small programs with a unity of purpose among its stakeholders. Nonetheless, the accounts by their faculty reveal considerable commitment to holism, engagement with students, community building, and the students and schools they and their graduates serve.

The importance of relationships and building community is largely ignored in the teacher education literature. While studies by teacher educators, particularly in self-study, emphasize the relationships with individual teacher educators, the building of larger communities of practice is under researched. The work of Beck and Kosnik (2001) is very concerned with relationships among teacher educators, teacher candidates, and associate teachers. As instructors in a cohort model, and as collaboratively inclined faculty, they have worked hard to build communities that reflect the integrative approach to life and learning in their social constructivist approach. As community develops less naturally in a large college of education, they have devoted particular attention modelling caring in community. as practitioners and scholars to on the smaller scale of cohorts to creating a more coherent program, stronger theory/practice links, closer relationships, and modelling a communal, collaborative approach. In "From Cohort to Community," Beck and Kosnik (2001) puzzle over the effectiveness of their cohort as community through 4 years of teacher candidate observation, surveys, interviews, and excerpts from written assignments. Their analysis of the data revealed multiple effects, including a strong sense of community and inclusion, high level of participation, more risk-taking, greater equity, more self-acceptance and personal growth, and collaborative professional learning. In "The Contribution of Faculty to Community Building in a Teacher Education Program: A Student Perspective," Kosnik and Beck (2002) focused specifically on teacher candidate interview responses concerning teacher educators. Their key findings, based on the responses, were:

1. Accepting students as individual human beings
2. Respecting students' ideas
3. Showing friendliness and care
4. Linking community and learning
5. Taking a stand on the direction of the community

These responses reinforce the importance of teaching as a relational activity (Kitchen 2005a, b) and, more importantly, the power of teacher education communities when teacher educators, led by tenure-track faculty, take a stand in the direction of community building. The success of community building in Mid-Town suggests that committed faculty can build caring community anywhere if they take the time and effort to teach their courses and structure their programs with community in mind.

Influence Beyond the Program

Teacher educators studying their own practice have a great deal to offer their own colleges of education, the institutions of higher education in which they are located, schools and school districts, and, in particular, teacher education research community. Research by teacher educators working in exemplary programs is particularly helpful to members of the S-STEP community as they seek to improve their own practice and enhance the programs in which they teach teachers. All three exemplary programs examined in this chapter are influential in a variety of ways. Particular attention in this section is paid to the impact on the teacher education research community, particularly S-STEP.

Bank Street

Bank Street is notable for its impact on education beyond its doors, particularly in New York (Darling-Hammond 2006). Darling-Hammond and Lit (2015) found that graduates remain in the teaching profession longer than other teachers and are more likely to assume leadership positions in the profession. Also, they note that Bank Street-affiliated "teachers come together over a common desire to continually better themselves, their work, and their impact on students, families, and their community" (p. 138).

Bank Street is also very engaged in promoting progressive education and effective practices, according to its website (Bank Street n.d.). It runs many institutes and conferences for educators on topics such as infancy, kindergarten education, language, and literacy, as well as certificate programs on education and educational leadership and professional development initiatives. Important professional development initiatives focus on science education and on culturally responsive teaching. Scholarly initiatives include centers that disseminate information and research on early childhood education and children's literature. There are also a range of short videos on teaching and learning strategies, featuring Bank Street children as participants. Of particular note is *Occasional Papers* series of monographs on a wide

range of educational topics; these monographs written and edited by distinguished educators and scholars, now over 40 in number, offer a progressive education perspective on important topics such as literacy, accountability, equity, and online learning. Only one, "A Progressive Approach to the Education of Teachers: Some Principles from Bank Street College of Education" by Nager and Shapiro (2007), focuses on teacher education at Bank Street.

Helen Freidus has made important contributions to teacher education research through her self-studies and other practitioner research on literacy, practice teaching, and reflective practice. Her work on literacy education (Freidus 2002b, 2010) offers practical approaches to integrating theory, practice, and reflection into teacher preparation, while her work on supervision (Freidus 2002a) and professional development groups (Freidus et al. 2009) exemplifies how the principles developed at Bank Street can be enacted elsewhere. Particularly rich are the insights offered in her collaboration on reflective inquiry and portfolios with Nona Lyons (Lyons and Freidus 2004; Lyons et al. 2013), as well as the case studies of how Freidus has incorporated reflection into her work at Bank Street. Thanks to Freidus, we as teacher educators are offered insights into how teacher educators in exemplary programs enact pedagogies of teaching by living alongside teacher candidates through course work, supervision, reflection on theory and practice, and ongoing teacher development.

Overall, the Bank Street College of Education and Bank Street School influences learning, teaching, and teacher education through exemplary practices and the mobilization of that knowledge in schools and in resources. The external studies of Bank Street (e.g., Darling-Hammond 2006; Darling-Hammond and Lit 2015; Horng et al. 2015; Beck and Kosnik 2006) are useful in understanding how exemplary programs integrate all the elements through clear vision, committed teacher educators, and strong relationships among teacher educators and with teacher candidates and the wider community. The work of Freidus, which epitomizes thoughtful teacher inquiry, is particularly valuable because it illuminates exemplary individual and program-wide teacher education pedagogy. I only wish that Freidus and her colleagues will write more studies of their practices in chapters, articles, and the Bank Street *Occasional Papers* series.

Mills College

Mills College's School of Education is highly regarded for its innovative programs in teacher education. As a *Teachers for Tomorrow's* school, it is seen as an innovator and an exemplar of excellence in constructivist, developmental, and social justice teaching and teacher education. The School of Education also participates in a range of community partnerships including the Center for Urban Schools and Partnerships, Educating for Democracy in a Digital Age, Inquiry into Leadership for Early Childhood Professionals, and the Oakland Education Cabinet. Its graduates, many of whom teach in urban schools nearby, are highly regarded and particularly appreciated for their attention to cultural and linguistic minorities (Mills College n. d.; Beck and Kosnik 2006). The college also houses the Mills College Children's School, a laboratory school guided by similar principles and informed by the expertise of teacher education faculty.

The scholarship of Vicki LaBoskey, Linda Kroll, and Anna Richert is respected by teachers and teacher educators in the United States and internationally. *Teaching as Principled Practice* (Kroll et al. 2005) is a significant and practical approach to addressing social justice in a constructivist manner. It offers rich descriptions of effective practices in language that is accessible to classroom teachers and features chapters by several teacher educators who live exemplify the principles of the program.

The faculty have also played important roles in the S-STEP community through their many publications. LaBoskey's (2004) seminal work on the characteristics of self-study has guided many teacher educators in assuring rigor in their work. In this chapter, while LaBoskey emphasizes the importance of modelling an inquiry stance and rigorous reflection on practice, her guiding mission is to improve "in order to maximize the benefits for the clients, in this instance preservice and inservice teachers and their current and future students." The self-studies by Mills College faculty and graduates, especially the theme issue of *Studying Teacher* Education, have advanced social justice to a central place in the S-STEP discourse. Also, LaBoskey was an editor of the *International Handbook of Self-study of Teaching and Teacher Education Practices* and president of the California Council on Teacher Education.

The challenge for Mills College is to keep up its contributions to teacher education scholarship with the retirement of the scholars who have written about its exemplary program. The teacher education community has much to learn from this exemplary program and self-studies that challenge us to constantly refine our practice individually and as faculty teams.

Mid-Town Option

The Mid-Town Option, thanks to a wide range of studies by Kosnik, Beck, and their collaborators, has contributed significantly to discourses on educational, teacher education, and exemplary programs. They have done so through self-studies and through related studies framed as reflective practice or action research, both of which are complementary approaches that both inform self-study and are often employed as methods in self-study. Kosnik and Beck's studies of practice, which have been cited above, constitute a substantive body of work focused on the workings of the one program in which they both work. Their work offers rich perspectives on the design and delivery of multiple elements of a program. Of particular value are their studies of the role of faculty members and teams in building community (Beck and Kosnik 2001; Kosnik and Beck 2002) and supervising field experiences (Beck and Kosnik 2002a; Beck et al. 2004). Also, important is their modelling of an inquiry stance that contributes both to program improvement and educational research. As Beck and Kosnik (2001) write, "The problem of the heavy work-load and lack of rewards can be overcome to some extent by doing research on one's own teacher education practice" (p. 947). The cumulative impact of these studies is significant, as each builds on the others to collectively illustrate how self-study works in individual program elements and cumulatively to develop an exemplary program. Also, their

practice of exploring different inquiries each year is a good model for all teacher educators in the self-study community.

The impact of Mid-Town on teacher education at the University of Toronto and in local school districts is significant, though less profound than that of Mills College and Bank Street. Beck and Kosnik argue that this research "enables us to make a stronger case at an institutional level for support for this kind of program" (p. 947). In no small measure due to their work, the teacher education program at the University of Toronto adopted a cohort model (Fullan 1993) and continues to do so today as a new, graduate teacher education program (McDougall et al. 2017). In the elementary program, the Mid-Town model of instructors working closely with a particular thematic cohort was adopted, even though most tenure-track faculty do not engage as fully in the teacher education dimension of their work (Beck and Kosnik 2002a). Mid-Town has also been active in promoting new and improved strategies within the wider teacher education: for example, its practicum handbook was the basis for a revision of the general handbook, and its strategies for improving links with partners school were adopted by other thematic and regional options (Beck and Kosnik 2006). Also, Kosnik has influenced the development of the wider teacher education program as the director of elementary teacher education programs and, more recently, as the academic director of the Institute for Child Study (a lab school and acclaimed graduate teacher education program).

Kosnik and Beck, the leaders of Mid-Town Option, have made deep commitments to influencing the pedagogy of teacher education and expanding the conversation to include teacher educators and teacher education researchers and policy makers not involved in studying their own practice. While they began with their own questions arising from dilemmas of practice in the classroom and program leadership, they have framed their inquiries in ways that are meaningful to other teacher educators.

Kosnik and Beck have also widened the scope of their work over the years. Through handbook chapters, they have studied teacher education reform efforts (Kosnik et al. 2016) and surveyed the continuum of preservice and in-service teacher education programs. Also, Beck and Kosnik's (2006) inquiries into the best ways to deliver teacher education led them to study eight innovative programs, including their own. Concern about the impact of teacher education on practitioners led them to study their own teacher candidates and other University of Toronto candidates during time in the program and into their induction years in the field (2003–2007). Over the years, this longitudinal study has expanded: many of the original participants continue to participate in the study, and additional teacher candidates have enrolled and continued in the study. This has resulted in dozens of articles and chapters as well as four books (Kosnik and Beck 2009, 2011; Kosnik et al. 2013; Beck and Kosnik 2014) on research findings. In *Priorities in Teacher Education*, Kosnik and Beck (2009) draw on their accumulated experience as teacher educator to make sense of the experiences of the first cohort of 22 participants who graduated from their elementary programs. The focus is on themes that emerged through semi-structured interviews with and classroom observations of participants over their first

3 years of practice. This led to the identification of seven priorities for initial teacher education: program planning, pupil assessment, classroom organization and community, inclusive education, subject content and pedagogy, professional identity, and a vision for teaching. Kosnik and Beck (2009) argue that "lack of priorization in teacher education is a serious problem, requiring urgent attention" (p. 1). They propose a "together we figure it out" model of social constructivism in place of the more common "we cover, they select and apply" approach to sampling and surveying topics. They identify theory and practice as interconnected and necessary to ensuring depth and clarity. Especially among third year teachers, they noticed a shift toward building their teaching around "big ideas" and prioritizing to make learning meaningful. Kosnik and Beck's understanding of fragmentation as a perennial problem in teacher education and their conceptualization of program integration as a solution are grounded in their own experiences and their self-studies as they helped craft Mid-Town into an exemplary program. The questions that arose from their practice and self-study prompted the longitudinal study questions and provided them with deep experiences and understandings through which to make sense of the findings. In summarizing the lesson learned, Kosnik and Beck (2009) write: "Learning to teach is a difficult and never-ending task; but a pre-service program that is prioritized, integrated, and connected to practice – and that embodies its own priorities – can significantly enhance teachers' effectiveness in their initial years and beyond" (p. 11).

Through their body of research arising from questions of practice, the Mid-Town team demonstrate that teacher educators in exemplary programs can influence teacher education beyond the self-study and practitioner-researcher communities. The application of *Priorities in Teacher Education* to the teacher education classroom is the focus of *Teaching in a Nutshell*. In this book, Kosnik and Beck (2011) attempt to help teacher candidates and teacher educators navigate the complexities of teacher education through "a discussion of the *what* and *why* of the priority on question, followed by a *case study* of a beginning teacher (a participant in our [longitudinal] research)" (p. 7) and principles and strategies for responding to the challenges posed by each priority theme. The framing of the problems reveals the knowledge of informed and experienced teacher educator, while the proposed learning activities are clearly based on their own practices over several years in a well-researched exemplary program. They have also edited a volume on literacy teacher educators (Kosnik et al. 2013) and applied the research findings to the growth of classrooms (Beck and Kosnik 2014).

Twenty years ago, Kosnik and Beck (2000) struggled to obtain research funding and ethical approval to study their practice. The progress made by the self-study community has validated this kind of research, so that it is no longer such a struggle. Teacher educators can learn from their example that it is possible to simultaneously improve teacher education in their own institution and develop far a rich body of related educational research. Similarly, more exemplary programs should engage their faculty in such research both to improve practice and to influence teacher preparation nationally and internationally.

Conclusion

In this chapter, I explore the pedagogy of three exemplary teacher education programs. The three programs – Bank Street College of Education, the School of Education at Mills College, and the Mid-Town Option in the Ontario Institute for Studies in Education at the University of Toronto – have been recognized for their exemplary programs guided by social constructivism (e.g., Beck and Kosnik 2006; Darling-Hammond 2006). Also, teacher educators involved in these programs have been active in practitioner inquiry and, in particular, the self-study of teacher education practices.

The purpose of the journey is to discover approaches that can contribute to the enhancement of teacher education practices and, especially, the renewal of conventional teacher education programs. This builds on "Approaches to Teacher Education" in which Kitchen and Petrarca (2016) reviewed teacher programs and approaches that focused primarily on theory, practice, or reflection, as well as ones that integrated all three well. These four elements, along with influence beyond the program, are used to organize this review of these programs as described in external studies of exemplary programs and in practitioner research from teacher educators with insider knowledge and experience.

The first section, a review of the literature on exemplary teacher education programs, was followed by descriptions of the three exemplary programs in this review. The third section is divided into subsections on each of the five elements. For each element, examples from scholarly chapters and articles by teacher educators in these programs are considered with a view to understanding how pedagogy and program structure contribute to the delivery of exemplary teacher preparation. Considerable attention is given to studies that are rich in description of the strategies that proved effective. In particular, self-studies and related work by teacher educators engaged in self-study are examined for the insights they offer on the pedagogy of teacher education.

The subsections on each element reveal that no element in an exemplary program is an island, that each is dependent on and interconnected with the others. The examination of theory reveals the ways in which to make knowledge and pedagogy meaningful as theory and in relation to practice and reflection. The examination of practice suggests that clinical experiences where aspiring teachers observe authentic learning situations and witness effective teachers assisting students in learning are most effective when there are strong connections to the principles and content of the campus program. The examination of reflection reveals that, while reflective portfolios have the potential to guide a teacher candidate's formal learning journey throughout the teacher education program, faculty advisors have a critical role helping teacher candidates construct their own understandings from the various elements of the program. The examination of integration highlights five strategies (Beck and Kosnik 2006), present in all three programs, that help integrate teacher preparation in order to prepare teachers for a changing world. Integration is difficult though not impossible, but possibility depends on teacher educators working

together with a coherent vision in order to pull the various elements together. Indeed, more than excellence in the individual elements, it is the interplay between the elements and the relationships among the players that makes the magic of exemplary programs happen. If we are to learn from exemplary programs, it is important that they share their work with others. The section on influence beyond the program offers insight into ways in which excellent exemplary programs can contribute to the greater good, most notably through research.

The challenges of delivering exemplary, integrated teacher education on a large-scale in conventional comprehensive universities are great. While improving individual courses is relatively easy, integrating across course requires time, effort, and similar visions. Meaningful relationships with teachers and schools though possible are rendered difficult by the size of the bureaucracies involved. Reflection is idealized by many, but few take the time to guide that reflection across the campus and field components. While most conventional programs do a good job of preparing teachers, they will only become excellent if they learn the lessons offered through research on exemplary teacher education programs and research by exemplary teacher educators working in them. By learning from Mid-Town, Mills College, and Bank Street, teacher educators and their institutions can develop new visions for teaching and learning that serve as the foundational element that guides how we *do* teacher education (Darling-Hammond and Baratz-Snowden 2007).

The S-STEP community already recognizes the limits of current practice, and studies of our practice are driven by commitment to breaking down the barriers to more practical elements, deeper theory, richer reflection, and integration. In this chapter, based on the lessons learned from exemplary programs, I challenge us to turn more of our attention as practitioners and scholars to the integration of various elements at the program level. In doing so, we also improve student learning, schools, and communities at a time when education is critical to living in a diverse and changing world.

Role of Self-Study in Navigating Teacher Educator Administrators' Responsibilities

40

Valerie A. Allison and Laurie A. Ramirez

Contents

Abstract

This chapter discusses the role self-study has played in supporting teacher educator administrators as they navigate roles and responsibilities associated with managing and leading in a variety of capacities (i.e., dean, associate dean, department chair, program director). We operationalize key terms associated with administration and explore the prevalent metaphors used to describe those who lead in organizations, particularly teacher education programs. The use of metaphors in the self-study literature conducted by teacher educator administrators is analyzed focusing on the implications metaphors carry for both leaders and those they lead. In exploring the literature, we identify distinctions in how leaders come to serve, how they go about learning their roles and responsibilities, and how they

make sense of their contexts and practices over time. We discuss the work of critical friends in supporting leaders to study and refine their practice. Throughout the chapter, we weave in descriptions of our self-study inquiries as teacher educator administrators, outlining what we have learned and how it might inform the work of others assigned to lead in teacher education. The chapter concludes with a discussion of possible directions for future self-study research concerned with teacher educator administration.

Introduction

The self-study of teacher education practices is a relatively young methodology in teacher education research. At the time the first edition of the *International Handbook of Self-Study of Teaching and Teacher Education Practices* (Loughran et al. 2004) was published, only a handful of researchers were conducting this type of inquiry into their own practice as administrators in higher education. One such scholar's chapter (Manke 2004) included work both by K-12 school administrators and by teacher educators concerned with administrative roles and responsibilities. Manke asserted that the interdependency of contexts (departments and colleges of education, universities, and schools and districts) in education and the fluidity of faculty and administrators within those contexts indicated a need to be inclusive in her review:

> Two forces, however, have broadened the field of self-study to include studies of adminis-tration in teacher education and in schools. One force acknowledges the reality that the programs, schools, classes and field experiences where teacher education takes place exist within institutions – departments, colleges, universities and the subdivisions, and schools and school districts. These institutions are organized to require administration and the nature of that administration has a crucial influence on the teacher education practices that occur within an institution. A second force acknowledges that the line between teaching and administration is never clear and distinct. Faculty members leave their classrooms to become program directors, accreditation coordinators, chairs, and deans. School administrators leave their offices to become teacher educators, whether in schools or in universities. (p. 1389)

While there is now a greater volume of self-study research focused on the work of teacher educator administrators, it might still be characterized as an emerging field. Prominent self-study scholars (i.e., Clift 2015; Loughran and Brubaker 2015; Roose 2010) have contributed to the dialogue on how self-study methodology might be utilized to interrogate the lived experiences and practices of teacher educator administrators. The large majority of these scholars have written from the perspec-tive of dean or associate dean. As Kitchen (2016) and we (Allison and Ramirez 2016) have noted, very few self-studies represent lower-level and more transitory

positions of teacher educator administration (i.e., department chairs and program directors).

Certainly there are commonalities among lower- and upper-level teacher educator administrators; however, there are also important distinctions that make lower-level teacher educator administration uniquely challenging (Buller 2012). Specifically, department chairs and program directors typically maintain full- or nearly full-time teaching schedules in addition to their administrative responsibilities. Additionally, the relationships of department chairs and program directors to other faculty in their departments are less hierarchical and complex than relationships between deans and their faculty members. In many cases, current department chairs and program directors are supervising or making decisions that impact faculty who have greater seniority and/or have previously held the same administrative positions (Buller 2012). Finally, the influence (or clout) a department chair or program director has to utilize in his/her role is less dictated by the job title and its delineated expectations than it is by other contextual factors. These might include how the role was executed by a predecessor, the history of relationships between the administrator and colleagues across the institution (i.e., the dean's office, the registrar, admissions), and the reputation the administrator has within his/her department prior to assuming leadership.

As we, Laurie and Valerie, began our administrative journeys in our respective institutions, we had little formal preparation and lacked a familiarity with potentially relevant literature on administrative role expectations in teacher education. Like Clift (2011), much of what we learned about leadership and our administrative roles and responsibilities proved to be "an exercise in ambiguity" (p. 162). Ours and Clift's were not unique plights. According to Cipriano and Riccardi (2010), more than 80% of department chairs "had absolutely no formal training for their administrative responsibilities" (as cited in Buller 2012, p. 3). Gmelch and Buller (2015) observe that the same is likely true for deans. "Many of them rose to their leadership positions because of their success at committee work and their duties as teachers and scholars, not because they had any formal training in the best way to run a program" (p. 1).

In an effort to develop our abilities and confidence as leaders, we endeavored to systematically study our emerging practice as leaders. Self-study has provided a means to do so that recognizes the interconnectedness and mutually informative nature of teaching and scholarship, which we view as equally important. As teacher educators and scholars, self-study has afforded us a means of maintaining focus on both, whereas other forms of research might put them at odds or favor one over the other.

We have been friends since meeting while in graduate school in the Western United States and became research partners in 2009, shortly after beginning our positions as teacher educators. Initially, we chose to collaborate on our scholarship largely because we felt comfortable with one another. Beginning new careers in new communities across the country from where we had grown up and completed our schooling was about as much newness as we could tolerate; we needed something familiar to hold onto, to tether us as we settled into our communities, positions,

and responsibilities. Our research collaborations in S-STEP have been enjoyable and fruitful both because we like one another and because we share similar frames of reference. We are close to one another in age, we grew up in the same metropolitan area, we started our careers in education as middle school/junior high English teachers, and we completed our graduate degrees having several professors and academic mentors in common. In brief, we speak the same academic, regional, and generational languages. But we are not carbon copies of one another, and our differences, like our commonalities, are vital to our research. Differences in our cultural backgrounds, our lived experiences, and our academic careers enrich and enlarge our perspectives of the work we do as teacher educators and, now, leaders.

Laurie is currently an associate professor of education at Appalachian State University, a moderately large university in North Carolina. Prior to entering academia, Laurie taught middle school English, Spanish, English as a Second Language (ESL), and World Languages for 11 years in a large, urban school as well as introductory teacher education courses at the university where she attended graduate school. During her tenure as a teacher, Laurie held various leadership roles, such as head coach, student government advisor, student teaching supervisor, and others. At her current university, she teaches courses in the undergraduate and graduate middle grades programs including courses in diversity, culturally/linguistically responsive pedagogy, and young adolescent development. In addition to her teaching responsibilities, Laurie is the director of the undergraduate middle grades program. Shortly after becoming the director, she was tasked with the responsibilities of graduate director and accelerated admissions director. Laurie was assigned all these positions without seeking them, the first coming prior to her earning tenure and promotion at her institution. She has served in those roles for more than 5 years and anticipates continuing in them for the foreseeable future. All of these roles require extensive student advising, program assessment, curriculum development, and myriad other administrative responsibilities.

Valerie is an associate professor of education at Susquehanna University, a small, private, liberal arts institution in Pennsylvania. Before coming to her current institution, she was a junior high English teacher, a staff development writer, a clinical instructor of teacher education, and an elementary principal. Valerie teaches courses in both the elementary and secondary education programs including courses on elementary literacy development and secondary education instruction, classroom management, and differentiation. Prior to obtaining tenure and promotion, Valerie was assigned to be her department's chair. A year later, she became the director of secondary education. Like Laurie, Valerie's administrative roles require her to complete or oversee a broad range of administrative tasks involving stakeholders that include students, faculty colleagues, campus leadership, K-12 personnel, and state and national level agencies. Valerie anticipates the chair position will rotate to another member of her department in summer 2019, at the end of her second 3-year term, but the director position will likely remain her responsibility as long as she is at her institution.

In our early years as teacher educators, we turned to self-study to examine the alignment, and as often the misalignment, among our ideals, our practices, and our

students' perspectives of our practice (i.e., Ramirez and Allison-Roan 2014b; Ramirez et al. 2012). Our goals included modeling the following in our teaching and in relationships with students: transparency, critical reflection, democratic principles, and social justice. We entered the academy with the hope that our efforts would lead teacher candidates to develop dispositions and practices that led them to pedagogies that promoted all learners' critical awareness and problem-solving skills, to classroom communities that were welcoming and vital to all learners, and to relationships with all learners and their communities that were authentic, caring, and empowering. While we have witnessed our practices and our identities as teacher educators evolve over time, we recognize that enacting our ideals is not a goal that can be ultimately achieved and replicated thereafter. Rather, in each moment as teacher educators, we are either moving toward or away from our ideals or core values. A benefit of being self-study scholars is that we have the tools to continually interrogate who we are and what we do relative to who and how we hope to be as teacher educators.

When we each assumed our roles as teacher educator administrators, we experienced crises of professional identity similar to those noted by other new leaders (i.e., Beijaard 2015; Collins 2016; Wubbels 2015), and we feared we would be pulled further away from who we aspired to be as teacher educators. In part, perhaps, because the roles we were assigned were not roles we had sought, we envisioned administrative expectations that would require us to think and act in ways that were antithetical to our teacher educator ideals. As we had as novice teacher educators, we turned to one another, first to share our angsts and then, in due time, to guide and support one another as we learned to be teacher educator administrators. The ideals we had consistently held for ourselves as teacher educators became the ideals we committed to hold in our new roles and responsibilities. Mirroring our earlier scholarship, we have used self-study to interrogate the intersection between our ideals and our thinking and actions as administrators in teacher education.

Contained within this chapter are descriptions of our self-study inquiries into our roles and responsibilities as teacher educator administrators. We outline what we have learned and how it might inform the work of other teacher educators assigned to leadership positions. We begin with an exploration of terms utilized in discussions and research of the academic and professional development of educational leaders. We provide explanations of how we have operationalized the terms in our inquiries. Following, we consider the images and metaphors frequently employed in discussing leaders, particularly educational leaders, and how that rhetoric shapes how leaders enact their roles and influence their contexts of practice. We look to the literature to identify distinctions in how leaders come to serve, how they go about learning their roles and responsibilities, and how they make sense of their contexts and practices over time. While we are primarily focused on self-study research of teacher education leadership in higher education, we, like Manke (2004) before us, draw connections with related self-studies concerning K-12 school administration as well as self-study inquiries conducted by teacher educators that are focused on administration/leadership issues. We have sought to make relevant connections to the broad field of literature on leadership in higher education (i.e., Behling 2014; Gmelch and Buller 2015;

Ruben et al. 2017) and to work by teacher educator administrators (i.e., Clift et al. 2015; Elliott-Johns 2015a) that is not exclusively framed as self-study inquiry. The chapter concludes with a discussion of possible directions for future self-study research and provides recommendations for those who become teacher educator administrators or who might be charged with supporting new leaders' professional development.

Defining Terms

One of the potential areas of confusion in discussing, studying, and researching educational leadership stems from the use of terminology. Terms like *administrator* or *administrative* duties and roles are sometimes used synonymously with *manager* or *managerial*. Likewise, the use of *leader* and *leadership* can be applied broadly or defined more narrowly, having significant impact on understanding. Notably, according to Volckmann (2014), definitions for *leader* and *leadership* within the literature exceed 1500, encompassed in 46 distinct leadership theories. Seemingly countless volumes have been published focused on defining and encouraging the development of leadership capacities in the business sector, K-12 education, and higher education (i.e., Bolman and Deal 2017; Gmelch and Buller 2015; Rath 2008; Ruben et al. 2017). Schratz (2015) examined his work as a dean through the dual lenses of *management* and *leadership.* He used *management* to distinguish enactments that adhered to established norms. *Leadership* signified those that sought to influence norms.

In this chapter, while discussing others and our own research, we use the terms *administrative role(s)* and *administrator(s)* when referencing professional assignments that encompass the oversight and supervision of programs (i.e., certification, accreditation) and other faculty or staff. In order to delineate the range of duties and responsibilities administrators might be charged with, we employ the term *managerial* in reference to tasks that are functionary in nature. These include, among others, completing duties of reporting, observing, evaluating, and scheduling (as well as attending and participating in meetings as a representative of a program or department). By their nature, managerial tasks are time-consuming and may involve knowledge and skill sets unfamiliar to newly appointed administrators, but they are clearly defined and can be easily observed and evaluated for indicators of competency and effectiveness. They are tasks for which expectations are institutionally defined and for which potentially some training is provided by others in the institution.

Leadership enactments were characterized as activities administrators find themselves engaged in that are ill-defined and that have grown out of fluid institutional and/or departmental circumstances influenced by broader political, economic, or social factors. In the context of teacher educator administrators (i.e., deans, department chairs, and program directors), leadership enactments might include, among others, marketing and recruitment initiatives, program development and adaptation, and political advocacy (Behling 2014; Buller 2012). These activities go beyond being functionary because the consequences for performing them (un)successfully

are higher. The individual administrator's reputation and career and ultimately the long-range viability of programs and others' academic or professional well-being may rest in the ability to envision and articulate alternatives to the status quo, as well as the ability to inspire others to work toward achieving new goals. Because they are ill-defined and contextually unique, leadership enactments often do not have defined performance expectations and are more difficult to directly observe and evaluate (Ruben et al. 2017). Depending on the institution, some new administrators may receive some guidance, mentoring, and feedback in carrying out leadership enactments, but leadership enactments are not tasks for which administrators have been formally trained (Ruben et al. 2017) or for which they can be easily, fully prepared. In illustration, as an associate dean of education, Clift (2015) came to appreciate that an important component of her role was to collaborate with and empower others in visionary endeavors. Similarly, Smith (2015) as a head of teacher education argued learning and practicing the art of diplomacy was paramount to the success of an initiative she spearheaded. The onus for developing and utilizing the dispositions and skillsets paramount to leadership enactments ultimately rests with the individual administrator.

Another term consistently found in the S-STEP research literature is *critical friends*. Critical friendship is highly promoted and valued, and its roles and expectations have been well enumerated (i.e., Loughran and Northfield 1998; Mena and Russell 2017; Pinnegar and Hamilton 2009; Samaras and Freese 2006). A critical friend is "A helping colleague who encourages the researcher to look at the problems, weaknesses, and emotionally-charged issues but, on the other hand, is willing to be honest and offer feedback that may result in discomfort and disagreement" (Mena and Russell 2017, p. 108). Many educational administrators have engaged in critical friendship, relying on one or more trusted colleagues to help them examine their roles, responsibilities, and practices as well as their personal and professional growth as teacher educators (i.e., Loughran 2015; Roose 2010). While the method of critical friendship is common and widely used, the manner often varies based on contextual factors or distinct research purposes.

Loughran, for instance (in Loughran and Allen 2014; Loughran and Brubaker 2015), employed a variation of critical friendship, *executive coaching*, in studying his work as a dean. Summarizing Hall et al. (2000), Loughran and Brubaker (2015) offered the following definition: "Executive coaching is a personal and specific approach to working as a critical friend in an attempt to offer an opportunity to challenge the coachee to see beyond the current situation and understand different perspectives on episodes, behaviours, and events" (p. 256). Within the context of challenging workplace issues, Loughran utilized a trusted confidant, Allen, to systematically guide him in interrogating his contextual circumstances and his reactions and responses. The objective was to support Loughran in his roles and responsibilities. Allen's own personal and professional development was not an intentional objective of the partnership.

In contrast, we have engaged in a form of critical friendship we identified as *co-mentoring*, initiated by a lack of mentoring and support in our new academic careers. In our early self-study scholarship, we engaged in co-mentoring as novice

teacher educators. Reminiscent of that work, in our collaborations as administrators, we have endeavored to mentor one another as we each faced challenges and responsibilities that came with assuming administrative positions in our respective institutions (Allison and Ramirez 2016; Ramirez and Allison 2016; Ramirez and Allison-Roan 2014a). "As co-mentors, we were better able to understand and (re) frame the challenges we faced in our new positions and critically analyze them in collaboration with a trusted colleague" (Allison and Ramirez 2016, p. 9).

Broadly speaking, critical friendships are valuable components of self-study research. But arguably, leadership self-study inquiries heighten the importance of working with a trusted colleague, someone who is a confidential sounding board, provides an outside perspective unencumbered by institutional politics, and dispassionately challenges rationalizing or defensive thinking and actions (Roose 2010). Without the opportunities critical friendship provides, teacher educator administrators might find themselves working in isolation and frustration. Critical friends allow us to express vulnerability and uncertainty, pose important or problematic questions, and garner feedback and perspectives beyond our own.

Metaphors and Their Implication in Teacher Education Leadership

In self-studies on teacher educator administration, a variety of images and metaphors have been used to illuminate how educational administrators envision and enact their roles and how they are perceived by others. These images serve as a shorthand, informing the ways administrators and others might perceive and evaluate the personalities, dispositions, and actions of administrators. Specifically, a metaphor held as an ideal by an administrator might resonate, or it might conflict with metaphor(s) held by the administrator's constituents. The resulting (dis)harmony carries consequences for the administrator in performing responsibilities and for professional relationships. For this reason, it is worthwhile to briefly discuss some of the leadership metaphors found in the literature and consider how they serve to frame administrators' practice and their constituents' perceptions of their efforts.

As we attested in describing our own entry into administrative roles (Allison and Ramirez 2016), preconceived, external images of administration are often negatively influenced by experiences with and stories of uninspired or ineffective supervisors and managers both in and outside the academy. In our cases, we both had experiences of working under school- or university-level supervisors whom we saw as inept or otherwise ill-suited for their positions. Everyone, it seems, has tales of a previous (or current) "boss" who was so bad that she/he damaged relationships and the well-being of others, impeded work, or otherwise harmed the organization and its constituents. Negative images attached to these stories are diverse, but all are damning:

- Technocrats – consumed with attending meetings and completing procedures and seem unaware of the goals and day-to-day work of faculty and staff.
- Micromanagers – attempt to survey and control the details of others' work.

- Dictators – insist others bend to their will and see and do things as they would.
- Doormats – incapable of being assertive; others push them around, and they seem to avoid carrying out responsibilities that might involve difficult conversations or confrontations.
- Wafflers – frequently change positions on issues and seem incapable of commitment and follow-through.
- Phantoms – absent, never in the office, and unresponsive to communication from constituents.
- Buffoons – incompetent, do not understand, and/or make errors in judgment or procedure that create confusion or more work for others.
- Self-promoters – are focused on their own advancement and/or accolades and might position themselves to get undue credit for others' work or accomplishments.
- Bullies – belittle or harass others, fuel disputes, and pit faculty or staff against one another.

Stories of highly effective and respected "bosses" are perhaps rarer. Arguably, at least, they are less often the focus of conversations. In those narratives, the administrative heroes might be characterized as:

- Visionaries – have clear visions of goals and the interpersonal skills necessary to prompt others to work productively toward achieving them.
- Servants or facilitators – provide the support and resources necessary for others to optimize their potential and carry out initiatives (individual and programmatic).
- Diplomats – mediate competing interests and/or personalities and draw constituents to common goals for the benefit of the program and institution.
- Mentors, teachers, or coaches – have the wisdom and capacities to help others develop professionally, are respected for their expertise, and provide affirmation as well as constructive feedback that others find instructive/useful.

Mills (2002, 2006, 2010), through his tenure and eventual exit from his position as dean, employed a range of metaphors, some humorous and others more serious, to described what he experienced and what he aspired to as a teacher educator administrator. At times he likened his work to being a cat-herder and suggested his faculty, at least occasionally, perceived him as Darth Vader, someone who had forsaken his teacher self and become an adversary to the real work of teacher educators. Conversely, looking back on his efforts as he prepared to step down from the deanship, Mills (2015) hoped he had been true to his teacher identity while a dean, which he had administered in a manner that was transparent and instructive to those who might step into the deanship or other leadership roles. Unfortunately, Mills is not alone in recognizing the potential for competing metaphors when one is balancing the tensions between the roles of teacher educator and teacher educator administrator.

Manke (2004) provided a literature review of self-studies that explored issues of administrative practice with an emphasis on factors of power, community, social

justice, and educational reform in the administrator literature. Manke (2000, 2004) interrogated her own practice as an associate dean; she posited that she saw herself as a teacher, one who would prioritize developing affirming relationships with students. She recognized and grappled with the consequences of unequal power both in relationships between teachers and learners and between educational administrators and their constituents (i.e., students, faculty, and staff). As an associate dean, she envisioned herself as a facilitator or problem solver in her interactions with constituents, but Manke recognized that her capacity to help others was largely due to the unequal distribution of power assigned to roles and job titles at the university. Students or personnel were obligated to request her assistance to solve problems because she could (if she chose to) wield influence over procedures and others by virtue of her position. Importantly, Manke noted that possessing the power to be helpful meant that she and her constituents clearly understood that she had the potential power to be equally unhelpful or punitive, to personify some of the negative images outlined above (i.e., micromanager, dictator, or bully).

In the years since the first self-study handbook was published (Loughran et al. 2004), the number of administrators using self-study methodology to investigate their practices has grown, predominated by explorations of the work of deans and associate deans (i.e., Loughran 2014, 2015; Mills 2006, 2010; Roose 2010). In addition, self-study scholar Elliott-Johns (2015a) edited a text that presents the perspectives of 14 deans of education in Canada, and Clift et al.'s (2015) edited text provides an international perspective on the deanship. Across the contributions in these texts and others, teacher educator administrators most frequently employ images of leadership that align with servant, facilitator, or diplomat:

> A dean is there first of all to care for other people and their professional (and personal) well-being, to be responsible for the work they must do as a team with all its problems and challenges, and to negotiate in so many related things with so many other people inside and outside the university. (Beijaard 2015, p. 35)

> I think of myself as being proactive when I have an idea that I want to share or enact, but I am also responsive to ideas initiated by others, as well as the input, criticism, and modifications of my own, as well as others' ideas. (Clift 2015, p. 31)

> I worked closely with faculty teams to re-imagine curriculum and programming so that everyone felt engaged...Rich discussion led to more innovative programming ideas. (Kitchen 2016, p. 78)

> It was an exercise in listening carefully to various views, detecting subtle commonalities, and exercising a creative mind in the search for unconventional and acceptable solutions. (Smith 2015, p. 143)

These images of servant, facilitator, and diplomat held as ideals by deans, and others, stand in sharp contrast to the images administrators use to describe their lived experiences and the psychological consequences of striving to meet their own and others' role expectations. Administrators across the studies address tensions they see between their roles and their other responsibilities and passions. They describe being controlled, being pulled in conflicting directions, and being overwhelmed by too many tasks, thus conjuring images of administration as servitude, imprisonment, or simply perilous. Sometimes these troubling images are found in the titles administrators choose for their articles and chapters: "Fortress Days – 1,278 of them" (Gronn 2015), "Bowing to the Absurd: Reflections on Leadership in Higher Education" (Mills 2010), and "Walking the Tightrope: Staying Upright in Turbulent Times" (Mandzuk 2015). More often they are alluded to in the descriptions of the work and its impact on the administrator:

> I accepted the position and was immediately thrown into the deep end. (Beijaard 2015, p. 35).

> If I don't take control over my time, others will do it for me. (Clift 2015, p.33).

> Drowning in charge of results, purchase orders, budget transactions, performance compliance, internal strategic planning, workload and resource management, it was difficult to get to outreach sector leadership, benchmarking, and related activities that are critical to such leadership roles in the context of contemporary universities. (Gore 2015, p. 170).

> I was tired of the politics of leadership: the endless paperwork, a culture of delays and inactivity, and university staff that undermined reform efforts. (Kitchen 2016, p. 80).

> I lived in a reactive mode, doing the work and reflecting on it in the moment...Are there too many demands of teacher education at this point for any administrator to be able to do the work well? (Roose 2010, p. 277).

In our study of entering into administrative roles (Allison and Ramirez 2016), we articulated feeling trapped or burdened by our appointments and the demands of our new roles. These feelings are laid bare in journal entries we shared with one another at the time:

> *It doesn't feel like it's a matter of being successful in my work (as an instructor, researcher, or chair). I find myself very much in survival mode. How can I avoid someone complaining or yelling at me (recently happened)? How can I make it through the day upright and not sobbing out of exhaustion?* (Valerie, 22 September 2013).

*Administration is killing me. I'm SO busy and it is not getting better!! I honestly feel like all I
do is go to meetings. And many of them feel pointless . . . I could have used that hour! I want
it back!!* (Laurie, 29 October 2013). (p. 10).

A close reading and analysis of the images and metaphors employed by admin-
istrators in education, self-study scholars, and others, describing their contexts and
the nature of their work, brings to light pervasive complicated dilemmas and
challenges that are seemly inherent to the positions. What administrators aspire to
accomplish and how they hope to enact their roles is often mediated and sometimes
fully thwarted by untenable circumstances. Arguably, it appears because the contrast
between administrators' ideals and reality is seen so frequently in the texts; it is not
simply a matter of particular individuals being ill-suited for their positions' require-
ments, but rather that many positions' expectations have become (or perhaps always
were) so demanding that no one individual could carry them out in a way that feels
successful and satisfying.

We assert contextual conditions that contribute to teacher educator administrators
feeling as if they are in survival mode, barely able to accomplish the most immediate
and essential components of their roles, resulting in not only individual burnout and
attrition but also in delayed or unmet departmental and institutional goals and
initiatives. These goals or initiatives might include noncritical programmatic
changes that are simply refinements to existing, functioning program(s) or practice
(s). However, in some circumstances, what is delayed or otherwise compromised as
a result of administrators being overextended and overwhelmed is work that has
far-reaching consequences for individuals and communities beyond the university
or institution. In illustration, Kitchen's (2016) stepping down from his position
as Director of Indigenous Programs might have resulted in lost continuity in
services provided and/or a disruption in the educational experiences of individuals.
If the directorship is a position that has a history of short tenures, constituents of
the programs the director oversees might, in time, lose confidence in the programs,
and the program(s) may be(come) underutilized, irrelevant, or somehow
unsustainable. Unrealized potential of educational programs serving indigenous
populations, as Kitchen describes, can translate into lost opportunities for tradition-
ally underserved, marginalized individuals and communities. In short, programs
that might have had a positive impact on factors of social justice do not realize
their potential.

Roose (2010) documented that the average tenure of education deans is
approximately 4.5 years, and many deans report burnout as the motivation for
stepping down from their positions. While Roose's reporting is focused exclu-
sively on the attrition of deans, there appears to be evidence that those in other
roles as teacher educator administrators experience similar, seemly insurmount-
able, challenges in the conditions of their work and the expectations and respon-
sibilities they shoulder (i.e., Collins 2016; Kitchen 2016). Attrition, particular as
a result of burnout, is not a concern exclusive to college and university teacher
educator administration. Rather, the short tenure of deans is reminiscent of
the attrition that has been documented with early-career teachers and with

school-level administrators; specifically, nearly 20% of new teachers leave the profession in the first 5 years, and on average, annually nearly 10% of public school principals leave their positions for reasons other than retirement (Goldring and Taie 2014; Gray and Taie 2015). This last statistic speaks to Valerie, who resigned from her position as an elementary principal prior to being eligible for retirement, in order to pursue a career as a teacher educator. As shared in Allison and Ramirez (2016):

> Valerie voluntarily terminated her position as an elementary principal in order to gain a healthier life/work balance for herself and her family. Over 5 years as a principal, she had felt increasingly uncomfortable carrying out administrative responsibilities related to the accountability movement of the 2000s (i.e., the implementation of scripted curriculum, high-stakes accountability measures, and rigid teacher assessments). Valerie envisioned greater professional autonomy and time to pursue research and writing interests as reasonable trade-offs for the higher salary she had earned as a school administrator. (p. 5).

Though Valerie was able to intentionally step down from administration, it was not long into her teacher educator career that she again found herself in a leadership position, one she felt she must accept. Laurie, both as a teacher and teacher educator, had no aspirations to assume an administrative role; however, she felt herself similarly positioned to assent.

Seeking the Reins Versus Being Enlisted

The literature chronicles two paths by which individuals find themselves in teacher educator administrative roles: voluntary and de facto involuntary. Some teacher educators intentionally apply for and pursue leadership roles, while others come to their positions through someone else's initiative. Likewise, in some institutions and contexts, appointments are for finite (transitory) terms, and, at their termination, administrators return to previously held positions as faculty members. Other positions are defined as permanent and/or are seen as stepping stones for higher education administrative careers. In some but not all instances, the distinction between voluntary versus involuntary leaders and transitory versus permanent appointments seems to have implications for how administrators define themselves in their roles, how they perceive and navigate the transition into leadership, and ultimately how they experience and balance the constraints and affordances of their leadership roles. Whitchurch (2011) reports that tasks academics do outside of their usual roles, such as administrative or managerial tasks, "have not been fully explored" (p. 100), resulting in a dearth of research in an area that affects many in academia.

In our cases, initiation into our administrative roles was the result of being recruited to serve by colleagues and upper-level administrators. As pretenured faculty, we felt considerable trepidation in the timing of our appointments, as well as for the responsibilities we were being asked to take on. Outlined earlier in this chapter, our apprehension was associated, in part, with previous experiences working under administrators we perceived as poor role models. Additionally, for

Valerie, her own dissatisfaction in her previous role as an elementary principal contributed to her uneasiness in becoming department chair:

> Valerie felt she was stepping back onto the "slippery slope" she had experienced as a principal. Valerie's journal revealed high levels of misgiving for how being department chair would impact her professional and personal life, demonstrated by her initial journal entry entitled 'Day one of my sentence' (Personal journal, 1 July 2013). (Allison and Ramirez 2016, p. 5)

Laurie noticed how the initial semester in the role of program director not only altered her relationships with colleagues but also revealed changes in her teacher education practices. Her early 2014 journal entry spoke to frustration and concern as conflicts between/among program and department faculty increased. Consistent with the concerns identified by Buller (2012) in appointing pretenured faculty to leadership positions, as the most junior faculty member of her program, Laurie was unsure of her position in resolving conflicts and felt ill-equipped to become entangled in them. She also noticed changes in her priorities and practices, with more attention placed on administrative and managerial tasks where teaching and service had previously been her focus (Personal journal, 5 January 2014).

Gore (2015) and Beijaard (2015), like us, describe their entry into leadership as being not completely of their own volition:

> I felt compelled to do it, against my better judgment and contrary to my self-interest, because I believed I could make a difference. (Gore 2015, p. 162)

> I was asked to take over this position for a period of four years. Why me? Among other things, because of my seniority and experience as a teacher educator and researcher in the field of teaching and teacher education – aspects that certainly make a new leader more acceptable in such kinds of organizations. (Beijaard 2015, p 35).

Also like us, these academics felt unable to decline these leadership "opportunities." Unlike us, they were no longer early-career teacher educators/scholars, and each of them remained in their assignments for relatively short terms. Beijaard served as an interim dean for three and a half years, and Gore served as dean for six. Gore's final accounting of herself in her role and her accomplishments could best be described as bittersweet resignation. In spite of positive recognition of her service, she exited her position with some sense of unmet expectations and goals:

> I didn't do the job I wanted to do as dean. I didn't achieve all I set out to do. (Gore 2015, p. 174)

While Beijaard (2015) did not express disappointment in his performance as interim dean, he did acknowledge that being dean necessarily drew his time and focus away from his passions of teaching and research. We have seen this same

phenomenon in our administrative roles, and it is echoed in accounts of numerous other teacher educator administrators, even those who chose to pursue their appointments (i.e., Loughran 2015; Kitchen 2016).

Kitchen (2016) stepped down from university administration after 5 years. In assessing his contributions and his learning, he concluded "I leave with greater humility, a better knowledge of my limits, and a deeper appreciations of the challenges of transformative leaders" (p. 81). Kitchen asserted that more needs to be done to support teacher educators in their transition into administrative positions, including professional preparation devoted to assuring novice administrators have competencies with managerial aspects of their work. Furthermore, if the goal is to ensure teacher education programs are led consistently by individuals dedicated to and skilled in promoting positive reform and social justice, administrators need to receive support in developing their understanding of the policies, practices, and culture(s) of their contexts. As Gore (2015) asserted, her efforts to bring about systemic changes were constrained within broader institutional and societal traditions and forces:

> Changing the organizational culture in my school meant trying to change aspects of the centuries-old institution of the academy. Addressing ingrained gender relations and industrial relations meant trying to impact on deeply embedded societal power relations. Attempting to alter funding models within the institution meant butting against conditions borne of the value society places on higher education, the social sciences, and education. (p. 174)

The literature from the broader field of higher education leadership (i.e., Behling 2014; Buller 2012; Ruben et al. 2017), the perspectives of the researchers cited above, and our own divergent experiences speak to the importance of professional development for those taking on administrative roles, regardless of whether or not they volunteer or are only temporary in their positions (perhaps even more so in instances of temporary, involuntary assignments). Expectations need to be clearly defined and adequate resources and mentoring provided so transitory administrators move more seamlessly into their new, often unfamiliar, responsibilities (Ruben et al. 2017). While it is not common for pretenured faculty such as ourselves to be appointed to leadership roles, it appears to be occurring with greater frequency in recent years (Buller 2012). When pretenured faculty are called to lead, institutional level support is imperative (Buller 2012).

Learning the Ropes/Roles

Kitchen (2016) and others (i.e., Loughran and Brubaker 2015; Ramirez and Allison 2016) suggest that, unlike positions in school administration (i.e., principals, superintendents), where advanced education and/or administrative certification are prerequisites for applying and being hired, teacher educator administrators are typically appointed or hired into their positions without any

formal education or other professional development for their roles. Unsurprisingly, this phenomenon within teacher education is mirrored across nearly all leadership positions in higher education (Gmelch and Buller 2015; Ruben et al. 2017). For many, both in and outside teacher education, Gore's (2015) observation resonates:

> Most of us who end up working as deans have little formal preparation for the role. We start the job with ideas formed during our apprenticeship of observation and gained from our experiences of leading and managing, much of which is, and remains, intuitive. (p. 161)

The assumption seems to be that experienced, successful teacher educators have the dispositions and latent skills to be successful teacher educator administrators. Based on our experiences, and those of other teacher educator administrators, reliance on dispositions and skills, real or perceived, will likely not suffice, particularly in contexts experiencing significant change or challenge.

Furthermore, Mills (2015) and Gore (2015) have described how the assumption that good teacher educators will intuitively know how to be good administrators too often resulted in novice administrators experiencing a lack of support as they struggle to learn their roles and associated tasks. "During my first full year as dean I realized that there was absolutely nothing in my academic or personal background to prepare me to be a dean of education" (Mills 2015, p. 150). Notably, the experiences of novice teacher educator administrators replicate those of novice teacher educators as illustrated frequently in S-STEP literature (i.e., Berry 2008; Guilfoyle et al. 1995; Ramirez et al. 2012). Teacher educators are typically recruited or self-selected from the ranks of practicing teachers who have been identified as successful/effective. Across institutions and geographic locations, the induction from teacher to teacher educator is not typically organized, systematic, or consistent. Berry (2008) noted, "Learning about teacher education is often experienced by the teacher educator as a private struggle" (p. 9).

Many institutions generally lack systematic mentorship for lower-level administrator positions, and the on-the-job training provided is inconsistent (Gmelch and Buller 2015; Ruben et al. 2017). In many cases, when it occurs, professional development is usually concerned with training for managerial task competency versus promoting the development of leadership dispositions and capacities. Additionally, professional development most typically occurs as on-the-job training and not prior to administrators entering their roles (Ruben et al. 2017).

Possibly an advantage of being employed at a small, private, and relatively well-funded institution, Valerie has had a consistent level of support and mentoring available to her since assuming her duties as department chair. Within the first year of her appointment, Valerie, along with other new chairs at her institution, was invited to attend an off-campus leadership workshop designed specifically for novice administrators. Also within her first term as chair, she attended a national conference dedicated to higher education academic leadership. Beyond the specific administrative professional development that occurred at these events, they were useful to Valerie in becoming better acquainted with her campus colleagues and

with peers at other institutions. In terms of ongoing on-campus support, Valerie's dean dedicates time in her monthly schedule for individual meetings with chairs, so they are able to engage in one-on-one discussions about department-level concerns. Finally, the provost's office holds periodic large group meetings for department chairs and other campus leaders. These meetings consistently include group discussions of administrative responsibilities and provide opportunities to develop or refine leadership skills (i.e., role plays of difficult conversations; case studies of personnel issues).

Valerie is appreciative of the intentional professional development available at her institution for administrators; at the same time, she knows it is not necessarily representative of what occurs elsewhere. Furthermore, her campus's strategies for addressing the professional development of chairs and other low- to mid-level administrators are not comprehensive. That is, they are not all the direction and support new administrators might need to transition smoothly into their roles. In spite of her preparation for and her background as an elementary principal and the concerted efforts by the upper-level administration at her university, Valerie still experienced many of the same challenges in learning and executing her role as chair that have been described in the texts discussed in this chapter.

In stark contrast to Valerie's campus-sponsored leadership professional development and initial preparation, Laurie had no formal training and only infrequent and superficial assistance in her new university administrative role. Much of what she learned about the position was learned in an "on-the-job-training" manner. With multiple changes in department chair and college dean (three times each over 5 years), Laurie was expected to fulfill her responsibilities with little or no help. Her journal entries consistently reported insecurity in her own abilities and uncertainty of the required duties of the position. Naturally, this led to feelings of vulnerability, frustration, and stress, which affected her professional life and eventually crept into her personal life as well.

As time went on, fortunately, there were some efforts put in place by upper administration that contributed to Laurie's professional development. Directors of all teacher education programs, both department and campus wide, now meet monthly. Laurie reported that at first, these meetings were largely informational, reporting upcoming deadlines for curricular changes or assessment cycles, changes to field experience placement procedures, etc. While not professional development per se, it was the beginning of a necessary shift. As directors across programs and colleges began to know each other and the commonalities and differences of programs and practices, the group began to insist on legitimate professional development, inviting assessment specialists, recruitment/marketing experts, and others to attend meetings and "workshop" on authentic, necessary tasks. Likewise, the group recently pushed for a document defining and outlining the responsibilities, requirements, and compensation benefits for director positions, which had not previously existed. Hopefully, that document will help new leaders who might find themselves in similarly involuntary administrative positions. Additionally, it can provide both guidance in administrators' responsibilities and outline limitations so they are not overburdened or completing tasks beyond those required.

Evidenced in our own experiences and those of other self-study teacher education leaders, we can conclude there is not consistency in institutions' induction and professional development for new teacher educator administrators. Arguably, efforts to study the impact of different approaches of supporting administrators would potentially lead to the adoption of practices that had positive consequences for administrators and their work. Institutions and their constituents would benefit from providing leadership professional development that resulted in administrators (particularly novices) understanding role expectations and feeling comfortable in their ability to complete the duties assigned to their role(s). Ultimately, because of power dynamics present in campus relationships, and the potential consequences (including the manner in which compensation is determined) that might occur if an administrator laid bare his/her uncertainties, his/her vulnerabilities, and/or his/her ignorance, professional development and support for administrators sponsored and/or carried out by the campus agents may never be fully able to meet the needs of their target audience. There are arguably some elements of leadership professional development that administrators must do independent of their institution and its affiliations. That may well include the personal and professional development that occurs through the opportunity to reflect and discuss with others specific critical incidents that unfold within one's context of leadership, as with a critical friend.

The Importance of Critical Friends

Across the texts we examined, numerous authors describe the value of having networks, colleagues, and/or critical friends outside their institutions. A critical friend with whom to collaborate, according to Russell (2007), is vital to self-study, providing support through the use of questioning to improve practice. Critical friends also serve to challenge assumptions, provide divergent perspectives, and offer unique lenses or distinct experiences that can inform the research and practice of the self-study teacher educator. An important condition, of course, in choosing someone to fulfill this role is that he/she is a friend. The vulnerability required to engage in self-study with others requires a trusting, committed, and supportive relationship where both (or all) parties not only listen and offer input and feedback but also allow space for the important "self" work. Often, self-study is rife with emotion, necessitating a colleague who is critical but also a caring friend. Perhaps this is even more important within contexts of leadership, as administrators are often wary of exposing their weaknesses or creating perceptions of inability or inexperience.

Roose (2010), after years of working in relative isolation, recognized the importance of collaborating with other education professionals. She systematically collected data over 18 years as a teacher educator administrator, journaling her experiences and logging her tasks. Once she began incorporating critical friends into her work, she saw a transformation in her thinking about both her research and her practice. Critical friends helped her reorganize her data, offering suggestions for the lenses through which she might approach her self-study. Likewise, she notes that

critical friends helped shift her analysis from the self to the other, as self-study research should, moving from the particulars of her unique situation "toward frameworks of analysis and conclusions that might reflect more administrators' experiences" (p. 276). She did note, however, the possible need to find critical friends outside one's own institution because of various issues such as confidentiality.

A factor that complicates the efforts of administrators to systematically reflect on and learn from their leadership experiences is, in most cases, a lack of an on-site peer group. Loughran and Brubaker (2015) noted, "Few colleagues are available to authentically debrief. . . due to imbalances in institutional positionality and authority" (p. 267). The work of leading is often lonely and isolating (Gore 2015). Given their responsibility for personnel-related decisions and actions, and the often legal and/or ethical dimensions of personnel matters, administrators, even in the friendliest and most cohesive contexts, can find themselves in situations where there is no one within their institution with whom it is appropriate to discuss their work experiences and the emotional and interpersonal consequences. As Gore (2015) recounted from her experiences, when contexts and circumstances are most challenging, administrators can feel isolated from their institutional communities:

> I received little direct feedback from colleagues about how I was performing in the role. The same institutional power relations that led to being treated differently when I started as dean contributed to a wariness. . . No doubt these relationships of power contributed to the "loneliness" of the position, about which I had been warned. (p. 173)

Further complicating the use of critical friends in research on leadership is the time it takes to engage in this practice. Loughran (in Loughran and Brubaker 2015) initially began a collaborative self-study with two others in similar dean positions. The administrative demands and the time-consuming nature of leadership made it difficult for the colleagues to sustain a meaningful and routine line of communication, uninterrupted by distractions and other pressures. Loughran laments the "dramatic loss of discretionary time" (p. 258), which research requires. Consistent with the challenges faced by others who have employed critical friends in their research on leadership, we have noticed a significant lack of time available to dedicate to improving our teaching, engaging in service, and sustaining our research agendas. Self-study, because of its inherent facility in connecting research and practice, has the ability to diminish these difficulties, but it entails a concerted, committed effort from all involved.

Conclusions

We are committed to this work because we believe engaging in collaborative self-study is a powerful strategy for addressing multiple concerns and needs teacher educator administrators might have. As we and others (i.e., Loughran 2015; Roose 2010) have described, collaborative self-study provides an extended professional community that is helpful in alleviating the isolation that can be felt by individuals in

administrative roles, particularly when faced with challenging contextual situations. Additionally, collaborative self-study networks facilitate distributed knowledge and the wisdom of multiple perspectives. While contexts vary, teacher educator administrators inevitably face similar professional demands. Having peers with whom to test out potential action plans and responses can protect against tunnel vision or shortsightedness. Likewise, being informed of challenges present in other contexts and being aware of how peers in other institutions respond to political and social forces (i.e., shifts in federal policies, licensure, accreditation, the evaluation of teacher performance) ensures more informed action by administrators.

As we have witnessed, by engaging in ongoing cycles of collaborative self-study focused on our practices as administrators, we have promoted greater alignment between our articulated beliefs and values and our actions. Through having a trusted friend who is committed to the same ideals, we have found the support needed to be courageous and persistence in blazing forward on initiatives intended to bring about positive changes in our contexts. We anticipate that we, as our roles and administrative experiences continue to grow, will continue to engage in collaborative self-study. While we did not initially seek our administrative assignments, self-study has allowed us to embrace them as opportunities for our professional growth and pathways for having greater influence within our programs and institutions. The opportunity to serve as leaders has afforded us with a more nuanced understanding of the complexities of our programs, departments, universities, and broader academic policies and practices. Through that newfound knowledge, we are in a better position to advocate for our espoused goals: social justice, shared governance, transparency, democratic practices, and critical reflection. As with our practice as teacher educators, as administrators we hope to be effective actors in promoting greater equity and social justice in the classrooms and schools where our graduates work as teachers.

In order to achieve the goals we have set for ourselves as administrators, we were tasked with finding a way to develop our professional skills and systematically examine our practices to ensure they aligned with our beliefs. Allen et al. (2011) contend the component typically missing or underdeveloped in educating and preparing leaders is "the intentional integration of the research and practices for assessing and developing the deeply held core beliefs, attitudes, and values" that are key to effective leadership (n.p.). Effective mentoring, coaching, or facilitating does not always happen naturally as many of the self-studies on teacher educator administration have demonstrated (i.e., Clift 2011; Mills 2010). And moving from teacher to teacher educator to administrator does not necessarily immediately prepare you to be a visionary, diplomat, or strong communicator (i.e., Kitchen 2016; Smith 2015). Based on the growing body of self-study literature on leadership and on our own experiences, we would argue that intentionality is essential, regardless of the means or method of professional development for administrative roles and responsibilities, especially in those that are ill-defined and/or more difficult to evaluate. Whether institutionally driven, individually explored, or collaboratively investigated, effective leaders should not rely on serendipity or chance if they hope to enact their practice in ways that are meaningful, equitable, and transformative (Gmelch and Buller 2015; Ruben et al. 2017).

As we plan to remain in our administrative positions for some time yet, we will persist in our efforts to enact our roles and responsibilities in ways that align with our beliefs about effective leadership. In order to do that, however, we will need to continue the cycle of inquiry, as teacher education is work that is ongoing, complex, and mutable. One of the possible queries we plan to pursue moving forward is retrospectively interrogate our journals, examining them for metaphorical representations. Have our ways of articulating our roles shifted, or have the images of leadership we employed initially changed over time? Our collaboration will carry on into the future, and we hope other self-study scholars who find themselves in lower-level, transitory administrative positions will join us in systematically studying and documenting their experiences and sharing their findings.

Out of this research, there are possibilities for further, related inquiry. Our collaboration developed out of a long-term friendship, which is not a luxury afforded to all who find themselves in newly acquired, uncharted administrative territory or simply in new institutions. Being able to rely on a trusted friend experiencing a similar shift provided a much needed way to navigate our new positions. We recognize that, while highly beneficial, our work together sometimes revealed disconnects because of the idiosyncrasies of our institutions. As advocated by Roose (2010), we call on the S-STEP community to discover ways to connect administrators across institutions, perhaps identifying potential collaborators whose institutions share particular contextual attributes. The broader S-STEP community can assist in cultivating critical friendships so teacher educator administration is no longer a solitary, isolated endeavor.

Another potential avenue of study derives from experiences such as those of Gore (2015) and Kitchen (2016), both of whom explored the ways in which leadership impacted their sense of well-being. They point to the need to strike a balance between professional work and personal life. Finding modes of self-care and time management can be critical in being able to maintain a leadership position over time, decreasing burnout, and providing more stability at all levels of leadership. The S-STEP community could benefit from further research on how individuals and institutions foster practices of work-life balance so teacher educators and administrators feel satisfied and successful. Are there ways that we can, as a community of teachers and scholars, help each other maintain a healthy balance so the work we do, in teaching and in scholarship, is sustainable over time and despite shifting roles and responsibilities?

The S-STEP community could benefit from retrospective analyses conducted by those who have been and are no longer in administrative positions (i.e., Gore 2015; Mills 2015), finding ways to aid the alignment of ideals and enactments as well as evaluate practices that were particularly beneficial to constituents. As the body of literature in teacher educator administration continues to grow, the S-STEP community could benefit from reports of successful and effective leadership. Such efforts may serve to enhance the value ascribed to leadership assignments, particularly lower-level, transitory positions. As Ruben et al. (2017), have observed:

In most institutions, recognition and incentives for serving in roles such as program director or department chair are limited. Often such contributions are not regarded or acknowledged as a significant component of one's professional contribution as an academic – certainly not to the same extent as other components of teaching and scholarship. A further difficulty is that many institutions of higher education lack clear markers and methods to assess excellence in leadership. (p. 13)

Furthermore, as self-study scholars, we might explore how being a leader informs and enhances teaching, scholarship, and service, rather than how it detracts from the responsibilities that typically characterize work in academia. The shift from obligation to opportunity, from burden to possibility, can perhaps begin to transform the perception and practice of teacher educator administration. As a community, over time, we can develop a more sophisticated understanding of the various roles within teacher educator administration and develop a body of work that can serve to guide new administrators, enhance leadership practices, and promote positive change within teacher education, the academy, and beyond to the work of teachers and schools in society.

The sociopolitical landscape of K-12 education and higher education has experienced seismic shifts over the last 30 years. In the USA, K-12 education has been shaped by high-stakes accountability initiatives dictated by the federal government: local, state, and national movements away from public community-based schools toward charter schools and tax vouchers for private schools; and a rapid progression toward a K-12 student population that is predominantly nonwhite. The profession of teaching and the teacher population have been undermined by negative media, organized campaigns to weaken professional associations (unions) and job security (tenure), and chronic conditions of low compensation and eroding benefits (retirement and insurance). There is a nationwide push to increase the academic qualifications of potential teachers; at the same time, there has been a dramatic decline in undergraduate students choosing to pursue degrees in education. External oversight of teacher preparation and teacher education programs has exploded, taking the form of a variety of admissions exams (i.e., CORE, PAPA), credentialing assessments (i.e., Praxis, edTPA), and mining of K-12 student academic performance data (i.e., PARCC), to evaluate the quality of preservice teacher education. While the specific details and degree of fluidity vary, other countries (i.e., Australia, Canada, & England) have similar K-12 and higher education contexts (see Clift et al. 2015; Elliott-Johns 2015a).

If it ever was efficacious to pay minimal attentions to the induction and professional development support afforded to teacher educator leaders, that is no longer the case. The current and anticipated environments of both K-12 education and teacher education dictate that future and veteran teacher educator administrators must have the capacity to hone their leadership skills and study the implications of their practice. Self-study can be a powerful tool for engaging in this work. As the twenty-first century moves toward its third decade, self-studies by teacher educator administrators that explore their adaptability and resiliency to ongoing changes in the landscape of education are indicated. Potentially most beneficial will be studies that consider the potential leverage teacher education and its leaders may have in shaping the education landscape versus simply being reactive/responsive to externally imposed changes (Craig and Orland-Barak 2015; Elliott-Johns 2015b).

Contents

Abstract

This chapter considers the challenges of impact in self-study in teacher education by framing the issue in two discrete ways. First, because engagement in research

is a prerequisite for impact, the challenges teacher educators might perceive in embracing and utilizing self-study of teacher education practices (S-STEP) methodology in their work is considered. Second, because impact suggests that doing one thing will have a tangible effect on another, the extent to which engaging in self-study can influence the quality of teacher educators' experiences and/or teacher education practices and policy is also considered. The chapter concludes with a discussion and review that invites the reader to contemplate ways forward for self-study research in teacher education.

Introduction

As self-study practitioners who have embraced and regularly used the methodology in our own work, we maintain a very positive view of S-STEP and join the international celebration of community and success established over more than the last 25 years. Still, in line with the major characteristics of self-study itself, we see it as a necessary and worthwhile endeavor to acknowledge and to describe challenges that teacher educators should be prepared to consider in this type of teacher preparation work and research. While many teacher educators study their own practice, the benefits are not always universally recognized. We see the challenges as very real and inevitably multilayered because the work of teacher education is itself multilayered.

Our collaborative intention is not to frame things in a negative way but rather to consider the ways in which different understandings, circumstances, and contexts can present challenges, as well as opportunities, for students and teachers of teaching. As in self-study, to describe the situation is to begin to understand it and then to be able to chart a course forward. We have warmed to the task and appreciate the critical friendship of reviewers and editors. We are self-study practitioners proudly committed to forms of self-initiated inquiry that are situated, improvement-aimed, and undertaken collaboratively, through the use of multiple methods to demonstrate trustworthiness. Self-study is central to the education of the teacher candidates and practicing teachers that we work with and has been central to our own development as university-based teacher educators and educational researchers and writers.

In what follows, we first provide a section that contextualizes the nature and aims of the self-study movement in relation to certain trends characterizing twenty-first-century teacher preparation. The section after that describes challenges that teacher educators might perceive in embracing and utilizing self-study in their work given a host of contextual factors that shape professional understandings. Then, a section is included that focuses on the extent to which studying one's practice makes a difference to both the quality of the experience of being a teacher educator and the

quality of teacher education practice. The chapter concludes with a discussion and review that invites the reader to contemplate ways forward for self-study research in teacher education.

Studying Oneself as a Teacher Educator: The Challenge of Agency

The principle of studying one's practice is well-established in education. As pre-service teachers in the 1990s, we were encouraged to reflect and report on our progress and suggest ways in which our lessons and interactions could improve or accelerate the learning experiences of the children who we were working with. This approach was part of the re-emergence of reflective practice in education, influenced by the work of Schön (1983, 1987) and developed by others (e.g., Calderhead and Gates 1993; Grimmett and Erickson 1988; LaBoskey 1994). However, what we experienced in our teacher preparation was not the sort of in-depth self-study of teaching practices that was beginning to emerge in North America and elsewhere (Shulman 1987; Cochran- Smith and Lytle 1993; Patterson and Shannon 1993; Kortha gen and Kessels 1999) and set to become an international initiative in the particular development and improvement of teacher education (Russell and Munby 1992). Although debates have continued about the impact and institutional status of such research (Cochran- Smith and Lytle 1999; Kosnick and Beck 2000; Simms 2013; Wineburg 2005; Zeichner 2010), the S-STEP community has framed the close study of one's own practice as an essential part of the ongoing journey of learning how to teach within the community of educational research.

In addition to encouraging their students to study their own learning and professional development as practitioners, a significant number of teacher educators in varying contexts in different parts of the world increasingly study their own experience and practice (Ritter et al. 2018). There is a certain paradoxical challenge here as self-study research has become both more difficult and more important in a period when many in education feel besieged, sometimes overwhelmed, by mandated, mechanistic systems of accountability, where expectations grow as resources shrink. Hargreaves argues that the growth of a competitive knowledge economy across the world has diverted teachers and teacher educators from "ambitious missions of compassion and community" toward the "tunnel vision of test scores, achievement targets and league tables" (2003, p. xvii). In England, the profession of teaching can be seen to be under siege at times, with a shortfall in recruitment and large numbers of teachers planning to leave the profession (NUT 2016; Lightfoot 2016). In the USA, the quest for accountability through a standardized, test-led "science" of education has shifted many teacher educators toward quantitative methods of assessment and research (Baez and Boyles 2009). There has been a structural shift from teachers' accountability to themselves, their colleagues, and their students toward accountability to external bodies. Individual and collegiate pedagogic creativity are styled as a problem rather than an asset in this scenario, with "assessment" as the dominant tool of control. The global tendency toward the marginalization of theory and reflection in education reform and policy, as seen in the promotion of programs

with minimal higher education input, such as Teach First (UK) and Teach for America (USA), has undermined the importance of research-informed reflection on experience in teacher education. One result, as identified by Bullough (2015), is that "many teacher educators and institutions no longer consider involvement in research on teaching as being of particular importance to quality teacher education" (p. 87).

Nevertheless, some people still become teachers and teacher educators because they want to be active agents in making the world a better place (Kelchtermans 2005; Troman and Raggl 2008; Marsh 2015). Many of the teachers and preservice teachers that we work with now continue to resist the standardized curriculum scripts and reach beyond the technical tasks of teaching in forming and building communities of learning. In these times, the case persists that students of teaching, teachers, and teacher educators grow and develop only when they look to themselves and consider their own practice closely (Russell and Loughran 2007). We know the risk of not reflecting on, and theorizing about, professional practice: without these important dispositions, teachers and teacher educators can become, as Eraut puts it, "prisoners of their early school experience" (1994, p. 71). For experience to have educational value, we need, as Dewey explained in 1916, to "extract its net meaning" through reflection (p. 323).

The various approaches that have evolved within self-study commonly challenge forms of research which marginalize and abstract the perspectives of participants. One stream of educational research from the mid-1980s informing self-study (e.g., Clandinin and Connelly 1986) has emphasized the use of self-narrative in the education of teachers in demonstrating how practitioners make meaning of their experiences through the stories they tell of themselves and their work. This is a central pillar in the self-study of teacher educators and shows how teachers of all sorts use and construct knowledge that is experiential, narrative, and relational and how this shapes, and is further shaped, by the contexts of their professional lives. Brookfield (1995) linked the lens of autobiography with the skills of becoming a reflective teacher by making the individual's role in the shaping of professional identity and the phenomena of education a central focus. The biographical perspective clarifies the understanding of learning and teaching with a view to empowerment rather than measurement. Weber and Mitchell (1995) and Mitchell and Weber (1999) invited educators to use a variety of life history-informed methods to revisit their past, their attitudes, and their beliefs so that they could examine and reinvent themselves as teachers. From this perspective teacher educators are potentially agents in the building of knowledge and the development of pedagogy, however prescribed it may have become: "They are once more both creators in, as well as created by, the social and cultural worlds they inhabit" (West et al. 2007, p. 32).

Research using self-study methodology has included seeking to develop practice by placing teacher educators' own narratives at the center of the process in order to examine the role of collaboration in self-study (Chryst et al. 2008: Crafton and Smolin 2008) and exploring the tensions between teaching, methodology, and theory in teacher education (Hamilton 2008). Kitchen's (2008) study of his own experiences of moving from school teaching toward tenure as a university professor

reveals the struggle of balancing teaching and scholarship for teacher educators. There has been increasing self-study on the professional learning and identity of teacher educators, including research examining the transition from teacher to teacher educator (Mayer et al. 2011; Williams et al. 2012), the development of a pedagogy of teacher education (Brubaker 2012; Jones 2015), working in different geographic, cultural, and institutional contexts (Hu and Smith 2011; McAnulty and Cuenca 2014; Monroe 2013), and the impact of gender and race on being a teacher educator (McNeil 2011; Skerrett 2008). Some self-study scholars have explored their work as leaders and administrators (Clift et al. 2015) or as authors and editors (Hayler and Williams 2018).

Those who engage in self-study of teacher education practices demonstrate that their own work in teacher education is improved as a result. This is valuable to the profession. Personal experience research adds new knowledge to the field when it makes clear links between the self-study and a wider problem that has relevance to others. Kosnick et al. (2009) demonstrate how they adapted and developed their courses of study in response to findings and analysis from a longitudinal self-study: "without studying our own setting we would have lost the opportunity to improve practice" (p. 163). For her self-study, Spiteri (2010) returned to classroom teaching in order to revisit and unpack her own assumptions of teaching and learning which encouraged her to form "a more developed understanding of the learners' role in learning" (p. 139). Hogg and Yates (2013) investigated their students' perceptions of the modeling provided by tutors, highlighting the value as well as the shortcomings of the approach in teacher education, allowing them to develop strategies for making the experience more relevant for their students. Peeters and Robinson (2015) explore the ways in which teacher educators need to, and can, learn from mistakes by considering how collaborative approaches encourage forms of "double-loop learning," allowing critical reflection and improvement of practice in a "safe" and supportive environment. Drake's (2016) 4-year self-study on coaching preservice teachers provides clear insight into the challenges of developing new and relevant approaches. Samaras et al. (2016) crafted their collective self-study with the specific aim of improvement of program coherence in clinical experience. The study informed program development and highlighted the benefits of faculty-wide self-studies more generally, providing an exemplar for much-needed, effective forms of staff development in teacher education.

Although the argument for studying one's self as a central element of engaging in serious-minded and ethical professional practice has been well-established, a number of perceived challenges in the lived realities of teacher educators can prevent this from occurring as we believe it needs to in teacher education contexts. The next section elaborates on the multilayered challenges that need to be recognized and addressed by teacher educators if they are to embrace and utilize S-STEP methodology in their work. Our purpose here is not to dissuade colleagues from learning about or engaging in self-study. Instead, we advocate just the opposite, as we believe that the challenges of engagement are often mitigated by the methodology and that the rewards of the work far outweigh the perceived risks.

Multilayered Challenges Involved with Doing Self-Study

In this section we categorize and discuss some of the perceived challenges that individuals might express or experience when engaging in self-study in teacher education contexts. Before presenting these categories and our descriptions of them, we need to make two points. First, there are no clear lines of separation between these challenges as they both influence and are influenced by one another. Second, although we use the term challenges, this should not immediately be viewed as having a negative connotation as, unlike barriers, challenges often represent opportunities to widen perspective and to progress to new or different understandings.

Personal Challenges: Being Vulnerable and Open

A research methodology that invokes the term *self* in its name immediately suggests that its conduct will require an intimacy that is often avoided in more traditional forms of research. Interesting and compelling topics of self-study often require discussing the problematic features of one's own identity and practice, which necessitates honesty and a willingness to share vulnerabilities and uncertainties. As a consequence, those considering self-study should be emotionally prepared, interested, and willing to embark on such a personal challenge and undertaking in their professional lives.

Further to this, since navigating teacher education contexts in a productive and scholarly way is too often left to the individual teacher educator with little or no guidance from others (Berry 2007; Guilfoyle et al. 1995; Kremer-Hayon and Zuzovsky 1995; Martinez 2008; Murray and Male 2005; Ritter 2007), self-study methodology advocates seeking out and building trusting relationships with "critical friends" (Costa and Kallick 1993). This requires being open to making connections beyond oneself. In her discussion of the methodological underpinnings of self-study, LaBoskey (2004a) made it clear how self-study must challenge the researcher's tacit understanding about teaching and learning by encouraging interaction with colleagues, students, and educational research. Critical friendship realizes this objective by facilitating an openness to critique that is necessary for advancing understandings and improving teacher education practice.

Professional Challenges: Shifting Identities

Many teacher educators move into their university positions from the classroom. Law et al. (2002) argued how individuals in the process of establishing their careers need to develop a personal narrative that incorporates past experiences into their learning in new professional contexts. This leads many teacher educators, at least initially, to see the need to hold onto their classroom teacher identities while striving to establish credibility as teacher educators (see, e.g., Boyd and Harris 2010; Carrillo

and Baguley 2011; McKeon and Harrison 2010; Murray and Male 2005; Swennen et al. 2009; Wood and Borg 2010; Williams and Ritter 2010).

While maintaining ties with the past may provide teacher educators with a certain measure of comfort, the roles of teacher and teacher educator are not the same, and ultimately a shift in role identification (Dinkelman et al. 2006a, b; Loughran 2005; Ritter 2007, 2009) must occur that takes into account the expectation that teacher educators are required to teach about teaching while also engaging in scholarly pursuits, such as the production of research. Undertaking this shift represents one of the primary professional challenges teacher educators must confront in developing a pedagogy of teacher education and in becoming active as researchers. As such, thoughtfully using one's own work in teacher education as a site of inquiry can be both useful and appealing because of the potential to simultaneously advance teaching and research outcomes.

Messiness of Practice Challenges: Complexity

Teacher education, like teaching, is an extraordinarily complex form of professional practice, as its effectiveness hinges on a number of factors that are not easily discernible or able to be manipulated. Labaree (2004) argued that there is chronic uncertainty about the effectiveness of teaching – and by extension teacher education – due to the fact that there are no practices proven to work independent of a given context, a vast array of intervening variables that mediate the learning relationship between teacher and student, a general inability to measure the effects teachers may have on students, complex and often contradictory purposes inscribed on the entire educational enterprise, and unanswered questions around who is being served and for what purposes (pp. 53–55). Such conditions can make it extremely difficult to investigate both teaching and teacher education because there are few causal relationships and no generalizations to be found. For its part, self-study embraces this complexity, with an aim "to provoke, challenge, and illuminate rather than confirm and settle" (Bullough and Pinnegar 2001, p. 20). Self-study practitioners tend to situate themselves in the middle of the uncertainty through the self-study research process.

Institutional Challenges: Expectations and Priorities

The institutional contexts in which teacher educators work can pose challenges for those interested in self-study research (Williams et al. 2012). While a sense of belonging is an essential part of any profession, many teacher educators express frustration at the perceived need to fit in with prevailing institutional structures and practices (Conle 1999; Cole and Knowles 1996; Guilfoyle et al. 1995; McKeon and Harrison 2010; Murray and Male 2005). Many teacher educators experience institutional political or power structures that challenge their sense of belonging and betray their focus on teaching (Donnell 2008; Guilfoyle 1995). Research

expectations figure prominently into how teacher educators perceive their roles (Ducharme 1993; Labaree 2004). Further, as institutions increasingly compete against other institutions, universities often define desirable faculty activity in terms of quantifiable "outputs." This suggests a need to constantly be putting out "products." Although self-study is convenient in the sense that it is local inquiry, it is not easy, or something that lends itself to quick findings. However, self-study can be a way for teacher educators to forge a nexus between their teaching and their scholarly identities, thus responding to the pressure to research and publish (Acker 1997; Knowles and Cole 1994; Mueller 2003; Murray and Male 2005; Wisniewski and Ducharme 1989) and the struggle for tenure (Acker 1997; Cole and Knowles 1996; Kitchen 2008).

Nature of the Academy and Broader Educational Research Community Challenges

Questions related to the nature of the academy that might give potential self-study practitioners pause include as follows: Who is getting hired? For what kinds of jobs? Few job advertisements explicitly seek qualitative researchers, let alone self-study researchers. Moreover, many teacher educators feel the need to establish themselves as active participants in the larger educational research community. This represents an important ambition for most of their career trajectories and speaks to the type of academics they aspire to become. Accordingly, traditional understandings of quality and rigor in educational research, defined by such characteristics as objectivity, generalizability, and validity, may cause some concern for those considering self-study as a research option. However, for those interested in personal empowerment through the generation of "local, situated, provisional knowledge of teaching" to potentially "trigger further deliberations, explorations, and change by other educators in their contexts" (LaBoskey 2004b, p. 1170), there is a growing community of self-study scholars who meet regularly at high-profile and prestigious conferences to both support and challenge one another in embodying their values in their practices as teacher educators and educational researchers.

Norms of the Public School System Challenges

Public school settings tend to be busy and sometimes chaotic places. Teachers often want to know what will work in their practice here and now, and school districts are often interested in professional development opportunities of a similar ilk for their faculty. Neither of these are necessarily priorities for self-study research, as they tend to simplify what self-study researchers acknowledge and accept about the complexity of teaching. Pinnegar and Russell (1995) point out that teacher education remains "a unique place to study teaching because in many ways it most visibly represents *the essential test of teaching*, one which involves three people: the teacher, the student becoming a teacher, and the student-teacher's students" (p. 6, emphases in

original). In this arrangement, the role of the teacher educator takes on a particular significance. Wisniewski and Ducharme (1989) described this potential significance in terms of two interrelated ideas: "the belief that the quality of education is directly related to the quality of classroom teachers, and the realization that the quality of teachers is directly related to their preparation for teaching" (p. 3). Using this rationale, although there may not be immediate returns for public schools, self-study practitioners ultimately serve teachers and the schools in which they work by studying their own practices and improving teacher preparation.

Doing Self-Study *Because* of the Messiness: Rising to the Challenge

While being aware of the multilayered challenges discussed in this section, an increasing number of teacher educators are choosing to study their own practice through self-study. As much as it is possible that some researchers could be discouraged by the "messiness" of the self-study process, others are drawn to it specifically because of its broad allowance for researchers to approach their studies with different motivations, across diverse contexts, and using a variety of methods (Berry 2004, p. 1312). Some are interested in better understanding their professional development, identities, or collegial interactions (Louie et al. 2003; Cole and Knowles 1998). Others focus more narrowly on their teaching, investigating specific aspects of their practice or the relationship between their beliefs and actions (Berry 2004). The sites of inquiry can vary according to the impetus for the study, research questions, or the physical location in which the researcher works. Moreover, the context can even be expanded to include points in space or time that challenge default assumptions and allow new understandings to emerge. In short, with self-study, teacher educators have a versatile and inclusive methodology with which to approach their messy and complex work.

What Difference Does Studying Oneself in Teacher Education Make?

To be sure, not everyone understands the proliferation of self-study of teaching and teacher education practices as being linked to particularly worthwhile or meaningful outcomes. In a commentary focused on preparing future generations of education researchers, Wineburg (2005) sardonically offered ten imperatives that would maintain the "vitality of our irrelevance." Number eight on his list reads:

> *Self-Study Is the Way.* We can never know too much about our own feelings as researchers, the shades and hues of how we came to formulate our research questions. We must document and write articles about each unfolding second of our practice. We're a fascinating lot, and there's still so much about ourselves we don't know. (p. 37, emphases in original)

Although the majority of those reading this chapter are not likely to agree with Wineburg's stagey characterization of self-study as just another way to maintain irrelevance, his view does raise important questions about the purpose and reach of self-study research in teacher education. This section puzzles over the challenges of impact by addressing the extent to which studying oneself makes a difference to (i) the quality of the experience of being a teacher educator and (ii) the quality of teacher education practice.

On the Quality of the Experience of Being a Teacher Educator

The quality of the experience of being a teacher educator (e.g., understanding, self-awareness, acceptance, confidence) seems closely connected to issues of socialization to the field and professional learning and development over time. Although much has been written about these issues as it pertains to classroom teachers, comparable scholarship has only recently begun to emerge in relation to teacher educators. In an article exploring the notion of professional development as a teacher educator, Loughran (2014) presented a framework illustrating:

> how the development of teacher educators' knowledge and practice of teaching *and* learning about teaching is intimately tied to: understandings of identity; the challenges and expectations of the teacher education enterprise; and, the place of scholarship as an important marker of knowledge, skill, and ability in the academy. (p. 272)

In arguing for the accumulation of knowledge across self-studies in teacher education as a way of connecting these approaches more clearly with the wider body of research in teacher education, Zeichner (2007) recognizes the ways in which self-study research has enriched the quality of the work lives of teacher educators while also contributing significantly to improvements in the quality of teacher education programs in a range of international contexts (p. 37). Drawing upon Goodson's (1992) notion from narrative life history research of a "genealogy of context" that allows one to reframe understanding of prior knowledge and experience in relation to current knowledge and perspective, we do not avoid analysis of the data from our own experiences within our research in teacher education. As Loughran (2014) makes clear, self-study research places teaching about teaching at the center of the research endeavor which is why teacher educators find it most useful (p. 8). Kosnick (2007, p. 25) makes a convincing case from her own self-narrative that being a teacher educator eventually entails the requirement to be a researcher of teacher education, as both are central to who we are and what we do as teacher educators.

It is our contention that, in seeking to examine and more fully embody their ideals in their identities and practice, self-study practitioners simultaneously improve the quality of their own experience as they learn about and contribute to furthering understandings in relation to each of the aforementioned teacher educator professional development areas identified by Loughran (2014). In what follows we share

our stories as becoming teacher educators (Ovens et al. 2016) to highlight key points in our development and understandings that address the overlap between self-study and our understandings of identity, the challenges and expectations of the teacher education enterprise, and the place of scholarship as an important marker of knowledge, skill, and ability in the academy.

Jason

As I reflect on my years as a teacher educator and researcher, I cannot help but think it a little ironic to now be writing on the challenges of engaging in self-study in teacher education contexts. You see, it was actually my sense of feeling challenged that led me to self-study in the first place. I was only 25 years old when I began my doctoral studies. I was not necessarily a teacher who had mastered his craft. I was not yearning for a new challenge. I was simply a pragmatist who knew he still had a lot to learn about teaching. My intention was to take a year's leave from my high school teaching position to satisfy the residency requirement associated with the Ph.D. and then to return to the classroom the following year while working on my degree part-time. But that did not happen. Instead, I found myself intrigued with teacher education shortly after my responsibilities as graduate assistant thrust me into that role as a university supervisor of student teachers. Although not quite "accidental," as has been reported by others in the literature (Mayer et al. 2011), my path to becoming a teacher educator was not intentional either. I came to my doctoral studies hoping to learn more about teaching for myself, but I immediately discovered such learning would have to occur at the same time as I was attempting to teach others about teaching. It was not enough to share with student teachers my experiences – my relatively short experiences, at that – from the classroom. I felt there had to be more involved in teacher education than that.

Fortuitously, I had data from which to consider this issue because, at the suggestion of Dr. Todd Dinkelman (who would later chair my dissertation), I got myself in the habit of writing reflections after each of my teacher education "moments" right from my very first day of graduate school. These reflections became the foundation for my early self-study work, which sought to examine various aspects of the transition from classroom teacher to teacher educator. Similar to others who find themselves making professional transitions (Williams and Hayler 2016), my *identity* as a former classroom teacher moving to teacher education was a recurring theme in my early research as I struggled to forge new professional understandings against the backdrop of my prior experiences. Indeed, one of my first research studies (Ritter 2007) had an entire category of findings focused on the challenges of establishing a professional identity as a teacher educator. By critically reflecting on and examining my background and identity as a classroom teacher in relation to my initial work in teacher education, I was able to recognize how my previous understandings and ways of doing things were not entirely appropriate or effective within my new context. This admission and awareness is a prerequisite for being able to discern the unique challenges and expectations of the teacher education enterprise. It also serves as a powerful reminder that individuals are always more in the process of "becoming" something than they ever are in actually "being" something.

After coming to recognize the constantly evolving nature of my own professional identity as a teacher educator, I continued to engage in identity-oriented self-study inquiries via working with colleagues in similar situations – albeit different contexts – to collaboratively investigate our developing understanding of our roles (e.g., Bullock and Ritter 2011; Ritter et al. 2011; Williams and Ritter 2010). One such inquiry that stands out to me was initiated with Judy Williams (Williams and Ritter 2010) from Monash University after an impromptu meeting at the Castle Conference in 2008. Judy presented a paper that addressed a question I posed in the discussion section of one of my earlier articles. After our meeting at the conference and identification of shared interests, we collaboratively investigated our experiences of becoming teacher educators through the concept of "communities of practice" (Lave and Wenger 1991; Wenger 1998). Despite our differences (e.g., experience in the classroom, subject matter and grade-level expertise, national context, gender, age, etc.), we found similarities in our process of becoming teacher educators in so far as we both recognized the importance of professional connections and belonging, as well as the need to negotiate new professional relationships with student teachers.

Perhaps because I found self-study so useful in navigating my professional identity, I went on to incorporate the methodology in studies to better understand and illuminate the shifting understandings, expectations, and practices associated with teacher education (see, e.g., Bullock and Ritter 2011; Ritter 2007, 2009, 2010, 2011, 2012; Ritter et al. 2011; Williams and Ritter 2010). Many of these topics surfaced in response to becoming more cognizant of the unique *challenges and expectations of the teacher education enterprise*. For example, not long after beginning my work in teacher education, I came to realize that teaching about teaching is not akin to teaching subject matter. There are important differences in the curriculum and pedagogy of teacher education (Loughran 2014). Evidence of my growing awareness of some of these differences is displayed in my first published self-study (Ritter 2007) when I discussed navigating the ambiguous role of a teacher educator in light of my own evolving expectations, the belief systems of student teachers, and the norms of the public schools. These influences in how teacher education gets enacted are not always in harmony, which can complicate advocacy and evaluation efforts.

A more comprehensive consideration of the challenges and new expectations experienced in making the move to teacher education appears in a later study in which I explored the evolving relationship between my beliefs and practices (Ritter 2010). That article details my initial years as a teacher educator by mapping my development onto six stages of understanding, including starting from default assumptions about teaching, invoking my classroom teaching experience as a source of expertise, resisting changing my views on teaching, beginning to focus on program objectives, taking the "content turn" (Russell 1997) in my work as a teacher educator, and taking the "pedagogical turn" (Russell 1997) in my work as a teacher educator. Although presented in stage model fashion, I did note in the conclusion that "my experiences point to how striving to consciously engage in the work of teacher education can also prompt….increased awareness of the importance of embodying one's own beliefs and values in practice" (p. 566). Focusing on the

question of purpose and the importance of embodying one's own beliefs and values in practice suggests a construct of professional learning and development that is personal, malleable, ongoing, and responsive to the evolving challenges and expectations of the teacher education enterprise. Importantly, a primary strength of self-study is that it can facilitate insight in the fluid contexts that comprise our lived experiences.

Another seemingly enduring issue associated with the quality of the experience of being a teacher educator relates to the expectations surrounding research in the academy. Although *scholarship is an important marker of knowledge, skill, and ability in the academy*, for many teacher educators, the desire to do research is not what led them into teacher education. It certainly was not the driving motivation for me. However, research productivity is a significant expectation at most institutions. And, even if it were not, some argue how being a "smart consumer" of research – which also implies an intimate knowledge of the production side of the research process – is an essential part of the experience of being a teacher educator (see, e.g., Cochran-Smith 2005; Loughran 2014). The necessity of being productive as an educational researcher, and some of the associated pressures that this expectation entails, surfaced in a collaborative self-study article I published with Shawn Bullock on exploring our transition into academia (Bullock and Ritter 2011):

> to a certain extent, meeting the research expectations of our positions involved some measure of strategic thinking. . . .While new academics may want to tackle perplexing teaching problems in novel ways, they must always be concerned about the frequency with which their academic work finds formal acceptance. (p. 177)

This excerpt speaks to the various ways in which the pressure to publish experienced by beginning academics at so many institutions of higher education might actually hinder their development to authentically recognize the place of scholarship as an important marker of knowledge, skill, and ability in the academy. But that does not mean that scholarship does not have an important role to play in the quality of the experience of being a teacher educator. Self-study can help teacher educators to realize the affirming role of scholarship in delineating and ultimately embodying their roles as teachers of teachers. This appears tenable due to its ongoing use in better understanding and articulating purpose within the teacher education enterprise, holding teacher educators accountable to their ideals through ground-level research that is often collaborative in nature and in "blurring the knower and the known in teacher education research" (Dinkelman et al. 2012). Self-study, then, offers a framework for understanding and accountability amidst the messiness of teacher education.

Mike

The central question for me remains how to be the teacher educator that I want to be in the context that I find myself in. I have been asking myself that question for some years now, and I have come to know that the shifting contexts of teacher education

provide both the biggest challenge and the most powerful motivation to the practice and process of self-study.

I spent a considerable amount of time studying teaching and learning, as a postgraduate student, as a primary school teacher, and as a teacher educator, but it was not until I began studying myself as a teacher educator, as part of my doctoral thesis, that I really began to gain an understanding of teacher education and what it means to be a teacher educator. After taking a job as a university-based teacher educator in 2004, I became less and less confident the longer that I worked there. I felt less and less authentic as the months went by. It was as though I had left one profession and not properly arrived in another, and my practical experience and classroom "knowhow" seemed to be less and less relevant, while my hard-won identity as a school teacher seemed to be withering on the vine. Feeling lost and isolated, I left the university after 3 years to teach and to study part time. As part of that process, I started writing my own story and made connections with others. I found Laurel Richardson and her work on writing as a method of inquiry (2000) and Russell and Munby's collection on self-study (1992), as I began to find my way back to teacher education via the conference at the castle and an international community of scholars. I took the narrative turn in coming to agree with Ricoeur (1983) that we actually *are* the stories that we tell about ourselves and others. This is not a straightforward journey that comes to an end. I do not think that you reach a destination where you know everything there is to know about yourself, about teaching and learning, or about teacher education. The process brings challenges and difficulties as well as insights, progress, and new understandings of the role.

Discovering, by talking with colleagues and through reading the accounts of others, that my own experience of dissonance was not so unusual in teacher education encouraged me to engage further with the research around transition from teacher to teacher educator (Mueller 2003; Labaree 2005; Murray and Male 2005), including new-to-me self-study research of teacher education practices (S-STEP) (Pinnegar and Russell 1995; Russell 1997; Ritter 2007; Brandenburg 2008). In attempting to complete my doctorate while also trying to work out what I might do next, I was encouraged to switch the emphasis of my research toward a self-narrative (Clandinin and Connelly 1996) and an autoethnographic approach (Anderson 2006; Ellis and Bochner 2000). Anderson's (2006) framework of analytic autoethnography provided the way forward for me, in overcoming the challenge of retaining one's own sense of agency and identity while meeting institutional and external requirements that seem to potentially divert and restrict their enactment. Perhaps this is the art of compromise and/or a way of refusing the institutional or national educational policy "script" (Ball 2015). This approach remains to some extent a pattern that I have followed as a teacher educator and through each of the research and writing projects that I have been involved with since then (Williams and Hayler 2016; Hayler and Moriarty 2017; Turvey and Hayler 2017). What seemed like a new synthesis of understanding, a new way of knowing, still rings true for me and seems especially relevant to research in teacher education where the affective (empathy, compassion, kindness . . .) are clearly combined for me with the analytic (evaluation, assessment, planning . . .) as essential elements of the enterprise.

While research and writing through self-study has helped me to work in new ways with students and to develop meaningful understanding of, and identification with, the teacher education community of practice, it has also made me acutely aware of the variations in expectations of research productivity between different institutions. While things are changing, in the UK "teacher training" currently sits largely within teaching-focused higher education institutions where the majority of faculty staff contracts stipulate an 80–20% divide in favor of teaching commitments. The stated aim of senior management in my own institution, for example, is to extend teaching-only contracts and to reduce staff costs by restricting research activity to externally funded projects. While contributions to the Research Excellence Framework (REF) assessment exercise are encouraged, institutional management support, in my own experience, is thin, to say the least in this area. The emphasis on supporting externally funded research presents significant challenges to self-study researchers in many institutions.

The work on my thesis that drew upon my own account and the account of other university-based teacher educators was my way into recognizing and researching the community of practice of teacher education and eventually my way back to working as a teacher educator. I came to understand and agree with Schön's (1971) point that all real change and learning involve feelings of "being at sea, of being lost, of confronting more information than you can handle" (p. 12). While the data and discussions from self-study investigations illuminate several of the key issues about becoming and being a university-based teacher educator in the first decades of the twenty-first century, it is clearly not their purpose to identify universal processes or generalizations. My own approach was to deliberately focus on individuals including, but not exclusively myself, and to engage in an intensely personal type of research process. The feeling of being at sea did not go away, but rather I developed some "sea legs" and learnt to move and think in a way that allowed new types of understanding to emerge. Through this process of research and writing, I found new ways of living and working with uncertainty. The methods used in self-study illuminate the often hidden experiences in our work, making things more visible without making them simple. The stories themselves have an evocative validity as they bring the news of experience and response from one person's world to another. I think in terms of narrative: like all narrative, self-studies are incomplete, fragmented, and partial. My research and writing contributed toward my own clearer, more positive perspective toward the profession of teacher education and helped to make a connection with others in recognizing a community of those who do this for a living, near and far from home (Hayler 2011). This offers the potential for others to use it in the same way while recognizing the complexity and differences of the contexts in which we develop our understandings. In this way self-study can, as Loughran suggests, go "beyond stories" in "continuing to push the boundaries of teacher education practices in meaningful and productive ways" (2010, p. 225).

My own motivation to research and write has been somewhat self-generated with support, encouragement, and collaboration coming from key colleagues, often based in other countries. Having, like Jason, also met Judy Williams at the Castle Conference in 2008, I have worked on a number of projects with her. Most significantly, in

2014–2015, we initiated, organized, and co-edited a collection of narrative accounts by scholars working in a range of countries, on the professional becoming of teacher educators (Williams and Hayler 2016). The edited collection gave Judy and myself the opportunity to work with a range of teacher education scholars and build working relationships with them as well as gain closer understanding of the trajectories and contexts of the work and lives of teacher educators. The current volume and the current chapter are further examples of how aspects of the teacher education community of practice develop and grow through collaborative scholarship and writing. Using narrative methods of self-study and sharing experiences with others have been a way of meeting the challenge of dissonance. The perspective provided by the process offers me a way forward in my work that connects past experience and present mind with future plans and action. I remain in the middle of the story as the story itself continues to change and to develop, as I and the profession of teacher education continue to change and develop, bringing further opportunities and further challenges for engagement with self-study.

On the Extent to Which Self-Study Makes a Difference to the Quality of the Experience of Being a Teacher Educator

Using our own stories as evidence, the sections above have attempted to illustrate some of the challenges that we faced and some of the ways in which studying oneself can enhance the experience of being a teacher educator by contributing to an advanced understanding of identity, illuminating the challenges and expectations of the teacher education enterprise, and exploring the place of scholarship as an important marker of knowledge and skill in the academy. Sceptics like Wineburg (2005) might argue that the quality of one's experience as a teacher educator does not necessarily hinge on engaging in self-study. They might argue that many in higher education naturally develop more nuanced understandings of their role, with an increased sense of confidence, as they mature over time. But the point is that engaging in self-study can accelerate and enhance the process of "becoming" a teacher educator and enrich the experience of "being" a teacher educator via its emphasis on seeking multiple views across contexts through ongoing critical collaboration with colleagues, as well as through its requirement to calibrate personal experience with public theory through the use of theoretical frameworks in analyzing and situating research findings. Such methodological features ultimately compel self-study practitioners to consciously pursue the sort of teacher educators that they want to be. When compared to the listless alternatives, such a purpose-driven professional existence may represent the ultimate in fulfilment and quality of experience.

On the Quality of Teacher Education Practice

In addition to considering its ability to enhance the quality of the experience of being a teacher educator, any examination of the impact of self-study as a form of

practitioner research must also explicitly consider its practice-related outcomes. While the purpose of most self-study research is "to provoke, challenge, and illuminate rather than confirm and settle" (Bullough and Pinnegar 2001, p. 20), it is also "improvement-aimed" (see LaBoskey 2004a). Many teacher educators realize, and report on, positive outcomes in their personal and/or collaborative practice when they critically examine their actions and contexts via self-study. This can contribute to increased understanding and change at various levels of impact. In the following section, we again provide narratives derived from our own experiences to illustrate how self-study has contributed to improved practice. We then merge our voices in a third section to consider how self-study research might have an impact on practice beyond individuals and/or small groups of interested teacher educators.

Jason

A clear example from my practice in which self-study yielded positive changes that would not have otherwise been probable can be found in a collaborative self-study I conducted with two of my former colleagues at the University of Georgia (Ritter et al. 2011). For the collaborative self-study in question, we analyzed written feedback we had provided to our student teachers following observation visits over a 3-year period. The three primary authors and principal investigators of the study were all social studies teacher educators interested in advancing understandings of teaching for democratic citizenship (see, e.g., Parker 2003). Using cultural psychology as a theoretical framework, the driving question for our study concerned the extent to which the values underlying our feedback either enhanced or constrained the sorts of inclusive understandings of democratic teaching and learning rooted in pluralism that we all espoused. In the findings section of that article, we noted how the:

> cultural frame for our critique, implicitly conveying the value of the ontology of individualism prized in European American contexts, might lead to adverse consequences in terms of student teachers' understandings and implementation of democratic teaching and learning rooted in pluralism. In particular, it was suggested that we may have inadvertently promulgated a highly individualistic conception of teaching for democracy relatively unresponsive to the needs of an increasingly diverse student population. Furthermore, it was argued how the cultural values of self-enhancement underlying much of our feedback did not appear particularly useful in encouraging student teachers to become self-critical professionals willing to honestly reveal their vulnerabilities, ask questions, or collaboratively inquire with others for the improvement of their practice. (pp. 42–43)

Directly responding to these findings in our practice, we all took conscious steps to move away from uncritically providing feedback rooted in the ontology of individualism toward publicly modeling our thinking about culture and its intersection with the democratic mission of schooling. We also made space to jointly interrogate such ideas with our student teachers in our post-observation conferences.

Further to its ability to increase awareness and improve individual teacher education practices, collaborative self-study with key stakeholders in education programs can also yield outcomes at that level. One example of this can be found in a collaborative self-study I conducted with some of my colleagues when we were

still graduate students yet solely responsible for field instruction of teacher candidates in our social studies education program (Ritter et al. 2007). For our collaborative self-study, we sought to find ways in which we might make a difference with our teacher candidates by establishing the necessary conditions and kinds of learning opportunities capable of influencing their beliefs and practices. The findings section of the article we eventually published included sustained discussion around three issues: how our individual approaches may have both enhanced and constrained our work; the roles we played, or should have played, as field instructors; and the challenges of promoting rationale-based practice. Following this discussion, a whole section of the article was dedicated toward addressing the implications of our work for our teacher education program. We wrote:

> our extensive experiences with the pre-service teachers served by the program place us in the unusual position of being able to offer constructive advice to the department's faculty regarding the direction of the program. To be sure, the tension that is engendered by this arrangement—we, along with our graduate student colleagues, have the most direct contact with students but very little control over how that contact is structured—found its way into this study and has motivated us to share a few thoughts on program reforms that may be worth pursuing. (pp. 352–353)

We proceeded to make recommendations such as engaging in more explicit discussions around the nature of field instruction and the role that field instructors should play in teacher education, providing rich and detailed descriptions and analyses of the many contexts within which field instructors work, and helping student teachers develop better understandings of the role their rationales can play in helping shape their practice *before* student teaching begins. These recommendations became regular points of conversation in our program meetings and served to reshape elements of the social studies education program.

Mike

For me, taking the pedagogic turn meant taking a narrative, self-study turn that yielded positive change through a focus on the application of "learning outcomes" and "success criteria" as a learner, as a teacher, and as a teacher educator. Self-study allowed me to understand the ways in which module and assignment learning objectives can act as a form of institutional control, with the potential to subdue and silence approaches to teaching, learning, and expression in all phases of education (Hayler 2017). I learnt a lot from this process, and given that my undergraduate students faced similar challenges in balancing comparable requirements, I developed a framework for adapting more "open" learning objectives and engaging with them discursively as part of my teaching work. The aim has been to reach a consensus with students that will allow them to approach the work in an individual way while demonstrating their knowledge and understanding of the module content.

The quality of reflection within several courses and modules within my institution has been influenced by this shift of perspective and process toward self-study. While reflection on practice has long been a stated requirement of our teacher education programs, it was only following a collaborative self-study on the ways in which we

might reflect through writing that was carried out by staff on a particular course that we began to develop the quality and purpose of the reflective tasks themselves. Within that undergraduate education course, we developed a new final-year module called "Reframing Identity," key elements of which have since been incorporated into other teacher education courses and modules. The aim is to support and encourage students to explore their understanding of education and to develop critical engagement with their experience, current knowledge, and ideas for the future. In the first semester of their final year, we encourage students to draw upon their studies, placement experiences, and reading from earlier in the course. The module hinges around the written assignment in which students critically reflect upon their own learning experiences to analyze and evaluate the educational principles and values that underpin their understanding of education. In the first sessions, we focus on the nature of memory and writing as a method of inquiry (Richardson 2000). Discussion centers on "creative analytic practice" and the crafting of story as a process of analysis. The students further reflect upon their own view of education and how this has been informed by their own experience through a writing task following each session, beginning to serially assemble a draft of the assignment. In later sessions we consider memory in autobiography looking at life history and narrative approaches. Discussion led by students considers the process of constructing their own stories of education. As part of the process, tutors share some of their own experiences of education. Each week we return to the serial assignment and discuss how they are approaching their writing, what they are learning as they write, and what they will do next. Later, we work in smaller groups and consider ways of making sense of stories from experience. I introduce them to the progressive/regressive approach (Sartre 1963; Denzin 2001) as a way of considering their data. The concept of the individual defined as a praxis that both produces and is produced by social structures (Sartre 1982) forms the basis of the progressive/regressive method as it combines psychological and sociological explanations of human action in practice.

The results have been sometimes astounding with students writing autoethnographic assignments that bring new understanding of their own experience to bear on new understanding about the development and nature of education in England. Encouraged by an environment that places reflexivity and self-study at the center of a critical narrative pedagogy, the students come to know and narrate something about themselves, and by narrating the subjective experience, they come to share something about education and how they will engage with it as educators.

Institutional and National Outcomes of Self-Study Research

Zeichner (2007) called for self-studies by teacher educators to be more closely connected to the mainstream research of teacher education so that "the voices of the practicing teacher educators are incorporated into syntheses of research on particular aspects of teacher education" (p. 36). The article rejected the "dualism of research either contributing to greater theoretical understanding or to the improvement of practice" and argued that self-study research "should attempt to work on both goals simultaneously" (p. 36).

While we have been able to identify a number of examples and perspectives on the individual and programmatic outcomes of self-study in teacher education that we argue are closely linked to the success of students, who in turn go on to nourish the schools that they work within and the children and young people that they teach, we have struggled to identify comparable outcomes of self-study at the institutional or national level in terms of agreed pedagogies or policy in the education of preservice teachers. The need for self-study emerges from experiences in the teacher education classroom. It is important to recognize that in education, individuals change practice through reflection and analysis of themselves and their work, which changes the programs that they work within, which are in turn part of the institutional and national pictures of teacher education, but we should also recognize that there remains little evidence of self-study being named, recorded, or embedded at these levels through institutional or national policy and strategy. This may make it more attractive for some practitioners, but it potentially leaves self-study on the margins of teacher education and educational research, vulnerable to reduction and removal as it appears to depend upon the individuals who embrace it.

Self-study rarely if ever appears in university or college prospectuses or course handbooks as a stated method of teaching or research in teacher education. We found no examples of government requirements for self-study research to be part of teacher preparation, although the notions of "reflection," "self-evaluation," and "action research" do form part of practicing teachers' continuing professional development. We know of no examples where self-study confidently leads the strategy and practice of teacher education at an institution as it does for those individuals who consider it as the most essential aspect of a pedagogy of teacher education (Russell and Loughran 2007). For the S-STEP practitioner, the grass is often greener on the other side (of the world) where we sometimes expect to find self-study at the very center of practice and come to recognize, on closer acquaintance, a kindred individual or a small group of expert self-study teacher educators working within a larger, far more traditional "top-down" teacher training environment.

This may confirm Zeichner's (2007) concern that self-study will remain in the margins of the research and practice of teacher education unless the community of S-STEP practitioners can make closer connections with mainstream teacher education research. We should remember however that convincing those who make policy to take any form of educational research seriously remains a challenge everywhere as ideological, political, and fiscal concerns come to dominate the agenda. Policy-led research rather than research-led policy leads to the marginalization of all genuine educational research, not only self-study in teacher education.

On the Extent to Which Self-Study Makes a Difference to the Quality of Teacher Education Practice

This section has considered the potential of self-study to yield beneficial teacher education practice-related outcomes. Along those lines, to the extent that self-study practitioners and relevant program stakeholders incorporate self-study as part of their work in teacher education, we feel that our stories illustrate how improved and more conscious and conscientious practice is a likely outcome. Focusing on one's own

teaching through self-study appears to breed intentionality. Still, the issue of impact is not as clear when the outcomes of self-study are considered at the institutional or national levels. Perhaps this should not be surprising. After all, self-study represents a practitioner-led "grassroots" kind of research that, in some ways, is still in its infancy. While modernist understandings with the unequal power relations that they bestow on certain academic circles currently play a larger hand in institutional and national decision-making related to teacher education, we nonetheless posit that self-study can be understood as gradually changing the culture of teacher preparation toward meaningful reform.

Discussion

In closing, we argue that there are many powerful reasons why an increasing number of teacher educators are choosing to engage with self-study methodology. By weaving the literature together with our own experiences, we believe that the contents of this chapter effectively revealed some of the benefits of meeting the challenges to engagement and impact in self-study for teacher educators researching their own practice. We primarily discussed these benefits in terms of how self-study contributes to both the quality of the experience of being a teacher educator and to the quality of teacher education practice itself. Highlighting these key elements has allowed us to consider the challenges and benefits of self-study as being closely linked with and in some ways dependent upon each other. Just as challenges can be seen through a number of layers and different contexts in the work of teacher educators, the strategies and the benefits of meeting those challenges can equally be considered through each of these lenses. In our view, what seems unmistakable based on our analyses is how self-study offers teacher educators striving to engage in conscious modes of professional activity a versatile and inclusive methodology with which to approach their unpredictable, messy, and complex work.

In terms of the quality of the experience of being a teacher educator, we argue that engaging in self-study accelerates the process of becoming a teacher educator and enriches the experience of being a teacher educator by facilitating advanced and nuanced understandings of agency and identity. As evidenced in our own stories, self-study gives insight to the challenges and expectations of the teacher education enterprise and to the place of scholarship as a key element of the profession where the teacher education classroom and the academy come together. Importantly, the methodological underpinnings of S-STEP can serve to gently encourage self-study practitioners to pursue the sort of teacher educators that they want to be. Clear evidence was also shared to illustrate how self-study does yield beneficial outcomes at the personal and programmatic levels as they relate to the quality of teacher education practice. Furthermore, despite the ongoing traditional leanings of the policy realm and the challenges presented by the neoliberal agenda, we suggest self-study is contributing toward positive change in the culture of teacher education. A sense of agency, which questions conformity, actually seems to be one of the more compelling and enduring characteristics exhibited by self-study practitioners. Along

these lines, it is with hopeful spirits that we, as teacher educators working on two separate continents, are reminded of and choose to end this chapter with a quote attributed to Margaret Mead: "Never doubt that a small group of thoughtful, committed citizens can change the world; indeed, it's the only thing that ever has."

Abstract

In this chapter we present examples of Living Theory research, a form of Self-Study, which show teachers, teacher educators, and administrators researching to improve their teaching and the educational experience of students and contributing the knowledge they create in the process to a professional educational knowledge base. We clarify the relationship between education and educational research and show how Living Theory is distinguished within other forms of Self-Study research. Consideration is given to the opportunities and challenges of promoting this approach and other forms of Self-Study research, as ways to improve practice in schools. We show the development of ideas since Whitehead's contribution 14 years ago, in 2004, to the first International Handbook of Self-Study on, "What counts as evidence in self-studies of teacher education practices?." Our emphasis in this chapter is on practicing educators, their professional development, and gaining academic recognition for the embodied knowledges of master and doctor educators.

Keywords

Self-Study · Living Theory · Teacher education · Educational influence · Authentic learning and self-directed learning

Introduction

Self-Study research – why bother? The theories of psychologists, sociologists, and others concerned with education can be useful for teachers to draw on when they try to improve their practice. However, how these theories are expressed in practice can be very different, as Ginott (1972) eloquently points to when he wrote:

> I have come to the frightening conclusion: I am the decisive element in the classroom. It is my personal approach that creates the climate. It is my daily mood that makes the weather. As a teacher I possess tremendous power to make a child's life miserable or joyous. I can be a tool of torture or an instrument of inspiration. I can humiliate or humour, hurt or heal. In all situations it is my response that decides whether a crisis will be escalated or de-escalated, a child humanised or dehumanised. (pp. 15 and 16)

As the decisive element in the classroom, we believe it is a professional responsibility of teachers to engage in a form of Self-Study research to ensure they are creating an energizing, life-affirming educational climate where learning and learners can thrive rather than simply survive. The purpose of Self-Study research is not to pump up the ego of a self-serving self but to research the self that is trying to contribute to the knowledge base of teaching and learning.

Why Living Theory research? We believe that what distinguishes a teacher as a professional educator is that they continuously research their practice to improve their educational influences in their own learning and in the learning of their students and contribute to the evolution of an educational knowledge base. We believe teachers can do this by researching their practice, integrating insights drawn from critically and creatively engaging with the knowledge of others, and holding themselves accountable by contributing the validated knowledge they generate to the growth of an educational knowledge base. We recognize that there are a variety of ways in which teachers can study themselves and their practices. In narrative inquiry, for example, researchers use narrative to help them create meaning in what they are doing; in autoethnography, researchers focus on the implications of cultural influences in their practice and understandings.

Researchers can also focus on Action Research which can include different schools of thought such as a Critical Theory school of Action Research. This gives priority to understanding the political, economic, and cultural influences in their Self-Study researchers practice and understandings. Living Theory researchers include insights from these different approaches to improve what they are doing. What particularly distinguishes Living Theory research from other forms of Self-Study is the generation of an evidence-based explanation of educational influence in learning. The explanations include the clarification of their ontological and relational life-enhancing values. These are the values that give meaning and purpose to their lives and form their explanatory principles of their educational influences in learning and the standards by which they hold themselves accountable as professional educators.

Relationship of Authors

We have researched for many years, both individually and collaboratively, in the UK, Canada, and other settings, as students and supervisors engaged in master's, doctoral, post-master's, and postdoctoral inquiries. Here we focus on our Self-Study research made public in international conferences, such as that reported in the conference proceedings of the S-STEP conferences (Castle 1-11), the American Educational Research Association (AERA), and international journals, such as the *Educational Journal of Living Theories* (EJOLTs). We are particularly concerned to share the growth of our educational knowledge since the publication of the first *International Handbook* (Loughran et al. 2004).

Central Points that Will Be Covered

The Self-Study research we introduce in this chapter is focused on two distinct but related concepts of "practice": the first is improving educational influences in learning in elementary and secondary schools; the second is contributing to the professional knowledge base of education. Our contributions are made through the academic legitimation and validation in the academy of the embodied knowledge of others and ourselves as educators and through making public our research in conference presentations and journal publications, for example, the master's degrees of Griffin (2011) and Mounter (2006, 2012) that focus on improving and explaining their practices in primary schools. Campbell's (2011) master's degree is focused on her teaching in a secondary school.

In her doctoral research program, Mounter is exploring the implications of asking, researching, and answering her question, "How can I (do I) contribute to the creation and enhancement of the educational influences of a community of learners, supporting each other and their own development?" In her doctoral inquiry, Campbell includes "being loved into learning" as an original explanatory principle and living standard of judgment in her contribution to knowledge. Delong's and Whitehead's postdoctoral inquiries include their research with Griffin and Campbell in the 2015 conference of the Action Research Network of the Americas in Toronto on, "Improving Practice with Living Theory Research in Living-Cultures-Of-Inquiry" (Whitehead et al. 2015). Huxtable and Whitehead's postdoctoral Self-Study inquiries include their research into the creation of professional educators with the living theories of master and doctor educators (Whitehead and Huxtable 2016).

The growth since 2004 in our educational knowledge, as Living Theory Self-Study researchers, has developed from an evolving understanding of self that is relational and dynamic and influenced by the sociohistorical and sociocultural influences in our practices and understandings. Having gained academic accreditation in higher education for making public our embodied knowledges as teachers, teacher educators, and professional educational practitioners, the growth in our educational knowledge is now focused on researching our contributions to the social movement of Self-Study researchers that is enhancing the flow of values and understandings that carry hope for the flourishing of humanity. This commitment to evolving understanding can be seen in the conclusion to the 2004 Handbook contribution:

> I am hopeful that the next ten years will show an extension of the dialogic influence of s-step researchers in contributing to the future of humanity. I am hopeful that this contribution will continue to focus on improving the quality of each s-step researcher's influence on his or her own learning and on improving students' learning. Finally, I am hopeful, given the evidence of the last ten years, that the evidence will show that we have continued to improve our contributions to the education of social formations as we contribute to the growth of educational knowledge through our self-studies of our teacher-education practices and our practices as global citizens. (Whitehead 2004, p. 902)

The evolving understandings also include our use of digital visual data and validation methods to clarify and communicate the meanings of the embodied

expressions of our ontological and relational values that we use in our explanations of our educational influences as Self-Study researchers. Our research to improve, understand, and explain practice has focused on enhancing educational influences in our own learning, in the learning of students, pupils, and colleagues and in the learning of the social formations that are the context of our practice and understanding. Whitehead (1989) coined the term living educational theories (sometimes expressed as living theories) for such valid explanations of educational influence in learning.

How the Chapter Is Organized

In this chapter, we have written as "we" when we have common understandings about Self-Study. Individuals are recognized by name when they are speaking about their own Self-Study and Living Theory. It is important to us to keep the voice of each researcher clear and strong in the text you are reading. From now on in the text, we refer to ourselves as Jack, Jackie, Marie, Liz, Cathy, and Joy. This is consistent with our relationships. For others we keep to the usual academic tradition of using surnames. When referring to our academic publications, we keep to the academic tradition.

The chapter is organized as follows:

– Living Theory research: Its nature and examples of how and why it "works" for us including our data sources, means of analysis, and validation methods
– Self-Study, Self-Study of Teacher Education Practices (S-STEP), and Living Theory research
– The value, opportunities, and challenges of Self-Study research in schools
– How we differentiate between education and educational research, why that is important, and the role of academic literature in our theorizing and research
– Our contributions to a professional knowledge base of teaching and learning and what we learned from the opportunities and challenges along the way
– Our ways forward to contribute to a flourishing of humanity as global citizens
– Concluding thoughts and next steps

To begin, we clarify the nature of Living Theory research, the relationship to other forms of Self-Study research, and the ways in which we have been engaged in the creation of our own living educational theories.

Living Theory Research: Its Nature and Examples of How and Why It "Works" for Us

In this part of the chapter, we clarify Living Theory research as a particular form of Self-Study that generates living educational theories. We relate Living Theory to other forms of Self-Study. We then illustrate the implications for teachers and other professional educational practitioners from our Self-Study research.

Nature of Living Theory

The nature of our Living Theory research is that it is characterized by our inclusion of "I" as a living contradiction in inquiries of the kind, "How do I improve what I am doing?" When we feel we are not living our values as fully as we desire in our practice, we have frequently used action-reflection cycles to help us progress. We imagine ways forward and choose one on which to take action in an action plan. We act and gather data to enable us to make a judgment on the effectiveness of our actions in living our values as fully as possible. We evaluate the educational influences of our actions.

As educational researchers, we submit our explanations to public scrutiny in our classrooms with our students, in professional development sessions, at conference presentations, and in our publications and in validation groups. In validation groups we ask participants to test the validity of our explanations and to help us to strengthen the comprehensibility, the evidence base of our assertions, our sociohistorical and sociocultural understandings, and our authenticity in living our values as fully as possible. We give more details later in the chapter.

Another of the distinguishing characteristics of our Living Theory research is that our explanations include the relational and ontological humanitarian values we use to give meaning and purpose to our lives, as explanatory principles and living (Laidlaw 1996) standards of judgment in our explanations. We have all experienced at times the limitations of printed text communications to carry the meanings of our embodied expressions of our values. Hence, we have all used digital visual data, to clarify and communicate the meanings of our values in the course of their emergence in our inquiries into improving our practice.

In developing our explanations of educational influence, we are identifying our practices as those of global citizens. We are meaning this in the sense that we belong to and are contributing to a global community of Living Theory researchers. Some of these contributions can be seen in:

(i) The 2015 Town Hall meeting of the Action Research Network of the Americas (ARNA) Conference in Toronto (Delong 2015)
(ii) A workshop on Living Theories in the 2017 ARNA Conference Cartagena (Whitehead 2017)
(iii) A keynote and workshop (Delong 2018) at the 2018 Action Learning Action Research Association Conference in Vermont, USA, with the theme of "The Action Learning Action Research Legacy for Transforming Social Change: Individuals, Professionals, and Communities' Developments, Organizational Advancements, and Global Initiatives" (Tetteh 2017)

Data Sources

The primary data sources are the embodied knowledges of practitioner researchers and the related traditional theories of others. When a practitioner researcher creates

and shares a report of their educational learning, this report can then become data for the next explanation of their educational influences in ongoing cycles of research. As Self-Study researchers seek to understand the sociohistorical and sociocultural influences in their own learning, they can use data from the most advanced social theories of the day. The data gathered includes any data that might be useful in an inquiry of the kind, "How do I improve what I am doing?" It can include traditional observation schedules and interviews, as well as quantitative data, such as test scores. It can also include digital visual data and data from audiotapes and transcripts of conversations, artworks, and performances in dance and music. In producing an evidence-based validated explanation of educational influence, it is crucial to understand how the data can be analyzed and the explanations validated.

Means of Analysis

Analysis of data is closely related to the purpose of a Self-Study inquiry. In this Self-Study research, the purpose is focused on understanding, improving, and explaining teacher educational practices. We believe that a central purpose of teacher education is to enhance the educational influences of a teacher in their own and their pupils' learning. Hence our focus is on explaining this influence. This involves the analysis of data in relation to the generation and testing of explanations of educational influences in learning. At the heart of our explanations of *educational* influence are the relational and ontological-embodied humanitarian values we use to give meaning and purpose to our lives as educators. The embodied expressions of the meanings of these values are clarified through our research and our analysis of visual data from our practice in which we clarify and communicate the meanings of our values in the course of their emergence in practice. We believe it worth emphasizing that you may need to engage with our analyses of our multimedia texts in order to comprehend our meanings. Mounter's (2008a) analysis of her educational influences with 6-year-old pupils in "Can children carry out action research about learning, creating their own learning theory?" is a valuable source of this form of learning.

We want to be very clear about the significance of including visual evidence from the Self-Study researcher's own practice in an explanation of educational influence. Living Educational Theory research has been extended considerably by developing methods for collecting and analyzing digital video data. These analyses include the clarification and communication of the meanings of the embodied expressions of ontological and relational values that individuals use to give meaning and purpose to their lives. The analyses include the use of multimedia formats to communicate the knowledge created. They are made public in journals published online that accept the inclusion of digital visual data, such as Educational Journal of Living Theories (EJOLTS 2008–2019).

In our understandings of the sociology of absences (de Sousa Santos 2014), we are seeing the logic and language used in Western academic traditions, especially in printed text-based books and journals, as potentially limiting and distorting the valid representations of the practices and knowledges of the educational influences

of Self-Study researchers. An example of multimedia analysis of data, in explanations of influence, can be found in Campbell, Delong, Griffin, and Whitehead's (Campbell et al. 2013) "Introduction to living theory action research in a culture of inquiry transforms learning in elementary, high school and postgraduate settings." Another example is in the account by Huxtable of her educational practice. It includes her concern with enhancing children's and young persons' abilities to learn to live a loving, satisfying, productive, and worthwhile life for themselves and others. In particular, we point to Huxtable's (2012) analysis of her educational influences in her inquiry, "How do I Evolve Living-Educational-Theory Praxis in Living-boundaries?"

As Self-Study researchers, who are generating and sharing their living educational theories, we wish to avoid the criticisms that have often been made of Self-Study researchers that the research lacks validity and rigor as it is merely subjective and anecdotal. We believe that we have avoided such criticism through the use of a rigorous process of validation.

Validation Methods

At the heart of our validation methods is the recognition of Popper's point that objectivity is grounded in intersubjective criticism and that we can enhance the validity of explanations through the mutual rational controls of critical discussion (Popper 1975, p. 44). Therefore, we establish validation groups of between three and eight peers to help to test the validity of our claims to knowledge and to strengthen the validity of our explanations through the exercise of critical discussion. We ask the members of a validation group to include in their responses to the following four questions that have been influenced by Habermas' (1976, pp. 2–3) ideas on communication and the future of society:

1. How could I enhance the comprehensibility of my explanation?
2. How could I strengthen the evidence I use to justify my assertions?
3. How could I deepen and extend my sociohistorical and sociocultural understandings of their influence in my practice and explanation?
4. How could I enhance the authenticity of my explanation in the sense of showing that I am living as fully as I can the relational and ontological values I claim to be using to give meaning and purpose to my life.

In the next section, we make a distinction between Self-Study, S-STEP, and Living Theory research. We go on to explain our choice of Living Theory and how a new teacher-researcher might engage in Self-Study.

Self-Study, Self-Study of Teacher Education Practice, and Living Theory Research

We make a clear distinction between Self-Study, Self-Study of Teacher Education Practice (S-STEP), and Living Theory research. Self-Study is a broad term that can

include the study of self in a wide range of contexts that are not contained within the boundaries of education. All S-STEP research is by definition a Self-Study and is contained by the boundary of "teacher education practice." Living Theory research is a form of Self-Study. What distinguishes Living Theory research from other forms of Self-Study is the "self" that is studied and the purpose. For example, self-studies can be carried out within many different perspectives, such as those of Adler, Freud, and Jung. Some S-STEP researchers, in researching their educational practice, do so through a Living Theory perspective, such as Farrell (2012). Not all Self-Study is contained by the boundary of an explanation of educational influences in one's own learning, the learning of others, and the learning of social formations, as in Living Theory research.

We also draw a distinction between S-STEP research and Living Theory research. S-STEP was established in 1993 as a Special Interest Group of the American Educational Research Association by a group which included White-head. Since then there have been many publications to show the wide range of methods (Tidwell et al. 2008), used by S-STEP researchers. These include methods drawn from narrative inquiry, phenomenology, autoethnography, grounded theory, case study, ethnography, and Action Research. Living Theory researchers draw insights from these methods in the generation of their explanations of educational influence. For example, in their edited writings on academic autoethnography, Pillay, Naicker, and Pithouse-Morgan (Pillay et al. 2016) show how a group of academics explore their self-studies of cultural influences in their practice. This emphasis on cultural influences is important to Living Theory researchers as they include sociocultural and sociohistorical influences in their educational explanations. In Living Theory research, the primary concern about improving practice is the responsibility of each person for explaining their educational influences in learning. In her research on cosmopolitanism, Keizer-Remmers (2017) demonstrates how the method of "social photo matrix" can be used with an Action Research process and other research methods to generate a multimedia Living Theory account.

In an edited text on, *Being Self-Study Researchers in a Digital World* (Garbett and Ovens 2017), the Self-Study researchers have produced a book that is mainly a printed text. It makes almost no use of digital technologies. However, Bullock and Fletcher (Bullock and Fletcher 2017) do point out that "The body is an important epistemology for teaching about teaching in any environment – new technologies offer new challenges for teacher education" (p. 45). Digital visual data is used to show Self-Study researchers expressing, clarifying, and communicating their energy-flowing, embodied values and understandings in educational relationships and has been used by Self-Study researchers who have made original contributions to educational knowledge that have been accredited within universities for master's and doctoral degrees (Whitehead 1996–2018).

Pithouse-Morgan and Samaras (2017) focused on the importance of digital technology to create accounts less dependent on text:

> As we embraced becoming less text dependent, our meaning-making became more translucent. We distilled two research poems from 40 pages of emails and letters and used these

poems to create a second, less text dependent, mood board representation to 'see' the 'essence' of our dialogic thoughts in space (see Fig. 10.2). In our second mood board, we aimed for balance between visual images and typescript. (p. 144)

The edited text to which they contribute claims to be presenting research on the intersection of Self-Study research, digital technologies, and the development of future-oriented practices in teacher education. Our main problem with the book by Self-Study researchers, as both Self-Study and Living Theory researchers ourselves who use digital technologies in our own teaching and research, is that its communications are limited by the domination of printed text. With the increasing popularity of e-media texts, with live URLs to multimedia data, it is possible to overcome this limitation. By referring to the multidimensionality of web-based materials, we hope to show how we are transcending such limitations although we recognize that we are working within the limitations in this printed text-based communication.

Another limitation of Self-Study, S-STEP, and Living Theory research that has to be guarded against is the omission of any engagement with social and other theories, including those that are currently extending thinking and practice. We are thinking of ideas that raise the possibility that the logic and language used in this research are contributing to what de Sousa Santos (2014) has referred to as "epistemicide" in terms of the elimination of *Epistemologies of the South*. We are extending this idea to the knowledge of practitioner researchers. Our use of digital technologies, especially with digital visual data from our own educational practices in evidence-based explanations of our educational influences, has enabled our contributions to educational knowledge to move beyond the limitations of both printed text and explanations that do not engage with such insights.

Why, as Individuals, We Chose to Engage in Living Theory Research

Why any educator engages in Living Theory Self-Study research, rather than another, is an existential as much as an intellectual decision, so here we each try to share our individual responses rather than a collective one. We have all used action-reflection cycles at some point in our inquiries and continue to do so as we encounter concerns, imagine what to do, gather data, evaluate the influence of our practice, and modify our concerns, ideas, and actions in the light of our evaluations. However, the generation of our living educational theories as explanations of educational influence goes further than the use of the action-reflection cycles.

Jackie: I chose Living Theory because it celebrates the embodied knowledge of teachers and challenges them to live their values more fully while working to improve their learning and teaching with their students. It thrives in and contributes to a living-culture-of-inquiry (Delong 2013). Values-based inquiry leads to values-based living, learning, and teaching, and as Bullough and Pinnegar (2004, p. 319) state "the consideration of ontology,

of one's being in and toward the world, should be a central feature of any discussion of the value of Self-Study research."

When I was ready to engage in doctoral research, I was unwilling to continue studying others' work and prescriptions for learning and leading. I needed the research to help me do a better job as a superintendent and be a better person. I was introduced to Living Theory just when I needed a methodology that was meaningful in my life.

Jack: Living Theory research "works" for me by enabling me to affirm my confidence that I am making a difference in enhancing the flow of values and understandings that carry hope for the flourishing of humanity. This contributes to my desire to live a loving and productive life. Working and researching cooperatively with others who are expressing such values and understandings helps to sustain and strengthen my activities in promoting the spread of Living Theory research as a social movement.

Marie: During the last years of my career as an educational psychologist, I became increasingly concerned that I could describe clearly what I was doing and how, but could not account for why, for instance, I would arrange for one speaker and not another to lead teachers' courses or why some theories attracted me and not others. I also knew that the criteria by which I was held to account, such as the grades children were given, were inappropriate at best and potentially damaging at worst, but I had no way of judging whether my work was making an educational difference and I believed it was important that I did. Living Theory research enabled me to ask questions that were important to me as a professional educational practitioner and create valid explanations for what I was doing and standards by which to judge my educational practice in the process of trying to improve it.

Living Theory research challenges me to recognize and hold myself to account to live the life-affirming and life-enhancing values that give my life and work purpose and meaning in ways that other forms of Self-Study, practitioner research or social science research do not.

Liz: I was introduced to Living Educational Theory while taking a methodology course for a master's degree. During the course we were introduced to a variety of qualitative and quantitative research methodologies. Initially, I was very interested in autoethnography until I learned about Living Educational Theory. Each student was asked to select one methodology to explore in more detail and present his/her findings to the class. I chose Living Educational Theory and for the next 3 days immersed myself in the research. Today, 7 years later, I can still feel the excitement and energy that I experienced while doing the research and presenting to my peers. I had been a practicing teacher for over two decades, and I was constantly reading, researching, attending workshops, and taking additional qualification courses all in an attempt to improve my practice for myself and the learners in my care; however, this was the first time I can say that I experienced educational freedom.

I felt that my experiences were valuable, and as I learned to unveil embodied knowledge in a critical and creative way, I became more confident as a teacher and researcher. I discovered and explored my personal values and the explanatory principles that guide my practice and my life which enabled me to examine self through a new lens. The growth I experienced surpassed my expectations and continues to do so today. I became a better teacher, researcher, mother, friend, and human being as I discovered my authentic self and my interconnectedness with others and the world. No other "educational" experience has provided that kind of learning and personal growth for me and the learners in my care.

Cathy: There are many directives, resources, and requests coming to administrators and other educators from the Ministry, the school district, agencies, parents, and the community at large on a daily basis. In order to have a clear, cohesive, directed way forward, I need to have a solid foundation for making decisions. Through Living Theory, I have developed not only an understanding of my values and beliefs but also a comfort with being public in questioning and modifying my actions to be better, to align, or to realign myself with my values. I used to believe that I had to be perfect or, close to it, to be a leader. As a leader and imperfect, I felt I was an imposter. Now I know, through my own research (Griffin 2011), the power of being a leader who makes mistakes, learns, and co-learns in public. I have seen and documented the effect authentic learning has on students and colleagues – it levels hierarchy, draws people in, brings down barriers, and builds productive working relationships very quickly. I now trust in my ability to be myself and see where that takes me.

Joy: Mooney (1957, p. 155) outlines research as a "personal venture, which, quite aside from its social benefits, is worth doing for its direct contribution to one's own self-realization." This idea of fulfilling my own personal and professional development as well as contributing socially is an important aspect of my ontological values and search for a research methodology. Lather's (1986) research reflects "our beliefs about the world we live in, but also the world we want to live in, combining our understandings of the present from the past and influences to a better future." Terre Blanche and Durrheim (1999) identify three dimensions within a research paradigm which I agree are important: ontology, epistemology, and methodology, describing the ontological and epistemological dimensions as the "worldview." Aligning this "worldview" (ibid., 1999) with my epistemological understandings of knowledge democracy (de Sousa Santos 2014) and methodological democracy, I find myself drawn to Lather's (1986) belief that we can combine our current understandings and reflections of the past to strive for the future we believe in. This defines my needs within a research paradigm.

Frankl (1984) focuses my choice of methodology and desire to be a values-led practitioner in my search for meaning in my life and

worldview. My exploration for a methodology that fulfills my need for a values-based, creative methodology enabling me as a practitioner to research my own role, values, influences, and practice and thus to create my own educational theory has led me to the Living (Educational) Theory research methodology (Whitehead 1989). Frankl explores the professional "spark," for me seen through my years of creating my own Living Theory methodology in my efforts to influence my practice, but also others in my social formations, as I strive for Frankl's description of "idealism": "promote him to be what he can be."

How Might a New Teacher-Researcher Engage in Self-Study?

New teacher-researchers may not be the same as preservice or novice teachers. New teacher-researchers may have had many years of professional practice in which they have been reflecting on how to improve their practice. It is important that they come voluntarily and that no coercion is involved. With support and encouragement, they become teacher-researchers as they learn how to make public their embodied knowledges as educators as they inquire into improving their practice and become knowledge creators. You can access the evidence and explanations of how new teacher-researchers have been supported in engaging in Self-Study in the eight volumes of *Passion in Professional Practice* (Delong et al. 2001–2007). The teachers engaging in these self-studies came from different practitioner inquiry traditions, with a shared desire to help their students to improve their learning. Some focused on narrative inquiry, others on Action Research, while others stressed the priority to be given to sociocultural and sociohistorical influences in practice and understandings. What attracted the teachers to Living Theory research was the focus on clarifying and communicating the meanings of the embodied, ontological values that the teachers used to give meaning and purpose to their lives in education. They identified with a Living Theory approach as it included the use of these values as explanatory principles in their explanations of their educational influence in the learning of their students.

In the Grand Erie District School Board in Ontario, Canada, while Jackie was a superintendent of schools, educators, including teachers, administrators, consultants, and educational assistants, researched and published their self-studies in eight volumes of *Passion in Professional Practice*. She was fortunate in that she had the influence to share her vision of teachers as researchers of their own classrooms. Positional influence can be a two-edged sword in that teachers could stay away from this vision because it came from a power source, but in this case, beginning with a group of seven (five teachers and two school administrators), hundreds of teachers came voluntarily to research and share their knowledge in the eight volumes and in workshops at conferences. They were each given 5 half-days of release time from teaching, small group sessions in the skills of research and support for writing their research, at first by Jackie, herself, and then many of them took up the leadership of the network. Of course, the teachers gave much more of their own time to conduct the research than the 5 half-days. The fact that Jackie was

conducting her own study to improve her practice (Delong 2002) at the same time helped to encourage teachers to try this new form of professional learning.

These insights gained by Jackie and the educators of the Grand Erie District School Board led into the developments of Self-Study in the Bluewater Action Research Network (BARN). Liz Campbell and Cathy Griffin, teachers in the board, created and led the network.

Liz: In the Bluewater Action Research Network, the research completed during 2013–2017 ranges from reducing anxiety in junior and senior kindergarten classes to learning without grading in a high school art class. The practitioners included early childhood educators, educational assistants, classroom teachers from kindergarten to grade 12, lead teachers, and administrators. This is easily the most rewarding work I have done outside of my classroom. Each year, I was more and more amazed and inspired by the desire and dedication of my colleagues to improve their practice which also helped me to improve my practice. In addition, all of the research is available to the public as participants shared and videotaped their results in a symposium each year. You can view the variety of questions and results and the feedback of BARN participants (Campbell 2017).

For the past 6 years, I have used Living Theory research as the foundation of my teaching practice. In the process of writing the dissertation for a PhD in Educational Sustainability, I have kept extensive journals (including video footage) of my classroom experiences and the development of my Living Educational Theory. I am at the beginning stages of data analysis and have already noticed some interesting patterns and themes.

In 2013, I wrote an *EJOLTs* (*Educational Journal of Living Theories*) article (Campbell 2013) which explains how I introduced my students to Living Theory research and recounts some of the classroom experiences I had to date. I have permission from students to share their work.

In the next section, we discuss the opportunities that we have experienced, as well as the challenges and obstacles to promoting Self-Study research in schools.

The Value, Opportunities, and Challenges of Self-Study Research in Schools

The Value of Teacher Self-Study in Elementary and Secondary Schools

First, we'd like to begin with some thoughts on the value of Self-Study in our schools. Its value ranges from improved teacher learning and instruction to improved student learning to students as co-learners and co-researchers.

Joy: As a primary school practitioner researcher in the southwest of England, I positively embraced Self-Study research in my classroom, as not only a

personal form of Continual Professional Development (CPD) but also as a self-knowledge tool for the children in my class (7 and 8 years of age). Research-led professional practice within an educational setting provides collaborative support, a "powerful and key factor in quality CPD" identified by Cordingley et al. (2003). Leitch and Day (2000) and Burton and Bartlett (2005) identify the benefits of educational research as a form of CPD.

Self-Study research was a personal decision and not part of the settings' formal CPD plans but my own explorations, as I sought to improve. As a shared research journey, the children and myself asked "How can we improve what we are doing?", "How can I improve what I am doing?", and "How can I improve what we are doing?". Although only a small project and not one the children would necessarily experience in other classes, the self-knowledge we all gained stayed with us beyond the class. I have experienced how research conducted within a research community affords the practitioner the ability to maintain a passion for, and an up-to-date knowledge of, research-based practice, as well as linking to equally like-minded souls (Mounter 2008a, b, 2012). By "like-minded," I mean those who have a curiosity and a need to strive to be the best practitioner they can be through the process of CPD. Our profession is losing passionate practitioners: some will leave the profession altogether; some will continue, a husk of the potential they could have offered. Snow (2001, p. 9) wrote of the rich resource of excellent teachers and identified how their skills and knowledge were largely untapped. Reflected in the new recommendations for teacher CPD from the Department for Education in the UK is highlighted an understanding that "High-quality professional development requires workplaces to be steeped in rigorous scholarship" (DFE 2016).

Jackie: Having spent much of my teaching career involved directly in professional development activities, I knew firsthand that traditional models of transferring knowledge and best practice to classrooms had abysmal records of efficacy. When I was introduced to Self-Study research using the Living Theory methodology, I came to see through my research to improve my own practice the potential to influence improvement in pedagogy and curriculum in classrooms. In addition, seeing the positive effect of teachers having control over what they saw as important areas of improvement for themselves combined to transform my own learning, leadership, and view of professional learning.

Both these issues of improvement and control resonated with the educators with whom I worked. There was a risk in introducing this vision in a school system: once individuals had power over their own learning, had the data to support their knowing, and spoke with their own voices, they could no longer be easily convinced that others knew more about teaching their students than they did, based on their self-studies. With their validated knowing, teacher-researchers began to see that academic

research could inform their instructional practices when they could research the strategies in their own classrooms.

Liz: As I was rereading this article recently, two things became obvious to me: the first is that much of what I wrote and observed many years ago is still very true and relevant today which I believe speaks to the sustainability of Living Theory research, and, second, I realized how profoundly affected my students were by fear of judgment and how the use of video in the classroom and in their research helped them to unveil this knowledge and, in many cases, to overcome it. In addition, last year, one of the themes that emerged in the Bluewater Action Research Network was the rise of anxiety and depression in junior and senior kindergarten students (4- and 5-year-olds). You can access these projects and the results at the URL for Bluewater District School Board (2017). I firmly believe that allowing students to conduct their own research is a powerful strategy for addressing the mental, academic, spiritual, and emotional needs of all students. Using a Living Theory methodology enables students to identify their beliefs and values and formulate a worldview that is clear and concise, and because it is their own unique theory, they are much more able and willing to live more fully according to their values and to be held accountable for their beliefs. This is an educational experience that can address, among many things, the concerns for the rising mental health issues that the children and youth of today are experiencing.

In the next section, we discuss the opportunities that have been available to us in supporting S-STEP research in our schools and school districts.

The Opportunities of Promoting Self-Study in Schools

Our main reason for promoting Self-Study in schools is that it is focused on enhancing professionalism in education through improving practice and contributing to the professional knowledge base in education. We distinguish between nonaccredited and accredited continuing professional development through Self-Study. Professional educators are continuously engaged in asking, researching, and answering questions of the kind, "How do I improve what I am doing?" The initial engagement with this question is motivated by a professional concern to improve practice and can lead to nonaccredited explanations of influence such as those included in the eight volumes of *Passion in Professional Practice* (Delong et al. 2001–2007). We believe that enhancing professionalism in education will require the accreditation of the embodied knowledges of educators and that the enhancement could depend on the

recognition of educators as master and doctor educators (Whitehead and Huxtable 2016).

In the years 2011–2018, Canadian colleagues have had access to funding to support practitioner research in schools. That is not to say that it has been easily accessible, in sufficiently large amounts or without strings attached. Prior to that it was a matter of incorporating it into system initiatives as Jackie was able do because of her access to budgets in the Grand Erie District – for 3 years she even had a budget line called "classroom research," but then it was eradicated.

Cathy: Given funding to release teachers for specific professional development (e.g., math), I look for ways to encourage research in self-identified directions while facilitating change in the areas identified by board and school priorities. I try to find connections between mandated activities or funding opportunities and the raw worries and hopes of educators wanting the best for their students. We are fortunate in Ontario to have many self-directed research project grants funded by the Ministry of Education and the teaching unions.

From the opportunities, we move to the challenges.

The Challenges of Promoting Self-Study in Schools

While our experiences of promoting Self-Study in our settings have commonalities, there are some differences.

Liz, Cathy, and Joy talk about the challenge of providing leadership for Self-Study researchers.

Liz: My experience of promoting Self-Study research within our local Board of Education and in my classroom in rural Ontario has been extremely challenging at times, so much so that I have come to understand why some people may feel intimidated and/or overwhelmed with the process. However, the rewards outweigh the challenges a thousandfold. The challenges are as unique as the individuals and their local contexts and experiences, and this is one of the universal challenges of Self-Study: there is no single formula, recipe, or procedure. However, this is also a key factor in the significance and effectiveness of Self-Study research. The inherent nature of Self-Study recognizes and values the unique individual and as such creates a space and place for the unveiling and articulating of embodied knowledge that can transform the practitioner. The ripple effect of this transformation is infinite.

Cathy: As a new administrator, it is taking time for me to get comfortable in my role and to feel confident in leading by making my own Self-Study public. In leading professional development within my school, it is challenging to make the time, amidst many other demands and requirements, to create a safe space for staff to voice the concerns they have about their own practice

and to talk about their values and passions. As we stressed above, we are fortunate in Ontario to have many self-directed research project grants funded by the Ministry of Education and the teaching unions.

It is a challenge to encourage and support staff to apply for grants that are available to educators to do Self-Study when educators are already very busy or have not had experience in leading their own professional development. Above all, it is difficult sticking to a vision of Self-Study when the cultural norm is to look to an outside source for the problem that needs to be fixed. I have to work hard to maintain my inner and outer dialogue as, "What is the nature of my influence as I strive to improve my practice?" instead of "I will teach them a, b, and c and that will fix the problem."

Joy: I am exploring further the challenges related to the testing of students at system-wide levels as I prepare my transfer paper from master's to doctoral studies. For instance, I see in our setting what Connolly and James (1998) describe as professional development and school improvement closely linked to numerically target-driven outcomes which held staff to account. In a world of challenge and league tables, Clayton et al. (2017) describe how this can narrow the focus of CPD to measurable outcomes, and then the fear is that CPD is led by the focus of the government, rather than practitioner professional development.

We believe that the challenges for Self-Study inquiry of any form are dependent on the person as much, if not more, than the context within which they are working. The opportunity and challenge for the researcher in making their inquiry public, however, may be influenced by a context in which it may be wise and to do so could damage health and job security. For all of us, there have been situations where it has been imprudent to publicly criticize our superiors and organizations. However, Boland says that he has been careful about criticizing the colonizing ways of his organization but now is finding the courage to do it:

> I notice that parrhesia (truth telling) is becoming increasing important to me (or perhaps just more practised). I have become increasingly bold when giving my opinion in areas where I think I have something to say. As an academic, reading Foucault on the topic has released hesitations I might have had and encouraged me to speak out in fora in which I would formerly have remained quiet. (Boland 2017, pp. 70–71)

Jackie: The way in which we teach Self-Study is also a challenge. To get teachers started in Self-Study, I ask them to write stories about what matters to them. Within those stories are the values and passions that inform their lives and teaching. The purpose is to get them to see their embodied knowledge and the knowledge of their colleagues. I deliberately steer them away from texts and "authorities" to get them to write and speak with their own voices. Only after I see their growing confidence in their ways of knowing, in conducting their own research, do I introduce them to the words of others such as research in the disciplines. With this

> confidence and control over their own learning comes an independence of thought that challenges authorities around them, such as school leaders and university research ethics boards (Suderman-Gladwell 2001).
> There is also the challenge of moving them from their stories which are descriptions of their passions and teaching challenges, to explanations of their learning in their investigations and how they can support their claims to know that they have improved. Their voices are most important, but they need the voices of others – students, colleagues, and the literature – to validate their claims.

One of the greatest challenges to promoting S-STEP research in schools is the one examined by Whitehead in *Teacher Education Quarterly* (1995) on Self-Study and Living Educational Theory. As part of his contribution to this issue, Jack analyzed the other contributions to this issue and pointed out the lack of evidence on the educational influences of the S-STEP researchers in the learning of students. This evidential base in explanations of educational influence continues to need strengthening in order to convince policymakers and other funders to provide the resources to develop a Self-Study approach to continuing professional development in teacher education. It is important to us to continue to ask ourselves and others, "What evidence is there that I have influenced the learning of students in my classroom?"

In answering such questions, it is important to engage in longitudinal studies in order to demonstrate educational influences in learning over time. The development of teachers' visions from preservice into their first years teaching, a longitudinal study has been analyzed by Parsons et al. (2017):

> Contemplating and articulating one's vision is a reflective process that guides teachers' instruction and professional development. However, little research has explored how teachers develop their visions from preservice preparation to their first years' teaching. The current study describes the visions of nine teachers over the course of seven years. The researchers describe teachers' visions, how the teachers enacted their visions, affordances to enacting their visions, obstacles teachers faced to enacting their visions, and how teachers' negotiated obstacles to enact their visions. Findings demonstrate the stability and influence of teachers' visions and the multitude of factors that impact teachers' daily decisions. (p. 12)

Like Parsons et al., we believe that longitudinal self-studies of teachers and teacher educators, with many years of reflective practice, can offer important additions to the professional knowledge base of education. We also belief that as well as focusing on visions, it is important to generate evidence-based explanations of educational influences in the learning of pupils/students. We have explained how such evidenced-based explanations can enhance professionalism in education through the academic recognition and legitimation of the embodied knowledge of Self-Study master and doctor educators. We are suggesting that present self-studies by teachers and teacher educators could be strengthened by focusing attention on evidence-based explanations of the educational influences of Self-Study researchers in the learning of their students.

In the next section, we discuss the differentiation between education research and *educational* research.

How We Differentiate Between Education and Educational Research

It is important for teachers working in education settings to understand what distinguishes *educational* practice, theory, and knowledge from practice, theory, and knowledge in *education*. Teachers have many roles and responsibilities. One is that of instructor tasked with efficiently enabling pupils and students to acquire the skills and knowledge that comprise the given curriculum prescribed by their organization, community, or society. Effectiveness of their practice is frequently judged in terms of students' test/exam scores. Other data is also often collected to evaluate the quality of teachers' practice, for instance, student (or parent) satisfaction questionnaires. This positions the student as a client or consumer with associated expectations of what constitutes teachers' practice. Numbers of admissions to high-prestige establishments or professions have been applied to define teacher effectiveness.

These different demands made of teachers can make it difficult for them to keep a focus on realizing their educational responsibilities toward their pupils and students. Unless teachers are clear about what constitutes educational practice, theory, and knowledge, it is easy for them to lose sight of what they might do as professional educators to improve what they are doing and contribute to the evolution of a knowledge base for the benefit of all.

Maturana, a Chilean biologist and philosopher, gives an insight into a pupil/student's perspective in his poem, "A Student's Prayer" (Maturana 1994, p. 61):

> Don't impose on me what you know,
> I want to explore the unknown
> And be the source of my own discoveries.
> Let the known be my liberation, not my slavery.
> The world of your truth can be my limitation;
> Your wisdom my negation.
> Don't instruct me; let's walk together.
> Let my riches begin where yours ends.
> Show me so that I can stand
> On your shoulders.
> Reveal yourself so that I can be
> Something different.
> You believe that every human being
> Can love and create.
> I understand, then, your fear
> When I ask you to live according to your wisdom.
> You will not know who I am
> By listening to yourself.
> Don't instruct me; let me be.
> Your failure is that I be identical to you.

In 1983, Hirst, one of the main proponents of the disciplines approach to educational theory, in which this theory was constituted by the disciplines of philosophy, psychology, sociology, and history of education, acknowledged the following mistake in his claim that much understanding of educational theory will be developed:

> ... in the context of immediate practical experience and will be co-terminous with everyday understanding. In particular, many of its operational principles, both explicit and implicit, will be of their nature generalisations from practical experience and have as their justification the results of individual activities and practices.
>
> In many characterizations of educational theory, my own included, principles justified in this way have until recently been regarded as at best pragmatic maxims having a first crude and superficial justification in practice that in any rationally developed theory would be replaced by principles with more fundamental, theoretical justification. That now seems to me to be a mistake. Rationally defensible practical principles, I suggest, must of their nature stand up to such practical tests and without that are necessarily inadequate. (Hirst 1983, p. 18)

So, we are seeing education research as being defined by the conceptual frameworks and methods of validation of the disciplines of education and educational research as being distinguished by the values-laden explanations that practitioner researchers produce for their educational influences.

Pring (2000) says that he sees educational practice as concerned with values:

> ... what makes this *educational* practice is the set of values which it embodies – the intrinsic worth of the activities themselves, the personal qualities which are enhanced, the appropriate way of proceeding (given the values that one has and given the nature of the activity).
> ... The *practice* of teaching embodies certain values – the importance of that which is to be learnt, the respect of the learner (how he or she thinks), the respect for evidence and the acknowledgement of contrary viewpoints. (p. 135)

However, Pring appears to be talking about educational practice denoted by values that are reified and impersonal and which do not communicate the personal and emotional commitment that is inherent in what is educational about education. He hints at this earlier in the same paper:

> Central to educational research, therefore, is the attempt to make sense of the activities, policies and institutions which, through the organization of learning, help to transform the capacities of people to live a fuller and more distinctively human life. Such research needs to attend to what is distinctive of *being a person* – and of being one in a more developed sense. It needs to recognize that the 'what' and the 'how' of *learning* those distinctively human capacities and understandings are by no means simple – they need to be analysed carefully. And *a fortiori 'teaching'*, through which that learning is brought about, will reflect that complexity. (p. 17)

While Pring understands the importance of research recognizing, "the 'what' and the 'how' of *learning*," he makes no reference to the "why" of the person doing the learning. This might account for Pring's reference to values giving no sense of

the living reality of "being a person" as a unique individual learning to live their own life as fully as possible, rather than an abstract "distinctively human life."

Practical Distinctions Between Education and Educational Research

The theories of psychologists, sociologists, and others concerned with education can be useful for teachers to draw on when they try to improve their practice. However, how these theories expressed in practice can be very different. In school-related terms, the pressure "to cover" the curriculum with equal emphasis on learning all skills can be overwhelming for teachers and can be viewed as reason for knowing what is educational. Teachers understand in an academic sense that some learning is more important than others but get caught up in teaching more and faster in lieu of teaching responsively so that the students learn deeply. Prescriptions for covering the curriculum may lead them to following checklists without rational thought or deep thinking. Education research is very good at producing models with prescriptions that ignore the dynamics of each classroom. Formulas and education theories can serve to undermine teachers' embodied knowledge and their confidence in it.

One of the vehicles for prescriptions is education texts (as opposed to educational texts) that direct teachers on how to teach. In the UK, the "national strategies" (DFE 2011) have been profligate with examples in the "literacy strategy" of how teachers should "deliver" the "literacy hour." Educational articles and books are those written by practitioners about their own practice not as a prescriptive "how to" but as one means of teaching that another teacher might learn from, not replicate. Once on a path to study oneself and one's practice with the help of colleagues and students, ideas are integrated from both education and educational research.

Educational research positions students as individual researchers needing to start with the identification of their own set of values and beliefs before interacting with the values espoused in the curriculum, in society at large, or by special interest groups.

Liz: I am talking about the problems with the application of education, as opposed to educational research, to classrooms when I direct your attention to the home page of the Ontario Ministry of Education's website (OME 2018), where you will see improvement in graduation rates highlighted and celebrated, with a clear indication to continue this "success." While this may seem to be an admirable goal, I have personally experienced some of the negative effects of a mandated general goal that does not take into account the unique and individual needs of each student, school, and community and places additional pressure on educators to comply and conform for the sake of the general good.

The Ontario Ministry of Education claims to be "one of the best in the world" developing "graduates who are personally successful, economically productive and actively engaged citizens" who are more likely to graduate and meet higher academic standards (p. 1). Again, a statement rife with values and beliefs that may not reflect the individual beliefs and values of the students the system is designed to serve. If the Ontario

Ministry of Education, or any education system, truly wants to meet the needs of individual students and contribute to a positive change in education, that is, create more educational opportunities for students and educators, then they would be wise to do more to recognize, value, and promote the use of theories, methodologies, and research that create genuine educational knowledge and learning.

Jackie: In coming to understand the difference between research in education and educational research, the transformational experience for me was the realization that academic writing prescribing how I must teach and lead according to a checklist (that just needed to be followed in order for me to arrive at excellence in teaching and leadership) was theoretical and not practical. Once I was encouraged by Jack Whitehead to write my own story/narrative, uncovering my values and examining if those stories showed me living or denying those values, I started to see the values as screens for making values-based decisions about my way of teaching and leading. Improvement no longer came from an external image of how I should live but from an internal drive to be a better person, leader, and teacher.

Reducing the educational explanations of practitioner researchers to the explanations in theories from the disciplines of education is still widespread in many university programs on education. In giving priority to the living theories of practitioners, Living Theory researchers are not rejecting or ignoring the knowledge created by sociologists, psychologists, philosophers, historians, management, administration, and other forms of theory in education. What we are rejecting is the idea that the educational explanations of individual Self-Study researchers can be reduced to explanations derived from these theorists, taken individually or in any combination. In the generation of our own living educational theories, we draw on insights from the work of Habermas' (1976) criteria of social validity, de Sousa Santos' (2014) idea of "epistemicide," Lather's (Donmoyer 1996, p. 21) notion of "ironic validity," and Biesta's (2006, p. ix) notion of "responsibility."

In the following section, we share a few of our own self-studies as examples of how educators engaged in Living Theory research contribute to the knowledge base of teaching and learning and what we have learned from the opportunities, obstacles, and challenges along the way.

Our Contributions to an Educational Knowledge Base of Teaching and Learning and What We Learned

We now identify a few examples of contributions to a knowledge base of teaching and learning, what specifically we believe that contribution to be and what we learned along the way.

Jack: In 1976, I was a participant in a local curriculum development into improving scientific understanding with 11- to 14-year-olds in mixed-ability groups. I produced my first evaluation (Whitehead 1976a) and

submitted it to the teachers with whom I was working and researching. The teachers explained that they could understand the academic models I used to explain their practice and influence but could not see themselves in the report. They asked me to go back to the original data I had gathered and redraft the report. Working with one of the teachers, I transformed the report in a way that the teachers agreed was a valid explanation of what they had done (Whitehead 1976b). I then saw that the report was in the form of action-reflection cycles. This was the first time I had explicated an action-reflection cycle in an explanation of educational influences in learning in inquiries of the kind, "How do I improve what I am doing?", and it marked a transformation in my approach to educational research.

Many of my contributions to the professional knowledge base of teaching and learning can be accessed in the master's and doctoral writings on my website (Whitehead 1996–2018).

My learning from the opportunities, obstacles, and challenges along the way has focused on learning how to rechannel my emotions of anger and frustration when I experienced personal and institutional blockages. I learned to redirect these feelings into a flow of loving energy to do what I believed in while looking for ways of maximizing the opportunities by going round the obstacles and transcending the challenges (Whitehead 1993).

Marie: I am still trying to learn not to "fight against" ideas and people but rather to find ways to work cooperatively to create and advance ideas, practices, and praxis that contribute to the flourishing of humanity. If I can look on some "obstacles and challenges" as expressions of other people's concerns presented with what I experience as negating, rather than hope-filled energy, then sometimes I can find a way of engaging in a productive dialogue with them rather than in dual monologues. I believe such dialogue holds the possibility of transforming the energy into a creative tension by which obstacles and challenges offer potential for productive engagement. Pound's living theory of alongsideness (Pound 2003) is a way of being that I find inspirational.

Jackie: Despite the fact that I have been conducting Living Theory research myself and encouraging and supporting others at the same time to create their own living theories for over 20 years, I have evolved and am still evolving my own understandings. I have committed myself to working to ensure that the voices of the teachers are respected, legitimated, and accredited. I exhort them to refuse to let anyone, supervisor, academic, or anyone, however kind they may seem to be, speak for them, take away their voice, and assume their knowledge. This passion that fueled my work came, I think, from experiencing firsthand that access to the temple of all knowledge is through the gates at the university and that the practitioner's knowledge is legitimated when university academics speak for them. I learned the importance of vulnerability, persistence, and creative

compliance as well as some skills for climbing over the walls. Much of this work can be found on mine and Jack's websites.

Liz: I have always maintained that one way to understand Living Educational Theory is to experience it for yourself. This is why I made a commitment, along with my colleague, Cathy Griffin, to share this knowledge and to support others who want to improve their practice. We applied for and received funding from the Ontario Ministry of Education Provincial Knowledge Exchange program for 4 consecutive years to facilitate a self-directed, Self-Study project using Living Educational Theory. We named our project BARN (Bluewater Action Research Network). Each year, we invited a few participants to co-facilitate with us so that we could support a large group of practitioners and to contribute to the sustainability of the program. Cathy Griffin has moved on to an administrative role, and I retired from secondary school teaching; however, the program continues to flourish as others eagerly step into the role of facilitator.

We began each session setting out our intentions, and then we would ask the participants for feedback at the end of the day, and we would use this information to plan our next session. Our goal was to create a safe place for practitioners to examine their practice within a loving community of inquiry. This was based on the model we experienced while completing our master's degree when Jackie Delong was our instructor.

At the time of writing this chapter, I received a text message from Krystal Damm that BARN had received the funding they requested to run the network again in 2018. This is a clear indication of the recognition and value of Living Theory work in Ontario and could be a useful resource for funding for other Ontario educators. You can access the 2016–2017 projects at Teach Ontario (2018).

Cathy: Writing about my contribution seems paradoxical to me when I feel the greatest result of my involvement in Living Theory Action Research has been change in my personal practice. However, because I have noted the key changes, studied their effect on students and colleagues, and intentionally shared what and why I do what I do in public forums including academic articles, I can describe these intensely personal revelations as both what I have learned and my contributions to the professional knowledge base. In describing my learning and contributions, I am validating the claims of the other authors in describing the nature of their influence on me.

Vulnerability is strength: Jackie placed herself in front of our entire Bluewater master's cohort and asked us for constructive criticism of her practice. From that experience I learned that in placing herself and her students in that uncomfortable position, she was breaking down the hierarchical walls that separated mentor/learner from student/learner and made it comfortable (or at least "uncomfortably comfortable," as one of my colleagues says) for everyone to take part in a culture of inquiry

(Delong 2013) as critical friends and equal learners. I, in turn, contribute in my local contexts by making public my values and intentions and asking for feedback on my own practice. Practicing and honing this skill in our BARN group helped create the safe environment Liz talks about. I also encourage educators to ask for feedback from their students. I have contributed to the professional knowledge base by writing academic accounts of the effect this practice has had on students in the EJOLTs journal and in a blog, Mentoring Moments (Griffin 2015–2016).

It is difficult for educators to open themselves up to feedback without seeing first how much strength it can give them and how much confidence and certainty in direction. I facilitate the use of student voice as feedback to educators in my local context and then share this with a wider audience whenever I can (e.g., Ontario Teachers' Federation Webinars). For example, I interviewed aged 12–14 English language learners (ELL) at our school which has a 40% ELL population and shared the video clips of these students explaining their values, concerns, and barriers to learning.

Hearing student feedback on our practice not only influenced widespread change in teacher practice, but it also prompted educators to elicit more feedback after making changes to their practice. I then got permission to share these student and teacher videos within our school board, at conferences, and as part of an OTF webinar to encourage others to use student voice to inform educational practice. It is important to have access to strategies and resources that other teacher-researchers have researched and tested. It is equally important to have models of how to integrate these strategies into your practice or to test your own strategies, through personal research. I want to give courage to others to carve their own path as a researcher rather than feel that academics who have published a book hold all the knowledge.

Learning is struggle and joy: I and every other teacher I have worked with struggle with translating best practice education research into our own educational practice. For example, in the Ontario curriculum, there is an emphasis on student metacognition: identifying strengths and weaknesses, setting, and monitoring goals. I struggled and struggled with how to make this authentic and meaningful rather than being the one to impose goals based on what I believed to be true. The battle ended up with me teaching my students to do their own Action Research projects and write their own learning skills for their report cards (Campbell 2013 and Mentoring Moments Griffin 2015–2016). Jack has influenced me to treat the niggling feeling, the living contradiction, as the next challenge, a joyous opportunity to investigate how or why I am not living according to my values. In anything I write or post, in each of my professional development contexts, I unveil my struggle and try to convey the joy of working the problem through to the end.

Joy: "...bringing more fully into the world the expression of a loving, life-affirming energy, of justice, of compassion, of freedom, of gift, of talent and of knowledge creation" (Whitehead 2007). This extract defines the values I hold as a person and as a practitioner, which I strive to hold and define through using a Living Theory methodology within my research, practice, and professional voice.

This quote from an interview with Desmond Tutu (2013) strongly resonates with my value of "nurturing responsiveness" (Mounter 2012), reminding me of the sense of community and flourishing of humanity I feel is so important in Living Theory research: "I need you, in order for me to be me; I need you to be you to the fullest."

It is vital to engender a research space of reflective pause and renewal, a form of CPD for a profession that all too frequently faces the past and not the future in a rush of changes. The requirement is to create a research community space for the melding of minds, a dynamic, safe, challenging, and exhilarating space and one in which to meet and enable others to meet in the physical and the virtual worlds. It is a place where time and distance have no meaning and barriers and borders do not exist, just the flow on a worldwide platform of renewal and energy defined within a Living Theory values-based framework.

My greatest learning came from opening this shared space for learning between the pupils and myself. I shared the cooperative research space of myself and my pupils (aged 6, 7, 8 years of age) in a rural mixed-age class in the southwest of England as we explored as researchers our own learning and influences on others. As a professional, I offer my research as a gift, but the pupils asked me a profound question one day, which transformed my practice, my values, and my role as a researcher: "Why is it only grown-ups that write about learning, when it is us that do the learning? Why haven't they asked us?" Child N (Mounter 2008a) In our shared Living Theory, we offered an exploration of learning from two perspectives: the critical reflection and analysis of professional and pupil. The pupils critically engaged with learning theories, before constructing and offering their own.

On You Tube you can watch an extract of the children discussing the changes they felt should be made to a research model called TASC (Wallace 2005) and how they had developed their ideas, even making a 3D model (Mounter 2008b).

My educational influences on learning and my affirmation of cooperative research with my class are seen and expressed in the educational relationship with my pupils, as I respond to their needs in relation to their learning. Our "gift" is for each other and other learners, and the educational profession is the QUIFF theory of learning constructed by the pupils. The sharing of our voices and research strengthened our gift, offering us personal and collective growth and transformation enriching the flourishing of humanity.

In the next section, we share our efforts to contribute to a better world by acting as global citizens and contextualize the global significance of Self-Study.

Our Ways Forward to Contribute to a Flourishing of Humanity as Global Citizens

Living (Educational) Theory methodology (Whitehead 2008) engenders a reflective understanding of self, others, and the ability to be part of a continual flow of energy for change. Whitehead (2017, p. 391) states that this can add to the flourishing of humanity, a concept explored continually since Aristotle. Keyes (2002) defines flourish as "living within an optimal range of human functions, one that connotes goodness, generativity, growth and resilience." Since humans are complex beings, there is no one way or best way forward. However, we believe we can make better progress together if each person is open and generous enough to make their contributions accessible and respectfully appreciative of that of others. In the spirit of "walking our own talk," we share a few examples of what we have done that we believe contributes to the flourishing of humanity which may transcend the potentially negating barriers of nationalism or ways of thinking and limitations of traditional social science research methodologies.

From a "personal and practical" perspective arising from our Living Theory work, we refer you to our work at the "1st Global Assembly for Knowledge Democracy: Towards an ecology of knowledges" that took place in Cartagena, Colombia, on 16 June 2017. This included contributions from Self-Study researchers from India, South Africa, Europe (including Ireland and the UK), Bolivia, Canada, Japan, and China and the keynote from de Sousa Santos.

In considering this global significance of Self-Study research, we are aware of the dangers of imposing a theory of knowledge that can serve the interests of what de Sousa Santos (2014) calls "epistemicide." By epistemicide he means the killing off of knowledges by the current hegemony of West/neo-liberalist knowledge systems. As practitioner researchers who have been successful in gaining academic recognition for our master's and doctoral degrees, we have experienced firsthand the pressures of epistemicide. We are committed to deeply heterogeneous and emancipatory approaches to knowledge. Through Self-Study research, we see ourselves contributing to the empowerment of diverse knowledge communities and knowledge systems critical to the long-term sustainment of people and the planet. In making this contribution, we acknowledge the pressures to conform to the current hegemony of West/neo-liberalist knowledge systems.

We also refer you to the Town Hall meeting, convened by Delong, at the 2015 Action Research Network of the Americas Conference in Toronto. In this meeting we contributed to a global community of Living Theory Self-Study researchers with the help of multi-screen Skype contributions and "living posters" from many cultures and countries such as South Africa, Canada, India, the Republic of Ireland, Croatia, and the UK (Delong 2015).

We now share some individual thoughts on our ways forward as global citizens.

Jack: My way forward is focused on learning how to develop and extend my cooperative ways of working and researching in enhancing the global influence of Living Theory research as a social movement. In particular, I am working and researching within organizations such as the Action Learning, Action Research Association, Action Research Network of the Americas, the Collaborative Action Research Network, the Bluewater Action Research Network, the Association for Teacher Education in Europe, and the S-STEP group at AERA, as well as with Living Theory doctoral and postdoctoral researchers in the Educational Journal of Living Theory, to extend the influence of Living Theory research. This involves the clarification and communication of meanings of cosmopolitanism (Keizer-Remmers 2017) and global citizenship (Coombs et al. 2014). It also involves learning how to contribute as fully as I can to the spreading influence of the values and understandings of the International Co-operative Alliance (ICA 2018).

Jackie: The way that I am taking forward and contributing to the flourishing of humanity is through the individuals and systems that I influence. It is in the capacities and accomplishments of the students, teachers, and administrators who have asked and answered their own questions to improve themselves and their world that I see them contributing as global citizens.

         If we focus on small incremental steps, through the teachers to the students, we build a future of values-based individuals that can be the change we wish to see (paraphrasing Gandhi). When I hear a teacher ask her students, "How can you help me to teach you better?", that democratic living-culture-of-inquiry (Delong 2013) that can transform the nature of the educational experience is evident. With students as young as 6–7 years of age (Schlosser 2011; Mounter 2008a & b), 9–10 years (Bognar and Zovko 2008), 10–11 years (Griffin 2011), or 16–17 years (Campbell 2011), we see them articulating their values and taking responsibility for improving their own learning. In small ways, these efforts contribute to improve the world and are in themselves part of the Living Theory social movement. It is also an issue of becoming truly democratic as we see Cathy asking her students to help her become a better teacher and learner and sharing her knowledge globally in her EJOLTs article (Griffin 2013).

         I continue to be involved in publishing in books and journals such as the Educational Journal of Living Theories and presenting at conferences globally such as ALARA World Congress, 2018.

Liz: One of the greatest challenges for classroom teachers is making time to understand and/or explain what they do, how they do it, and, most importantly, why they do it. We are so busy with the day-to-day demands that it is difficult to carve out time for reflection and collaboration.

However, it has become readily apparent to me that the most valuable resource in education is the educator. When time and space is created for practitioners with a desire to improve what they are doing, as we did with BARN, the results are simply astounding. Practitioners gain insights about their values and become extremely aware of their influence on students, their colleagues, and their community in general. This heightened awareness influences their teaching which has a profound positive impact on student learning and improves interactions with colleagues and the school community.

Currently, I am in the process of writing the dissertation for my PhD which will include an account of my evolving Living Educational Theory. My guiding question is "How has love influenced me as a teacher, researcher, and learner?" Publicly sharing this account is one way I intend to contribute to the flourishing of humanity. After the completion of my PhD, I hope to be able to continue to support new and veteran educators through professional development opportunities and courses for credit in Bachelor of Education, master's and PhD programs.

Cathy: Yesterday I walked into the classroom of a teacher who is working with his colleagues and me to improve our teaching of algebra. I turned my camera on and started recording. A challenge was presented to the class and they got to work. I panned the room and captured all students getting to work, busily talking, making charts, looking at the board, and thinking in silence. I followed the teacher around and captured some conversations with students. "This is what I'm thinking…," "You know I'm not going to give you the answer, but I'm wondering why you tested so many of the ordered pairs?", "I think next I need to…," "I know this is the answer because…," BZZZZ – I check my phone that just vibrated, "There is some cool patterning happening in my room if you want to visit."

When I arrived at the second classroom, the students were already into an individual consolidation activity, but the teacher's eyes lit up when she saw me. She jumped right in, excited, "The lesson worked so well! I had to step out for a minute, and when I came back in, they were still all talking about math! I just walked around and listened." I circulated the room and looked at what the students were writing. And **all** of them were writing about math – WOW! They understood what they had learned. The answers were diverse and individual.

I have this vision of a school in which these real examples are the norm. Each individual is flourishing – motivated, engaged, and learning. The perceived and real pressures have dropped away, and what is felt by all is excitement in challenges, the joy in the struggle that is learning. Each individual is on a learning journey and is able to talk to others about the mistakes they have made, their successes, their challenges, and the action they are going to take next. My way forward to realizing this vision is to model my own learning, to ask for feedback on my efforts to improve from

teachers and students, to facilitate opportunities for individuals to identify their own values and concerns, and to engage in Living Theory research. If I can influence educators to take control of their own learning, they will in turn influence students take control of theirs.

Joy: My living values have at the heart a belief in ontological, epistemological, and methodological democracy. As an active Living Theory researcher, I make a living commitment to a global methodological and knowledge egalitarianism and personal and collective growth and transformation, identified by Whitehead (2008) as "the flourishing of humanity." I am, as a way of being, "living research," in my way of viewing and interpreting the world I interact with, adding to my living archive and thus my Living Theory methodology. Living Theory research builds a community of knowledge creation and sharing by crossing all borders and recognizing each contribution to the educational knowledge base.

Marie: My current way forward to contribute to a flourishing of humanity globally is by learning how to cooperate with people in other communities and cultures who share my desire to realize humanitarian values in practice through extending the global influence of Living Theory as a social movement. Those with whom I am learning to cooperate include Living Theory doctoral and postdoctoral researchers working in diverse fields and countries. By working with the editorial board and development team of the Educational Journal of Living Theories, I hope to contribute to the development of a platform for making freely accessible public accounts of professional educational practitioners, which meet high academic and scholarly standards, and contribute to improving educational practice, opportunities, and provision globally.

In our work we have been developing possibilities, which connect Living Theory, Self-Study researchers, and communities. For instance, we encourage teachers to create and share their "living poster": an attractive A4 poster including text and images which provides brief details of the Self-Study context, interests, and values that motivate them and that give their life and work meaning and purpose. It includes research passions, details of any publications, the URL to their website (if they have one), contact details, and the URL to a 3-min YouTube video of them introducing themselves and their work. If you would share your living poster, this would enable us to extend the influences of Living Theory research as a social movement by bringing your self-studies into different professional community spaces and to contribute to global connections. An example can be seen by visiting living posters (2017) on Whitehead's website (1996–2018). Another way is to make contributions to EJOLTs and other journals in order to build the capacity of researchers to use multimedia to express their energy-flowing values and create the critical mass of teacher-researchers that Snow (2001) called for at the 2001 AERA.

In our concluding thoughts, we share how Living Theory and other forms of Self-Study can inform and improve practice and next steps.

Closing Thoughts and Next Steps for Teachers

Our main concern has been to provide the evidence that demonstrates how Living Theory/Self-Study can help to improve your teaching and educational influences in your students' learning. Improving the educational experiences of students, while enhancing professionalism, includes a Self-Study researcher gathering data and analyzing the data in terms of the values that constitute an improvement in educational influence in students' learning. It also includes submitting an explanation of these educational influences to a validation group of peers who will help to strengthen the comprehensibility, evidence, sociohistorical and sociocultural understandings, and authenticity of the explanation. Self-Study researchers can learn much from the opportunities and challenges, including understanding how to differentiate between education and educational research and the role of academic literature in Self-Study theorizing and research.

We have stressed the importance of establishing and sustaining networks of practitioner researchers committed to contributing to the flourishing of humanity. It is essential for professional growth and our ability to live authentic and productive lives to work within a community of people who share similar values. We are encouraging you to make connections with people who are passionate about learning, improving practice, and generating educational knowledge. We believe that you will feel energized, especially during challenging and difficult times, by belonging to professional communities of Self-Study educators, like BARN. In acknowledging the important contribution that financial support and educational leadership can make in enabling you to research your own educational practices as Continual Professional Development, we are encouraging you to seek out such financial support and leadership.

It is important to influence the nature of educational leadership. Sympathetic and committed supervisors and leaders of the research groups are most helpful in this process of generating living educational theories and gaining academic accreditation. In order to legitimize and respect the embodied knowledge of practitioners, an influential leader, who has political understanding, who has access to resources, and who has created his/her own Living Theory, is most helpful. In addition to political knowledge, that person needs a full understanding of how systems work and can assist in moving Living Theory and other forms of Self-Study research forward. Influential leaders do affect change in power and knowledge structures: they can do this by sharing their values and research, by modelling and sharing their vulnerability (Delong 2013, p. 26), by recognizing and supporting practitioners that share their values, and by dedicating themselves to researching their practice.

Self-Study researchers need to develop an awareness of the issues of power and knowledge that affects students' learning and their own. These issues also influence Living Theory and its emergence as a social movement (Whitehead 2016). Wherever we are able, we try to influence others to ask co-workers and students to self-evaluate and to ask for evaluations of their practice from their peers and students. Where shared power exists, there is no hierarchy, only democracy and shared learning. Self-Study researchers can learn so much from students because we

can work and research cooperatively with them to help them to improve their practice and to generate their own living theories. We need more teachers who ask students, "Help me to teach you better." It is in the students' stories of transcendence that we find the passion to continue to encourage and support teachers to share their embodied knowledge and create their own living theories.

Suggested next steps for teachers are closely connected with community-based research as Self-Study researchers participate in contributing to a global social movement of Living Theory researchers. While Self-Study researchers continue to act and research locally in seeking to improve practice and generate and share educational knowledge, they need to contribute to a global social movement of Self-Study researchers who are generating and sharing their living educational theories. This research will involve the submission of proposals to educational conferences and journals that publish Self-Study research.

For the sake of our planet and humanity, we need more individuals who are self-assessing and who conduct Self-Study, S-STEP, and Living Theory research. We hope that strong teachers and leaders can transcend the pressures of a constant barrage of dictums from the powers in the school systems, departments of education, and universities telling them how to teach and how to lead and that they will stay true to their values as explanatory standards of judgment. By continuing to strengthen our local professional communities of Self-Study researchers and making global connections through S-STEP and other conferences (Delong 2018), it may be that we can stand together against epistemicide and draw strength to continue to improve students' learning and to challenge and confront wrong thinking.

We are hoping that you will contribute with us in sustaining a critical and creative engagement within a living-culture-of-inquiry that is focused on personal/professional improvement to contribute to a global social movement that is focused on the flourishing of humanity.

Polyvocal Self-Study in Transdisciplinary Higher Education Communities

43

Anastasia P. Samaras and Kathleen Pithouse-Morgan

Contents

Abstract

This chapter draws on theoretical, literary, and artistic thinking to describe a multifaceted conceptualization of polyvocality in self-study research. It offers exemplars of enactments of polyvocal self-study research enacted across disciplines, institutions, and continents in large-scale faculty self-study higher education communities in the USA and South Africa. They serve as models that

validate the self-study methodology more broadly outside of teacher education in polyvocal transdisciplinary faculty self-study groups. More specifically, the exemplars serve as ways to illustrate design elements of Paidiá: guideposts for facilitating and enacting polyvocal self-study research in transdisciplinary higher education communities and the positive impact for learning. Finally, the chapter circles back to the important foundations created by the S-STEP community for teacher educators, with its continued development in polyvocal self-study transdisciplinary higher education communities. To end, it looks forward to the upcoming developments and contributions by the global self-study community for future work in self-study research.

Prologue

Anastasia   Returning to the larger story or the "so what?" for the self-study field is always important. Let's start thinking about *why and how* we are opening new spaces for professional learning and development by enacting polyvocal self-study research in transdisciplinary higher education communities.

Kathleen   There seems to be a growing interest in self-study of professional practice beyond teaching and teacher education. I think that the *so what* question, or as Claudia Mitchell always asks, "What difference does this make anyway?" (2008, p. 366), will be vital and will help us perhaps to begin to make some sense of what polyvocal self-study in transdisciplinary higher education communities can look like – in relation to the well-mapped field of self-study in teaching and teacher education.

Introduction: Opening New Spaces Through Self-Study

In 1992, at an American Educational Research Association (AERA) symposium, a group of teacher educators initiated the Self-Study of Teacher Education Practices (S-STEP) Special Interest Group (SIG). Developing rapidly, the S-STEP SIG "quickly [became] one of the largest special interest groups of the [AERA] Association" (Korthagen 1995, p. 99). S-STEP grew into a welcoming academic and professional community of mostly teacher educators (Samaras et al. 2012a) and

expanded to include schoolteachers (Austin and Senese 2004; Samaras 2011; Samaras and Freese 2006).

The S-STEP community's shared emphasis on the authority of a practitioner's experience (Munby and Russell 1994) meant that teacher educators were researching issues situated in their own teaching practice and making them public for others to learn from their experiences. Self-study research also came to entail specific methodological components as identified by self-study scholars. Those components include openness, reflection and reflexivity, peer review for validation, interaction with critical friends, transparent data analysis and process, and improvement-aimed exemplars which contribute to professional learning and knowledge generation (Barnes 1998; LaBoskey 2004; Loughran 2004; Pinnegar and Hamilton 2009; Samaras 2011).

In 2004, *The International Handbook of Self-Study of Teaching and Teacher Education Practices* (Loughran et al. 2004) provided a comprehensive compilation and conceptualization of self-study research, documenting its development, a professional knowledge base, methodology and methods, and implications for teaching and teacher education. Korthagen and Lunenberg (2004) make a case that, within a decade of its inception, self-study research led to both individual and "institutional gains" (p. 425) for teacher educators and programs, albeit with much struggle for each in relation to validating, collating, and publicizing these gains as an integral part of the broader knowledge base of the educational research community (LaBoskey 2006; Samaras and Freese 2009; Zeichner 2007). While this groundwork established by the S-STEP community serves as a touchstone and vital resource, self-study research continues to evolve because of the ongoing developments envisioned and enacted by the S-STEP community.

Boundary Spanning in Transdisciplinary Higher Education Communities

The work of self-study scholars as reflective inquirers "demands that the work be situated in a community of learners who will provide multiple perspectives and critical deliberations" (Rodgers and LaBoskey 2016, p. 99). As noted by LaBoskey (2004), multiple viewpoints are vital in self-study research processes because they push scholars to consider and reconsider their personal ways of knowing and epistemological stances. Self-study research is paradoxically both personal and interpersonal with learning, thinking, and knowing arising through collaboration and the appropriating of feedback from others (Samaras and Freese 2006). It is the community that helps to extend an individual's understanding to develop and encourage divergent views and alternative perspectives to help validate the quality and legitimacy of each other's claims (Vygotsky 1978, 1981). We have found this particularly to be the case in witnessing the shift and extension of self-study research beyond teacher education and within transdisciplinary higher education communities.

Self-study has begun to move beyond the work of teacher educators and colleges of education to other practitioners and in new teaching spaces in colleges and universities; it now offers a broader inclusiveness to practitioners from multiple fields of professional expertise and from diverse disciplinary backgrounds (Samaras and Freese, 2006). Self-study of professional practice is being conducted by professionals who hail from teacher education as well as diverse fields in higher education contexts (e.g., Pithouse et al. 2009; Samaras et al. 2014a). This has allowed other practitioners to locate the authority of their own experiences (Munby and Russell 1994). Moreover, dialogue and interaction between varied perspectives in transdisciplinary communities are resulting in innovative ways of conceptualizing and undertaking research (Harrison et al. 2012; Samaras et al. 2014b).

In considering the role of educational development in the academy, Davis (2017) challenges educators "working in corners, spaces, ends and turns" to "model the way for an appreciation and application of the concept of transdisciplinarity . . . . [which] enhances the impact of individual disciplines but allows potential for the student learning experience to be improved" (p. 138). From this perspective, working in transdisciplinary communities can enable educators to transcend "empty spaces. . . and see how they fit together as a whole and as a foundation on which to grow and deepen the practice" (Marshall 2015, p. 6). If as Davis (2017) argues, higher education is a public good, then how do we open new spaces, working beyond our own corners for our collective good? And where Davis suggests a cojoining of subject pedagogy and educational development as a Scholarship of Teaching and Learning (SoTL), we have been exploring that very development with disciplines and self-study research in S-STEP. We situate our work in S-STEP because of what we see as its vital distinguishing features: (a) a unique combination of specific methodological components that facilitate methodological inventiveness (Pithouse-Morgan et al. 2016; Pithouse-Morgan and Samaras 2019; Whitehead 2004) and (b) a location of inquiry in the self and with the ability to change aspects of that self because of collaboration with others (LaBoskey 2004; Pithouse-Morgan and Samaras 2015a; Samaras 2011).

Like SoTL, we see S-STEP as offering productive ways to deepen thinking about interconnections between teaching and research. Here, we consider Badley's (2002) assertion that research and teaching are both modes of inquiry that are needed for the sustainability of our work in higher education regardless of program:

> . . .for higher education, . . . what we ought to be interested in is in creating better learning organisations (or better *inquiring* organisations), better that is in containing more *variety* and *freedom* (and democracy), as well as leading to more *growth*. Instead of the rather impoverished view of teaching and learning . . . we need a greater variety of approaches to both research and teaching. (p. 451)

Hawkins (2017), in her discussion of providing a transdisciplinary program of research education for early career researcher and doctoral students in the UK, notes

the importance of institutional support for such efforts. Since self-study unites research and teaching, the institutional changes suggested by Hawkins aptly apply. Those include providing physical and virtual workspaces, as well as research support such as project grants and scholarships. And, as Hawkins points out, working in transdisciplinary communities in higher education:

> requires an acknowledgement of the need to challenge and restructure traditional hierarchies of knowledge, a willingness to be open to ideas and methods from other disciplinary areas, a genuine desire to add value to a collaborative venture that includes communication and reflection, and ability to work with a degree of ambiguity. (p. 6)

Unlike the more traditional methodologies often deployed both in educational research and in the wider field of the scholarship of teaching and learning, self-study in transdisciplinary research communities can transcend discipline, status, and context – joining early career academics with tenured, senior faculty and also joining teacher educators with other higher education practitioners and with professionals beyond higher education. Although self-study was "developed specifically by and for teacher educators" (Rodgers and LaBoskey 2016, p. 98; Samaras 2002), the body of published self-study research contained in the 2004 *International Handbook of Self-Study of Teaching and Teacher Education Practices* (Loughran et al. 2004), the biannual *Proceedings of the International Conference on Self-Study of Teacher Education Practices* (1996–2018), and the numerous peer-reviewed journal articles and books reveals growing evidence of collaborative self-study being enacted with and by other practitioners who are not teacher educators.

Some of these are higher education practitioners from other specializations who joined with teacher educators to study ways to improve their learning and that of their students. For instance, a teacher educator, a history professor, and a student development professor collaborated to explore their practice of problem-based learning as a strategy for teaching and learning in higher education (Daynes et al. 2004). In another example, a research librarian and professor of education conducted a collective, phenomenological self-study to explore their multiple roles as researchers and instructors in a distance education program for public school teachers (Brown and Duke 2005). A third case is that of Lyons et al. (2013) who, working across the professional disciplines of teacher education and social work, came together to bring into dialogue three self-study cases of their own and their students' experiences of reflective inquiry in professional learning. A fourth case involved a teacher educator serving as a critical friend for doctoral students in higher education who used artifacts to study their professional identities at their respective research institutions (Evans et al. 2015).

There are also instances of self-study research by higher education practitioners working together in disciplines other than teacher education. To illustrate, Stockley and Mighty (2004), educational developers with a mandate to help university educators enhance their practice, conducted a collaborative self-study with the dual aims of improving their own practice and also encouraging self-study among

other university educators. In another instance, Meskin and Van der Walt (2014) collaborated to build on and extend the work of the S-STEP community by exploring ways in which self-study can offer a new arts-based research paradigm for drama and theater studies. Other examples involve students and faculty collaborating within disciplines outside of colleges of education (Hernández Gil De Lamadrid and Román Mendoza 2015; Stanley and Conway 2015).

Additionally, there are cases of higher education practitioners exploring the value of self-study in dialogue with professionals outside of higher education. In one such instance, Wilcox et al. (2004) – practitioners from the fields of library science, higher education, and occupational therapy – explained that self-study "allows practitioners to engage in inquiry that contributes to their own capacity for expert and caring professional practice while also contributing to the growth of their professions" (p. 307).

We are teacher educators who facilitate and participate in transdisciplinary self-study research communities in our home countries of the USA and South Africa. Over the last decade, our work has centered on the transdisciplinary extension and enactment of self-study methodology within our respective home countries, where we have taught and learned with others about self-study research. We have each worked with colleagues outside our disciplines and across continents to study our practice in facilitating and enacting transdisciplinary self-study, often in large groups of up to about 40 university educators (Pithouse-Morgan et al. 2015; Samaras et al. 2015). Our related experiences first brought us together in 2012 with the goal of learning from each other. We see ourselves in Eckert and Stacey's (2000) description of "complementary colleagues. . .who have different concerns, expertise,. . . and frames of reference," but who have a common purpose (p. 535). Our common purpose has been to learn more about and from facilitating and researching transdisciplinary self-study learning communities (Pithouse-Morgan and Samaras 2015a; Samaras et al. 2015). This transcontinental, transcultural research collaboration has generated insights that might not have been readily apparent to culturally homogeneous research teams or individual researchers (Sleeter 2014). Through our collaborations, self-study has become more than a research methodology. For us, it is a continuing process of seeking out innovative and responsive ways of knowing and re-knowing, seeing, and becoming, as facilitators and enactors of self-study research in transdisciplinary situations – what we have come to call *polyvocal self-study in transdisciplinary higher education communities*.

In this chapter, drawing on theoretical, literary, and artistic thinking, we describe a multifaceted conceptualization of polyvocality in self-study research. We next offer exemplars of enactments of polyvocal self-study research in the USA and South Africa as models of polyvocality in transdisciplinary faculty self-study groups. The exemplars then serve as ways to illustrate each design element of what we have called Paidiá: guideposts we offer for facilitating and enacting polyvocal self-study research in transdisciplinary higher education communities. We close the chapter circling back to the important foundations created by the S-STEP community for teacher educators, with its continued development in polyvocal self-study

transdisciplinary higher education communities. We do this while looking forward to the upcoming developments and contributions by the global self-study community for our future work in self-study research.

Taking a Polyvocal Stance in Self-Study Research

It has been noted that self-study research is collaborative (Barnes 1998), interactive (LaBoskey 2004; Loughran and Northfield 1998), individual, and collective (Samaras and Freese 2006) and requires critical collaborative inquiry (Samaras 2011). To this, we add *polyvocality*, which makes visible how dialogic encounters with diverse ways of seeing and knowing can deepen and extend professional learning in self-study research (Pithouse-Morgan and Samaras 2015a).

Polyvocality can simply be taken to mean "multiple voices." However, in conceptualizing polyvocal self-study, we have drawn on Russian philosopher Mikhail Bakhtin's (1984) in-depth examination of polyvocality (which he referred to as polyphony) as a narrative mode in the novels of Russian author, Fyodor Dostoevsky, who interplayed different voices and perspectives in his novels. Bakhtin recognized polyvocality as occurring when:

A plurality of independent and unmerged voices and consciousnesses, a genuine polyphony of fully valid voices . . . with equal rights and each with its own world, combine but are not merged in the unity of the event. (p. 6)

In musical terms, polyphony describes compositions in which two or more unique sounds or voices interweave and complement each other and yet remain distinctive (Devoto 2007). For Bakhtin, polyphony as a defining characteristic of Dostoevsky's novels was indicative of a significant development in human capacity for artistic expression and perception, with wider sociocultural ramifications:

We consider the creation of the polyphonic novel a huge step forward not only in the development of novelistic prose, that is, of all genres developing within the orbit of the novel, but also in the development of the *artistic thinking* of humankind. It seems to us that one could speak directly of a special *polyphonic artistic thinking* extending beyond the bounds of the novel as a genre. This mode of thinking makes available those sides of a human being, and above all the *thinking human consciousness and the dialogic sphere of its existence,* which are not subject to *artistic* assimilation from *monologic positions*. (Bakhtin 1984, p. 270)

The special polyphonic artistic thinking that Bakhtin recognized in Dostoevsky's novels can be seen in the work of present-day writers such as American novelist Toni Morrison (1992) and Nigerian novelist Chimamanda Ngozi Adichie (2006). To illustrate, in Adichie's novel, *Half of a Yellow Sun* (2006):

The novel's narrative arrangement represents a bold attempt at enabling a wide spectrum of perspectives including, but not limited to, that of the younger generation (Ugwu), the expatriate (Richard), the intellectual (Odenigbo) and the middle class. These multiple voices

are unified into a coherent narrative thread by an inventive narrative architecture in which the focalising characters are bonded in a nexus of passionate and close-knit interpersonal relationships transcending racial, class, gender and generational divides. (Akpome 2013, p. 34)

In terms of educational research, Bresler (2005) highlights that the polyphonic thinking and expression that is experienced in making, listening to, and creating music can offer more nuanced and complex representations of lived human experience than the monologic positions often taken in conventional research reports where the researcher studies others and alone or with minimal interaction with others. As Bresler explains, "real life consists of simultaneously multiple voices, sometimes silent, always present—thinking, interacting, experiencing, creating the texture of life" (pp. 173–174).

In our reading of Bakhtin's (1984) exploration of polyphonic thinking and expression, we have distinguished three vital qualities of polyvocality that are significant for self-study in transdisciplinary higher education communities. These are (a) *plurality*, in which "the boundaries of a single voice [are] exceeded" (p. 22); (b) *interaction and interdependence* between "various consciousnesses" (italics added, p. 36); and (c) *creative activity* (italics added, p. 97) through polyvocality as "an artistic method" (p. 69) and as "artistic thinking" (p. 270). In our view, this multifaceted conceptualization of polyvocality – as characterized by *plurality*, *interaction and interdependence*, and *creative activity* – offers a new and generative dimension to ways of thinking about self-study methodology and especially about our educational practice and that of others.

Exemplars of Polyvocal Self-Study in Transdisciplinary Higher Education Communities

In this section, we offer two exemplars of learning encounters by self-study scholars who have lived out *plurality*, *interaction and interdependence*, and *creative activity* in transdisciplinary higher education learning communities in the USA and South Africa. We draw on our multidimensional understanding of polyvocality to organize our discussion of the exemplars and to demonstrate and validate the authenticity and generative professional applications of this polyvocal self-study for and beyond teacher education. Kuhn (1976) explains exemplars as "concrete models of research practice" (p. 415). Building on Kuhn's work, LaBoskey (2004) notes: "Self-study achieves validation through the construction, testing, sharing, and re-testing of exemplars of teaching practice" (p. 860). These exemplars show rather than just tell about the power of polyvocality and transdisciplinary in teaching, learning, and enacting self-study research in higher education communities.

Exemplar 1 The Self-Study Scholars' Collaborative on the Visually Rich Digital Learning Environment (S3C) in the USA

This exemplar is adapted from a published book chapter: Smith et al. (2018).

Enacting Polyvocality in a Transdisciplinary Self-Study of Teaching and Research Community

By Lesley Smith, Lynne Scott Constantine, Allison Sauveur, Anastasia P. Samaras, Autum Casey, Anya S. Evmenova, Seth Hudson, Seungwon "Shawn" Lee, and E. Shelley Reid, with contributions from Rebecca Ericson, Mary Ewell, Laura Lukes, Star Muir, Jill Nelson, and Laura Poms

Context

At George Mason University (GMU), a large public university in Virginia, the mantra of "where innovation is our tradition" is evident across its colleges and particularly in its commitment to supporting faculty teaching combined with cutting edge research. In 2014, with the support of GMU's Centre for Teaching and Faculty Excellence and 4-VA, a research consortium of the four largest public institutions in Virginia, the Self-Study of Scholars' Collaborative (S^3C) on the Visually Rich Digital Learning Environment was launched. The goal of this initiative was to support faculty development and to build research capacity using self-study research methodology and tools of visually rich digital environments. While S^3C introduced participants to a wide variety of visually oriented digital tools, the activities were focused not on learning to use these tools but on broadening participants' understanding of what is possible in visually rich digital active learning environments.

The project was designed with multiple layers and dimensions of plurality providing an array of participant interactions and interdependence within a curriculum of visually rich digital creative activities. We offer a discussion of this polyvocality in this transdisciplinary self-study teaching and research community through the exemplar of S^3C.

Plurality by Design

Three parallel endeavors anchored the S^3C faculty self-study learning community: individual self-study research, meta-study research, and a collective investigation of the teaching potential of visually rich digital active learning environments. Individual self-study research in S^3C focused on a pedagogical or curricular challenge selected by each individual participant. The collaborative meta-study focused on structured research into the nature of self-study as a tool for reimagining teaching practices and provided a shared ground to foster collaboration. The collective investigation of using visually rich digital tools focused on adding to each participant's knowledge base of options and opportunities within visually rich digital learning environments.

The third anchor for S³C, the visually rich digital environment, introduced a new factor that intrigued the three S³C cofacilitators, Anastasia, Lesley, and Lynne: Would the participants move from experiencing the environment as primarily requiring instrumental change (acquiring and learning suitable tools for the classroom), or would they experience it – through the use of visually rich tools – as an opportunity to re-envision their practice as scholars, teachers, and curriculum developers?

As psychologist Keith Sawyer noted, one of the key preconditions for creativity lies in the ability to confront the unknown and trust the truth of process: "Before you can arrive at the right questions, you often need to go ahead and make something, and then reinterpret it as something very different based on what happened when you made it" (2013, p. 32). Participants selected were willing to embrace the dispositions of a beginner's mind and its comfort in uncertainty. Beginner's mind, a Zen Buddhist concept, stresses openness and the ability to explore without preconceptions. In the S³C pro-posal, Anastasia, Lesley, and Lynne described beginner's mind in the context of S³C as willingness to explore participants' pedagogy and curriculum in "studios" of collaborative inquiry and exchange, embrace mistakes as part of the process of growth, cultivate openness to continuous learning and divergent thinking, experiment courageously, learn from others outside their discipline and instructional units, be vulnerable within the learning community, and share the knowledge generated.

The project brought together a plurality of interaction, interdependence, and creative activity of 14 participants from various disciplines and colleges. It also brought transdisciplinary cofacilitator expertise to this faculty self-study group. Lynne, an artist and scholar from the School of Art, brought her expertise in the visual; Lesley, a digital literacy expert from Higher Education, brought her expertise in the digital; and Anastasia, a teacher educator and self-study scholar, brought her expertise in self-study methodology and pedagogy.

Lynne and Lesley had both been participants in the Scholars of Studying Teaching Collaborative (SoSTC), the first multi-semester, transdisciplinary faculty self-study research and learning community at GMU which Anastasia inaugurated in 2010 (Samaras et al. 2012b, 2014a) with a dozen participants. In SoSTC, participants transcended discipline and status uniting graduate students, adjunct and full-time contingent faculty, tenure-track, tenured, and senior faculty in a single endeavor. This plurality was also evident in the second faculty self-study group at GMU, Scholars of Studying Teaching Collaborative on e-Learning (SoSTCe-L), launched in 2012 with a dozen participants. Lesley had joined Anastasia in co-facilitating that group along with other participants from SoSTC.

In 2014, the three diverse scholars came together to learn from each other and with the participants of S³C. The 14 Mason faculty members in the final

group included 11 women and 3 men, drawn from 6 of the university's constituent colleges as well as from the Office of the Provost. The mix thus reproduced one of the key preconditions for maximal learning identified in the research on faculty learning communities and confirmed in research results from SoSTC and SoSTCe-L: the encouragement and nurturing of collaborative conversations and action across disciplinary, programmatic, status, and spatial divides.

Interaction and Interdependence

In S^3C, participants had opportunities to work on individual self-study projects while they also engaged with a plurality of participant perspectives in visually rich digital experiences. A key element to individual projects was faculty work in transdisciplinary research subgroups or critical friend teams, within which individual projects were debated, analyzed, and shaped. And yet, as Lesley noted, it was the group's commitment to discussing and researching the meta-study that gave the group the continued momentum that was needed. The three S^3C cofacilitators also worked as critical friends to conduct a collective self-study about co-facilitating faculty self-study.

Through the varied mindsets of critical friends and the leveling effect of exploring new visual approaches to teaching, learning, and thinking among peers experiencing beginner's mind, S^3C participants drew a renewed sense of their own expertise. However, they defined that expertise differently than at the beginning of the S^3C experience. This expanded vision of expertise included the patience to sit with others in their uncertainties, to stew productively in their own, and to share knowledge whose relevance may not be obvious, but will unfold.

For Seth Hudson, who teaches creative writing for computer game design, the support of critical friends encouraged him to try an audacious experiment in arts-based research for his self-study. He collected audio recordings of his class sessions and, instead of transcribing and coding them, produced a visual analysis of the data as waveforms generated in the recording software. Mapping course activities to the waveforms, he developed a sense of the students' "being there" and a renewed concept of his identity as an instructor.

Anya, an expert in assistive technology in the special education program, initially approached the academic diversity of the S^3C group with trepidation:

> . . . the first time we met, it was kind of awkward at the beginning. . . . And then when we started sharing our projects and suddenly people started to . . . actually provide suggestions and share something that can apply to your project from their field . . . that's where I said, "Oh my God, we *can* learn from multidisciplinary collaboration."

Meta-study research confirmed that, for all S^3C participants, as for those in the prior GMU self-study collaboratives, the cultivation of critical friends

(continued)

groups contributed significantly to the collaborative's success and formed an important outcome of the group's work and structure. Those working across disciplines gained a keen advantage of alternative points of view and ways of knowing and learning. Participants praised the cultivation of transdisciplinarity; critical friends who approached research and teaching from different disciplinary perspectives, and who shared expertise in different content areas, stimulated participants to create projects they might otherwise never have imagined.

Bridging the individual studies and the meta-study were the meetings of critical friend teams, a vital element of the self-study methodology in which small groups of participants provide deep attention, critical response, and supportive listening to one another as each person's study progresses. The combination of individual and collaborative research responsibilities nurtured both individual autonomy and a shared bond that, over the course of the collaboration, can extend from the professional and pedagogical to "notations of connection, emotion, and revelations of self-assessment and what could be learned through interdisciplinary group perspectives" (Samaras et al. 2012b, p. 253).

Although self-study is a collaborative method, it relies upon each individual's motivation, willingness to be reflective, and tolerance for uncertainty to build the group's collective capacity for change. The S^3C data suggested that these capabilities are important resources directly tied to the success of the self-study endeavor. For example, Shelley, director of the Center for Teaching and Faculty Excellence and a writing teacher who educates teaching assistants in her field, recalled a pair of beginner's mind emails she sent to Anastasia. In the first, she combined six "Am I doing the assignment right?" questions into an anxious wail. In the follow-up, "Ignore that email" message, she announced that she had regained her willingness to experiment courageously. S^3C cofacilitator Lynne noted that participants like Shelley were willing to stew productively in their disorientation if they were strongly motivated by the hope of reorienting their research and teaching:

> These are people who know how to learn. What they need is the specific motivation to put their subject matter, their teaching practice into the context of self-study as a mode of improvement and into the context of visual thinking as a mode of breaking up the logjam.

To support participants' desires and motivation, the three facilitators met and communicated regularly to create activities that balanced structure with the flexibility necessary to nurture emergent ideas.

Creative Activity

Creative activities during the monthly S^3C meetings included participants' development and presentations of visual research artifacts representing their research questions; visual commentaries, such as visual memos, drawings, and sketches in response to exploratory prompts; images shared with the collaborative and with public audiences; and reciprocal self-interviews within critical friends groups.

The atmosphere of the meetings, and the more frequent meetings of the smaller critical friend teams, confirmed what the facilitators had hoped: the explicit focus on visually rich digital environments cut across any individual expertise in teaching, learning, research, self-study, visual analysis, and digital tools that participants (including the facilitators) brought to the table. The mild disorientation nurtured beginner's mind for all participants, including the facilitators, creating a communal ground zero from which innovation might begin.

It also became clear that the expanded role of the visual within the environment of self-study had a meaningful impact on participants' pedagogies and on their sense of professional efficacy. For example, near the end of the third semester of S^3C activity, Autum engaged in reciprocal self-interviews with her critical friend, using the Meskin et al. (2014) protocol. While listening to the audio of the interviews, Autum had an aha moment through which she came to embrace a less idealized image of what good teaching looks like:

> I like beautiful, aesthetically pleasing images. That being said, they are of no use to me for the self-study. The imagery I need to collect for my self-study is the chaos of 25 students in groups taping out a set on the floor for the first time or the torched fabric created from doing a burn test to demonstrate that different fiber contents can be determined by burning the fabric … What has been most useful to me is documenting the transition from my idea of organized learning to actual learning. …and … yes, we're all experts in our [content] field, but none of us [is] expert at the thing we're trying to do [in our teaching] necessarily.

As participant experiences demonstrate, not only were participants' attitudes about incorporating visual and digital resources overwhelmingly positive, but their attention to visual or digital elements also helped them discover or refocus on key self-study elements.

Like Autum, Seungwon "Shawn" who teaches meeting and event management and technology in the School of Recreation, Health and Tourism, rethought his assumptions about pedagogy when he introduced visual metaphor, a technique he learned about during an S^3C meeting, into his teaching of convention programming:

> Previously I used a traditional teaching method of verbally explaining "Dos and Do-Nots" in program development. Then I decided to adopt the visual image metaphor

(continued)

method to discuss Do-Nots. The cargo ship image with collapsing cargos due to an overload of same size and pattern of cargos was used to start the discussion, and it instantly helped students relate to the concept. Then students were asked to share their own metaphor image of best and worst convention programs. I was pleasantly surprised by their holistic and out-of-box ideas on the once challenging task.

In addition, participants welcomed the opportunity to collaborate with S³C colleagues and combine insights, broadening the segment of the academic community to which the results would be productive and increasing the potential for creative impact on the quality of college and university instruction across disciplines.

Conclusions and Implications

At the outset of S³C, we surmised that individual autonomy and initiative, self-sustaining reciprocal faculty development, an appetite for intellectual risk and renewed idealism, and activism within academia all might be nurtured through self-study framed within visually rich digital environments. Although exploration of the visual did itself trigger revelations for participants, the greater insights across the S³C collaborative as a whole related more comprehensively to the practice of self-study within that visually rich digital context. Based on the outcomes of S³C, one might speculate that engaging in self-study in the specific context of the visually rich digital environment triggers the "disorienting dilemma" (Mezirow 1990, 1991) that precedes individual and collaborative transformation.

Participants' struggle to understand the complexities of self-study methodology slowed down the rush to certainty and conclusion. When combined with the challenge to focus on digital environments, without the typical "how-to" perspective conventionally offered to faculty, the result was to broaden the nature of the study by opening existential questions critical to the future of higher education.

In S³C, perhaps given its vertiginous dual challenge, with the integration of the visually rich digital environment as an equal focus, the solidarity of the "we" was striking. As a participant noted, "We were all, in the very beginning, very off balance because we didn't understand what self-study was, or how to do it."

Laura, assistant director of the Center for Teaching and Faculty Excellence who also teaches geosciences, stressed how academic behavior changes in the face of uncertainty, where expertise does not equal control:

> The nature of self-study [is that] you have to be open to the process and not necessarily understanding the process initially, and you have to be OK with that. I think that creates a different collaborative dynamic among the faculty, because there's no expert in the group. So I think it kind of levels the playing field a little bit, where people have to get comfortable with being uncomfortable.

(continued)

Gustavsen (2001) argues that the capacity for new forms of action is affected most directly by the extent to which a rich and diverse network of professional relationships is present. The successful crossings of boundaries perceived as impermeable jolted participants into a more adaptive, organic, and subversive vision of their identities as teacher and scholar. Methodology matters. Studying about teaching using self-study methodology improves learning beyond the self and for others. As Ham and Kane (2004) explain about the self-study of teaching, "Teaching is by definition a socio-ethical act—it is to try to do good for an other" (p. 127). Sharing the research with others moves the study beyond the self to raise issues of moral, ethical, and/or political reform (LaBoskey 2004).

In this exemplar of polyvocality, we present how the fluidity in the methodology of self-study, combined with the location of inquiry in the self and with the ability to change aspects of that self in collaboration with others, can subvert a status quo that threatens or denies the authenticity of teaching scholars. This can empower scholars to set the terms of the debate about higher education, rather than react to terms set by others. For instance, Seth stated that his self-study work inspired him not only to be more accepting of his practice but also to share his findings with colleagues:

> I now view my curiosity and semester-to-semester revisions of courses as a strength rather than a lack of certainty. I am experimenting to make my teaching the best it can be for a particular set of students in a particular context; self-study allows me to capture data and potentially share with colleagues. Doing so has the potential to impact my field rather than *just* my practice.

Anastasia further envisions this potential thus:

> . . .methodology centers all of us in a set of very diverse contexts that we bring to the table. . . . If this methodology makes so much sense to a group of very different professionals. . .it validates the methodology.

The polyvocality triggered self-sustaining reciprocal faculty development focused on support, discovery, openness, and reproducibility. Moreover, the holistic mutual support thus generated in this community of inquiry supported intellectual risk. Finally, participants both rediscovered and renewed the idealism and activism that first drew them to the academy, confirming the regenerative potential of polyvocality in a transdisciplinary self-study of teaching and research community.

Exemplar 2 The Transformative Education/al Studies (TES) Project in South Africa

This exemplar is adapted from a published book chapter: Pithouse-Morgan et al. (2015).

Learning about Polyvocal Self-Study in a Transdisciplinary Self-Study Research Supervision Community

By Kathleen Pithouse-Morgan, Nithi Muthukrishna, Daisy Pillay, Linda van Laren, Theresa Chisanga, Thenjiwe Meyiwa, Relebohile (Lebo) Moletsane, Inbanathan Naicker, Lorraine Singh and Jean Stuart

Context

We are a group of ten graduate research supervisors from the Durban University of Technology, the University of KwaZulu-Natal, and the Walter Sisulu University who have contributed to the Transformative Education/al Studies (TES) project in South Africa. (At South African universities, graduate research advisors or mentors are known as "supervisors." Unlike the committee model that is often used in North American universities, in South Africa each graduate student usually has only one research supervisor.) TES is a research-intervention project that aims to study and enhance the development of self-study research and supervision capacity within a transdisciplinary, multi-institutional research-learning community located across a range of university contexts in the Eastern Cape and KwaZulu-Natal provinces of South Africa. The TES project began in 2011 and was, in part, a response to the critical need to enhance research supervision capacity building in the higher education sector in South Africa.

The student participants we supervise in the TES project are university educators registered for master's and doctoral degrees, and all are using self-study methodologies to research their own educational practice. These "staff-students" teach in diverse academic and professional disciplines, including communication, clothing, business studies, education, drama, English education, jewelry design, and mathematics education. A variety of academic and professional disciplines is also represented within our group of self-study research supervisors: drama education (Lorraine); educational leadership and management (Inbanathan); educational psychology (Nithi); English language studies (Theresa); English and media education (Jean); gender studies (Thenjiwe); mathematics education (Linda); rural education (Lebo); and teacher development studies (Daisy and Kathleen).

Under the auspices of the TES project, we have, throughout our 7-year collaboration, been working together in a self-study supervision community. We have been driven by the imperative to have critically constructive conversations about our own supervisory practices and selves, with the aim of providing enhanced support for our students' individual self-study research projects.

Polyvocal Self-Study: A Dialogic Reenactment

One of the core principles or guideposts for self-study research is its insistence on collaboration with others during the research process (Samaras and Freese 2009). Thus, self-study requires sustained attention to relationships between self and "others" in research. Others can include published work that has influenced the researcher's thinking, coresearchers, research participants, and critical friends – peers who work with the researcher to offer alternative perspectives and feedback (e.g., Samaras and Sell 2013; Schuck and Russell 2005). Staff-student and supervisor participants in the TES research learning community serve as critical friends for each other's research. Thus, in TES, there are three layers of critical friends working together – with ongoing learning conversations that move across these layers: supervisors with supervisors; staff-student with staff-students; and supervisors with staff-students. In this exemplar, we are focusing on our learning conversations as supervisors with supervisors.

From the beginning of the TES project in 2011, we (the TES supervisors) have been meeting regularly to discuss our supervisory experiences and practices. Early on in these discussions, we identified a need to "walk our talk" by studying ourselves as self-study supervisors (Lunenberg and Samaras 2011). As self-study researchers, we can use any appropriate method to help us respond to our research puzzles (Loughran 2004; Pithouse-Morgan and Samaras 2019). Furthermore, in self-study we are required to use multiple methods to gain diverse perspectives on the same phenomenon (LaBoskey 2004). In our work as self-study researchers and supervisors, we have found that less conventional arts-based self-study research practices can be of particular value in facilitating the enhanced subjectivity and reflexivity that we are seeking. To illustrate, in co-authored publications, we have collectively explored our understandings and experiences as self-study supervisors using the visual arts-based research practice of metaphor drawings (Van Laren et al. 2014) and the literary arts-based research practices of poetry and dialogue (Pithouse-Morgan et al. 2015).

In our ongoing scholarly collaborations, we are seeking to be increasingly reflexive in our quest to confront and make public our inquiry into ourselves as research supervisors and how those selves interact with other selves within particular research contexts. For us, this involves a recognition of the value of engaging with a plurality of views, perspectives, and responses (Vickers 2010) – thereby allowing us to find our voices in relation to the voices of others. We have found that relational research reflexivity requires not only self-awareness but also self-exposure, which in turn requires a fair measure of emotional self-knowledge and self-care (Rager 2005). In our experience, it is less frightening to reveal and reexamine our relational selves in the presence of colleagues who we know well and trust. Increasingly, we have also become aware of how being reflexive together through thinking deeply about and questioning our professional practice

and selves in dialogue with significant others – what we have come to call, "co-flexivity" – can deepen and extend our learning, being, and becoming as self-study supervisors and researchers (Pithouse-Morgan et al. 2015).

In this exemplar, we make visible our learning about polyvocal self-study through the medium of reflexive dialogue pieces. As a literary arts-based device, dialogue can help readers to come to understand more about the characters in a story and to see how growth happens through interaction between characters (Coulter and Smith 2009). Pelias (2008) explained that, in a performance, a monologue "comes forward as a 'what is'," while a dialogue "stages 'what might be'" (pp. 191–192). In taking a dialogic approach, we build on the work of self-study researchers who argued for the use of dialogue as a method to critically analyze their self-study process and content (e.g., East et al. 2009). East et al. further explained that reflexive dialogue as an analysis tool is useful "to focus on [our] insights-in-the moment as they arise spontaneously in the actual dialogue process" (2009, p. 58). In representing our collaborative professional learning, we aim to communicate our diverse voices and to demonstrate how these voices came together to make meaning of the complexities, challenges, and value of polyvocal self-study in transdisciplinary learning communities in higher education. The dialogue pieces show how our individual views and knowledge can be strengthened, challenged, and broadened through conversations with others in which "empathic under-standing" (Bresler 2008, p. 230) is sought. As Bresler (2008) clarified, empathy, or the ability to identify with feelings and beliefs of another person, is dialogic and "in that dialogue, the researcher/performer is touched and expanded, not just in terms of factual knowledge, but also in her resonance to the world" (p. 230).

Through our ongoing face-to-face and e-mail interactions, we have been able to deepen and extend our understandings of the characteristics and possible implications of polyvocal self-study in our work together as self-study research supervisors, as well as what relevance this might have for others. The reflexive dialogue pieces that follow are composed of lightly edited excerpts from transcripts of our audio-recorded conversations as well as our e-mail correspondence.

Plurality: "It is Always Better to Know Different Stories or Perspectives"

Lebo   I recently heard Nigerian novelist Chimamanda Adichie speak on "the dangers of a single story" (2009) – that it is always better to know different stories or perspectives on a context or an issue. Informed by this, I think the idea of co-flexivity has the potential to ensure that our analysis of issues and the claims we make are not based on a single story or perspective. Our multiple

	perspectives, debated and sometimes agreed upon and at other times diverging, have the potential to enable us to arrive at more "trustworthy" claims.
Kathleen	And I also think that as we bring our diverse disciplinary knowledges in, we offer ideas that we weren't all necessarily exposed to before, while also creating new knowledges and ways of knowing.
Inba	In working in this co-flexive way, each one's cognition becomes a resource for the others, and we build on that. And we also challenge each other's cognition as well.
Theresa	It eventually becomes like a movement, not necessarily for change but for something that can at least be parallel and accommodate people who can't always fit into a box.
Kathleen	With our group, you've got that sense of a space where those ideas can be taken and shared and explored.
Inba	Yes. There's no blueprint. Every self-study is unique and each one takes a different direction.
Daisy	I'm reminded of St Pierre's (1997) famous phrase, "producing knowledge differently and producing different knowledge." I think that's what happens, because each of us responds with our knowledge and when we put it together, we produce different knowledges, and the way we come to produce it is changing as well.

Interaction and Interdependence: "Then There's a Oneness and a Connection"

Kathleen	Our conversations illustrate the Bakhtinian idea of the "interanimation" of thinking (Holquist 1981, pp. 429–430). When we are in a polyvocal group, our ideas interanimate to create new ideas that are group ideas. In self-study, Guilfoyle et al. (2002) talked about the "brain in the middle of the table" – that there's a new idea that belongs to all of us.
Jean	I think it's related to the openness of our collaboration. There's no resistance against an idea coming in.
Lorraine	And it's not about egos. So, there's a lot more room for this type of engagement. Ego can be very destructive to collaboration, and it's very powerful in the academic world.
Daisy	When you get rid of the ego – "I am this and I know this" – then there's a oneness and a connection.
Lorraine	There's a lot of healing that happens that way. Because the breathing and energy that you release helps the next person.

Daisy	Changing what we do here is changing us as people.
Kathleen	I find that is a very emotional process. And you shouldn't enter into it to lightly. You have to have a certain amount of . . .
Daisy	Courage . . .
Kathleen	And resilience.
Lorraine	It seems to be light and effortless. Yet we know otherwise.

Creative Activity: "Most important is how one becomes creative about it"

Thenjiwe	James Scott (1990) talked of domination and the arts of resistance: hidden transcripts. When people are dominated, they can get pushed to be very generative. In a context where there is domination, like in academia where there is so much positivism, I regard the kind of work that we're doing as something of that nature where, within the framework and prescripts of a dominating system, the marginal gets pushed to come up with scripts that transgress . . . and more importantly generate knowledge.
Theresa	Like protest literature?
Thenjiwe	I am just reminded of that in terms of how, with our students and us as individuals, the kind of work that we do and are pushed to produce is an exemplar of what Scott (1990) defined as a transcript that is birthed because of the dominating framework within which the scribe finds herself.
Linda	So, if we get pushed into a corner, we've got to find creative ways of getting out?
Daisy	Authoring our own scripts.
Kathleen	I know for me, as a self-study supervisor and researcher, what happens in our group makes me a lot more confident in being creative and thinking outside the usual. When you're able to discuss it with a group of like-minded people, then you can see that there is some merit in this idea that might be considered completely "off the wall" by other people.
Nithi	I think the other thing is that most of our students come from exposure to very traditional, linear kinds of research. But what I have found is that they embrace the experience of a dynamic learning community that explores creative ways of doing research.
Daisy	But still, sometimes, having a supervision meeting is a struggle. You've got to think: "Who is this student? What's the best way to be setting this person free to become creative?"

(continued)

Thenjiwe   Most important is how one becomes creative about it. How you react and how it becomes useful. How you work with that is actually a kind of performance, a kind of an art.

Conclusion and Implications

In this exemplar, we have used the medium of reflexive dialogue pieces to represent and make meaning of our emergent understanding of polyvocal self-study and the difference it makes to us as self-study supervisors. We have shown that in order to extend our research supervision to knowledge creating, we used reflexive dialogue as a co-flexive research method to enhance our polyvocal professional learning.

Through composing the dialogue pieces, we were able to condense and articulate significant aspects of complex, polyvocal conversations that took place among the ten of us over a long period. The use dialogue as a literary-arts based device assisted us in our quest to offer an evocative and multifaceted account of our experiences of learning through and about polyvocal self-study. The dialogue pieces also serve as a means for us to invite readers into the human interaction and relationships that are at the heart of our shared experiences.

Dialogue as a literary arts-based device also enabled us to illustrate that there were diverse voices at play in our process of knowledge generation, and we were cautious not to integrate them into one all-encompassing account. Our collaborative, multi-voice process reflects the power of polyvocality in professional learning and development. As a group of self-study supervisors from diverse disciplines and subject positions, we were able to engage in dialogic praxis, bringing a multiplicity of standpoints, interpretations, and agencies to bear on our collective engagement. We journeyed in and out of the uncertainties, tensions, and complexities of self-study research supervision, raising complex epistemological and theoretical questions in the process.

Informed by the work of Louie et al. (2003), first, we see how our collective self-study has enhanced our analyses of issues and helped to bring depth and complexity into our work. Second, our exploration and articulation of polyvocality as a key principle of our collective work has made us more mindful of the value of listening to and valuing multiple voices and perspectives. We have become more aware of how collective self-study research across diverse higher education institutions and disciplines can provide us with opportunities to build a more holistic and deeper understanding of our practice as self-study supervisors. Third, as our discussion above suggests polyvocal self-study involves negotiating the complexities of a multiplicity of voices in a process of dialogic engagement between self and other and the tensions and dilemmas

within the self. Thus, a significant realization for us has been the social and emotional support that working together has provided us as collaborators over a number of years. Mutual trust, respect, and an ethic of care that has deepened and strengthened over the years of working together has helped to ameliorate possible power differentials among the collaborators that could potentially silence some of us.

But, we also need to consider potential implications beyond the TES project and our own work as self-study supervisors. How might this account of our collective inquiry into polyvocality in a transdisciplinary self-study research supervision community potentially benefit others? Methodologically, we have attempted to write this exemplar in a transparent and demonstrative way so that it shows rather than just tells about our praxis. We hope that it will serve as an accessible resource for others who are interested in polyvocal self-study research. Conceptually, we offer our learning as a contribution to continuing scholarly conversations about the significance of polyvocality in self-study.

Paidiá: Design Elements for Facilitating and Enacting Polyvocal Self-Study in Transdisciplinary Higher Education Communities

Building on the exemplars from the USA and South Africa, in this section of the chapter, we share and elaborate on what we each have come to understand and practice through collaborating with others as "Paidiá: Design Elements for Polyvocal Self-Study in Transdisciplinary Higher Education Communities." The acronym "Paidiá" is a Greek word, meaning "children." The well-being of children is central to the work of self-study scholars who strive to improve learning for others. When we see the school buses filled with children and the children walking to school in our neighborhoods, we are always reminded of the grave importance of our work as self-study teacher educators and for all those who teach to educate an informed and inclusive citizenry. Paidiá also has connotations of "play" (Ifenthaler et al. 2012), and this reminds us of how we learn in transdisciplinary higher education communities through "playing with our ideas and sharing those ideas with colleagues, [through] muddying up our hands, making mistakes, and enjoying the process of learning and coming to know the world through our engagement in it" (Samaras 2011, p. xiii).

Our elements of design were co-constructed from collaborative inquiry into our repeated explorations of polyvocal self-study in transdisciplinary higher education communities and informed by a strong theoretical and conceptual base, which we have enacted and validated in practice. From the work of the George Mason University self-study projects, our design elements are strengthened by key

conceptual underpinnings of Neo-Vygotskian-based transdisciplinary learning communities in practice (Samaras et al. 2008; Vygotsky 1978, 1981). These comprise:

(a) The encouragement and nurturing of collaborative conversations across disciplinary, programmatic, status, and spatial divides
(b) Multiple expertise in a shared leadership and reciprocal learning model
(c) Exploring new symbols for mediating written language using visually rich digital tools which cut across any individual expertise in teaching, learning, and research (Samaras and Pithouse-Morgan 2018)

From the work of the South African Transformative Education/al Studies project, our design elements are strengthened by a conceptual perspective of "reflexive ubuntu" (Harrison et al. 2012, pp. 16–18). This reflexive ubuntu perspective interweaves conceptions of:

(a) Southern African *ubuntu* philosophy. This can be explained as "understanding the value of locating oneself in the experiences of others as a form of demonstrating an ethics of care and trust" (Harrison et al. 2012, p. 17).
(b) Co-flexivity (collective reflexivity). Reflexivity requires critical attention to ways in which researchers' positionings, understandings, and beliefs affect research processes and representations (Kirk 2005). Co-flexivity can be explained as "being reflexive together through thinking deeply about and questioning our professional practice and selves in dialogue with significant others" (Pithouse-Morgan et al. 2015, p. 148).
(c) Co-creativity (collective creativity). This can be described as connecting in arts-informed ways with critical friends to allow us to see in imaginative and responsive ways that can transform our educational and research practice (Harrison et al. 2012; Pithouse-Morgan et al. 2015; Samaras and Pithouse-Morgan 2018).

The Paidiá Design Elements Exemplified

The two exemplars presented in this chapter epitomize each of the Paidiá design elements, as follows:

Personal Situated Chosen Inquiry

> *Participants choose to join in and choose their inquiries situated in their immediate personal-professional contexts and also in relation and response to wider sociocultural-historical-political contexts.*

In both the USA exemplar of the S^{3}C faculty self-study group and the South African TES project, university educators chose to participate and learn about the self-study methodology by enacting a self-study of their teaching and professional practice.

Accountability

Accountability begins with each participant reconsidering her/his professional practice with input and support from critical friends to build self-regulated, authentic professional learning.

Applicants to the S^{3}C faculty self-study group were recruited both through open announcements and through one-to-one outreach to individuals. Participants submitted an application articulating their interest in joining the group and what they chose to study. The TES project workshops and meetings have always been open to any university educators who wish to learn about self-study and to contribute to the learning of the group. Invitations to TES project activities have been shared via university-wide notices, online and national research networks, and word of mouth. Working with critical friends in the S^{3}C faculty self-study group and in the TES project has encouraged participants to be accountable to themselves and to each other.

Integrated Critical Creative Collaboration

Central to polyvocality are ongoing, intellectually safe, dialogic collaborative structures for reciprocal mentoring to recognizeze and value co-flexivity (collective reflexivity) and co-creativity. Co-designed platforms promote generative engagement with participants' contributions, enriching each other's learning as well as that of the community.

In the S^{3}C faculty self-study group, each participant, including the cofacilitators, developed a self-study project grounded in her or his own teaching practice while also engaging in a meta-study which was a collective self-study of the nature of the progress and development as a faculty self-study of teaching collaborative invested in studying professional practice. The collective investigation of using visually rich digital tools focused on adding to each participant's knowledge base of options and opportunities within visually rich digital learning environments. The multi-institutional, multicultural, multilingual, and transdisciplinary composition of the TES project community has offered multiple possibilities for collaborative exploring and enacting of a shared purpose of educational transformation. In addition, there is recognition of the complexity and diversity of experiences of each individual involved in a self-study research process. Because of the involvement of participants who are professional artists and designers and

others who are fascinated by learning from and through the arts and design, TES project activities have been enhanced the exploration and sharing of arts-informed and digital self-study research methods.

Design ↔ Dissemination

> *Participants share phases of their research as work in progress and make it public through presentation, writing, and other forms of dissemination, noting a transparent research design that clearly and accurately documents the unfolding research process and incorporates ongoing peer dialogue and critique.*

During the monthly S^3C faculty self-study group meetings, participants presented the unfolding of their ideas with the whole group. Additionally, critical friend teams shared their progress and offered feedback on drafts with peers. The group worked collectively to design a presentation where they shared their early work using visuals to represent their topic in a gallery walk at a university conference (Smith et al. 2015). The TES project has offered sustained support for the development of a research learning community comprising self-study researchers who are at different stages of the research process, as well as both novice and experienced self-study researchers, thus allowing learning and collaboration across varying levels of experience. TES project participants have met as a large group at least once a year since 2011 for inter-institutional workshops, and they also have regular contact via an online social learning platform. There are also smaller TES groups that meet weekly or monthly at each of the three host universities. These face-to-face and virtual meeting spaces have provided regular opportunities for participants to share their work in progress for constructive feedback from critical friends. A tangible impact of this sustained support has been seen in the high number and quality of single- and co-authored conference and seminar presentations and peer-reviewed publications generated by the project community from 2011 onwards.

Improved Learning for Self and Others

> *A polyvocal learning process entails critical and collaborative deep questioning of practice and the status quo in order to improve and impact learning for participants, critical friends, and significant others, as well as for contributing knowledge to professional scholarly communities.*

In both the S^3C faculty self-study group and the TES project, participants embraced the cultivation of transdisciplinarity; critical friends who approached research and teaching from different disciplinary perspectives, and who shared expertise in different content areas, stimulated participants and their ways of

knowing. Working with critical friends entailed reciprocal learning and professional growth. Despite the different contexts of the two groups, we have found that both groups can be characterized by a conscious effort by participants and facilitators to learn from and develop each other's professional and research capacities and doing so within an appreciative and supportive space. Thus, at the heart of both of these self-study research communities is co-learning.

Authenticated and Invited Polyvocal Leadership

> *Facilitators authenticate self-study research by practicing it in transdisciplinary learning communities while also inviting polyvocal leadership by encouraging participants to contribute their diverse expertise and experiences.*

For the S^3C faculty self-study group, the invitation to contribute to writing about the experience in a meta-study drew 9 out of 15 participants as volunteers to lead as co-authors and with contributions from the entire group. The wide-ranging developmental activities of TES project workshops and meetings over the years have only been possible because of leadership by participants who have used their rich multiplicity of professional and academic expertise to co-facilitate these activities.

Conclusion: Looking Out Toward Wide Futures

In this chapter, we have been able to share diverse ways of seeing and knowing through self-study because of our connections and creative activities with others in transdisciplinary communities in higher education. Owing to the pioneering and meticulous work of S-STEP community members since the early 1990s, self-study research has come to be internationally recognizable and valued due to the thoroughness, deep thought, and care for others inherent in using a combination of specific methodological components. Drawing on the work of Bakhtin (1984), our multifaceted conceptualization of *polyvocal self-study – as characterized by plurality, interaction and interdependence*, and *creative activity –* offers a further, generative dimension to ways of thinking about and appreciating self-study methodology. Additionally, our Paidiá design elements offer our real-world professional learning about enacting and supporting polyvocal self-study in large transdisciplinary higher education communities. In making public these design elements, we encourage further studies to build a fuller knowledge base on this topic.

As illustrated by the exemplars in this chapter, polyvocal professional learning through self-study research has unveiled an untapped portal of self-study through examining the depths and expanse of transdisciplinary, transnational, and transcultural collaboration and dialogue (Pithouse-Morgan and Samaras 2015b; Samaras and

Pithouse-Morgan 2018). Polyvocal self-study has illuminated the value of plurality and heterogeneity as well as commonality, bringing into dialogue multiple perspectives and many stories, not only in terms of stories of experience but also in terms of ways of seeing and doing and particularly in becoming and transforming self and others (Pithouse-Morgan and Samaras 2018; Pithouse-Morgan et al. 2015; Samaras et al. 2014b).

The exemplars demonstrate how sustained and extensive self-study research conversations across specializations, institutions, and continents can generate transformative possibilities for higher education professionals imagining practice and collaboration in new ways. Transdisciplinary and transcultural collaboration among self-study community facilitators and participants can result in innovative and culturally responsive ways of learning, teaching, and enacting self-study research in higher education. The exemplars exhibit the potential not only for individual faculty development through self-study but also for institutional development. Self-study research leads to changes in faculty teaching and faculty development, which can be shared with colleagues, other programs, and colleges and more widely through presentations and publications (Pithouse-Morgan et al. 2017; Samaras et al. 2017). Building individual and collective capacity with small changes over time can lead to larger changes, impacting institutional, national, and transnational capacity in higher education.

As we have experienced, there are gifts in sharing and learning about self-study research with other higher education practitioners and across contexts. There is a collaborative recognition by participants enacting polyvocal self-study in transdisciplinary communities that this work helps self-study research grow to inform higher education research and practice in generative and holistic ways. We have watched self-study research grow over our many years as members and leaders in S-STEP and in many ways – noting how higher education professionals around the globe are finding self-study useful in their specific contexts and disciplines. We share self-study with the world because we have witnessed its validity as a methodology in a global context as we have worked and learned from and with others. All the while, we hold dear and central that self-study research was founded and grows because of teacher educators like us willing to share this unique methodology that helps us and others to grow professionally and especially in our teaching. We honor the accomplishments of the S-STEP community and its multiplier effect in higher education. We encourage self-study scholars to consider ways to further develop and contribute to future work in polyvocal and transdisciplinary self-study research.

Office, and Walter Sisulu University's Research Office. We further acknowledge that any opinion, findings, conclusions, or recommendations expressed in this material are those of the authors, and, therefore, the funders of TES project activities do not accept any liability in regard thereto.

Part VI

Self-Study Across Cultures and Languages

The sixth and last part of the *International Handbook of Self-Study of Teaching and Teacher Education Practices* focuses on the emergence of self-study research in languages other than English and the experience of translating and transforming self-study to fit with local contexts, languages, and cultures in different communities. It includes diverse examples of the ways translation and transformation have impacted on the different studies and the researchers themselves. It gives examples of processes of integrating self-study to different cultures, challenges with language, difficulties of translating "self-study," how self-study has been introduced to teachers and teacher educators in different communities and used in professional development, and how to use language in a novel way to explore reflexivity. Chapters illustrate how self-study has helped teacher educators meet the challenges of providing programs based on active engagement, collaboration, and community in politically volatile regions of the world and how self-study research can expand ways of knowing and understanding practice.

Self-Study Across Languages and Cultures

Contents

Abstract

In this introductory chapter to the section on self-study of teacher education practices across languages and cultures we focus on the emergence of S-STEP research in languages other than English, although the work of a few researchers who do write in English is included for reasons that we explain in the text. Given the origins of S-STEP as a Special Interest Group of the American Educational Research Association (AERA) and the prominence of English as a global language of research, self-studies in languages other than English remain rare. However, this does not mean that all S-STEP researchers speak English as a first language, and these descriptions of the journeys of teacher educators coming

to understand this methodological approach to examining their practice are of interest to us all, regardless of the context in which we work. This chapter provides examples of how S-STEP research is currently being experienced in Europe, Iceland, Israel, Quebec (Canada), Chile, South Africa, Japan, and South Korea, as well as two specific contexts in the United States, through the voices of researchers in those countries.

The process of translation and adaptation can lead to disconnectedness and dissonance, for as Giroux (1997) states, "What we think it means to do research has to do with our conception of meaning, our view of cognition and beliefs about the forms of consciousness that we are willing to say advance human understanding..."(p. 5). Conceptions, views, and beliefs have linguistic distinctions and are culturally located and expressed through the common language of a society. Therefore it is important to pay attention to language and culture when considering self-study research, which has strong contextual links and is often very personal. In the first *International Handbook of Self-study Research of Teaching and Teacher Education Practices* (Loughran et al. 2004), there are chapters written by researchers from non-English speaking countries, notably the Netherlands and Israel, but an exploration of the particular experience of working in a language other than English on self-study of teacher education practices research was not a focus of inquiry. We believe that it is important in this current version of the handbook on self-study research, the *International Handbook of Self-Study of Teaching and Teacher Education Practices*, to turn the focus toward an exploration this experience of translating and transforming self-study to fit with local contexts, languages, and cultures. This section, "Self-Study Across Languages and Cultures: An Overview of the Chapters," includes chapters which provide diverse examples of the ways such translation and transformation have impacted on the studies and on the researchers themselves.

While the development of the self-study research community is strongly connected to the Special Interest Group (SIG) of the self-study of teacher education practices (S-STEP) of the American Educational Research Association (AERA) since its beginnings in the early 1990s (Loughran 2004), the self-study of teacher education practices has had an international membership from the beginning, welcoming researchers from a wide range of backgrounds and different countries, including non-English speaking ones (Bashiruddin 2006; Margolin and Tabak 2011), for some time. However, presentations at AERA, the Self-Study Castle Conference at Herstmonceux, and publications of self-study research in major journals such as *Studying Teacher Education* have always taken place in the English language, (Since 2014 the journal *Studying Teacher Education* has included abstracts written in Spanish for each article published.) meaning that speakers of

other languages have to translate and adapt their terminology in order to participate in the larger S-STEP community.

A section based on self-study research in countries other than the conglomerate of the United States, Canada, England, Australia, and New Zealand self-study researchers was promoted during the initial discussions about an updated handbook. However, the roots of this section that draws together stories of self-study in languages other than English began even earlier. During an S-STEP presentation at the annual American Educational Research Association (AERA) meeting in 2014, we were struck by the challenges faced by colleagues undertaking self-studies in languages other than English and in cultures where the notions of self-study were not familiar. At that time, we began to talk about the particular challenges we face in our institutions where research most often takes place in a language other than English. Our initial discussions led to the organization of a symposium entitled "Translating and Transforming the Self-Study of Teacher Education Practices into Languages and Cultures Other than North American English" (Thomas 2015), which was accepted for presentation at the AERA annual meeting the following year. That symposium, which included presenters from South Africa, Belgium, Iceland, and Quebec, Canada, stimulated discussion among those who attended the presentation about the necessity of finding the right language as a means for expressing strongly held ideas and beliefs about teaching and teacher education. The discussant for the session, Amanda Berry, is an Australian citizen who was living and working in the Netherlands at that time. Berry acknowledged the difficulties that researchers who work in languages other than English have in attempting to translate their work into English in order to share it with the greater S-STEP community. She also talked about the power of self-study as being untranslatable; that is, so closely connected to the language and culture of S-STEP researchers, that it cannot be disassociated from the language in which they work. However, there is opportunity in this process of translation and transformation because

> This is where the power of self-study lies, not something that is a problem to be resolved but something problematic to be explored and opened up. The act of explaining means you have to try to articulate meaning, and make meaning together in a new context. (Berry 2015)

The presentations at this symposium also revealed the ironic situation that most of the time the term "self-study" is not translated and that the English term self-study is generally used, even when researchers speak and write in other languages. Berry (2015) noted this irony and made connections to the challenges also faced by S-STEP researchers who regularly work in English to have their research seen as legitimate and valid by colleagues outside of the S-STEP community (Loughran 2007). Through the chapters in this section, we see evidence of these challenges, but also of the power and possibility that self-study brings.

Issues of Language and Culture in Self-Study Research

Almost all of the researchers whose work appears in this section have faced the challenges of translating self-study of teacher education practices research and transforming it into comprehensible scholarly language that is accessible to the wider S-STEP community in a variety of different ways. We also find evidence of transformation of self-study research practices to fit with local cultures in the chapters from South Africa, Korea, Japan, Israel, and Iceland. For example, Chisanga and Meyiwa describe how their realization of how the principle values of self-study research could be connected to their local Ubuntu culture allowed them to adopt what had originally seemed a very foreign approach to research. We also see how researchers from the collective, rather than individualist cultures of Korea and Japan, found ways to adapt self-study research practices in ways that were appropriate for their contexts. The experiences of these researchers help to illuminate some of the taken-for-granted meanings of self-study that are brought to light when examined from the different perspectives that multiple translations afford. For example, Belgian researchers Vanassche and Kelchtermans (2015a) write:

> ...we came across language issues in our process, especially with regard to the self-study label itself. Self-study in our language is often translated in a way which has connotations with an almost therapeutic process of introspection. Given the fact that self-study's goal of scholarship and its associated expectation of research rigor have been questioned so often, this connotation was to be avoided. I believe it is important to dare to think in creative ways when translating a new approach or field of research to one's local contexts and not be afraid to make some adjustments (even not in its label, as we did).

It is very important to point out the issues of language with relation to self-study as it will be clear that language is an issue that comes up often in the following chapters. The difficulties of translating the term "self-study" are described repeatedly, with different solutions found. However, even in English, the language in which pretty much all self-study research is now published and presented; the discourse we use for discussing self-study as a research methodology has been questioned and challenged (Butler 2016; Garbett 2012). Changing the discourse of research in teacher education practices, such as self-study has done, can be seen as revolutionary (Loughran 2004; Vanassche and Kelchtermans 2015b). Listening to these stories of revolutionary change in languages and cultures other than North American English is inspiring because the researchers have had to work very hard to adapt what they have read or heard about in the literature or at conferences to find a way to make self-study practices make sense, both linguistically and culturally within their own scholarship traditions. The term "self" leads to questioning, requests for explanation, and doubtful responses within research communities, and translating the intentions of researching one's practice is not easy. Listening to the voices of how different groups of people in different contexts have overcome challenges and found ways to improve their practice as well as make the process work within their linguistic and cultural communities can help us all learn more about what makes self-study so effective.

Those of us who regularly work in the English language are in a privileged position, and this privilege means we also have a responsibility to take the first steps to opening the conversation beyond the English language to include researchers of all languages. A handbook is intended to provide a broad range of experiences with a particular subject, in this case self-study, which can be used as guidelines for exploring the subject in depth with a view to learning how to become adept in that subject.

Broadening and Deepening Self-Study Through Crossing Borders

These chapters show that despite possible initial dissonance, self-study is inherently well-suited to the research of teacher education practices in a wide range of international contexts and the participants in the studies referred to in this section of the handbook report positive learning experiences from their collaborative self-studies. It appears that there are universal aspects of self-study research, such as a desire for wanting to learn more about one's practice in order to improve it, that transcend languages and cultures. At the same time, the contexts of teacher education and the ways in which the preparation of teachers take place can vary widely across the globe. Additionally, expectations of teacher educators in terms of research and practice can also vary, and, of course, languages may or may contain expressions that are readily transferable to self-study methodology. All of these can make the experience of carrying out self-study research quite different and quite challenging for researchers who need to adapt self-study to a different language and culture. However, to date, little discussion of the challenges of translating and adapting self-study to languages other than English has taken place within the self-study community. When researchers begin working with fundamental notions about research practices that are very different from or even nonexistent in their working languages, they are forced to create new ways of speaking about their research in order to legitimize their work. The chapters found in this section of the handbook are written by authors who seek to share the challenges and creative processes of researchers from a wide range of nationalities and thereby add new insights to self-study research for everyone.

As this theme of self-study research across languages and cultures is somewhat less developed in S-STEP, there was a discussion about whether this particular section "Self-study across languages and contexts" should be presented in a separate book focussing only on that issue. We made a convincing case that this section should appear in the handbook because it is crucial to demonstrate that we are ready to expand beyond the initial group of researchers and their colleagues and students. Expanding self-study beyond its current state where it is firmly entrenched in the English language and North American, Western Europe, and Australian/New Zealand educational research culture demonstrates a coming of age for this research methodology and illustrates how, as a robust, vital, rigorous, and legitimate form of research, it can be adapted, translated, and expanded to

fit a wide range of languages, contexts, and cultures within the field of education and still be essentially the self-study of teacher education practices.

The community of self-study researchers is welcoming, inclusive, and adaptable. Opening up spaces for new members to adapt self-study research to other languages and cultures will allow the community to continue to grow and develop its original potential of being transformative. Bringing these stories into the mainstream conversations of self-study, such as can be found in a handbook, will permit self-study to broaden and expand. This is true for countries like South Korea and Japan, where self-study research methodologies are very new and largely unknown, but also for countries like the United States, Canada, Australia, and New Zealand, where it is much better known. This section has been described as the "international section," but as Guðjónsdóttir has been quick to point out, we are all "international," and it would be a real mistake to categorize self-study researchers into "English speakers" and "others" or "American researchers" and "international researchers." Such categorizations are patronizing and divisive, and a strong, mature, and flourishing community that studies teaching and teacher education has no need to make such divisions around nationality or language, given the many universal similarities we share. Our objective should be to become truly international, a perspective where connections between people of every nation are emphasized and collaboration and support can lead to improvement in teacher education across national and linguistic boundaries.

Self-Study Across Languages and Cultures: An Overview of the Chapters

This section of the handbook contains chapters about self-study research or examples of how self-study is being implemented from almost every continent. In every case, issues of language, culture, and community in relation to self-study methodology are apparent. There are two chapters from Asia, where self-study is at an emergent stage. These chapters describe how self-study has been introduced to teachers and teacher educators, as do chapters from South Africa, Chile, and Quebec, Canada. A collaboratively written chapter from Europe describes studies that have taken place in England, Ireland, the Netherlands, and Iceland. Other chapters provide outlines of self-study research for improvement of teacher education, such as the chapter from Iceland, and two chapters by American researchers who regularly write in the English language, but who have used self-study to examine alternate cultures within their own institutions.

Shin and Im in ▶ Chap. 45, "Self-Study in Korea", explore how a group of educators from South Korea discovered self-study through a chance encounter with Anastasia Samaras while studying and working in the United States. Shin and Im felt that self-study could be a means to improve the South Korean educational system and, with the support of others, translated Samaras and Freese (2006) and Samaras (2011) into the Korean language. When implementing this approach, they also chose to transform the usual approach of individuals embarking on self-study alone or with

a small group of self-chosen colleagues. In this case, teacher educators first explored self-study and then set up subject area groups of teachers and helped them to implement self-study as a form of professional development. This collective approach of working together as a group of researchers who are simultaneously critical friends, instead of carrying out individual studies, is an important reflection of how Korean culture focuses on the collective rather than the individual. While there are many examples of collaborative self-study research in the literature, beginning with the Arizona group (Pinnegar et al. 1994), it is an option to work this way, as individual studies are also very possible in North American, European, and Australian/New Zealand contexts. The unique contribution of this chapter is its description of exploring S-STEP as means to improving teaching practice while also integrating local cultural norms that focus on the collective rather than the individual.

The importance of the collective rather than the individual is also a part of Japanese culture, meaning that self-study needs to be adapted in Japan as well. Megumi Nishida begins her ▶ Chap. 54, "At the Dawn of Revolution in Teaching" with an historical account of her journey to self-study and her understanding of herself as a hybrid educator, someone who grew up in Japan, but who is now completing her doctorate in Iceland. She therefore sees herself as someone who understands two very different educational systems. In this chapter she reflects on how her personal experiences as a student and later a teacher led her to become critical of the Japanese system of education. She then describes her process of discovering how, in her absence, self-study has slowly begun to become known in Japan although it is still not widespread. At the instigation of one influential educational psychologist, Nobuko Takeda, a group of self-study researchers in Japan has been formed, who meet to discuss ways to work together to improve education in Japan. Takeda spent some time in the Netherlands in 2006, and there she met Dr. Fred Korthagen. Takeda undertook the Japanese translation of *Linking Practice and Theory: The Pedagogy of Realistic Teacher Education*, written by Korthagen along with colleagues Kessels, Koster, Wubbels, and Lagerwerf (2001). The group of Japanese self-study researchers is led by Kazuhiro Kusahara at Hiroshima University, who also invited John Loughran, a well-known Australian member of the self-study community, to visit Japan and share his knowledge about self-study.

A collectively written chapter on self-study in Europe includes sections from the Netherlands, England, Ireland, and Iceland. ▶ Chap. 47, "Self-Study Methodology: An Emerging Approach for Practitioner Research in Europe" by Lunenberg, MacPhail, White, Jarvis, O'Sullivan, and Guðjónsdóttir, looks at how each country has used self-study methodologies to support improvement in teacher education. Dutch researchers use an approach that involves teacher educators working with groups of teachers, facilitating self-study research with them as a means for providing professional development that will lead to improved teaching, as was seen in the Korean chapter. Lunenberg points out that in Dutch teacher education programs, teacher educators usually have a great deal of experience as teachers, but do not have a research component in their job descriptions. Researchers in Dutch universities do not teach

pre-service teachers. Lunenberg describes how she and other researchers set up and guided a group of teacher educators at several universities in the Netherlands to carry out self-studies on their practices with a view to improving them. The chapter on Europe begins with some background information on the wide variety of differences that can be found in teacher education programs across Europe, as well as the steps that have been taken to collaborate and make teacher education more uniform across the countries of the European Union. McPhail describes self-study as being present in small pockets in England, rather than widespread, as individuals and small groups of teacher educators discover the approach. Action research has been a way into self-study, and people working together at local levels at the University of Hertfordshire and the University of Bath, for example, have made connections between approaches. The biannual conference at Herstmonceux Castle has been the focal point for English researchers to make connections with the broader self-study community. In Ireland self-study is mainly limited to a small group of sport pedagogy scholars who saw the potential for collaboration and improvement of their practice through connecting with self-study researchers from other countries, such as Canada. University-based teacher education is relatively new to Iceland, beginning only in the 1970s. An early member of the faculty of education, Hafdís Guðjónsdóttir learned about self-study during her doctoral studies in the United States and quickly embraced this opportunity to use this approach to critically reflect on her practice. She brought self-study home with her, and since 2004 self-study has been offered as a graduate research seminar. At the same time, self-study has been met with disapproval and resistance in Iceland, and this community remains small but dedicated, with several researchers completing doctoral dissertations using self-study as a research methodology.

Kristinsdóttir, Jóndóttir, Gísladóttir, Óskarsdóttir, and Guðjónsdóttir have also written a chapter exclusively about self-study in Iceland, ▶ Chap. 49, "Cultivating Self-Study: Developing a Discourse to Better Understand a Particular Culture," wherein they elaborate much further than in the collective chapter on Europe on how a small but determined group of researchers has worked collaboratively to improve their teacher education practices around the topic of inclusion. In this chapter on self-study in Iceland, Kristinsdóttir et al. describe the history of the creation of a scholarly community of self-study researchers at the University of Iceland. They too faced issues of language and the difficulty of translating the term "self-study" into Icelandic. They also write about the challenges of always having to translate their research back into English in order to publish or present it at conferences. Taking the time to explore and analyze their collective and individual visions, values, and beliefs about education, teaching, and learning helped them to define their professional identities as teacher educators and gave them impetus to continue to explore this through self-studies. The connections to their scholarly community helped support them in their desired roles as professional change agents in the Iceland scholarly community.

Turniansky, Friling, and Tuval also describe how using self-study as a research methodology to examine their teacher education practices allowed them to create a working community of colleagues in a challenging situation in Israel. ▶ Chap. 50, "Continuous Collaborative Self-Study in a Multicultural Teacher

Education Program," begins with details about the complex context in which they teach. The Israeli authors go on to explain how they use self-study to examine the experiences of students and teacher educators in their teacher education program in a college in the south of Israel where half of the students are Arabic and classes are mixed. Both Jewish and Arabic teacher educators collaborate to offer the courses leading to teacher certification for Israeli schools. The chapter describes how self-study has helped the team of teacher educators meet the challenges of providing a program that is based on active engagement, collaboration, and community in this politically volatile region of the world. Complicating their task is the difference in language and culture between the two groups, and the power imbalances given that the courses are offered in Hebrew. Adopting a collaborative self-study approach to researching their teaching context meant that the group was able to listen more closely to each other and to identify sources or potential sources of conflict. This enhanced communication and deliberate efforts to work together despite differences supported the team and allowed them to overcome challenges from within and outside of the college. Their desire to best meet the needs of all students in an inclusive and respectful way has given them the possibility to provide their students with a safe and accepting environment for learning to teach.

Chisanga and Meyiwa write about adopting self-study methodology to examine their teacher education practices in South Africa in ▶ Chap. 52, "Reflexive Ubuntu, Co-learning, and Transforming Higher Education at a Rural University in South Africa." Theresa Chisanga and Thenjiwe Meyiwa describe how their university in rural South Africa was searching for a means to instigate changes leading to academic revival and transformation. Chisanga and Meyiwa recount their personal journeys to becoming teacher educators including fascinating details about their respective childhoods in rural South Africa. These researchers explain how each found self-study research expanded their ways of knowing and understanding their practice when they became teacher educators. The establishment of a self-study research group at their university gave them an opportunity to more fully explore this methodology, including the realization that this "foreign" approach to research actually fits very closely with traditional South African Ubuntu values. It also became a means to improve both teaching practice and academic scholarship at a small rural university that struggled with both.

Fuentealba, Hirmas, and Russell, writing from Chile, describe a growing movement toward teacher education reform, aided by self-study in "Introducing Self-Study of Teacher Education Practices into Another Culture: The Experience in Chile." These authors provide background information on the introduction of self-study to Chile, beginning in 2010 following a series of visits that Tom Russell, another prominent member of the S-STEP community, made to Chile to work on improvements to teacher education in that country. Russell's interest in reflective practice and the learning student teachers engage in during the practicum was highly influential to Fuentealba, and he and Russell formed a deep and lasting professional and personal friendship as a result of their work together on reforming teacher education in Chile. Fuentealba, through Russell, learned to question the way he had been taught to teach and how he was teaching his

own students. This self-reflection led him to integrate self-study into his own practice and to want to share this approach with other teacher educators. When Caroline Hirmas became involved, she quickly saw the potential of self-study, and she encouraged the translation of several articles, chosen by Russell and Fuentealba from various issues of the journal *Studying Teacher Education* (STE) and published in a volume in Spanish in 2016 entitled *Formadores de formadores, descubriendo la propia voz a través del self-study.* There are now several small but thriving self-study groups in Chilean universities, and they are connected to the larger community by the decision of the editorial staff of STE to now publish the abstracts of all articles in both English and Spanish. It is interesting to note that at a recent conference in Santiago, Chile, there were four presentations that used self-study as a research methodology. Even more interesting, the expression "self-study" is not translated into Spanish, despite the fact that the presentations were made in Spanish. This is a typical response to the difficulties of translating the term self-study that is seen in many of the chapters in this section.

The term "self-study" has not been translated into French, either. ► Chap. 46, "Introducing Self-Study of Teacher Education Practices into Another Culture: The Experience in Chile," describes Thomas' efforts to establish a community of self-study researchers among her French-speaking colleagues at her university in Quebec, a province in Canada. When Thomas attempted to introduce self-study to her institution, she encountered resistance as these colleagues questioned the legitimacy and validity of a research methodology that is unknown in their language. The main challenge facing French-speaking researchers is the lack of a body of literature on self-study in French, which leads to lingering questions of validity in terms of this research. A small group of researchers indicated an initial interest in using self-study to examine their teacher education practices, but without the assurance that they would be able to publish the results of their studies in French, and with little interest in attending the International Self-Study Conference at Herstmonceux (the Castle conference) and AERA conferences because they only take place in English, sustained engagement with self-study did not take place.

This section of the handbook also includes two chapters by colleagues from the United States who regularly write in the English language, but who have used self-study to examine alternate cultures within their own institutions. They have, as many researchers building on self-study methodology, been questioned by their professional community. It is not only the language that is challenging, gender, age, country of origin, and religion can each play a large role in the transformation of self-study research practices as researchers match their actions and beliefs with local and professional cultures.

Farrell and Winkle, in ► Chap. 51, "Reflexivity in Graduate Teacher and Researcher Education: Our Journey to Arts-Based Self-Study", have developed a new way of envisioning and understanding the world that could be said to be using language in a novel way to explore reflexivity. While Farrell and Winkle are located in the United States and work exclusively in English, they can be said to be working in a somewhat different language, the language of art and art-based research. At the same time, art-based methods can be said to be a universal language crossing all borders, and therefore we can resonate with their approach wherever we come from

or wherever we are situated. These researchers describe how they have worked together for many years to develop a living theory of arts-based reflective pedagogy, which they call Arts-Based Dialogic Narrative Analysis. They begin with descriptions of their individual journeys as artists and the influence of Vygotskian sociocultural theory on their understanding of how people experience the world. The authors then describe how they studied the effects of the implementation of visual thinking strategies as professional development for teachers in a low socioeconomic and linguistically diverse region of Florida. Through a combined methodological approach, including self-study, these researchers examined the implications of visual thinking on the creation and appreciation of art as the basis for an arts-based reflexive pedagogy, which allows for the integration of an aesthetic approach to the construction and analysis of research data.

Brown and Schneider use self-study to explore their professional identities and leadership styles and work toward changing the culture of their School of Education in ▶ Chap. 53, "Exploring Intersectionality as a Means to Precipitating Change." In this case, self-study allows them to more fully understand the culture that is deeply rooted in their faculty and ultimately transform it. Brown and Schneider employed collective self-study to examine the effects of leading a team of faculty from a School of Education in the northeast of the United States toward much needed improvement of programs. They detail the challenges and frustrations of trying to use a democratic approach and give voice to all when many of their colleagues refused to cooperate. As a result of documenting the experience using a self-study approach, they discovered their voices, their leadership styles, and their professional identities while taking part in the process. Their conclusions describe the importance of not simply responding to the frustrations and challenges with anger but learning to understand why some colleagues responded as they did and learning to view the difficulties of implementing change with multiple perspectives and compassion for others.

Concluding Remarks

In this section of the handbook, it is clear that there are struggles with language, and, in many cases, a decision has been made not to translate the term "self-study" because there literally is no equivalent in another language. The lack of a translation shows the uniqueness of the approach, but also underlines the difficult cultural leaps that people must make to arrive at a place where they can integrate this approach into their practice. If there are no words to describe self-study, it is likely that the philosophy, the vision, and the beliefs behind such an approach are also difficult to grasp and to express. It is important to take the time to discuss the issue of language in relation to self-study because language is so closely related to identity, and self-study requires us to closely examine and challenge our identities as teacher educators.

The important influence of senior members of the self-study community reaching out to respond to requests for information and support is also an overarching theme of this section. We have seen how Anastasia Samaras was instrumental

in supporting the emergence of self-study in Korea, how Tom Russell introduced self-study to Chile, and how Fred Korthagen and John Loughran have contributed to the beginning stages of a self-study community in Japan.

Almost all of the chapters in this section have shown how self-study can serve as a means to overcoming obstacles to change and understanding and embracing that change, despite the challenges. Self-study as a research methodology provides a framework for deeply understanding many aspects of practice and inspires researchers to look for ways to improve practice. These chapters provide examples of communities of learning, whether grass roots and organized by teachers and teacher educators themselves or whether there are facilitators organizing self-study for others, and underline the great importance of creating and sustaining communities in ways that are reflective of the local culture.

At this time, as we move forward beyond a rather small group of researchers who initiated the self-study SIG, it is crucially important that as we move forward with self-study, we take note of the wide variety of voices that now belong and are seeking to belong to the S-STEP community. It is entirely to the advantage of this community to broaden the range of understandings of how self-study can be interpreted and carried out in a much wider range of contexts than was initially envisioned. It is important to listen to self-study researchers from a very wide range of contexts to learn about how they are interpreting self-study, to hear more about their challenges and to learn from the particular insights that they bring.

A Case Study on the Improvement of Classrooms with Self-Study

Hye Young Shin and Chilseong Im

Contents

Abstract

Teacher educators at Chonnam National University's College of Education found that there were many opportunities for teachers to improve their classes in Korea, but the opportunities were not effective. Therefore, they decided to collectively study their teaching in their classes from 2013 to 2014 and then also sought ways to apply self-study for classroom teachers in the Korean educational milieu. One of the most distinctive features of this

application of self-study to the Korean context is the concept of a critical group of colleagues. With university-based teacher educators at the Research Center for Curriculum and Instruction, teachers of different subject areas played critical roles in the group. These teacher educators collaboratively designed and enacted a self-study approach in a large-scale initiative involving 36 middle and high schools in South Jeolla Province from March until August 2015. They worked closely with the teachers in those schools in self-study research projects. All the while, the teacher educators were also studying the impact of self-study on their own teaching. The teachers who wanted to improve their classes received various suggestions about how to improve their teaching, prepared specific approaches and activities to try out in their classes, enacted these changes with students, and presented the results to the group. This process allowed teachers to have opportunities to improve their classes and gave teacher educators a deeper understanding of the challenges faced by teachers in the field. In documenting the process here, the authors of this chapter demonstrate how self-study can be successfully adapted to the Korean educational context and therefore provide inspiration for how other educational researchers and teachers interested in self-study can translate and adapt the approach to their own contexts. This study shows that a collective critical peer group can be effective in educational situations where it is difficult for teachers to reveal their own problems or positively accept personal criticism due to the relationship with their peers, such as Korea.

Teachers' professional development · Self-study methodology · Critical friends · Korean secondary school teachers

Background to the Korean Context

Korea is traditionally a country with a high zeal for education along with China and Japan. As of 1998, Korea and Japan's percentage of middle and high school attendance is 96.94% and 98.61%, respectively (Jeong and Lee 2004). Kim (2014) indicated, "Korean parents are preoccupied with their children's education, overinvesting, and trying to be freed from tension and [financial] insecurity and the college entrance rate is among the highest in the OECD (2014, p. 105)." However, this intense education system is an exam-oriented one, with a focus on encouraging students to get good grades on written tests. In the Chosun Dynasty (1392–1910), passing a government exam to become an official offered people an opportunity to raise their social status, and Korean people still believe that entering a high-ranking university through the entrance exam will guarantee social status. That is why Korean education mainly consists of "teacher centered lectures, rote learning, tests focused on memorized knowledge and homework (Chung 2000, pp. 136–137)."

The Korean government (Ministry of Education) is making an effort to escape this educational tradition. One of the efforts is to strengthen teacher

education for classroom improvement. Im's (2015) survey about teacher education in Korea conducted in 2013 showed that more than 71% of teacher education focuses on teaching pedagogy. Teacher education is largely divided into professional development workshops and certification workshops. Certification workshops are for second degree licensed teachers to get their first degree license. Professional development workshops are a teacher-specific training program to satisfy the educational needs of teachers. The average length of a professional development training session is 60 h. In Korea, active professional development for improvement of teaching is mostly done unilaterally by teacher educators who merely ask teachers to enact lessons that teacher educators design, such as action learning which is one of the learning methods for solving a real problem in teaching practice through team discussions. Through such training workshops, teachers may not learn any professional teaching methods that can be applied to their own classes. First of all, a particular classroom method works only in certain classroom situations, not all classrooms. During professional development programs, experienced teachers may share their experiences with other teachers in the name of "discussion lessons. " Sharing these lessons can draw empathy, but it is difficult for other teachers to gain expertise from them because the context may not be relevant to everyone. Im (2015) indicated that 77.1% of major instructors in professional development in education are teachers in the field and 9.4% are university-based professors who are subject area specialists in teacher education. In Korea, teachers also evaluate their colleagues in order to improve their teaching. However, there are several limitations to improving classroom learning by observing and evaluating colleagues. Firstly, it is difficult to assess all of the classes a teacher may teach with one school visit. Secondly, if your peers are not experts in instruction (or teaching), then their observations, and subsequent comments, will be influenced by their educational beliefs and not necessarily by what they are seeing. Thirdly, it is easy for classroom observations to remain external rather than directly connected to the content of the class, especially when the peers' subjects are not the same as the colleague whose class they are observing. Fourthly, it is only with several visits that a colleague can offer truly constructive feedback and suggestions, and this is hard to achieve.

Professional Development for Teachers in Korea

Because of this reality, many teachers would like to have more professional development even if they have already opened their classes for colleagues to offer feedback based on observation. For language arts teachers, a survey with 33 questions was circulated during a professional development event for 34 middle and high school teachers in Gwangju in 2014 to explore what topics teachers think they need to learn for their professional development. The survey results showed topics teachers would like to have are ranked by (1) subject area specific teaching methods, (2) assessment methods and applications, (3) teaching pedagogy, (4) use of teaching materials, (5) teachers' knowledge of language arts, (6) curriculum and instruction, and (7) recent theories and trends of teaching (Im 2015).

The lesson improvement workshops that teachers want are not about receiving knowledge about a particular teaching method or sharing a non-professional classroom experience but rather about solving the problems that they face in their classroom. Therefore, in order to improve teachers' classes in Korea, Chilseong Im, the author of this chapter, sought a way of improving teaching along with Hye Young Shin, the co-author of the chapter, during his 2012 visit to George Mason University. Hye Young Shin is a faculty member at the American University in Washington, D.C., who has an interest in self-study methodology for teacher educators. While teaching Korean language and culture and pursuing her Ph.D. in Education at George Mason University, Professor Shin first learned about the theory of self-study through her mentor and dissertation chair, Professor Shelley Wong. Professor Wong is a fellow professor of education with Anastasia Samaras, who has used self-study methods to improve her classes for many years and is an active member of the S-STEP community. Professor Wong introduced Professor Shin to self-study and asked her to be a critical friend. Then she introduced Professor Shin to Professor Samaras. As a result, Professor Shin learned the effectiveness of the self-study methodology and, in turn, introduced self-study methodology to Professor Chilseong Im, who was a visiting professor at George Mason University (GMU).

Professor Chilseong Im began this journey into self-study by reading Samaras and Freese's (2006) book, *Self-Study of Teaching Practices*, together with Professor Hye Young Shin as well as Professor Young A. Jung, a researcher who also teaches at the Korean Studies Centre at GMU. They met to discuss the possibility of the application self-study to the Korean context. Later, Chilseong met Professor Samaras during the winter of 2012 and consulted her on the research and application of self-study for teacher educators. He also discovered Samaras' (2011) book, which is titled *Self-Study Teacher Research: Improving Your Practice Through Collaborative Inquiry*, and then returned to Korea to translate this book with his colleagues.

Professor Samaras visited Korea in March 2016 to give lectures to Korean researchers interested in self-study at Chonnam National University, Seoul National University, Ewha Womans University, and Cheongju National University of Education as well as at GMU's Songdo campus in Korea. Professor Samaras' visit and special lectures encouraged the nation's interest in and research on the self-study of teacher education practices (S-STEP).

Phase I: Teacher educators' self-study of teaching. Professor Im introduced self-study to professors at the Research Center for Curriculum and Instruction at Chonnam National University (Gwangju) who were agonizing over improving Korean teachers' classes in 2013. The center is made up of professors who are teaching pre-service teachers in middle and high school content/subject areas at the College of Education. In this center, 12 professors first studied self-study together, using Samaras' (2011) book as course material, in the second semester of the school year of 2013–2014. They then applied the self-study method to their classes and discussed the results together. The professors who participated in the meeting were Chilseong Im, Jong Hee Kim, Chul No, Keunho Kim, Mun Hong

Cheo, Bomi Shin, Chul Woong Park, Eun Young Jeong, Nansook Yu, Jihyang Oh, Jae Hyeok Choi, and Jong Won Park. The professors at the center are in response to study with the Research Center for Curriculum and Instruction at Chonnam National University introduced an opportunity for teachers to engage in self-study with the support of an experienced researcher in the first semester of 2015.

At the end of the group studies to learn about self-study methods, the professors believed that they had a deeper understanding of the process of and reasons for using self-study to improve their practice, and they also agreed that they better understood the difficulties they were facing as teacher educators. They realized that they had to study their practices independently in order to improve their own practices through self-study. Therefore, with the support of the Institute of Liberal Education at Chonnam National University, during the first semester of 2014 (March through August), the professors each conducted a self-study of their own lessons/ classes. Meanwhile, the professors discussed how their self-study research could benefit both pre-service and experienced teachers at the middle and high school levels.

Phase II: Workshops for in-service teachers to introduce self-study for the improvement of practice. Based on the examination of self-study methods and the professors' own self-study experiences with their university classes, the Research Center for Curriculum and Instruction submitted a plan for self-study methods workshops for middle and high school teachers to the Office of Education in South Jeolla Province and received financial support from the South Jeolla Provincial Office of Education and then sent an official letter to all middle and high schools in South Jeolla Province to select teachers who wanted to participate in self-study workshops. These teachers volunteered to participate, hoping to be able to improve their teaching. Under the plan, 36 middle and high school teachers in South Jeolla Province were able to participate in monthly self-study workshops for 30 h from March to August 2015.

The purpose of the workshops was to provide opportunities for the teacher participants to explore problems or issues they were experiencing with their teaching through self- study. In terms of region, South Jeolla Province is far from the center of Korea, and because of the large number of islands and rural areas, communication is challenging between schools and teachers, and it is difficult for them to receive help and support from external experts. Therefore, teachers often have to solve problems in their classes alone. In order to break down this sense of isolation, and because of the cultural significance of group-based professional development for Koreans, it was decided to form criticalfriend groups rather than pair up individual critical friends for these workshops. According to Costa and Kallick (1993):

> . . .a critical friend, as the name suggests, is a trusted person who asks provocative questions, provides data to be examined through another lens, and offers critique of a person's work as a friend. A critical friend takes the time to fully understand the context of the work presented and the outcomes that the person or group is working toward. The friend is an advocate for the success of that work. (p. 50)

The participants were 43 teachers from middle and high schools in South Jeolla Province. Korean, English, Math, Science, and Social Studies are the main subjects taught in Korea, so teachers of these subjects received invitations. However, at the request of music and home management teacher educators, teachers of these subjects were added to the group. The workshops leaders were eight professors/teacher educators including a program director, one specializing in each subject area, from the College of Education at Chonnam National University's Research Center for Curriculum and Instruction.

Enacting Self-Study Research with Teachers

The Research Center for Curriculum and Instruction, a center founded in 2008 at Chonnam National University for the development of education in each subject area of middle and high school in Korea, has since hired professors specializing in education. Since its establishment, the professors at the center have been working together to improve the teacher education classes and discussing how to apply these improvements. Thus, there has been a buildup of human trust among the professors, which created an atmosphere where they could express their opinions relatively freely.

These professors who agreed to lead the self-study workshops concurred that applying self-study to Korea requires adherence to the basic principles of self-study, despite the differences in culture. Therefore, they adapted Samaras' (2011) text, *Improving Your Practice through Collaborative Inquiry*, and the translation of this book in Korean, which was published in 2014. During the workshops, they referred to the self-study research processes in Samaras' (2011) text and sought possibilities to adapt them to the Korean educational situation.

First meeting (March). The teachers who participated in the workshops had never tried self-study. Therefore, Professor Chilseong Im, who is a lead translator of Samaras' book (2011) and was in charge of training for all participating teachers, explained the concept of self-study, the method, and the significance in Korean education. Next, the professors of each subject area who had already experienced self-studies and had studied the related literature led the groups made up of teachers from the same teaching subjects. With the help of each of the professors, each individual teacher diagnosed problems in his or her classes and then set up their own self-studies. The teachers had a difficult time defining their problems and turning them into a challenge that they could examine through self-study in order to learn more about their practice. In the past, the teachers had participated in a lot of professional development sessions, but they had little experience of exploring their own problems because the previous professional development sessions usually focused on requiring teachers to apply commonly used teaching pedagogies, without taking into account their individual contexts and particular classroom issues.

During the self-study workshops, teachers were usually asked to take turns to present what they were currently struggling with in their classroom situations. Whenever a teacher gave a presentation, the other participating teachers would try to refine the problem and give the teacher feedback for finding the solution

with the help of the teacher educator in the group. Various strategies were employed to support the teachers in the process of defining their self-study research questions. Since each individual worked on his or her own problems, the method of diagnosing problems differed slightly within each subject area. For example, the science specialist teacher educator conducted a preliminary survey of science teachers in relation to their classes. Before their first meeting, the teacher educator e-mailed each teacher participant in that group a questionnaire titled "Looking Back on Your Science Courses," which clarified the problems experienced by those teachers. The purpose of the survey was to understand the participating teachers' perceptions were about teaching and learning in science classes. The results gave the group of science teachers a basis for their discussions during the following workshops.

Second meeting (April). The second meeting was a time for each group made up of the teachers and professors who worked in the same subject area to discuss the progress of their self-studies. The group sought additional ways to address their challenges, which had been specified in the first meeting. First, the individual teachers explored and wrote possible solutions based on the literature or on their own classroom experience. Solutions presented by the teachers were often vague, as they were general and universal, such as "include student discussion activities," or simply unclear. Once a solution was announced by each teacher, the professor and participating teachers discussed its appropriateness and how to make it into a viable solution. There were lively discussions on what was the best solution because teachers in the same subject area but with various years of teaching experience participated in the discussion together.

Across Korea, secondary schools provide identical educational content, and classroom situations are very similar. Therefore, most teachers in the same subject are likely to experience the same problems. So even if a teacher raises his or her own issue, most teachers have experienced it or are likely to experience it. Therefore, most teachers actively agreed with and participated in the discussions of all the problems brought forward by the participating teachers. Therefore, experienced teachers and novice teachers with little experience gathered together to discuss the problems jointly and to find out the causes of the problems based on their various opinions and to seek solutions together. For example, a teacher raised a question about the difficulty of bringing emotion into the discussion when students were allowed to freely present their opinions about texts that they read in class. Younger, less experienced teachers said that they should respect open thinking and encourage the responses of various students when teaching poetry in the language arts class. On the other hand, more experienced teachers said that the students should be led to an appreciation of the core text in preparation for the internal and external exams. In the end, they found that discussing the situation was helpful and decided that listening to students' opinions should be an important component of a language arts class.

The reason why we chose a group, including professors, and not an individual as a critical friend was because of the Korean cultural background. In Korea, "We" (the group) is valued more than "I" (the individual) (Im 2014). In Korea, the relationships between co-workers are more important than the content of the

communication that they may have. There is a culture of formal conversation, meaning that even close friends do not reveal their problems. Therefore, it was important that a group of colleagues who were more friendly and interested in solving problems than personal friends were defined as critical friends. Also, teachers who were particularly isolated and had to travel quite a distance to participate wanted to hear many opinions about how to resolve classroom challenges. Participants were asked to both identify their own problems and to act as critical friends, and everyone discussed the issues together. This consciousness of working on self-studies together allowed the group to see themselves as a learning community (Lave and Wenger 1991; Wenger 1998) leading to the identification of individual problems as belonging to the whole group. So although classroom problems were individual, group thinking could be utilized, along with the input of the professor, to identify problems, find solutions, and implement the necessary changes in class. After some solutions were determined with the help of the critical friend collaborative group, the teachers designed their new class plans so that the solutions could be applied to their classrooms. During the planning process, each teacher was encouraged to design lesson plans that might solve their problems through discussions with the professor and other participating teachers at each stage of the planning. The participating teachers were asked to implement the changes that they had researched and discussed with their group in their own classes to see how the students would react by the third group meeting.

The teachers were encouraged to start with an examination of the learning abilities and attitudes of their students before implementing the enhanced lessons because many participating teachers were reluctant to share the results of their efforts to improve their teaching as they did not wish to be judged. Beginning with an exploration of the abilities and attitudes of the students was helpful in allowing the teachers to present their situations in objective ways. Few teachers will disclose his or her situation as a problem because of the Korean culture of covering things up and not revealing weaknesses to others. This cultural influence on the way people respond to working on improving their practice made this aspect of collaborative self-study challenging for these teachers. However, when multiple people in a peer group presented their opinions on solving various problems, the teacher who confided the problem and asked questions was able to comprehensively review the opinions of the group and relate them to his or her personal educational experiences and eventually decide how to implement them.

Third meeting (May). The third meeting was also a school subject group meeting. The meeting was held to share the results of practical classroom applications that were implemented as solutions to the problems discussed by the group. The identified problems or issues were discussed together by the participating teachers, with the help of the professor in charge, who also provided extra resources, in the form of suggestions and references. The teacher participants were encouraged to revise lessons to reflect these revised and supplemented solutions. The group of teachers was then asked to share with the group their lessons and approaches to teaching that took into account the agreed upon solutions before the fourth meeting.

The process of making changes to the teachers' practices by continuing to discuss problems that arise in class even after improvement has been implemented takes into consideration the Korean education situation. Korean teachers have always followed a particular method of professional development, such as group discussions, but have little experience with identifying their own problems in teaching and finding ways for improvement on their own, which is the core of self-study research (Samaras and Freese 2006).

Teachers in Korea are especially used to receiving general comments and general "answers" in the traditional professional development workshops offered to them. At the beginning of this series of workshops, many of these participating teachers were not interested in hearing which class improvement methods could be applied to their classes because their past experiences with workshops have not been positive or particularly effective for helping them with their teaching. Therefore, even though the professor and their fellow teachers helped them explore the solutions they could use, many teachers were afraid that this would not solve their own problems. Mindful of these less than positive past experiences with professional development, the professors who participated in the self-study community judged that if a teacher was not confident with a particular solution, it would be difficult for them to put it in practice. They realized that it would be necessary for the participating teachers to try out these solutions with their classes several times, as well as to modify and adapt them, in order to be truly convinced of their effectiveness within each particular context. As a result of this realization, they encouraged the teachers to try out the possible solutions several times in their classes and to make note of the results each time, which they could then share with the group at the next meeting. *Fourth meeting (June)*. The participants met in their school subject groups at the fourth meeting as well. At the third meeting, each teacher had presented the problems and difficulties that they were still experiencing in the classes even after they had implemented the suggested solutions. The group members looked to the literature provided by the professors to seek out additional ways to modify their teaching and discussed the problems from different angles. In the case of the mathematics group, the professor and other teachers attended the classes of participating teachers to find out what was still problematic about the classes even after the adaptations had been implemented. The teachers were then asked to implement these refined solutions again in class. Post-evaluation after implementation of the solution was recommended by the professors. Like pre-assessment through examining the abilities and attitudes of their students, many teachers had not previously done post-assessment of any modifications and adaptations they had tried in the classroom.

Fifth meeting (July). During the fifth meeting, the school subject group meetings were followed by a whole participants' meeting where the results of the self-studies were presented. All the professors and teachers were asked to share their group's process of using self-study as adapted to the different subject areas to the whole group at the meeting. There was general feedback on the self-study process for each participating teacher by the professors. In the meantime, the participating teachers

had already received feedback on their particular school subject within their smaller groups. Since this was a general meeting where everyone was present, there was additional feedback on some of the self-studies from other professors and teachers. Discussions emerged about problems or difficulties across the school curriculum and secondary education as a whole as participants found commonalities with other school subject groups.

This fifth workshop was attended by Hye Young Shin, a faculty member at the American University in Washington, D.C., and one of the authors of this chapter. Shin had been meeting regularly with the team of teacher educators on Skype and also visited Korea on several occasions. She contributed by giving written feedback to the group on the entire self-study process.

Sixth meeting (August). The sixth and final meeting of the self-study workshops had the participants return to their school subject groups. At this meeting, the teachers revisited their process of self-study by reflecting on the feedback they had received during the whole group meeting. They then compiled all this information with their own findings and wrote a collective formal report. In the report, the professor in the group contributed a description of the self-study process for each subject, and each teacher described his or her own self-study process and learning. The report contains an overview of the professional development workshops, from the introduction of self-study at the first meeting to the final individual reports on the self-studies and their applications. Each teacher's research report focuses on the situation of his or her own class and the classroom problems they wanted to solve, the specific process they used to explore these problems and to try to find solutions, and the eventual improvement in their teaching that they noted.

The organized result reports were given further feedback by professors specializing in teaching methods in Korea and abroad, including the professors Hye Young Shin (American University), Young A. Jung (George Mason University), Hyuk Suh (Ewha Womans University), and Young-Taek Shim (Cheongju National University of Education), and the final report was completed in October 2015. The final report was shared with all participating professors and teachers. The final report was then sent to the South Jeolla Provincial Office of Education, allowing other teachers in Korea access to the study process and the results.

A summary of the six meetings is shown in Table 1.

Reflecting on the Key Elements of a Self-Study

As part of their self-study, the professors participating in these workshops wanted to reflect on their enactment of five key self-study elements with teachers according to Samaras (2011). These are (1) explore personal circumstances, (2) explore critical collaboration, (3) improve learning, (4) use clear and systematic research processes, and (5) generate and publish knowledge. This section of the chapter will discuss each of these elements as they relate to this Korean experience with self-study.

Table 1 Themes and contents of the self-study workshops

Meeting month	Meeting group/unit	Meeting agenda	Activities/contents
March	Subject and whole	Self-diagnosis of problems	Understanding self-study methodology Diagnosing classroom problems of each teacher by subject areas
April	Subject	Discussion of solutions of problems	Search for solutions to problems
May	Subject	Additional information for revision of the first class	Perform pre-assessment about students' abilities, interests, and attitudes Implementation of the first attempts at problem solving Discussion of lessons and first modification or supplementation
June	Subject	Supplement for revision of the second class	Implementation of second attempts at problem solving Discussion of lessons and their revisions Perform post-assessment of changes in teaching
July	Whole	Conference on the improvement of classes	Conference on the improvement of teaching Feedback by a wider group of participants, including outside professors
August	Subject	Final discussion	Final discussion on the improvement method Preparation of a result report

Explore Personal Circumstances

The participating teachers were invited to explore issues that they were having in their classrooms. The participating group of teachers and each subject area professor helped them understand exactly what the problem was, what might be causing it, and what they could do to improve their teaching.

Explore Critical Collaboration

The teams of five to seven teachers and a professor from each subject area worked together to help each other, each playing the role of a critical friend. Teachers and professors were critical friends, but the roles of teachers and professors were somewhat different. The discussion with critical friends was led by a professor.

The professor acted as an observer to allow the teachers to identify and resolve the problems themselves. Instead of taking an active role in the discussions, the professors gave advice on solving problems by providing theory and offering suggestions on methods of teaching when necessary. Other teachers usually gave advice based on their own experiences, and professors explained the advice that they gave based on academic theories along with the pros and cons of the theory. The division of roles between teachers and professors as critical friends was a way for each teacher to ensure their own validity on how to improve their classes because both theoretical and experiential knowledge was taken into account. This confirmation of validity relieved the burden of the individual teachers' choices of what to change in their practice and helped justify the applications of previously little-known methods of classroom improvement. In Korea, individual teachers are under a lot of pressure when they choose to improve their classes alone because Korean culture expects them to follow expert advice when enacting change. That is why it is difficult for them to make efforts to improve their classes on their own and explains why they have mainly relied on authorized methods of class improvement instead of seeking to clearly understand the problems and to find solutions.

Improve Learning

To fully understand the process of guiding teachers to improve their lessons through self-study, the participating professors decided it would be advisable for them to have an experience in improving their own classes first. So the professors who took part in the professional development workshops first studied self-study and applied it to their classes at the university for a semester. The group discussions between these collaborating professors also helped to determine how to support the improvement of teaching, whether at the university or secondary school level. All the participating teachers were then supported to learn what to consider in deciding on how to improve their classes by applying the suggested methods of class improvement twice and jointly discussing the issues encountered in each of the group meetings. The main reason behind the teachers' increased self-study abilities was the support of a critical group of fellow teachers and professors who had differing educational experiences.

Before the self-study workshops with teachers began in March 2015, the participating professors gathered once a month to act as critical friends to each other while each one in turn identified a problem in one of the their classes and looked for solutions. Based on this experience, the professors were then able to share their own process of solving their problems with their own classes of pre-service teachers with the participating teachers in the self-study workshops. The professors judged that implementing self-study could also help teachers improve their ability to solve problems in other subject areas that were not covered in the professional development project.

Clear and Systematic Research Processes

The fact is that teachers know many ways to improve their classes but are not always willing to apply them to their lessons consistently because these ways may be very general, and the teachers are unsure about the possible outcomes. In addition, the teachers fear that others see these outcomes as negative and that they may be judged unfavorably on their teaching. Three methods were considered to solve this problem. First, the professor of each subject area played the role of a critical friend. Secondly, teachers continued to revise and add to the solutions they already had so that these would become applicable to their classes. Thirdly, it was recommended to see whether any actual improvement could be seen through various methods of collecting data, such as surveys and observations, whenever possible.

Generation and Publication of Knowledge

Experience in class improvement was presented and shared in the form of reports on the results. However, in these reports, instead of focusing only on methods and results, teachers decided to present the specific problems that they diagnosed in their classrooms and what they did about the solutions, as well as how they tried to solve the problems with the other teachers who also experimented with new solutions. This process allowed teachers with similar problems to refer to similar situations in order to lay down a series of stepping stones for resolving problems oneself.

Results of the Self-Study in a Korean Context

The Research Center for Curriculum and Instruction at Chonnam National University published the results of the self-study group in a report entitled "Research on classroom innovation through teacher's own improvement." It also reported to the South Jeolla Provincial Office of Education, which financially supported the training sessions.

With the combined results from the report, it is clear that the teachers gained a lot of benefits from the recent self-study workshops program. First, participating teachers could directly or indirectly experience a variety of classroom activities they could integrate into their teaching that were related to their subject area while communicating with other teachers. The collective critical community of the fellow subject area teachers gave space to discuss both their successful and less successful classroom experiences six times in repeated attempts to solve each problem, resulting in the sharing of a variety of approaches. Participating teachers were able to apply these new approaches either directly or indirectly to their own classes as a result of taking part in the self-study process.

The second result is greater confidence on the part of participating teachers due to improvements in the classroom. The participating teachers now have a clearer sense of what good lessons are in their subjects and also have more faith in themselves and their abilities to teach well. Teachers who were anxious about their classes became more confident as a result of their own improvement through these workshops.

Third, teachers are actively willing and eager to improve their lessons. Teachers who have complained about poor experiences in their efforts to improve their classes in the past have come to realize that class improvement is possible through the self-study workshop approach. As a result, they are willing to try to improve their classes by themselves. Although not all attempts that were made to improve classes through implementing self-study were successful, the first experience of improving it on their own has taught them that it is possible and can be effective in the future.

The fourth result is that most subject teachers found their own professional identity as related to their subject areas, which is a very positive outcome for the study. Although different courses use different teaching methods, when the self-study community approach began, the participating teachers had only ever applied the teaching methods commonly used in Korea that can be applied to all subjects. However, the home management curriculum and the music curriculum cannot have same effective ways of teaching because their subjects are different. During the self-study sessions, the participating teachers felt the most important thing to do was to identify the nature of the subject area they were teaching, or the unique features of their courses. The participating professors in the sessions helped teachers fully understand these unique features.

Finally, the participating teachers had the sense that they needed to look at their lessons from the students' perspective to improve their lessons. In addition, looking back on their classes, teachers came to discover the strengths of their lessons that they hadn't realized before.

In terms of the teacher educators who participated in the project, Professor Han, one of those professors made this comment:

> Professors who participated in self-study programs had also benefits. The participating professors were able to better understand the educational milieu by keeping talking with the teachers on the site. One of the difficulties for teachers is loneliness in the classroom. Teachers need to be professional, but it is not easy to teach a great class every time. Also, it is not easy to have a critical friend or colleague who is concerned about your class. Therefore, I wanted to provide the space where participant teachers could share these concerns with other teachers, and where I, as a teacher educator, would be able to apply what I learned from the workshops for prospective teachers. (personal communication, August 1, 2015)

Conclusion

This series of self-study workshops was the first time in Korea that teachers were given an opportunity to solve their classroom and teaching problems through sustained communication with teacher educators and fellow teachers using self-study

methodology. Much has been gained from the process by participating teachers and professors. For instance, collective thinking helped the group solve each teacher's proposed problems, and the teachers learned about how implementing self-study can help them solve their own problems. They also acquired new ideas on how to teach through a shared discussion process of both positive experiences and problems. Above all, teachers who had been troubled by class problems were encouraged and motivated to seek new solutions. Both the teachers and professors who participated in the sessions expressed hopes that the class improvement workshops would continue.

Nevertheless, the teachers still found themselves to be bound to an old custom still very present in Korean culture and wanted someone to give the right answer for them. They felt it was effective to improve their lessons with methods of learning by doing, but they still felt exhausted and uncomfortable being asked to examine their practice and reflect on that practice. They wanted a special medicine that would cure all their problems at once. It seems that all teachers were not convinced that self-study of their practices would be effective ways of improving what happens in their classrooms. Therefore, in the future self-study workshops, teacher educators plan to question the participants as to their expectations of this type of professional development. Teacher educators also need to question themselves as to why teachers are still bound by the old customs of having someone else solve all their problems. What would a self-study community in Korea need to do to convince teachers that they are able to generate their own improvement in their classes?

The self-study project described in this article is meaningful in that it is the first self-study lesson improvement training officially implemented in Korea. This training has prompted further self-study research in Korea. Professor Samaras and Professor Shin subsequently paid a visit to Korea, and their lectures and advice contributed greatly to the establishment of self-study in Korea. Prior to the project, there were several personal findings on self-study, but this project provided an impetus to activate self-study research and practice more broadly in Korea. In terms of self-study research, the significance of this project lies in its operation as a critical group of peer teachers working alongside teacher educators to improve teaching. The project involved expert professors of each subject area exploring self-study methods along with teachers in that subject area in order to improve teaching in ways that are appropriate for Korea's educational situation. Through collaborative group exchanges, and by participating in all the training sessions for teachers, they operated a critical peer group where everyone could participate, but the professors were central to the exchanges. This collective critical peer group system has been shown to work effectively in educational situations such as Korea, where it is difficult for individuals to express personal problems and to give and receive critical advice.

Introducing Self-Study of Teacher Education Practices into Another Culture: The Experience in Chile

46

Rodrigo Fuentealba, Carolina Hirmas, and Tom Russell

Contents

Abstract

The three authors have collaborated since 2015 to introduce self-study of teacher education practices to small group of teacher educators at a number of universities in Chile with significant support from the Santiago office of the *Organización de Estados Iberoamericanos*. This chapter describes the origins of the project and its

several stages between 2015 and 2018, with each author's perspective presented in turn. Transferring a significant new research methodology from one language and culture to another has proven to be both complex and engaging, inevitably proving informative and stimulating for both academic cultures. Personal experiences of each author are described as well as views of several participants. The efforts to introduce self-study are ongoing, and it has been helpful to take stock by preparing this account.

Introduction

This chapter describes events in the period 2010–2018 that led to the introduction of the literature and strategies of self-study of teacher education practices to a number of teacher educators working in several universities in Chile. It also provides details of relevant parts of our different backgrounds with respect to teacher education and self-study. After an introductory that describes how the authors came together on this project, three perspectives are presented in turn – Rodrigo, Carolina, and then Tom. Some of the illustrative quotations appear in both Spanish and English as a reminder that moving between languages and cultures can involve many challenges as well as rewards.

Setting the Stage: How We Three Met and Connected

In 2010, Tom Russell was invited to contribute to a project about teacher candidates' learning in the practicum being conducted by a university in Santiago, Chile. His Dean at the time, Dr. Rosa Bruno-Jofré, works closely with academics in Argentina and Chile and suggested his name when a university in Santiago was focusing attention on its students' practicum experiences. As part of his continuing interest in how individuals learn to teach, Tom has a strong interest in teacher candidates' learning in the practicum (Martin and Russell 2010; Munby and Russell 1994; Russell 2005, 2014, 2017) as well as in self-study of teacher education practices. He is particularly interested in the differences between learning from books and lectures (propositional knowledge) and learning from first-hand experience (craft knowledge). He was attracted by the opportunity to learn about the challenges associated with practicum learning in another context and culture.

In October 2010, three faculty members traveled from Santiago to Kingston for a week of discussion and visits to observe Queen's University teacher candidates in local schools. Then in December 2010, Tom visited Santiago for 1 week of extensive discussions of reflective practice and practicum learning. Rodrigo Fuentealba was

one of the leaders of the project and was familiar with some of Tom's writing; late in the week, he and Tom talked at length over dinner and established the foundation for what has become a deep professional friendship.

In 2011, Tom was invited to Amsterdam to attend a seminar on the future of teacher education. Rodrigo was now Dean of a Faculty of Education at a different university in Santiago, and Tom shared the invitation with Rodrigo, who also attended. Accommodation in Amsterdam was particularly difficult at the time; Rodrigo joined Tom and his wife LaVerne and another delegate and her husband in a two-story, three-bedroom apartment (of sorts) reached by one of the longest, steepest staircases on the planet. Sharing the seminar, the accommodation, meals, and a few tourist explorations moved the friendship forward rapidly. In 2012, Rodrigo invited Tom to give a keynote presentation at an international conference of Spanish-speaking teacher educators being hosted by his university.

Not long after Tom's second visit to Santiago, Rodrigo moved to a third university as Academic Director in the Faculty of Education of Universidad San Sebastián, where he later served as Dean for 4 years and is now Director of Research and Postgraduate Studies. Between 2012 and 2017, Tom made 11 more visits to universities in Santiago, La Serena, Concepción, Valparaíso, Talca, and Valdivia. Most of these visits were facilitated or hosted by Rodrigo and focused on reflective practice and its relationship to the process by which individuals learn to teach. For Tom, visits to a range of universities over an extended period of time provided greater understanding of the directive, transmission-style teaching strategies common in Chilean universities and also of the considerable pressures on teacher candidates in Chile to demonstrate their abilities to prepare reports that link research literature to their practicum learning opportunities. As in many teacher education programs worldwide, in Chile the term *reflection* is used widely and freely but does not correspond to the term *reflection-in-action* presented by Schön (1983) and of particular interest to Tom for its relevance to learning from experience. For Rodrigo, Tom's visits seemed to offer insights into alternative approaches to reflective practice and ways in which teacher educators can attempt to more effectively foster linkages between theory and practice in the context of teaching.

One of the simplest strategies that Tom introduced involves asking those who are learning to teach to write a short description of the most important idea they are taking from a class, something that Tom called a "ticket out of class." This idea came from an experienced teacher more than 15 years ago and involves giving students a small sheet of paper at the end of class to write the main idea being taken from the class and a topic they would like to explore further. Today an Internet search for *exit slips* yields many results about this strategy. Rodrigo and others began to use it with their students and also at the conclusion of meetings of teacher educators, a strategy they refer to as "ticket out."

On one of his visits to Santiago, Rodrigo introduced Tom to Carolina Hirmas, the Education Officer in the Santiago office of the *Organización de Estados Iberoamericanos* (OEI, or Organization of Spanish-American States; http://oei.cl. OEI has its headquarters in Madrid). When Carolina developed an interest in the literature of self-study of teacher education practices (S-STEP), she saw an

opportunity to encourage innovation and obtained funding for the publication of a book that introduces self-study (a term that does not translate clearly into Spanish and so is used without translation) to teacher educators who work in Spanish. The book *Formadores de formadores: Descubriendo la propia voz a través del self-study* (Russell et al. 2016) includes 11 articles selected from issues of *Studying Teacher Education* as illustrative of a range of issues of possible interest to teacher educators in Chile and other Spanish-speaking countries. Selected articles were translated into Spanish and published in print and in PDF with permission of the journal's publisher. Tom attended the book launch in Santiago in March 2016, at which time Carolina developed a small group of Chilean teacher educators who expressed interest in exploring self-study of their own teacher education practices. OEI support for participants included travel expenses, networking, meeting spaces, and general encouragement with an unfamiliar research methodology.

While Rodrigo and Carolina were working to introduce self-study of teacher education practices to the Chilean community of teacher educators, Rodrigo and Tom found a new way to interact and extend their discussion of how individuals learn to teach. In the 2014–2015 academic year and in the 3 years that followed, Rodrigo has observed many of Tom's physics methods classes at Queen's by connecting via Skype. In the period 2016–2018 and with the consent of his students, Tom has made video recordings of his classes and shared the recordings with Rodrigo. The recordings were helpful when Rodrigo's schedule did not permit observation during class time; they also proved helpful to Tom's students who were unable to attend a particular class.

As Dean in the period 2015–2018, Rodrigo continued to teach. From a self-study perspective, he found that his observations of Tom's classes helped him to imagine new ways of interacting with his own students. As they often interacted on Skype after many of his classes, Tom found that Rodrigo became an important critical friend with respect to understanding and planning his own teaching. Critical friendship (Schuck and Russell 2005) is often seen as an essential feature of a self-study and became a central feature in connecting Chilean teacher educators with each other for self-study purposes. Funding from Queen's University and from Universidad San Sebastián has enabled Rodrigo to visit Tom's classes for 1 week in each of the 4 years that he has been observing Tom's classes. Although Rodrigo has always explained his interests to Tom's students during the first class that he observes via Skype, the students have reported that Rodrigo's participation in two classes in person has given personal meaning to the observations and helped them to understand why someone in another culture might find value in observing Tom's teaching of their class.

The Perspective of Rodrigo Fuentealba

During the period between 2005 and 2010 in Chile, the sense of urgency to make changes in the processes of teacher education was widespread. In this context, Rodrigo, a teacher educator, participated many times in commissions of academic

specialists from different backgrounds regarding the paths to follow in order to promote change. 2005 was of particular importance for Rodrigo, as he took part in a working commission that produced the first report of the National Commission for Initial Teacher Training (Ministerio de Educación de Chile 2005). This report took into consideration the multifactorial processes of change involved in teacher training and, in order to achieve progress, concluded that it was not enough to make adjustments only at the level of the curricular structure of teacher training programs; they needed to put greater emphasis on disciplinary or pedagogical content. It was also an opportunity to discuss the type of candidate who should be eligible to study pedagogy, highlighting the need to raise entry requirements for careers in pedagogy, which in turn generated the need to promote this professional career (teaching) for students who obtain high scores on national tests for admission to universities. Another issue that became apparent was the need to have effective training spaces for the practicum and not just places to visit, observe, and comment on. It was then imperative to establish closer alliances among teacher training centers and schools, as professional teacher training is not a mere accumulation of theoretical knowledge but also requires significant practical experiences that facilitate the process of socialization into a school environment (Darling-Hammond 2014; Avalos 2002). Although these ideas brought about changes in the training process for future teachers, at the time of their implementation, it was common to see traditional teacher training procedures and practices continuing.

As part of an academic team particularly interested in the process of the practicum, Rodrigo became actively involved in discussions of teacher education and, along with others, began to work on the need to examine in detail the relationship between teacher education classes in the university and students' personal experiences in the practicum (Veeman 1984). Thus the period between 2005 and 2010 was a time to establish links with the school system. It was, and still is, uncommon to develop relationships between the university and the school system in Chile. Building relationships implied a risk for all those involved, setting aside certainties and opening hearts and minds to an adventure with an unpredictable ending.

One of the first insights involved the way that teacher educators relate to teachers in schools. Traditionally, university academics in Chile have rarely established bidirectional collaborative links; rather, such links were seen as instances in which school teachers were instructed about how to teach. With little or no experience of how to promote an interactive, two-way relationship between schools and universities, we had to start reading and studying about it, since every time we visited a school, it was evident that traditional ways of interaction would not be useful. Experience convinced us that if we wanted to look for new ways of doing things, we needed to act accordingly. In this context, we began to look for international references on the topic, and we identified a text entitled *Teachers and Teaching: From Classroom to Reflection* that coincided with our concerns:

> The contributors to this book respect and take seriously the work of teachers and the challenges of teaching. The chapters in this volume speak clearly to the fact that teaching can be taken seriously, in schools and in programs of teacher education. To take teaching

seriously is, at least in part, to seek new ways of bringing together the practice of teaching and research on teaching. (Russell and Munby 1992, p. 1)

As the research team became immersed in the school environment, it became increasingly evident that classes in the university were only a part of something much more complex and, as the team accumulated more experience, the focus was no longer on just the student or the school teacher. The focus extended to academics' analysis of their teaching practices and how this self-knowledge sometimes triggers challenging professional and personal journeys.

Rodrigo and Tom's First Meeting

As part of the research team interested in investigation of the practicum that could enable them to better understand how a teacher learns to be a teacher, Rodrigo chose to start accompanying teacher education students to the schools where they observed or began practicum placements. Accompanying students is unusual in the Chilean context, and it necessarily led Rodrigo to initiate conversations with the teachers in the school who received students. Thus he began to notice and explore various additional aspects involved in the process of learning to be a teacher, and the more he listened to different teachers' opinions (experienced teachers and teachers-to-be), the richer was the experience he gained from the school environment, first-hand experience that one cannot get by reading published reports of teacher education research.

In addition to these exchanges with teachers and students, Rodrigo also began to look in more detail at which of his own teaching practices could be fostering or possibly hindering the productivity of these interactions with others. When the school teachers began to ask questions such as "Do you have classroom experience?" or "How long have you worked with children before becoming a university professor?", he began to understand that the answer to those questions could help him to understand something that Tom had written years earlier concerning the role that the authority of experience plays in the practicum learning process. Rodrigo found that having the authority of teaching experience (Munby and Russell 1994), rather than the expected authority of academic theory, made him more visible to teachers in schools as they took conversations with him more seriously.

When Tom and one other Canadian teacher educator visited the research team for a week, they shared perspectives about teachers in the school system, future teachers, and professors who taught courses or supervised practicum experiences. As Rodrigo listened to what Tom was saying about the importance of practice as a space for professional growth, the development of real experience, and the value of seeing it as something more than a space for the application of theory learned at the university, he could not help but look back at his own teacher education program, and he began to question those personal experiences. The more he tried to reinterpret those early experiences, the more inadequate and biased his descriptions or explanations appeared. Nevertheless, he was able to see more clearly some patterns in his

experiences. Considered from a practical rather than a theoretical perspective, he drew some unexpected insights. For example, he recalled that all his university teachers had told him to learn first and then apply what he had learned in practicum experiences, suggesting that recommended practices should not be attempted until their grounding in theory was fully understood first. He has since found many reasons to question that perspective on teacher learning.

In that extended and informal conversation with Tom face to face at the dinner table, and notwithstanding the limited knowledge of each other's language, they managed to exchange points of view that brought them closer despite the geographical and cultural distances between their workplaces. The value of the exchange of experiences, active listening, and respect for the other is consistent with Dewey's idea that a positive attitude strengthens reflective processes (Dewey 1933).

The Challenge of Self-Study

For Rodrigo, questioning his role as an educator of future teachers meant looking for better answers not only in theoretical perspectives but also in asking questions and collecting data from his own students using methods of self-study. In a meeting with future teachers at a university in the north of Chile in 2015, Tom had asked student teachers "What aspects of your practicum experiences in schools helped you learn?" and "What aspects were least helpful?" Some of the responses to the first question were "Classes where we could *do* things; when there was not a single solution to a problem; when we had the chance to work in groups; when the teacher was interested in what we said." Responses to the second question included "Classes where the teacher kept talking on and on; when only a single answer was expected; when the teachers stated one rule, but broke it themselves."

From the richness of these answers, Rodrigo felt challenged to seek and explore the uncharted territory of giving a voice to his own students. At the beginning of the semester, he would supervise his students in different schools, even if it seemed strange for a Dean of the Faculty to do so. He gave a small notebook to each of the 20 students in which they could write freely about incidents they were not able to solve, trying to describe as thoroughly as possible the situation and what they ended up doing. They did not object to sharing their notes with Tom and Rodrigo.

The students' surprise at receiving the gift of a notebook soon gave way to curiosity about whether their notes would ever be read and returned. With only two exceptions, the students in that class shared their notebooks with Rodrigo on a regular basis. He sent frequent reports to Tom via email and Skype in which he shared his excitement and curiosity about the students' comments. Rodrigo also took notes as he observed how Tom was responding to his students at Queen's, finding alternatives to such empty responses as "this is fine" or "this doesn't work for me." Allowing his students to engage him in a conversation about a situation of conflict, he was better able to inquire or challenge himself to find alternative ways to respond to situations. Consider the following student comment:

> Even though there was a lot of noise and children walking around the classroom, I did not despair. This made me happy because I did not get nervous ... I left school with the satisfaction that I made them involved, that they learned and I was able to call almost everyone by name ... with the certainty that I made clear that a teacher cares for students and that a teacher is interested in them and what they are doing. (X, a second-year student)

To this writing Rodrigo responded as follows:

> Thanks, X. I thank you for the way you are approaching the situation, how you make a clear distinction. The role of the teacher is not to keep students silent, but to open possibilities for learning." Then I added a follow-up question: "What are you learning as a teacher?

To that question the student replied:

> I have learned to value my previous experience and act according to my values. I recognize that my training as a person and a teacher will help me face professional challenges in the best possible way as they unfold, and that they can also be solved collaboratively.

In this example, as in others, Rodrigo could gradually see how practice became a transformation tool in their processes of apprenticeship and, in his case, an incentive to expand ways of giving voice to his students and to avoid falling into the temptation of valuing declarative knowledge over procedural or craft knowledge of practice.

This experience, along with exchanges with Tom, increased Rodrigo's interest in deepening his understanding of how students were interpreting their practicum experiences, so he mirrored one of Tom's exchanges in class: He asked students if it were possible to distinguish patterns in his teaching and what effects those patterns had on their learning. Along with rescuing the value of learning by observation (Lortie 1975), the answers to both questions gave Rodrigo the possibility of paying more attention to that tacit knowledge traditionally rendered invisible by a formative culture that favors propositional knowledge.

Experiences with his students, conversations with Tom, and observing or visiting Tom's classes have become privileged spaces to develop new habits and practices (Duhigg 2012) that defy the traditional and comfortable answers learned first in his life as a student and then as part of a professional culture that places great emphasis on both the authority of position and the authority of reason (Munby and Russell 1994).

In the ongoing challenge of generating conditions to learn how to think and act as a teacher, the use of tickets out of class has become a metacognitive device that allows students to analyze their own practice. It has also allowed Rodrigo to understand in more complex and distinctive ways how future teachers learn. From two questions answered anonymously by students before leaving class ("What was the most important idea of the class?/What did I learn today?" and "What question stands out after today's class?"), Rodrigo has come to acknowledge a variety of ways in which the message of a class that he believed was clear could be interpreted from multiple perspectives.

In a general way, Rodrigo observed that the initial reaction from the class was one of surprise, especially if an end-of-class question was to be answered anonymously; they would ask "What is this for?" As it eventually became common practice, students themselves became more thoughtful in writing their tickets out of class. The following examples from a class in 2017 also give some insight into the student culture in Chilean schools and universities:

What was the most important idea of the class?/What did I learn today?
- I learned what learning is, how teaching takes place and the type of interaction that exists among people.
- How to manage some classroom situations, different points of view of my classmates about what teaching involves.
- Different types of teaching, the difference between passive and metacognitive learning.
- I learned that all people learn in different ways and at different paces, and we should not demand that people learn the way we do. We must respect the mixed-ability classes.
- When we are in the role of teachers and we face an unexpected situation, we have to make good decisions and react accordingly.

What question stands out after today's class?
- Why is it necessary to know about different types of teaching?
- Why are different learning styles important to consider?
- What is proper teaching?
- Is it necessary to have different points of view?
- I leave with many questions in mind, such as how can you notice all that everyone is learning? How can we come to such a conclusion?
- How can I know if my reflections are appropriate?
- How thoughtful are we in certain situations?
- How can I have more knowledge about pedagogical reflection?

These examples come from a first-year class whose diversity of opinions suggests openness to an alternative to traditional epistemology, one in which the predominant voice is not that of the teacher but that of the students. As Martin and Russell point out, an alternative epistemology acknowledges that voice "lends credence to experience. In an epistemology of practice, it is essential to listen to one's own voice and also to the voices of one's students. Voice authorizes experience. . . . While voice tends to have little significance in an epistemology of technical rationality, we have come to see it as central to an epistemology of reflective practice."

Having considered the development of the relationship between Rodrigo and Tom and the introduction of Rodrigo to self-study, the discussion turns now to the perspective of Carolina on the efforts to introduce self-study of teacher education practices to teacher educators in Chile. Carolina has worked with OEI for 6 years; prior to her work with OEI, she worked in the education area for UNESCO.

The Perspective of Carolina Hirmas

As Rodrigo explored self-study methodology in his classes with teacher education students, he shared his activities first with Tom and then with Carolina. Rodrigo suggested to Carolina the publication of a book to introduce self-study methods and experiences to teacher educators in Chile, and Carolina found funds within OEI to see this idea through to reality. Once the book was launched in 2016, Carolina obtained funds to invite 15 teacher educators to participate in activities to introduce them to the possible value of self-study research. She and Rodrigo created groups of interested teacher educators from several different universities, although such collaboration between universities is uncommon in Chile. Initially, 19 teacher educators were arranged into 3 collaborative groups. In the second year, two more groups were created and funded. Over a 2-year period, 50 teacher educators representing 13 universities have participated at some stage in these collaborative inquiries into self-study. Most of the participants are female and have more than 5 years of experience in teacher education as well as prior experience teaching in primary or secondary schools. Many of the participants are associated with faculty supervision of the practicum at their universities. Interest in a novel methodology supporting improvement to personal teacher education practices continues to grow. There continues to be a cultural preference for working in small groups rather than individually.

What Carolina liked most about working to support self-study of teacher education practices involved emphasizing at each meeting the importance of this type of research for the transformation of the teacher educator's own practices and the modification of their understandings and assumptions about teacher education. Teacher educators who have been involved in the analysis of their own practices have discovered new perspectives on the processes of teacher education, and this has led them to consider changes to their ways of interacting with their student teachers. They have raised important issues concerning strategies for dialogue and ways of asking questions, as indicated in the following statements by one of the participating teacher educators:

> *Tenía ciertas inquietudes con mi docencia: yo respondía mucho al porqué en lugar de que ellos se respondieran el por qué. Hacía yo la tarea de conducir con mayor fuerza la reflexión, entonces me di cuenta que yo los estaba induciendo demasiado. (Cuando cambié la manera de dialogar) ellos me decían ¿y no nos va a decir? ¿No nos va a preguntar? Cambié las preguntas de retroalimentación respecto a lo que hicimos, como lo hicimos.*
>
> I had certain concerns with my teaching; often I was answering the why questions instead of having the students answer them. I promoted the task of driving reflection with great force, and then I realized that I was leading them too much. (When I changed my way of talking) they would say to me, "Are you not going to tell us?" I decided to change the feedback questions to "What did you do? and Why did you do it that way?". (L. Garrido, octubre 2017)
>
> *Me di cuenta que ellos van a ser futuros formadores, entonces necesitaban aprender como estaban aprendiendo, entonces cambié las preguntas, por preguntas meta-cognitivas… (Les preguntaba) ¿cómo llegaste a este aprendizaje? Di un vuelco en el tipo de preguntas. Sentí que para los formadores son esas preguntas las que se requiere plantear.*

La información está por tantos lados que ellos necesitan hacer esa reflexión . . . no alejar tanto la universidad del terreno

I realized that they are going to be future teachers, so they needed to learn how they are learning, so I changed the questions to metacognitive questions . . . (I asked them) How did you get this learning? I made a change in the type of questions. I felt that, for future teachers, these are the questions they need to be asked. The information is so accessible so what they need to do is that reflection, . . . not to separate the university from schools. (L. Garrido, October 2017)

Carolina believes that these changes in the ways they look at themselves in their teaching are both paradigmatic and positive, because it is not easy to look freely and openly at oneself, nor is it easy to be questioned by others, in this case by critical friends and by one's own students. Then it is even more difficult to take the next step, which is to change one's teacher education practices. Both steps are occurring, and simultaneously there are changes in their professional identity and how they see teaching and their role as teacher educators. There are also changes in their relationship with their students of pedagogy, making them increasingly aware and involved in how learning about teaching occurs in the university classroom

Me defino como acompañante, mas que la profesora que les va a entregar el contenido que dice el programa. Eso ha sido exigente para no perder la identidad frente a los estudiantes. Les dije que ellas iban a colaborar para mi formación de profesora. Les llamo la atención que ellas eran el foco de observación. Yo les decía que era un beneficio para entregar mejores herramientas para ellas y para las generaciones que vienen.

I define myself as a companion, rather than as the teacher who will deliver the content that the program specifies. That has been demanding, taking care not to lose my identity as a teacher educator in front of the student teachers. I told them that they were going to collaborate with my teacher training. I called attention to the fact that they were the focus of observation. I told them that it was a benefit to provide better tools for them and for the generations to come. (P. Troncoso, October 2017)

Supporting and Encouraging the Participants

In her efforts as a critical friend to the self-study teams, Carolina has found it powerful to discover that becoming more aware of their own thinking and the assumptions implicit in their teaching practices is on its own a significant change. The participants are beginning to realize the assumptions they have been making about their students and how their perceptions and expectations of their students change when they intentionally listen to them, mainly by using tickets out of class or exit slips. Two of the strongest cases for listening to students and giving them voice have been made by Richert (1992) and Cook-Sather (2002). The perspectives they offer contrast dramatically with assumptions implicit in the traditional academic culture in Chile, where it often appears that teachers know but students do not and that students will know after their teachers have told them.

Perhaps the most challenging activity for the teacher educators in the Chilean self-study network has been *writing* about this self-study process, putting words to the findings, deepening their analyses of their points of view, and enriching the

interpretation of the findings with their own theory and academic literature. In their research reports, it is common only to name the critical moments; they tend not to develop them, explain in detail, or delve into their theoretical-reflexive argumentation. Carolina wonders what is influencing this phenomenon: Is it the lack of practice with academic writing, or do they fail to see the theoretical value of their questions, processes, and reflections? Participants acknowledge that they find it difficult to write about the richness of the self-study process, their reflections with critical friends, and the changes they are making.

> *Es una tensión: necesito la fundamentación, pero en qué momento la doy. Comparto en que tengo que fundamentarlo, pero sobre qué, cuándo y cómo.*
> It is a tension. I need the foundation, but at what moment do I give it. But what do I base it on, when and how? (P. Troncoso, October 2017)

Working with Rodrigo involved giving feedback on the teacher educators' written reports and asking individuals to explain how and why they reached a certain insight, what happened in classes, what their students reported, what they expected from their students, what their students expected from them, and what the theory that they had been consulting says about the issues. In one of the later meetings with three of the university teams, there was greater understanding of the need to go further in their reflections and analyses. It seemed helpful to the participants to have their reports read and returned with comments, asking them more questions to push their thinking further.

Carolina and Rodrigo have insisted on, and seen advances in, the participants' understanding of the importance of addressing evidence from their students as well as evidence from their personal notes and analyses. These first self-studies in Chile have generated significant excitement in the teacher educators as a result of the presence and feedback of their critical friends. This has been particularly relevant because everyone reports not having previously had an opportunity to analyze with their colleagues their university teaching, their practices, questions, aspirations, problems, and assumptions. Thus most of the evidence they record corresponds to insights that emerged from their critical friends much more than from their students. Self-study has provided an opportunity to speculate about their teaching role, their expectations of students, and their goals for improvement as teacher educators.

Another issue that Carolina has been understanding more fully involves the concept of single-loop and double-loop learning (Argyris and Schön 1974): "In single-loop learning, we learn to maintain the field of constancy by learning to design actions that satisfy existing governing values. In double-loop learning, we learn to change the field of constancy itself" (p. 19). Each cycle of inquiry and transformation in self-study closes with new questions to students about how they perceive the changes in the classroom, whether or not they perceive changes, and how they interpret them. This means involving our students much more in the process of self-study, which implies sharing our own theories about teaching and the changes in the conceptions that have been generated as teachers engaged in self-study. Self-study involves double-loop learning in which we identify the assumptions implicit in our everyday beliefs and practices and then construct new

practices. As Fuentealba and Russell (2016, p. 228) wrote, "by sharing, critiquing and building on each other's reflective conversations with our practices, we helped each other identify our tacit assumptions and then move beyond with new practices."

Carolina understands that teacher educators' assumptions not only guide their practices as teacher educators but also, in turn, help to make the future teachers more aware of their practices and theories about teaching. This point has been consistently supported by Rodrigo, who had more clarity from the beginning about this.

> *Yo en mi caso en clase, yo he tratado de hacer explícito ante los estudiantes cuál es el marco desde el cual yo hago algo. Es un doble ejercicio, tanto para mi, como para ellos. Como los estudiantes van y hacen cambios*
>
> In my case, in class I have tried to make explicit to students the framework from which I do something. It is a double exercise, both for me and for them—how students learn and and how they make changes. (Rodrigo, 13 October 2017)

Another issue that produces tension for the participants is academic writing, of which most participants have done little, perhaps in part because of their involvement with supervision of the practicum. From the point of view of understanding our introduction of self-study, this has been challenging. Personally, it has meant spending time reviewing the structure of meetings, the participants' writing, and the general development of ideas.

Reasons for OEI's Support of Self-Study by Teacher Educators

The network of teacher educators that has been constituted with the support of the *Organización de Estados Iberoamericanos* has been the backbone of the Professional Development Program of OEI. The reasons why OEI believes it is important to encourage and support self-study of teacher education practices by Chilean teacher educators include the following three points.

First, self-study can strengthen institutional collaboration on teacher education by establishing and supporting pairs of critical friends from different institutions. The processes of research and professional learning about the own practices of teacher education are promoted by reflective critical dialogue among teacher educators from different universities. The critical friendships can generate a climate of confidence for sharing not only professional goals but also the meaning they derive from their work, the questions that emerge in their conversations, and the insights they gain from analysis of their experiences of teacher education practice.

Second, self-study is a personal approach to research that involves the investigator in studying how new teachers are taught. This formative approach can encourage personal changes that give greater meaning to the preparation of new teachers.

Third, in many instances research on teacher education and on education more generally is conducted by people who do not possess a personal commitment to teacher education. Research guided by the methodology of self-study (LaBoskey 2004) involves investigating one's personal teaching practices, and thus the problems that emerge in the classroom challenge teacher educators to think about their

work in new ways. Thus self-study research is part of the process of improving university teaching with respect to the preparation of future teachers.

The Perspective of Tom Russell

When the opportunity to consult with a university in Chile appeared in 2010, Tom knew no Spanish and little about the history and development of Spanish-speaking cultures. He did have a longstanding interest in the challenges of moving between university and school – between "theory" and "practice" – and he has been involved with self-study of education practices since its formal organization in 1993. The three Chileans who visited Kingston in October of 2010 provided Tom with an introduction to issues of teacher education in Chile. He expected the visit to Santiago in December to be his only visit, and he had no way of anticipating that it would plant the seeds for both professional friendship and continuing collaboration.

By 2016, Tom had made eight more visits to Chile that included trips to universities in other cities. The project to select and translate 11 articles published in *Studying Teacher Education* from English to Spanish was an exciting challenge, and the launch of the book's publication by OEI quickly attracted interest among Chilean teacher educators. Carolina then convened an initial group of teacher educators who expressed interest in learning the methodology of self-study of teacher education practices. While Tom has attended two of the meetings supported by OEI and he has joined them in writing about their experiences, the work of introducing and supporting self-study has been that of Carolina and Rodrigo.

Learned primarily at a distance, Tom summarizes here some insights and understandings about the introduction of self-study methodology to teacher educators in Chile. Producing and launching the OEI publication of *Formadores de formadores: Descubriendo la propia voz a través del self-study* felt like a huge accomplishment that represented most of what would be needed to launch self-study in Chile. Of course it proved to be little more than an interesting first step. Just as thought differs from action, reading about self-study is quite different from personally developing and conducting a self-study.

The academic culture in Chilean universities could easily by seen by visitors as embracing a top-down approach to teaching in which, as elsewhere, the professor knows and tells and the student is expected to learn by listening. Academic cultures in English-speaking nations seem to have that approach as their foundation, but they have developed many techniques for masking or moving away from that foundation. Just as self-study methodology remains of interest to only a small group of English-speaking teacher educators, so progress by Chileans has been slow and tentative.

By listening to Rodrigo and Carolina describing and analyzing their experiences introducing self-study, Tom has developed a tentative hypothesis: By beginning by establishing pairs and small groups of would-be critical friends working in different universities, rather than with naturally formed pairs at the same university, the focus may have been more on dialogue across contexts and less on studying one's personal practices in one's own classroom. Collaborative, small-group discussions come

naturally to Chilean teacher educators; the more isolated focus of an individual self-study of practice may be novel and thus more challenging and slower to take place.

Moving from the familiar paradigm of formal research in which the investigator works at a distance from the phenomena being studied to a new research paradigm in which the investigator is central and is writing about craft knowledge rather than theory-based knowledge may be more challenging than we initially acknowledged.

While discussing one's teaching with others seems to be uncommon in most universities around the globe, in the English-speaking context, there is a literature of the scholarship of teaching and learning, and many universities have units that are often called centers of teaching and learning. In the Chilean context, talk about teaching seems to be even more uncommon. It is far easier to complain about the curriculum or students' poor behavior or disappointing lack of ability than to ask how one's actions might be contributing to problematic situations in the teacher education classroom.

As in many other contexts, in Chile it is not common to discuss with students the quality of their learning experiences. While many English-speaking programs have shifted terminology from *student teacher* to *teacher candidate*, in Chile those learning to teach are referred to as *teacher-students*. Some participants have felt it too risky to ask students their reactions to changes in classroom practices. This is an obvious challenge facing self-study research that often benefits from metacognitive conversations with those learning to teach.

In August 2018, Tom attended a 2-day meeting of 20 teacher educators (from 11 universities) who have been participating in OEI-supported discussions of self-study research. By describing his own background as a teacher, teacher educator, and, ultimately, a self-study researcher and by presenting his own plans for his next self-study of his practices, he hoped to encourage those present to review their own backgrounds (as Rodrigo has) and to identify more specific ways in which they might direct a personal self-study. Discussions among participants and question-and-answer interactions revealed strong interest in making next steps with self-study research. Taking the time to write as well as discuss with others is an important next step. Taking the risks associated with finding ways to listen to one's students is another important next step that could be a focus for discussions at future meetings.

If these insights and understandings gleaned by an outsider are even close to the mark, it is easy to see that the introduction of self-study of teacher education practices in Chile is both complex and challenging, yet it is also engaging and rewarding. Conversations are occurring that would never have occurred otherwise. These discussions would not be happening without the persistence and enthusiasm of Carolina and Rodrigo, who have created a unique opportunity to learn from the introduction of self-study of teacher education practices. There are clear signs of progress while keeping in mind that this exercise involves not only moving from one language and culture to another but also changing the existing academic culture in Chile that, like all academic cultures, is deeply rooted. As Schön (1995) argued, our universities are hesitant and ill-prepared to recognize alternative epistemologies such as that associated with learning from first-hand experience.

Abstract

This chapter highlights the European contribution to the growing knowledge about self-study methodology. Europe is a patchwork of countries, cultures, and languages. Looking at teacher educators in Europe, we see a broad variation in background, tasks, and opportunities for professional development and self-study research.

In this chapter we firstly map the development of self-study research in Europe which has mainly been the work of individuals and small groups. Then we focus on four countries that are in the forefront: England, Iceland, Ireland, and the Netherlands. In all four countries, self-study has proved to be a useful and stimulating way to aid the transition from being a teacher – or researcher – to becoming a teacher educator. Self-study methodology not only supported the understanding and development of the teacher education practice but also led to identity development. Most helpful proved to be working together and mentoring and sharing results publicly. In this context the role of the biannual S-STEP Castle Conference in England, which offers European self-study researchers to connect with colleagues from North America and Australia, plays an important role.

Keywords

Europe · Professional development · Collaboration · Going public

Introduction

The aim of this chapter is to offer insight into the positioning and development of self-study research in Europe. We will also demonstrate the contribution of self-study research to the professional development of European teacher educators and to the international knowledge base of teacher educators. Based on our findings, we will reflect on the further development of self-study research in Europe.

Europe

When we discussed the possible contribution of this chapter to the Handbook, we were conscious that this would not be an easy task. In 2017, when we started to work on this chapter, Europe counted 51 countries. The 28 member countries of the European Union have taken steps to increase the compatibility of the higher education system, for example, by using the same bachelor-master's system, and to support student and teacher exchanges (http://ec.europa.eu/education/policy/higher-education_en). However, the social, economic, cultural, and language differences among the EU countries are still considerable and even greater when we take all European countries into account. For example, Europe has more than 100 national and regional official languages (https://en.wikipedia.org/wiki/Languages_of_Europe). Although half of the Europeans are able to have a conversation in a second language, mostly in English (http://ec.europa.eu/education/policy/higher-

education/bologna-process_en   and   https://en.wikipedia.org/wiki/Languages_of_
Europe), this does not mean – as we will see later in this chapter – that it is self-
evident for European teacher educators outside the UK to connect with English self-
study literature from countries where self-study research is widespread (Australia,
New Zealand, and the USA).

Teacher Educators' Backgrounds

The backgrounds and professional interests of teacher educators in Europe vary
across countries. A study among more than 1000 teacher educators in six European
countries (Belgium – the Dutch-speaking part called Flanders – England, Ireland, the
Netherlands, Norway, Scotland) shows, for example, that most teacher educators in
these countries have a master's degree, but in the Netherlands, England, and
Scotland, there is still a minority of teacher educators with only a bachelor degree.
Moreover, in the Netherlands, England, and Flanders, teacher educators with a Ph.D.
are relatively scarce. In Scotland 95% of the teacher educators have teaching
experience, while in Flanders only 59% of the teacher educators have been school
teachers (Czerniawski et al. 2017; InFo-TED 2016). The study also measured the
academic and educational interest of teacher educators. Academic interest comprised
activities characteristic of research universities (e.g., reviewing papers and pre-
senting at conferences), and educational interest comprised activities and content
areas specific to teaching and teacher education (e.g., curriculum development and
assessment). Significant differences among the six countries were found. Preferences
for professional development activities aligned with academic interest were higher
among Norwegian and English teacher educators and lower for Dutch and Flemish
educators.

Preferences for professional development activities aligned with educational
interest were higher among Flemish and Dutch teacher educators and lower among
English, Irish, and Scottish teacher educators. In Iceland, since 2008, to qualify for a
position as a teacher educator, a Ph.D. degree is required, whereas before this a
master's degree was the benchmark. Still, many Icelandic teacher educators do not
think of themselves as researchers, and there is lack of consensus about the impor-
tance of being research active. However, the employment duties of teacher educa-
tors, professors, lecturers, and senior lecturers, are generally divided into 48%
teaching, 40% research, and 12% administration. This means that all Icelandic
teacher educators are required to conduct research as well as to teach student
teachers.

Given these differences in a small sample of European countries, one has to
conclude that the background of teacher educators in Europe varies broadly.

Professional Development of Teacher Educators

The development of self-study research in Europe has to be viewed in the context of
increasing attention on teacher educators' professional development which started in

the beginning of this century. In 2001 the Dutch Association for Teacher Educators (VELON) established a Professional Standard for Teacher Educators and provided the possibility to become registered as an experienced teacher educator (Koster and Dengerink 2001). A program for teacher educators, focusing on the pedagogy of teacher educators and practitioner research, followed (Boei et al. 2015). In 2004 the Association of Teacher Educators in Europe (ATEE) established a Research and Development Community (comparable with a Special Interest Group) called Professional Development of Teacher Educators. In 2007 a brochure, initiated by UK universities and colleges, *Becoming a Teacher Educator: Guidelines for the induction of newly appointed lecturers in Initial Teacher Education*, was published (Boyd et al. 2011), and in 2012 the Flemish Association for Teacher Educators (VELOV) presented a Development Profile for Teacher Educators (https://velov.files. wordpress.com/2012/02/velov_bro_en_111206.pdf). Flanders also offers master's classes for teacher educators (Tack 2017). The Hungarian Association for Teacher Educators has established a Teacher Educators' Academy that also offers professional development activities (http://ec.europa.eu/dgs/education_culture/repository/ education/events/2012/educator/hungary_en.pdf). Interestingly, from the point of view of research engagement, Norway concentrated on the researcherly development of teacher educators by establishing NAFOL, a national Norwegian National Research School in Teacher Education, that supports teacher educators in writing their Ph.D. thesis (Lunenberg et al. 2017). Additionally, the European Commission (2013) mentions Austria, Estonia, Finland, Germany, Luxembourg, and Sweden as countries where there is some focus on the professional development of teacher educators. This kaleidoscope of activities shows that the context for self-study research in Europe varies widely.

From a policy point of view, the European Commission publication *Supporting Teacher Educators for Better Learning Outcomes* in 2013 was a milestone. For the first time in history, European governors of 28 countries recognized the important role of teacher educators in the educational system. *Supporting Teacher Educators for Better Learning Outcomes* identifies the centrality of well-prepared and well-supported teacher educators in school improvement and emphasizes the need for systematic and sustained professional learning opportunities to be provided for them. This policy document echoes long-held professional opinions that teacher educators are the "linchpins in educational reforms" (Cochran-Smith 2003, p. 3) and that they need more coherent and extensive professional development (Lunenberg et al. 2014).

Also in 2013, the above mentioned International Forum for Teacher Educators Development (InFo-TED) was established. The founders explained their initiative as follows:

> In our four different European countries – Belgium (Flanders), England, the Netherlands and Norway – we have each developed initiatives to support the professional development of teacher educators nationally, carried out research on the occupational group and tried to speak out to influence our respective policy-makers and governments. All of us have also worked on these issues in transnational contexts. (...) We have long been interested in the

potential of teacher educators' learning across and within different European contexts. In many ways our interests start from what Michael Schratz (2014, p. 2) calls 'raising awareness for a new expectation of what constitutes a European teacher i.e. a teacher educator working within a European context of professionalism'; our own agenda adapts this call to focus on the idea of what might constitute a European teacher educator and the professional learning she/he might need to operate effectively in both national and transnational contexts. (Lunenberg et al. 2017)

The mission of InFo-TED, which has since extended to include Ireland and Scotland, is "to bring together, exchange and promote research, policy and practice related to teacher educators' professional development." So far, InFo-TED developed a conceptual model for the professional development of teacher educators, carried out an extensive survey to map the professional needs of teacher educators, developed a virtual learning platform, and organized a summer academy to increase opportunities for teacher educators' professional development as well as to encourage them to become leaders in teacher education in their own jurisdictions (http://info-ted.eu/).

Self-Study as Practitioner Research

Along with the increasing attention to the professional development of teacher educators, both the broad familiarity with practitioner research in Europe and the academic sceptics are contextual factors to consider when we look into self-study research in Europe. The borderline between practitioner research and a structured reflection on a particular practice proves thin, which – also in Europe – frequently led to critical discussions about the quality of practitioner research (Lunenberg et al. 2007). Without a solid theoretical embedding and a public scrutiny that reviews quality, there is only a story, no study (Loughran 2008). As Loughran and Northfield (1998) stated:

> Reflection is a personal process of thinking, refining, reframing and developing actions. Self-study takes these processes and makes them public, thus leading to another series of processes that need to reside outside the individual . . . the generation and communication of new knowledge and understanding. (p. 15)

The specific focus of self-study research requests careful attention for these quality criteria.

Whitehead, who from the beginning has represented an important English contribution to the development of self-study, stated that self-study presented the challenge of a "living contradiction": researching the "I" requires stepping back from the "I" (Whitehead 1993). Self-study research is distinguished from other types of practitioner research by its focus on the "I" (Coya and Taylor 2009), on the teacher educator himself or herself in relation to his or her practice. Samaras and Freese (2006) describe the paradox aspect of self-study research: individual and collective, personal and interpersonal, and private and public. Public, because knowledge

development is crucial to ensuring that self-study extends beyond the individual and offers more than "just a story" (Berry and Kosnik 2010).Therefore self-study needs to be both self-initiated and interactive (LaBoskey 2004).

In sum, the increasing attention for the professional development of teacher educators and the existing tradition of practitioner research could be a fertile soil for self-study research. But do European teacher educators accept the challenge of self-study research?

Self-Study Research in Europe

From the beginning of the American Educational Research Association's (AERA) special interest group Self-Study of Teacher Educators' Practices (S-STEP), individual European teacher educators have been involved in S-STEP: Fred Korthagen from the Netherlands was discussant at the 1992 AERA symposium "Holding up the Mirror: Teacher Educators Reflection their own Teaching" (Loughran 2004) that lead to the establishment of S-STEP a year later. In the first edition of the *International Handbook of Self-Study of Teaching and Teacher Education Practices* (Loughran et al. 2004), contributions from Belgian, Icelandic, English, and Dutch authors were included.

To map the development of self-study research in Europe since 2004, we searched the Castle Conference Proceedings from 2006 to 2016. We found multiple contributions from England, Iceland, Ireland, and the Netherlands (see below) and some contributions from Czechia (Svojanovsky and Nehyba 2016) and Scotland (Griffiths et al. 2008a, 2008b; Jess et al. 2016). We also searched *Studying Teacher Education* (Volumes 2013–2017) and used our networks to locate other self-study initiatives. In Flanders, Vanassche and Kelchtermans facilitated a self-study group from 2009 to 2011, which was extensively studied and resulted in the PhD thesis of Vanassche (2014) and a Flemish Section in Ritter et al. (2018), among other publications. To complete our search, an email was sent to all members of S-STEP to invite European colleagues to share their self-study activities with us. This invitation did not lead to additional information.

In the remainder of this section, we focus on four self-study communities that have existed for more than 1 or 2 years and share their work publicly. We report on developments in (1) England, (2) Iceland, (3) Ireland, and (4) The Netherlands. Then, in the final section, we will look across these countries into some common themes and reflect on the future of self-study research in Europe.

The Development of Self-Study Research in England

In England, the development of self-study research, which is specified as such, started from small beginnings. It has not become so rapidly or extensively embraced by the teacher education community as in the USA and Australia or even in other European countries such as the Netherlands. It appears to exist in pockets of practice

across the country, driven by local interests and needs, which reflects the rapidly changing, fragmented and competitive context of teacher education in England (Hayler 2010; Jackson and Burch 2016; McNamara et al. 2017). The term "self-study" is not familiar to many teacher educators and is not often included in consideration of ways that teacher educators undertake practitioner research (e.g., Boyd and White 2017; Philpott 2014). The focus tends to be toward reflective practice (Schon 1987) or inquiring into professional practice through action research (McNiff 2013). English colleagues may see their "self-study" research as a case study (Vázquez 2014); autoethnography (Hayler 2010); narrative inquiry (Hayler 2010); reflective narrative (Akinbode 2013); reflective practice (White 2011); and action research (Whitehead 2008). The Collaborative Action Research Network (CARN) founded in 1976 in the UK aims to encourage and support action research projects, including personal projects, making the accounts accessible and contributing to the theory and methodology of action research (https://www.carn.org.uk). There are strong commonalities between self-study, personal action research carried out within a collaborative network, autoethnography, and self-narrative inquiry, each drawing on reflection and inquiry in order to improve one's practice, interaction with critical friends, and professional literature and contributing to the professional knowledge of teacher educators.

Within many Higher Education Institutions, there has been an expectation for teacher educators to carry out research as part of their role (Murray et al. 2011). An issue with the use of self-study could be the extent to which universities accept this methodology as an acceptable research approach to include in their submission for the Research Excellence Framework (REF) through which English universities receive financial reward for contributing to the knowledge base (www.REF.ac.uk). The term self-study could suggest "navel gazing," a lack of rigor and an inability to contribute to the evidence base for teaching because of the difficulty of generalizing from small-scale research. There may also be an ill-founded assumption that self-study, along with other practitioner research, is simplistic and individualistic and lacks theoretical underpinning.

Influences on the Growth of Self-Study in England

The biennial "Castle Conference" of S-STEP, held at Herstmonceux Castle in England, has been significant in the development of self-study in England, along with the journal of this association, *Studying Teacher Education*. In 2006, a group of researchers from two English universities presented an interactive exhibition to explore their workspaces using visual- and image-based methods (Griffiths et al. 2006) at the Castle Conference. Mike Hayler, of the University of Brighton, participated in the Castle Conference in 2008 and at the following conference contributed a paper about self-narrative and the pedagogy of teacher educators (Hayler 2010). In 2016, he collaborated with Judy Williams (from Australia) to present a paper about their learning as co-editors, as a less considered aspect of the practice of teacher educators (Williams and Hayler 2016). Kerry Jordan-Daus, from Canterbury Christ Church University, contributed to the conference in 2014 with colleagues about their experiences of a new self-study group that she had instigated as Head of Department

(Wilson et al. 2014). In 2016 her paper in the proceedings was about finding her way as a leader (Jordan-Daus 2016). Also in 2016, Bryan Clift, of the University of Bath, and his mother Renee wrote a paper about the tension of moving between institutions and their roles as academic and family member (Clift and Clift 2016). These authors have also published an article in *Qualitative Inquiry* using shared family histories, memories, and experiences in their self-study of education practice (Clift and Clift 2017). Daniel Vázquez was one of only two academics from English universities to publish in *Studying Teacher Education* between 2013 and 2017 with his reflections on tutoring ancient Greek philosophy to first-year undergraduates at Kings College, London (Vázquez 2014).

The work of Whitehead in developing self-study master's and doctoral groups has been the largest influence on developing a self-study community in England. He has developed a Living Educational Theory, which is a form of self-study because the "I" of the researcher is at the heart of the inquiry (Huxtable and Whitehead 2017) but also embraces the values of the researcher that "carry hope for the flourishing of humanity" (Huxtable and Whitehead 2017). The website at http://www.actionresearch.net is the main forum supporting a Living Educational Theory approach to research, where members explain the enactment of their own self-study methodologies in improving practice and contributing to educational knowledge. Available from this website is the *Educational Journal of Living Theories* (EJOLTS) which provides evidence on the enactment of self-study methodologies in professional learning, a community space, a postdoctoral research group, and a research support group. Jack Whitehead and Marie Huxtable wrote two papers for the 2008 Castle Proceedings, exploring the implications of living educational theories for self-study (Whitehead 2008; Whitehead and Huxtable 2008). Each year they have continued to be part of the S-STEP SIG community, presenting the development and explication of living theory methodology, including the exploration of the use of digital multimedia narratives to enable more valid communications of the meanings of the explanatory principles of S-STEP researchers (Whitehead and Huxtable 2010, 2014; Whitehead 2014). In 2016 they contributed their own self-study of improving their contribution to the professional development of educational practitioners (Huxtable and Whitehead 2016).

Emerging Patterns in English Self-Study

One of the ways that self-study has been successfully used in England by practitioners is around transition into becoming a teacher educator (Chivers et al. 2010; White 2011), experiencing transition between roles within teacher education (Jordan-Daus 2016; Williams and Hayler 2016) and life transitions (Clift and Clift 2016, 2017). This links with an exploration of identity development in teacher education. In the research project described by Chivers et al. (2010) six novice academics in a university education department undertook a year-long exploration of transition into their new roles. Facilitated by more experienced colleagues, they met together regularly to share their challenges and achievements. They focused on their perspectives and emotional responses to working in this new environment and documented this through visual representations at each meeting. These were collated and

analyzed at the end of the year. The visual approach was particularly powerful in enabling participants to share their emotional journeys and served to demonstrate their growing confidence and the development of their new identities. Visual and multimedia methods have also been effectively used in other self-studies, for example (Griffiths et al. 2006; Whitehead 2008, 2014; Whitehead and Huxtable 2014). Collaboration within the group aided critical reflection and a rigorous approach.

Interest in self-study in the School of Education, University of Hertfordshire, was initially developed from a reflective practice group of teacher educators led by Helen Burchell. Burchell was interested in narrative and visual approaches to research and how this could be used in inquiry into practice, and she connected to Jean Clandinin and other North Americans through the AERA. Here she met American and Australian colleagues who were leading self-study approaches, and she introduced their ideas to the School. Jarvis undertook a self-study into her teaching of students in the field of special educational needs, and Burchell acted as her critical friend. Engagement with the wider self-study community developed when Burchell and Jarvis presented a paper at the Castle Conference 2006 on the role of dialogue in developing self-study (Jarvis and Burchell 2006). At this conference they obtained John Loughran's book *Developing a Pedagogy of Teacher Education* (Loughran 2006), and a copy of this book was subsequently purchased by the Head of the School for each member of staff in the School. Jarvis led a study of this book, involving lunchtime discussions and small inquiries into aspects of our teacher education practice inspired by the text. The text by Russell and Loughran (2007) which documented many examples of self-study was also used by groups of staff as inspiration for thinking about their own practice.

Burchell and Rees attended the Castle Conference in 2008, and in 2010 Chivers presented the results of a self-study group as discussed above (Chivers et al. 2010). After completing the research and participating together in the preparations for the Castle Conference, including writing an abstract, responding to feedback, and reviewing the abstracts of others, new colleagues were enabled to participate collaboratively in research processes:

> The process and elements of the early academic group described here have eased a transition towards a new identity as an academic. The process has also meant we have become immersed in research and presenting at conferences. This has opened up for me a whole new perspective that I am looking forward to investigating further in formal study programmes and within my practice. I am also keen to continue to develop more new initiatives and feel that the group has given me the professional confidence to do this. (Chivers et al. 2010 p. 54)

This enabled them to begin to take on a researcher identity, something that is likely to be new to those coming from schools or preschool settings. White joined the group later and undertook her own self-study to develop her identity as a teacher educator (White 2011).

Alongside these developments Jack Whitehead was invited to speak to colleagues in the School and others undertaking a doctorate in Education. This raised the status

of personal inquiry into practice and the significance of self-study in professional development and learning. An experienced teacher educator in the School undertook her doctorate externally using a reflective approach to personal inquiry which involved a study group to support criticality. One of the articles she wrote as a result of this doctoral study was published in *Studying Teacher Education*, the only other article between 2013 and 2017, from England (Akinbode 2013). She found the experience of self-study transformational, discovering that "by opening reflective spaces, one can become aware of how emotions have a powerful impact on the rational aspects of being a teacher" (p.72). She concluded that "as a result of engaging in this process of self-study, I have become more mindful of what is taking place in my practice as a teacher and more aware of my emotions and my responses to them" (p.72).

Looking back at these developments, a clear thread emerges of engagement in self-study by colleagues in the School of Education, University of Hertfordshire. It was built through people working together in the School and being inspired by people and texts from the wider self-study community, particularly those from North America and Australia. The role of the Castle Conference was also key in making connections and providing an opportunity for engaging with the community. It is interesting that we did not recognize this thread of engagement ourselves until it was pointed out to us by Lunenberg in 2017! Having now told the story of our development in this field, we are determined to build on these foundations and to move the narrative forward.

Going Forward

England is ripe for a growth in the use of self-study groups to support the induction and professional development of teacher educators within and across settings. The Castle Conference should try to become more visible to teacher educators within England, as it is a strong opportunity to develop self-study and collaborative international partnerships in this field. Going forward, it may prove useful for people within England who use this method to connect more with each other as well as the international community.

Developing Self-Study of Teacher Education Practice in Iceland

Action research as a form of practitioner research has been developing in Iceland from the 1980s, beginning with courses for in-service teachers in 1984. This can be seen as the groundwork for introducing self-study of teacher education practice (S-STEP) since some of the teachers participating in these action research courses later became teacher educators at the University of Iceland and brought with them the professional activity of reflection on their practice. Teacher education was situated at the upper secondary level until 1974 when it moved to bachelor level and in 2012 to master's level. In the same process, the research task of teacher educators grew. That became an additional difficulty in the transition from being a teacher to

becoming a teacher educator, which next to teaching people to become teachers is already a complicated task (Loughran 2014).

Around the turn of the millennium, Dr. Hafdís Guðjónsdóttir began her career as a teacher educator. She had been conducting action research for more than a decade, but at S-STEP sessions at the AERA conference in 1999, she learned about self-study of teacher education practices as a research methodology. She discovered that self-study offers a frame for teacher educators to critically reflect on their practice and a forum to understand what they do, how and why they do it, and how this can help to improve their practice and to make their study public (Samaras et al. 2012). In addition, the researcher gains an ontological sense of her stance in the professional world and creates a space for dialogue about her knowledge and for understanding of her own practice (Pinnegar and Hamilton 2010). This appealed to Hafdís, and she adopted the methodology as she became a teacher educator. She collaborated with colleagues around the world, especially with Dr. Mary Dalmau, a teacher educator at Victoria University in Melbourne. As they developed as teacher educators, they published their work in chapters and articles, for example, *Framing professional discourse with teachers* (Dalmau and Guðjónsdóttir 2002); *Revisioning And Recreating Practice: Collaboration in Self-Study* (Bodone et al. 2004); *Transformative Pathways: Inclusive Pedagogies in Teacher Education (*Guðjónsdóttir et al. 2007*)*; and *On Fire for Teacher Education: Enacting Active Scholarship* (Dalmau and Guðjónsdóttir 2012).

Iceland University of Education (IUE)

Self-study of teacher education practices is not a common practice at the Iceland University of Education (IUE). In 2004 the first course on action research was offered at the IUE. Since then, the course is offered annually and has good attendance. Gradually, qualitative research gained recognition and respect, and master's studies were conducted using action research methodology. Many of these studies were from teachers looking into their own teaching or work in education. However, these studies were not focused on the self or on how the practitioner was developing or transforming but more on how the practice was developing and changing. The formal claim for recognition of self-study methodology came with a doctoral study in education by Hafþór Guðjónssons, who in 2002 defended his thesis titled *Teacher Learning and Language: A Pragmatic Self-Study*. With this research, self-study formally emerged in Iceland. His doctoral thesis was followed by three more doctoral self-studies. Karen Rut Gísladóttir (2011) wrote *I am deaf, not illiterate: A hearing teacher's ideological journey into the literacy practices of children who are deaf* (see also Gísladóttir and Guðjónsdóttir 2014 and Gísladóttir 2014), Jónína Vala Kristinsdóttir (2016) presented *Collaborative inquiry into mathematics teaching: Developing a partnership in researching practice in primary grades and teacher education* (see also Kristinsdóttir 2010), and in 2017 Edda Óskarsdóttir finished *Constructing support as inclusive practice: A self-study.*

In 2015 Hafdís, Jónína, Karen Rut, Svanborg Rannveig, and Edda decided to study how they became self-study researchers. They conducted reflective focus group meetings to discuss their development. Data was collected through recordings

that were transcribed and analyzed. Hafdís used the methodology of self-study of teacher education practice to further develop as a teacher educator and to create courses. She continued to develop and publish her work consistently. When, a few years after she had finished her doctoral thesis, Jónína came back to the University, she and Hafdís collaborated and conducted a self-study when creating and teaching a course for teachers in mathematics and inclusion. Jónína was very knowledgeable about action research, and she described her move to self-study as follows:

> When I got to know action research I was very pleased with the frames offered and as I began to use the method I found it very helpful to have these guiding lights to support my research. The frames with the action research cycle were not limiting and I wasn't worried that I was doing things in the right or the wrong order. Then when I got to know self-study it felt the most natural thing in the world. (Reflective focus group meeting, February 2, 2015)

Hafdís and Jónína published their work in chapters and articles, for example, *Teaching all children mathematics: How self-study made a* difference (Guðjónsdóttir and Kristinsdóttir 2006) and *Team-Teaching About Mathematics for All, Collaborative Self-Study* (Guðjónsdóttir and Kristinsdóttir 2011). In 2012, Hafdís and Svanborg began teaching together. Svanborg was a new university teacher and got to know self-study as she and Hafdís studied their collaboration and teaching in one of their courses (Guðjónsdóttir and Jónsdóttir 2012, 2016; Jónsdóttir and Gísladóttir 2016). She found self-study a rational way to research her practice and to reflect on her role in implementing the innovative elements they were trying out. However, as she started to mention this method to some colleagues, they frowned upon it and made some demeaning remarks. Svanborg reflected on her experience:

> If I look back on how I experienced beginning with self-study with Hafdís on our course *Teaching diverse groups of students*, it felt so sensible. But we lacked the words in Icelandic that properly covered the English concept self-study. We wrote about our findings in Icelandic using the words "kennarar rannsaka eigið starf" ("teachers research their own work") for self-study. It was somehow as if *self-study* was banned as a word in our language – and we were looking for the proper expression to use in Icelandic. (Reflective focusgroup meeting, February 2, 2015)

Svanborg did not let what our colleagues said about self-study affect her too much and carried on with self-study together with another colleague, Karen Rut, and with Hafdís, publishing both in Icelandic and English (Guðjónsdóttir et al. 2014). The process empowered her to become the university teacher she wanted to be. In her words:

> I also discovered that the research process helped me and my colleagues to respond to students needs and make our courses more influential in a positive way. In the collaborative self-study projects with Karen and Hafdís I have learned to analyse my visions, uncover my values and beliefs and I have developed my professional identity. (Reflective focusgroup meeting, February 2, 2015)

Their collaboration turned into a publication on teacher education practice in Icelandic and was used as an opportunity to broader introduce S-STEP in Iceland. Initially this became an issue for the editors of the journal, because they did not

understand self-study methodology (one example about yourself: how can you generalize the findings?), but after some explanation the study was published.

Looking over the history of the development of self-study in Iceland, we can see that action research and self-study have gained ground in Icelandic research hand in hand with the development and acknowledgement of qualitative research. With qualitative research gaining recognition, the visibility of the researcher is more often considered a strength rather than a weakness. This has led to a different view in which the self has started to emerge as an important part of the research process and findings. However, self-study of teacher education is not a common practice of many Icelandic teacher educators, but it is a strength for teacher educators who practice it.

Moving on

Our experience with introducing self-study in Iceland has met with a lack of understanding and knowledge about the methodology in our professional community and with prejudice that has appeared as demeaning remarks about the usefulness and respectability of the method or as disinterest. Developing a community of teacher educators engaging in self-study, however, is becoming a reality that we hope will spur others to engage in self-study. A key to such development is presentation and publication in Icelandic and finding the Icelandic words that convey the core of the methodology.

From 2013, Hafdís, Karen Rut, and Svanborg have teamed up and collaborated as teacher educators and self-study researchers. They have developed collaborative supervision for students working on their master projects and published their work as articles and chapters: *Using Self-Study to Develop a Third Space for Collaborative Supervision of Master's Projects in Teacher Education* (Jónsdóttir et al. 2015) and *Collaborative Supervision: Using Core Reflection to Understand Our Supervision of Master's Projects* (Guðjónsdóttir et al. 2017). Moreover, they transformed a course on inclusive education building on the data from their self-study. This study was published in *Creating Meaningful Learning Opportunities Online* (Guðjónsdóttir et al. 2015).

This small group of teacher educators that has developed as a self-study research team has learned that collaborative self-study of shared teaching and learning experiences can help draw out the complex thinking, decision-making, and pedagogical rationale that supports the professional work of teacher educators. Analyzing our vision, values, and beliefs can help us gain an understanding of our professional identity and become active change agents (Dalmau and Guðjónsdóttir 2002; Loughran 2014). In this writing we have tried to shed a light on how a group of scholars in our country created and developed a self-study discourse in their professional community.

The Story of a Sport Pedagogy Self-Study Group in an Irish University

Introduction

Self-study in Ireland appears not to be as well-established as in other countries. We found two publications of Nona Lyons and Carmel Halton (University of Cork)

who, together with Helen Freidus (USA), studied their critical roles as facilitators of reflection in transformative learning in three different settings (Lyons et al. 2012, 2013). A third article was by Annelie Eberhardt (with Manuela Heinz, Eberhardt and Heinz 2017) who, coming from Germany to Ireland, reflected on the messiness of action research while studying how she can support teachers in becoming critical inquirers of their own classrooms. Worth mentioning is the website of the *Network for Educational Action Research in Ireland* which sets out "to explore the appropriateness of self-study approaches to action research for practitioners" (http://www.eari.ie/neari-network-for-educational-action-research-in-ireland/).

We focus in this section on conveying the story of how self-study has brought together a group of sport pedagogues in the University of Limerick to consider opportunities for collaborative teaching and research. We outline what sport pedagogy is and who the members of the group are before focusing on our work to date in self-study and current self-study projects. All members of the sport pedagogy group identify as physical education teacher educators, appreciating that this is a sub-discipline of sport pedagogy. With this specific shared identity, self-study research provides a method for systematic inquiry into teaching and teacher education, encouraging a network of practitioners/researchers who bring an inquiry-oriented stance toward researching their own practice.

Who Are We?

Sport pedagogy is the joining of education and sport. In its broadest context, sport pedagogy includes physical activity, physical education, wellness, and sport for all age groups. Sport pedagogy is evidenced-based and practice-focused, built on a foundation of effective teaching and coaching, and aimed at promoting participants' learning (Armour 2011).

The complement of sport pedagogues in the University of Limerick resides in the Department of Physical Education and Sport Sciences and includes two professors, one senior lecturer (emeritus), four lecturers, two Applied Studies Coordinators, and four doctoral students. All are involved in teaching in the two physical education teacher education (PETE) programs. Half of the group have doctoral degrees, while the others are studying for doctoral degrees as full-time staff members or full-time doctoral students who have come predominantly from teaching school-level physical education. This allows a cross-fertilization of academic staff ideas on teaching and PETE with the modern realities of schooling that the Applied Studies Coordinators bring with them. Encouraging such networks within PETE programs not only strengthens the sense of a shared community of practitioners/researchers but also encompasses a level of program accountability in providing evidence of the extent to which a PETE program effectively provides teachers and pre-service teachers (PSTs) with intended experiences. A number of the group are internationally respected as sport pedagogues and have contributed significantly to the research literature in the sport pedagogy domain through the publication of books, book chapters, and peer-reviewed papers.

Focus of Published Self-Study Work and Ongoing Self-Study Projects Within the Group

Several members of the group have amassed self-study research outputs that focus on their experiences of being a teacher educator (MacPhail 2011, 2014, 2017; Tannehill 2014), being members of a teacher education learning community (MacPhail et al. 2014; Parker et al. 2016; Tannehill et al. 2016), and considering the continued and future use of self-study as physical education teacher educators (Ní Chróinín et al. 2016; O'Sullivan 2014). This ongoing interest in self-study frames a number of projects that the group is currently undertaking, and we would like to expand on three particular projects here. The first two reside within the group of sport pedagogues at the University of Limerick, while the third provides an example of working across institutions and countries.

Project 1: Encouraging colleagues to explore their identity and practices through self-study

Five members of the sport pedagogy group had a shared symposium accepted for a US conference in March 2015. The group included three established researchers in self-study and two colleagues who were new to self-study. Indeed, this was one colleague's first research writing endeavor. Between the established researchers presenting an introduction to self-study, exploring our move as a sport pedagogy faculty from focusing on the "me" to "us" and concluding the session, the two colleagues who were new to self-study presented on their self-study of (i) being commonly identified as the "adapted physical activity person" and (ii) their feeling of "going back to school" in being prompted to consider their positioning as a teacher educator, a dance educator, and a dancer. All five presenters worked successfully on securing a peer-reviewed publication from the work (Tannehill et al. 2016).

Project 2: A collegial involvement in self-study

The aim of this research is to undertake collective teacher education self-studies on the enactment of curriculum and instruction models within a PETE program to enhance our understanding of how a close collegial self-study teacher educator community of practice can support each other. The research entails physical education teacher educators aligning themselves to a specific curriculum and instructional model they will deliver throughout a module on the undergraduate program. The teacher educators will work in groups of three with one person responsible for the delivery of the model, a second person acting as a critical friend on a weekly basis to that person, and a third person prompting the research component of the initiative. Such promoting can include encouraging weekly documentation of delivery and associated experiences and discussions with the critical friend documenting the teacher educators' and PSTs' perspectives of the specific curriculum and instructional model. All three members of the group will contribute to a collective self-study of their involvement in the initiative.

Project 3: Self-study and meta-critical friendship

International engagement across teacher education programs has been an element of our self-study work (Ní Chróinín et al. 2015, 2017). Three physical education teacher educators (two from Ireland and one from Canada) have collaborated to develop and implement new pedagogical approaches in two PETE programs. Additionally, we have sought to describe and interpret how two distinct layers of critical friendship were used to support the pedagogical innovation in PST education (Fletcher et al. 2016; Ní Chróinín et al. 2016). Across a 2-year period, we experimented with a pedagogical practice we named LAMPE (Learning About Meaningful Physical Education) integrating it into the teacher education programs of both prospective primary and secondary teachers of physical education. Critical friendship was applied in two ways: (1) the first two authors served as critical friends to each other as they taught their respective teacher education courses using LAMPE, and (2) the third author acted as a meta-critical friend, providing support for and critique of the first two authors' development and enactment of the innovation. Over 2 years, the two layers of critical friendship held significant benefits in advancing and supporting the development of the innovation while also contributing to the professional learning of all participants. The role of meta-critical friend (in this case a senior academic) was in collaborating with two early to mid-career academics in supporting their pedagogical innovations. It involved three distinctive roles as a meta-critical friend in the three-way conversations that are a feature of the self-study projects. One was as a "connector of ideas," seeking to support two colleagues to gain a broader perspective on the research. A second role was an "interrogator of ideas" which allowed the critical friend to probe and help their colleagues to better articulate principles of practice of this pedagogical approach and positioning it within the wider literature. A third position of the meta-critical friend was as a "mediator" in challenging colleagues to examine the nature of their research relationship pushing the boundaries of how they acted as critical friends. This role drew on Fullan's (1993) concept of teacher change in moving beyond politeness in earlier interactions to more critical interrogations of each other's practices and thinking.

Closing Remarks

The group are interested in extending their investment in self-study through potential future deigns including (i) across program and department collaborations around a theme and (ii) across PETE programs and physical education teacher educators nationally and internationally.

Self-Study Research in the Netherlands

Dutch teacher educators have a rich background in teaching, but their research background is often limited, also because traditionally most teacher educators have no research time. In the last decade, however, a shift can be noticed. Student teachers are more often requested to carry out a research project in their final year of teacher

education; thus teacher educators are expected to support student teachers to do so. This is one of the reasons that the attention for teacher educators' research capabilities has increased. In this context, in 2007, Lunenberg et al. (2010a) started the first Dutch self-study project called "Self-study: Teacher educators study their own practice." The naming of the project showed that, like in Iceland, we were struggling with a translation of "self-study research" that was meaningful in the Dutch context without losing the self.

The project aimed to contribute to the introduction of self-study research in the Netherlands as well as to support the participating teacher educators to further develop their scholarship. During a year a small group of teacher educators from different teacher education institutions, together with the facilitators, met monthly, and in between the meetings, the participants got individual support. Since then, this initiative was followed up by two more self-study trajectories, in 2008 and in 2015 (Berry et al. 2018), a 5-year-long self-study community from 2009 to 2013 (Lunenberg et al. 2012), and a self-study writing group from 2016 to 2018 (Lunenberg et al. 2018). All of these self-study activities were extensively studied not only for its effects on the participants but also with the wish to learn more about facilitating self-study research.

Inspired by these loosely connected initiatives, other self-studies initiatives also popped up in the Netherlands. Bronkhorst and Van Rijswijk (Bronkhorst et al. 2013) studied the (dis)continuities they experienced in the transition from being a researcher to becoming a teacher educator and vice versa. Koster and Van den Berg (2014) report about a self-study of six teachers who explored dilemmas that challenged their professional values. De Heer et al. (2018) collaboratively carried out an ongoing self-study on their development as researchers in a shifting landscape: the increasing emphasis on research in their institution, the policy choices that followed, and the consequences of these choices for themselves and their collegial collaboration (see also De Heer et al. 2010). Kools (2017, 2018) also wrote about the processes in a self-study group she hosted and about the topics the participating teacher educators chose to study.

Learning Self-Study Research

Researching the self-study activities mentioned above showed that these strongly contributed to the professional learning of the participants (Berry et al. 2018; Geursen et al. 2010, 2016; Lunenberg et al. 2010a, 2010b; Zwart et al. 2008). They helped them to improve their practices, offered them a new perspective on research, and enabled them to better understand the pitfalls student teachers meet in their research projects (Radstake 2018). Focusing on a specific research theme also helped to get a grip on literature (Lunenberg et al. 2010a, 2010b). Reading academic publications in English does not only require a literal understanding but also understanding of meaning. Reading literature that was related to a self-chosen research question helped. Interestingly, the issue of understanding the meaning of the English language also led to a long-term cooperation between a Dutch teacher educator teaching English in the Netherlands (Janneke Geursen) and a Canadian colleague who taught English to French-speaking Canadians (Lynn Thomas), who

met at the Castle Conference. This resulted in several collaborative self-studies (e.g., Thomas and Geursen 2013, 2016).

Another important aspect that stimulated learning was working in a group (Lunenberg et al. 2010a, 2018). The safety of the group supported moving through chaos and finding one's path, and it offered emotional support:

> Our community proved to be a safe meeting place, a place where we could inform each other about the discoveries we had made when studying our practices, discussing not only the how, but also the why of our findings and thus contributing to improving not only our personal practices, but also each other's. By analyzing deeper meanings underlying the outcomes, we have "moved beyond the story." (Lunenberg et al. 2012, p. 189)

Identity Development

The results of studies on the 2007 and 2008 self-study trajectories (Lunenberg et al. 2010a, 2010b) revealed that the learning through self-study went deeper than cognitive and practical learning; it also led to identity development (Geursen et al. 2010; Lunenberg et al. 2011). In self-study literature, it is often emphasized that self-study research is a productive way to combine teacher educators' dual roles of teacher of teachers and researcher, because self-study research starts with a challenge or problem related to being a teacher of teachers (Loughran 2014). In the Netherlands, however, most teacher educators only have a role as a teacher of teachers. Hence, for Dutch teacher educators, self-study research is not a way to combine the roles of teacher of teacher and researcher but a way to extend their teacher educator role as a teacher of teachers and to explore the new role of researcher (Lunenberg et al. 2018). This did not mean that there were only positive feelings with regard to the (new) role of researcher (Lunenberg et al. 2012). Research became more familiar, but the consciousness of the complexity of research also grew. This led to what Tack and Vanderlinde (2014) call different researcherly dispositions. Some teacher educators defined themselves as teacher of teachers who now knew more about research; others became teacher educators/researchers. In addition to publications mentioned in this chapter, several articles were published in the *Dutch Journal of Teacher Educators*, and almost every year self-studies were presented at the annual Dutch Conference for Teacher Educators. Going public had a remarkable effect on self-confidence. Since 2008 participants in Dutch self-study activities also presented their work at the Castle Conference, which was experienced as a highlight:

> The huge diversity of self-study approaches, of collecting data, and of presenting surprised me and offered me a lot of new information and ideas. Also the informal meetings were valuable. (. . .) Mirroring my own practice to the practices of others made me also more conscious of my qualities and my added value as school-based teacher educator. (Hagebeuk 2018)

Facilitating Self-Study Research

The unfamiliarity of Dutch teacher educators with (self-study) research was the reason to organize the Dutch self-study projects mentioned above and to provide structural support for the participants, offered by experienced self-study researchers.

At the beginning a main source of inspiration for the facilitators was the work of Hoban (2007). Since 2007, an increasing number of studies on facilitating self-study research have been published (Davey et al. 2010, 2011; Pithouse-Morgan et al. 2015; Samaras et al. 2008; Vanassche and Kelchtermans 2015) that further inspired the development of supporting self-study research in the Netherlands. A comparative study (Lunenberg and Samaras 2011; Samaras and Lunenberg 2010) helped the development of a set of guidelines that could support self-study research.

Loughran's introduction of the journey metaphor was helpful in naming the Dutch approach (Loughran 2014). It combines space for both individual and collective experiences and the idea of following personal interests in a loosely pre-structured environment. It also helped the facilitators to look into their own role from different perspectives: "What would be my role as a facilitator during the journey: group member, journey leader, luggage porter?" (Berry et al. 2018).

Self-study research of the facilitators showed the importance of thoughtful pedagogical choices in the meetings. Because most Dutch teacher educators have teaching only positions, they had no outspoken opinion about the facilitators' research expertise, but they were quite alert to the pedagogical approaches used. Hence, the thoughtful pedagogical approaches helped to build trust and feelings of safety (Lunenberg et al. 2018).

One other specific issue of facilitating Dutch self-study activities was meeting participants' methodological doubts about reliability and generalization and discussing the challenging idea of going public with a personal study (Lunenberg et al. 2010a, 2010b). These issues contributed to a risk of losing the "I" when participants had to translate a practical challenge into a research question. In a reflective article one of the facilitators remarked:

> I think culture plays a very important role here, and not just research culture. There is a tendency in the Netherlands to be rather critical of others, but also of ourselves. Being open, sharing insecurities, and even showing achievements is not really encouraged. And although the value of critical reflection backed by theory is recognised by many teacher educators, you still feel the fear of being considered "soft". (Berry et al. 2015, p. 47)

Hence, Dutch facilitators had to take into account the cultural context in which a self-study was carried out. The study of Vanassche in Flanders, a country with a comparable culture, also emphasized the importance of this aspect (Vanassche 2014; Vanassche and Kelchtermans 2015).

Self-Study Research in Europe: Present and Future

The aim of this chapter was to offer insight into the positioning and development of self-study research in Europe; to demonstrate the contribution of self-study research to the professional development of European teacher educators and to the international knowledge base of teacher educators; and to reflect on the further development of self-study research in Europe.

This aim is ambitious, taken into account that Europe is a patchwork of countries, cultures, and languages. Looking more specifically at teacher educators in Europe, we see a broad variation in background, tasks, and opportunities for professional development. The attention to teacher educators' professional development in Europe started in the beginning of this century, and while this attention is spreading, the situation per country still varies from structural approaches to no approaches at all. On a policy level, the European Commission publication *Supporting Teacher Educators for Better Learning Outcomes* in 2013 was a milestone. However, the consolidation of this policy document into national policy and practice is a challenge.

The development of self-study research in Europe is intertwined with the professional development of teacher educators. Self-study could also build on existing European traditions in practitioner research, such as action research.

In this chapter we have explored in-depth the developments in four countries where self-study research has been carried out since the beginning of the century (England, Iceland, Ireland, the Netherlands). As described above, for example, in England and Iceland, the familiarity with action research often was a base for teacher educators to further explore what self-study methodology could offer. This building on action research and other forms of practitioner research can also be seen in other European countries, among them Norway (Ulvik 2014; Smith 2017). Another stimulation to explore the possibilities that self-study methodology has to offer was the increasing importance of research in countries such as Iceland and the Netherlands where traditionally former teachers were appointed as teacher educators. Consequently, most teacher educators in these two countries did not have a research background and therefore explored ways to become familiar with research. In the Netherlands this led to the initiation of facilitated self-study trajectories. The Irish context reported earlier provides an example of a successful framework where those less familiar with research were welcomed and incorporated into a subject-specific self-study research group.

In all four countries, self-study has proved to be a useful and stimulating way to aid the transition from being a teacher – or researcher – to becoming a teacher educator. Self-study methodology not only supported the understanding and development of the teacher education practice but also led to transformative learning, i.e., to identity development. It helps teacher educators to become conscious about the roles teacher educators fulfil (such as teacher of teachers and researcher but also curriculum developer, coach, assessor, broker) and how best to position themselves in relation to these roles.

Working together is an important condition for conducting self-study research. As pointed out in the Introduction of this chapter, researching the "I" requests stepping back from the "I," which cannot be done without critical friends. In the Icelandic situation, this entailed working together in a small group. In the Netherlands several self-study trajectories and communities have been organized in the last decade. In England, Iceland, and Ireland, self-study research has been developed by collegial groups within a university.

A self-study group offers safe, practical, and emotional support and connects – as can be read in the Irish contribution – the "me" and "us," offering meta-critical friendship. In addition, the Irish collaborative self-studies of researchers and practitioners have strengthened the PETE program at the University of Limerick.

The Dutch contribution emphasizes how the safety of a group helped to overcome doubts, strengthened by a critical culture, about the reliability of self-study research. Dutch and Flemish studies (e.g., Vanassche 2014, Vanassche and Kelchtermans 2015) show that facilitators of self-study groups need to take national characteristics, such as a critical culture, into account. Most outspoken in this context is the language issue. In Iceland, as well as in the Netherlands, finding the right words to talk and write about self-study methodology is a challenge, and teacher educators who want to frame their self-studies sometimes struggle to connect their Icelandic and Dutch practices with Anglo-Saxon publications.

In all four countries, cooperation across the ocean also plays an important role in the support for and further development of self-study research. Considering the relatively small European self-study communities, working together with colleagues from North America and Australia is important. The English section clearly shows how connecting with colleagues abroad, participating in S-STEP activities at conferences, and reading and discussing international literature contributed to the development of self-study research in the School of Education of the University of Hertfordshire. In this context the role of the biannual S-STEP Castle Conference in England should not be underestimated. For European teacher educators, this conference has proved to be an important portal to self-study research and to cooperation with colleagues from other countries. It is also important to note that for some attendees, this is their first experience of "going public" and of presenting in English.

On the Road to the Future

Writing this chapter has helped us to map and get an overview of self-study research in our own four countries and in Europe. So far, the development of self-study research in Europe has been the work of individuals and small groups, and the institutional embedding is still limited in the four countries discussed in this chapter, countries that are in the forefront.

On the positive side, this chapter shows what these relatively small initiatives have already contributed to the professional development of teacher educators and also highlights the European contribution to the growing knowledge about self-study methodology.

We see several future chances for self-study research in Europe. As stated in the Icelandic contribution, this chapter shows that only a few active change agents are needed to trigger the development of self-study research in a country.

Moreover, the attention for research in teacher education and for researcherly dispositions of teacher educators in Europe is growing, and self-study research can contribute to this growth and help to broaden the professional identity of teacher

educators. Also, the increasing consciousness of the influence of different national contexts and different languages can help to develop more tailored initiatives to stimulate self-study research in various European countries.

The section above on self-study research in England, Iceland, Ireland, and the Netherlands also offers practical suggestions for involving more teacher educators in self-study research. A few examples are as follows: In Ireland a self-study mentoring scheme has been developed that is focused on mentoring self-study researchers as well as the critical friends. In the Netherlands pedagogical approaches of supporting self-study groups have been made explicit. In the English contribution, participating in the procedures of the Castle Conference is given as a successful example of learning to write and publish, and in Ireland writing short articles for professional journals proved to be productive. Both approaches can also be seen in the Netherlands.

Working together on this chapter has offered us a solid base to further promote self-study research in Europe. We feel it could be interesting to explore the possibility to organize small invited seminars to identify cross-Europe possibilities for self-study research. We also will continue publishing about self-study research from a European point of view, to gain deeper insights into the specific cultural and contextual influences in play within specific, and across, European countries. Working together on self-study research and writing can strengthen our existing connections and build our emerging practice. We look forward to building on these foundations.

Introducing Self-Study in Quebec: The Challenges of Promoting S-STEP in the French Language

48

Lynn Thomas

Contents

Abstract

The self-study of teacher education practices is largely unknown among French-speaking teacher educators in Quebec, Canada, because there are almost no publications of self-study research in the French language. This chapter recounts how one researcher introduced the self-study of teacher education practices to colleagues in a French language university in Quebec. The chapter describes the challenges of making this methodology intelligible and compelling to colleagues who carry out research in a language where self-study as a research methodology is unknown. Exploring how colleagues came to understand the potential benefits of self-study of teacher education practices for teacher educators helped to redefine and clarify the importance of self-study for the author.

Introduction

This chapter examines the challenges of introducing self-study to a group of researchers at the Université de Sherbrooke, in Sherbrooke, Quebec, Canada. In that sense it is not a self-study but rather an account of a journey toward introducing self-study to others who do not have ready access to the literature due to differences in language and culture. However, my voice as a self-study researcher creeps in from time to time as I critically examine the process of helping my colleagues learn about ways to examine their practice as teacher educators and reflect on the implications of why this process was more challenging than I expected. I kept a journal of these reflections during the process and include some entries from that journal in this chapter.

Self-study of teacher education practices as a research methodology is practically unknown in the French language educational research community and was certainly unknown to the researchers in my institution before the group and I began to work together to explore the potential of this research methodology. As a seasoned self-study researcher whose first language is English, my initial intention was to translate self-study into French and present the potential advantages of carrying out self-study research for the improvement of teacher education practices to my colleagues. I soon realized that a simple translation of research articles would not be enough to support the learning of a new research paradigm, since the idea of university professors researching their own practice was a very novel perspective. This chapter has been written to explain how I translated and adapted the methodology, in concert with my French-speaking colleagues, to meet their needs given that there has been no precedent for self-study research in French. Through systematic study of how this collaborative French language research group began to understand self-study as a means for exploring and understanding their practice as teacher educators in ways that made sense to them, I explored the depths of my own understanding of self-study research and reconsidered how and why it was so pertinent and important to me in my own bilingual context of teacher education in Canada.

Context

The research climate in Faculties of Education at French language institutions in Quebec, Canada, contains an interesting hybrid of influences primarily based on European French language research traditions from France, Belgium, and Switzerland, joined with some influences from English language research from the United States, and to a lesser extent, other Canadian provinces. The self-study of teacher education practices as a research methodology has not been translated

into French and is virtually unknown among researchers in French universities in Quebec, although English-speaking researchers in Quebec do research their practices and publish self-studies, for example, Claudia Mitchell from McGill University (Pithouse-Morgan et al. 2014). Canada's education system right from preschool through university is completely decentralized, meaning that each province controls and administers educational institutions separately. Within Quebec there are two entirely separate educational systems for students based on language of instruction, either English or French. This is also true for universities, and there is surprisingly little interaction, collaboration, or even communication between professors at English language universities and those at French language universities. English is a minority language in Quebec, and there are many more French institutions than English ones at all levels of education, including universities. In order to fill vacant positions, particularly in the regional areas of the province, including the university where this study took place, professors are often recruited from French-speaking countries in Europe and elsewhere, reinforcing the influence of the French language research climate mentioned above.

It should be noted here that the teacher educators referred to in this chapter are all tenure stream or tenured professors with doctoral degrees working full time with undergraduate and graduate level students who are studying to be teachers. In Quebec, as is true elsewhere in Canada, the United States, and other countries, university professors in the field of education are expected to carry out research, teach courses, and contribute to the institution in a service capacity in that order.

Introducing Self-Study to Quebec

Although I am bilingual and able to speak, read, write, and teach in French, I generally choose to carry out almost all of my research in English, as that is my first language and the language in which I did my graduate studies. I was introduced to the self-study special interest group (SIG) at the annual meeting of the American Educational Research Association (AERA) in 2007 in Chicago after attending a session about the professional identities of teacher educators (Hamilton and Lunenberg 2007) and was profoundly affected by the potential of this approach to studying and improving my practice as a teacher educator. Although I have worked at this French language institution for the past 15 years, I never found it easy to participate in collaborative research with my colleagues as the conceptual frameworks and background literature they use most frequently are not familiar to me. Graduate students in education in Quebec are expected to read French educational researchers, whereas the most common influences during my graduate studies in Vancouver, Canada, were American researchers. In fact, when I first arrived at the university where I now work, I found myself unable to join in conversations about educational research because I had never heard of any of the "big names" that my colleagues were referring to, despite the fact that I had completed my doctoral studies only 5 years earlier. I felt that I needed to start all over again to read the same authors that my colleagues had studied during their graduate work in order to

be able to join in conversations and be taken seriously as a researcher. This was true even though the department is widely multicultural, with professors from Belgium, Switzerland, France, Romania, Morocco, Rwanda, and Burundi as well as Quebec. One thing they all had in common is that they had completed their graduate studies in Education in the French language, meaning that they were introduced to research in education within a French language paradigm. I did begin to read about educational research in French and did participate in studies with colleagues, but it continued to feel foreign to me and very separate from the research that I undertook in English.

When I was introduced to self-study of teacher education practices by a happy accident, I immediately felt like I had found an important research community that was supportive while it also challenged me to examine my practice as a teacher educator. Initially, I felt it was enough to have found a congenial research community, even if it did not connect in any way with my home university. In addition, it was very difficult to imagine that my colleagues might be interested in learning more about self-study because I could not refer to any literature on self-study in the French language. I often felt like I was living in two very distinct worlds of educational research, an English language one and a French language one, and there was no common ground between the two.

However, over time and through casual conversations about conferences and my professional activities during a sabbatical study leave, the self-study of teacher education practices became a topic of discussion with colleagues, and a few colleagues in my department indicated an interest in learning more about this approach. With a desire to bring self-study home and to encourage my colleagues to learn more about the potential of this approach, I organized a few informal meetings and shared information, such as access to the *Studying Teacher Education* journal, as well as making a more formal presentation. A few colleagues and students were intrigued and indicated that they wanted to learn more about this approach to research but were reluctant to read articles written in English. Introducing self-study to my colleagues was a slow process because it was difficult to find ways to make connections to what my fellow researchers already understood as valid research. Even those who were particularly interested in learning more about self-study approaches and the potential for improving teacher education practice struggled to be able to relate to such research when all of the literature is published entirely in English. I needed to look at breaking the cycle and providing researchers with examples of self-study research written in French. It is interesting to note that providing examples of self-study research in Spanish was one of the first things that colleagues in Chile chose to do, using funding from the government to translate several articles from past issues of *Studying Teacher Education* in book format (see ▶ Chap. 46, "Introducing Self-Study of Teacher Education Practices into Another Culture: The Experience in Chile" by Fuentealba, Hirmas, and Russell). This volume also includes examples of teacher educators in South Korea and Japan working with translated copies of self-study literature.

I considered taking on the translation task myself, but I am not a translator, and even professionals will translate from a second language into their native tongue.

Since my first language is English and not French, it quickly became clear to me that I was not the person to translate self-study literature from English into French. However, finding a first language speaker of French who is interested enough in self-study to undertake this translation has proved difficult. After an initial data search on the French language search engines, I did not find any publication related to self-study written in French at that time. As I noted in my journal at the time:

> I think the only thing to do would be to apply for a grant and pay a professional to translate some of the better known works on self-study, but even to know where to begin will be hard! There is so much published, how to even choose which book or article to start with? How could I presume to know what would be most useful or inspiring to French colleagues? I cannot simply assume that what speaks most clearly to me will also best for them. (Personal Journal, 02-23-2017)

At the same time as some of us were discussing self-study, another one of my colleagues started a research group to study the integration of technology in university-level teaching (PeDTICE for pedagogy and information and communication technologies, http://pedtice.org), which was open to exploring other aspects of researching innovations in higher education. The members of this group demonstrated a strong interest in developing and improving pedagogical practices in higher education (Bélisle et al. 2014) and experimenting and sharing innovations in their practice of teacher education (Nizet and Meyer 2014). I decided that this group would be a good home for a self-study community and offered to present self-study in a more formal way to the members of this research group.

After an initial meeting, which was organized to present both Scholarship of Teaching and Learning (SoTL) and self-study of teacher education practices, a small core group indicated an interest in pursuing self-study. Guided by Samaras (2011) and inspired by studies on the positive aspects of collaborative self-study (Kitchen et al. 2008; Davey and Ham 2009), we began the process of examining, exploring, and transforming self-study into a Quebec context. Following my presentation on self-study as a research methodology, one colleague decided to carry out a self-study of an innovative aspect of his practice, and he asked another colleague to act as a critical friend. A few graduate students became interested in using self-study research methodology for their thesis studies. This meant that their supervisors had a vested interest in learning more about the research methodology, meaning that further discussions and a sharing of resources, such as Loughran, LaBoskey, Hamilton, and Russell (2004) and Samaras (2011), took place. For a short period of time, it appeared that we were really getting going and that teacher educators at my university would regularly undertake self-studies with a view to improving their practice. I really believed that we had overcome the challenge of a lack of literature in French and that we were on our way to creating our own literature in the French language.

However, the encouraging start did not last, and it soon became apparent that my colleagues continued to view self-study as somewhat peripheral to their main areas of research. Subsequent meetings had poor attendance, and there was no interest in

getting together to share progress in self-study research on a regular basis. Once they had learned about it, self-study became a definite possibility for my colleagues, but it did not become a regular choice for research and publication. Reasons for this will be discussed in the next section.

Ongoing Challenges for Establishing a French Language Self-Study Research Community

There are several reasons why there is still very little self-study research being carried out in French in Quebec at this time, despite my colleagues' interest in examining their practice and exploring ways to improve it, and despite the introductory discussions and translations that I have provided. These reasons are not limited to researchers who work in the French language and may even apply to English-speaking teacher educators who choose not to do self-study, even after learning about it. In this section I step back and take a look at some of these reasons and reflect on the ongoing challenges, which may also be true for researchers working in other languages than English in this field.

Concerns About Intentionality, Legitimacy, and Honesty

As Gregory et al. (2017) have pointed out, most publications on self-studies describe the research process and the outcomes, while few explore how the researchers came to understand the research methodology and how to use it to explore and improve their practice. In their article, Gregory et al. (2017) describe the process of learning about self-study through a doctoral seminar. The questions and concerns of these doctoral students were very similar to those of this self-study group in Quebec. For example, Gregory and her colleagues mention that the members of the doctoral seminar were very concerned about revealing vulnerabilities when asked by their professor, an experienced self-study researcher, to share experiences (p. 263). These students also note that they worry about not finding appropriate questions or topics for self-study research, as well as wondering about intentionality, legitimacy, honesty, and a loss of control (p. 264). Similar concerns arose for our group in Quebec, and there are no easy answers to these concerns. Sometimes it is easier to simply find another way to examine similar questions about practice in teacher education.

One approach to research that shares similarities with self-study is the Scholarship of Teaching and Learning or SoTL, and this proved to be a bridge of sorts for the group. This literature has many similarities with self-study in that it is also undertaken with a view to researching, teaching, and learning in higher education institutions. Although it is not necessarily about one's own practice, SoTL outlines a research process that is similar, in the sense that each approach invites instructors in higher education to seek out ways to improve their practice. However, there are also important differences between the self-study of teacher education practices (S-STEP) and the SoTL. For example, SoTL methodologies

are more similar to action research than self-study in many ways. Hubball and Clarke (2010) write, "Essentially, SoTL internalizes theory and practice through a systematic and cyclical process of inquiry that involves hypothesis testing, planning, observing, analysis, and action" (n.p.). Huber (2006) notes that "The scholarship of teaching and learning is typically pursued as a kind of practitioner or action research by teachers in their own classrooms. . ." (p. 72). Despite the fact that the research on the SoTL is also primarily published in English, it was found to be more accessible to the French-speaking researchers as there is a slowly growing body of French language research in this field (see, e.g., Bélanger 2010; Rege Colet et al. 2011; Lison 2013; Bélisle et al. 2014). Several of my colleagues who initially expressed an interest in self-study now regularly describe themselves as SoTL researchers and make that approach a focus of their research and practice. In my journal I noted the following about the SoTL-self-study dichotomy:

> I wonder if the fact that it is not centered on the self that they feel more comfortable. Studying oneself as a practitioner requires one to take the research one step (or even several steps) closer to the personal, which is very distant from where my colleagues started as researchers since they were taught that research could be objective. Self-study is also very difficult work as it requires total honesty with oneself and a willingness to share that honesty with others. Perhaps it requires more time to adapt to very different approaches to research. I also think that it needs a welcoming, supportive community of seasoned self-study researchers, such as I experienced. I cannot make that community for them all by myself. (Personal Journal, 04-08-2017)

The number of published books and articles by reputable scholarly publishing companies and the existence of a journal (*Studying Teacher Education*, published by Taylor and Francis) were all labelled "reassuring" for the members of the group. As noted earlier, the group members primarily see this type of research an objective of improving teaching practice at the university level as similar to the mandate of the Scholarship of Teaching and Learning (SoTL) community (Hutchings et al. 2011; McKinney 2006), as therefore evidence that research into the practice of teaching in higher education is timely, important, and legitimate.

There is a clear belief that such evidence of legitimacy was particularly important in a francophone context because there is a general consensus that the culture of research for French-speaking educational researchers is more rigid and narrowly defined than what is deemed acceptable in English North American or Anglo-Saxon research communities. One reason given for this rigidity is that there is less research of any kind, including research into education, published in French than in English. French speakers are less exposed to the range of possibilities of educational research and are less likely to take part in the kinds of discussions around validity and legitimacy that have been front and center in North America in the latter part of the twentieth century and into the first decade of the twenty-first century (Eisner 1993, 1997; Zeichner 1999). This is particularly true with regard to self-study (Bullough and Pinnegar 2001; LaBoskey 2004; Samaras and Freese 2009; Loughran 2010). An important literature review article that outlines important research tensions that self-study researchers should pay attention to in order to produce findings

that are rigorous and relevant (Vanassche and Kelchtermans 2015) is also written in English, despite the fact that the authors are European. Another theory put forth by the group is that educational research in the French language is a relatively new phenomenon, and therefore researchers are still seeking out their niche within the larger research community in the French language. There is a movement within social sciences research in French to emphasize the scientific aspects of research in education, perhaps as a means of gaining legitimacy and acceptance within a larger research community. For example, we have also seen the renaming of Faculties of Education, as Faculties of the Sciences of Education. At the same time, contradictions about what is most legitimate abound, such as the fact that one group member claims that anything written in the English language, regardless of what it is, is seen to be more scientific, because English is the language of science.

Language Issues

As the bilingual member of the group, I initially simply translated the essential terminology related to self-study research into French, given that I was the most familiar with self-study and fluent in English. However, I am not a translator, and French is a language I learned later in life as an adult, so the translations were not always ideal. Language has proved to be an ongoing issue for us as translated terms are still under debate. There is no readily available translation for the term "self-study." The closest term might be "auto-étude" (Literally, self-study, but this makes no sense in French.) or more completely "étude sur ses propres practiques en formation à l'enseignement" (Study of one's own practices in teacher education), but neither of these phrases was found to be satisfactory, and members of the group began to use the English term on a regular basis, even when speaking French. One colleague mentioned that the use of the word "self" in French (*soi-même*) would be too controversial as it was unlikely to be easily understood. There was a consensus that the English language term is more objective and does not imply the same narcissism that the French words do. Another member of the group mentioned the fact that no one has translated the word yet, so there is a reluctance to be the first for fear of being misunderstood. There was a sense that there is a pejorative tone to some of the different French translations that we were able to come up with for the term. It is interesting to note that the group member who carried out a self-study and submitted a proposal for presentation at a French language conference did not use the term self-study in the title of his work (Petit 2015). He defended his decision by stating that he did not want to use an English term in a French language presentation and was not entirely sure as to how it would be accepted by conference organizers. I find this to be an example of how difficult it is for French-speaking researchers to feel truly comfortable using self-study research methodology. It is interesting to note that when this colleague decided to publish his self-study, he chose a bilingual Canadian journal, *The McGill Journal of Education*, and did include the term "self-study" in the title in English, even though he wrote the article in French (Petit and Ntebutse 2017).

Despite the general consensus to use the term "self-study" even when speaking French, several members of the group did note that using the English term gave them an impression that they were talking about something foreign every time they spoke about the research methodology. The fact that they could not go to the journals they were used to consulting about different aspects of research in education and that they had to read only in English to learn more about the methods were serious stumbling blocks for immersing themselves in the research. Each time they wanted to explore a new idea, journal article, or other resource related to self-study, they had to spend a considerable amount of time translating the text and discussing the findings and outcomes in terms of what they already knew as legitimate research. The current available options for publication are still not ideal, in that French speakers must either make the extra effort to translate their work into English in order to publish it or write up their self-study research in French and run the risk of not being able to publish it.

It is interesting to note that the term SoTL is also very frequently used in French despite the fact that it is possible to translate this phrase quite easily to "l'érudition de l'enseignement et l'apprentissage." In fact, we noted that the term "SoTL" being an acronym and neither English nor French was somehow neutral, and therefore many French-speaking researchers find it appropriate for use in a French language context. However, this neutrality of an acronym does not transfer to the term "S-STEP" (self-study of teacher education practices), and it is difficult to be entirely certain why some terms travel well across linguistic barriers while others don't.

Enacting Cultural Shifts in Understanding Educational Research

From the beginning I found that there were challenges in explaining to my colleagues what the purpose of self-study was, not only from a research perspective but also from a perspective of improving practice. I was told that from a French language and cultural background, the idea that a teacher educator might learn about teaching from examining his or her own practice was a new and intimidating idea. My colleagues struggled with the idea that as the authority in the classroom, how could a teacher question his or her own decisions about how to teach? How could someone who is supposed to be an expert on teaching explain and justify such research to his or her students? Openly embarking on self-study as a teacher educator appears to send a contradictory message to undergraduate student teachers because if one is not an expert, why is one teaching at a university? Hearing that a professor wants to learn more about his or her practice would not reassure them that enrolling in the course would be a worthwhile endeavor. They would assume that the professor does not know what he or she is supposed to be teaching! In addition, the study of self and one's own practices appeared to be suspect within a research tradition that defines knowledge as an external entity. For many French-speaking researchers, it would require a paradigm shift that immediately leads to suspicions about the legitimacy of the research. The foundation of research as it is known in French language contexts is frequently based on providing positivist empirical evidence for

claims of knowledge. While qualitative research methodologies have gained general acceptance, some suspicions remain, and we still regularly see articles explaining and defending qualitative research methodologies (Mukamurera et al. 2006). Action research is well-known, but it is considered to be "lower level" research, suitable for teachers, but not for researchers at the university level (e.g., see Goyette and Lessard-Hébert 1987; Pelt and Poncelet 2011; Prud'homme et al. 2012). When there is also no mention of self-study research in the French language, it is difficult to legitimize the adoption of the terminology and therefore the theoretical stance necessary to carry out such research. The fact that self-study is little known by French-speaking researchers is of concern to my colleagues. Teacher educators in such countries as the Netherlands, Iceland, and Chile where English is not the first language have become active self-study researchers (see ▶ Chap. 47, "Self-Study Methodology: An Emerging Approach for Practitioner Research in Europe," by Lunenberg, MacPhail, White, Jarvis, O'Sullivan, and Gudjonsdottir, and ▶ Chap. 46, "Introducing Self-Study of Teacher Education Practices into Another Culture: The Experience in Chile," by Fuentealba, Hirmas, and Russell, both in this volume). My colleagues asked, "Why hasn't this method been endorsed by the French-speaking world if it is so great?" In response, my question then became, "What do I need to do in order to make it accessible and acceptable to my colleagues?" I continue to ponder these questions all the while questioning my own legitimacy as a researcher within their academic world. When I was working on self-study with colleagues from outside of my university who were committed to S-STEP to improve their teaching, I didn't question the legitimacy or importance of this research. Once I brought it home to my university and found that there was a mixed reception, I myself began to have doubts and questions about legitimacy and validity in self-study research.

In an attempt to answer some of these questions for myself, I began by returning to different definitions and explanations of self-study and was particularly influenced by an early definition written by Bullough and Pinnegar in a seminal article in 2001:

> A self-study is a good read, attends to the "nodal moments" of teaching and being a teacher educator and thereby enables reader insight or understanding into self, reveals a lively conscience and balanced sense of self-importance, tells a recognizable teacher or teacher educator story, portrays character development in the face of serious issues within a complex setting, gives place to the dynamic struggle of living life whole and offers new perspective. (Bullough and Pinnegar 2001, p. 19)

This makes so much sense to the way I understand my work as a teacher educator, because living life whole or completely is a dynamic struggle, and there are no simple ways of trying to find insight and understanding of self. A new perspective is refreshing, enlightening, inspiring, and the very best we can hope for because there are no right answers about the best way to teach our students. I also enjoyed returning to the work of Russell (2005). He reminds novice self-study researchers that:

> Those who engage in self-study often confront an apparent contradiction, for self-study is not the private and personal affair that the label might suggest. Self-study relies on

interaction with close colleagues who can listen actively and constructively. Self-study also relies on ideas and perspectives presented by others and then taken into one's personal teaching and research contexts for exploration of their meaning and consequences. (p. 5)

As part of the process of attempting to establish a self-study research group, I found it necessary to take the time to simply discuss what self-study means to me and why I continue to research my practice using self-study. Since many of these discussions took place in informal settings, they were not recorded or analyzed as research data. However, I found it interesting to jot down what different colleagues mentioned during our discussions as a way of better understanding what my colleagues were looking for from me in terms of information and guidance to begin self-study research.

According to one member of the research group, the appeal of self-study was the structure it provided to reflect on her practice in a systematic and rigorous way. She felt the approach would be helpful for her because it was more structured than simply "reflective practice," something she knew she should do because she was constantly encouraging her students to do it. This colleague sees links with anthropology, where the researcher pays attention to the minutia of everyday life and the regular practices of different members of society, but this time the researcher is focused on herself and her work as a teacher educator as well as others around her. The questions of "Why am I here, and why do I do what I do?" in line with the moral dimension of teaching (Kelchtermans 2009) take on a greater importance when they are part of a research project with explicit objectives and a validated methodological approach.

The complementarity of researching one's practice as a teacher educator with a view to improving it was mentioned as an attractive aspect of self-study research, as it highlights connections between the different aspects of a professor's work, that is, the research and the teaching, that are not always evident.

Moving Forward in Supporting the Development of Self-Study in French Language Contexts

As of the time I am writing this chapter, none of my colleagues have embarked on actual self-study research projects, and the initial enthusiasm has somewhat waned. No one else has yet submitted a proposal to the S-STEP SIG of the AERA or the biennial Castle conference. While I am sustained and encouraged to continue with self-study by the relationships and professional friendships that I have developed with the global self-study community, my colleagues have yet to experience this community and continue to feel more connected to their own French language research communities. When we factor in the multiple demands on teacher educators' time and energy, it is not surprising that it is still difficult for French-speaking researchers to make the effort to integrate the self-study of their teacher education practices into their professional routines.

It is clear to see that there are questions that continue to preoccupy the group. They continue to wonder why self-study has not been endorsed by French-speaking research community. In light of this fact, they also question what they will need to do in order to make it an accessible and acceptable form of research to their colleagues. They are concerned about how the fact that there is no literature on self-study in our professional language affects the receptivity of our colleagues to this approach, and wonder what to do about that. It is daunting to imagine that one small group of researchers at one university can influence a community that is spread over several countries around the world.

Taking the time to reflect on our motivation for exploring self-study was an essential step to more fully understanding the benefits of integrating this approach into our research agenda, but it was very time-consuming, particularly for those who struggled to read in English. Concerns about rigor and legitimacy, particularly for non-tenured faculty, are often present (Butler 2016; Garbett 2012).

Such concerns mean that for the majority of the members of the self-study research group in Quebec, the research methodology is seen as a sideline and not a primary research focus. The group members see the methodology as more related to improving practice than fulfilling the research requirements of their faculty positions. The direct connections to what is considered to be "real" research are still not visible to many colleagues because they do not see this work legitimized in the research journals they frequently consult.

Currently, the research in self-study has been limited to the English language, although a recent publication from Chile in Spanish shows that this is slowly changing (Russell et al. 2016). Researchers from other language backgrounds have had to work in a language in which they may not feel entirely at ease in order to participate in the self-study research community. This chapter documents the process of transforming self-study into a French language approach to understanding inquiry into teacher education practices. It is important to acknowledge the particular challenges that teacher educators whose working language is not English must face when choosing to incorporate self-study research into their research practice. Many researchers whose first language is not English face multiple challenges in their professional lives because they believe they must strive to attain legitimacy in their work by presenting and publishing at least some of their work in English. Therefore, self-study is a challenge because it takes place in English within a wider public sphere and is therefore less accessible to those who are not comfortable reading in that language. At the same time, some might see it as a form of legitimacy, because it takes place in English in a wider public sphere, given that English is considered to be the language of scientific research. We cannot lose sight of the fact that in the French language educational research community, there is collective pressure to build and maintain a strong research community in French. The questions around legitimacy, rigor, and validity that self-study researchers working in English faced in the early days of self-study (e.g., LaBoskey 2004; Loughran 2004) are still very present for colleagues who are not able to point to a body of literature in their working language to support their work. As one member of the group put it, it is difficult to dally in the marginal when one is already looking

in from the margins. The ongoing challenge will be to bring self-study in from the margins through positive learning experiences about their teacher education practices on the part of self-study researchers, who are then prepared to share these experiences through publishing articles in major research journals in the French language.

researchers, individually and collectively, are representative for our route to the creation of a self-study community. Particular attention is paid to discourses about teacher education practices. We give insights into how we have developed scholarly terms in our native language to be able to discuss within our community of practice the theoretical and methodological approach we have adopted in researching our own practice. Analyzing our vision, values, and beliefs helped us gain an understanding of our professional identities and become active change agents within our professional lives as we developed self-study of teacher education practices.

Context and Theoretical Background

Most teacher educators enter the profession of preparing new teachers without any formal preparation and often with little support from experienced teacher educators. This often leaves them insecure of how to develop a space for student teachers to enter a professional community. Self-study researchers have brought in a certain degree of congruence by "walking the talk," by researching their own practice, and by developing educational practices according to their interpretation of the findings (Korthagen and Lunenberg 2004). Self-study researchers contribute to the development and restructuring of teacher education based on writing about their findings. This dynamic process between teacher education, self-study, and writing about our findings leads to increased congruence of practice, theory, and ethics in professional identity and engagement. Self-study provides an important opportunity for university and school researchers to do their separate work together and frame a shared discourse (Feldman 2009). As a research methodology, self-study is a frame for practitioners to critically reflect on their practice. It gives them a forum to understand what they do, how and why they do it, and how to improve and find a way to make the study public (Samaras et al. 2012). In addition, the researcher gains an ontological sense for her stance in the professional world and a space for dialogue about knowledge and understanding of her own practice (Pinnegar and Hamilton 2010).

All the five authors of this chapter are Icelandic teacher educators who have conducted self-studies both individually and with others. Hafdís was a classroom teacher for 26 years and has been a teacher educator for 18 years. Jónína was a classroom teacher for 20 years and teacher educator for 22 years. Edda was a special needs teacher and coordinator for teacher support for 19 years. She did a self-study of her practice as a coordinator for support services as part of her thesis work and is now a teacher educator. Svanborg was a classroom teacher, a woodwork and innovation education teacher at the primary level for 28 years, and a teacher educator for 12 years. Karen Rut worked in deaf education for 6 years where she used teacher research to explore how her assumptions about literacy education affected students' opportunities for learning. She is now starting her sixth year as a teacher educator.

Our experience of studying our own practice led us to explore the nature and purpose of self-study. We wondered about the interplay in self-study between the exploration of our professional identity, the systematic understanding and recreation of our practice, and the creation of new knowledge and contributions to educational discourse.

Self-study of teacher education practices (S-STEP) was developed in English-speaking countries, and as reported by Samaras et al. (2012), the dominant membership is English speaking (e.g., from the USA, Canada, the UK, Australia, and New Zealand), with a small percentage of members from other countries (e.g., Iceland, the Netherlands, Brazil, Belgium, Chile, South Africa, and Israel). Thus, most presentations of self-study, oral and written, are in English. To deeply understand our practice and present our studies, it is critical for us to not only do so in a foreign language such as English but also in our native language, Icelandic. To create an understanding of the methodology and to underpin our foundation of self-study, it is important to create a discourse in our native language that we can use to better understand ourselves and our practice. An essential element in self-study is the use of dialogue in the process of coming to know and understand the practice (Pinnegar and Hamilton 2010). In different linguistic and cultural contexts, it is fundamental that this dialogue is responsive to native languages and related to the local cultural context as well as to the language in which the research might ultimately be presented to the self-study community and beyond. We initially came to be as persons through our first language and cultural context. Our identities are therefore closely connected to our native language. It is challenging to explain our knowledge generation about our practices as teacher educators through self-study when there is no or little discourse of self-study in our main language.

The groundwork for introducing self-study in Iceland can be seen with the action research work that started with courses for in-service teachers at master's level from 1984 onward. Gradually and alongside with qualitative research gaining recognition and respect, research at master's level was conducted using action research methodology. Many of these studies were done by teachers who were looking into their own teaching or work in education. However, these studies were not very focused on the self or how the practitioner was developing or transforming and more how the practice was developing and changing.

In 2004 the first university course on self-study methodology was offered in the Iceland University of Education under the Icelandic word "starfendarannsóknir" (literally translated practitioner research), and this word has gained recognition. The course is offered annually and has good attendance. The formal claim for recognition of self-study methodology may be seen to have come with a doctoral study in education as Hafþór Guðjónsson successfully defended his thesis (which was written in English) in 2002 called *Teacher Learning and Language: A Pragmatic Self-Study*. With this event, self-study formally emerged within the Icelandic teacher education community. At the same time, Hafdís has been an active member of the S-STEP special interest group of AERA and has been writing about and publishing her self-studies in English. In 2006 Jónína published an article in Icelandic building on her master's thesis (Kristinsdóttir 2006). In this article, she

introduced her study as being a research on her own work, and in brackets she translated it to self-study. This was the first publication of self-study written in Icelandic. In 2007, Hafdís and Jónína published an article in Icelandic about their self-study of teaching a course for teachers about mathematics and inclusion. In the article they talk about teachers researching and developing their work, but they do not use the word self in the Icelandic version. In the English abstract, they use self-study. In the methodology and methods sections, they use the word "ígrundun" (reflection) to explain their actions but refer to self-study scholars as they explain their study. In 2012, Hafdís and Svanborg published a self-study article on teacher education practice in Icelandic where they talk about university teachers researching their practice. In Icelandic there is no special word for the term teacher educator. Rationalizing that the word self-study and the special role of being a teacher educator needed an explanation in the Icelandic context due to the different vocabulary, they also took the time to carefully introduce self-study as a methodology to Icelandic readers in this article. Self-study as a methodology became an issue with the publishers and was not accepted in the beginning, but after some explanation the article was published. These first articles written in Icelandic about self-study have helped with developing our language about self-study of teacher education practices.

Self-study as a research methodology is a way for insiders to reflect critically on their practice for gaining understanding of the practice and self, to be able to improve and transform both the practice and the self (Samaras et al. 2012). To understand our practice of creating a community of practitioners using S-STEP more deeply, and to support our interpretation of our research results, we decided to use the theoretical concepts of legitimate peripheral participation (LPP) together with the methodology of self-study. Since LPP is a way to describe how beginners become experienced members of a community of practice, and how learning, thinking, and knowing take place when people engage in shared activities, we believed it could help us to better understand how self-study was developing in our professional community and how it was transferring into Icelandic (Lave and Wenger 1991; Wenger 1998). By sharing our thinking and experience with each other, we could not only present our point of view but also gain insight from alternative points of view and negotiate new meanings and understandings. At the heart of the LPP is a membership in a social community where learning takes place, here the S-STEP community in Iceland, and therefore by creating a group of researchers with different experiences of self-study, we believed our dialogue could pave the way to guide newcomers toward a mastery of knowledge and skills of self-study and support the old timers to gain new ways or platforms of how to transfer self-study into Icelandic and the community of practitioners (Lave and Wenger 1991).

We have diverse backgrounds and belong to different communities, within a complex landscape of learning (Wenger-Trayner and Wenger-Trayner 2015), that all affect how we interpret the learning that developed within our community and thus our own individual development as teacher educators. When developing learning communities where the diverse background of the participants is respected,

everyone's contributions must be valued. Through the process of sharing experiences and developing norms, the community provides supportive structures for individual inquiry and acts to mediate knowledge so that knowledge grows within the community, as well as for each individual (Jaworski 2006).

The purpose of this chapter is to examine how the methodology of self-study of teacher education practices developed in Iceland and consolidate our professional foundation. Our goal was to explore the process of applying self-study, the interpretation of self-study research, and the challenges posed by transferring self-study across linguistic and cultural contexts.

Methods

This is a self-study of teacher educators and practitioners exploring the interpretation of self-study research in their professional community and the development of the discourse. It is a critical collaborative inquiry with a focus on a transparent and systematic process.

The study is conducted by five teacher educators with varied experience of self-study of teacher education practices. Entering this study, each of the five of us had lived our individual as well as collective stories of engaging in self-study. We have all worked together in self-study differently combined, as two or three collaborators, as a supervisor and doctoral researcher, or as critical friends in individual self-studies. Thus, our research question became:

• How has the methodology of self-study of teacher education practices and the discourse developed in our Icelandic community?

For us to understand our experiences of translating and transforming self-study from English-speaking contexts to the Icelandic language and culture, we decided to collect data through our narratives and meeting with each other in discussion groups producing descriptive and critical data of the development of self-study in Iceland. We decided to organize a focus group meeting for the five of us over lunch. In planning for the meeting, we agreed that each of us would bring a dish and, while preparing that dish, think of the ways in which it was representative for our self-study journeys.

Placing the dishes on the table, we were curious to see what each of us had brought. As we sat down, we decided that we would circle and share our experiences of translating and transforming self-study in the Icelandic context while we tasted the dishes. Our lunch meeting took 2 h. The discussions were recorded and transcribed. In reading through the transcript, we identified and further explored issues and themes together with our narratives that exemplify the story of self-study in Iceland and how self-study became a part of our professional identities.

We also expanded our gaze on the story by collecting themes and issues that have emerged in our collective self-studies and to give an extended insight into how self-

study of teacher education practice and the language of it developed in Iceland. Writings about our self-study at different times helped tracing this development.

Using Self-Study to Grow as Teacher Educators in Iceland

We describe examples of common issues and themes we have identified from our collective self-studies, as narratives from each of us and collective stories. Then we will pull it together and discuss the main themes.

Translating Self-Study Between Languages

The first hurdle we had to cope with as we began to develop the S-STEP community in Iceland was the language. In Iceland there is a strong demand to use our native language and to create vocabulary for new professional concepts. There is even a language committee in the country to support people in so doing. We learnt soon that the word self does not translate well and creates many questions and demands for further explanation.

Developing Our Own Language

Action research has been developing in Iceland from the 1980s. Since the idea emerged, there has been a search for the best Icelandic words to capture its meaning. Action research and self-study developed somewhat hand in hand in Iceland with action research gradually gaining respect and recognition in the academic community and self-study researchers arriving 20 years later, with both groups of researchers searching for identity and the proper Icelandic words for what they do. Writing articles in Icelandic has been a part of this search for ways with words that allow us to discuss different dimensions of self-study as we have got to know it through English. Direct translation of self-study is "sjálfs-rannsókn" which has the connotation in Icelandic culture as being directly connected to psychology. "Sjálfs-rannsókn" refers to looking inward, reflecting on your personal identity and not your professional self.

We have tried using different words and combinations of words to express the concept, always trying to convey the professional ground that self-study practice is built on. One combination we have used is "fagleg starfsrýni" that translates to "professional inquiry," but we found that to be missing the "self" that is such an important part of self-study and the part of realizing how intertwined our personality is with how we do our work. Often as we speak about self-study in Icelandic, we tend to use the English words "self-study" in the middle of the Icelandic sentence as we had not found the suitable words in Icelandic. Recently we have started to use the word "starfstengd sjálfsrýni" or work-related self-inquiry to capture that meaning.

Laying the Groundwork: Paving the Way

At our lunch meeting, Hafdís brought homemade chocolates and told us the story behind the development of the recipe and how it represents how she developed her understanding of self-study. She felt safe bringing them because she has been developing her chocolates for 40 years and now has a recipe she feels secure with. It is made of good material that cannot fail, but to develop the recipe to the point where it is today took a long time, a journey with many mistakes and tryouts. Her journey of her educational practices has been similar, and through her self-study she came to an understanding of that. Hafdís explains that the work of making the chocolate is now mostly in the hands of the second generation of her family that took it to another level, and she hopes the same thing will happen to self-study. The next generation of educators will soon take over. Hafdís also brought bread, a new recipe she was trying out, to represent that we also have to take chances. We will try out self-study methodology, experimenting with the vocabulary, the methods, and the presentations and, in doing so, make it safe and trustworthy for others who wish to join the self-study community.

Hafdís describes her first steps in doing self-study:

> When I was a grade school teacher (grade 1–10) in 1974–1982 I felt that we, as teachers, needed to reflect on our teaching in order to analyze what went well and what not and find out why. Such work was not known back then and I did not have any words to describe what I was doing and at the beginning I did not realize it was important to write it down. My colleagues would say to me: "you're just an impossible teacher, you don't know how to teach", if I was reflecting and wondering what was going wrong or not as well as intended. But I persisted and took all available courses for teachers and then realized that I had to write about my inquiries.

At the lunch meeting, Hafdís described the reaction she got for her work:

> I wrote an extensive report about my findings of my studies into my own teaching over a whole school year and I sent it to the Ministry of Education. I still haven't received an answer from them now 30 years later.

Later on, around 1987, Hafdís went into further education and studied special education at the master level (a professional skill course conducted for practicing teachers that lasted for 2 years). She had just vaguely heard about action research but did not know what it was about. As a part of these studies, she got introduced to action research. She reminisced about it in this way at our meeting:

> When I got to know action research I was very pleased with the frames offered in the process and as I began to use the method I found it very good to have these guiding lights to support my research. The frames with the action research cycle were not limiting and I wasn't worried that I was doing things in the right or the wrong order. Then when I got to know self-study it felt like the most natural thing in the world.

We can see looking over the history of the development of self-study in Iceland that action research and self-study have been gaining a steady ground in Icelandic research hand in hand with development and acknowledgment of qualitative research. With qualitative research gaining recognition, where the visibility of the researcher is considered a strength rather than a weakness, academia in Iceland has opened up to a different view where the "self" started to emerge as an important part of the research process and findings.

Researchers Finding Their Place and Their Voice Through Self-Study

The rest of us who began working with Hafdís as researchers found many parallels between action research and self-study and that both approaches made sense to us for improving our practice. However, we were also on our own journeys as practitioners and researchers and coming to understand how self-study could be of help to us in different ways.

First Acquaintance with Self-Study

Jónína learned about action research early in her career as a teacher in primary school. She started to study her own work and focused on the children's learning in the classroom to be able to respond to their learning needs, thus changing her own way of teaching. She then transferred what she learned when she became a teacher educator alongside with her teaching in primary grades:

> *When I focused on listening to the children, noticing the communication in the classroom, I realized that it impacted my teaching at both levels. This was the spur of my self-study and has become a part of my identity as a teacher educator.*

Jónína continues her story:

> *I studied in Sweden around 1980 and learned a lot about quantitative and qualitative studies but there was not a focus on action research. As I returned to teaching in my elementary school in Iceland, we had a course for the teachers in the school about action research and did some studies on our work with that method. When I started to teach at the Iceland University of Teacher Education, I told stories from my own teaching in primary grades to explain to student teachers and give examples of the pedagogies they were learning about. My goal was to help them linking theory and practice. At this time, I realized how important this dialogue between my own teaching in elementary school and my teaching on university level was.*

> *I reviewed my experience at the meeting: I have been looking into how young children's mathematical ideas develop. I discuss with the children their own ways of solving problems and in that way make sense of how they understand the mathematics involved. . . . Then I was so fortunate to teach a girl with considerable learning disabilities. And when I started to look at how she worked and how she understood, I learned so much about children's diverse ways of learning.*

> *This experience supported me in always focusing on children's abilities within the teacher education in response to the emphasis on disabilities often placed within educational*

institutions. Now I am doing my doctoral research and I am still investigating my own work. I have been analyzing what I am doing and have concluded, that I am doing a research on three levels: a developmental research as I am working with in-service teachers to learn about their practices, then there is the level of their own action research within their classrooms and finally what is my self-study where I am developing myself in my profession.

Beginning her teacher education career, Jónína was fortunate to simultaneously teach in elementary grades. Her dual role as a teacher educator and an elementary school teacher urged her to reflect on her own practice and study her own teaching in collaboration with colleagues at both levels. When she joined Hafdís and Edda to teach the graduate course on mathematics teaching in diverse classrooms, they decided to study their own teaching and have written several papers about their self-study and introduced their work at conferences. Participating in the self-study community in Iceland has strengthened her in studying her own practice, emphasizing inquiry and collaboration. In her doctoral thesis, she wrote about her own development as a researcher and a teacher educator, when researching with teachers in schools.

Challenges in Conducting Self-Study Research

As we strive to create our professional substance through self-study methodology, we are challenged by our colleagues, who question the activity of researching your own practice.
Svanborg described her experience:

I was a new university teacher and got to know self-study as Hafdís and I studied our collaboration and teaching in one of our courses. I saw self-study as a rational way to research our practice and our role in implementing the innovative elements we were trying out. However, as I started to mention this method to some colleagues, they frowned upon it and made some demeaning remarks.

I reflected in our meeting: If I look back on how I experienced beginning with self-study I started by doing a research with you, Hafdís on our course Teaching diverse groups of students. I had heard about this kind of study but mainly as action research. But from the start it felt so sensible. But we lacked the words in Icelandic that properly covered the English concept self-study. We wrote about our findings in Icelandic using the words in Icelandic "kennarar rannsaka eigið starf" ("teachers research their own work") for self-study. It was somehow as if self-study were banned words in our language – and we were looking for the proper words to use in Icelandic.

I did not let what my colleagues said about self-study affect me too much and carried on with doing more self-study with Karen Rut and Hafdís, writing findings and publishing both in Icelandic and English. The process empowered me to become the university teacher I wanted to be or perhaps rather come closer to becoming that teacher. I also discovered that the research process helped me and my colleagues to respond to students' needs and make our courses more influential in a positive way. In the collaborative self-study projects with Karen and Hafdís I have learned to analyze my visions, uncover my values and beliefs and developed my professional identity.

Svanborg has found strength in the collaboration of doing self-study and developing teaching with Karen and Hafdís. She finds that she has elicited and

strengthened her core values in teaching through the self-study processes and thus also reinforced her professional identity. Constantly gathering evidence and reflecting with colleagues has enhanced her efficacy to respond to students' learning needs and at the same time adhere to the requirements of academic standards.

Edda described her experience of action research and self-study:

I got to know action research through teaching a graduate course in teacher education with Jónína and Hafdís in 2004. We did a self-study on the course and I immediately felt it was so natural and sensible to study your own work to develop it and change in the direction you wanted it to grow.

Edda reflected in our meeting on what she was doing in her current doctoral research:

I am looking into how I am working in a school. With the teachers, we are working together at developing and organizing special education as inclusive practice. And I have been struggling with defining what I am doing, what concepts to use for my methodology. In my mind practitioner research is action research. I wasn't comfortable with using self-study as it is so often about university teacher doing research on their own work.

I am a teacher in that school and I work with all of these people. I decided not to evaluate the work of the others but focus on my own work with their input, looking at how I matured and developed in the process. So, I have been trying to rationalize and argue for what I am doing in my research for the last two years.

I described this at the lunch meeting: I was becoming quite confused. And at the last supervisory meeting the second supervisor said I was doing two kinds of research, one action research and one self-study. That pushed me to the edge – it was too confusing.

So, I am finding out what to call my research, looking into what is allowed and what is not. Then I decided it would be what I made of it as long as I was not violating anyone in the research, it will be my creation. I am looking into the space between myself and the subject of my research. Is it self-study or action research?

Edda was being confused about what to call her research, if it could be called self-study. She was getting mixed messages from her supervisors about how they understood what she was doing and needed to rationalize her way of research as self-study. Her understanding of the self-study methodology expanded through examining this dilemma. She found that the methodology is constantly developing and that there is room for different approaches and designs of research as long as you adhere to certain ground rules.

Adopting the Recipes: Developing Language

Karen's preparation of her dish for this meeting represents her journey into doing self-study. She used a recipe of spinach pie and adapted it to the ingredients she had available but still adhered to the main ingredients and methods of putting it together.

When she described her dish to her colleagues, she told them how she got acquainted with ideas about action research and teacher research in her doctoral studies at the University of Madison and that teachers could be studying their own work. In her work as a teacher of Icelandic, she wanted to know how she could best teach deaf students to read and write and wanted to find answers or methods on how to do that. In the lunch meeting, she reflected:

> I had come to realize that it is one thing to "know" the answer to a question and another to put it into practice. In my research proposal I called the method "teacher research" and I was aware that these kinds of studies were called different things. And in my case, I was doing a research on my own teaching, how I used methods and developed processes in the process of inquiring into my situation and students' learning. This method opened new possibilities for me and it felt so natural to work in this way. This methodology spoke directly to me as a teacher, I felt I shared a language with others who were using this method; it was a kind of a teacher language that hit me right in the heart.

> I first learned about these ideas in English and developed my understanding in English and translating and transferring it to my native language was a special undertaking.

> I had been so excited when I was in the U.S., I got to know action research communities and I intended to get everyone on my side to do this kind of research in Iceland. I wanted to establish the same kind of research communities where we would investigate our work, grow together and support each other in the same way I had seen abroad.

> Eager to work with others and present my ideas I "walked into walls" in my school and I didn't realize until later what was happening. I wanted so much to enter into conversations with my colleagues. I got some unclear comments, sometimes difficult to identify, but I got this bad feeling and found it difficult to say that I was researching my own work; it felt unnatural saying it out loud. I described this at the meeting:

> When I did present my work, I got answers such as: "Uuh, that's interesting. But how can you do that, isn't it a full job to teach?" And I started to doubt my work and if I hadn't had these ideas about teachers researching their practice from abroad, I would have said "it's not possible". Reading their work helped me move forward developing my practice.

> Then I got into contact with people at the Iceland School of Education, first with Hafdís and later also Hafþór who had both done self-studies and could talk about it in Icelandic. I had found people who understood what I was talking about and felt again that my research was real research. Before meeting them, it had been difficult to talk about my research in Icelandic but Hafdís and Hafþór invited me to join in teaching the Action research course they were teaching so I could practice talking about my research in Icelandic. I described my first presentation at our lunch meeting:

> When I did my first presentation in Icelandic I have to admit it was both in Icelandic and English because we were just in the process of developing the discourse of Self-study in Icelandic as we grappled with these terms in the English speaking literature.

Gradually Karen has been able to ground herself and her study, and even if she called her doctoral research "teacher research," it has strong characteristics of self-study. In her thesis Karen explores and scrutinizes her preconceptions about deaf education and what it means to learn to read and write in order to recreate ideas about

what she wants to stand for in her teaching as an Icelandic teacher of students who are deaf. In other words, through her study she was developing her professional identity.

> *I was finally able to adopt the "recipes" I had got to know studying at the University of Madison to my own research and reality in Iceland. And now I take part in doing self-study in teacher education and discussing other self-study researches in Iceland. Although the community of self-study researchers in Iceland is small, we have now created our Icelandic concepts that seem to best catch the meaning of the original English words and we have now the experience of using that vocabulary that others can make use of.*

Collaborative Self-Study of Teacher Education Practices

Beginning in the late 1990s, Hafdís and Mary Dalamau collaborated on conducting a self-study with the purpose being to better understand teaching and teacher education practice. They wanted to learn to become and develop as teacher educators and learn to teach about teaching (Dalmau and Guðjónsdóttir 2002; Guðjónsdóttir and Dalmau 2017). Reflecting back on their collaboration, Hafdís writes:

> *The focus in one of our courses was on inclusive education and a strong impetus for developing the course was our view that to effectively teach inclusion in action, we were required to consistently model inclusive practice. However, unveiling the contradictions between university academic expectations and teaching practices meant that both the students and we, the university colleagues, had to share similar roles and responsibilities. Both groups had to recognize and be willing to be both learners and leaders during various stages.* (Reflective journal, 2004)

Because teacher educators have a graduate degree, they have a formal preparation as researchers. However, most of them enter the profession without any formal preparation for teaching at the university level and often receive little support from experienced teacher educators. As Hafdís entered the teacher education, she began her reflections along with her colluegue Mary Dalmau who had moved back to Australia:

> *Our experience led us to question the nature and purpose of self-study. What is the interplay in self-study between the exploration of our professional identity (psychological or thera-peutic focus), the systematic understanding and recreation of our practice (practice research focus), and the creation of new knowledge and contribution to educational discourse (conceptual and dialogic focus)? While each aspect is important, the self in the title may tip the balance in favour of personal exploration and quest for self-understanding.* (Reflective journal, 2004)

When she entered the field of teacher education in Iceland 18 years ago, Hafdís began to teach a course on mathematics teaching in diverse classrooms together with Edda and Jónína. From the onset, they have studied the way they approach the

teaching of the course and reflected collectively on their work. They have presented their work at conferences and reported on their study (Guðjónsdóttir and Kristinsdóttir 2006, 2007a, b, 2011; Guðjónsdóttir et al. 2007, 2010).

> *Our self-study and inquiry into the development of the course supported us in reflecting together on our teaching and also to reflect and respond to each other in our teaching. Traditionally, special education focuses on students' deficiencies. In our course we explore students' abilities in mathematics. Traditions and knowledge from two disciplines are brought together to create a vision on teaching all children mathematics.* (Reflective journal, 2006)

> *Our collaboration has helped us see from a broad range of views how our students are learning, and in so doing we believe that we have managed to respond to them in a professional way. A part of the course work is to reflect on stories our students tell about their work with children. They also solve mathematical problems together and together we discuss their diverse ways of solving the problems. By discussing our responses to our students and helping each other understand their learning, we have opened up a forum and encouraged our students to critically reflect on their classroom practice in the light of current research on inclusion and mathematics.* (Reflective journal, 2009)

> *The transformation from theory to practice does not proceed automatically, and teacher educators can create learning communities for teachers and should be responsible for supporting them in teaching mathematics in inclusive schools. By writing about our research and our collaboration we believe that we can make the new knowledge accessible and meaningful to others.* (Reflective journal, 2009)

All our work, our pedagogy, and the trust we have managed to build while teaching the course, enables us to collaborate during our teaching and demonstrate the possibilities of the ways in which student teachers can teach (Russell 1997). The process of writing about our research enhances our understanding of how our collaboration and team-teaching have grown to develop into a community of inquiry, where we collectively reflect on our work (Jaworski 2006). It has also affected the learning community that we have developed together with the teachers. In our experience, the novice teachers' confidence in teaching mathematics is considerably enhanced through the activity of collectively reflecting on ways to solve mathematics problems.

Hafdís, Svanborg, and Karen have also conducted self-studies on a graduate course Working in Inclusive Practices; they have been developing since 2012 and on their collaboration in supervising masters' students. They have reported on their work in conferences and by writing about their self-study research (Guðjónsdóttir and Jónsdóttir 2012; Guðjónsdóttir et al. 2014; Jónsdóttir and Gísladóttir 2017; Jónsdóttir et al. 2015).

As we iteratively interrogated and analyzed our data, we discovered that we built our teaching on similar ideologies and were able to analyze the pedagogy we used in practice. We found that our pedagogy was learner focused, emphasizing creativity and resourcefulness combining the pedagogies of inclusive pedagogy and emancipatory pedagogy of innovation education (Korthagen and Vasalos 2005; Lave and Wenger 1991; Wenger 1998; Wenger-Trayner and Wenger-Trayner 2015). We have all matured as self-study researchers through collaboration with colleagues, and as

individuals we have supported each other on our route to develop as teacher educators.

Influencing Our Practice: Community and Culture

The findings from our study of the development of self-study in teacher education practices in Iceland reveal that our former experience as teachers in school impacted how we developed as teacher educators. Additionally, the collegial support we offered each other in conducting self-study had a major impact on our professional growth.

Becoming Aware of Our Process to Change as Teacher Educators in Iceland

In preparation for our focus group meeting, each of us reflected on our experience of looking into and learning from our own practice. As we met and discussed the stories we told about our practices and looked back to our collective work, we came to understand how we had improved and transformed both our practice and ourselves as teacher educators (Samaras et al. 2012).

When tracing our experiences as reflective practitioners, we started by looking back to our teaching in primary grades, our first professional practice. We had a common background as teachers in schools, but the communities we belonged to differed in the degree of support we felt we had received from our colleagues and the educational authorities as we travelled through different landscapes of learning (Wenger-Trayner and Wenger-Trayner 2015). This was particularly reflected in Hafdís', Karen's, and Jónína's stories. Jónína was supported as an action researcher in her school, but Hafdís and Karen both had to struggle with getting the message through that reflecting on one's own teaching is an essential part of the teaching practice.

Adopting the theoretical concepts of legitimate peripheral participation (LPP) (Lave and Wenger 1991; Wenger 1998) supported us in analyzing our participation in the self-study community that was developing in Iceland. Svanborg and Edda reflected on their experience of entering the field of self-study in collaboration with colleagues within teacher education. They both had separate experiences of discussing their research with other colleagues who were not practicing self-study, receiving sneering remarks about doing self-study as they collided with a culture that was skeptical to the methodology of self-study. Doing self-study and taking part in the S-STEP community in Iceland with researchers with different experiences had a major impact on their professional confidence. Their contribution was valued within our community, and through the process of sharing experiences and developing norms, we were able to provide supportive structures for individual inquiry and mediate knowledge that grew within our community, as well as for each individual (Jaworski 2006).

Developing a Language and Culture of Self-Study Research Within Our Community

The desire for developing as teacher educators conducting self-study research has had a major impact on our professional development as well as the way we discuss our profession in our native language. By presenting our work at conferences and writing about it both domestically and internationally, we have been "walking the talk" and developing educational practices according to our interpretation of our findings (Korthagen and Lunenberg 2004). It has given us a forum for critically reflecting on our teaching in two languages on our way to improving our practice as well as making these studies public (Samaras et al. 2012).

In striving to find words in Icelandic for discussing the methodology of self-study, our dialogue in the process of coming to know and understanding our practice has been essential. Reflecting on the meaning of the concept "self" in self-study has sharpened our own understanding of self-study and the balance between our professional roles and our ontological stance. As researchers we have gained an ontological sense for our stance in the professional world and a space for dialogue about knowledge and understanding of our own practice (Pinnegar and Hamilton 2010). Collaboration and inquiry into our profession as teacher educators and researchers have reinforced our community building and boosted our beliefs on learning as a social activity.

Eliciting Our Pedagogy

With our backgrounds as teachers in primary grades, we had been developing the pedagogy of inclusive teaching and inquiry-based learning and teaching throughout our professional lives because that was what made sense to us as teachers of young children. To us, schooling means that all students must have opportunities to receive education that matters in their lives, and therefore it is important that schools create learning spaces for all students to become successful. This reflective work of doing self-studies helped us to identify our common mission, which is to be caring and inclusive as persons and as educators.

In our search for a pedagogy of teacher education that represents our beliefs and values about teaching and learning about teaching, the self-study methodology supported us in creating and developing our teaching practice. It is difficult for teacher educators to extend beyond didactic, teacher-focused approaches in order to include learner-centered and practice- and inquiry-based learning and teaching. However, our dilemma was not simply related to our teaching techniques but also to the university culture. Student teachers often resist these changes, because over time they have learned to be more comfortable when their teacher educators are talking or answering questions or when they work on a prescribed task.

All teachers, including teacher educators, have a valuable role to play in the educational discourse, and it is important to recognize and value their unique knowledge. For critical pedagogy to develop, it is also important that space,

collaborative opportunities, and a frame for the dialogue are created in collaboration with student teachers and teachers. Thus, knowing how to differ professionally, passionately, and constructively is critical if we are to question the status quo and reach new understandings of learning and teaching. If as educators we wish to take a critical and transformative stance in our research and teaching, we must challenge our own and our students' construction of the world.

By writing about the findings from our self-study in Iceland, we have contributed to the development and restructuring of teacher education. It is our vision that writing about findings from our university teaching, where we have collaborated with both pre-service and graduate students, we have started a shared discourse about teaching within schools and universities (Feldman 2009).

Developing a Learning Community of Self-Study Researchers

This study sheds a light on how scholars in our country created and developed a self-study discourse in their professional community. An Icelandic self-study learning community has emerged in spite of challenges. A key to this development is to understand and acknowledge the methodology and have the language to talk about it in our native language. We make efforts to become visible and claim space – in Icelandic.

A part of our experience with introducing self-study has been, on the one hand, a lack of understanding and knowledge about the methodology in our professional community and on the other hand prejudice that has appeared in the form of demeaning remarks about the usefulness and respectability of the method or simply a lack of interest in hearing about our work. We see a relationship between the lack of understanding and knowledge and this prejudice or lack of interest. Despite these negative experiences, developing a community of self-study teacher educators is becoming a reality that we hope will spur others to engage in self-study. A key to such development is presentation and publication in Icelandic and finding the Icelandic words that convey the core of the methodology.

We think now we have found the proper words to use in Icelandic for self-study. They are the words "starfstengd sjálfsrýni" (direct translation: "professional self-inquiry") as we want to emphasize that self-study is related to the profession and the self still the focal point. However, we are aware of the fact that we have not made these words a part of our active vocabulary because we still have to think for a moment and ask ourselves "what were the words we are going to use for self-study?" And often we just use the English words as we speak Icelandic although it would be a relief to break away from that habit. We have been supervising master students in the last 5 years who have been doing self-study, and they have used the words for action research in their writing in Icelandic. We must now "stand up" for self-study in Icelandic and have our students use the self-study vocabulary and dive into the rich literature that underpins this methodology as we supervise them in their research and writing. It is not enough that we have emerged as researchers and teacher educators through self-study; we must also support our students to do so as well and to use the Icelandic language in doing so.

What we have perceived is that we have:

- Developed the discourse in our native language
- Adapted our teaching
- Influenced colleagues and our students
- Served as change agents – with a focus on empowering teachers
- Written and published about our work both in English and Icelandic

We have been adopting self-study in Icelandic research, a methodology that was developed in English-speaking countries within different cultures by people who are university teachers and were elementary or secondary school teachers before they entered the field of teacher education like we were. Our work is the work of Icelandic researchers that took a methodology developed in the English language and transferred it to the Icelandic language and context. As we have looked back on how we implemented and developed this methodology in our country, Iceland, we have taken steps to make clear what we are doing in our research and how we want to talk about it. We have been searching for some time for the feasible words to use in Icelandic, and it has been a bit of a game of hide and seek. But as we claim, we have now created the suitable Icelandic words, so we must not only use them ourselves, we must also distribute them to others, to give them the language for discussing the research method that can empower their profession and themselves.

Conclusions

Collaborative self-study of shared teaching and learning experiences can help draw out the complex thinking, decision-making, and pedagogical rationale that support the professional work of teacher educators. Taking part in self-study in teacher education has empowered us and supported us in making changes in our practice. It has made us realize what our core mission is (Korthagen and Vasalos 2005) and what we are doing that is worth keeping and developing further. Analyzing our vision, values, and beliefs helped us gain an understanding of our professional identities and become active change agents within our professional lives (Dalmau and Guðjónsdóttir 2002; Loughran 2014). This study sheds a light on how scholars in our country created and developed a self-study discourse in their professional community.

Continuous Collaborative Self-Study in a Multicultural Teacher Education Program

An Israeli Perspective

50

Bobbie Turniansky, Dina Friling, and Smadar Tuval

Contents

Abstract

This chapter presents several stories: the story of multiculturalism in general, the story of being part of a multicultural team, and the story of trying to be intercultural teacher educators. We choose to present our research by interweaving examples and understandings from collaborative self-studies we have done in the context of a multicultural post-graduate teacher education program. Both our student body and our program team are comprised of Arabs and Jews – groups with long-standing historical, political, and cultural conflict between them. Intergroup diversity includes language, religion, places of residence, educational systems, customs, and power structures. Among our understandings is the fact

B. Turniansky (✉) · D. Friling · S. Tuval

that there will always be several sides to the story. There are often different, sometimes opposing, points of view; therefore solutions may be temporary, fragile, or even illusions. Once we realize this, we understand some expectations we have as teacher educators are unrealistic. As educators we have a moral responsibility to face uncomfortable issues although from time to time, we must consciously decide to respect others' wishes not to deal with them. Our blended educational environment is a fragile bubble that lets us function in our conflictual, complex reality. This situation demands constant vigilance, causing constant tension. Our continuous self-study helps us cope with this reality by channeling the tension into searches for ways to improve our practice. We understand that unsurprisingly, the ingredients for successful continuous self-study resemble those needed for multicultural education and work – collaboration, trust, patience, and hearing the other.

There is no one definitive recipe for Israeli salad but there are two essential main ingredients – finely cubed tomatoes and cucumbers. There might be parsley, onions, olives or other additions but without these two ingredients, it is not "Israeli salad." For purposes of this chapter, we will be focusing on the main ingredients comprising the Israeli salad we are a part of – Arabs and Jews.

Besides the obvious aim that our work on this chapter will help us gain more insight into what we do, how we do it, and how we can do it better, we, Bobbie, Dina, and Smadar (our contributions are equal and author order is random), three veteran Jewish members of the ACE Jewish-Arab teacher education team, have two additional aims for this chapter.

On the one hand, this chapter is about a multicultural team working with multicultural students. Most groups are composed of individuals who are diverse in many ways, some more obvious than others, but here our focus is primarily on cultural diversity as related to Jews and Arabs and more specifically, as related to southern Bedouin Arabs and Jews. This diversity is expressed in many areas, for example, language, religion, places of residence, educational systems, female dress, customs, gender expectations, power structures, collectivism, and individualism.

However, another important characteristic of our context is the long-standing historical, political, and cultural conflict between Arabs and Jews. Since our situation seems to be fairly unique in the self-study community, we hope we can help others develop additional ways of looking at their own situations by sharing our experiences and understandings.

Our second aim is the hope that through this chapter, readers can gain some insight into how ongoing teams can study their practice through changing constellations of collaboration and how adopting an inquiry stance can fruitfully lead to a

blurring of the boundaries between doing and learning. In the chapter we will attempt to convey several stories such as the story of multiculturalism in general, the story of being part of a multicultural team, and the story of trying to be intercultural teachers. Instead of presenting a discrete self-study, we will be interweaving examples and understandings from our self-studies into our understandings from the literature and back again. This less traditional form, which at times may resemble disconnected bits and pieces, is probably as close to giving the feel of the way we practice and research our practice.

Four Surprises in the Literature

While searching for studies which could enrich our learning about multicultural teacher education, the first surprise we had was realizing there are many studies relating to "teaching about diversity" or the question of how to teach pre-service teachers (or other students) about diversity and multiculturalism when the student population is predominantly the majority population (see, e.g., Assaf et al. 2010; Depalma 2010; Han 2016; Jett and Cross 2016; Smolcic and Katunich 2017; Spatt et al. 2012 and Schulte's chapter in the previous handbook, 2004). Although we can, and did, learn many things from these studies, they do not describe our situation.

> ...it is one thing to teach for diversity (i.e., to promote appreciation of and respect for diversity, and how this can be manifested in teaching practice, for my students' edification) and quite another to function effectively as a teacher in diverse settings. (Griggs and Tidwell 2015, p. 100)

While we stress to our students that there are cultural differences in every class even when on the surface, all, or most, of the learners come from the same culture, and we have a workshop on personal cultural identity reinforcing this point (Mansur 2016), our focus here is different. Most Jewish and Arab Israelis live in separate places and learn in separate primary and secondary schools. As opposed to the studies mentioned above, we are studying how to teach our multicultural classes, and how we work as a multicultural team. Rather than "*teaching for multiculturalism,*" it is "*living multiculturalism.*"

The second surprise was that many of the self-studies we found of teacher educators and multiculturalism focused on situations in which teacher educators found themselves in another culture or working primarily with students from another culture such as Berry's experiences as an Australian working in Holland (Williams and Berry 2016) and Lee's (2011) self-study of a Korean doctoral candidate supervising American teacher education students. Again, while useful and informative, our situation is different.

The third surprise was discovering that much of the research on intragroup multiculturalism is based in the management literature where the discussion centers around multicultural workgroups (e.g., Meeussen et al. 2014; Oerlemans and Peeters 2010; Stahl et al. 2010).

The fourth surprise was that despite extensive searching, most of the published self-studies from Israel we found were done by members of our team. Two important exceptions are Elbaz-Luwisch (2001, 2004), who inquired into improving her practice of teaching Arab and Jewish students, especially when there are external conflictual events which impact the combined classroom group and Poyas (2016), who describes her self-study following a clash between herself and a student concerning the teaching of "political" literature. In addition, there are also some studies focusing on general pedagogical issues rather than something unique to Israel (e.g., Kosminsky et al. 2008; Margolin 2008, 2011; Olsher and Kantor 2012).

Some Background

When Jews and Arabs intermix in kindergarten, elementary or secondary school, it is usually because of a minority of Arabs who study in Jewish schools, where the language of instruction is Hebrew, rather than Jewish pupils studying in Arab schools where the language is Arabic. In southern Israel, where our college is located, there are many Arab teachers who have come from the north to teach because of greater job opportunities and many live in the mainly Jewish city of Be'er Sheva. Most of the Arabs in the south identify themselves as Bedouins, and between the Bedouins from the south and the Arabs from the north, there is also a great deal of cultural and even linguistic diversity.

The religion of Arabs in Israel may be Muslim, Christian, or Druze, but the religion of the southern Arabs who comprise almost all the Arab population of Kaye College is Muslim. Therefore, we will be referring to Muslim Arabs when we talk about our students. The faculty of the college is approximately 30% Arabs and 70% Jewish and the student population of our college approximately 50% Arabs (mainly Bedouins) and 50% Jews. In the regular Bachelor of Education program (granting a B.Ed. and teaching certification), the programs for kindergarten and elementary school are separate for Jews and Arabs, while the two groups study together in the special education, high school, arts, and physical education programs.

About ACE

ACE, a post-graduate teacher education program, educates preschool–12 and special education teachers. Our students, numbering approximately 160, represent the multicultural face of Israeli society: immigrants and Israeli-born, secular and religious, and Jews and Arabs. The program also includes 15 staff members from diverse disciplines, cultures, and backgrounds. The team and students are all Israeli citizens.

ACE is a dialogic program of learning through doing, sharing, asking questions, and conceptualizing. There are no theoretical textbooks. The program name – ACE – represents the conceptual approach that framed its construction:

- **Active**: Active engagement is the source for learning and becoming.
- **Collaborative**: Collaborations between schools and the college, as well as our collaborative learning environment, involve all ACE members in developing a creative learning community.
- **Education**: Developing an educational dialogue in this community creates a web of interactions forming the basis for multiple possibilities of action, considering sociocultural diversity and different contextual situations.

Researching ACE

Believing in the importance of adopting an inquiry stance, the ACE team's research path of collaboratively researching our practice almost since ACE started, included most of the team. For those of us involved, practice and researching our practice became so entwined that sometimes it is difficult to define when one stops and the other starts. Our approach is an open-ended one based on a rhizomatic conceptualization (Deleuze and Guattari 1987; Larsson and Dahlin 2012; Semetsky 2008 – more detail can be found in the ▶ Chap. 21, "A Rhizomatic Self-Study: Aiming at Social Justice in a Conflictual Environment" by Barak, Tuval, and Turniansky in this handbook). This approach is less a distinct methodology than a mindset (Waterhouse 2011). The territory is undefined, and any part can connect to any other part. The boundaries between data and interpretation are indistinct, and all the activities, "data collection, analysis and interpretation happened simultaneously" (St. Pierre 1997, p. 180).

Over the years we have been continually collecting data in one form or another with the result that our data are varied and cover both team and student perspectives. There are both purposefully generated data such as protocols from team and subgroup meetings, student feedback, student assignments, staff personal reflections, and team member interviews around various subjects, and incidentally gathered information from informal discussions between team members. Some of the research was planned and had defined beginning and end points, but much is ongoing as an integral part of our being part of the ACE. In fact, almost everything describing the self-study groups that East and Fitzgerald (2006) studied and the conditions necessary for their success, describes things we have learned about our own collaboration including the difficulty of explaining it to others (e.g., Barak et al. 2010; Friling and Turniansky 2016; Gidron et al. 2016; Turniansky and Friling 2009; Tuval et al. 2010, 2011).

We try to be as ethical as possible in our continuous research. Our students are made aware of the fact that we continually research the program and if we want to use a specific assignment as data, for example, we ask the students involved their permission to do so. Some data were collected by the students themselves at our request. In this chapter, all names used are pseudonyms except for those of the authors: Smadar, Dina, and Bobbie. In other articles and presentations, real names of team members sometimes appear but only after receiving specific permission to do so. Students' real names are never used.

Most of the data presented here was gathered over the last 5–6 years and is translated from the original Hebrew. Following are a few of our self-studies that are relevant to multiculturalism and collaboration.

Some of our research consists of critical research-based examinations of the team, by the team. For example, after interviewing nine out of 10 team members, we explored our development as a professional team through examining our individual career stories (Barak et al. 2010). A related project, "Negotiating a team identity through collaborative self-study" (Tuval et al. 2011), reports on a collaborative self-study led by three team members, but involving the rest of the team, in which the desire to understand a crisis in the team led to the analysis of team meeting protocols and emails about those meetings.

A self-study (not yet submitted for publication) that will play a prominent role in the present chapter is one in which eight team members, Jews and Arabs, participated. The data used were students' written anonymous responses to our request to write about their experience of learning in our mixed learning environment of Arabs and Jews. The analysis of their responses surfaced the stereotypes, expectations, and surprises, good and bad, that the students had about the "other."

Through our collaborative self-study "Heard and unheard voices in a multicultural teacher education environment" (Barak et al. 2016), we discovered blind spots within our professional space. The study, based on personal reflective vignettes and conversations between five team members regarding our experiences of being teacher educators within a multicultural environment, led us to understand that although we would like to believe we are promoting social justice and equitable education, we have to approach it more consciously. Different interpretations of the same situations, perceptions of status, and hierarchy and emotions were all revealed by the unheard/heard voices.

For our latest research continuing the examination of heard and unheard voices, we analyzed the protocols of formal and informal team meetings centering around two critical incidents relating to the relations between Jewish and Arab team members (Turniansky et al. 2018). This self-study reinforced the importance of acknowledging our own cultural identities, and facing up to the fact that seeing or not seeing cultural differences and their effects is a choice we make.

Being Part of a Multicultural Collaborative Team

As the program grew, the ACE team grew and diversified. New members joined, and a few left, but most who came stayed. Slightly less than half the team have been members since the program's first years, and this number is dwindling as team veterans reach retirement age and new members join. With expansion the team is more heterogeneous in terms of age and goals, leading to internal subgroups within the team: those continuing the ongoing collaborative research tradition and those setting out on their own, usually in the direction of doing disciplinary research rather than researching their practice. Today we number 15: 7 men and 8 women, 4 Muslim Arabs and 11 Jews.

The team's way of being emphasizes collaboration – in our teaching, in our daily work life, and, as mentioned above, to a slightly lesser extent in our research. Collaboration occurs in different groupings ranging from pairs to the entire team. No one is uninvolved although different levels of personal involvement can sometimes lead to intragroup tensions (Mansur et al. 2011). Most team members teach multiple workshops and are part of more than one internal sub-team thereby creating a network structure of connections between people, ideas, practice, knowledge creation, and spaces and opportunities for learning. As a highly networked, interdependent team with a strong culture, collaboration is not something we do – it is part of who we are (Tuval et al. 2011).

Each team member both facilitates program workshops and acts as a pedagogical tutor in the field. We teach in overlapping co-teaching teams that change according to the needs of the program and team members' preferences. Many of the co-teaching teams are multicultural – one Jewish and one Arab team member.

The networked team structure and the deeper meanings of collaboration sometimes take time to discover and get used to.

> There's a different type of thinking here. In the first year I was very confused. ... It took time until I began to see how things are done and [then I realized] it's opposite to the point of view that your knowledge is yours. That was a totally new experience for me. It took me a long time to understand that it's okay. I don't have to be the sole possessor of this knowledge and it doesn't have to stay only with me. It's out there and everyone needs to use it. That is, all of us together own the knowledge. (R - cited in Friling and Turniansky 2016, p. 104)

We work as a self-managed team, collectively deciding most aspects of our program. We are a dialogic team who enjoy talking with each other around our round table, the table that has taken on a symbolic function as an expression of our collaboration (Turniansky and Friling 2009). Over the years our multicultural team has developed a shared mental model, a model that helps people "to describe, explain, and predict events in their environment" (Mathieu et al. 2000, p. 274), but parts of that model are always open for discussion (Mansur et al. 2011).

For this chapter, in addition to re-examining existing data, we also conducted individual interviews with 11/15 team members (4 Arabs and 7 Jews) on their experiences of working in a multicultural team.

Focusing on the team as a whole, Alon talked about its advantages and how the Jewish members should change their behavior a little to make it better.

> A mixed Jewish-Arab team is interesting and fruitful. You always have to see other perspectives, to think about the taken-for-granted. It's something different . . . Arabs and Jews have different life styles, different emphases. It's not bad, it's different . . . Our team in general is pretty inclusive and there's an atmosphere of acceptance but sometimes we [Jewish members] have to be quiet, something difficult for us, to make room for the Arabs because their discussion style is different. In our meetings it is very obvious they're less spontaneous, and we [Jews] don't always stop.

All team members interviewed expressed the view that the personal, not the "cultural," part of the multicultural team is the focus of our co-teaching interactions. Adi (Jewish) described her work with Imad (Arab) that started long before they became part of the team.

> I've worked with Imad 20 years or more, and the issue of Jewish/Arab isn't relevant. We work great together. Apparently "mixed" working demands a longish learning and adaptation process.

Imad also does not feel differences after years of collaborative work with the ACE team.

> I've been co-teaching for years with Jewish colleagues. I feel I fit in well. I make my voice heard and there's mutual respect.

However, Adi described her first time co-teaching with another Arab teacher differently.

> Working with him wasn't easy and I asked him if it because of me. He answered that things are okay.

We cannot know if these issues were discussed within the co-teaching teams since each teacher was interviewed separately. However, we can see that ongoing collaborative work increases the feeling of collegiality and moves the cultural differences to the background.

Cultural Diversity, Multiculturalism, and Multicultural Education

There is no absolute agreement as to the meaning of cultural diversity, which we and others use interchangeably with multiculturalism (Fylkesnes 2018), or the meaning of "multicultural education."

Multiculturalism, which can be represented by a mosaic, and colorblindness, typified by the melting pot metaphor, are opposite perspectives on managing cultural diversity (Plaut et al. 2011). The main issue is, are cultural differences valued and celebrated or ignored?

Multiculturalism is not always seen positively. While the multiculturalism road keeps the minority identities safe, it can be perceived by the majority as a threat, and therefore, in general, members of the dominant or majority culture prefer colorblindness, while members of minority cultures feel more included with multiculturalism (e.g., Jansen et al. 2015; Meeussen et al. 2014; Morrison et al. 2010; Plaut et al. 2011).

For example, a study in a South African university analyzed students' photo-narratives about space and safety (Shefer et al. 2018). Results showed that a sense of safeness was experienced in spaces frequented by a diversity of people. The diversity

seemed to provide a sense of safety, community, and common purpose. More participatory and personal pedagogies where expressing diversity was encouraged were also important in promoting a sense of safety.

Writing about official multiculturalism in Canada, Fleras states "Multiculturalism represents a racism in its own right by taking differences too seriously or not seriously enough" (2014, p. 245). He sees it as "fostering the illusion of inclusion" (p. 245), thus leading to new racisms. Multiculturalism is also perceived as permitting a "form of participation on the part of those designated as 'cultural others' that is limited to the decorative" (St. Denis 2011, p. 308).

We often see signs of this effect in our program when cohorts of students and their mentors plan different events for all or part of the ACE community. When planning these events, the issue often comes up of how to make sure both main cultures are represented. Many times, Arab students will volunteer to make pita and labneh (a yogurt cheese). Very rarely, if at all, are matters such as different ways of knowing or learning raised leading to "the folklorization of multiculturalism" (St. Denis 2011, p. 308).

One instance where the discussion moved in another direction occurred when a group of students (Jews and Arabs) had to prepare an educational discussion for the ACE community. Smadar, one of their mentors, told the rest of the team about the group's planning meeting.

> A group of Jewish students offered to discuss how sex education is conducted in schools and what we should do. The ensuing discussion aroused much laughter among the Jewish students as they brought up examples which included talking about genitals. In the meantime, the students from the Bedouin group became quieter and quieter, and only when we, the facilitators, specifically asked for their opinion on the subject did they express opposition to it because "we do not talk about it, and if we do talk, it's not in that way." After a long discussion in which we (Smadar and Hakim, her Arab co-teacher) attempted to get everyone to express themselves and listen to the meaning of what was being said on both sides, the subject the group decided to bring to the final discussion was "Culturally sensitive sex education - is it possible?"

What happens to students in ACE? In the following sections, we will look at some of the cultural unknowns they have to deal with.

Stage 1: Entering ACE Is Like Sojourning in a New Culture

Beyond the differences between the cultures of the students, with very few exceptions, the learning environment we created is itself a culture foreign to them. They quickly realize it is something unknown and, for some, it is a stressful situation (Turniansky and Tuval 2016).

In many ways, this is a process of acculturation – first-hand contact of people from different cultures, in this case, the meeting of different learning cultures. Contact and participation and cultural maintenance are two dimensions proposed for studying acculturation (Berry 1997). The intersection of contact and

participation, being involved with other cultural groups, and maintenance, striving for preservation of cultural characteristics and identity, creates four possible outcomes:

- Integration – positive on both dimensions
- Assimilation – positive adaptation, negative maintenance
- Separation – negative adaptation, positive maintenance
- Marginalization – negative on both dimensions

In ACE we have seen examples of all these outcomes.

Stage 2: Meeting Intragroup Multiculturalism

We regard education as a social mission and the teachers as educators who can deal with important social questions and leading processes which narrow the gaps and promote tolerance of diversity in a democratic and multi-cultural society. (Vision statement, Kaye Academic College of Education)

Multiculturalism brings with it many issues that need to be addressed, just a few of which we will present here. As part of our ongoing self-study, we asked all our students to anonymously describe their experiences in our learning environment which includes both Arabs and Jews. Most quotes in this section are extracts from their texts.

First Impressions and Changing Perceptions

Social identity theory (e.g., Tajfel and Turner 1985) proposes that people tend to categorize both themselves and others into social groups (gender, religion, and so on). The in-group is the group the individual identifies with; the out-group is "the other." However, social identification is not always "yes/no," it is often a matter of degree of identification. Identity salience is "the probability that a given identity will be invoked" (Ashford and Johnson 2001, p. 32). Several factors influence identity salience and one particularly relevant in the present case is how aware we are of the out-group(s).

Although male Bedouin students are sometimes less visually obvious, the presence of the many female Bedouin students in the college, and in ACE, is very noticeable because of their dress. Exposure to the multicultural situation begins the moment candidates arrive for their group interview, part of the acceptance process, or, even previously, in the registration office.

Many students, from both cultures, started the year with concerns, fears, or simply negative opinions or expectations about meeting the unfamiliar.

In the beginning I was concerned. I never sat in the same room with Bedouin women. I was concerned about what the relationships would be. I was afraid of prejudice and I really didn't know what to expect. (Jewish student)

> In the beginning I was very scared. How can I deal with this situation? How can I talk? How is it possible to deal with people whose religion, language and general way of life are different from mine? (Arab student)

A little later, like anthropologists, our Jewish students show a great deal of interest in learning about the Bedouin from a cultural standpoint, and the Bedouins seem to enjoy learning about Jewish customs and beliefs. For example:

> In terms of my personal experience, I'm happy I was given the opportunity to get to know a new culture I hardly knew a thing about; about the values and customs of Arab culture. . . (Jewish student)

> It's a very good experience for me because I'm a Bedouin and very far from the Jewish culture. It's so unfamiliar to us. Therefore, participating in this class is very good for me. (Arab student)

However, in general, there is a priori asymmetry with the minority group being more knowledgeable about the majority than vice versa. Some Arab students emphasized that they know the Jews and their culture, but the Jews do not know them or their language (see below for more on language).

> Actually, we know Hebrew. We studied it and understand it, but they have no knowledge of Arabic and don't have much knowledge about the Arabs. Not everything we undergo in our lives is like them. . .

For many students, participating in ACE contributed to a change in perceptions about the other. One insight often developed on both sides is that the two major groupings, Arabs and Jews, have more intragroup differences than either group thought. This realization happens both regarding the others and "my group" (which is often harder for students to accept). The two large groups gradually come to be differentiated smaller groups, possibly the first step toward seeing individuals, not groups. After that stage, the power of prior stereotypical thinking becomes more obvious and similarities "between us" start popping up. The following quotes from two Jewish students clearly show this process.

> Over time I started knowing the Bedouin women. I understood that the generalization "Bedouin women" was very broad and shallow and that you must know them personally to form an opinion.

> From our group I learned to accept the other more than I thought I would. Unfortunately, before I got to the group I thought a little differently about the Bedouins, especially the women, because I never had contact with them. I always thought they were quiet, don't talk much, and have low status [in their community] – "be pretty and shut up." But when I met them I understood that there's not much difference [between us]. Like us, there are women who are spirited and those who aren't.

But preconceptions, prejudice, and change do not belong solely to the Jewish students.

> In the beginning I didn't enjoy the idea of integrating Jews and Arabs. I would have preferred a group of only Arabs who have the same ideas and the same daily stories. But after I started in ACE and I mingled a lot with my Jewish peers, I changed my point of view and now I don't regret being in this mixed situation at all. (Arab student)

As mentioned before, the overall learning experience in ACE is very different from previous learning experiences most of our Jewish and Arab students have had. One Arab student strongly makes that point as she contrasts her multicultural experiences in the university with those in ACE.

> [In the university] I often tried to get closer to Jewish students, but they were afraid of me. If I managed to talk to someone one time, she didn't come close a second time. Maybe it's because the way classes are run. We meet in a class and that's it. Afterward, everyone goes her own way. Even on the bus I take, if there's an empty seat next to me, no one Jewish sits in it. I see the fear in their eyes. I ask myself, why are they afraid? Why won't they give me a chance? When I started my journey in ACE, I never thought we would get to the situation we're in now. Today we're more than friends. It's unthinkable that we'd meet without hugging each other. Each of us asks the other how things are going. We talk and happily argue. We dance together in class, sing out loud. Everything is because of ACE . . .

Of course, it would be naive to think that everything is ideal that there were prejudices, but everything changed because the two groups learned together. Some second-year Jewish students voiced other opinions:

> I think ACE tried to create something that exists in me. I don't think it changes political opinions that most of the [Jewish] students have about Arabs. And when I hear these students talk, most of them don't really connect [with the Arab students], and if they do, it's not real friendship.

> In my opinion, the thinking did change. The first time we wrote about it, I wanted everything to be good, a lot of cooperation and respect. But after a year and a half, there's cooperation and respect, but often there's a sharp turnaround, and the Jewish women go back to being with their own group and so do the Arab women. . . . However, with all the cooperation we had between us, you can feel there's discomfort. I always hope to be cooperating for good. Continue with Jews and Arabs learning together until we get to a state of cooperating from the heart.

The second student quoted above is frustrated but hasn't given up hope that the relationships between the two cultures can change and thinks ACE has a role to play in the process.

Language

There are many cultural differences worthy of investigation, but our intertwined practice and research has shown us that language, the trigger for us researching the issue of multiculturalism, is a matter deserving special attention. Language is central to personal and cultural identities, and the politics of language pattern onto inclusions and exclusions, particularly concerning issues of citizenship and belonging (Eidoo et al. 2011, p. 72).

Language is a big issue. Language defines who is in the group and who is not. It is part of our identity. Despite the proclamation of multiculturalism in the College vision statement, and although Arabic is the native tongue of approximately 50% of the college's students and 30% of its faculty, Arabic does not appear on the permanent direction signs in the main building. Notices in Arabic or Arabic and Hebrew can be found on notice boards, but they are usually put up by specific departments.

For Israeli Arabs, Hebrew is their *third* language since spoken Arabic and literary, written Arabic are basically different languages. Arab school children start learning Hebrew in school at an early age, while most Jewish children learn little or no Arabic in school. Although our college has a program educating pre-service Arab teachers to be Hebrew teachers for Arabic speakers, the program educating Jewish teachers to be Arabic teachers for Hebrew speakers closed many years ago because there were no applicants.

On the instrumental side, studying in a foreign language is not an easy task and our experience with lower class participation on the part of Arab students in ACE is mirrored by Halabi's (2018) research on Arab students studying for a master's degree in a different teachers' college.

Some of our Bedouin students see a chance to improve their Hebrew through interacting with Jewish students but both Jewish and Arab students also see negative outcomes of learning together.

> Interaction with the Jewish students also gives me a chance to know Hebrew the way they speak it and that improves my vocabulary. (Arab student)

> The situation in which Arabs and Jews learn together has negative elements, mainly the hurdle of the Hebrew language. It's hard to understand the material and the assignments they ask us to do. If it was in Arabic it would be easier for us. [Arab student]

> I know the assignments are hard for them, that they [the teachers] don't cut them any slack and make them write in Hebrew. (Jewish student)

Language is also an issue for some team members. Bobbie and Basam look at the issue of language from the point of view of someone who is often not using their native tongue. For Bobbie, not having many opportunities to speak English is more of an emotional issue, while Basam is aware his behavior changes because of feeling less mastery of Hebrew. For both, language embodies both important cultural and identity aspects.

> As someone who immigrated to Israel from the United States, albeit many years ago, I still feel much closer to English than to Hebrew. I miss the opportunity to speak English and sometimes just start speaking it anyway. Hebrew will always be my second language. I have no emotional attachment to it. (Bobbie)

> One weakness of Arabs and Jews [working together] is that language is important. Not only about emotions, that's marginal . . . I feel at a disadvantage regarding my mother tongue. There's a different culture. Sometimes there are tensions. It depends. It's important. Not

everyone can co-teach. Co-teaching with other Bedouin I can be spontaneous. Here I'm not spontaneous. If they give me a choice, I choose not to co-teach. Second choice is to co-teach with someone with the same language and mixed co-teaching, third place. (Basam)

Tamar, a native Hebrew speaker, looks at the issue from perspective of co-teaching with Arabic speakers.

... with Imad, I tried understanding what he was saying. On the one hand it seemed strange and unconnected to the subject, but on the other, I really wanted to understand him. ... with Basam, he's so creative and has a lot of ideas, and I feel, maybe because of me, he doesn't express himself enough and say what he thinks. When he does talk, it's amazing. ... It bothers me.

Basam's feeling that he is held back when he must work in Hebrew is echoed by Tamar's impression from working with him.

Hakim, an Arab team member, perceived his language difficulties as a huge problem until he saw Bobbie's acceptance of her own difficulties:

Language is not a simple obstacle. Sometimes you have an idea, but you lack the specific concept you need. It puts you at a disadvantage with a colleague who has the experience, the language, and the concept. I always wanted to see how the others looked at my language. Slowly I'm letting go. For example, Bobbie doesn't have mastery of Hebrew as a native language, and if you look at her, that's fine, legitimate. I used to see it as "the end of the world."

Many Hebrew speaking students get annoyed when Arab students start talking among themselves in Arabic during class and, apparently feeling left out, ask for a translation or ask the Arab students to speak Hebrew. How do the Arab students feel? We have no direct information from our students, but the following quote about Spanish gives us a lot to think about.

So, if you want to really hurt me, talk badly about my language. Ethnic identity is twin skin to linguistic identity — I am my language. Until I can take pride in my language, I cannot take pride in myself ... Until I am free to write bilingually and to switch codes without having always to translate, while I still have to speak English or Spanish when I would rather speak Spanglish, and as long as I have to accommodate the English speakers rather than having them accommodate me, my tongue will be illegitimate. (Anzaldua 2007 as cited in Eidoo et al. 2011, p. 72)

Language, however, is not the only potential source of conflict.

Potential for Conflict

There can be conflict in any group, but Paletz et al. (2014) propose a dynamic constructivist model assuming greater likelihood of experienced conflict, direct, or observed, in multicultural settings than in culturally homogeneous settings.

Whether they will benefit from conflict or be stymied by it depends on the relevant cultural meanings, or the lens through which individuals make sense of the world. Cultural meanings

influence both the extent to which individuals perceive specific social interactions as conflict and the degree to which individuals can tolerate conflicts. (p. 239)

There will be conflict, but conflict does not always bring negative outcomes in its wake. A major factor is whether the conflict is perceived as a threat. If not, conflict can benefit more complex thought and creative thinking (Paletz et al. 2014). Trust is a factor in allowing conflict without perceiving threat, but although deep trust is evident in the team (Friling and Turniansky 2016), most of whom have worked together for many years; trust is harder to create in a group of students who come together for a short period and have no common past and no expectations for a common future.

Multiculturalism can be perceived by members of the dominant culture as a threat to their inclusion (Plaut et al. 2011) and core values (Morrison et al. 2010). However, variables such as the level of ethnic identification can have an impact on the reaction to it. When ethnic identification is a more central part of the self, the majority's response to multiculturalism may be to protect "my group" and our values, and a greater orientation toward maintaining hierarchies between groups (Morrison et al. 2010).

In ACE, a recurring example of the majority's perceptions of inequity concerns holidays. Although our college has included the recognition of multiculturalism in its vision, the college is closed for major Jewish holidays but not Muslim holidays. The college sends out holiday wishes (as it does for Jewish holidays) and notifications that Muslim students will not be in class those days, but classes continue as usual. Bobbie's experience is typical of what often happens as a result:

> One day, a holiday when Muslim students were absent, some Jewish students complained: "It's not fair. Why do they get off both for our holidays and their holidays?"
>
> The question angered me, and I responded: "Perhaps you should ask why the college doesn't think Muslim holidays are important enough to close the College like they do for Jewish holidays." They didn't understand my point.
>
> I added a childhood story about the "problem of going to school in the USA with a matzah sandwich [on Passover]". They still didn't understand.
>
> Again, a familiar feeling of helplessness.

In an interview, Maya, a Jewish team member, referred to her perceptions of how the students view each other, emphasizing the "personal baggage" students bring to our meetings.

> I think our team is leftist and not racist. But among the students, there's "soft racism" and a few show "hard racism." Soft racism is stereotypes, and then, deeper familiarity and cooperation soften the feelings. When there's hard racism [among Jewish students], there's fear and hatred, and then it's not really changeable. I assume there's hatred of Jews too. But they [the Arabs] don't show it too much – maybe because they're a minority, maybe because of a desire to please.

Being a Multicultural Teacher Educator

As educators we tell our students they enter the classroom and all other professional situations and interactions as whole people, and therefore they must understand themselves and their life experiences and how they influence their perceptions. The same holds true for us (Griggs and Tidwell 2015).

For example, in a self-study trying to capture and understand their beliefs and practices about race, Galman et al. (2010) found their "beliefs and practices perpetuated and reinforced white racial knowledge" (p. 229). When they raised issues of race in class, they unwillingly accepted the fact that whites did not participate. On the other hand, in voluntarily focus groups they ran, only students of color participated, and their reactions were that the dominant white group should be the one to bring up issues of race and say that racism is not okay.

Poyas (2016) describes a self-study sparked by an incident in her master's level literature class in a northern Israel teaching college. The class, attended by 13 Jewish and 3 Arab veteran teachers, focused on reading a novel written from a Palestinian perspective – a fact that led to tension between Poyas and one of the Jewish students. Her ensuing self-study, besides revealing the difficulties of teaching literature in our divided society, revealed her blind spots and mistaken assumptions:

> My starting assumption, which proved mistaken, was that our group, composed of teachers and educators, acknowledged the need to observe reality through different prisms and knew how to spend time in opaque and somewhat fragile spaces. (p. 276)

In ACE, we have the added dimension of co-teaching which can make multicultural teaching easier and more effective but can also raise additional issues to deal with as the following section shows.

Multicultural Co-teaching

Our major first and second year workshops, "*Wisdom of Practice*," are co-taught and when possible, the co's are culturally mixed. Having a multicultural team greatly aids being a multicultural teacher. We are constantly learning from each other and expanding our cultural knowledge and awareness, but it is not always easy to accept the other's opinions. For example, a disagreement arose between Adi and Basam who taught a workshop on inclusion and integration.

> . . . there were Bedouin students who objected, on religious grounds, to hearing a homosexual's lecture on his school experiences. Basam also thought it was provocative because it's a conservative society and inappropriate to bring someone like that. We argued because I thought it was distorting the truth if we don't bring him. But in the end, I agreed to compromise because I felt I take the reins too much and he holds himself back. I let him decide who would come to talk, and, in the end, it didn't happen at all. (Adi)

In this instance, Adi felt the need to move aside during a culturally related conflict because she felt more dominant than Basam was when making decisions, especially as she felt her decision was less culturally sensitive than her co-teacher expected.

Since each of us is also a pedagogical tutor observing students in the field, giving feedback and, ultimately, deciding if they have passed their field teaching experience, the pedagogical tutor becomes a major part of the students' experiences, even beyond the scope of the workshop and the field experience. In students' eyes we have a lot of power. Over time we realized that choosing who to talk to about a request for "personal consideration," the "person like me" or "the other", is often at least a partially strategic choice. The result is:

- Students tend to turn to the "similar" teacher when they want a deeper understanding and consideration of their problem or request or when it deals with a very personal matter.
- Students tend to turn to the "other" teacher when less cultural knowledge about their situation may be to their advantage.

> Bobbie: Arab students have come to me at least twice during the past few years saying they would not be in class a certain day because it was a holiday. Since I had never seen this event observed as anything other than a date which is noted and a day when Arab schools are closed (as a part of teachers' work contracts), I asked an Arab team member about it and received confirmation of my suspicions that they were expected to be in class that day. Apparently, the students thought they could benefit from my ignorance.

> Imad: [In answer to an interview question about whether he thinks he must represent the Arab point of view when co-teaching] I have a problem with this. I don't have a problem with holidays and folklore; I even see this as part of my role in the team. The point that bothers me is the subject of professionalism and teacher education. I don't give discounts to Arab students. I don't want to consider where they come from and what their home situation is. Jewish students have problems too. The Arab students think we have to cut them some slack and sometimes exploit Jewish teachers with stories, that in my opinion, we have to understand, but we don't have to take it easy on them because of it.

Being an educator can involve walking a tightrope between different parts of multiculturalism and colorblindness. Student teachers may have difficulty distinguishing between the need to maintain high expectation from their pupils and being empathetic and caring (Tellez 2008), as can teacher educators. Empathizing with a student who has a difficult home life, economic difficulties, or an unhappy marriage is easy but what form should that empathy take when talking about academic responsibilities and performance? When does the request to take something into consideration become a request to "cut me some slack"?

Dealing with the Big Issues

All of us experience discomfort, even fear, when talking with our students about certain issues (Cutri and Whiting 2015). For example, Galman et al. (2010)

discovered they missed opportunities to discuss race and racism in the classroom. Their study suggested that they:

> ... at least partially failed our students of color in the name of being nice by privileging white comfort to avoid bringing conflict to the fore and thereby making ourselves uncomfortable. (p. 233)

Sometimes that discomfort stems from uncertainty that we will know how to deal with emotions or conflict that might ensue. Often, we do it anyway; other times we avoid the issue. We warn our students that as teachers, at times they will have to deal with uncomfortable topics in class and in preparation, often ask them to discover what those specific issues are for each of them and work on how they might handle them. As Elbaz-Luwisch puts it:

> There's a body in the middle of the room. We ignore it. As the teacher, I show students how to do this and they follow my lead. Since my students are teachers and prospective teachers, trained by years in classroom, they are already inclined to ignore the body. But the fact that I set an example is undoubtedly reassuring. Usually, of course, we ignore the body by ignoring it - we don't speak about it, we don't look directly at it, we change the subject quickly if there's a risk of noticing it. Sometimes, however, we have to ignore it by speaking about it - by saying the right things and then carrying on with our assigned topic. (Elbaz-Luwisch 2004, p. 9)

Poyas' self-study (2016) showed that sometimes mistaken assumptions can blind us to the existence of the body in the room and increase the importance of our understanding that living and working in the historical and political environment we do, events outside the college campus cannot be ignored. Over the years there have been several national events involving, or leading to, conflicts between the Jewish and Arab-Bedouin populations, and as a team, we often try to talk through issues, to clarify to ourselves our connections to the subject and discuss possibilities of where we want to go with it and how to get there. Team support and co-teaching help us confront and deal with the discomfort. Here we will look at one event and how we dealt with it.

Destruction and Death: The Jewish-Arab Conflict

In early 2017, a severe confrontation between Arab Bedouin and police forces resulting from the demolition of homes belonging to Arab Bedouin residents of the unrecognized Arab village of Umm al-Hiran exacted a heavy toll: two dead – a Bedouin teacher and a Jewish police officer. Some of the Jewish students have family in law enforcement and some of our Bedouin students and team members live in or near the same community, and many know the family that lost their father. Most of the ACE team knows his wife, who teaches at the college, and some of his children study there. Feelings on all sides were running high with rampant rumors and accusations (Turniansky et al. 2018).

The conflict was covered extensively in the media and the voices of participating police officers were heard. The emotional storms from that day were also expressed in the classrooms during small group meetings (covering the entire ACE community) which allowed students and staff to relate to the events as they experienced them.

Afterward, the team met to discuss the discussions. A Bedouin member reported:

> In the beginning the Bedouins didn't talk ... they had no information about the factual situation and this is a problem because they had nothing to say ... (Imad)

Another Arab member said she asked the Bedouin girls to start the discussion:

> Three of them spoke in a row – only the Bedouin women. These are women who barely talk unless we specifically ask them to and they talked openly about their fear of being in Jewish towns. (Alham)

Another Bedouin team member faced a situation he had not encountered before:

> The question came up in the group: What is there to talk about? ..... and then they started talking. But this is the first time I heard something like that. I knew that there was radicalization, but I did not imagine it was so extreme.

In certain groups the encounter was heated, with derogatory epithets, expressions of anger, and the feeling that each side barely listened to the other. Samdar, a Jewish team member, emphasized what was going on:

> My experience was of two worlds that spoke in different languages [left-wing/right-wing]. Two realities. These are people I sat with yesterday when we discussed very emotional subjects in research and everything was in the same language. In the essential things, there is something very strong that separates us – I don't understand the other side either.

These meetings surfaced the polarization between the two groups, which seem to have difficulty even finding points to talk about with each other. However, half a year later, distanced in time from those meetings in early 2017, in her summary of her learning over the year, one of the Jewish students wrote:

> I learned to express my opinion but, no less importantly, to listen to the other's opinion. ... The Jewish-Arab conflict in Israel is a painful issue, and I am always happy to take part in discussion about it. During that conversation [Umm al-Hiran], I expressed my position on the subject, a position not everyone in the room agreed with. Hakim, one of the Arab facilitators in the room, patiently listened to me and insisted I finish what I started saying even when others interrupted me. From this I learned the importance of an open and civilized discussion in which everyone gives his opinion. Hakim "fought" so I could finish what I was saying despite the fact (I assume) that it didn't exactly match what he was thinking. I assume the ACE learning framework gave us a glimpse of a new and integrative way of learning we didn't know before.

This student, who expressed very extremist views in the initial meeting, testified over 6 months later; that charged encounter strengthened her awareness of the importance of listening to others, even when there was no agreement between them, and spoke of the importance of dialogue.

But for some students, ACE is a special place, outside the conflicts of the "outside world." After the initial discussion, we felt that a follow-up on the next class day was necessary since some students were left very unsettled by it. However, in Bobbie's group (six Jewish students, eight Arab students, co- taught by a Jewish and an Arab facilitator), the students could not understand why we were bringing the issue up again. One of the Arab students put it very bluntly: "We're in a bubble here. Don't burst it!"

From Simple Salad to a Dish Worth Remembering

From our work on this chapter, we realized that intercultural education may be a more useful term for us than multicultural education.

> Meaning to "move between" cultures, intercultural teaching captures what it is to teach effectively in multicultural contexts. (MacPherson 2010, pp. 1–2)

"Intercultural" may be less influenced by perceptions of history and hierarchies than "multicultural."

> An intercultural perspective has an educational and a political dimension: interactions contribute to the development of co-operation and solidarity rather than to relations of domination, conflict, rejection, and exclusion. (Portera 2008, pp. 483)

Portera's explanation resonates well with the ACE program rationale regarding praxis in terms of *being* in varied situations and the ability to learn and change. We believe building a collaborative learning community where everyone can learn and has something valuable to contribute is essential for learning to navigate within the complex, ever-changing web of emotions, perceptions, interactions and sociocultural backgrounds influencing almost all learning processes.

> Concepts such as identity and culture are not interpreted any more as static, but as dynamic. Otherness or strangeness is not seen just as a danger or risk in terms of conspicuous behaviour or illness, but instead as a possibility for enrichment and for personal and social growth. (Portera 2008, pp. 485)

This emphasis of the dynamic nature of culture and identity as raising possibilities and challenges for personal as well as social growth describes our reality, and this stage of our continuous self-study, emphasizing the complexity of multiculturalism and intercultural education, leads us to several insights.

A trap we do not want to fall into is assuming the issue of Arabs and Jews is usually behind something said, done, or felt within team interactions. From what we heard, often it is purely a matter of personalities. These reactions might result from the fact that for the team, multiculturalism is taken for granted and, therefore, attention is focused in other directions. We **can** say we are becoming more attentive to the possibility of unheard voices.

There will always be several sides to the story. There are often different points of view, sometimes opposing points of view, therefore solutions may be temporary, fragile, or even illusions. Once we realize this, we also understand that some expectations we have as teacher educators are unrealistic. Trust is essential for openness and risk-taking, and the challenge is finding ways to help its development in groups of students with no common past and no expectations for a common future. Despite the difficulty, we, the ACE team members, have a moral responsibility to deal with "the body in the middle of the room" (Elbaz-Luwisch 2004) and the courage, time, and energy to face the issue even if it causes opposition and angry reactions. However, from time to time, we must consciously decide to respect others' wishes not to deal with it. Another challenge is knowing when to do what.

Our Arab colleagues and students wrestle with complex identity issues. One challenge we face as teacher educators is making our diverse group of Jewish students more aware of the issue, more empathetic, and, hopefully, more willing to take an active stand to make all citizens equal citizens.

Using the Israeli salad, so popular in our Mediterranean area, as a metaphor, gives another perspective on our complex situation. The salad is very simple; anyone can make it in a few moments. But if all you do is chop some tomatoes and cucumbers and throw them into a bowl, it can be a boring salad. As mentioned, these are the basic, necessary ingredients but what makes it interesting is each individual's personalization: different proportions, additional ingredients, and seasonings. Some flavors are strong, spicy, and others subtle. Suddenly, our bicultural approach becomes multicultural and intercultural.

Our blended educational environment might not work in a lot of other places, but we have managed to build a fragile bubble that lets us function in our conflictual, complex reality. This brittle situation demands constant vigilance, causing constant tension. Our continuous self-study helps us cope with this reality by channeling the tension into searches for ways to improve our practice. We understand that unsurprisingly, the ingredients for successful continuous self-study resemble those needed for multicultural education and work – collaboration, trust, patience, and hearing the other.

We also must guard against the danger of becoming self-satisfied with our practice by ensuring that we retain the novice way of being (Friling and Turniansky 2016), a state of being that makes it possible to continue seeing things with fresh eyes and asking new questions about them. As Jane, a founding member of ACE put it when interviewed as part of a study on our development as a professional group (Barak et al. 2010),

> This is a game of life within tensions that we often call collaboration and paralysis. It's not a peaceful life. Even today, after so many years, we don't have a feeling of "OK, we've reached some serenity ..."

The biggest challenge still standing before us is exploring how to strengthen the protective bubble mentioned above to make it less sensitive to outside influences and at the same time to expand its influence outside our program.

Abstract

In this chapter we trace our development as collaborative arts-based self-study researchers and the rhizome-like influences we have had on ourselves, colleagues, and graduate students. Our journey has taken us recursively from an arts-based pedagogy to self-study methodology and from methodology to reflexive pedagogy as we strive to develop our unique living theory. Each section discusses both methodological and pedagogical approaches used within the context of graduate teacher education, research courses, dissertation thesis advising, and professional development contexts in the broader communities. The chapter mirrors research and practice representative of our growing research interests over the last several years focusing on the integration of the arts, the use of arts-based research methods, and the use of self-study methods coupled with a variety of narrative tools for data collection, analysis of data, and representation of findings. The evolution of our collaborative self-study journey led us to discover how arts-based methods could be useful as both processes and products for our research. Our results led us to the development of a new research methodology that we refer to as arts-based dialogic narrative analysis (ABDNA).

Keywords

Arts-based dialogic narrative analysis · Arts-based research · Methodology · Reflexivity · Collaborative self-study research · Visual thinking strategies

Introduction

The development of self-study in our academic culture parallels the trajectory of each of our journeys as scholars and researchers in the school of education at a midsize private, faith-based institution of higher education in the southeastern region of the USA. As self-study researchers, we have taken a creative, arts-based approach in both the doing and teaching of self-study and reflexive practice while simultaneously using art as a mediating artifact to reflect on and develop our own work, as well as engaging others in exploring their research and scholarly pursuits through an arts-based, self-study lens. Additionally, we have developed and explored reflexive arts-based self-study activities as pedagogic devices to mediate students' developing understandings of positionality and reflexivity in qualitative research processes in general and in self-study methods and practice more specifically. Our journey has taken us recursively from an arts-based pedagogy to self-study methodology and from methodology to reflexive pedagogy as we strive to develop our unique living theory.

In this chapter we trace our development as collaborative arts-based self-study researchers and the rhizome-like influences we have had on ourselves, colleagues,

and graduate students. Each section discusses both methodological and pedagogical approaches used within the context of graduate teacher education, research courses, dissertation thesis advising, and professional development contexts in the broader communities. The chapter mirrors research and practice representative of our growing research interests over the last several years focusing on the integration of the arts, the use of arts-based research methods, and the use of self-study methods coupled with a variety of narrative tools for data collection, analysis of data, and representation of findings.

The evolution of our collaborative self-study journey led us to discover how arts-based methods could be useful as both processes and products for our research. Our results led us to the development of a new research methodology that we refer to as arts-based dialogic narrative analysis (ABDNA). Using a visual and narrative format, we hope to demonstrate our successes in integrating self-study into our academic culture, as well as a variety of local and international contexts, while critically reflecting on the significance of these experiences on our own practices as teacher educators and doctoral research advisors. To begin this narrative journey, we have chosen to introduce ourselves through narrative profiles to provide the reader with personal biographical details that will serve to elucidate how our early years were pivotal in forming both our philosophical and epistemological inclinations.

Our Art-Making Materials: Personal and Contextual Resources

Jill: The Artist

My training as a visual artist began in childhood under the tutelage of my father, who introduced me to "the arts" at a very young age and nurtured both my fascination with the making and the viewing of anything arts related. Whenever I was ill, my father would bring me a paint by number kit; containers of clay, glue, and small objects for collage making; as well as books on "how-to" draw, paint, mold, etc. My "formal training" began with painting classes at a small gallery owned by my father's friends and then continued at the Lowe Gallery on the University of Miami campus, while my brother was in classes for advanced science and math. I think that I was pegged as the future artist, while my brother was being groomed for aeronautical engineering!

My dad made a living as a painting/interior contractor, but his true passion was singing, performing, and helping his children with projects. Every weekend was spent at fairs, movies and live performances, craft and art shows, or outside in South Florida's beautiful, visual landscape. As a child I learned to appreciate the beauty of the world around me, both man-made and natural, through my father's discerning eye. I will be forever grateful for his guidance in helping me to view the world with wonder and awe: a habit of mind that has been instrumental in guiding me throughout my professional journey. But it was my mother, herself a teacher and school administrator, whose advice I took while earning my Bachelor of Fine Arts,

majoring in drawing/printmaking and art history – "get your teaching certificate while you're there. When you can't make a living as an artist, you can teach. You've always been wonderful with children." It is Mom I can thank for having the foresight to guide me to my vocation and true calling: teaching. Throughout my professional life, my mother has always been there as my champion – to listen to me, to advise me, to support me, and to reassure me that I had chosen the most noble of professions of teaching.

As a visual artist, art educator, and teacher educator – coupled with my roles as principal, faculty member, chair, associate dean, and dean over the last 30 years – I have deepened and expanded my knowledge in a number of areas within the field of education, and I have deliberately worked to synthesize this knowledge while engaging in scholarly endeavors. Both my formal educational background, coupled with my years serving as teacher, curriculum director, principal, professor, and dean have compelled me to constantly seek ways to integrate and synthesize the foundation and knowledge I have gained from various disciplines in order to enhance the subjects that I have taught. Experiences gleaned from these professional roles, juxtaposed against the fields of curriculum and instructional leadership, have allowed me to traverse the literature and make connections between seemingly disparate fields. My research agenda has evolved in parallel to my practice, finally bringing me full circle in the pursuit of my own essential knowledge and truths, as evidenced by explanations of practice that demonstrate my emerging living theories.

I can trace my journey back to when I first started teaching as an adjunct instructor for my university. I was asked to teach action research for the first time and was able to offer this to teachers working in the school where I was principal. As I guided the students in my graduate course, as well as the teachers who chose to participate in a yearlong study of their practice in the classroom, I felt the power of studying and reflecting on my own practice as a teacher educator, observing that what I was experiencing was the beginning of my own "living theory" of how educational influence was being evidenced in the stories and actions of the social formations in which I was living and working.

My journey as a teacher educator and self-study researcher took a turn when I first turned my lens backwards, to my roots and grounding as an art teacher and visual artist. It began when I took a 2-week training in Visual Thinking Strategies (VTS) – my paradigm shifted. It was serendipitous that I wound up at the Lowe Gallery of Art on the UM campus to take my students on a field trip (EDU 555-Integrating the ARTs) and wound up in the VTS training. The epiphany I had during those 2 weeks hit me like a bolt of lightning: My practice *was* my canvas, and I realized that I could begin using "the arts" as both the foci for my unfolding research agenda, as well as to examine my practice through my self-study scholarship.

Carter: The Actor

My career trajectory within academia began not from the classroom, but rather from the stage. I graduated with a bachelor's degree in theater performance in 1985 from

Indiana State University with a number of professional summer stock credits already under my belt. I even had to forgo commencement exercises in order not to miss the first week of rehearsals for a reoccurring summer acting job as – what I have now come to refer to as – a "professional Cornelius Hackle" in the Jerry Herman musical, *Hello, Dolly!* This set into motion a decade of both paid and unpaid performance work around the country, much of it in New York City. However, once I became a member of the professional actors' union – Actors' Equity Association – the paying jobs in New York became fewer and fewer. What had been my office "temp job" became permanent, and within 10 years I was an assistant vice president of a leading structured finance insurance company. This career transition was as much of a surprise to me as it was to my parents: an academician father and a librarian-cum-stage mother. My husband – then partner – had a significant job opportunity which had us relocating to South Florida, and, soon after our arrival in Miami, the USA was struck by the horrific tragedies of September 11, 2001. Through the sadness and turmoil which followed, I made the decision to transition to English language teaching as a vocation and enrolled in an Applied Linguistics MA program in order to obtain the requisite knowledge, skills, and credentials to teach English at the college level. There was certainly something performative about teaching, and I have little doubt that my "he's-a-natural" classroom successes have been supported by the formal preparation I received for the stage, as well as my own professional experiences in theater performance. Still, as life's journey continued, I was feeling less and less like an actor and more like an educator and that felt – and still feels – right to me.

While teaching English language at an area college, I returned to university once again: this time to earn my PhD in curriculum and instruction with a specialization in teaching English as a second language at Barry University, where I currently serve as an Associate Professor and Program Director for our master's degree programs in curriculum and instruction. You see, I am a product of institutional incest. I am one of the rare, eschewed-by-the-academy-at-large examples of university programs' hiring their own academic children. Jill and I share a close academic kinship: she has long been and continues to be my teacher, mentor, friend, and research partner. It was through both coursework and collaborative research inquiries with Jill that I was first introduced to self-study as research practice. Nearing the end of my coursework was the *Doctoral Colloquium in Curriculum* course and then facilitated by Jill – a course which we will be describing more fully elsewhere within this chapter – and it was in the Colloquium where I began to understand the opportunities for the resurrecting and leveraging of my artistic abilities, sensibilities, and identities.

Bill Ayers' (2006) *Trudge toward Freedom: Educational Research in the Public Interest* was pivotal in activating my view that I and other "educational researchers can gain sustenance and perspective by drawing on the humanities—poetry, film, theatre, and imaginative literature—in their search for knowledge and understanding" (p. 81), especially when one's aim is to serve a public good through empirical inquiry. In particular, Ayers' description of the work of performing artist, Anna Devere Smith (1993), and her performances in *On the Road: A Search for American Character* triggered within me a reawakening of myself as a theater artist with

tools and sensibilities valuable to educational research, specifically through ethnodrama (Winkle 2016).

Our Canvas: Theoretical/Methodological Underpinnings

Vygotskian/Sociocultural Theory

Our work has been grounded in past experiences with each other and with other communities of practice, where we have explored the integration of arts-based research methods to portray perceptions of our collaboration as both construct and process. The theoretical underpinnings guiding our work are based on the primary concept that learning is a social activity (Vygotsky 1978; Wenger 1998). Fundamentally, Vygotsky's theory of social learning resides in the concept of the mediated mind, "human beings do not have a direct relationship with the world; their relationship is mediated by objects, others, and the self, as well as through tools and cultural artifacts" (Vygotsky 1978). His theory describes development as starting on an external-interpersonal-social plane before being internalized and intrapersonally appropriated through language, the most important mediational tool.

Vygotsky also considered the art image as a form of communication, as it exposes and connects the "unconscious and the conscious" conflicts and emotions within and between the artist and the viewer (Lima 1995, p. 417). According to Vygotsky (1978), when the viewer is surprised by something unique in an image or process, the shock caused within the viewer's visual experience mediates psychological change, resulting in the generation of new mental dispositions. These forms of critical thinking allow opportunities for art problem-solving in the zone of proximal development (ZPD), which operates when individuals are jointly engaged with others during art activities (Hedegaard 1990). As a shared, collective experience, the art activity nurtures interpersonal procedures that become social, historical, and cultural traditions among participants (Hedegaard 1990). Learning in the ZPD "transforms" the individual's self-image, their art skills and knowledge, and their working relationships as they engage in the art activity (Wells 1999, p. 333). Changes that may occur during art activities may include "a capacity to participate more effectively in future actions," "the invention of new tools or practices," and "the modification of existing tools or practices, and changes in the nature of social relationships" (Wells 1999, p. 328).

Arts-Based Self-Study: Narrative Inquiry, Portraiture, and Visual Narrative Inquiry

The use of an arts-based educational research (ABER) approach within each of our shared inquiries was intentionally chosen to disrupt conventional approaches to research and the representation of our findings and is grounded in Dewey's challenge "to break through the conventionalized and routine consciousness"

(1958, p. 184) so that we might view things in new and perhaps truer ways. The evolution of our development as collaborative arts-based self-study researchers mirrors Weber's (2014) explanation of the use of images rather than words as a better representation of the complexity of the whole while offering multiple viewpoints and multiple interpretations of theoretical positions.

We believe that a distinctive aspect of our approach is the pairing of the visual and the narrative. Thus, we integrate the methodology of *portraiture* (Lawrence-Lightfoot and Hoffmann Davis 1997) which itself is grounded within a phenomenological frame utilizing various ethnographic inquiry approaches. Story is central to portraiture, and we therefore draw upon narrative inquiry (Clandinin and Connelly 2000) traditions of understandings of experience as dialogically three-dimensional: interaction, continuity, and temporality. A distinction between traditional ethnographic inquiry and portraiture is that ethnographers listen *to* a story, while portraitists listen *for* story (Lawrence-Lightfoot 2005). *Voice* of participants is a key construct within portraiture: as witness, interpreter, preoccupation, autobiography, discernment of others' voices, and voice in dialogue. But the voice of the researcher or portraitist is not silent. "With portraiture, the *person* of the researcher – even when vigorously controlled – is more evident and more visible than in any other research form" (Lawrence-Lightfoot 2005, p. 11). Intentionally resisting research traditions of documenting pathology and suggesting remedies, portraiture calls for an initial search for *goodness* within the phenomena under study (Lawrence-Lightfoot and Hoffmann Davis 1997). It assumes that areas of strength, flaws, weaknesses, and inconsistencies will be revealed through explication of emergent themes, participant and researcher relationships, context, voice, and the resultant portrait or aesthetic whole (Dixson et al. 2005).

Portraiture aims to bridge the realms of science and art. It aspires to capture the essence of human lived experience and examine, interpret, and present findings through aesthetically rich stories or *portraits* which we believe results in making empirical educational research more accessible to a broader audience of stakeholders. The primary tools and artifacts used throughout our longitudinal self-study inquiries have been language and art/image-making. Together, these tools and artifacts have been pivotal in helping us to reach new levels of understanding of self, of each other, and of our collaboration. Data and findings generated throughout our ongoing research have caused a ripple effect (Weber 2014) that has had a significant influence on each of us within our practice. Correspondingly, as we introduce our graduate students to a variety of unique lenses for analyzing their experiences in new ways, they are expanding their epistemological knowledge bases and introduced to unique approaches to ethical and just practices with their own students.

As artists and inquirers, we are inspired by Bach's (2007) conception of *visual narrative inquiry,* which – in her use – primarily involves photography and photographic images as a means to explicating, expanding, or evoking participants' or one's own narrative story or experience. Building upon the work of Clandinin and Connelly (2000) and others, she suggests photographic images provide a visual realm to explore the dimensions of interaction, continuity, and temporality central to

the conceptions of narrative inquiry. While in our own work we have not yet incorporated the use of photographic images, we believe Bach's working definition for a visional narrative inquiry remains apropos: Visual narrative inquiry is an "intentional, reflective, active human process in which researchers and participants explore and make meaning of experience both visually and narratively" (p. 281).

Visual Thinking Strategies

In one of our first papers *Looking In, Looking Out: Reflection, Refraction, and Transformation Through Three-Dimensional Self-Study,* we reported on what occurred in our self-study community (Farrell et al. 2013) when we brought a specific pedagogy that *democratizes the arts,* Visual Thinking Strategies (VTS), to a culturally and linguistically diverse low socioeconomic status (SES) urban high school. VTS, the brainchild of Abigail Housen and Phillip Yenawine, has been used for over 20 years through their nonprofit organization Visual Understanding in Education (VUE) to study how looking and talking about art, facilitated by teachers, impacts cognition (Yenawine 2014). Housen (1999) investigated visual thinking in her doctoral research while examining the experience of museum attendees when viewing works of art. From the patterns of thought that emerged in her longitudinal, qualitative study, Housen posited and developed her five-stage aesthetic developmental theory. The theory describes the characteristics of the novice art viewer as they progress through a series of experiences in art interpretation. Each of the five stages represents a more sophisticated level of knowledge, thinking, and communication. Housen's theory, coupled with Yenawine's background and experiential knowledge in museum education, led to the development and implementation of the VTS curriculum for grades K–2, 3–5, and 6–8. The teacher-facilitator using VTS presents a series of 10 lessons over a period of 20 or more weeks to the student/ viewers. There are three principal stages which are designed to stimulate the thinking, communication, and visual-literacy skills of students: (a) looking at art images of increasing complexity, (b) responding to questions which are developmentally based, and (c) participating in carefully facilitated teacher-led group discussions (Goldberg 2005). The student/viewer is asked to orally respond to a grade-level appropriate narrative art image, prompted by the teacher-facilitator with the three sequential questions that guide all VTS inquiry: (a) "What is going on in this picture/image?", (b) "What do you see (in the picture) that makes you say that?", and (c) "What more can you find?" (Visual Understanding in Education 2012, pp. 5–5). During the art interpretation session, the students draw upon their observations and prior knowledge in order to communicate their thinking through interpretive-art dialogue by openly discussing their observations and reasoning in a mediated environment. This is then facilitated through clarifying statements and paraphrasing with neither explicit endorsement nor contradiction by the teacher; this democratic and dialogic environment nurtures divergent thinking and unpredictable, complex descriptions of viewers' interpretation of the image (Hubard 2010; Zander 2007) supported by evidentiary reasoning (Guilfoyle et al. 2004).

Our research for this chapter was grounded in our hope that these students would benefit from the rich discussion and interaction that emanates from participation in VTS to enhance their skills in communication, critical thinking, visual thinking, and writing (Housen and Yenawine 2000). At the time we were advocating for the role of the arts in a milieu that placed great value on verbal thinking while many students were visual thinkers. We wished to develop the multiplicity of lenses and the "plasticity of body and mind" that would allow for multiple modes of thought, knowing that visual thinking skills atrophy when not developed or with lack of practice due to over emphasis on verbal and numerical activities (Brumberger 2007). Our belief at the time was that through the introduction of the VTS pedagogy to a group of teachers, we could help them to reframe some of their classroom content through visual thinking methods while guiding them to be more reflective in the process (Schon 1983).

Our Journey from Pedagogy to Arts-Based Self-Study Methodology

In 2013, we – along with doctoral student Mark Rosenkrantz – embarked on a collaborative self-study inquiry examining and aesthetically representing our experiences and learnings surrounding the conception, planning, and implementation of a *Visual Thinking Strategies* (VTS) (Yenawine 2003, 2014) professional development training series for teachers in a low-socioeconomic, culturally and linguistically diverse urban high school in Southeast Florida (Farrell et al. 2013). The quasi-longitudinal self-study was informed through a *Portraiture* (Lawrence-Lightfoot and Davis 1997) methodological approach which we disaggregated through three metaphorical phases of "Old Masters" painting techniques and processes: *Grisaille*, *Color Washing*, and *Opaque Color Application*. For us, these three metaphorical phases would guide us through an (1) initial and preliminary study or sketch of the phenomena – rather than a fully formed portrait or series of portraiture artifacts – (2) a laying in of reflexive analysis in terms of our own sensemaking vis-à-vis the phenomena, and finally (3) the "completed" portrait.

It was during this "grisaille phase" when we organically developed the arts-based research methodology – serendipitously born of the VTS instructional pedagogy – that would become central to our ongoing work as collaborative self-study researchers, teacher- and researcher-educators, and dissertation research advisors: *arts-based dialogic narrative analysis* (ABDNA) (Winkle and Farrell 2014).

As teacher educators and researchers in a liberal arts and professional studies university located in an urban environment, we are faced daily with acting on and living out the social justice commitment of our university's mission, which is grounded in the core commitments of *knowledge and truth, inclusive community, social justice,* and *collaborative service*. Through a formalized Community Learning Partnership involving neighboring public and private schools, the mission is enacted through the cross-institutional sharing of personnel and resources in order to provide educational and leadership opportunities for secondary school students,

teachers, and administrators who encourage collaboration and support the nurturing of these values among all community stakeholders. As a result of our ongoing collaborative efforts to assist one of the "neediest" high schools in in this partnership, we were asked to bring strategies and best practices to the teaching faculty to help boost student performance in multiple content areas. Our ultimate charge was to introduce VTS to educators and to foster an understanding of and value for both visual and verbal ways of thinking as we attempted to create a *culture of inquiry* while offering teachers the opportunity to learn VTS and introduce it into their respective classrooms. We had entered this new inquiry as instructional practitioners and researchers constantly searching for ways of enhancing our practice – and ourselves – while striving to add legitimacy to our "scholarship of teaching" (Shulman 1986) and "living theory" (Whitehead 2007) through self-study.

In this section, we include an abridged sharing of the inquiry, its processes, and findings which led us to the development and refinement of the ABDNA methodology.

Developing Methodology Within Grisaille: Three-Dimensional Self-Study of Professional Development Practitioners

Grisaille – an artist's term derived from the French word *gris* or gray – refers to a monochromatic painting technique used extensively by European Old Masters artists predating 1800. This technique of painting historically served the purposes of providing (a) an opportunity for the preliminary study of the person or subject; (b) a form of underpainting for a forthcoming, more richly detailed aesthetic artifact; (c) a teaching device used by mentor artists to focus students' attention to depiction of subjects' form; and (d) an opportunity for the laying in of contextual background elements (Krieger 2001) which we suggest contributes to a viewer's understanding of time and place. In the Grisaille phase of our inquiry, we preliminarily sketched and "work[ed]-out all compositional considerations and tonal value relations before proceeding to the final color version of the painting" (Krieger 2001, p. 25). And as a newly formed collaborative triad of PD facilitators, we first worked through the developing understandings of our relationships to one another, sharing and valuing each other's particular areas of expertise.

Through a series of meetings that involved the administrators of the high school with faculty and administrators from our institution, the decision was made to begin using this school as a field experience site for placement of pre-service student teachers enrolled in our required TESOL (Teaching English to Speakers of Other Languages) methods' classes. While revealing the specific academic and linguistic needs of the student population in the school – largely English language learners (ELLs) with Hattian Creole as a first language – a series of conversations led us to consider how the use of a VTS curriculum and pedagogy might assist the high school teachers in helping their students acquire the vocabulary and critical thinking skills needed to assist them in successfully matriculating through high school.

We were asked by the principal to bring VTS to the school as a professional development opportunity for the teachers as a means of raising student achievement and helping the school to meet its desired goals for adequate yearly progress, as determined by the state.

Methodology

Recognizing the legitimacy of using multiple qualitative methods in self-study research (Bullough and Pinnegar 2001) – and sensitive to the forms we used to design and sketch our inquiry – careful consideration was given to our methodological choices and stance. Initially, we entered the research responsively, through a series of collegial conversations and informal meetings, when the seeds were planted for the current inquiry to begin. Our initial dialogue began inside and outside of the institution over the course of several weeks in both informal and formal contexts that resulted in our formalization of the current inquiry. Through individual and collective reflections of these early meetings, we were able to "reframe" (Schon 1983) our individual goals for how our study should unfold, as well as our perceptions of how the teachers might feel about the imposition of the VTS PD. In true self-study fashion, the nature of our collaborative dialogue was replete with stages of communal reflecting and reframing (Loughran 2002), helping us to unpack our individual perspectives and work them out through our shared dialogue.

This dialogue was the impetus that helped us to explore new ideas, theories, and concepts that we were applying, enhancing our understanding, and spurring us to further action (Guilfoyle et al. 2004). As we continued to meet, reflect, and record, individually and collaboratively, we were reminded of and encouraged by the work of other self-study researchers as they reported on their experiences with promoting reflective practice (Dinkelman 2003) and developing a shared research agenda to better understand one's practice and to improve teacher education programs (Berry and Crowe 2007). Throughout our work we were mindful of Zeichner's (2000) call to build on the self-study work of others as we engaged in and reported on our own collaborative self-study efforts.

As our inquiry progressed over time and as we engaged in cycles of data gathering and analysis in a storied way, Bullough and Pinnegar's (2001) words reminded us that "[T]he aim of self-study research is to provoke, challenge, and illuminate rather than confirm and settle" (p. 20) helping us to work through our questions and concerns – separately and together – and resulting in changes to our perspectives (Griffiths and Windle 2002). At times we had difficulty finding intersubjectivity regarding our research design, as we were constantly sketching, shaping, and thinking about how we would represent our research and validate our "claims to knowledge" (Whitehead and McNiff 2006). A pivotal moment occurred when we saw that our forms of inquiry and representation were becoming one and the same, developing simultaneously and interactively rather than linearly (Berry and Loughran 2002).

As researchers we tried to understand experience through multiple lenses while remaining cognizant of our own perspectives and the influence of those perspectives (Eyring 1998). The ability to fluidly shift one's focus from the experience, to what

shapes the experience, allows for more detail to emerge and a deeper understanding of the phenomena. As "native phenomenologists" (Keen 1975), we alternately explored our areas of inquiry, experiencing, reflecting, and interpreting, individually and collectively.

We began, then, to view ourselves within the inquiry as the lateral faces of a three-sided prism, with the phenomena (the VTS professional development series) viewed through the prism base. This relocated self-study to a deeper location within the prism core, where the central triangle became the methodology that grounded our inquiry as we viewed the phenomena through the lens of existing self-study literature. The interior triangles are the three dimensions of narrative inquiry: interaction, continuity, and temporality (Clandinin and Connelly 2000). Figure 1 below is a visual representation of our prism as research lens.

By using the prism as our representational lens, we established our guiding question:

> In what ways does the experience of designing and implementing a Visual Thinking Strategies professional learning community in an urban high school influence our practice as HE administrator, teacher educator, and art education practitioner?

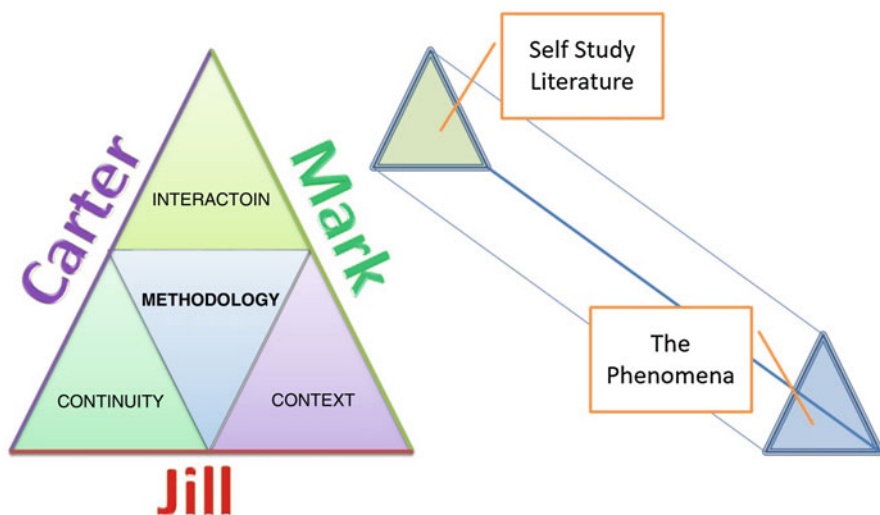
As we began the implementation of the VTS PD series, there were various contextual constraints that were impediments to our desired progress. Scheduling of PD sessions, district policy regarding teacher professional development responsibilities, personal life circumstances, professional responsibilities, and participants' attitudes and beliefs about professional development and art interpretation were acknowledged by us as challenges inherent in the development of the VTS cohort. We continued to examine and reflect upon our ongoing relationships to and with


Fig. 1 Prism as research lens

the teachers and leadership of "Henry Ford Senior High School" and – as well – our continuing co-construction and development of the evolving VTS curriculum for diverse high school learners.

Data and Analysis

Multiple data sources for the initial phases of the study included our ongoing dialogue, through email and face-to-face (F2F) meetings; telephone and Skype communication; preliminary meetings with administrators and teachers; journals; individual, collective, and community reflections; visual artifacts; and audio and video recordings of self-study meetings. As the study progressed, the researchers were each responsible for collecting data in the field related to individual and collaborative actions, observations, and reflections on the VTS training sessions and ongoing negotiations with school partners. Visual artifacts were used throughout the study to represent both data sources and findings and as a primary means of engaging in data analysis.

Data were also constructed and interpreted through a process of reflective art-making sessions, the products of which were analyzed, guided by the three VTS questions. Coming together for extended blocks of (mostly) uninterrupted time, we independently drew, painted, and sculpted what each of us perceived as "going on in the picture" of our work together as researcher-practitioners and, as well, the evolving grisaille of the professional development learning community which was emerging through our work at "Henry Ford Senior High School." Next, each of us – as artist – used our own work as the object of an audio-recorded VTS session facilitated for the other two researchers. For example, Jill used one of her own images – a gesture drawing of a VTS lesson being delivered at the school site – for her facilitation with Carter and Mark using the VTS pedagogy, questions, and nonjudgmental orientation: "What is going on in this picture?", "What is it you see that makes you say that?", and "What else can we find?". In other words, we used the pedagogy of the VTS teaching strategy central to our PD as a means to understanding our own experience of the phenomena of both planning and implementing the VTS training series. Figures 2, 3, and 4 below are the products of this initial foray into ABDNA.

Three-Dimensional Collaborative Self-Study Portraits: Findings

In this section we describe our findings (Farrell et al. 2013), which emerged as a result of engaging in multiple cycles of DNA, before, during, and after the creation and examination of our visual artifacts. It was during the third phase of our analysis when we began to ask ourselves, "what happens in a prism, and what has occurred in our prism?" During these cycles of ongoing dialogic inquiry as we explored the social, cultural, and historical contexts of our learning and practice, we simultaneously experienced Bakhtin's ideas of heteroglossia, extracting meaning from each other's words and using them to explain our own meanings and intentions (Guilfoyle et al. 2004). The following themes emerged during the final stages of our ABDNA, and we have chosen to use these themes – with vignettes from our individual narratives – as evidence to validate our newly found "claims to knowledge" derived from this study (Whitehead and McNiff 2006). Our themes extended

Fig. 2 Jill – The emerging VTS community

Fig. 3 Carter – Framework for a community of influence
Fig. 4 Mark – Three hands reaching
our understanding of our collaborative self-study as prism as the following: refraction, transparency, illumination, mirroring, and dispersion. The hyperlinks which follow each theme's description take readers to artistic artifacts which have narrative evidences of our learnings superimposed.

Refraction: Moments of Tensions

These were "critical incidents" (Loughran and Berry 2005) where tensions that surfaced during our dialogue in meetings caused us to push beyond our comfort zones and beyond our current thinking and current ways of knowing. These transitional moments of tension – drawn from misperceptions and, at times, opaque communications – often inhibited us with each other and during certain interactions. Yet, due to the nature of our dynamic, they also served as catalysts for each of us, pushing us in new directions and leading to new insights, both individually and collectively.

Transparency: Moments of Honesty

The refraction, or refracted moments, led to increasing honesty in our relationships, with one another and with others in our respective communities. This was when we truly engaged in the professional dialogue characteristic of many self-study groups (Guilfoyle et al. 2004) and essential to true collaboration. The safety we all felt with each other, and the value that we all put on the work, allowed for these moments of honesty, necessary in working through the critical moments in our collaborative research process, as well as the critical tensions inherent in our practice, which were revealed through our research. Eisner (2002) stated, "Representation can be thought of, first, as aimed at transforming the contents of consciousness with the constraints and affordances of a material" (p. 6). Together, as a team, we designed and acknowledged the constraints and choices of materials that mediated our access and ability to engage in the representation of our research and vision of the VTS PD curriculum.

Illumination: Moments of Clarity and Transformation

These were moments of insight when it all came together for one, or all of us, as a result of the scaffolding of our professional dialogue. Often, working on the debriefing of a VTS session and the planning for the next stage, something said by one of us would ignite another and help us to come to new insights and to shape our understanding of the phenomena. These "critical moments" were the experiences that helped to transform our existing notions of self, other, learning, and ways of knowing. Throughout our research there were times in our sharing of concepts and negotiating shared meaning that required us to go beyond words and included visual image-making as a way of processing our thinking individually and together. Cultural pluralism is the acceptance of multiple modes of representation in the mediation of thinking (John-Steiner and Mahn 1996). The internalization of our socially constructed meaning was supported by both discussion and image-making activities.

Mirroring: Visions of Self in our Collaborative Partners

Art is communication, the mediation of thinking through form (Eisner 2002). As we attempted to understand each other's experiences and actions, specifically when

engaged in our "art/image-making" ideas surfaced among all of us concerning our professional learning, forming our emerging living theories. "Living theory" is defined within the context of real-life theorizing, evident from the way teachers reflect on their practice, gather data, and generate evidence to support claims based on beliefs. The testing of these beliefs for validation occurs through ongoing dialogue and critical feedback (Whitehead and McNiff 2006).

Dispersions: Educational Influence on Others

We began our work together as collaborative research partners with several goals in mind. In this particular inquiry, the improvement of our own practice, in each of our respective roles, was pivotal for each of us as practitioners and self-study researchers. We each acknowledge "traces" of our individual selves that have been shaped and influenced by our interaction with one another within the prism of our collaboration. While we cannot emphatically make claims that the present study had a significant impact on the students and teachers with whom we interacted throughout the duration of this study, we do feel that there were incidents that occurred where the "rays of light" shining through our relationship break into constituent spectral colors, resulting in moments of influence external to the prism of our self-study collaborative. The relationships and ideas communicated through our dialogue extended our influence to other relationships, actions, and ideas that emerged in other places.

From Pedagogy to Methodology: Developing an Arts-Based Dialogic Narrative Analysis

Following this work with Mark – who was, by now, deeply invested in his dissertation thesis work – Jill and Carter continued to reflect upon our experiences within the triad collaborative, but our conversations seemed always to return to the data analysis processes that had so naturally emerged. Beyond the valuable learnings and new understandings of ourselves and our practices as developers and deliverers of professional development training, we had a shared conviction that perhaps the most significant outcome of the work had been the germinating seeds of a data analysis method grounded in the orientation and procedures of the VTS pedagogy. As a continuation of this dialogue around our experiences, we codified the procedures and shared them through academic presentation at the Fifth International Qualitative Research Conference in Guanajuato, Mexico (Winkle and Farrell 2014), formally conceiving it as *arts-based dialogic narrative analysis* (ABDNA). To follow is a description of the three-stage recursive process:

Studio Stage

ABDNA has three recursive stages. In the first stage (*the studio stage*), we come together to negotiate a reflexive foci or prompt. We then independently create visual representations of our self-study collaboration. Using a variety of art-making materials, we draw, paint, and sculpt what each of us individually perceives as "what

is going on in this picture," i.e., the picture of our self-study relationship. The art-making typically occurred in relative silence, though in close personal proximity with occasional verbal interactions.

Gallery Walk Stage

In the second stage – generally a week later and while audio or video recording ourselves – we meet to display our visual artifacts. We take part in a *gallery walk* whereby we each reflect on what we believe is represented in each other's images. It is at this stage where each artistic artifact creator takes on the traditional role of VTS facilitator and engages the co-researchers using the three VTS questions which are at the heart of the pedagogical strategy. At this point, the artist-facilitator does not confirm or contradict viewers' interpretations of their experiential art objects; through their paraphrasing and questioning, they maintain a neutral orientation while facilitating viewers' opportunities to express interpretation of meaning vis-à-vis the artifact:

1. What is going on in this image?
2. What do you see that makes you say that?
3. What more can we find?

We use these questions to begin our dialogue, unpacking the images as artifacts in order to mediate our understanding of the phenomenon of our experiences as viewed by each one of us as a member of the collaborative. The art that we each created was the tool – the cultural artifact – that was used to ask each other what we saw in each other's work or what we perceived was going on in that image. At times we modified the questions slightly, to fit our purposes, asking each other "what do we see that we *perceive* made the artist visualize it that way?" We used this process with each of the multiple images that we had created, taking turns to look, to reflect, and to ask each other "OK, what more can we find?" Ultimately, the artist-facilitator *does* share their personal interpretation of their own artifact and the meanings she or he had intended to instill within the image, resulting in a new cycle of dialogic analysis which is – again – recorded. This opportunity for the artist to share their "intended" meaning is a significant departure from the traditional VTS pedagogy which would never reveal an artist's original intent or meaning.

Recursive Content-Analysis Stage

In the third stage (*recursive content analysis*), we transcribe and then collectively view, review, and code the video recordings of our gallery walk sessions using a content analysis approach: examining our data for keywords, phrases, and other notations and denoting categories of concepts which were refined and reduced, first individually, then collaboratively through our combined perspectives.

This assemblage of stages in the ABDNA data collection and analysis reflects our notion of heteroglossic dialogue (Bakhtin 1984) used to represent the multiplicity of voices and meanings shared through our research. Through this sharing, "living and telling, reliving and retelling" (Clandinin and Connelly 2000), we reveal to each

other differing perspectives and interpretations of events. As we attempt to understand each other's experiences and actions, ideas surface concerning professional learning, forming an emerging living theory. "Living theory" is defined within the context of real-life theorizing, evident from the way teachers reflect on their practice, gather data, and generate evidence to support claims based on beliefs. The testing of these beliefs for validation occurs through ongoing dialogue and critical feedback (Whitehead and McNiff 2006).

Through the interplay of our language and iconography, we see the influencing actions of our dialogue and the resulting changes in our interaction. The boundaries that inhibit the sharing of insights and meanings of our experiences with one another begin to disappear, allowing our intellectual and emotional skins to become permeable and allow for the flow of the *rhizoaction* to move us to newer levels of shared understanding of a particular phenomenon.

Recursive Journeying from Methodology to Reflexive Pedagogical Device: Evolution of the Doctoral Colloquium

Our journey has taken us recursively from an arts-based pedagogy to self-study methodology and from methodology to reflexive pedagogy as we strive to develop our unique living theory. While retrospectively examining the trajectory of our collaborative self-study research, what emerges for us is the distinction between our uses of a specific arts-based pedagogic approach (VTS) when delivering PD in a community of classroom teachers, to our later use of the VTS questioning as the basis for a methodological tool for data analysis, resulting in our development of ABDNA. The findings that emerged from that study and implications for our practice led us to the next stage of our journey wherein we began to integrate arts-based pedagogic devices within the context of our graduate teacher education and research courses as tools to engage students in reflexive processes and practice. The reciprocal manner in which we have engaged in team-teaching and the examination of our practice as collaborative self-study researchers has resulted in the integration of self-study, arts-based research methods, and emancipatory practices within several of our graduate courses, but more specifically it has led to the evolution and regeneration of "the Colloquium," a unique course that reflects the recursive journey of our collaborative research which has evolved to its current form as a direct result of our longitudinal inquiry: we have come full circle.

Historical Orientation to "the Colloquium"

Since the inception of the PhD. in curriculum and instruction program at our institution, the "Colloquium" has been a distinct course that offers advanced study of special topics and current issues related to the broad field of curriculum while providing continuous support and direction to doctoral students in

developing their expertise in areas of inquiry and research, identifying professional development activities, writing professional publications, and designing presentations. Intended as a unique complement to the prescribed curriculum core, but required by curriculum and instruction majors, the Colloquium is open to intermediate and advanced doctoral students who wish to "broaden their horizons" by considering perspectives, issues, and principles central to other disciplines, professional fields, or areas of criticism, as juxtaposed against the broad field of curriculum thought and inquiry.

The course activates participants in critical reflection around research-based *knowledge and truth* claims through readings and collegial discourses vis-a-vis purposes and motivations for engaging in educational research. Through explicit examinations of whose voices and truths are privileged and whose are marginalized, course participants consider their own and others' motivations for choosing a particular research foci: potentially identifying opportunities for entering into empirical inquiry through a *social justice* or advocacy lens, congruent with our university's mission and core commitments. By engaging participants in readings, community and service activities, as well as collaborative arts-based experiences, we take action to foster an *inclusive community.* This is specifically embodied through a community service or community action project or research proposal which promotes a public interest.

Historically, this was a course that Jill had conceptualized and written, taught, and labored over every other year, and one in which she implicitly embedded pedagogies and methodologies that she was utilizing as part of her own professional development and evolving research agenda (i.e., self-study, VTS, arts-based research methods, and portraiture). While the stated overall goal is to engage students in issues relevant to their programs using academic as well as "popular literature" as sources, she had always used this course as an opportunity for students to consider contemporary issues and topics situated within the current milieu while examining their own and others' motivations for choosing particular research foci and offering them opportunities for entering into inquiry through a social justice or advocacy lens. In truth, the Colloquium was also an opportunity for Jill to open students' eyes to her own passions: the arts and the environment and the sustainability and significance of both.

In the first few iterations of delivering the Colloquium, students' comments attested to their "ah-ha" moments when forced to consider how they might use their researchers' lens to both advocate for the interests and perspectives of marginalized groups while trying out different methodological tools. It was also evident that research foci selected by students in the Colloquium oftentimes became the seeds of their dissertation research. We have often referred to one of Carter's comments, reflecting on his doctoral coursework, when he shared the impact of the Colloquium on his epistemological orientation and the motivation he felt to do "research in the public interest." It was also during that same offering of the Colloquium–when on a "field trip" to hear Philip Yenawine–that Carter was first introduced to Visual Thinking Strategies. The seeds had been planted.

Transference of Course "Ownership"

In the summer of 2013, Carter shadowed Jill when she decided to use Maxine Greene's *Releasing the Imagination* (1995) for the first time, along with Lynn Butler-Kisber's *Qualitative Inquiry* (2010). Jill had already been dabbling with arts-informed inquiry and the integration of arts-based methods in her research and had recently used collage, visual mapping, and painting in a collaborative self-study done with two doctoral students (Farrell et al. 2012). Having served as videographer in this study, Carter was familiar with the arts-based approaches, and we readily agreed to using collage as a pedagogical device. Through the art-making collage activities, we hoped to scaffold students' examination of their own – and others' – motivations for choosing research foci. The aim was for students to identify opportunities for entering into inquiry through a social justice or advocacy lens through the development and articulation of a personal advocacy position which gives voice to a marginalized population or entity. We further had students articulate its application through a community-based research project or project proposal that serves the public interest.

That summer was a pivotal moment in the history of the Colloquium, as the groundwork laid led to the generation of the next few years' iterations where we were motivated to expand our knowledge and that of our participants with new theories, curricula, and pedagogical strategies emerging from our own collaborative self-study research and our engagement in critical praxis with each other, as well as our colleagues in the larger communities in which we were each engaged. Our shared delivery that summer also resulted in the recognition that some of the pedagogic and methodological tools that we were using in the course, and in our self-study inquiry, were "keepers" and that these things needed to be more explicit in the syllabus.

This experience, along with insights gleaned and lessons learned, led us into the next phase of our collaborative research: *From Mission Alignment to Lived Curriculum: Walking the Walk in a Doctoral-Level "Special Topics" Course* (Farrell and Winkle 2014). This collaborative self-study examined the nature of our co-facilitation of the next iteration of the Colloquium which was presented at the 13th Biennial Colloquium of Dominican Colleges and Universities.

Having grappled with the intentional and amorphous nature of the Colloquium, but challenged with the parameters of an upcoming program review, we used our self-study lens to explicate processes in which we were engaged as we attempted to transform a "flexible" curriculum in order to codify key readings and experiences in our effort to maintain meaningful and explicit alignment to our University Mission and Core Commitments, regardless of the faculty charged with its facilitation. This required us to shift from the written curriculum, the syllabus as it had existed, to the lived curriculum: what was actually happening in terms of including an ABER and social justice focus – engaging our students in "doing research in the public interest."

Once again we tried on a different arts-based lens, choosing to represent our findings vis-à-vis this self-study inquiry through the performative metaphor of a dance. Why dance, one may ask? It was during this time that both of our roles were

shifting and the nature of our relationship as collaborative research partners and critical friends was taking us both into new directions. Jill's responsibilities as an associate dean were mounting, and her availability to teach multiple courses in the doctoral curriculum core was limited. At the same time, Carter was establishing himself in his full-time faculty role and beginning to explore ethnodrama as a research practice (Winkle 2016) while also wanting to take on additional course preps in the doctoral program. The Colloquium was a course that Carter had long coveted, and, while Jill was reluctant to let go, she knew the time had come to release ownership and that Carter was the one faculty member who "got it." We saw this as an opportunity to come back as research partners, once again exploring our dyad through a collaborative self-study lens with dance as the chosen art form.

It was during one of our research meetings when we were working on the presentation for the Dominican Colloquium that the idea of stepping into someone else's shoes was explored. Our shared dialogue took us from "if the shoe fits, wear it" to "following others' footsteps" to "can I live without my favorite shoes?" This was a critical juncture in the dynamic of the collaboration as Carter found himself walking on eggshells as he cautiously provided and responded to critical feedback about the existing syllabus and his own experience of the course, while Jill had to carefully navigate and steer the conversation, mindful of Carter's developing role as a faculty member. We vividly remember the meeting when we were both moved to jump up and do the waltz, ever mindful of not wanting to step on the others' toes!

In 2015 – during the next iteration of the Colloquium – Carter "flew solo" with Jill joining the final session as we used "arts-based dialogic narrative analysis" (ABDNA) to unpack the students' collage presentations. At this point we had agreed to adopting a persistent theme for the Colloquium "non satis scire: to know is not enough," but we were still grappling with a yet-to-be-codified learning outcome which included an exploration of educational research practices absent from the core doctoral research curriculum, such as arts-based inquiry, self-study, participatory action research, and emancipatory inquiry.

Returning to a Co-facilitated Colloquium

Our relationship as self-study research partners over the last 2 years had taken on a new dimension in tandem with the direction of our professional identities. As we were evolving in our respective practice – Carter as a more seasoned faculty member and Jill as Dean – opportunities for collaborative research had become more limited. But given the nature of our relationship and the commitment we each held to growing our "living theory," we continued to meet regularly for critical friends' sessions. It was during one such session in the Fall of 2016 when the seeds for our latest inquiry were sown. During the previous summer when Carter was given the opportunity to teach Qualitative Inquiry in the doctoral research core for the first time, he decided to be more explicit in helping students to be more aware of their positionality as researchers, mindfully and explicitly including reflexivity (Berger 2015). At the same time, Jill had been exploring the use of mindfulness in her daily

yoga practice, as a tool for helping her to deal with the challenges of her administrative role, as well as personal challenges presented after the sudden death of her husband. The shared dialogue and arts-based research that was undertaken during that time led to our latest study, *Mindfully Journeying Toward Researcher Reflexivity in Dissertation Advising and Graduate Education: A Visual-Narrative Inquiry,* a paper presented at the Eighth Annual Conference of The Qualitative Report. This collaboration and the renewed synergy created during our working sessions served as a catalyst for the decision to have Jill return with Carter as co-instructor of record for the delivery of the Colloquium.

The Journey of Our Living Theory Continues

In reflecting on our journey, we are reminded of Barone and Eisner's eloquent words, "the place of the artistic and the aesthetic in the process and product of social research has indeed been illuminated and expanded" and "artistry in the social research process is nothing new" (Barone and Eisner 2012, p. x). As collaborative self-study researchers utilizing a combined methodological approach to our research and practice, we have engaged in the implementation of art-making and reflexive pedagogies to unpack the transformation of our practice and, in turn, brought these devices into the classroom for the purposes of engaging our graduate students in understanding and reflecting upon their respective practices. We believe our use of arts-based devices lets a broader audience "read" our research and participate in our experiences as researchers and practitioners and helps to make these methods more available/accessible for consumption and adaptation by our students and colleagues. The rhizome-like influences evidenced by our learning and the explanations of our educational influence on others in our academic community have been strengthened by our deliberate choice of an arts-based self-study approach as both our methodological and pedagogical approach. Our engagement in the research process of self-study while utilizing arts-based methods at all stages has allowed us to explore and unpack our practices with a depth and richness not available through more traditional research paradigms. We believe that our journey into the "how" and "who" and "why" of self-study (De Lange and Grossi 2009) – specifically through the integration of an aesthetic approach to both the construction and analysis of data – may prove fruitful to a wider community of educational researchers who similarly envision an artistic approach to research that extends beyond artistic or visual modes of representation (Weber and Mitchell 2004) within self-study.

Abstract

This chapter discusses the introduction of self-study as a viable research methodology at Walter Sisulu University (WSU), a comprehensive poorly resourced institution in a rural setting in South Africa. It outlines the processes followed towards establishing a self-study research group and shares the challenges and successes that followed. As authors, we are two African women scholars with multiple backgrounds who had to negotiate different personal and scholarship landscapes in this venture. In the chapter, we share the experiences and

approaches adopted, and to do this, we had to draw from our values and cultural ideals, as people working in a university with many challenges. We reflect on this "mission" by looking at how we went about this project and how the university community received, and, finally, we reflect on what we have learned and unlearned for us to have had some results. The reciprocity between self-study research and forms of knowing is now widely acknowledged. Drawing from (LaBoskey, The methodology of self-study and its theoretical underpinnings. In: Loughran JJ, Hamilton ML, LaBoskey VK, Russell T (eds) International handbook of self-study of teaching and teacher education practices. Kluwer, Dordrecht, pp 817–869, 2004), (Kirk, Starting with the self: reflexivity in studying women teachers' lives in development. In: Mitchell C, Weber S, O'Reilly-Scanlon K (eds) Just who do we think we are? Methodologies for autobiography and self-study in teaching. Routledge/Falmer, London, pp 231–241), (Samaras, Self-study teacher research: improving your practice through collaborative inquiry. Sage, Thousand Oaks, 2011), and Pithouse-Morgan and van Laren (South Afr J Educ 32(4):416–427, 2012), our commitment has been driven by the quest to generate knowledge and contribute towards meaningful social transformation at the university. The work of these scholars encapsulates the theoretical lens used in this chapter. The discussion includes situated perspectives, care, and unlearning, borrowing heavily from the reflexive ubuntu philosophy (Harrison et al., Alternation 19:12–37, 2012; van Laren et al., South Afr J High Educ 28:639–659, 2014), an offshoot of ubuntu, a concept which was "renaissanced" by Mandela, South Africa's first democratically elected president. Our analysis shows that our cultural backgrounds and religious affiliation have affected not only our approach to our self-study work but also our thought processes. In turn, these elements have affected how we have engaged in different contexts with our students and colleagues. We explain how our personal journeys and stories brought us together through the Transformative Education/al Studies (TES) project and examine the challenges and contradictions of introducing self-study research in an environment that ironically needed an approach like self-study for revival and transformation.

Introduction and Background

In this chapter we share experiences and approaches adopted in introducing self-study research at Walter Sisulu University (WSU) in South Africa and the journey so far. WSU ranks low, towards the bottom of the national research profile, and continues to have negative growth in this area (DHET 2010, p. 10). The institution is understandably keen to redress this profile. WSU is a South African rural university that is relatively under resourced. It is one of the universities known as

"previously disadvantaged" bearing a history if having been set up by the apartheid government in a former Bantustan, a "homeland." With the fall of apartheid, the new government reconfigured the country's higher education institutions. WSU is a result of merged institutions and is referred to as a comprehensive university as it is made up of a former traditional university and two former technikons (Meyiwa et al. 2014). Citing some of WSU's challenges note that many of its students, both undergraduate and postgraduate, come from disadvantaged backgrounds as most of them would have attended poorly resourced rural schools. As they enter the university mostly underequipped for higher education, they would find this level of education an immense challenge. The additional challenge is that the official language of teaching and learning is English which is a second language for many students. In turn, WSU staff face challenges in both teaching and guiding students research. Evidently, this profile explains reasons behind WSU's low research ranking. It has been our conviction that WSU is an ideal learning environment for self-study research approaches because self-study's purpose is that of fostering change. The WSU environment encouraged us to rethink and reshape our practice of teaching and conducting research.

A few years ago, Thenjiwe joined the university as a research professor in the Faculty of Education, having just become a member of the team that initiated the Transformative Education/al Studies (TES) project introduced self-study to the university. To date, TES runs across three institutions in the country and has been immensely successful in self-study and related research activities nationally and internationally. Although having started as a project, we would like to regard TES as a movement, owing to its reach throughout major universities within South Africa. The project uses self-study as a mode of research enquiry and engagement for its postgraduate students and their supervisors that span beyond its origins, i.e., the field of teacher education, echoing Pithouse-Morgan and Samaras' (2015) observation that the genre of self-study has developed to accommodate any profession seeking to improve its practice. Principally, the TES movement comprises of a group of postgraduate research supervisors who use the project as a research-intervention vehicle towards studying and enhancing self-study research and supervision of postgraduate students (Harrison et al. 2012). TES derives its origins from a research project that was funded by the South African National Research Foundation. Since TES' inception in 2010, its researchers who are largely based at various universities have endeavored towards improving their teaching and inter alia research practice (van Laren et al. 2014). As a collective of transdisciplinary and multi-institutional research learning community, the main persuasion of the movement has been collaborative and collective enquiry on strategies of reflecting and in turn enhancing on-the-job practice. It has been at various meetings that outcomes of the TES community's reflections are turned into joint conference presentations and ultimately co-published papers. The focus of the paper ranges from forms of co-learning that we derive from the collaborations and include strategies of strengthening supervision of postgraduate students.

The main objective for the introduction of self-study at Walter Sisulu University was to contribute to the improvement of the research profile of the university and to

do so by adopting two key elements in the institution's vision and mission thus to be innovative and responsive to the community needs. Thenjiwe's main role at WSU was to mainly serve as a "research champion" – towards developing and enhancing research capacity of early career researchers and postgraduate students. The first step in introducing self-study at WSU was for Thenjiwe to persuade a small group of postgraduate students to adopt this methodology in their research. Theresa joined in as a novice self-study researcher and supervisor later. So, from our perspective, the first direct experience was postgraduate research supervision which entails guiding the students' higher degree research projects, starting from providing training in research methodologies, guiding them in the conceptualization and execution, and writing out in the form of dissertations their research findings. The joys and challenges of this experience have since been published in our collaborative paper with some of our students (see Meyiwa et al. 2014). In this publication we reflected and in retrospect appreciated the challenging environment in which self-study research was first conducted within the university. We pointed out that we were compelled to be innovative and self-evaluating in our practice. With each research activity, of our individual and collective projects, collective reflection and reliance on each other was intense. We echo Whitehead's (2009) assertion that it is through self-evaluation that an improved research ethos can emerge. Eventually, we acknowledge that the introduction of self-study methodology was one way to bring innovation to research and perhaps assist more people improve their practices. This is an outcome that would also raise individual and institutional capacity as well as promote self-study as a viable and valid research methodology that can put many researchers directly in touch and in ownership of their research, teaching.

Self-study as a research methodology in our university was largely unknown and where people had heard of it, unacknowledged, a no-go-area because it was generally viewed as "not research" due to a perception that it promotes a frowned-upon egoistical individualistic rather than societal approach to life; the latter is mostly espoused in rural communities. Self-study at our university was for a very long time only practiced by individuals; it was not acknowledged, welcomed, or accepted. This is for many reasons, some of which coincide with the experiences of self-study research elsewhere. These include, firstly, the very fact of our university not being immune to the "posturing position" common to many that are opposed to self-study research as aptly addressed by Craig (2009) and Arnold (2011). It is looked down upon and the promotion and acceptance of the traditional "scientific" paradigm regarded as sacrosanct. Secondly, we were women researchers, in a patriarchal culture that extends to universities where unlike male, female researchers are not highly regarded. Additionally, we did not hold any particular powerful positions in the institution, and, thirdly, it did not help that we were from the humanities and social sciences and not from the natural sciences, at a time when the former sciences were so looked down upon that the whole division at the time had just been (literally) closed down. Lastly, we were both coming from outside, Thenjiwe Meyiwa from another province and Theresa Chisanga from a neighboring country. While these factors may not mean much, there are moments when they do matter in South Africa, a country with a legacy of apartheid and a government that

legislated segregation along race and ethnic lines. Evidently, it could be argued that this policy of segregation, in recent years, has been appropriated by some South Africans and found its expression in xenophobic attitudes and violence against foreign nationals. When one puts all these elements/factors together, we were easily a questionable pair, propagating questionable research ideas, and this was a huge challenge. In supervision, for example, we had to come up with some novel ideas to get our students' proposals accepted by the relevant committees, as shared in our first collaborative paper (Meyiwa et al. 2014). The journey has nevertheless been worth every second as we soldiered on, learning from each other and discovering that the factors above did not mean we were therefore the same and it would be easy. Within and between us as shown below were two people with significantly different backgrounds, which we had to work around, and found ourselves immensely enriched.

In this chapter, we build on our previous work (Meyiwa et al. 2014) and explain how our personal journeys and stories brought us together through the Transformative Education/al Studies (TES) project. In this chapter, our main objective is to share our experience in the postgraduate supervision, using self-study, with a cohort of students who were new to it, even as we were ourselves also doing some of the learning along the way. We hope in this way to contribute to the growing body of literature on self-study research, especially in South Africa where the challenges require more and more innovative approaches for specific circumstances. We examine the challenges and contradictions of introducing self-study research to a cynical audience in an environment that ironically needed something like S-study for revival and transformation. We look at the process of our own self-study journey, attending the TES workshops, taking part in conferences, and eventually doing our own self-study research, forming a TES-Self-study research group at WSU and publishing and sharing our experiences.

Holtman and Mukwanda (2014) discuss the challenges of postgraduate supervision, including the overall expectations in South Africa and how this expectation does not always tally with the situation on the ground. Borrowing from de Beer (2009), we realize that as postgraduate supervisors in this environment, our identities are uniquely bound or embedded within our social and personal experiences. It became clear to us that we had to bring this connectedness to the fore and instinctively knew it would be relevant to our mission. As a result, we have had to draw from our values and cultural ideals, as people working in a university with many challenges. We reflect on this "mission" and pose three questions:

(a) How did we as African women scholars with multiple backgrounds in very challenging situations negotiate different personal and scholarship landscapes in establishing self-study scholarship at our university?
(b) How has the university community received this?
(c) What have we learned and unlearned for us to have had some results?

We note how, to us, it has been like translating self-study from one language into another, without much training in translation, for ourselves and for those who have

journeyed with us, having to use intuition and creativity and surprisingly stumbling upon some positive outcomes. Like Harrison (2009), it started off basically as "tinkering" and began to make sense only along the way as the journey unfolded.

In this chapter we reflect on our experiences of the introduction of self-study research approach at Walter Sisulu University (WSU), a rural South African institution with a perspective that regarded self-study as an egoistic approach alien to its communal culture. We discuss how we established a self-study research group and share related challenges and successes. The chapter investigates our personal experiences, identities, and scholarship, acknowledging the contribution that these attributes made in our self-study research journey at WSU. Further, the discussion lists and demonstrates that our cultural backgrounds and religious affiliation have affected our own and our students' learning. Finally, we reflect on how WSU as an institution has been affected and shifted its regard for self-study, after a realization of the successes of the self-study research group.

Theoretical Underpinning

The reciprocity between self-study research and forms of knowing (Clandinin 2013; Eden 2007) is now widely acknowledged. Drawing from LaBoskey (2004), Kirk (2005), Samaras (2011, 2013), and Pithouse-Morgan and van Laren (2012), our commitment has been driven by the quest to generate knowledge and contribute towards meaningful social transformation at the university. The work of these scholars encapsulates the theoretical lens used in this chapter. This includes situated perspectives, care, and unlearning, borrowing heavily from the reflexive ubuntu philosophy (Harrison et al. 2012; Eden 2007; van Laren et al. 2014; Ngunjiri 2016), which was "renaissanced" by Mandela, South Africa's first democratically elected president. Our analysis shows that our cultural backgrounds and spiritual leanings have affected not only our approach to our self-study work, but also our thought processes. These in turn have affected how we have engaged in different contexts with our students and colleagues, as Samaras (2011) puts it: self-study begins with your wonderment about your practice.

Ubuntu as understood and practiced for centuries in Africa is also well encapsulated in the immense work of Johann Broodryk (1997, 2002, 2005), which gives detailed explanations and definitions of the African Ubuntu philosophy and its various applications. Gade (2012) eloquently states that at the center of ubuntu philosophy is the practice of caring for other people, appreciating that due to the interconnected between people, it is essential to draw from and put together a variety of resources towards uplifting disadvantaged people. Working in a university set in the deep rural areas of the old Transkei, the general student population is from the poor communities and very poorly resourced high schools. This factor has always had implications even for the type of postgraduate student one gets. The domino effect of this is that as supervisors of postgraduate work, you are expected or even required to give a lot more support than usual because one cannot assume that all the students at this level would be able to stand on their own from beginning to end, in the same way. Holtman and Mukwada (2014) refer to a "pastoral role" in relation to

supervision at the university of the Western Cape (UWC). It sometimes felt that way for us. As supervisors, we had to strip ourselves of all preconceived ideas and work out of the box. To achieve this, the practice of Ubuntu became a guiding light. Consciously incorporating the values of understanding, love, and care, working together to find solutions became part of our practice. In this respect, we found ourselves listening more carefully, and rather than appearing to have all the others as the students themselves seemed to expect, these were "worked out" in a collaborative way. Self-interrogation and guided question and answers worked better that "I have read your work; this is what is wrong with it; go and do a, b, and c; and it will be ok." The shared experience of student and supervisor and the stories ended up enriching the whole process to the extent that as supervisors, we were also opening to learning because now and again, something one had not thought about emerges. It became a journey of discovery for both.

As indicated above, the university's research and publication record has hovered for a long time around the bottom of the national level. Our other interest and concern, therefore, were to use self-study to help encourage collaborative work and contribute to the enhancement of research output for staff across the disciplines. So, while dubbing in self-study supervision, we also tried to establish S-S research groups as part of the Transformative Education/al Studies (TES) Project which was being established across three South African institutions, as outlined in Harrison et al. (2012) and in Samaras et al. (2016). The focus of these publications is on the kind of support and development that university educators may need to advance their professional practice. They show how trough the TES movement university educators have been supported, in their individual projects and in supervising students – to realize growth in their professional practice. The publications also demonstrate how national and transcontinental dialogues have made self-study researchers learn from each other and how they have developed towards further strengthening their practice and support given to postgraduate students.

The belief that being educators, one cannot divorce oneself from one's personal story and experience as this naturally influences one's teaching as observed by Samaras et al. (2004) became paramount.

Co-learning: Negotiating Identities and Values

We carry a lot of identities between us as alluded to above our backgrounds are quite different. Thenji born in South Africa in an urban setting while Theresa in Zambia in a rural setting. But we also have a lot in common; we are women who are passionate about what we do. We have both experienced one parent parenting and have a concern for students especially those who may not be very strong academically. Each of these identities is associated with different, sometimes conflicting, demands and responsibilities. In introducing self-study, we have had to carry out the "mission" within the context of a university with established ideologies, values, and well-defined boundaries. We have found that the manner in which we interpret these boundaries is crucial to the task of realizing the outcomes we had set for ourselves as scholars and supervisors at our university, i.e.:

1. Presenting self-study as a new and novel form of conducting research related to the on-the-job practice
2. Guiding the first cohort of self-study graduate students as supervisors

As part of our learning, we found that such a reflection and awareness was vital. Ensuring that our interpersonal working styles interact with the established culture of the university was crucial in our own individual journeys as researchers seeking to introduce self-study. We have learned to walk the path carefully as we negotiate our identities (professional, academic, and personal) with that of the university. Probing our personal experiences, we use critical reflexivity (Scott 2014) to demonstrate the manner in which we have negotiated both collectively and as individuals our "journeys" within the university. In doing so we have equally come to appreciate the bidirectional learning of the mentor-mentee (supervisor-student) relationship from both perspectives, confident that by decomposing the nature of this relationship, one can describe how learning and development happen within a rural university. We have found that being cognizant of the bidirectional learning strengthens the relationship we have with mentees and in turn make us feel less vulnerable – as we accept the fact that we are also learners in this journey. Taking cues from Whitehead (1989), Ellis and Bochner (2000), and Taylor and Wallace (2007), we have used data obtained from our personal narratives (as mothers, daughters, and mentors outside the university) to appreciate that conducting self-study research is unsettling. In retrospect, we realize that we have had to be equally conscious of the need to which Pillow (2003, p. 175) refers, i.e., that of researchers demonstrably confessing their self-recognition. Indeed, we have been operating in a "learning laboratory."

Our work has been influenced by the notion that there is richness and depth in research that is "looking inward" (Mitchell et al. 2005, p. 4) and acknowledging this as a form of learning. Equally we as individuals are cognizant that our experiences are steeped within each other's learnings; described by Pithouse et al. (2009) as a form of establishing connections.

Changing contemporary work environments and ever-changing socioeconomic contexts in which university personnel find themselves present researchers with complex problems that often demand collaborative inquiry and bidirectional learning. In these contexts, disciplines across the spectrum are required to reconsider their philosophies and the way they have always conducted their business. Self-study, we firmly hold, accentuates improving one's on-the-job-practice while being consciously aware of one's identity and cultural background. Acknowledging and appreciating these facts have made us realize the value of being open to learning between us and from other people. The context of our university has been viewed as a learning opportunity – for us and our students. Hence, we felt the need for introducing self-study at our university.

Acknowledging the importance of working with one's research niche with a research focus and approach that neatly coincides with intended career trajectories, the responsibility of introducing self-study at our university demanded that as researchers we forge innovative synergies between our own research and the self-study project. In retrospect, author 1, who first introduced self-study at the university, notes that "the task was not as simple...but acknowledges that

learnings flowed in both directions from colleagues and students that knew nothing about self-study and me." Further, with co-learning new approaches are likely to emerge.

It is worth noting that the bidirectional learning and support that has been of great value is mostly received from fellow self-study colleagues based at other institutions. Through meetings, seminars, and workshops held with them, our knowledge and research capacity in self-study have been enhanced. Implications and effects of collaborative and co-learning from all parties go beyond the boundaries of scholarly and/or research work but have been expressed as being relational as well. The relationship between us as supervisors and of our students and fellow self-study colleagues at other institutions is vitally important. As a senior researcher and supervisor, Theresa declares "it is imperative to appreciate the need to be able to respect and learn from both your students and colleagues." Over time the benefit extends back to improved self-study supervising and research. As time progresses our self-study analytical and research skills get sharpened, a kind of development that is encouraging to observe as a senior researcher.

As authors, we regard ourselves as senior researchers, supervisors of graduate students, mothers, daughters, and mentor/care for other young people outside the university life, e.g., within our cultural communities and at church, including extended family. Our research subject fields reflect multidisciplinarity as they range from English language and linguistics, gender, and cultural studies. Currently we are associated with two different universities with different histories and academic persuasions. The connecting thread between us is the rural university at which we introduced self-study. Our experience with the university is varied so is the experience we brought as we came to the university at different times with different contexts and purposes. Given the varied discipline paths from which we as researchers came to join the university, Thenjiwe Meyiwa observes that "bringing self-study to the university was somehow unsettling for me as the subject field of self-study was fairly new to me; thus I had to deal with the issue of a shaky academic identity as my main field of study was very different to the focus of the task at hand, of introducing self-study. I had to project confidence in a field of study in which I was still a learner." What kept us above water was belief that we could transfer our research skills to a variety of other research area. The "sink or swim" mentality kicked in.

Arnold (2011) poignantly notes that the exploration of self is "an inevitable attribute of knowledge construction." We as "students" and now self-study practitioners have come to learn and appreciate the "self" in our research. The self-reflexive narrative stories below of our lives capture the essence of who we both are: embodiments of the African girl child – the one born and raised with the privilege of both African and Western education which for us also carries both systems of values. The combination of these values is sometimes contradictory, but being grounded in the one from home, one can survive the dangers of identity crises and appreciate the privilege of both. Armed with the two, we are today able to be ourselves – mothers, sisters, academics, researchers, mentors, community leaders, and a host of other things that bear testimony to the multiple selves that have spurred us on to self-study research. The stories explain why we are concerned

about what we do and who we are, and the rest of the paper together hopefully responds to the "how" and other questions.

Thenjiwe Meyiwa: "My Existence: An Offshoot of Many Others"

My existence; it is a revolution, it is an explosive, it is a conglomeration of many "reserves" – yet it is pure common sense. The Zulu oral tradition, the unwritten culture of the Inanda Mission Reserve where my umbilical cord is planted, my grandmother's house at aMahlongwa where I was raised, and the Meyiwa clan into which I was born form the basis of my being and my identity (This is based on isiZulu, the most widely spoken South African indigenous home language.). *So is my existence! My early memories and the source of my knowledge emanates from abakwaMsomi, abakwaNomndayi, oSingila, oHlombe kasigqi senkehli, kwaswane kabetha, kwamntwana ngebele, umakoti egoyile* (Clan praise names, based on proper names of family forbearers).

    I saw my early memories, my intuitions, and my acquired knowledge confirmed when I enrolled at a higher institution of learning. In retrospect, I recall that the tools of the Eurocentric philology and related linguistics were inadequate instruments of discovery and understanding of the learning I had to undergo. It is education imparted by the Meyiwa clan and my grandmother MaNgcobo and all the African oral-style milieus that led me to make sense of the bookish modernist schooling. The Meyiwas, the Gumbis (My mother's clan name)*, and the Ngcobos provided me with experimental and experimentable science of living and dynamic anthropology. I now know life better because I have experienced, experimented, and studied it through a rich life with my immediate and far afield African family. I owe my awareness of life to varied African oral traditions. Through this tradition I am able to "travel" from written style to oral style on to global style . . . such has been the advance of my research and the achievement of my work. Is it mine? NO! It is not mine. It belongs to many people I have travelled with, people of all colors, but who are connected to the African soil.*

    Essentially, I am a beneficiary of various African people, men and women, in South Africa and across Africa who educated . . . continue to educate, who trained . . . continue to train, who mentored and inspire me, and whose faith and belief in me contribute to my success in my scholarship and personal life.

    It is this immense heritage and as a mother, daughter, daughter-in-law, and sister that has shaped my thinking and appreciation of self-study. It has taught me to embrace various forms of knowledge and conducting research.

Theresa Chisanga: "Everyone's Child"

I was born in the Northern Province of Zambia in Mpika at a small rural Catholic mission station to parents who belonged more to the 1800s than the 1900s. My father [was born] in 1907 and my mother in 1912. They were always more like grandparents to me as my mother was in her 40s and my father nearly 50.

I was the eleventh. In those days, there were no school in the rural areas, and it would take years before things would change.

When eventually the missionaries established a school, it was far away and especially for girls; the boys could or were allowed to do "weekly" boarding school-walk the whole day Sunday to the school with provisions and walk back Fridays. The result was my brothers did some schooling enabling them later to work in the mines and earn a living, while my four oldest sisters had to marry very young and start families.

I and the last, but one sister were the lucky ones – by the time I was 6 years old, there was a little missionary school nearby, 6–7 km, a total of about 14 km walking distance every day. You grow up to be strong.

I was brought up steeped in the African traditions, Ubuntu being embedded in me; after all, I was everyone's child in the village. If I was caught doing wrong, any adult around "was" my parent and could correct and discipline me right there.

Equally, if there was too little [money] for my school uniform and fees, everyone in the village brought what they had to add, and so I could finish school. Every child was thus privileged.

I did well by any standards, but I am the sum total of my whole experience: an African woman, a mother, a chaplain, a professor, a researcher, a mentor. This, one can do because of the grounding.

I teach English language; it is not my tongue, and neither is it that of my students. To compound it all, my mother tongue and that of my students are not the same. So, I have to work hard, and they have to work hard too to meet up with me and me with them.

Now self-study, that has been a great help: how do I improve my practice as a ...?

The reflexive 'ubuntu'-
I reflect upon everything I do and how I do it, backwards and forwards, I care.
My TES research group, my family.
There always I find the answers. Well, almost always.

The point of these brief personal stories is that, from therein, deep within our beings is where we found the determination, the patience, and the feeling for "the other" as we struggled in guiding the supervisees. Author 2, for example, because of where she is coming from, has the tendency and the capacity to see everyone who is struggling the same way as she would herself or her own, having grown up in an environment where this was the norm.

Co-learning: Establishing a Self-Study Collaborative Research Group

The second step was to establish a self-study collaborative research group; this was after working with individual postgraduate students, which included getting each student to do self-evaluation and reflect on their individual research, flowing out of group discussions. This process equally introduced students to reflexive research and formed served as a basis for training them towards understanding a process of

generating knowledge. Further, together with the training workshops hosted by our TES sister institutions, the Durban University of Technology and the University of KwaZulu-Natal, and under the leadership of (initially) Joan Connoly and Liz Harrison and later led by Kathleen Pithouse-Morgan, together with our postgraduate students, we participated in various intense self-studies methodologies with internationally renowned scholars like Jack Whitehead, Anastasia Samaras, Mieke Lunenburg, etc. At first, a small group of us went through these paces and systematically came back to share them. The group, which had initially been about 30, has since stabilized to around 20.

The third step was for TES-WSU to be able to stand on its own and begin to conduct their own workshops and training sessions. By 2014, 2 years after the establishment of the self-study group at our institution, we were able to host our first workshop in January 2015; a maiden feat that gave us confidence and served as a spring board for future workshops. Over 2 days, 80 staff members turned up to hear about self-study research. Our colleagues from KwaZulu-Natal came over to help us facilitate that. Since then, we have had workshops at the University Annual Research Conference and hosted our own international guest (M Lunenburg) self-study guru for the benefit of the WSU University community.

The stability of this group and the consistent meetings have given great confidence to and promoted self-study in the university; some postgraduate students serve as mentors to their fellow students and take the lead in conceptualizing conference paper presentations. The Directorate of Research Development has since not only provided funding for most of the workshops so far but has pledged more funds and given great support and has encouraged us to carry on, signalling not only acceptance of the research methodology but legitimacy which is attracting more people to the group and to try out self-study research.

What Has Made It Work?

Our university is a poorly resourced institution and the research throughput rates are very low. This luckily for us is not an uncommon occurrence around the country, and the self-study "happening" has coincided with a call from the DHET and everybody for transformative education using innovative ideas that would help turn things around and recently demonstrated in some of our postgraduate students organizing multicampus colloquia on self-study research approaches. The TES arch question of how can I improve my practice has certainly struck a chord in our university. Moreover, the emphasis on reflexive practice is something novel but which makes serious common sense people are willing to at least think about it. In our environment, there are too many ready-made credible excuses to even think about "how I do things." Coupled with this is the desire on the part of many staff members to be able to publish, and TES seems to offer some assistance in this. Not only do we do regular workshops, but we also assist each other in collaborative work which has shown tangible results, exemplified in co-teaching and co-publications.

Reflecting on the Journey So Far

McNiff (2008, p. 1147) indicates that we can show our conclusions are reasonably fair and accurate by "presenting evidence in the form of practitioner testimonies as well as my own. ..." A university postgraduate student who recently graduated with her a master's degree participated in a media coverage which led to her success self-study research story being broadcast on campus radio. What follows below are instances of the evidence showing that our work has bone some results.

Upon its inception, TES and the concept of self-study were frowned upon as indicated above (Meyiwa et al. 2014). However, things have now certainly changed. With the attendance and presentation of many TES research projects and papers at national and international conferences and workshops, there have subsequently been a number of publications resulting directly from the TES activities. We have both been led and been lead authors and graduated a few postgraduate students. This has given confidence and great impetus to self-study research in our university.

The Directorate of Research Development (DRD) has come to the table and funded some of the self-study workshops and conference presentations for members of the self-study/TES group. At the last two Annual International Conferences, the group was invited to facilitate self-study workshops during the conferences. Both were very well attended. The Centre for Learning and Teaching Development (CLTD) has expressed an interest in partnering with the TES group to cascade self-study to interest groups in the faculties. We are working on this, and as we conclude this paper, the Faculty of Education Sciences has just approved a Faculty Self-study Research Group to which we have already been invited as facilitators. The District Education Officers in the region whom we had invited to an international workshop by Mieke Lunenburg in 2014 have indicated their interest for us to work with the teachers in the schools around Mthatha. This is already at an advanced stage as work in progress.

Implications and Scholarly Significance

In an e-journal of *Organizational Learning and Leadership*, Uzoechi Nwagbara (2011) argues that in contemporary times, while organizations function within anxious modes of advancing the ideal and reality and that all systems are affected by change, the organizations continue to maintain some conventions. Equally, our university determines boundaries for its researchers, including the way in which they are expected to conduct and produce knowledge – largely following centuries-old research methodologies.

While trusted tradition is often the primary strength of organizations, given university's rural context, it became complex to navigate varying perspectives, theoretical paradigms, approaches, and skills already entrenched (of our own and of the university) – and on the other hand, introducing self-study. The temptation to default by falling back on what one knows best, i.e., previous experience and

research methodological processes that have proven to work in the past, was persuasive. This tendency and reliance may have both negative and positive outcomes, but it is crucial to reflect and identify such effect. We had to be conscious of this and find ways of counteracting on it.

We realized the need to regard the people of the university (students and staff) as an important resource upon whose previous knowledge to build – thus making connections. This kept us going, assisted in building confidence in us and others. Everyone has knowledge, derived from his/her cultural background and previous training, irrespective of a subject field. We have come to realize that, besides various previous training, it is of benefit being associated with a university that is considered to be in a learning phase and that is trying to rebuild its research base.

Concluding Remarks

Since the introduction of self-study at our university, several years ago we have come to realize the value of constantly learning from each other and from our students and colleagues, steeped in self-study research. What has persuaded us is being driven mainly by the urge to find ways of improving our own research practice and that of our students. This paper highlights the manner in which researchers could, using reflexive approaches, engage with practicalities of introducing a new subject field at a university with established practices. We are of the view that there ought to be an incessant search for novel and innovative forms in which researchers, as mentors, evaluate and engage with their research practice. On reflecting on our self-reflexive exercises over the past 5 years, we realize how this process has propelled us to take a step back and engage with our relationships. We have found that bidirectional and co-learning are significant in this exercise. It has been a journey not unlike engaging in putting self-study across in a language other than the familiarity of English in our academic environment. When we started, we did not know each other, we were not familiar with self-study research, and we had to learn on the job, "learn each other," and lead the team. It worked for us because we believed in it. We believed in it because it made sense. Craig (2009) observes while arguing for personal inquiries that no research genre achieves its results from data that is haphazardly engaged. The researcher's personal experiences, beliefs, and inclinations do play a part.

The research culture of our university and the self-study scholarship has had to be adapted to find the middle ground. In looking back at the process of our own self-study journey, attending the TES workshops, taking part in conferences, and eventually doing our own self-study research, forming a TES-Self-study research group at WSU, and publishing and sharing our experiences, we have shown how we, individually and severally, have become active collaborative researchers, publishing with our students as well as with colleagues in our supervisors' group. The Walter University Transformative Education/al Studies (WSU-TES) project now has an active group of about ten staff and staff students with several research activities. The group meets regularly, to share and collaborate on research projects. Many are now

enthusiastic about research and the relevance of their personal stories in improving their practice. We argue that more reflexivity and self-revelation are required in advancing this kind of scholarship, born outside of Africa but inherent in the African Ubuntu philosophy.

Exploring Intersectionality as a Means to Precipitating Change

53

A Collaborative Self-Study of Institutional Transformation

Nancy Brown and Stephanie Schneider

Contents

Abstract

Two educational leaders utilize self-study to understand the role that their collective and individual histories played in the transformation of a School of Education. In this chapter, we tell the story of the transformation of the SOE by presenting both voices. As we began looking for the underlying theory to help explain the complexity of our initial insights, we were intrigued by the amount of intersectionality in our situation. The intersectionality of our backgrounds could not be dismissed as we went through our daily administrative tasks. At the same time, the collective also has multiple identities that shaped the organization. Intersectionality works on multiple planes in higher education leadership. This study explores the personal transformation and growth of these two administrators on the vanguard of this school-wide change.

Self-Study, Teacher Education, Assessment, and Higher Education Administration

In this chapter, two educational leaders utilize self-study to understand the role that their collective and individual histories played in the transformation of a School of Education. In the summer of 2015, I began a new position as Dean of the School of Education in a small Northeastern, state college. This position represented not only a change in job title but also a change in lifestyle from Midwestern suburbs to the heart of the big city. Within the first 2 weeks of my position, all but one of the vast majority of untenured faculty members visited my office to inform me that they were grossly unhappy and on the job market. Welcome to the deanship. The holdout untenured faculty member visited to share her love of policy and change. She came equipped with a list of ideas for improving the School of Education (SOE). Our connection was instantaneous. This faculty member, a self-identified policy geek, volunteered for the role of Assessment and Accreditation Director. This meeting began a partnership, collaboration, and a friendship that is at the heart of this self-study. Together, Dean and policy geek laid the groundwork of change for the faculty, students, and programs of this tired SOE. At the same time, we decided to use self-study to understand the task ahead of us and our progress in meeting our goals. In this chapter, we tell the story of the transformation of the SOE by presenting both voices. Unless noted, what is presented is our collective voice. At times, we used specific data points from our collective data set. This is delineated throughout the chapter.

We were both new to our roles (Dean and Assessment and Accreditation Director) and were faced with the challenge of updating a school with unhappy faculty, low educational outcomes, and a poor local and state reputation, in the context of dismay in public education. This is especially apparent with the new Secretary of Education, Betsy DeVos (Vazquez 2018). The constant search for balance between the common good and our own personal agency were the new realities that framed what now confronted and challenged us on a daily basis. As we began looking for the underlying theory to help explain the complexity of our initial insights, we were intrigued by the amount of intersectionality in our situation. Crenshaw (1991) in her landmark paper *Mapping the Margins: Intersectionality, Identity Politics, and Violence against Women of Color* argues that for Black women, legal justice was hard to come by. Judges in the cases cited in the study argued that oppression came from either race or gender, but not both, thus ignoring the intersectionality of these Black women. The ideas presented in this seminal paper became an integral part of our self-study because we were examining our roles as women in leadership and the multitude of ways that our identities shaped the way we transformed the School of Education. The intersectionality of our backgrounds could not be dismissed as we

went through our daily administrative tasks. At the same time, the collective also has multiple identities that shaped the organization. Intersectionality works on multiple planes in higher education leadership. For us, gender, age, country of origin, and religion each played a large role in ways that we led the change.

As critical friends, we quickly concluded that we needed one another's objective perspectives if we were to thrive, not merely survive. Heeding Loughran's call (2004) to inquire into our new practice, using the systematic research lens of self-study helped us to illuminate our roles from the personal lived experience to a general understanding within the context of a broader cultural frame. In this chapter, we will share our personal and intertwined narratives collected over the past 2 years exploring the blurred lines between our personal and professional identities as our administrative roles as Dean and Director of Assessment and Accreditation have developed within our higher education institution. Specifically, our work within the genre of collaborative self-study was instrumental in leading us to explore new ways of understanding our own theoretical base and the ways our personal identities enabled and inhibited the changes of the SOE. This study explores the personal transformation and growth of these two administrators on the vanguard of this school-wide change.

The School of Education (SOE)

Our SOE is one of the three schools within a small, diverse, public 4-year liberal arts college. Early in the 1960s, it was designed by the State to be a model of diversity. As a result, the college is one of the most diverse in the country. We take great pride in the fact that many of our students are nontraditional and first-generation students, and yet we continuously apologize for being "only" a teaching institution. This conundrum is especially true within the SOE. The common mantra among faculty is: "Discussions about the field are more robust with multiple viewpoints, and we are creating a better world for all by preparing diverse students for teaching positions." Yet the faculty apologize for the constraints that we face that are in part because we serve nontraditional students. Something as innocuous as times classes are given can be contentious due to work and family obligations of our students. As a longtime faculty explained at our first faculty meeting, "We at our college have a low self-esteem about our work and our students" (Dean's Journal 9/19/16). Although our school takes great pride in the diversity represented when nontraditional students are in the classroom, often the actual implementation of practices that support a diverse population are hollow words.

When we started our positions more than 2 years ago, the SOE's mission focused on three principles: professionalism, social justice, and interdisciplinary instruction. Written in the early 1980s, this mission lacked clarity and buy-in from faculty and staff alike, not because of a deficiency in the mission but rather a growth in the field of teacher education. Moreover, there was little within the program that actually linked to the amazing mission. With continuing success in getting accreditation and reaccreditation, there was little motivation or incentive for transformation on an

individual or school-wide level. Nevertheless, the faculty did want change, and it was our job to facilitate that change.

Theoretical Framework

Our theoretical framework came out of numerous discussions based on our data points from journals, conversations, and interviews. Specifically, we wanted to focus on the intersectionality of our backgrounds as teacher educators, ethnographers, and what we believed would be a discussion of gender in leadership. However, the content of the notes revealed something much more complex: an intersectional collision of gender, heritage, and age. Yet, this self-study was as much about others as the study of ourselves. Harré (1984, p. 44) describes the interwoven nature of the individual within the social construct. We moved through the quadrants of the Harré space from the individual to the collective, back to the reflective individual, and finally to bringing enhancement to the collective. Furthermore, Berkhofer (1998) writes, "Any study of otherness must assume degrees of difference and sameness: enough difference to warrant a description of otherness and enough sameness to permit knowledge and empathy" (p. 177).

We lead a team of faculty and staff that, like most institutions, are working toward the same goal. We are all trying to prepare a new generation of excellent, diverse, hardworking teachers. However, on the individual level, we are all different. It is the differences of individuals that create a dynamic school but also caused the most internal strife. How were we, as leaders, going to transcend the differences of our faculty to help them achieve our stated goals? Would they trust us enough to allow this to happen? The main differences in our faculty, as we will discuss later, are age and gender. Finally, the difference of culture and heritage also was evident.

The notion of balance as something that needs to be achieved is, we think, a uniquely gender-based phenomenon. We had many conversations where we discussed how we were going to juggle our home and work lives. The policy geek has a young child and cannot devote, in her mind, enough time to the job. She is the primary caregiver to her child and simply cannot work late or take on the extra travel needed to do the job well. The Dean's career was put on hold while she raised her children. There was simply no other way to have both a family and career. Challenges like these were discussed in detail in Monroe et al. (2008). Traditionally, men do not have this problem, as they are typically not the primary caregivers to children or parents. Recent works by Sheryl Sandberg (2013) and Anne-Marie Slaughter (2014) both explain how women need to "lean in" or "cannot have it all." As academics and administrators, we run into similar problems that many women in technology and government have. The conversation is changing when it comes to women in the workplace, and women simply have a more difficult path. From anecdotal evidence (Amatulli 2017; Hallberg 2017) and #metoo, women are not on an even playing field as men when it comes to having our voices heard as equals.

Clift (2015) points out that leaders in higher education also need to stay current in their field to be of the most use for their organization and themselves while achieving

a work/home balance. Thus, the role of a Dean or Assistant Dean includes the challenge of negotiating their identities as leaders and scholars, as well as personal and professional lives. It is very difficult to switch these two parts of self. There is not some switch that puts us into "dean-mode" or "mom-mode." Often, we find ourselves needing to do both simultaneously. Our cell phones are always within reach, and there is a constant worry that the men would deem us unprofessional. The Dean has said to her young female faculty that we juggle too many balls and to pay attention to the one that is about to hit the ground. One major way that gender discrimination happens is through service and administrative work. Monroe et al. (2008) found that "However defined, service was complained about by a majority of women; everyone commented that women do far more than their share of the service and suggested that this work is uniformly lower status, and not rewarded or appreciated by the system" (p. 220). The policy geek is, at this time, without tenure and has taken on a tremendous amount of service to the detriment of her research. The work, while important to the school, is not necessarily putting her in the position to advance her research agenda or be more marketable to other institutions where research is privileged. Yet, the policy geek did go into administrative work and more service because the Dean gave her a space to work and be creative. In addition, as self-study researchers, both administrators understood the relational aspect of our positions within the SOE, which was elucidated by LaBoskey (2004). Self-study allows us to critique our own practices, challenge our orthodoxies, and learn through experience in a systematic way. There is also the relational aspect that is so important to self-study practitioners (Laboskey 2004, p. 820). We are leaders in a School of Education. Each of our decisions impacts not only our faculty but also our students who are, in turn, teaching children.

Methodology

We are both ethnographic, qualitative researchers. A big part of ethnography is capturing what anthropologist Clifford Geertz (2009) calls "thick description." Geertz states, "What the ethnographer is in fact faced with except when (as, of course, he must do) he is pursuing the more automatized routines of data collection-is a multiplicity of complex conceptual structures, many of them superimposed upon or knotted into one another, which are at once strange, irregular, and inexplicit, and which he must contrive somehow first to grasp and then to render" (p. 10). When we started this SOE transformation in September of 2015, we developed the following methodology to record, collect, and code reflective data on the changes we were implementing:

- Journal entries written daily.
- Text messages.
- Check-in meeting notes – check-ins were of two types: one-on-one and post-group meetings.
    - One-on-one: Discussing pressing and current issues and leaving 10 min at the end to discuss the project and progress and share primary insights from journal entries.

- Post-group: Staying an extra 5 min after department meetings to reflect on what the hell just happened. It's worth noting that this part is a self-study of leadership rather than teaching and reflecting on your leadership of the meetings.
- Emails to faculty about the change.
- Faculty meeting notes.
- Weekly formal meetings between the Dean and Director of Assessment and Accreditation.
- Meeting notes from the chair meetings.
- Notes on informal conversations.

Yet, data is not always straightforward, nor does it tell a whole story without the analytical work that rigorous self-study can provide. It will become clear that some methodological techniques were successful, while others were less successful. We defined success as timely, clearly written data points. Unfortunately, we worked in real time, and journal entries were often half written. Text messages were lost to phone changes, and much of our substantive data points – conversations as the Dean was driving in traffic and the policy geek was bathing, feeding, or playing with her toddler – were not recorded. In most of our conversations, we tended to "compose a life" (Bateson, pg. 232). The thick description presented is an amalgam of formally analyzed data points and our impressions based on memory. Once we came to terms with the amorphous nature of the data set, we analyzed the data, looking for patterns relative to categories of changes within the SOE. We realized the patterns sorted into challenges that we struggled with. Our findings section is organized by these challenges.

A second troubling issue that surfaced was that we were not looking, as Geertz did, at foreign populations living very different lives than us. We are studying our own school and are wary of what Glesne (2006) calls "backyard research" (p. 31). This lens means that we are studying our own institution and must ask the question: Is this too close to us to be counted as "objective?" We argue here that objectivity is not the point. The school needed to be changed, and our perceptions – as well as the perception of the state, potential students, and partners – all count more than objectivity for its own sake. As qualitative researchers, we sought to understand the conditions of the SOE in order to transform them. Thus, we recognize the subjective stance we had to take. Ascribing to a hermeneutical theoretical stance (Gadamer 2014), we believe that the researcher is involved in and part of the interpretation of the experience. The truth of spoken or written language is revealed when we, as researchers, explore the conditions for understanding its meaning. Thus, it is essential that we both recognize and integrate what we bring to our research and the context within which our research exists.

Findings and How We Got There: Challenges of Self

Through self-study, we shifted and are continuing to shift our School of Education. We turned it from a 1970s relic into a model of clinically based student practitioners. This was a collective effort of both the Deans and faculty and staff who used

self-study to systematically understand what areas needed to be improved and how to get to the end goal of creating teachers that would make positive changes for all pre-K-12 students in our community. We began by making small changes and constantly talking positively about our ability to make change. We early on decided to think of the obstacles we encountered as challenges. Thus, the Dean and policy geek constantly reread our data points (journal entries, emails, department minutes, conversation notes, and recordings) asking what enabled change and what was a deterrent. Perhaps the most important method that we employed was interviewing other faculty and taking notes of the conversations, always asking what worked and what did not. We tried to build a narrative based on our data. The narrative is a complex ethnography where we were persuaded on the action that we had to take (Atkinson 1990, p. 83). TheK intertextuality of the text was informed by our self-studies on an individual level that we then had to converge to take action that both of us felt was appropriate.

Once we identified and listed the failings, so evident in our narrative, we grouped them under what we called challenges. In this way, we were turning the negative thoughts of our failures into solvable challenges by inventing ways to overcome each one. Lastly, we looked at our own intersectionality to understand what in our individual conceptions caused us to classify something as a challenge. This last process, clearly the hardest, took a great deal of time, thought, talking, feeling, frustration, and peace. However, this last process in the self-study, more than any other, enabled us to lead the change. It is what self-study researchers call the turn back to self.

Challenge One: Making a Cultural Shift Using the Best of Multiple Viewpoints

The very first item on our agenda was to look at the culture of the College and the School of Education. We began with a question: Was our program in line with the ideological underpinnings of the college and SOE? The answer was a resounded *no*. In deciding how to move forward – and as new in this leadership role – we began by trying to understand the culture of both the School of Education and the College as a whole. Beginning by assessing the College's culture, it was evident that an activist stand on social justice and an emphasis on diversity were ingrained into the very fabric of the college. However, we also noted that the upper administration of the College is mostly male. There are men of color, but only one woman has a VP role. Although the College prides itself on diversity, there is little intersectional diversity in the higher ranks. This is one fallacy of diversity. All voices are not represented at the highest levels of administration, possibly leading to difficulty implementing changes within our School.

This same emphasis on diversity existed in the School of Education. The faculty were made up of a wide diversity of cultures, genders, races, ages, and religions. Mirroring the upper administration of the college the previous administration of the school was also male. Two of the three college deans are females, and that too is mirrored in SOE department chairs. Overwhelmingly, the School of Education

faculty are made up of hardworking, dedicated, and smart faculty, faculty that work well together. However, in analyzing our data, issues of gender and age became evident. Many of the newer hires were female and young. Their ideas were often great but were sometimes challenged by faculty who were entrenched in the original mission of the SOE.

In one meeting about a course that had changed, the policy geek was with a new adjunct and two junior faculty members: one female and one male. The objectives of the class were altered to reflect the new program, and everyone was very excited. Also teaching the course was a retired professor who designed the original program. He gave great advice and excellent resources, but after he left the meeting, we were all struck by his sadness (policy geek notes, 8/10/16). I cannot imagine seeing a program that I helped build be radically changed by new people without mourning the old program as well. That retired professor is one of the kindest people I have ever met. He helped to mentor me when I was first hired. He gave me all of his class lecture notes and offered to have me observe the way he taught. Still, the program needed to be changed to meet our new accreditation agency as well as new regulations from the state. More than that, the course changed because we learned and grew because of the work of the retired professor. The retired professor chose not to return, and we all realized his value and our loss. It was in these kinds of meetings that we both realized a bridge had to be built between the old and new to make this school the very best.

It was difficult at times to observe and understand the clashes and growing pains. We observed young female faculty "shy away" instead of "leaning in." We watched experienced and highly competent males demand when they thought they were losing control. We were horrified when a retired faculty used students to make a public statement because his program was being changed by a younger female faculty. We were enamored of the kindness, historical knowledge, willingness to share, and willingness to help of the male former leaders. We were divided in our feelings about the silencing of two older female professors – strong women who, we now realize, were cast aside. Older men tend to be lionized as geniuses, who may be difficult to work with, whereas older women are shrill or crazy and not to be taken seriously (Berdahl 2017). We were equally appalled when we realized that it might not be issues of gender that had forced one woman to disengage. Throughout all the growing pains, we instinctively knew that gender, age, experience, and culture were complicating the communication surrounding moving forward. We also knew it was our job to move past this to create a new SOE culture.

And finally, by May 2016, the entire SOE came together for an assessment retreat. This was the first one led by the new Dean and policy geek. Rather than focus on numbers, we started out with a simple question: What makes a really good teacher? Fenstermacher (1994) asked the question "What is known about effective teaching? (p. 4). These questions threw into sharp relief what we needed to do, what programs should look like, and who we wanted in our programs. The responses from the entire faculty were excellent. More important, after much healthy and heated debate, we were all on the same page. Regardless of age or gender, we are all teachers and we all had, much to our surprise, the same vision. We built on each other's ideas. We were

beyond excited. The day ended with a baby shower. To us, this shower represented the coming together of the faculty regardless of age or gender; we all celebrated our hard work and the joy of a new baby.

What was our role as leaders in enabling folks to cross the cultural issues that divided us? From the data, we realized that our role was to create a comfortable space where all voices could be heard and respected. The retreat was that space. We worked in groups and had full faculty and staff dialogues. We came together to play games and laugh together. As leaders, our most important task was to step back and let our faculty and staff do their jobs. Our role was that of facilitator. The faculty, with their years of experience teaching and researching, know what good teachers are and how to teach future teachers.

Another thing we did was have part of faculty meetings devoted to kvelling (a Yiddish expression) or bragging about our faculty and staff and their accomplishments. It is a small thing, but it keeps all faculty and staff up to date on what everyone is doing and lets everyone cheer for one another. It is building the school up as a team.

The crux of this challenge was respecting the past while looking toward the future. We tried, and sometimes failed, to make everyone happy. There were many growing pains in our leadership process. Much of this was due to communication issues and a political landscape that was constantly changing under our feet. This leads us to challenge two.

Challenge Two: Making a Cultural Shift Against a Background of New Political Challenges

The second challenge we faced was the most amorphous and came from the external pressure of accreditation. This was the changing of our philosophy against the backdrop of new political challenges that were ongoing from the Dean's arrival. Teacher education is under attack from many fronts. There is a push in the United States to close down schools of education. Teachers from preschool to secondary education are blamed for the ills of society to poor learning outcomes. Many think that teacher preparation programs are not working. Often, students with lower standardized test results go into teaching. Accreditation is one way to ensure teacher preparation quality. While this is an admirable goal, the system is imperfect. No matter how imperfect however, there is immense pressure to get accredited. If we do not, our doors shut. Frequently we say to ourselves that we are building the airplane while we are in the air.

We faced an existential decision when we had to decide who we are as a School. Our ways of doing things were entrenched into the old accreditation reality, and there was pushback from some faculty when proposed changes were made. The major point of contention was simple. What was done in the past worked to get us through accreditation. Why change? Of course, the simple answer is that we were able to say external pressures. The accreditation agency changed; thus we had to do things a little differently. In notes from meetings and conversation, clichés like "don't

reinvent the wheels" or "don't burn down the house to kill an ant" were written several times. The question became how do we change without "burning down the house?" How does an organization move forward building on the past successes, honoring the past? We were not doing well, and the status quo had us in serious trouble with the State and upper administration. We had to start developing better programs. This was agreed upon by the faculty. However, what the change would look like was confused and tied up in the rules and regulations that govern teacher education. Our aha moment occurred when we realized that we had to forget the rules and work with our strengths.

We challenged our departments to make programs that would create great teachers. We started with Childhood Education. The faculty in Childhood Education are all, with two exceptions, junior faculty. Consequently, the main focus for the group was how to modernize the program. Each of the faculty members felt that developing a clinically rich program was critical. There were questions of how to develop partnerships to sustain the program's aims, as well as logistical issues of how students would get to partner schools and how this will impact their schedules. In addition, the Childhood Education faculty underwent a process of deep reflection for several semesters to determine what the ideal childhood teacher would be. This process started as department meetings, phone calls, interviews, journals, and talking to school districts. Self-study is about improvements, not just reflection. Once we started the process of becoming a clinically rich program, we went all in. We divided the mandated 100 hours of school observation into all of our methods courses. After a few semesters, we realized that it wasn't working exactly according to plan and changes needed to be made. Hours upon hours were spent trying to figure out a way to get enough classroom time along with getting our teacher candidates enough time in the classroom working with pre-K-12 students. Some students were not happy with the changes because there was more of a burden on them to attend all classes to complete the hours required. Faculty were tasked with developing partnerships with local school districts to have our classes held in their schools. Yet this was the most important change that we made. Without this change, we felt that the time spent in the classroom talking about theory would not match the practice the students needed.

The Special Education Department followed suit. They, too, revamped their program to include a clinical model of teacher education. Again, the faculty partnered with local school districts. This required reaching past the comfort zones for both College faculty and our partner districts. As the Dean, I shook lots of hands, listened to superintendents, and supported my faculty. We, as a School of Education, were able, in 2 short years, to change the conversation in many of the 126 different school districts that surround us. We changed the perception of school districts, the larger state system, and the state department of education. We joined state committees and encouraged faculty to do the same. The faculty put their energy into getting to know and work with the teachers and principals of local school districts, while, as leaders, we joined initiatives to get to know the local district superintendents. Basically, we all became involved in education beyond the borders of our own SOE. We were now being seen as the innovative teacher education program. School districts were reaching out to us, tweeting about our partnerships.

However, these were the easy programs to change. We were both trained special education teachers; the Dean was a childhood teacher. It was easy to lead when we all more or less had the same vision, where we all spoke one language. It is the last program, Adolescent Education, that remains a challenge.

Of the three departments in the School of Education, only two underwent significant renovations. Both of those programs are being studied for continual improvement. Our last department is the most difficult one to change. Adolescent Education contains programs that are shared between Arts and Science and School of Education. The idea of these two distinct units collaborating is a very innovative one. It incorporates much of great teacher education, the seamless integration of content and pedagogy. Yet in practice issues of power and culture are often inhibitors of innovation. As it was structured, each subject area has a coordinator that has a joint appointment between the two schools. While in theory this was a great idea intended to build collaboration, in reality the coordinators often were caught in the center of the power struggles. The other difference from the other two departments is that the Adolescent Education Department has the most graduate programs. Culturally, the personalities are very strong in both the content departments and the SOE coordinators. Each group, although personally liking one another, often will band together by school to resist change. The messages received from upper administration were also often conflicting seeming to support one side or another. In many ways, this is an age-old argument of the importance of content vs pedagogy. Yet all would agree that both are needed. I, as Dean, did not understand the culture of the institution well enough to begin these discussions. My attempts at collaboration were not seen in the way they were intended and often came across as just the opposite. Over the summer the policy geek proclaimed this the year to revamp Adolescent Education. We had such high hopes and again felt defeated. After several failed attempts at leading this change, we decided to work with each department separately and (probably the hardest part, as the leaders) to leave it to others. As a friend once told me, sometimes the thing to do is put down the rope – meaning just walk away. We stepped back and allowed the coordinator and the two department chairs to find common ground – together. So far, two of the five departments are making progress toward innovative reinvigorated programs. We remain hopeful that others will follow. As a new leader, a lesson of power and building trust first was a difficult one to learn. We keep trying to humbly gain the trust of all the faculty.

Perhaps the most striking discovery in this study was how large of a role religion played. Much of the accreditation work was accomplished by the assessment leaders. During our weekly meetings, we made a conscience decision not to worry about the rules and think about what makes a better teacher and what is the purpose of accreditation. We made a choice to question this entire process. Questioning knowledge is a foundation of the Jewish faith. We are taught to question. The Talmud is a text where Rabbis questioned the meaning of the Torah (Brown et al. 2008). We realized that religion played a major role when our Assistant Dean for Data and Accreditation, a White, Jewish man, wrote a scathing letter to our accreditation agency questioning the validity of two of the five standards. It was from this letter that we started to question and argue with the purpose of accreditation. The Dean

created a space wherein we were able to recreate the dinner tables of our youth when our parents encouraged us to question what was taught to us at school. Over many shared meals, we hashed out our questions, concerns, and cries of outrage over this process. From these conversations, we mapped out a detailed plan of action.

The many conversations made us acutely aware that leaders tend to promote and trust those like them. What we are frustrated by with our own upper administration (promoting men) is what we may be doing to our faculty. We feel different ways about this finding. On one hand, from all evidence, the people in the inner circle are the ones who are doing the majority of the work, and the others have stepped back. On the other hand, we went into the transformation wanting every voice to be heard, which was something that could not happen even with our best efforts at being inclusive on committee membership, assessment retreats, and one-on-one conversations. This reliance on the familiar, on the comfortable, is our place to begin our next study as we struggle to make our SOE truly an open and accepting place for all.

Conclusion

As we analyzed our expansive data set, it became clear to us that we had the people, both faculty and staff, to improve our school. The process of improvement is why self-study was so vital. Self-study allowed us to analyze in real time the ways the changes were implemented and whether or not they were succeeding. It also gave us ample data to assess our progress. Self-study is a way to be nimble with our thinking and opens up new possibilities that we have not thought of before. In particular, we are concerned with what Laboskey (2004) said was the ways we test theories about teacher learning as, "the way in which self-study researchers are engaged in developing and testing these theories about teacher learning is through the investigation of our own practice, our own efforts to facilitate such learning" (p. 819). How we develop our practice is through "reframing" (e.g., Loughran and Northfield 1998; Schoen 1983). Since we are looking at an entire school, there had to be a systematic analysis of the micro and the macro. We started by looking at ourselves and our impact on the SOE, and then moved out to see how our faculty, staff, and students were impacting the school finally, returning to study ourselves and our role in the complex dynamic.

In our self-study, we found that there were major intersectional challenges in transforming our SOE. The very first was how the policy geek became the unofficial Assessment Director. Both of us are white, Jewish women who were raised in the same area with similar backgrounds. We both attained our bachelors at the state institutions and were special education teachers. Although there is an age gap, we bonded over these commonalities. More than this, we both have a similar worldview and tend to exhibit similar strengths and weaknesses as administrators. The relationship, as described above, is one of critical friendship but also of mentorship. The transformations undergone by each of us were born of an intersectional amalgam of who we are and what we bring of ourselves into the positions of leadership.

During the summer of 2017, I, the policy geek, was able to attend a leadership conference. This conference was an intensive 5 days in the middle of the woods with

no access to technology, where I was forced to think about my leadership style. I journaled the experience and came away more empowered. I found that I was very competent about the big picture and tended to like a more chaotic style. I liked the excitement of a lot of ideas on a whiteboard without any order to them. However, I also realized that I am terrible at deadlines, details, and organization. As I led the committee for assessment, I had to rely on others to keep track of my multiple ideas, and they had to keep me focused. In addition to my leadership style, I began to realize that I take my personal life into my work. As a mother, I found that I wanted to make everyone feel happy and comfortable at the risk of asserting myself. As a woman, I realized that I was socially conditioned to be this way.

In one of my Dean's journal entries I wrote, "I'm not sure my leadership style and my being a Jewish mother is all that different. I invited all to the lunch table. I modeled being a working mother for the young females. I supported all sometimes with jokes sometimes with scolding." This kind of mentorship was born from the intersectionality of mother, woman, academic, and age. It was born from my heart and head. It is how I taught first grade, raised my children, and now lead.

We found that we cannot separate our leadership styles from who we are fundamentally as humans. This is the nature of intersectionality. As Crenshaw (1991) found, one part of your identity does not supersede another. We live in a certain sociocultural context wherein we view the world through the lens of our experiences. We both faced immense challenges due to our identities. Yet we realized that in some ways, we were also perpetuating the same frustrations that we had onto others. The first draft of this paper was filled with rage. Rage at the faculty for being who they are and not who we wished them to be through our own lenses. When a colleague read the draft, she was appalled. We spent several sleepless nights angry at ourselves and at each other. Finally, we started writing again; yet this time it was about compassion for our faculty and for ourselves. It is ultimately through compassion that we were able to reach mastery of our findings and of the culture of the School of Education.

A Hybrid Educator's Prospect of Self-Study in Japan

Megumi Nishida

Contents

Abstract

This chapter investigates the potential of self-study of teacher education practices (S-STEP) in Japan. A concept of teacher education and the term teacher educator are rather new in the Japanese education context. Reflection may be a familiar concept to them; however, its focus is on negative aspect. As a hybrid educator between Japan and Iceland, I reflect on my personal and professional experience of being a student and an educator in the Japanese education system while exploring how S-STEP is discussed. My interview with the progressive teacher educator reveals her struggles that she deals in order to promote the concept of reflection and S-STEP. Cultural and English language are two potential challenges that emanated from the investigation, and they need to be understood in light of their education context. Upon this circumstance, I prospect my role as a critical friend to the Japanese educators and teacher educators for their self-study journey through inquiry in the same mother tongue.

M. Nishida (✉)

Introduction

Recently, I celebrated my 10th anniversary since my migration from Japan to Iceland. It has been like being in a storm as I continue to pursue my professional career as an educator. Living and working with people of all ages in Iceland greatly influence who I am today: The hybrid educator who tries to balance between two different teaching cultures to expand her teaching boundary. While conducting my self-study as the hybrid educator in the global context, I realized that it is time to look into my Japanese side again.

The purpose of this chapter is to inform the self-study practitioners and interested individuals what is happening in the context of self-study and teacher education research in Japan. My focus of this study is to explore the movement toward the introduction of self-study in Japan while reflecting on the process of my transformation from a merely immigrant educator to the hybrid educator who has become empowered through self-study of teacher education practices (S-STEP). By sharing my personal story (Samaras et al. 2004; Samaras 2011) as a case, I aim to encourage other immigrant educators, Japanese educators, or any educators around the world to keep challenging themselves in the everchanging teaching context and to do so through the methodology of S-STEP. To make sense of my stories and connect it to reality, this question guides me throughout the chapter: How do I position myself in order to collaborate with the S-STEP community in Japan?

My Personal and Professional Story

The concept of reflection is actually quite familiar to Japanese people as it is our foundation of life. The reasons for this may be the Buddhism and Zen ideas that underlie our society (Sharf 1993). Since my early childhood, which was during the era that the country achieved high economic growth during 1970–1980s, I recall that Eastern philosophy had a strong influence over my way of thinking and my appreciation of my daily routine. The Zen master Shunryu Suzuki (1995) said: "We just do what we should do" (p. 47). I was told so by my school teachers, and there was no space or habit to question what it really meant in my life.

I was neither a good nor a happy pupil at Japanese elementary school. My academic performance was poor, and my mother was summoned to the school and criticized for my attitude toward studying. I needed to use my fingers, sometimes even my toes, to count numbers up to grade four. Obviously, I was not good at mathematics! The homeroom teacher said that it was all my fault. My mother was encouraged to buy extra workbooks on mathematics to work at home. Unfortunately,

she did not know how to fix my strategy of using my fingers. The workbooks were left on our bookshelves and forgotten forever. Despite of my feelings of discouragement, I suppose that my homeroom teacher's attitude was perhaps appropriate according to the context of the era: Teacher-centered and knowledge banking education (Freire 1993). Teachers received full respect from parents, and the indications of children's academic achievement were based only on their grades. Markus and her colleagues point out that Japanese gold medalists in the Olympic Games still focus on their failure rather than success (Markus et al. 2006). I should state that at that time, the idea of reflection was negative for me, even if I was doing well in other things besides studies. In school, children are expected to reflect on their behavior if they get into trouble. In history, we are told to reflect on the mistakes from the wars and learn from history to make a better future. If I watch the news on TV, politicians, policy-makers, and business people are always apologizing for their inappropriate actions. In conclusion, they all say "we reflect on our mistakes." My early childhood memories were full of reflection in negative way, but my teachers at junior high school showed me hope that every student has a potential to improve their learning. Especially Mr. Odajima was an innovative social studies teacher in my eye. With my theoretical knowledge and empirical experience today, I can confirm that his teaching strategy was active learning that stimulated our learning through meaning-making activities associated with unit themes in textbook (Watkins et al. 2007). I remember clipping pictures from travel brochures and pasted them on the world map I drew during the class period. I learned by instinct that creativity generates knowledge. I looked forward to every lesson. His geography class opened my eyes to the diverse world. Almost 30 years later, I still remember the way he described how a fjörd was formed, and extreme midnight sun and northern lights in Nordic countries in which I live now. He became my future role model.

The first turning event of my life took place when I was in the senior year of high school in Japan. I became an exchange student to the United States through the American Field Service (AFS) Intercultural program. Compared to the high school I attended in Osaka, Japan, my host high school in the United States was almost 50 times smaller. The students complained about its small size, but I appreciated how people valued my talent in music and my courage to jump into a different world. It took time until I felt I was included due to the language differences. This experience allowed me to use English as a communication tool and gave me openness to diversity.

Coming back from my AFS year, my future vision became clear that I wanted to become a teacher to encourage Japanese students with low self-esteem. I pursued a teaching license in social studies and English for the secondary level. During my preservice teaching practice in late 1990s, I had an opportunity to observe a lesson study. Lesson studies (Lewis et al. 2006; Dudley 2011; Takeda 2017) are becoming popular outside of Japan, and they have great reputation; however, their purpose or procedure in literature is much different from what I saw as a preservice teacher in Japan. I do not even remember which subject it was, but the teacher I saw was very nervous in the front of the classroom, which was full of senior teachers watching from the back of the room. After the lesson, there was a meeting where he received

feedback from observing senior teachers. I do not remember exactly what he was told, but I cannot find a better metaphor than public execution to explain the moment. Observing teachers commented only on negative aspects of the lesson, and nothing constructive or positive was mentioned. I can still picture that teacher, who was only looking down on the floor, so I cannot even recall his face. There was nothing beneficial for him during this experience, and it must have been very humiliating. The lesson was supposed to be provided to colleagues to help them learn from each other, but it was obviously the opposite. What did I learn from this experience of lesson study? I learned that it would not be a good idea to become a teacher at a public school. I did not wish to get executed like that.

After working for private companies for few years, I began working as a social studies teacher at a cram school, a so-called *juku* in Japanese. I worked to squeeze knowledge into 4th graders' brains and give them technique for succeeding at exams. My students came to the *juku* after regular school with a boxed supper, studied until 10 pm, and then went home to study more. What my supervisor told me to do was to maintain students' interests in social studies. I thought that I would stimulate students' sense of autonomy in order to motivate their learning, just as my former social studies teacher did. The 4th graders loved my games and studied hard, but my supervisor thought that I had lost my mind. It was absolutely not their culture to use games at that kind of school. The critical point came when one of my students' mothers did the homework instead of the student. The student had too much homework to do from other subjects, and she did not get enough sleep at night. Preparing for higher education, even as young children took precedence over a concern for a high quality of life, including such necessities as sufficient sleep. This incident was the beginning of the end of my interest for teaching and being involved in education. I felt miserable, but I had to work for a living. Struggling with contradictory circumstances, I challenged myself with different tasks within that school, where I found both joy and misery among children.

The second turning point of my life began in October 2008, when I moved to Iceland to start a family with my Icelandic husband. It was a week after the declaration of the economic crisis in Iceland. Having neither a job nor Icelandic language skills, I had nothing to do. However, when I was wrapping up something with old newspaper, I saw an advertisement for the new full-time English program called *International Studies in Education, MA,* that would start at the University of Iceland. I didn't hesitate to send in my application.

A few years later, I finished my master's study about Icelandic preschool educators' professionalism. I thought that I would never be a teacher again, but my master's research project healed my traumatized experiences associated with my past teaching experience. I saw hope in education through preschool educators. I decided to participate in a teacher education program to become a qualified teacher in Iceland. This experience gave me more confidence and courage to pursue my academic career with a PhD.

While conducting my doctoral self-study of my experiences as an immigrant educator, I had an opportunity to collaborate with Japanese special needs professionals who traveled to Iceland to study the Icelandic inclusive education system.

My theoretical knowledge of inclusive education was limited to the university courses I took in Iceland, but reflection on this collaborative experience made me aware that my practice is deeply rooted in the Icelandic inclusive philosophy. Reflection helped me to identify my hybrid resources. When I find myself balancing between two cultures, I feel empowered. I decided to explore my collaboration with the professionals who have much more experience and theoretical knowledge in the field than I do. Our collaboration developed, and it triggered my research visits to a Japanese teacher education program at the Hokkaido University of Education at Kushiro Campus in 2016 and 2019 to promote preservice teachers' understanding of inclusive education.

Investigating the Current Status of S-STEP in Japan

As my self-study proceeded in Iceland, I became curious about finding out how S-STEP was introduced to or is practiced in Japan. It could make sense to teachers as we have a culture of reflection, but it needs to be introduced with extra care due to current Japanese educational context. If I step back from my native country and observe it from the Icelandic perspective, I see that Japan is in a complex situation. The Japanese education system is facing major changes as traditional educational values are questioned. One change is the implementation of active learning and inclusive practice by the Ministry of Education, Culture, Sports, Science, and Technology in Japan (abbreviated to MEXT) (2018a). Government announcements must be strictly followed. Teachers in practice and teacher educators are struggling with the transformation of the educational traits from teacher-centered to student-centered (Asanuma 2015). Why does this complex situation matter in order to promote S-STEP in Japan? I believe that there are two potential challenges that we need to acknowledge: the cultural challenge and the English language challenge. As a Japanese proverb says, it is our virtue to keep our heads down. It means that we do not show our capabilities or efforts so that everyone stays at the same level to keep a sense of unity among peers. Interviews with Japanese students reveal a sense of guilt if they critically ask for something that might break the calmness and harmony of the class (Fox 1994). Markus and Kitayama (2010) point out that culture is formed by how the "psychological process (of people) may be implicitly and explicitly shaped by the worlds, contexts, or sociocultural systems that people inhabit" (p. 422). If your head is sticking out, it should be hammered down. If teachers try to understand about themselves through self-study, it has to be done secretly so that their colleagues can remain their comfort zone.

The purpose of the Japanese education system after the World War II has been to educate all to establish democracy and a culturally mature nation to contribute to world peace and people's welfare (MEXT 2006). However, working conditions for teachers make this difficult. Compared to the international average of the student-teacher ratio (OECD n.d.), it is obvious that Japanese teachers need to continue with knowledge transmission teaching strategies in order to keep students under control due to large class sizes. Japanese teachers' additional workload is causing depression

(Nakada et al. 2016). Reflection is the core of S-STEP, but there may not be enough space for reflective practice among teachers because of insufficient time, knowledge, and a lack of positive motivation toward learning a new strategy under these conditions.

Another challenge for promoting S-STEP in Japan is language, especially the English language. In S-STEP, sharing personal living stories through publication is critical (Ham and Kane 2004; Loughran 2004; Pinnegar and Hamilton 2009; Samaras 2011). However, all of these publications are only in English. Action research seems to be well known to teachers in Japan, especially for enhancing Japanese-English teachers' classroom teaching (Murakoshi and Ehara 2018), but they are mostly written in Japanese. Udagawa (2011) calls it the "localization of higher education" (p. 50) because practice, research, and publication can be all conducted within the educational context in Japan. There is no urgent demand for using English for academic purposes. If there are any articles written in English, they are related to English language teaching or scientific research on teachers' mental health (Okuno 2007; Nishino and Watanabe 2008; Nakada et al. 2016; Moritani and Iwai 2018). Literature on teacher education written in Japanese is limited, and the concept of teacher education seems to be still foreign to Japanese teachers (Takeda 2017). At many Japanese higher education institutions, students do not receive enough English to use it as a communication tool (McVeigh 2002). This means that the average teacher will have difficulty accessing all of the literature on S-STEP because it is only published in English. Self-study is an individual process, and people must be permitted to undertake it when they are motivated to learn more about themselves and their teaching practices. If teachers encounter the way to explore their professional roles, such as through S-STEP, their eyes would be wide open and motivated to take "a stance toward understanding the world" (Pinnegar and Hamilton 2009, p. v).

Seeking Evidence of S-STEP in Japan

Searching further to identify "self-study" on the Japanese journal database (CiNii, J-STAGE) on August 20, 2018, I found only four articles. In the Japanese language or educational context, self-study is often referred to as the personal and individual learning methods used to acquire new skills such as learning a foreign language. Watanabe (2017) is the only article that briefly mentions self-study and S-STEP and it explores research about professional development of social studies teaching. Later in September 2018, I discovered that the first article about collaborative self-study practice in Japan was published in March by two graduate students of social studies education and history (Kim and Hirotane 2018). According to Watanabe, there is some research that uses teachers' life stories, and their main purpose is for understanding the transformative process of their values through self-reflection rather than exploring how teachers understand themselves as teachers. Watanabe suggests that Japanese academics should shift their perspective of teacher education and professional development for teachers from a technical approach focusing on

improvement to professional interaction among teachers. Watanabe uses the terms *sempai* (senior) and *kohai* (junior) teachers in practice and recommends that their research focus can be on their sempai-kohai relationships where senior teachers support junior teachers.

The use of terms *sempai* and *kohai* in Watanabe's argument made me wonder how it would be to enhance the interaction between *sempai* and *kohai* in the Japanese education context because of the strong hierarchy that is still present in school settings. Collaboration between senior and junior teachers may not be equal. The most well-known example in academic circles would be lesson studies. Typically, senior teachers comment critically on their junior colleagues' practice, but junior teachers would hesitate to comment on seniors' practice. Based on my own experiences, I used a metaphor of public execution in the earlier section, because I believe that the strong cultural values or expectations of hierarchy may hinder the development of collaboration in lesson study. But is that still true today? I have been away from my native land too long to know what the reality is there now.

Searching for "self-study" in the Japanese characters revealed a Facebook page of the group called the *Research Group on Teacher Education* (教師教育学研究会). The group was formed by teacher educators, and they actively offer seminars and workshops on professional development. According to their list of past activities, Kazuhiro Kusahara, a professor of Hiroshima University, invited Dr. John Loughran to visit that university in 2017, and the group hosted a symposium and workshop in Tokyo in December 2018. Those events were sponsored by various educational organizations such as the Hiroshima University Educational Vision Research Institute (EVRI) (2018), which is led by Kazuhiro Kusahara, the same person who invited Dr. Loughran. Furthermore, the Research Group on Teacher Education Facebook page announced an online course run by Dr. Fred Korthagen, the well-known Dutch researcher in teacher education in November 2018. Books by Dr. Korthagen and his colleagues have been translated into Japanese (e.g., *Linking Practice and Theories: The Professional Teacher Educator*).

Talking with the Advocate of the Japanese Education System

Nobuko Takeda, who endeavors to be the advocate for children and youth of the Japanese education system (Takeda 2017), is a professor of educational psychology at Musashi University in Tokyo and the organizer of the Research Group on Teacher Education (n.d.). A day after my first contact with her through Facebook, we discussed our concerns about Japanese teacher education for over 2 h over the phone. There is a 9-h time difference between Iceland and Japan, and it was midnight when we hung up, but I could not sleep with excitement because I had discovered that there is someone who bravely takes action for the change of the Japanese teacher education system.

Being a clinical psychologist, Takeda has always been concerned about children's rights, including the right to learn. Her prior experience as a children's psychotherapist at a psychiatric hospital continues to motivate her to be an advocate of

children's voices for changing social values. It was a heartbreaking fact to hear from Takeda that children's suicide rates increase around the first days of school in April and September, the beginning of school after vacations (Oi 2015). The reason for suicide is simple: children do not want to go to school. They cannot see hope for themselves in the education system. Takeda explained that suicidal children are often bullied by their classmates, but her analysis of the situation includes the fact that adults, such as parents and teachers, promote educational values based on the current teacher-centered education system. This is the nemesis of many children's desperation about their future that may lead them to take their own lives.

According to Takeda, school teachers may focus on improving their teaching skills but generally do not prioritize children's knowledge generating experiences. They are highly skilled in teaching techniques, and their reflection about their practice is hard on themselves. But this attitude needs to be shifted to meet the global shift in educational values that places the child at the center of his or her learning (MEXT 2018a). I believe that Takeda will be a key person for promoting and supporting the necessary change in school teachers' attitudes toward their teaching and their own learning about their teaching.

Professor Takeda met Dr. Fred Korthagen during her visiting professorship in the Netherlands in 2006. The meeting inspired her to translate the book *Linking Practice and Theory: The Pedagogy of Realistic Teacher Education* written by Korthagen et al. (2001), which appeared in Japanese in 2010. This was also around the time that the number of graduate schools for teacher education increased across Japan and school teachers began to open their eyes to the possibilities of higher education for professional development. Graduate school programs recruit experienced retired teachers, whose theoretical knowledge and research experience are limited, to teach in these programs, which means that they are not experienced in teaching higher education and their practice is not informed by research. Takeda pointed out that there is not enough collaboration between retired school teachers and university teachers. Retired teachers can teach about practice, but not about how to research one's own teaching, while university teachers have theoretical knowledge and research skills but no practical teaching experience in primary or secondary schools (Takeda 2017). Today the Japanese translation of *Linking Practice and Theory: The Pedagogy of Realistic Teacher Education* (Korthagen et al. 2010) has become popular among teachers who desire to develop their learning about teaching. Takeda believes that there is not enough literature about teacher education available in Japanese, and she strategically translated the term of teacher educator (教師教育者 or literally teachers' educator) to promote the idea that teacher educators must include reflective practice as a part of their teaching and strive to further their knowledge of their own teaching practice (Takeda 2011b). Takeda's intention for the translation of the book was to question whether the concept of pedagogy exists in the Japanese teacher education context. In her understanding of the term pedagogy, it fits in the European context that educators stand by the learners' side. Takeda believes that Japanese teachers need to promote the understanding of concepts of reflection and pedagogy among teacher educators (Takeda et al. 2013). The first encounter with S-STEP for Takeda was when she joined the symposium of social

study teachers' professional development held at Hiroshima University in 2015. She was on her sabbatical at University of Toronto, but the Internet technology made it possible to join online. S-STEP researchers Alicia Crowe and Mieke Lunenberg were the guest speakers. When Takeda learned about S-STEP, she realized that the idea of S-STEP is useful and necessary for the transformation of teacher education in Japan. The concept of teacher as researcher is also unfamiliar to Japanese culture, including teacher educators. Since then, it has been a critical part of Takeda's endeavors to introduce S-STEP as a research methodology in teacher education and to encourage teachers to learn about their practice as teacher researchers through her publications.

Takeda's second translated work is *The Professional Teacher Educator: Roles, Behaviour and Professional Development for Teacher Educators* (Lunenberg et al. 2017) by Mieke Lunenberg and her colleagues, Jurriën Dengerink and Fred Korthagen (Lunenberg et al. 2014). In her translation of the book, she introduces the idea of S-STEP for the first time to Japan. Her third and the latest publication connected to S-STEP will be the translation of S-STEP articles written by John Loughran (Takeda et al. 2019). A group of teacher educators has been working on the translation and Takeda's role in this project as chief editor is to intertwine Loughran's arguments for S-STEP into the Japanese educational context. In this translation, the group of teacher educators has identified the critical issues for advancing a S-STEP approach in the field of teacher education and teacher educator professional development. In their view, teacher education as a field of academic study is not mature enough to accurately interpret the concept of S-STEP within the Japanese education context because the concept of teacher researcher is underdeveloped. The quality of peer-reviewed articles about teacher research reveals the fact that individual teachers' autonomy for learning about their teaching is not promoted and the technical aspects of teaching are central to current professional development initiatives. In the Japanese educational context, professional development is intended to help teachers polish their transmission teaching techniques, but it actually requires quite complex skills such as interpersonal and communication skills (Takeda 2009, 2010). Teacher reflection is focused on their techniques of transmitting their knowledge to students, rather than on their students' perception of learning. However, Takeda also acknowledges that there are numbers of study groups such as her Research Group on Teacher Education run by Japanese teachers for the purpose of their professional development. Takeda's belief is that S-STEP should be conducted by teacher researchers who are interested in learning more about how theory and practice interact and are interdependent (Takeda et al. 2013). In the new book, which translates the research of John Loughran, Takeda elaborates the fundamental ideas of S-STEP such as working with critical friends who are also in the context of teacher education to minimize the risk of misconception. When this third book is published, Takeda wishes to shift her academic focus back onto children's clinical psychology, but she hopes that her endeavor of S-STEP promotion in Japan would continue to increase even there are only a few practical research articles on how to carry out S-STEP written in Japanese.

However, in her opinion, S-STEP should be carefully introduced to Japanese teachers and teacher educators while situating examples in the Japanese education context. There is a concern about the term "self-study," and how it could be misinterpreted based on the current understanding of self-study as a simple description of how one teaches, without enough emphasis placed on empirical data collection, rigorous analysis, and deep reflection of one's understanding of one's teaching self. Clear and complete explanations of each concept are essential for helping Japanese teacher educators, researchers, and teachers understand what is involved in this methodology. In literature, there is a lot of discussion of preservice teacher education, but a focus on teacher educator's professional development is lacking. It is true that teaching at a public school is a respected and popular occupation because of the financial stability and the social status in the community (Takeda 2010). However, Takeda argues that the quality of teacher education at universities is deteriorating in recent years due to social changes. Expanding knowledge is no longer the main focus of education with the implementation of active learning, but there is a gap between the governments' intention and reality (MEXT 2015). My teaching experience with the Japanese teacher education program during my research visit in 2016 showed that preservice teachers have rarely experienced student-centered learning themselves. As Takeda pointed out, university teachers and retired school teachers may lecture about theories and their teaching experiences in school settings to preservice teachers, but it does not support preservice teachers' reflective practice experience to cope with the curriculum reform. Looking back on the teacher education program I took in late 1990s, it was probably much more competitive to enroll in any university because there were not as many options available as today. University education used to be much more academic or lecture based (Okuno 2007), and university students' intelligence was sufficient for subject area teaching at the primary and secondary levels even though they may have lacked in teaching skills and experience. Today, the number of universities in Japan is enormous, which encourages student enrollment in any university available for their ability, instead of their motivation and interests (MEXT 2018b). Those university teachers who are my generation or older have only experienced teacher-centered approaches, where a professor speaks in front of a couple of hundred students in a big lecture hall and there is no chance for interaction among students (McVeigh 2002). Except for students of teacher training colleges, preservice teachers generally complete only a few weeks of field experiences during their teacher education studies (Takeda 2010, 2017). In short, the emphasis in preservice teacher education is on technical aspects of teaching rather than nurturing each preservice teacher's skill to learn from reflective practice. As a result, preservice teachers get through teacher education without having learned to reflect, and without enough experience with interaction with other students, but having acquired the requisite techniques for prefectural teacher recruitment exams.

As the Japanese advocate for children, youth, and now S-STEP, Takeda foresees that the Japanese teacher education system is finally opening their view to the world (Takeda 2011a). However, she also wishes to pursue her professional practice as clinical psychologist to nurture children's learning spaces and to develop her

community through publications so S-STEP has become only a small part of her work.

The critical challenge of the current teacher education system is that teachers' theoretical and practical knowledge is limited without learning from other countries. Many influential research articles are written in English, but teacher educators do not challenge themselves enough to learn from the international examples due to the culture and language barriers. Young researchers with English proficiency have begun to take actions to introduce globalism in education. Japanese teacher education is at a dawn of revolution.

My Potential Role as a Critical Friend in the Implementation of S-STEP in Japan

> If that is their view of inclusive education, I have to be respectful...What I can do here, or somewhere in Japan, may be to keep questioning to different views. (My reflective journal, July 2016)

This journal quote is from the day when I wondered about the understanding of inclusive education among preservice teachers during my research visit to Japan. My mission there was to promote the understanding of the concept of inclusive education. By the end of the visit, I came to realize my potential role as a critical friend to the Japanese teacher education system. Finding a balance of critical friendship within a hierarchal system has been my challenge, but the hierarchal system is an important part of our culture to keep harmony, and I should respect that. Fortunately, my collaboration with the Japanese preservice students has been successful because of the support of my Japanese colleagues. We try to develop dialogue to understand each other, and that helps me thoroughly contextualize myself in this situation. I believe that communication is the fundamental solution for any challenge I may face.

My thoughts from the journal quote are finally linked to my conversations with Nobuko Takeda and my research question. Practical examples of S-STEP should be carefully, yet urgently, introduced to Japan but linked to a contextual understanding of the teacher education system there. I feel encouraged to bring new strategies and knowledge from the global community of education research to Japan to light the path of Japanese teachers and teacher educators. Teacher educators still research on other teachers, not research on themselves as teachers. In the current education system in Japan, the amount of knowledge delivery is the priority, rather than generating new knowledge. Teachers need to be able to reflect on their own practice to reconstruct themselves and generate their own grounded theories about what their practice means.

My hybrid viewpoint as an immigrant to Iceland from Japan and my experience as a S-STEP researcher in the global context are beneficial to the development of S-STEP in empirical ways. S-STEP methodology can be a powerful tool for enhancing the quality of teachers and teacher educators and helping them move to the next level

of understanding about teaching (Pinnegar and Russell 1995; LaBoskey 2009; Crowe and Dinkelman 2010). It can also remind them that reflection is not always negative, especially if they come from a similar background as I, where I learned that reflection is nearly always negative. Critical reflection actually takes much energy and courage to examine oneself. You might want to look away, but positive reflection empowers a S-STEP researcher to transform her identity, which I experienced myself from being an immigrant educator in the Icelandic education context to a hybrid educator in the global context. Still I should warn others that it is like a two-edged blade if it is not interpreted properly. Thus my potential role as a critical friend to the teacher education system in Japan may be as an inquirer who keeps questioning from the hybrid perspective in our mother tongue. The time has come for teachers and teacher educators to step out of their comfort zone and become researchers of their own practice through self-study.
