New Age

New Age, a spiritual movement that started in the United States at the beginning of the 1960s, arrived in Latin America in the 1970s. Given that it does not involve an institutional organization or a unified system of beliefs and practices, it is difficult to measure exactly how widespread it is. However, many authors have shown that the New Age movement has a significant presence across South America. Participants are mainly urban dwellers with a high level of education and income.

Participation in the New Age movement involves the occasional purchase of goods and services, of which there is an enormous variety; it also can involve visits to therapy centers where Western medicine is combined with Asian treatments and local aboriginal medicine. In Brazil, for example, the practice of consuming the drug *hoasca* (ayahuasca) as promoted by the Union of the Vegetable (*Uniao do Vegetal*, UDV) and by the religion Santo Daime is common among New Age believers as well.

The New Age movement springs from different sources and brings together different religious and philosophical trends as well as self-help; these are often dissociated from their original contexts and lack institutional and dogmatic structure. New Age is based on the idea that sacredness is not limited to religion; what is sacred involves a complex universe of knowledge, beliefs, and actions through which an attempt is made to control the environment.

The “neo-esoteric” or “alternative” circuit allowed the New Age movement to spread over the past two decades. It includes different places where people come to search for health, spiritual development, and conscious illumination. The core of this circuit

consists of people participating in a vast selection of spiritual, mystical, ritual, therapeutic, and body knowledges, techniques, and practices. Some of these disciplines existed in South America even before the New Age boom, including astrology, Buddhism, homeopathy, vegan eating or macrobiotics, yoga, and Gestalt psychology. Others arrived in the past 15 years—such as art, crystal, color, gem, or aroma therapies; tai chi chuan; Dō in; Reiki; Rebirthing; and Feng Shui, to mention just a few.

María Carozzi and Guilherme Magnani have classified the diverse New Age activities that can be found in all the main cities in South America. They are divided into holistic centers that provide different services—from oracular consultation, therapies, and alternative body movement workshops to conferences and classes—and a wide variety of stores that offer products for consumers, including bookshops, pharmacies, tourist agencies, organic groceries, and religious artifacts shops. All converge in a variety of New Age and alternative magazines as well as at New Age festivals and fairs. People come and go at many of these holistic centers and shops without creating strong bonds or making a commitment to stay, both of which are encouraged by therapists and gurus.

In terms of therapy, the New Age movement has integrated a great number of Asian and aboriginal techniques as well as Western nonallopathic medicine, including psychological, body-related, and spiritual procedures. The Neijing school of Chinese medicine, for example, boasts three schools in Montevideo where healers can train and has been a presence in Uruguay for many years.

As María Carozzi has argued, unlike in the United States, participation in the New Age circuit entails a more radical cultural transformation in South America that requires making autonomy, continuous circulation, and participation in temporary groups sacred in some way. At the same time, the movement has created a novel urban lifestyle in major South American cities that sustains the demand for specific consumer products.

Asian Religions: Hare Krishna and Buddhism

ISKCON, or the International Society for Krishna Consciousness, is the official denomination for the

Hare Krishna movement. It is possible to consider the rise of ISKON in South America as part of the alternative movement that characterized the 1970s and 1980s, principally among the young urban middle classes. The largest Hare Krishna center of South America is in Brazil.

The Hare Krishna movement appeared in Brazil during the mid-1970s and was particularly popular among young urban dwellers from the middle and upper classes with a high level of education. During this decade, the books of the Indian guru Prabhupada Bhaktivedanta Swami were translated into Portuguese, and the New Gokula community was founded. This community would go on to become one of the most important Hare Krishna centers in South America. From then on, the Hare Krishna movement spread, and many new temples opened in different cities. In 1985, the National Meeting of Alternative Communities was held in New Gokula, a meeting that increased the popularity of the Hare Krishna movement across the country. In the 1990s, attracted by the improved lifestyle, many Brazilian devotees traveled to India to stay at the ISKCON guesthouse. To reproduce the Indian lifestyle, Hare Krishna practitioners from Brazil brought back Indian clothing, food, and music. In 1996 and 1997, new Hare Krishna cultural centers were created, and a monument to Prabhupada was constructed at the New Gokula, whose centennial celebration attracted 2,000 people.

Buddhism, which is characterized by a wide variety of traditions, arrived in South America in the 20th century. The spread of Buddhism can mainly be attributed to Buddhist schools, Japanese Zen, and Tibetan Buddhism. Starting in 1950, South American intellectuals began to take a growing interest in Buddhism. Works by Alan Watts, D. T. Suzuki, and Eugen Herrigel helped Buddhism reach a wider audience. There are Buddhist groups in Argentina, Chile, Bolivia, and Uruguay, though the greatest number of Buddhists can be found in Brazil (due to its demographics). According to the 2000 census, Buddhists constitute 3% of the Brazilian population, a percentage similar to that of Spiritists, Jews, Muslims, and Hindus.

Of the three schools of Japanese Zen Buddhism, the Sōtō Zenshu School, which privileges meditation, or zazen, as a practice for enlightenment, is the one that was brought to South America by Japanese immigrants in the 1950s. Although

Buddhism was initially limited to the immigrant community, which attempted to maintain its traditional rituals and ceremonies, at the end of the 1970s, Brazilians who had no Japanese roots had also become interested. Ryokan Tokuda and Daygo Moriyama were two of the most important figures in opening up Buddhism to the non-Japanese population.

In around 1980, Japanese Buddhist masters began visiting the region, while local Buddhists began traveling abroad to complete their studies; later, these Brazilians would return to lead the local centers. Around the same time, Zen Buddhism was brought to Argentina by Chinese and Korean immigrants (with the goal of serving their respective ethnic communities), Japanese missionaries arriving from Brazil, and non-Asian Argentines who traveled to study in Brazil, France, and Japan and later founded their own centers when they returned to Argentina in the 1990s. At the turn of the 21st century, the French master Stephan Kosen Thibaut brought his mission to Argentina, Uruguay, Chile, Bolivia, and Cuba. Kosen had split from the International Zen Association in the 1990s to found his own community; his first center was in Europe, and then, he came to South America. In 1999, he founded the first Zen temple in Latin America, the Shobogenji Temple in Argentina, where the annual Latin American Zen congress is held.

NEW RELIGIONS IN THE UNITED STATES

The United States has provided fertile soil for thousands of new religions, in large part because the constitutional separation of church and state led to a vigorous religious voluntarism that allowed for any religious expression imaginable. Most new religions have roots in older traditions but are new by virtue of unorthodox practices or beliefs, the charisma of a prophet who receives new revelations, or the tension in which they coexist with the dominant society. In the United States, four primary types of new religions predominate: communitarian, millenarian, Asian inspired, and Western esotericist. Some of these categories are overlapping, while a few groups may fall outside this typology. Overall, however, most new religions in the United States fall comfortably within these four categories.

Pejoratively called “cults” by their critics, new religions are difficult to define. Sometimes they are called new religious movements, alternative religious movements, or emerging religions to avoid calling them cults, a word loaded with negative connotations. A religion that is new to the United States, such as the International Society for Krishna Consciousness (ISKCON), may be old in India, where the roots of the movement are found. Many immigrant religions may be considered new as a result of their novelty in America. Some scholars of new religions have argued that what characterizes

them is their marginalization by the broader culture, while others maintain that the newness of a religion makes it distinctively different from older forms of the same faith, and still others claim that “alternative religion” best describes the variations found in nontraditional groups. The umbrella term *new religion* encompasses all of these theories.

New Religions in the 19th Century

The 19th century saw the rise of dozens of new religions that practiced communal living. Growing in part out of dissatisfaction with the dislocations caused by the Industrial Revolution coupled with the rise of the Romantic movement, which idealized nature, many groups capitalized on the abundance of available land. The most successful communitarian experiment in American history was that of the Shakers, started by an English visionary named Ann Lee (1736–1784). Lee’s followers believed that she was the second coming of Christ, and they lived communally in anticipation of the Kingdom of God on earth. The Shakers built 19 self-contained agricultural communities from Maine to Kentucky and grew steadily throughout the 19th century, but they died out because their practice of celibacy failed to attract new members. In contrast, the Oneida Perfectionists practiced a form of sexual freedom called “complex marriage.” Under the leadership of John Humphrey Noyes (1811–1886), the Perfectionists believed that exclusive marital ties were inherently selfish. Thus, men and women should be married to all in the community and could have sex with multiple (heterosexual) partners as long as it was approved by Noyes. The group ran a successful commune in upstate New York for about 30 years until Noyes’s death; afterward, members formed a joint-stock corporation best known for the manufacture of Oneida flatware.

Nineteenth-century millennial expectations led to the development of three new religions within the Christian tradition, which survived into the 20th century and today are successful globally due to widespread missionizing. The Seventh-Day Adventists began with the failed predictions of William Miller (1782–1849) and others in his movement, who set particular dates for the return of Jesus based on their interpretations of the Bible. After the final “Great Disappointment” on October 22, 1844,

Ellen G. White (1827–1915) and others reinterpreted the Millerite predictions and thus began the Seventh-Day Adventists, who observe the Sabbath on the 7th day of the week, Saturday. Joseph Smith Jr. (1805–1844) started the Church of Jesus Christ of Latter-Day Saints when he translated what he claimed were some golden tablets he had discovered, thus bringing the *Book of Mormon* to light. Like the Adventists, the Mormons believe in ongoing revelation and the imminent return of Jesus. Unlike the Adventists, however, Joseph Smith and his successor, Brigham Young (1801–1877), practiced polygamy, which brought them into conflict with wider American society, until the practice was officially abandoned in 1890. A final group that expects the impending arrival of Jesus is the Watchtower Bible and Tract Society, better known as the Jehovah’s Witnesses. Its founder, Charles Taze Russell (1852–1916), provided specific dates for Jesus’ advent and encouraged followers to missionize people so that they can be saved before the end of the world comes.

In addition to the communitarian and millenarian new religions of the 1800s, a number of groups indebted to the Western esoteric tradition emerged. Western esotericism is a diffuse philosophy that encompasses beliefs in gnosticism, hermeticism, the unity of all religions, and the idea of correspondences (as it is above, so it is below). Some movements were short-lived. Spiritualism, for example, in which living mediums make contact with the souls of the dead, waned amid charges of fraud. But other movements have lasted into the 21st century. The Theosophical Society, founded by the Russian émigré Helena P. Blavatsky (1831–1891) and Americans Henry Steel Olcott (1832–1907) and William Q. Judge (1851–1896), claimed to teach a perennial wisdom: All religions of the world have esoteric teachings that lead one to knowledge of the self and the universe. Theosophists adopted and popularized beliefs and practices from Eastern religions, such as karma, reincarnation, awakened masters, salvation as gnosis or knowledge of the cosmos, and meditation and yoga, and attracted a small, well-to-do following. Although the organization split over philosophical and political issues, the Theosophical Society in America exists to this day as a branch of the international Theosophical Society. New Thought, another movement indebted to the

Western esoteric tradition, emerged from Christian Science and emphasizes the power of thought over matter, especially over illness. Mary Baker Eddy (1821–1910), who founded the Church of Christ, Scientist, taught that God is mind, spirit, soul, life, and love. Because God is all, illness, and indeed physical existence, is false consciousness and a delusion; a correct comprehension of God results in healing. New Thought movements emerged when Eddy's students formulated their own teachings and founded separate organizations, most notably Emma Curtis Hopkins (1849–1925), whose students went on to develop Divine Science, Homes of Truth, Unity School of Christianity, and Religious Science. These groups emphasized healing, the reality of the spirit, and the primacy of thoughts and their determining effects on matter.

New Religions in the 20th Century

In response to Jim Crow laws in the South, and de facto segregation in the North, African Americans turned to alternative religions with a millenarian orientation in the first half of the 20th century. The Moorish Temple, set up by Noble Drew Ali (1886–1929) in the second decade of the century attracted those who were disaffected with White Christianity and inspired by the Black nationalism of Marcus Garvey (1887–1940). In 1930, Elijah Muhammad (1897–1975) assumed leadership of the Nation of Islam, another Black nationalist group. The Nation of Islam explained the inferior status of African Americans with a creation myth that posited a fall from racial superiority due to the machinations of an evil scientist. A program of self-help and Black separatism promised a brighter future. After Muhammad's death, his son Warith Deen Mohammed (1933–2008) took the Nation of Islam in the direction of orthodox Sunnī Islam, and the group became the American Muslim Mission. In the late 1970s, Louis Farrakhan (b. 1933) revived the Nation of Islam and its founding myth. In recent decades, however, Farrakhan has emphasized the movement's ties to Sunnī Islam. The 1930s also saw the rise of the Peace Mission, established by Father Divine (ca. 1880–1965), who claimed to be God. In contrast to Black separatist groups, the Peace Mission preached an integrationist message, in which Blacks and Whites lived and worked together, pooling resources and living cooperatively. Given

the times in which it arose, however, Divine also insisted on celibacy, so that the group could not be accused of miscegenation.

Father Divine and the communitarian program of the Peace Mission influenced another millenarian and communal group in the United States, namely, the Peoples Temple. Jim Jones (1931–1978), a charismatic Pentecostal evangelist in Indiana, started Peoples Temple in Indianapolis in the 1950s. His message of “apostolic socialism”—that is, living the life of the early Christian church—attracted thousands of followers once he moved to California in the mid-1960s. Jones visited the Peace Mission several times and modeled much of his language and style after Father Divine. About 1,000 Peoples Temple members moved to an agricultural commune located in Guyana, South America, in 1977 and 1978. Reports of abuses in the community, called Jonestown, prompted the visit of a U.S. Congressman in 1978, who was assassinated on leaving the jungle community. More than 900 individuals then took poison in a murder-suicide ritual that shocked the world.

Yet another millenarian and communal group, the Branch Davidians, had a tragic end. Victor Houteff (1885–1955) established the Davidian community in Waco, Texas, in the 1930s as an outgrowth of Seventh-Day Adventism. The Branch Davidians under the leadership of Ben Roden (1902–1978) emerged from the Davidians in the early 1960s, and they lived communally outside Waco. By 1984, the leadership of the Branch Davidians had been assumed by a charismatic prophet named Vernon Howell (1959–1993), who, as David Koresh, prophesied imminent apocalyptic events. A violent confrontation on February 28, 1993, between the Branch Davidians and agents of the U.S. Bureau of Alcohol, Tobacco, and Firearms (ATF) left four ATF agents and six Branch Davidians dead. A 51-day standoff between the Branch Davidians and Federal Bureau of Investigation (FBI) agents ended when tanks were used to insert CS gas (potent tear gas) and dismantle the community's housing. A fire began, killing 76 men, women, and children still in the buildings. The cause of the fire remains in dispute.

Despite these incidences of violence, dozens of other communal groups peacefully rose, fell, or changed throughout the late 20th century. The Holy Order of MANS began as a type of esoteric

monastic community in the 1960s but eventually affiliated with the Orthodox Church in America. The Farm, begun in the 1960s by the followers of Stephen Gaskin (b. 1935), a charismatic professor at San Francisco State University, today has about 200 members living in a cooperative, but no longer communal, agricultural project in Tennessee. Some young Christians living the hippie lifestyle in the 1960s became “Jesus freaks”—long-haired evangelicals who proselytized a message of Jesus’ love. The Children of God (now called The Family International) took this message further, practicing free love under the inspiration of their leader David Berg (1919–1994). The Twelve Tribes, like The Family, are a millenarian Christian group living in what they believe are the world’s end-times. They practice a strictly monogamous lifestyle, however, and live in self-sufficient agricultural communes. Jewish new religions in the 1960s mirrored their Christian counterparts. Young Jews wearing hippie garb and cooking vegetarian meals moved into Shlomo Carlebach’s (1925–1994) House of Love and Prayer in San Francisco, where they engaged in ecstatic practices of Hasidic Judaism.

The Turn East

Americans’ familiarity with the religions of Asia prior to the 1960s was limited. Swami Vivekananda (1863–1902) introduced Hindu Vedanta philosophy to Westerners at the World’s Parliament of Religions at the 1893 Chicago Exposition. In 1920, Swami Paramahansa Yogananda (1893–1952) founded the Self-Realization Fellowship in California, which taught the unity of all the world’s religions and direct personal experience of God. During the 1950s, the Beatniks practiced what they believed to be Zen Buddhism, some misinterpreting its doctrine of emptiness to be a reflection of their own nihilistic attitudes, while the writings of D. T. Suzuki (1870–1966) popularized and clarified Zen for a mass American audience.

It was not until the repeal of the Asian Exclusion Act in 1965 that Americans began to have greater access to the religions of Asia. With the lifting of limitations on immigration from Asia, a new generation of Hindu, Buddhist, Sikh, and other teachers of Eastern religions found a receptive audience among members of the counterculture. Drug experimentation, coupled with antiestablishment

protests, prompted young Americans to seek alternatives to their parents’ religions. The alignment of Asian immigration with an openness to new religions saw a “turn East” that was intense, though short-lived.

A number of gurus came from India, bringing both traditional and innovative teachings of Hinduism. Best known was ISKCON, founded by A. C. Bhaktivedanta Swami Prabhupada (1896–1977). The Hare Krishnas attracted young men and women, some emerging from the drug culture, who could be seen wearing colorful Indian clothing as they sang and danced in praise of Krishna on street corners. After the death of Prabhupada, the organization experienced mismanagement and a series of abusive gurus, but today, families of South Asian origin comprise the majority of ISKCON temple members. Also quite successful throughout the 1970s was 3HO—the Healthy, Happy, Holy Organization—brought to the United States by Yogi Bhaajan (1929–2004), who taught Kundalini Yoga to members, who practiced a type of Sikh dharma (religious doctrine and way of life). Maharishi Mahesh Yogi (1918–2008) introduced yogic practices through Transcendental Meditation, in which thousands followed very simple meditation techniques. Today, a large community of Transcendental Meditation devotees have settled in Fairfield, Iowa, where the Maharishi University of Management is situated. Bhagwan Shree Rajneesh, later called Osho (1931–1990), was perhaps the most notorious of the Indian gurus. His collection of 90 Rolls-Royces and the crimes committed by some of his devotees overshadowed his message of free choice and love in all its aspects.

Interest in Buddhism grew slowly in the United States, where it has seen its greatest popularity in the decades of the 1990s and 2000s. Nichiren Buddhism came to the United States from Japan in the 1960s, and practitioners learned to recite the mantra *Nam Myoho Renge Kyo*, which was said to lead to success and prosperity. Soka Gakkai International, a lay society, was instituted in 1975 as an organization separate from Nichiren Shoshu and has surpassed its parent organization in global membership and influence. Shambhala International is the organizational expression of one of the largest and most important Tibetan Buddhist movements in the United States today, which was founded by Chögyam Trungpa Rinpoche (1939–1987) in 1971. Trungpa appealed to young countercultural

Americans with his unconventional approach to religion, and though Shambhala went through a series of hard times after his death, it has emerged as a very successful group.

The Anticult Movement and Cult Wars

In response to the defection of young adults from traditional religions in the United States, during the 1960s and 1970s, an anticult movement (ACM) arose. Initially comprising parents concerned about the welfare of their adult children, it soon became dominated by health professionals and anticult experts. Both parents and professionals claimed that brainwashing—the idea that individuals were forced to adopt new beliefs through compulsory measures such as sleep deprivation, fasting, and isolation—explained the radical changes they had seen in their relatives. As a result, the ACM adopted its own coercive practices, and several deprogrammers served prison time on kidnapping convictions. In addition to the ACM, an evangelical Christian countercult movement (CCM) arose. The CCM considers any religion that is not its version of Christianity to be a cult. The ACM, in contrast, has a more secular outlook. Representatives of the ACM and CCM often charge sociologists and historians of religion who are not explicitly anticult as being “cult apologists,” insufficiently critical of the abuses practiced by members of a few new religions.

Two of the most controversial groups have been the Church of Scientology and the Unification Church. Founded by the entrepreneur and science fiction writer L. Ron Hubbard (1911–1986), Scientology is a religious philosophy that incorporates elements from Western esotericism, Buddhism, and other religions into a practical program that promises success and well-being through the practice of auditing, which eliminates the effects of negative memories. The Unification Church, now called the Family Federation for World Peace, was started by the Rev. Sun Myung Moon (b. 1920), a Korean minister who claims to be the second Messiah, come to fulfill the work of perfecting humanity left undone by Jesus. Both Scientology and the Unificationists have been criticized for aggressive proselytizing tactics and for requiring members to work long hours for little or no pay.

The news media have played a role in defining a “religious fringe” and pushing new religions to the margins by focusing on rare occasions of

violence and abuse rather than on accomplishments and successes. Although such violence is the exception rather than the rule, the perception of “dangerous cults” dominates the popular understanding of new religions. According to researchers, the Satanism scare of the 1980s, for example, was almost entirely fabricated by zealous law enforcement officials, ambitious mental health professionals, and the news media and led in some cases to the prosecution of child care workers and others. It is clearly the case that some new religions have coercive practices or threaten their critics, but the majority are peaceable.

The Future of New Religions

Immigrants continue to bring new religions and new expressions of old religions to the United States. A variety of Christianity-based new religions have come from South America and Africa. New types of Buddhism have come from Taiwan, and Japanese new religions have found U.S. adherents. Groups that once seemed out of the mainstream now appear to be part of larger world religions such as Hinduism, Buddhism, and Islam.

One rapidly growing new religion in the 21st century is the New Age movement, the most recent manifestation of Western esotericism. Although the millennial expectations of 20th-century New Age practitioners have moderated, interest in a New Age lifestyle nevertheless remains visible in the many bookstores that sell crystals and Tarot cards and offer courses in yoga and Tai Chi. J. Z. Knight (b. 1946), who claims to channel an ancient spirit named Ramtha, is one of many channelers who blends “New Thought,” Spiritualist, and other esoteric elements together into a philosophy that attracts those who claim to be “spiritual but not religious.” Contemporary Paganism, like the New Age movement, mixes Western esotericism with other types of spirituality, most notably pre-Christian religions in which the natural world is animate. Even UFO (unidentified flying objects) groups, which believe in the salvific function of science and technology, have adopted elements from Theosophy and Western esotericism. Thirty-nine members of the Heaven’s Gate group, for instance, who collectively committed suicide in 1997 to reach “The Level Above Human,” believed that they had true gnosis about their noncorporeal nature.

While theories of deprivation have argued that new religions arise in times of economic crisis or political repression, it is perhaps also true that the health of a free society can be measured in the vibrancy and diversity of the religious landscape. Unlike some countries, in which only a handful of religions are sanctioned by the state, the United States, both historically and constitutionally, grants most religious groups recognition in the form of nonprofit, tax-exempt status. Although persecution of new religions has occurred and will likely persist, the cycle of the rise and decline of new religions in the United States is likely to continue as well.

NEW YORK CITY

Located on the northeastern coast of the United States, New York City (NYC) is a global city with great religious and cultural diversity. It consists of

five boroughs, Brooklyn, Manhattan, Queens, Staten Island, and the Bronx, and is the most populous in the United States, having a population of approximately 8.4 million people. As a leader in the commercial, financial, fashion, education, art, entertainment, and media industries, NYC's influential networks hold sway over global markets, culture, and innovation. Despite its prominence in all of these areas, NYC remains multiracial, multicultural, and multireligious—a city of immigrants and migrants who live in approximately 500 distinct neighborhoods, comprising 200 separate ethnic groups attending several thousand places of worship.

The first inhabitants of the area that eventually became NYC were the Lenapes, a band of indigenous people that included the Canarsee, Rockaway, Manhattan, Hackensack, Wiechquaesgeck, and Rechgawawank Indians. The Lenape way of life, largely oriented around agriculture, hunting, and trading, was governed by a belief in spirituality and that all people were created by Kishilemukong's (the Creator) thoughts. They also believed that every natural thing possessed a spirit or *manetu* and was alive. As a result, the land around them was perceived to be a gift from the creator and, thus, was treated with care and respect.

The arrival of Giovanni da Verrazano, the first European to see Manhattan in 1524, marked the beginning of a new phase in the religious history of the region. In the years that followed, several Dutch, English, French, and Spanish explorers visited the area to trade and fish. This diversity and emphasis on trade seen in these early expeditions were to become the defining characteristics of the early Dutch settlement and later the City of New Amsterdam, on two levels. One, because of the diversity among the colonists, toleration of other cultures and religions was necessary for the harmonious functioning of the colony. Second, as a result of the difficulty that the Dutch West India Company experienced in attracting settlers, the company was amenable to accepting religious, cultural, and social diversity within the colony. Thus, in 1654, when Governor Peter Stuyvesant attempted to establish the exclusive rights of the Dutch Reformed Church by preventing the disembarking and settlement of 23 Jews from Brazil, he was rebuked by the directors of the Dutch West India Company for intolerance, an act that in their opinion would interfere with their economic ventures.

The city's tradition of religious freedom was further solidified by the "Remonstrance of the Inhabitants of the Town of Flushing" (1657)—a document in which the colonists in the Town of Flushing protested Governor Stuyvesant's proclamation banning Quakers from New Amsterdam and threatening to fine anyone found guilty of "harboring" a Quaker. Both actions served to affirm that the city would be one governed by tolerance and be a place where the oppressed and persecuted from any country would find refuge.

In 1664, the city of New Amsterdam was captured by the British and renamed New York in honor of the Duke of York. With British rule came the establishment of the Church of England and, at different times, several heated disputes between colonists adhering to the Dutch Reformed, Presbyterian, and Anglican faiths. Despite these arguments, however, the city's defining characteristics of diversity and tolerance remained. In 1664, the city had a population numbering approximately 1,500 people, consisting of Dutch, English, Flemish, Walloon, French Huguenot, German, Danish, Swedish, African, and Jewish—each living their lives and practicing their religious beliefs in various ways.

For much of the 18th and the beginning of the 19th century, NYC mirrored the rest of the United States in being predominantly Protestant. This dominance began to undergo dramatic changes in the 1830s as a result of the emigration of Catholics from Ireland and continental Europe. The growth of Catholicism in the city was met with tension and controversies over the teaching of religion in public schools and differences in religious observance—chiefly in Sabbath keeping. Adding to the tension were various stereotypes about these new immigrants—who were seen by some city leaders as poor people who had a propensity to concentrate in areas that fostered criminal activity and delinquency. However, due to the valiant efforts of the immigrants and their leaders, like Bishop John Hughes, NYC would become a center for Catholicism by 1863.

The religious diversity of the city was further augmented in the latter half of the 19th century by the influx of thousands of Jews who were fleeing eastern Europe. In Harlem and the Lower East Side, where they settled, the Jews established places of worship. The Jewish community was not without conflict due to differences between the German Jews, who were generally more financially stable, had a longer residence in the city, and

established Conservative and Reform congregations, and the newer immigrants from eastern Europe, who were poorer and Orthodox in their beliefs. The Reform and Conservative forms of Judaism that were transplanted to NYC continued to develop and later would become very influential in the continually intellectual focus and practice of those branches of Judaism, both in the United States and worldwide.

In the closing decades of the 19th century, the city continued to be a place of refuge for immigrants from various ethnic groups. These included the Italians, East Europeans, Greeks, Russians, and Chinese. For each of these ethnic groups, religious practices became one of the primary ways through which they could intentionally preserve various aspects of their identities and cultures while creating a place of community, affirmation, and belonging within their new home. For many of these immigrants, their houses of worship served multiple functions—a place to worship, a place for social gatherings, and a place to find assistance (social, informational, financial, etc.) in navigating the new context in which they found themselves.

NYC's position as a place of refuge for those seeking a better life was not limited to those who came from other countries, as evidenced by the influx of African Americans from the South following World War I. For these Blacks, many of whom settled in Harlem, NYC provided a place where they could collaborate with one another over their shared experiences to begin creating new ways of seeing African American culture—the arts, politics, the wider society, and ultimately themselves. All of these elements became the seedbed for the Harlem Renaissance and, later, the Black Power, Pan-African, and civil rights movements. Although some of these social movements may have found religion on the whole to be confining, the spirituality that forms the bedrock of African American life continued to be visible in the works and social engagement of various artists and political figures and in the lives of the African American people. For most of the African Americans in NYC, their faith tradition was primarily Protestant. However, for many of the younger African Americans, the Protestant faith being practiced seemed to be out of touch with many of the real issues that made up Black life in America—namely, racism, economic and social inequality, and the continual disregard and neglect of Black identity

and culture. This discontent would lend to the rise of the Nation of Islam and other movements such as the Black Panther Party in the 1960s.

In the 1920s, the face of Catholicism within the city began to undergo ethnic and cultural diversity as Puerto Ricans took up residence in the city. This trend has continued and, due to the influx of large numbers of Catholic immigrants from various Latin American countries in the late 20th century and early 21st century, has resulted in the creation of several Spanish-language congregations whose practices of faith, festivals, and culture have ties to the peoples of the Americas instead of Europe.

In the decades following the passage of the Hart-Cellar Immigration Act in 1965, the religious landscape of NYC became more diverse. As many non-European immigrants who took advantage of the removal of the national quota system traveled to the United States and to NYC in particular, they brought with them their religious beliefs and practices. In their new home, they gathered for fellowship, established places of worship, and built communities. For some, NYC became the headquarters of worldwide ministries that they would take to other countries, including their country of origin (e.g., some Pentecostal denominations). For others, however, NYC became the place of discovery of new forms of worship practices (e.g., Hindus having classes to teach their children about their faith) or a place where they could freely practice their faith without suspicion (e.g., Santería). For these new religious adherents and for those who have long resided there—Muslim, Buddhist, Hindu, Catholic, and Protestant—NYC remains a place of welcome, religious diversity, and tolerance. Although these characteristics have been buffeted in light of the events that occurred on September 11, 2001, they still remain and continue to thrive in the city of New York.

NEW ZEALAND

Voyagers from eastern Polynesia evidently settled in the South Pacific islands of New Zealand from the late 12th century onward. Their descendants, the Maori, developed a unique variant on Polynesian religion, identifying features of the natural world with their gods and heroes. The land itself was said to have been formed when the trickster Māui caught a great fish (the North Island) while standing in his canoe (the South Island). Despite a brief encounter with the Dutch in 1642, New Zealand was not reincorporated into the wider world until its rediscovery by the British in 1769. Protestant missionaries encouraged Maori chiefs to sign the Treaty of Waitangi (1840), which brought them under British rule and legitimated large-scale immigration of mostly Christians from the British Isles.

By then, ravaged by new diseases and intertribal musket warfare, Maori increasingly adopted the religion brought by Anglican (1814), Wesleyan (1822), and Catholic (1838) missionaries, initially valued more as conduits of European goods and skills than as preachers of the gospel. In an effort to restore lands and *mana* (status, ultimately spiritual in origin) lost through colonization, Maori prophets founded syncretistic religious movements, often identifying their people as Israelites. Most Maori, though, joined the increasing variety of imported denominations and sects, including the Latter-Day Saints (Mormons), from 1881.

New Zealand religion has been characterized by a peculiar blend of conservatism and innovation—both usually following but occasionally leading international trends. Interest in esoteric and New Age religions has always been high by Western standards. The Women's Christian Temperance Union promoted female suffrage (achieved in 1893), and prohibition of alcohol was almost introduced in 1919. While the world's first female Anglican diocesan bishop was ordained in 1990, denominational priorities undermined the Council of Churches in Aotearoa, New Zealand, in 2005. Liberal Christians have applauded recent legislation decriminalizing

prostitution (2003), recognizing heterosexual and homosexual civil unions (2004), and removing the right of parents to forcefully hit their children (2007), but conservatives have vociferously denounced such “attacks on the family.” The 1857 organization of the Anglican Church through a “voluntary compact” ruled by the laity, clergy, and bishops meeting in synods influenced Anglican constitutions overseas, but the 1992 establishment of parallel episcopates and synods for Maori, European, and Pacific peoples remains unique.

Despite intimations of a distinctively New Zealand spirituality, Christianity is waning, with only 52% of the country’s 4 million inhabitants claiming to be Christian and 32.2% explicitly rejecting any religious affiliation. Anglicans (13.8%), Catholics (12.6%), Presbyterians (10.0%, including Congregational and Reformed), and Methodists (3.0%) form the largest churches. Their decline, slowed by immigration, especially from the Pacific Islands, is not compensated by the sometimes high-profile “Christians” (4.6%), Pentecostals (2.0%), or Baptists (1.4%). Changes in settlement criteria since 1987, moreover, have led to increased arrivals from Asia and the Middle East, accounting for rapidly growing percentages of Hindus (1.6%), Buddhists (1.3%), and Muslims (0.9%).

NICARAGUA

Nicaragua, located in Central America between Honduras and Costa Rica, has a Catholic majority, but its population also includes Protestants, Jehovah’s

Witnesses, Mormons, Jews, Buddhists, Muslims, and adherents of Myalism-Obeah. According to the 2005 census, in a population of 4,537,200 people, 58.5% are Catholic, 23.2% are Protestant, 2.5% profess other religions, and 15.7% declare none.

In 1523, the first of the Spanish conquistadors arrived, bringing the Roman Catholic apostolic religion to the animist aboriginals and building a church in 1524. In 1620, British explorers conquered the Caribbean coast and founded some Anglican missions; missionaries of the Moravian Church arrived in the Caribbean in 1849.

In 1881, the Nicaraguan president, Joaquín Zavala, expelled the Jesuit order under the suspicion of their provoking an aboriginal rebellion against the government. Under the regime of José Santos Zelaya, conflicts escalated; Zelaya separated the Catholic Church from the state, established schools with Protestant teachers, and in 1899 exiled Bishop Simeón Pereira y Castellón.

Several Protestant denominations later became established: the Central American Mission (1900), Seventh-Day Adventists (1904), Baptist Convention of the North (1917), and God’s Assemblies (1919); their growth was slow but accelerated in the 1960s.

The American Capuchins created “Delegates of the Word” in 1967, raising awareness among farmers and organizing lay people for a political pastoral project against the Somoza dictatorship (1937–1979). With a similar objective and inspired by Liberation Theology, the Ecclesiastical Communities of Base were founded (*Comunidades Eclesiales de Base*, CEB) in Managua in 1970, and subsequently spread throughout the country. Miguel Obando y Bravo was appointed archbishop and condemned the dictatorship. The Sandinista Rebellion triumphed in 1979, and four priests were named ministers: Miguel D’Escoto, Foreign Relationships; Ernesto Cardenal, Culture; Fernando Cardenal, Education; and Edgar Parrales, Social Affairs. Thus, the “Church of the Poor” began during the Sandinista regime.

Following a visit from Pope John Paul II in 1983, the archbishop began an offensive against the government and denounced the “Church of the Poor.” In 1975, Miguel Obando y Bravo was appointed Cardinal of Central America and met with the opposing parties, businessmen, armed-opposition chiefs, and the U.S. government in an effort to debilitate the regime.

In 1990, the Sandinista Front of National Liberation lost in the national elections, and the

CEBs retreated, delegitimated by the Catholic hierarchy. According to Pierre Vayssière, during the following decade, the Church collaborated with neoliberal policies, leaving the impoverished population isolated in the CEB while Protestant churches grew.

As a result of pressure by the Catholic Church, the government's sexual education guide was withdrawn in 2003, owing to what was characterized as a lack of Christian values. Afterward, in 2006, the Alliance for Life (a Catholic-Protestant partnership) obtained congressional support for reform of the Penal Code, which was approved in 2007 and which penalizes therapeutic abortion. Although previously legal in Nicaragua, at present abortion is illegal in all cases, even if the mother's life is in danger.

NIEBUHR, REINHOLD (1892–1971)

Reinhold Niebuhr was the most prominent Christian intellectual in the United States during the middle half of the 20th century. Born on June 21, 1892, in Wright City, Missouri, to a theologically

inclined family of German immigrants, he was raised in Lincoln, Illinois, and among his siblings were the Yale ethicist H. Richard Niebuhr and Hulda Niebuhr, Professor of Christian Education at McCormick Theological Seminary. Educated at Elmhurst College, Eden Theological Seminary, and Yale University Divinity School, Niebuhr was ordained a minister in the German Evangelical Synod of North America in 1915.

From 1915 to 1928, he served as the minister of the Bethel Evangelical Church in Detroit, where his experiences as pastor to working-class automobile industry laborers led him to become an outspoken critic and an advocate of socialist principles. Denouncing the demoralizing effects of industrialism on workers, Niebuhr openly criticized Henry Ford and used his pulpit as a forum on workers' rights. In addition, he spoke out against the Ku Klux Klan, which held unusual sway in Detroit. Those years as a pastor were documented in his autobiographical *Leaves From the Notebook of a Tamed Cynic* (1929) and led Niebuhr to abandon the popular Social Gospel movement.

Rejecting the moral idealism and unconditional abhorrence of violence among liberal churches, Niebuhr's viewpoint of "Christian realism" became the hallmark of the ethics that he taught at Union Theological Seminary in New York City, where he was professor of applied Christianity from 1928 to his official retirement in 1960, though he continued to teach at Union for several years afterward. Among Niebuhr's most notable books during this period of time are *Does Civilization Need Religion?* (1927), *Moral Man and Immoral Society* (1932), his 1939 Gifford Lectures, *The Nature and Destiny of Man* (1941 and 1943), and *The Irony of American History* (1952).

A major theme of these books was that humans' capacity for sacrificial love could only be expressed by individuals and that collectivities—including business and governments—were the agents of self-aggrandizement. Hence, a realistic approach to ethics required structures of justice and countervailing power (e.g., labor unions) to force collectivities to have more social responsibility than they were inherently capable of having. This Christian realism was the foundation of a Christian approach to politics that scoffed at the efficacy of idealism and thereby allowed the former pacifist to become a supporter of U.S. military action in World War II, anticommunism, and the

development of nuclear weapons. At the center of these commitments was a radical distinction between individual and group morality and the acceptance of group egoism as our inescapable reality.

Niebuhr founded and served on the editorial boards of several journals, including *The Christian Century* (1922–1940), *Radical Religion* (1935), *The Nation* (1938–1950), *Christianity and Crisis* (1941–1966), and *New Leader* (1954–1970). In addition, Niebuhr helped found the Fellowship of Socialist Christians in the 1930s and the Union for Democratic Action in 1941. Niebuhr was married to Ursula Keppel-Compton, chair of the religion department at Barnard College, with whom he had two children. He was the author of the Serenity Prayer, a version of which is now famously used by Alcoholics Anonymous. Niebuhr was awarded the Presidential Medal of Freedom in 1964 by President Lyndon Johnson. He died in Stockbridge, Massachusetts, on June 1, 1971. His political thought continues to be a strong legacy in the United States for both foreign and domestic policy and is claimed by both liberals and conservatives.

NIETZSCHE, FRIEDRICH (1844–1900)

The 19th-century German philosopher Friedrich Nietzsche was victimized, posthumously, by the distortion of his work by Nazi propagandists, but in subsequent decades, scholars have convincingly shown his critical thinking to be completely incompatible with, and opposed to, Hitler's

National Socialism. Influenced by his formal training in philology, Nietzsche's first work is a critique of the metaphysical prejudices that inform epistemological language. In *Beyond Good and Evil* (1886), he attacks philosophical idealism and Descartes' classic thesis, "I think, therefore I am," rejecting the effect of a "grammatical illusion" that falsely presupposes that all action (thinking) has a subject ("I"). Nietzsche's refutation is an assault on the illusions of a free consciousness and the unity of the thinking subject, as well as on all philosophic positions based on the theory of truth. As a precursor to modern depth psychology, Nietzsche conceived of consciousness as a reflection of the multiple forces that escape human rational control. Thus, behind all morality lies a pathos that is masked by its principles.

For Nietzsche, Western metaphysics originates with Socratic philosophy and, to a greater extent, with Christianity, defined as a "morality of the weak" in *On the Genealogy of Morality* (1887). The fundamental pathos is a vengeful resentment directed against superior humans and therefore represents a negation of the world and life. According to Nietzsche, Christianity invented God to maintain humans in a state of resignation and pessimism achieved through piety and guilt. A cruel moral system was constructed based on a fictitious equality to impede human distinction and growth. Even the postreligious Enlightenment notions of liberty and individual responsibility are products of the same slave morality; humans, as social animals, define their duties within the repressive herd. The ideal consciousness remains dominated by the base instincts it is supposed to combat.

In *The Anti-Christ* (1888), Nietzsche proposed a controversial transvaluation of values: Dionysus versus the Crucified One, or the will to power of the *Übermensch*, or Superman, against the falsifying values of Christianity. The *Übermensch* is an individual who accepts the strongest instincts and discovers in them a superior creative will. The opposition between aesthetics and ethics, the notion of the *Übermensch*, and the desire to eliminate the weak has been interpreted as the prelude to, or the proclamation of, the racial theory, the "final solution," and the "aesthetization" characteristic of National Socialism's political totalitarianism. However, the notion of the *Übermensch* can better be understood

as the individual exaltation of assumed instincts resolved through a battle of the spirit. In Nietzsche's writings, there is no racial or anti-Semitic connotation; rather, the implication is an awakening of a critical spirit and individual will, which subvert the reactionary and mass fanaticism of Nazi totalitarianism as well as contradict its criminal ideology. The famous proclamation "God is dead," in *Thus Spoke Zarathustra* (1885), celebrates the unleashing of the will to power against religion. It should be interpreted as a critical antihumanism, not intended to destroy humanity but rather to overcome humanism's ideological illusions. Nietzsche's philosophy aims to emancipate and better protect humanity from totalitarian threats, using "suspicion" rather than good intentions.

NIGER

The Republic of Niger is a landlocked country in the Saharan Desert in northern Africa, bordered by Algeria, Burkina Faso, Chad, Benin, Libya, Mali, and Nigeria. It takes its name from the Niger River, which runs through its southwestern tip. Like its neighbors Chad and Mali, it has a very low population density and low rates of urbanization, concentrated in the capital Niamey. Niger is one of the poorest countries in the world and relies heavily on mining exports, particularly uranium ore.

Niger's religious history is closely tied to that of North Africa, evidenced by the high percentages of

Muslims and the minimal presence of Christian groups. Modern-day Niger spans an area that was home to four distinct cultural regions before colonization: the Djerma civilization in the southwest; Hausaland along the southern border, which stretched into modern-day Nigeria; the nomadic Tuareg civilization in the north; and the farming settlements of the Toubou in the Lake Chad basin. Evidence of settlement in the area dates back to the 10th millennium BCE. Parts of Niger were first consolidated by the Muslim empires of the 17th, 18th, and 19th centuries CE. Contact with European explorers and colonizers occurred in the late 19th century. The French established administration over the area in 1922, after heavy resistance from the Tuareg people of the north. Niger became an independent republic in 1960, and after a series of economic difficulties and political transitions, it now functions as a multiparty democracy with free elections. Many of its minority groups, however, continue to struggle for representation in the government.

Islam first arrived in Niger in the 15th century, brought by Arab traders along the trans-Saharan trade routes. Over the following three centuries, Islam was solidified as the majority religion, though many of the region's inhabitants continued to practice traditional religion in addition to Islam. Christianity came late to the area and has seen limited growth. Most of the earliest Christian missionaries came north up the Niger River from Nigeria, but there were no Christian missions in Niger itself until the 1930s.

Today, more than 90% of the population is Muslim, and the majority of these are Sunnīs. Christian groups account for less than 5% of the population. There is also a small community in southwest Niger that has followed the Baha'i Faith since its arrival in the 1960s. Although very few of Niger's inhabitants follow traditional African religion exclusively, elements of indigenous religion continue to be widespread among the Muslim population. Among the Hausa people of Niger and Nigeria, the female-dominated spirit possession cult of *Bori* is still popular. The republic's constitution guarantees freedom of religion, and the country's religious groups have a long history of peaceful coexistence.

NIGERIA

Nigeria is the most populous country in Africa, the eighth most populous country in the world, and the most populous country in which the majority of the population is Black. Nigeria is situated on the Atlantic coast in the West African region and has a landmass of 923,768 square kilometers. It shares land borders with the republics of Benin in the west, Chad and Cameroon in the east, and Niger in the north. The more than 150 million people of Nigeria have evolved a cultural setting that is a study in contrasts and one with complex dimensions. Nigeria is a vast country characterized by cultural complexity, a multiplicity of religious loyalties, ethnic plurality, and linguistic differences as well as diverse historical experiences.

Nigeria's social boundaries are often described as artificial. This characterization is correct in the sense that certain ethnic groups and communities were split and located within the colonial state territories of different European powers following the 1884 to 1885 Berlin conference. Thus, although Nigeria formally became one entity in 1914, after the amalgamation of the then northern and southern protectorates along with Lagos, many members of the different ethnic groups found their kinsmen and neighbors just outside Nigeria's political boundaries. The name *Nigeria*, derived from the River Niger that runs through the territory, was coined by Flora Shaw, the future wife of Baron Lugard, who at the time was the colonial governor-general. Today, there are estimated to be more than 250 ethnic groups in Nigeria. While no ethnic group enjoys absolute numerical majority, four main groups can be identified, including Hausa and Fulani in the north, Yoruba in the west,

and Igbo in the east. Some other groups include Kanuri, Ibibio, Idoma, Efik, Ijaw, Itsekiri, Nupe, Tiv, and Urhobo. All the ethnic groups have different cultures, which together constitute the country's variety of cultures and religions, often expressed in terms of "unity in diversity."

Contemporary Nigeria seems to have produced the most profound religious vitality, with interaction of the indigenous religions, Christianity, and Islam producing new religious constellations that have attracted more scholarly attention than anywhere else on the African continent. Although several religions exist in Nigeria, religious affiliation appears to be characterized by rather distinct regional divisions, thus helping accentuate regional and ethnic distinctions. However, by the 1990s, Islam dominated the north and has competing numbers with Christianity in the southwestern Yoruba, while among the southeastern Igbo group, Christianity appears predominant. The growth and transformation of these religions can be better understood when considered within the locus of mutual religious interaction, rivalry, and influence. This contest for space and influence has produced new religious movements, which appropriate symbols and employ religious imageries from one or the other of the religious traditions. This gives them an innovative interpretation and produces a new kind of religious creativity. Beyond the focus on religion as a coterie of belief and ritual patterns, the treatment of religion as an epistemological phenomenon allows for a deeper understanding of the complex interaction between Nigeria and other parts of the world. One important aspect of the interconnectedness between globalization and the religious diversity of Nigeria lies in the fact that its religious constituencies both influence globalization and respond to the challenges and opportunities that globalization offers. The connection between globalization and religion in Nigeria can partly be understood in terms of the legacy of European colonial conquest and occupation, neocolonialism, and the introduction of Islam and Christianity. The global scope of religions in Nigeria transcends the country itself and extends into the diaspora. The institutional capacity, demographic mobility, and public visibility of these religions in Nigeria and in the Nigerian diaspora have integrated them into the global religious map.

The spread of Islam and Christianity saw the introduction of new religious ideas and practices

into indigenous communities. The encounter transformed indigenous religious thought and practices but did not replace it; rather, it remains resilient and able to maintain cohesion in a global context. In the face of globalization, religions in Nigeria are characterized by their negotiation between continuity, change, and transformation. With the growing revitalization and internationalization of indigenous religion, many Nigerians are beginning to appreciate more fully their indigenous practices and becoming more concerned with preserving their cultural and religious heritage. Thus, communal rituals, ceremonies, and festivals in commemoration of specific divinities are becoming internationalized. The annual Osun-Oshogbo festival for the Yoruba Osun divinity and the Ngenukwenu of Uburu, an Igbo clan, have become international events that attracts devotees and tourists from all parts of the world. Orisa—a Yoruba religion—now has a much broader spectrum of worshippers from all countries, with tremendous diversity in educational background, cultural exposure, professional experience, and skill.

Furthermore, Orisa is being affected by consumerism and the new technologies of the information age. Books and pamphlets of the do-it-yourself or teach-yourself type are being published by some people, particularly in the Americas, who perceive the religion as marketable. Films and videocassettes, for instance, of Orisa ceremonies and rituals are broadcast and commercialized. The growth of Orisa in the United States and Europe has been characterized by the proliferation of religiosity, in which most Orisa ritual leaders operate and communicate through Internet websites with old and new clients as well as with the wider public. Interestingly, some of these leaders are “White” Americans or Europeans rather than Africans. This accentuates the demographic shift from an ethnic-based religion to a global, multiethnic congregation. Orisa in the West is assuming alternative forms of spirituality for Africans and a growing number of Americans and Europeans.

Nigeria has continued to serve as a significant theater for the dramatization of Islam and Christianity, especially since the beginning of the 20th century. While three major religions exist in Nigeria, cases of violence have largely revolved around the different traditions of Islam and Christianity. Members of these two religions have

continued to live as rivals as they battle for supremacy in the political and socioeconomic spheres of the country. Underlying some of the religious violence is the quest for dominance and authenticity; some adherents or proponents of the competing religious groups attempt to unseat the rival religion, impose their values, and control the state. Some of the violence has also been motivated in part by local and global events such as the Miss World show in 2002 and the Danish editorial cartoon controversy of 2005, thus exemplifying how the local is global and the global is local.

Nigeria has witnessed an increasing proliferation of Pentecostal and charismatic churches, especially since the 1950s and 1960s. Their social-political involvement in both the local and the international religious space has been a force in shaping contemporary Christianity in Nigeria. Many of them constitute ministries that offer social services that state and local governments often fail to provide, including schools, hospitals, and other welfare-related services for members and communities. The mission-related churches have also acted in ways that have put them on the global map. The antigay stance of the Church of Nigeria, Anglican Communion, partly in response to the ordination of homosexual bishops by the Western Anglican body, has drawn both local and global attention. In pursuance of global evangelization, some of the Nigerian churches engage in what is often termed “reverse mission,” aimed at re-evangelizing what they perceive as the secularized or “pagan” West. Thus, some of these churches define themselves as global or international churches with a “global mission.”

Some of these churches have continued to maximize use of the mass media and Internet websites as conscious strategies of self-insertion and identification within a global religious landscape. It is common to find on such websites pages for submitting prayer requests, payment of tithes, and online live worship, thus compressing worship space and time. Islam has also continued to employ various print and electronic media, including Internet satellite broadcasting systems and websites, to widen its reach as a global religion and to facilitate ties among communities of origin and the Muslim diaspora. Like some Nigerian churches, the Islamic groups are also taking up extrareligious functions such as social welfare programs within the diaspora context. Thus, their focus is not only the

spiritual well-being of their members but also the transactions of transnational economics in combination with religious activities. Religions in Nigeria could therefore be said to traverse geographical and cultural space through missionization, migration, tourism, and mediatization. Therefore, a consideration of Nigeria and its religious development must be seen in relation to the global context and its patterns of negotiating global forces.

NILE CIVILIZATION

See Egypt

NIUE

Niue, known as the “Rock of Polynesia,” is a predominantly Christian island in the South Pacific. While indigenous practices remain evident both in communal life and in syncretic beliefs, the Protestant Church of Niue, a Congregationalist

body also known as the Ekalesia Nieuve, commands adherence of 75% of the population. Owing to its history of missionary activity, another 15% of the populace are members of the Church of Latter-Day Saints, with 7% identifying as Roman Catholic and 1.5% as members of the Baha’i Faith. Christian and indigenous practices have been synthesized to a greater or lesser degree on the island and can be seen in the belief in *aitu* (ancestral ghosts) and prohibitions around places where violent deaths occur. The *fono* (prohibition) that falls on such places can be lifted by a pastor, illustrating the attribution of traditional Niuean powers to the Christian clergy.

The island, which in 2003 became the first “WiFi Nation” with free wireless Internet service provided across the country, was for many years known as Savage Island after the inhabitants drove off Captain Cook, preventing him from landing there in 1774. The reputation of the Niueans kept colonial powers at bay, but Samoan missionaries arrived on the island in the mid-19th century, followed by English missionaries from the London Missionary Society in 1861. The presence of the religious institutions played a role in the politics of the island by softening the Niuean perception of the British Crown, which resulted in King Fata-iki offering to cede Niue’s sovereignty to the British Empire in 1887; however, his offer was not accepted by the British until 1900. Niuean national identity too is a direct result of missionary and colonization activity coupled with service in foreign wars and trade; up to the 20th century, community was understood at the village level, with Niueans first identifying as members of a village rather than as citizens of Niue. With export migration to New Zealand, which had annexed the island in 1901, national identity grew to distinguish the newly emigrant Niueans from other Pacific Islanders. New Zealand granted Niue independence in October 1974, resulting in the self-determination of Niue but with continued financial and military support from New Zealand.

Christianity has become associated with modernization in Niue, evidenced in the names of villages (e.g., *Hakupu*, lit. “Any Word of God”) as well as the local anthem *Ko e Iki he Lagi* (lit. The Lord in Heaven). Pastors of the Ekalesia Nieuve, normally trained in Samoa, play a large role in the civic life and are consistently popular choices for

election to political office. One of the country's main secular holidays, Peniamina's Day, celebrates the day the missionary hero Nukai Peniamina returned to Samoa with the Christian gospel after (as the legend goes) being abducted from the island and trained as a pastor at the Malua Theological College in Samoa. A secular holiday celebrating the introduction of Christianity to the island illustrates the extent to which religion has become enmeshed with the state.

NONVIOLENCE

Nonviolence can have many meanings. Sometimes it means merely avoiding, or intending to avoid, causing physical injury to anyone. When nonviolence is motivated or justified by religious commitment, it usually means refraining from violence on principle rather than merely for practical reasons, intending to avoid harm of any kind to anyone, and wanting the best for everyone. However, there can be no single definition, because every religious community or tradition defines and deals with nonviolence in its own distinctive way. Sometimes there are differing views about nonviolence within the same religious tradition.

This entry demonstrates the complicated relations between religion and nonviolence by focusing on three traditions in which nonviolence has

played an especially important role: Christianity, Hinduism, and Buddhism. It also briefly explores the relation between religious and nonreligiously based nonviolence in the contemporary world.

Roots of Christian Nonviolence

Scholars debate about the role of nonviolence in early Christianity. It may have been a common and important part of Christian life from the beginning. Within a few decades of Jesus' death, the author of the Gospel of Matthew recalled that the early followers of Jesus claimed that he admonished his followers to "love your enemies" and, if struck on one cheek, to "turn the other cheek" (Matthew 5:25–27). However this teaching may not have been a central tenet of the young religion. While some early Christians died as martyrs without resisting—and gave the early Church a reputation for pacifism—others served as soldiers in the Roman army.

After Christianity became the official religion of the Roman Empire in the fourth century CE, there continued to be some Christians who tried to follow the teaching of "love your enemies" by refraining from all violence. However, they were a rather small minority. Christian leaders and theologians generally found ways to legitimate war (using theories of a "just war") and other forms of violence sanctioned by the government.

The first organized Christian groups strictly committed to nonviolence that left a strong mark on the historical record emerged in the 1520s, the early years of the Protestant Reformation, in German-speaking lands. They called themselves Anabaptists ("baptized again") because they believed that religious faith must be a free choice of the individual, not bestowed or mediated by any agent of the church.

The Anabaptists split into numerous groups, including Mennonites, Hutterites, Brethren, Amish, and others. They intended to live by all of Jesus' teachings, including the one in Matthew 5 about nonviolence. Seeing no hope of changing the sinful ways of the world, they withdrew into their "gathered" communities so that they could pursue perfect love and peace, which they thought was possible for them since (they believed) they had been saved from sin by their faith. Thus, they generally stayed out of political involvement or movements for social change. However, they were rarely left in peace by

the authorities; they often had to move to escape persecution. These churches, sometimes called the “historic peace churches,” are still found all over the world today, though some have become more involved in society and politics in recent years.

The Quaker movement, which began in 17th-century England, was committed to nonviolence as a way of cultivating love for all people. Quaker theologians claimed that all outward violence is an expression of selfish desire and pride, which leads to anger, which leads to aggression. People whose behavior is guided by their relationship with God will purge themselves of desire and pride. Thus, they will not do violence to anyone.

But Quakers believed that every person has both the potential for godliness—the “inner light,” as they called it—as well as the potential for evil within him or her. So all should be treated as equals and friends. And all should be free to find their own way to God; no one should be coerced, especially in matters of religion. Moreover (and here was their great innovation), if every person has “that of God” within him or her and is on the way to being saved, then every society can eventually become free from sin. Quakers therefore got involved in efforts to improve political and economic conditions, drawing on humanism as well as their own religious beliefs. But they were committed to keeping all their efforts strictly nonviolent. Their primary concern was not political change but religious virtue.

As time went on, some Quakers compromised their strict nonviolence. This led to reform movements that pushed for withdrawing from the world. However, some Quakers continued to be concerned about social problems, and in the 20th century, they emerged as strong proponents of political and social change.

One of the issues that concerned Quakers most was slavery. They played a large role in outlawing the slave trade in England in 1807. In the United States, by the 1820s, an alliance including Quakers and other Protestants was demanding the abolition of slavery. A faction of the abolitionists led by William Lloyd Garrison insisted on nonviolence. Their opposition to slavery grew out of their religious belief that all humans should be ruled only by God, not by another person. They argued that a person who uses violence is trying to impose his or her will on, and thus rule over, another. So a true Christian will renounce all violence.

Garrisonian abolitionists helped free slaves in practical ways, most notably through the underground railroad. But Garrison, a gifted writer and orator, emphasized the power of words. His movement’s goal was not to free slaves one by one but to outlaw the institution. When the Civil War broke out, even Garrison and many of his followers decided that they could achieve that goal only by violence, and so they joined the prowar ranks. Others adhered to their nonviolent principles. The most famous was Adin Ballou, who had founded a utopian community in Massachusetts called Hopedale, where he put the principles of nonviolence into practice in daily life.

Christian Nonviolence in the Early 20th Century

Through the end of the 19th century, nonviolence was not seen primarily—and in the historic peace churches not at all—as a method of social and political change. It was seen, above all, as a way to maintain individual spiritual purity by refusing to accept the authority of human rulers and worldly values. Yet the Garrisonian abolitionist movement created an important precedent by combining principled nonviolence with organized political effort.

That tradition came back to life during World War I. Predictably, members of the historic peace churches in Europe and the United States refused to fight. More surprisingly, a significant number of men and women from other Protestant churches denounced the war as morally wrong, and some were led to question the legitimacy of all war, or even all forms of violence. In 1919, this new turn to nonviolence sparked the formation of the International Fellowship of Reconciliation (IFOR). Its founding document declared that love, as revealed in Christ, is the only sufficient basis of human society, and it set forth the goal of creating a world order based on Christian love. By 2009, IFOR was active in 53 nations around the world.

The men and women in IFOR see sin manifest less in individual misbehavior than in unjust and degrading social conditions. So they expect society to be improved by reforming social, political, and economic structures. Many believe that capitalism is a fundamental cause of war and most other forms of violence. Christian love, in their view,

calls for a new economic system so that all might share equally in the abundant goods and services produced by industrialization.

In the United States., IFOR was also heavily influenced by the new trend of pragmatism, which judged beliefs by their practical results, especially their ability to help every individual fulfill his or her highest potential and to improve material conditions for all. IFOR rejected the idea of a military draft, since forcing men into the military would deprive them of their personal freedom. The most important innovation of the World War I era was to treat the ancient religious appeal to the individual conscience and the modern concern for reforming institutions as two sides of the same coin.

This era also saw women rise to leadership positions in the nonviolence movement for the first time. Many of those who founded the Women's International League for Peace and Freedom in 1915 were religiously inspired, although the organization was not explicitly Christian.

Nonviolence in South Asia

The traditional religions of South Asia have always put a strong emphasis on reverence for life. Each of the many religious communities there had its own interpretation of nonviolence and how to implement it. Jains, in particular, have gone to great lengths to avoid doing harm to any living creature. However, before the 20th century, all agreed (and resembled traditional Christianity) in one respect: Nonviolence and the avoidance of harm were observed as a way to maintain individual spiritual purity. Often, this was explained in terms of avoiding the bad effects of karma, the residue of actions in this life that would prevent one from escaping the wheel of rebirth.

In the 20th century, Mohandas "Mahatma" Gandhi brought a great change. Although he always declared himself a Hindu, he drew on Jain and Christian sources to develop a view of nonviolence as a method of social and political change that resembled the view emerging in the United States and Europe. However, Gandhi always insisted that his religious life was his highest priority. Social and political work was merely a method for pursuing spiritual perfection. His goal was to be a perfect living embodiment of Truth, for he believed that "Truth is God."

Gandhi taught that the most basic barrier to following Truth is desire, which leads us to pursue selfish goals rather than Truth and thus reinforces the illusion of the self as a separate reality. When we selfishly pursue our own goals, we try to control others, coerce them, and make situations turn out the way we want. The only way to transcend desire is to practice *ahimsa*, Gandhi's term for nonviolence (a Sanskrit term for noninjury), which literally means having no intention to coerce others or control the outcome of events. *Ahimsa* means never asking "What do I want others to do?" Others are always left free to make their own choices. Nor does *ahimsa* mean asking "What do I want to do?" since "want" is a sign of desire. *Ahimsa* means asking only "What is my duty toward others? How can I serve others?"

Loving service is the way to "persist in truth," the literal meaning of Gandhi's term *satyagraha*. Since satyagrahis must serve the needs of the whole world, the term came to denote primarily acts of nonviolent resistance to political, social, and economic wrongs. Gandhi admitted that this means each of us making ourselves the judge of what is true. But since satyagraha forbids coercing others, when conflict arises, satyagrahis do not inflict suffering on others in an effort to defeat them. Rather, they take suffering on themselves as a test of their own commitment to the truth as they see it, while always remaining open to other views of truth. Thus, they can take a firm stand on a moral issue—unto death, if necessary—without imposing their view of truth on others.

Gandhi taught *ahimsa* throughout India from 1915 to 1947, as leader of the movement to free his land from British rule. His followers included not only Hindus but also Muslims committed to nonviolence, organized in the Khudai Khitmagar. At independence, Gandhi called on the new nation to be a model of nonviolence; he was devastated to see Hindu-Muslim conflict turn violent and break the nation apart, into India and Pakistan. Although neither nation has been governed by Gandhian principles, there are still numerous movements following those principles in South Asia, working for social, economic, and political reform.

Modern Religious Nonviolence

Gandhi was already famous in Europe and the United States by the 1930s, and his example

helped inspire a small number of Christians to refuse participation in World War II. In the United States, some of these were Catholics, inspired more by Dorothy Day's Catholic Worker movement, the first Catholic group to advocate strict nonviolence. Gandhi's greater impact came when Martin Luther King Jr. led African Americans in a largely nonviolent movement to win their civil rights. King's nonviolence blended Gandhian teaching with the Christian theology of personalism, based on the idea that every person is endowed by God with unique potentialities. Justice is a condition in which all are equally free to explore and fulfill their own potentialities. But everyone needs the help of other people, indeed the help of a whole society, to fulfill his or her potentialities. So justice and freedom require that each member of society should care about all the others and help them become what they are meant to be.

Ideally, in what King called the beloved community, everyone will extend selfless care and mutual support to everyone else, realizing that no one can be free and fulfilled unless all are free and fulfilled. When such a cooperative spirit of love and interconnection pervades every aspect of life, there is full and positive peace.

King recognized that as society is now, people are tragically separated from each other and all too easily come into conflict. The goal of religion, King preached, is to move society toward the beloved community by acting for justice. Our acts must involve unyielding confrontation and pressure, because oppressors will usually change their ways only when coerced. However, as long as we are motivated by selfless love offered equally to everyone in the conflict, we participate in the divine force working to harmonize the opposing sides. Acting nonviolently for positive change makes the beloved community real in the present.

King also pointed out that nonviolence is the most practical way for a powerless people to gain their rights. He represented a growing tendency to see nonviolence primarily as a way of creating concrete improvement in society and only secondarily as a way of individual spiritual growth—as opposed to Gandhi, who saw nonviolent action as an end in itself and denied that its value could be measured by its results.

This shift toward a pragmatic view opened the way for nonreligious people to join nonviolent

moves in greater numbers. In the 1960s, for example, millions around the world protested against the U.S. war in Vietnam, motivated by many different faiths or no specific religious faith at all.

Buddhist Nonviolence

Some of the earliest protests against the Vietnam War were in Vietnam itself, led by Buddhist monks. Since its origins in India, Buddhism has tended to support nonviolence (though Asian history certainly records instances of violence committed by Buddhists). Vietnamese Buddhists held to the tradition of nonviolence. But they reflected modern influences in the early 1960s, when they began to use nonviolent techniques to create powerful pressures for political change.

One who became especially famous was Thich Nhat Hanh. Exiled from Vietnam, he has traveled the world promoting what has come to be called “engaged Buddhism,” a melding of Buddhism and political activism. Another very famous leader of this movement is the Tibetan spiritual leader, His Holiness the Dalai Lama.

Both base their teachings on the traditional Buddhist principle of emptiness: Nothing has any independent permanent essence; nothing can exist by itself. Whatever appears to be an isolated “thing” is actually a combination of its constituent elements. Everything that looks like a separate entity is actually a process dependent on, and therefore interwoven with, other processes.

This Buddhist view of the world necessarily leads to principled nonviolence. Nhat Hahn teaches that the root of violence is anger. Yet there is no real boundary between our inner anger and the world's anger, the source of all conflict and violence. What we call the external violence of society is interwoven with our own aggressiveness; to harm another is actually harming ourselves. On the other hand, the preservation of oneself is the same as the preservation of all; the healing of one's own suffering is the same as the healing of all suffering. Nonviolence and compassion for all are thus natural responses for one who is mindful of the true nature of what Nhat Hahn calls “inter-being.”

The Dalai Lama shares much the same point of view. However, he starts from the principle that all people want to be happy and avoid suffering.

Experience shows, he claims, that we are happiest when we are realistic—that is, when we recognize our interconnection with all beings, letting ourselves feel whatever they are feeling. To be happy, then, we should consciously offer empathy and compassion to all beings, doing whatever we can to promote their happiness and relieve their suffering.

Since violence increases the suffering of another, and all people are connected, an act of violence inevitably reduces the happiness and increases the suffering of the one who perpetrates violence, too. Kindness, generosity, and nonviolence are the only route to happiness. And an individual can be happy only when he or she is extending compassion to all humanity, which means working to change the political, economic, and social structures so that they will be more conducive to the happiness of all.

Engaged Buddhists recognize that even the most powerful or unjust people are harmed by the suffering they create. Seeing that the antagonists in any conflict are merely two sides of the same reality, engaged Buddhists stop fighting and extend compassion to all.

Both Nhat Hanh and the Dalai Lama have added another new element to nonviolence: Every person is connected not only to every other person but to all of nature. Nonviolence should therefore be extended beyond human relationships to our relationship with the natural world and indeed the entire cosmos.

By the late 20th century, the quest for personal spiritual growth that originally motivated nonviolence had been merged with a larger quest for a society of genuine liberty and justice for all. Despite their many differences, all the major nonviolence movements in the 20th century have agreed that all humanity is interconnected; whatever any one person does, or whatever happens to any one person, has an effect on everyone else. If any one person is dominated or harmed by another, the harm from that domination undermines the freedom and well-being of everyone. Therefore, no one has the right to exercise authority over another against the other's will. Responsible freedom means respecting and promoting the freedom of all others; it means working for justice. It also means an attitude of universal love. Only a loving society can be just; only a just society can express love. No individual can attain the ideals of freedom, justice, and love

unless society is built on, or at least moving toward, those ideals as shared values.

NORDIC COUNTRIES

The Nordic countries are Denmark, Finland, Iceland, Norway, and Sweden. A common feature in all five countries is the existence of majority Evangelical Lutheran churches with different

degrees of autonomy in relation to the state. The populations demonstrate high membership rates in these churches combined with high participation in church-based rites of passage but low rates of church attendance. The religious landscapes are changing, partly due to processes of modernization and globalization and partly due to immigration of people who are adherents of non-Lutheran and non-Christian religions.

Church and State

Soon after the Reformation, the Evangelical Lutheran churches were established as state churches in all five countries. During the 1800s, growing revival movements developed into free churches in Sweden and into movements and organizations inside the frames of the majority churches in the other countries.

Today, the relations between church and state vary. The most stable church-state relations are found in Denmark (5.4 million) and Iceland (290,000), where few changes have taken place. According to the Danish Constitution of 1849, "the Evangelical Lutheran Church is the Danish popular church and supported as such by the state." Denmark achieved freedom of religion and also instituted a folk church that received "support" from the state and that the state could use for its own support. An important feature in the Danish case is the lack of democratic institutions inside the Danish Folk Church, a development that has taken place in the other countries. The Danish Folk Church is a relatively liberal church that integrates different groups into its fold. The large majority of Danes seem to accept that the state rules the church and has the final responsibility in determining the framework for its activities. The relations between church and state in Iceland are not controversial either. However, the Church of Iceland has since the late 1950s formed democratic institutions such as the Church Assembly, which represents a development of autonomy from the state in internal matters.

In Norway, church-state relations are under pressure. The constitution of 1814 states that "the Evangelical Lutheran religion is the public religion of the state." In contrast to the other Nordic countries, Norway (4.7 million) continues to have a defined state religion. Norway was the first of

these countries to debate autonomy from the state within a state church system. Partly due to the struggle during World War II to maintain an independent church away from the Nazi occupational forces, the Church of Norway took the initiative during the postwar years to form a representative church council with certain governing functions. Once these and other democratic institutions (the annual Church Assembly) were formed, they implied a growing autonomy from the state in internal matters. Today, the state church system is debated, and there are calls for reforms.

The most profound changes have taken place in Sweden (9 million), where church and state separated in 2000. Historically, a law from 1809 stated that "the King should always be of the pure Evangelical teaching." Consequently, it was argued that "the religion which the Swedish King must confess . . . thereby is state religion." During the 1950s to 1980s, several state-appointed commissions dealt with church-state relations. In 1982, the "Church of Sweden Law" was introduced, which gave more autonomy to the church. In 2000, a new law defined the Church of Sweden as an open, democratic Evangelical Lutheran church with autonomy from the state.

Finland (5.2 million) constitutes a unique case, as it has two national churches, the Finnish Evangelical Lutheran Church and the Orthodox Church. The Lutheran Church has long enjoyed broad autonomy from the state. The Church Assembly was in 1870 granted decision-making rights in internal matters, and when Finland became independent in 1917, its constitution did not mention church or religion, even if the president became the highest protector of the Lutheran Church. The Orthodox Church was also declared a national church on par with the Lutheran Church. Although the state church system was formally abolished in 1919, the Lutheran Church continued to fulfill its traditional role and receive public funding. The Religious Freedom Act from 2003 (replacing the one from 1922), stated that the role of the state was to secure freedom of religion for all in Finland. Today, Finland has a situation similar to the one in Sweden.

The differences in church-state relations have increased during the past 30 years. On one side is Sweden with autonomy from the state, followed by Finland with a great amount of autonomy. On the other side is Denmark, where the Folk Church

is closely tied to the state. Iceland maintains a state church system, although with some church autonomy. Norway resembles Iceland but is moving in the direction of Sweden and Finland, with looser ties to the state.

Church Membership and Rites of Passage

Even if church-state relations are undergoing change and contemporary Nordic countries are modernized and secularized, large parts of the populations are members of the majority churches and use their rituals during important events in life. On one part of the scale is Iceland, which scores the highest on church membership and participation in its rites of passage. In 2005, more than 90% of Icelanders were members of the church, almost 95% of newborn children were baptized, and the same number were confirmed. Most weddings and practically all funerals took place in the church.

On the other end of the scale is Sweden, which has the lowest scores. In 2003, the members in Church of Sweden amounted to 80% of the population. The same year, 70% of all infants were baptized, 58% of all weddings took place in the church, and 87% of all funerals were conducted by the church. However, only 39% of all 15-year-olds were confirmed.

In the middle are Finland, Norway, and Denmark. Traditionally, Finland has been more similar to Iceland, Denmark to Sweden, and Norway in the middle. In 2003, 84% of Finns belonged to the Evangelical Lutheran Church and about 1% to the Orthodox Church. In that year, 87% of all infants were baptized in the Lutheran Church, and 68% of all weddings and 98% of all funerals took place there.

In 2006, 83% of Norwegians were members of the Church of Norway. Seventy-four percent of all infants were baptized, and 67% of 15-year-olds were confirmed. One peculiar phenomenon in Norway is the growing Norwegian Humanist Association (*Human-Etisk Forbund*), with 80,000 members (2007). The association arranges humanist rites of passage, such as infant name giving, confirmation, weddings, and funerals.

In Denmark, 83% of the population were members of the Danish Folk Church in 2004. The same year, 76% of all infants were baptized in the church, 72% were confirmed, and 90% of all funerals took place there.

The membership rate in the majority church relative to the population continues to be relatively stable in Iceland, but it has decreased in Sweden, Finland, Norway, and Denmark since the 1970s. Participation in rituals has also been declining, but more so for confirmations and weddings and less for infant baptism and funerals. The decline can partly be explained by secularization and partly by changes in the populations due to immigration of people of non-Lutheran or non-Christian religion. This is especially true for Sweden, Norway, and Denmark.

Religious Identity, Practice, and Faith

A Nordic survey from the mid-1990s asked, "Do you consider yourself to be a confessing Christian, Christian in your own way, or not a Christian?" This survey confirmed the pattern of Icelanders as the most religious and Swedes as the least, with Finland closer to Iceland, Denmark closer to Sweden, and Norway in the middle. Forty-two percent of Icelanders saw themselves as "confessing Christians" but only 17% in Finland, 15% in Norway and Denmark, and 10% in Sweden. The largest group in all the countries answered "Christian in my own way," which indicates a subjective religious identity. This was true for 76% in Finland, 70% in Denmark, 69% in Sweden, 58% in Norway, and 53% in Iceland. When it came to the identity "Not Christian," Norwegians scored the highest with 27% (probably due to the influence of the Norwegian Humanist Association), followed by Sweden (21%) and Denmark (15%). Only 7% of Finns and 5% of Icelanders considered themselves non-Christian.

Even if church membership is high and few see themselves as non-Christian, people's religiosity is not necessarily demonstrated by going to church. The European Social Survey (ESS) from 2006 showed that the number of people who said they attended Sunday services and religious meetings at least once a month or more was 13% in Finland and Norway, 11% in Denmark, and 10% in Sweden. A study (World Values Survey) in 2000 showed that 12% of Icelanders attended religious meetings at least once a month or more.

The low rates of church attendance do not mean that religious faith is absent. Rather, there is

a widespread private religiosity in all five countries. Once again, Icelanders seem to score the highest and Sweden the lowest on these measures of religiosity. The European Values Study in 2000 showed that 84% of Icelanders and 69% of Danes but only 53% of Swedes believed in God. The same year, 74% of Finns reported in a study that they believed in God. A study in 1998 (International Social Survey Programme) showed that 76% of Norwegians believed in God or a higher power.

A unique feature of Iceland is a widespread faith in spiritualism, which appeared in the early 20th century and constitutes part of popular religiosity today. For example, funerals in Iceland are often accompanied by séances, where a medium will provide proof that the spirit of the deceased lives on.

Several new religious movements appeared in the Nordic countries during the 1970s, but they remained small. More significant are New Age values, which have a wider effect on popular culture and appear in settings not traditionally considered religious—TV entertainment, rock concerts, magazines, and commercials. Some New Age values and beliefs, such as faith in reincarnation, also find support in the population. Surveys from Norway (International Social Survey Programme, 1998) and Sweden (2005) showed that 20% believed in reincarnation. A survey from Denmark (World Values Survey, 1990) showed that 16% of Danes believed the same. Thus, New Age ideas and values play a role in the media and have some support among the population.

Church attendance is low, and only a small group can be classified as “active believers.” Icelanders and Finns scored higher than their neighbors, Swedes, Norwegians, and Danes, when it comes to private religiosity. Nevertheless, people in the Nordic countries have not abandoned their religious beliefs. They generally practice religion in a low-key way and believe in God, but in their own, private way.

Ethnic and Religious Minorities

Among the largest indigenous groups in Europe are the Sami (80,000–100,000), who inhabit the northern parts of Norway, Sweden, Finland, and the Kola Peninsula of Russia. They speak various Sami languages, classified as Finno-Ugric. Traditional Sami shamanism existed until the 18th century, when the Sami were forced to convert to

Christianity. In the 1840s, Swedish Sami vicar Lars Levi Læstadius led a strict Lutheran revival among the Sami. Today, most Sami belong to the majority Lutheran churches in Norway, Sweden, and Finland, and among these, Læstadianism is still dominant. Some Sami belong to the Orthodox Church, as in Russia and Finland, and a handful in Norway. There have also been recent trends of a return to shamanism among some Sami.

Due to processes of globalization and international migration, the Nordic countries are becoming increasingly diverse, even if they vary in this area. Iceland and Finland are still exceptionally homogeneous, whereas Sweden is the most heterogeneous country in this region, followed by Denmark and Norway. Few Icelanders belong to any other religious denomination than the Lutheran majority church. For historical reasons, Finland is more heterogeneous religiously speaking than Iceland. The Finnish Orthodox Church dates back a thousand years when Greek-born monks founded monasteries there. When Finland was annexed by Russia in 1809, the Church of Russia invested in the growing Orthodox Church. In the 1950s and 1960s, the Finnish government funded several new churches, rectories, and cemeteries. Today, the Finnish Orthodox Church (57,044) is a national church, and services are held mainly in Finnish.

In 2003, only 2% of Finns belonged to registered religious communities outside the national churches, such as Jehovah’s Witnesses (19,195), Free Church of Finland (13,443), Roman Catholicism (897), Islam (2,603), Baptist (2,595), Methodist (244), and Jewish (1,189). In 2005, 14% of Finns (800,000) did not belong to any religious community, which included unregistered Pentecostals and Muslims. Indeed, the first Muslims in Finland immigrated during the 19th century. The Tatar Muslims came from central Russia during the 1870s and 1930s, and they founded the Finnish Islamic Congregation in 1925. Finland was one of the first countries in the West to officially recognize a Muslim community. Today, the Tatars (800) constitute a small, well-integrated minority belonging to the urban middle class. The fastest growing group of Muslims in Finland consists of immigrants, who come from Somalia, the Middle East, and former Yugoslavia. In 2003, more than 20 Muslim community organizations were registered. Although the official membership counted 2,100 in 2001, the estimated number is more than 25,000.

The most religiously heterogeneous country is Sweden. In 2001, 3% of all Swedes belonged to free churches, of which Pentecostalism was the largest (90,000). Roman Catholicism (160,000) constitutes the second largest church, followed by various Orthodox churches (100,000). The largest community of faith outside the Church of Sweden is Islam (250,000–300,000), which constitutes approximately 3% of the population. Swedish Muslims consist primarily of immigrants or people of immigrant descent from Bosnia, Iran, Iraq, Turkey, and the Middle East. There are three Muslim national organizations in Sweden, with more than 100 organized communities. Other religious minorities are Jews (20,000), Buddhists (10,000–15,000), and Hindus, Sikhs, and Baha'i (a few thousands each).

In Denmark, Muslims constituted 3.8% of the population in 2006 (207,000). Danish Muslims are for the most part immigrants and immigrant descendants from Turkey, Iraq, and other countries of the Middle East, North Africa, Pakistan, Somalia, and former Yugoslavia. Other religious minorities are Hindus (12,000), Buddhists (20,000), Orthodox Christians (7,000), and Baha'i (260). Estimates suggest that there are 35,000 registered Roman Catholics, 2,400 members of a Judaic faith community, and 5,500 members of Pentecostal churches.

In 2007, almost 9% of Norwegians were registered as members in faith communities outside the Church of Norway. The Christian churches that have experienced the most growth are Roman Catholicism (51,508) and Pentecostalism (40,398). However, the largest community of faith outside the church is Islam, with 79,068 registered members in 2007, a little less than 2% of the population. Muslims of immigrant origin come primarily from Pakistan, Iraq, Somalia, Bosnia, Iran, or Turkey. Other religious minorities are Jehovah's Witnesses (14,756), Buddhists (10,753), Hindus (4,098), Sikhs (2,440), and Jews (868). The toleration of multiculturalism in Norway and the fear of a rising Muslim population triggered the tragic terrorist attack by Anders Breivik on July 22, 2011, killing 77 people.

Whereas Iceland and Finland are more homogeneous than Sweden, Denmark, and Norway, the latter four countries are all becoming increasingly heterogeneous. Finland is the only Nordic country

with a Muslim minority dating back to the 19th century. Today, Islam constitutes the largest religious community outside the majority Lutheran churches in Sweden, Denmark, and Norway. These four countries also have a growing group of Muslim converts. Studies suggest that about one third of Muslims go to religious meetings on a regular basis. A 2003 Danish study found that 35% attended religious meetings regularly, and a 2006 Norwegian survey showed that 30% participated in religious gatherings once a month or more. Estimates from Sweden also confirm the picture that one third of Muslims are religiously active. In addition to the growth of non-Christian religions in the Nordic countries, there is also an array of Christian immigrant churches.

Changing Religious Landscapes

The Nordic countries have majority Lutheran churches with different relations to the state. Even if large parts of the populations support these religious institutions, the ties are weakening, and there is a growing subjective religiosity. In many ways, there is a polarization of the religious landscape in the sense that increasing parts of the populations, especially in Sweden, Denmark, Norway, and Finland, are moving away from the majority churches. At the same time, there is a growing diversity with the formation of new immigrant religious communities—Christian, Muslim, and others—with a more active membership. Altogether, religion in the Nordic countries is less dominated by the majority churches than it was just a few decades ago.

NORFOLK ISLAND

Norfolk Island is located approximately 900 miles east of Australia (1 mile = 1.609 kilometers) in the southwest Pacific Ocean, and as an external region and dependency, it is part of the Commonwealth of Australia. It has no established religion since Section

116 of the Australian constitution prohibits the Commonwealth from establishing a state religion or imposing religious observances. According to the 2006 census, of the approximately 2,000 residents of Norfolk Island, 593 identified as members of the Church of England, 370 reported having no religion, and 308 declined to answer the question. There is a significant Catholic population (214), and other Protestant denominations include the Uniting Church in Australia (198), Seventh-Day Adventists (60), Australian Christian Churches (17), and Jehovah's Witnesses (15), with 15 residents belonging to a non-Christian religion. Actual attendance has become relatively low, and many ministers are only temporarily assigned to the island.

The English explorer James Cook found these 13 square miles uninhabited in 1774 and claimed the island for Britain. From 1788 to 1814 and again from 1825 to 1855, the island served as a penal settlement. Norfolk Island was virtually abandoned again for 13 months, until Queen Victoria gave the land to the 194 residents of Pitcairn Island, who had outgrown its 1.7 square miles, and they formed the first free settlement on Norfolk Island. The Pitcairners were the descendants of the mutineers of the well-known HMS *Bounty*, a British merchant ship, including English sailors and Tahitians; the Tahitians were mostly women who had married the sailors and converted to Christianity. Over half of the islanders today are Pitcairn progeny, and their story remains central to the cultural history of Norfolk Island; in fact, along with English, their official language is “Norf’k,” a blend of 18th-century English and old Tahitian. While some Tahitian traditions remain part of cultural celebrations, the religious beliefs and practices of their Tahitian ancestors are largely absent from Norfolk Island today.

The mutineers had established Seventh-Day Adventism on Pitcairn Island before bringing it to Norfolk Island, and some of their descendants identify as such today. In 1867, the Church of England set up the Melanesian Mission, a missionary agency supporting Anglican churches in the geographical region of Melanesia, which was then headquartered in Norfolk Island. Though the headquarters have moved, the mission continues today, providing financial and staffing support for the Church of the Province of Melanesia, an independent province of the Church of England.

Catholic missionaries also visited the Island during the late 19th and 20th centuries. Currently, Norfolk Island, like Australia, is becoming increasingly secularized: In the 1996 census, 13% identified as having no religion, compared with 18% in 2001 and 20% in 2006.

NORTH AFRICA

North Africa is a culturally and geopolitically bounded region of Africa that includes the modern states of Algeria, Egypt, Libya, Morocco, and Tunisia and the disputed territory of western Sahara. The United Nations' definition of northern Africa as a geopolitical subregion also includes Sudan, and Mauritania is also sometimes included. The majority of the regions' inhabitants are Muslim, although there are significant religious minorities of Jews and Christians, particularly in Egypt.

The region is sometimes referred to as the Maghreb, meaning "west" in Arabic, to denote its position as the western portion of the Islamic world. However, most technical definitions restrict the Maghreb to Algeria, Morocco, and Tunisia. The region has been of central importance to the development of both Christianity and Islam since its initial Christianization by the third century CE. Central tenets of Christian thought were developed in the region's notable urban centers, particularly Carthage (in modern-day Tunisia), Hippo (in modern-day Algeria), and Alexandria (in modern-day Egypt). Although little is known about religion in the region prior to the arrival of Christianity

and Islam, preclassical Egyptian civilization is a significant exception. Written records and archaeological evidence from Egypt have provided some of the best preserved data regarding traditional religion on the continent.

The population of the region is made up of Arabs, Berbers, and Egyptians (in the east) and those of mixed Arab-Berber descent. The term *Berber* refers to the indigenous peoples of northern Africa, though this label was originally imposed by Roman outsiders, and many Berbers today prefer the term *Imazighen*. Although Arabic is now the first language of the region, Egyptian or Coptic is still spoken in Egypt, and Berber languages are still spoken by a small minority of those living in the mountains of Morocco. Some Berber groups, including the Kabyles in Algeria and the Chleuh in Morocco, retain much of their traditional culture and identity.

The geography of the region is dominated by the Mediterranean coast along its northern boundary and the Saharan desert in the south, which covers nearly 90% of the region. The Atlas Mountains stretch across Morocco and northern Algeria and Tunisia, forming a steppe landscape that recedes to the Sahara. Berber and Egyptian groups have traditionally cultivated the fertile land found in the valleys of the Atlas Mountains, the Nile valley, and along the Mediterranean coast. Economically, Algeria and Libya rely heavily on rich oil and natural gas reserves. Both Egypt and Tunisia have strong tourist economies, and Egypt has developed significant textile, electronic, and engineering industries as well. Apart from the western Sahara, which is controlled partly by Morocco and partly by an independent military front, the states of the region have been independently governed since the 1950s and 1960s.

Due to the desert boundary, Egyptian history has been politically, religiously, and culturally distinct from the rest of the region. Ancient Egyptian civilization developed along the Nile River with close ties to the Mediterranean world, and this produced remarkable architectural and cultural achievements, including written records dating from the beginning of the 3rd millennium BCE. It is thus one of the oldest recorded civilizations in the world. Today, Egypt is the most industrialized and urbanized country in the region and is highly influential in the Arab world.

Religious and national identities have been closely linked across the region due to the pervasive influence of Islam. Although all of the modern states in the region are considered secular, Islam has played a significant role in the formation of postcolonial government institutions and legal codes. For most of the region's population, the teachings of Islam and Islamic practice are of central importance for how cultural and social institutions are to be organized. However, in the modern era, there has been significant diversity in approaches to the application of Islamic tradition to politics, and debates between traditionalist and reformist Islamic political parties have produced a range of results across the region. Morocco, for example, on attaining independence enacted a system of family law that adhered strictly to traditional Islamic law, and only recently has it reformed some of these laws to grant more rights to women and minority groups within the country. Tunisia, by contrast, implemented radical reforms in family law in its postindependence period that reflected the vision of a modernizing secular state.

Pre-Christian History

The preclassical religion of Egypt has been illuminated through a variety of written records, though none of these provide a complete picture of the Egyptian religion. It is believed that before the political consolidation of Upper and Lower Egypt in 3100 BCE, Egyptian religion was characterized by numerous local nature gods and very little widespread unity. Pharaohs, as local rulers, were associated with particular gods, and rituals revolved around the Nile and its utilization and control. After consolidation, centralized rule became increasingly associated with certain gods, primarily the sun god Ra, and a more universal, hierarchically organized pantheon of gods developed. The cults of Osiris (a central male deity) and Isis (his female counterpart) became increasingly widespread. These cults are often categorized as "mystery religions," due to the fact that devotees underwent extensive secret rituals to attain salvation.

Outside Egypt, significantly less is known about the region's religious history prior to the Roman conquest. As in many other parts of Africa, the traditional religions of the Berber people are obscured due to the absence of recorded evidence. After Phoenician, Greek, and Roman colonies

were established in the western portion of North Africa, there began a long history of cultural and religious exchange along the trade routes of the Mediterranean and the Sahara. The Phoenician colony of Carthage, in modern-day Tunisia, had extensive economic and cultural influence in the region well into the Roman-Christian era. Though most of its written records were destroyed in the Roman invasion, references to Carthage in other sources indicate that it was a wealthy and flourishing urban center. Two other nearby colonies, Africa and Numidia, were later founded by Rome. The colony of Africa was named for a local people called the Afri, and later it gave its name to the entire continent.

The Christian Era

The history of Christianity in North Africa begins almost as early as Christianity itself. Founded by Alexander the Great in 331 BCE., the city of Alexandria on the Nile River delta later became a center of early Christian history, perhaps second only to Jerusalem and Rome. When the Emperor Constantine established the Christian Byzantine Empire in 330 CE, Alexandria was named one of the three sees of Christendom, along with Rome and Antioch. Alexandria was home to many of Christianity's founding theologians, including Clement and Origen, who engaged in debates over the doctrine of the divinity of Christ and the nature of the Trinity. The term *Coptic* is used to refer to the church in Egypt that, according to tradition, originated with Saint Mark's evangelization of Egypt. The Coptic Church produced the first Christian monastic movement. These Coptic monks and hermits, called the "Desert Fathers," are today the subject of many traditional stories and fables. Today, the Coptic Church is the largest religious minority group in the Arab world, with roughly 4 million adherents.

The spread of Christianity to the rest of North Africa began around 250 CE and was nearly complete by 400 CE. The reach of the North African church was primarily confined to the coast, extending only about 200 miles inland from the Mediterranean. Both Carthage and the colony of Hippo became Christian centers, though in the second and third centuries the Christians in both cities were frequently persecuted and martyred. Important figures during this time included Cyprian, a

Carthaginian convert who later became bishop of Carthage and died a martyr in 258 CE, and Augustine of Hippo, a Berber from modern-day Algeria, born in 354 CE. Augustine of Hippo became one of the most important figures in church history. His extensive writings include the *Confessions* and *City of God*, which are still widely read.

The Islamic Era

Muslim Arabs first entered the Byzantine province of Egypt in 635 CE and then spread quickly across the Maghreb. Since the terms *Islam* and *Muslim* did not develop until the latter part of the 8th century, these invaders were usually just called “believers” or “emigrants.” By 710, they had reached the far western end of North Africa, had destroyed the city of Carthage, and had founded two new cities, Kairouan and Tunis, in modern-day Tunisia. The decline of Christianity was initially slow, and yet, with the exception of the Coptic Church of Egypt, it was nearly complete by the 12th century.

Islam in the Maghreb was shaped by numerous waves of Islamic dissidents, who frequently fled west for refuge or to establish new Islamic sects. Thus, Maghrebi Islam combines a variety of elements from various Islamic groups. Some of its most characteristic traditions have been the Mālikī School of Islamic law and the tradition of the Mahdi, a coming prophet who will restore justice in the world. Another influential sect, the Kharijites, were puritans who believed that the Muslim world should be ruled according to populist, democratic principles. These teachings took root among some of the Berbers in the Maghreb, fueling a series of later Berber revolutionary movements.

During the period between 900 and 1300 CE, a series of Islamic empires ruled the Maghreb and its surrounding areas. Each of these empires was influenced by Sunnī Islam, a movement begun in the 8th and 9th centuries that emphasized the study of right action and legal codes based on the teachings of Prophet Muhammad. Sunnī Islam thus became firmly established in the Maghreb during this period. The last of these empires, the Almohads, was defeated by Spanish and Portuguese forces in the early 13th century. For several centuries, the region was ruled by fragmented states until the 16th century, when all of North Africa except

for Morocco came under the rule of the Ottoman Empire. The Ottoman influence was slight, however; in most cases, it was limited to indirect rule. Prior to European colonization, independent monarchies had been established by deposing Ottoman authority in Morocco, Tunisia, and Algiers (modern-day Algeria).

The popular Islam that became firmly rooted in the region during this period emphasized order, respectability, and decency in public life coupled with the focus on the Muslim family as the center of social organization. The adult Muslim male, as the head of the family and its representative to the wider society, carried a number of particular responsibilities and privileges as outlined in Islamic legal codes. The focus of teaching and practice was based on the responsibility of the male individual to behave properly in society rather than on the society’s or state’s responsibilities to its citizens. The advent of the secular nation-state model in North Africa would later come into conflict with this firmly rooted orientation toward Islamic religious law and the Muslim family structure.

The Colonial Period

The colonial experience of North Africa was marked by intense and persistent armed conflict as well as the persistence of precolonial religion, language, and traditional cultures. While in other parts of Africa, Christianity came to dominate religious life and European languages were adopted as primary, North Africa retained its near-universal Muslim identity and use of Arabic. Prior to colonization by Great Britain and France, Islamic state-building movements originating in western Sudan had established the Sokoto Caliphate across the region from 1804 to the late 1850s. The Sokoto Caliphate extended its reach from Sudan into western Africa and offered a model for Islamic nationalism throughout the colonial period. It also contributed to the indigenization of Islam and the spread of Arabic literacy among the mass population in the region.

During the height of the Islamic empires of North Africa in the 10th century, the Muslim world was the foremost civilization in areas such as mathematics, astronomy, and medicine. By 1800, however, European nations had come to dominate international conquest and trade, and North Africa was one of the first regions to feel the effects of this transition. In 1897, the Sokoto Caliphate fell to the British, and

over the previous three centuries the Ottoman Empire had become gradually weakened by British conquest. In the end, though, France was to play the most dominant role in the colonization of North Africa throughout the 19th century. The French colonized Algeria in 1830, Tunisia in 1881, and the northern half of Morocco in 1907. Spain controlled southern Morocco and Italy controlled Libya through the colonial period. Egypt was ruled by France for 3 years after being invaded by Napoleon in 1798, then was technically independent, though dominated by British influence, through most of the 19th century. It became a British protectorate in 1882.

Before colonization, the Islamic community based on kinship ties and religion was the primary political unit across North Africa. Although colonization had little effect on the importance of Islam to the national identities of North Africans, it shifted the primary unit of political action to the territorial state. The region had been ruled by foreigners for centuries, but before European colonial rule, these empires had always been Islamic. The importation of a state based on secular principles transformed the role of religion in society, and the colonial and postcolonial period saw a range of responses to this change. Some political leaders and Muslim intellectuals embraced many Western ideas and technologies, while others saw modernization as fundamentally contradictory to their belief system and even took extreme measures of withdrawal from modern education and technology. Sufism, a mystical branch of Islam that emphasizes the radical purification of society according to religious principles, had a huge impact on the region during this period. Sufi orders often fueled both religious revivals and armed nationalist struggles. Short-lived independent Islamic states were established by the Sufi leader Abd al-Qadir in Algeria and by Berbers in the mountains of Morocco during this time, but they were quickly dismantled by the French.

Of all nations, Algeria has one of the bloodiest histories of colonial struggle. Between 1830 and 1871, armed uprisings took place almost yearly; and its independence in 1954 was achieved only after the bloodiest war of independence in the 20th century next to the Vietnam War. Algeria had been considered part of France itself and had been governed as such, though Algerians could only gain French citizenship if they renounced Muslim law. By the mid-20th century, French settlers constituted more than 10% of the population, and close connections to the French educational

system had created an influential francophone Algerian elite.

Egypt was home to some of the most prominent Islamic modernists, including Muhammad Ali (1761–1849), who made radical attempts to modernize the country and adopt Western technology and knowledge. Egypt experienced industrialization beyond that of its neighbors, coupled with a heavy burden of foreign debt and increasing economic inequality. Across the region, however, there were also huge numbers of rural dwellers whose religious and social lives were changed very little by modern ideas. The impact of colonization in North Africa was felt in the creation of parallel worlds: the traditional, Arabic-speaking Muslim masses and the Western-educated, secularized, francophone elites.

The Independence Period

After the states of North Africa achieved independence in the 1950s and 1960s, they began the long process of building state governments that would balance the demands of the Islamic society on the one hand and modernization on the other. The states that have emerged have all been officially secular and in favor of modernization; however, they also name Islam as the state religion. There are also variations in the degree to which popular religious practice has been secularized, with certain elements remaining central in parts of the region and dwindling elsewhere. Generally, elements that survive across the region include pilgrimage to Mecca (Makkah), prayer in mosques and the role of the mosque as a community center, some presence of ecstatic and mystical sects, nationally and locally celebrated festivals and feasts, the observance of the fast of Ramadan, and the ban on consumption of pork. Additionally, the central role of the Muslim family persists, and despite the influence of Western feminism and an increase in women's participation in politics, men and women continue to inhabit segregated public and private spheres. The wearing of the veil continues to be widespread, though the reasons for doing so are diverse and not always religious.

Islamic revivalism in North Africa has been highly publicized in the past two decades as a reaction against secularization and fuel for terrorist activity. Although it is true that "Islamism," as the political ideology of the modern revival is sometimes called, tends to involve skepticism of Western values and

dissatisfaction with the results of independence, very few of these groups engage in violent activity of any kind. Instead, they generally work to build Islamic schools and hospitals and engage in other grassroots activity to strengthen the religious fabric of their societies. Usually, their political writings have focused on the renewal of an Islamic society in North Africa based on religious ideals. The democratic protest movements that toppled authoritarian regimes in Tunisia in 2010 and in Egypt in 2011, along with armed struggle in 2011 against the established regime in Libya, has brought a new political vibrancy to the region involving democratic religious parties.

these regions have been included in the entry on Latin America, so this entry will focus on the North American countries of Canada and the United States, which are quintessential modern experiments. Nearly from the beginning, these nations have separated religion from national government, created a pluralistic religious settlement, and opened the public square to competing religious claims. Nonetheless, at various times in their histories, religion has dominated the cultural and, more rarely, the political ethos. This has been especially true with regard to Christianity in the contemporary, globalized era. Thus, creating an open religious market allowed the religions of North America to thrive rather than wilt as some theorists of secularization have suggested. Indeed, religions are innovative and have seized opportunities to insert themselves into the public square. This entry examines the present demographics and the history of religions in North America, concluding with an analysis of the consequences of these movements with regard to the contemporary period.

Modern Demographic Realities

The Christian experiment succeeded in North America, though not without cost. When the Europeans came to the continent in the 15th and 16th centuries, it is estimated that there were 2 million indigenous people already living on the land. Due to disease and warfare, by 1900, only 500,000 remained. Meanwhile, Christians missionized and "Christianized" the indigenous populations, with mixed results. Nonetheless, through the centuries, Christianity was able to dominate the North American religious market. This is apparent when examining the present religious demographics of North America. Out of Canada's 33 million people, 77% self-identify as Christian (43% Roman Catholic, 29% Protestant); other religions make up 6% of the rest, with Islam as the leading minority religion at 2%. Of the Canadian population, 16% claim no religion, which makes this population nearly identical to its counterpart in the United States.

The United States has a similar demography to that of Canada. Seventy-nine percent of the nation self-identify as Christian, but in contrast to Canada, U.S. Protestants dominate at 51% of the population compared with Roman Catholics at 24%. There is a similar percentage of minority religions as in Canada; however, Judaism rather

NORTH AMERICA

Though the term *North America* sometimes includes Mexico, Central America, and the Caribbean Islands,

than Islam is the leading U.S. minority religion at 2%. Two demographic trends are critical to keep in mind: First, in both countries, the number of affiliated Christians has fallen by nearly 10% over the past decade, with those claiming no religion gaining the lion's share; second, the makeup of U.S. Protestantism has also shifted dramatically, with a nearly 10% decline in gross population as well as a change in the overall proportion of Protestants to the rest of the U.S. population. Among U.S. Protestants, the mainline churches (Congregationalist, Presbyterians, Episcopalians, and Lutherans) have declined dramatically over the past 40 years, and evangelicals now make up more than half of the total Protestant membership.

In other words, in the open religious markets of North America, Christianity still dominates the culture, but other subcultures, particularly those with no religion, are now becoming a force to be reckoned with. Indeed, religious subcultures are a potent reality in North America, leading to vitality and fragmentation both culturally and politically. Globalization, with its open communication and instant gratification of nearly every impulse, has little patience with the status quo, leading to a fissiparous family of competing religious sects. We now trace the historical etiologies of these modern trends.

Domination and Christianization

The early explorers of the continent were from French and Spanish Roman Catholic backgrounds; they created multiple settlements and sought to convert the natives to Christianity. They were led by Jesuits and Franciscans with good intentions but with little real success. Indeed, early contact was marked by the devastation of Amerindian populations, unprotected from European diseases and nearly helpless against European weaponry. Nonetheless, and particularly in Canada, the French staked their claim and built a foundation that would become the French Catholic-dominated province of Quebec.

The early power of the Catholics, particularly in the United States, was superseded in the 17th century with the founding of the Puritan Boston settlement: a "Christian experiment" that was sustained by a demanding discipline, both in their churches and in their government. One had to be a Protestant Christian to live in the community. This Puritanism

created religious refugees such as Roger Williams of Rhode Island, who demanded a political polity that was open to "others" despite his acceptance of the religious exclusiveness of his fellow Boston Puritans. Williams's experiment was the origin of the Baptist idea of "soul freedom," allowing each one to make up his or her own mind—an innovation that caught fire by the 18th and 19th centuries, particularly in the southern and western colonies.

The Quaker experiment, led by William Penn, seeded Philadelphia as a city of brotherly love and was a critical player in the political culture of Revolutionary America. In the next century, Quakers led in the Anglo-American abolitionist movement. The most recent incarnation of the Quaker culture is its contribution to an anti-institutional spirituality. To be sure, today, these forms of spirituality that abjure formalized religion percolate across the American scene. The early-American egalitarian spirit rejected a professional clergy, leveling the playing field between clergy and lay people in the Baptist traditions, and nearly obliterated the distinctions in the nondenominational Christian churches created in the 20th and 21st centuries. Finally, a spiritual but not religious ethos picked up power and numbers, creating diverse modes of spirituality. Some even adopted forms of Asian religions from the East in 19th-century New England that blossomed on the West Coast in the 20th and 21st centuries.

A third Christian folkway came by way of the Scotch-Irish Church, who were embodied first in the Calvinist denominations—Presbyterians and Congregationalists; 0.25 million Scotch-Irish immigrated to the American colonies between 1717 and 1776 and filled the Appalachians from Pennsylvania to Georgia. This particular type of cultural and religious ethos coveted a "natural liberty" built on creating "elbow room" so that all individuals could provide for themselves and their families. This religious and cultural ethos cultivated an "us versus them" habit of mind and a refusal to associate with those they perceived as different. These so-called others, often Indians, were turned into enemies. This powerful strain of American Christianity has been both a cultural and political force. Andrew Jackson, the first president from this tradition, was notorious for expelling the Cherokee from their legal lands and sending them on forced migration (the Trail of

Tears) in the 1830s. Woodrow Wilson, president from 1913 to 1921, was from this tradition as well. Though more refined than Jackson, he was deeply engaged in cultural, religious, and political crusades “to make the world safe for democracy.” The most recent exemplar of this tradition is George W. Bush, who carved out a religious politics that political historians have seen as shaped by Methodist perfectionism, advocating a compassionate conservatism coupled with a cosmic sense of U.S. destiny, reflecting a clear line between good and evil. Just 9 days after 9/11, Bush remarked, “The course of this conflict is not known, yet its outcome is certain. Freedom and fear, justice and cruelty have always been at war, and we know that God is not neutral between them.”

The last powerful British Christian movement in the early-European settlement of America was the Virginians. They brought to the continent the Anglican religion, called the Episcopal Church in America. Virginian gentry came to the New World as elites or nearly so, cherishing a form of personal dominance based in class and race. They heralded an Enlightenment form of religion embodied in Thomas Jefferson’s Christian deism; following this ideology, they created an Enlightenment-based governmental polity, balancing devotion to religion with restraints placed on it. The First Amendment to the American Constitution (which lacks any mention of God) prohibited the state “establishment” of religion and ensured its “free exercise” and was modeled on Jefferson’s Virginia Statute for Religious Freedom. John Adams, hailing from Boston Puritan roots and the second president of the United States, was nonetheless, in his adult years, a Unitarian—a European American invention. In a letter to Jefferson, he stated that the founding fathers had achieved independence based on the “general principles of Christianity.” Having witnessed the anticlericalism of the French Revolution in 1789, George Washington, Adams, and Jefferson believed that religion, or what they called “General Christianity,” was the truth on which a stable social order must be built.

By 1759, British dominance on the continent had been established with the conquest of New France in Canada and the dominance of Puritans, Quakers, and Virginians, which shaped the American Constitution. Even so, the British Canadians accommodated to the French with the Quebec Act of

1774, allowing the French Catholics to accept British power in the North Country. Early on, Canada had no interest in independence from their mother country, and indeed, many Protestants who remained loyal to the British in the United States fled to the north. These were known as Foreign Protestants, including large numbers of Lutherans who today live in the south shore area of Nova Scotia. After America gained its independence, Protestant immigrants to Canada included Anglicans as well as Presbyterians and Methodists. The Methodists gathered around Toronto, a city that became known as one of the largest gathering places of Methodists in the world, eventually establishing the nondenominational University of Toronto.

The tensions in Canada between various religious groups continued in the 19th century with the influx of Presbyterians from Scotland. This immigration was one of the causes of the 1837 rebellion in upper Canada, which was stopped by the new government, which accepted the growing voice of non-Anglican Protestants. Nonetheless, the Ultramontane French Catholics in Quebec practiced a strict and conservative form of Catholicism, fighting with the anticlerical French Catholics as well as battling the staunchly monarchist and pro-British Anglicans of English Canada. These tensions were eased in part by the large immigration of Irish and southern European Catholics in the mid-19th and early 20th centuries. A similar movement of Catholics occurred in the United States during the same period. Tensions in the United States increased, however, as the Protestant hegemony was undercut and Catholics were seen as corrupting both the “true” faith and American “Protestant” culture.

The early and mid-19th centuries in the United States solidified the Protestant hegemony culturally if not politically. A Pan-Protestant culture made up of Congregationalists, Presbyterians, and German Lutherans in the North and Methodists and Baptists in the South and Midwest colored the country with a churchd religion that was warmhearted and reform minded. Revivals burned over many districts across the country, seeking to light the fire of faith in Holiness movements that became fragmented and exploded with religious entrepreneurs who created new religions, such as Christian Science and the Church of the Latter-Day Saints (the Mormons), as well as creating new sects of Christianity, such as the

Seventh-Day Adventists and Jehovah's Witnesses. Each expressed in some form a deep desire for personal transformation. This was the age of reform. Voluntary organizations expanded, and social advocacy to correct every sin filtered across America. Christian revivalists like Charles Grandison Finney battled alcohol, supported women in ministry, and became a force against slavery. It was the latter, of course, that splintered not only the country but also many denominations along the Mason-Dixon Line; Presbyterians, Methodist, and Baptist were divided by the issue of slavery, each citing biblical verses to support their heartfelt positions.

Modernity and Its Consequences

The secularizing power of modernity increased toward the end of the 19th century to confront religion in North America. It came, chiefly, in the writings of the British naturalist Charles Darwin. In his book *On the Origins of Species* (1859), Darwin argued for an evolutionary theory for the human species. It challenged the most fundamental anthropology of Protestant Christianity and, at that time, the Catholic faith as well. For Protestants, the Bible said that humans were made in God's image. The reaction against Darwin and others who extolled his ideas set off a chain of events that forever fragmented Christianity in North America. Partly in response to the movement of modernity, French Catholic Quebec became ultramontane—that is, conservative Catholic. From 1850 into the mid-20th century, Quebec maintained one of the highest rates of Mass attendance in the Catholic world, adopting the core positions that condemned liberalism and identifying with the first Vatican Council of 1870, which condemned all forms of modern liberalism, including the separation of church and state.

In somewhat similar terms, although manifested in part as a reaction to Catholicism, American Protestant Christianity attacked Darwin's evolutionary theory and, moreover, denied and rejected the so-called higher criticism of the Bible as antithetical to the true Christian faith. This growing counterculture percolated for many years but erupted most profoundly in the modernist-fundamentalist debates of the 1920s. The precarious homogeneity of 19th-century Protestant evangelical culture split apart. Harry Emerson Fosdick, a New York City Baptist, attacked fundamentalism

in his 1922 sermon "Shall the Fundamentalists Win?" His position won the day, but his more conservative comrades turned away from the Protestant mainline to form a powerful and parallel culture that was at first sectarian but later in the century began to engage mainstream culture. The five fundamentals of conservative Christianity included the inerrancy of Scripture, the blood atonement of Christ, the authenticity of Jesus' miracles, the virgin birth of Christ, and the Second Coming; these doctrines became a litmus test for many conservatives in the 20th century by identifying what were thought of as "true" Christians.

Mainline and liberal Christians, beginning in the first decades of the 20th century, argued for a social gospel of justice for the poor and those in the urban areas that had been exploited by the explosive growth of industrial factories. Walter Rauschenbusch, a German Baptist theologian, pleaded for a gospel that not only "saved" the soul but also cared for the body. But following World War I, the social gospel crumbled, and many simply wanted to enjoy the world at peace. The Depression that began in 1929 not only undercut employment but depressed the church and stalled the early-century hope of Christianizing the world. Few had time to think about anything but caring for their own. Modernization and the new global economy brought with them the stark realities of impersonal workplaces, exploitive business practices, and urbanization. Religion in North America became relatively inward and cautious. Conservative Christians, particularly in the United States, began a long process of building a distinctive conservative culture over what they interpreted as the corrupt secularity of American culture. Christian conservatives built schools, colleges, and churches that communicated a strong message of family first, traditional social values, and hard work. Their labor did not go unrewarded, although the full force of their political power was only felt in the last quarter of the 20th century.

In the post-World War II period, with its "return to normalcy," churches boomed, families grew, and the global economy became a reality through new markets, modern transportation, and ever-improving communication. But a new expression of modern secular culture was on the horizon, the counterculture of the 1960s. Against the background of an affluent middle class, an unpopular war, and leaders who seemed uninterested in the voices of young

people, many youth rebelled. The changes to religion were more than cosmetic. The Vatican Council of 1962 to 1965 made accommodations to modernity and undercut some traditional practices and conservative norms in a period of declining attendance and adherence. The “quiet revolution” in Quebec had the effect of changing the Quebecois from one of the most conservative and traditional Catholic populations into one of the least. New seminary candidates declined, brothers and sisters left the monasteries, and attendance at Mass decreased. The Catholic Church continued to express a stable set of conservative moral positions that condemned birth control and took stances against both homosexuality and the ordination of women. The Roman Catholic Church, however, did become more engaged in social justice issues; the 1983 U.S. Bishops’ letter on “The Challenge of Peace” was a powerful indictment of war. Nonetheless, rather than drawing Catholics into the church, every move toward engagement with modernity seemed to provide them with more excuses to leave.

The Protestant mainline churches in the United States and Canada engaged the modern world as well, but they advocated a liberal, rather than conservative, social platform. The United Church of Canada, representing nearly 10% of Canadians, became the most liberal Protestant church in the world, supporting women’s ordination, gay pastors, and homosexual marriage. The mainline churches in the United States—the Presbyterian, Congregational, and Episcopal churches—did not go as far as their northern sister churches, but they instituted the ordination of women and expressed a new openness to talk about homosexuality as well as supporting abortion rights for women. Again, this liberal movement engaged the culture, but it did little to keep young people in the churches. A relatively dramatic decline in church membership occurred over the last half of the 20th century, with most mainline churches losing more than 40% of their membership. The mainline was not only sidelined, but it lost most of its public influence on cultural and political issues of the day.

Key Trends in the Contemporary Cultural Scene

At the end of the 20th century, the secular principles of modernity had deeply affected the religion

of North America. Globalization, as the latest expression of modernity, created new modes of transportation, communication, and technologies that affected culture and religion in profound ways. Nonetheless, globalization has neither destroyed nor homogenized religion but created a space where greater variety can and does exist. In this space, religion has developed multiple subcultures that include many different groups, none of which dominate in quite the same ways as in the past. In this sense, smaller interest groups must partner with others to achieve electoral victories. On the liberal side, gays partner with labor unions, blue-collar workers with liberal elites, and Hispanics with White professionals. For political conservatives the partnerships are equally diverse: libertarians with White evangelicals, southerners with Orthodox Jews, and low-tax atheists with conservative Catholics. Thus, to attain power in Canada or in the United States, coalitions must be developed, and former strangers will have to create unexpected alliances.

Nevertheless, two groups are growing in North America more than others. On the one hand, those who decline to identify with any religion and, on the other hand, particularly in the United States, those who are often called conservative Christians, including evangelical nondenominational types, fundamentalists, and charismatics. The “no-religion” group currently makes up approximately 16% of the population in both Canada and the United States and includes atheists, agnostics, and a variety of humanists. In the United States, writers, scientists, and academics such as Christopher Hitchens and Sam Harris have written best-selling jeremiads against the rationality of a belief in God. This latest barrage of antireligious books surged following the attacks on U.S. targets on September 11, 2001. It was nearly impossible not to notice that religion was implicated in these attacks; to be sure, a rare form of extreme Islamic faith impelled the hijackers to run commercial airliners into the Pentagon and the twin towers of the World Trade Center. In the notes found in the hijackers’ suitcases, nearly every step of their journey was facilitated and directed by verses from the Qur’an. Many have argued that these actions went directly against the Islamic tradition, which forbids the killing of innocents. At the same time, the al Qaeda leader Osama bin Laden (d. 2011) made it clear that those in the Twin Towers, the Pentagon,

and the hoped-for final target, the White House, were not innocent of crimes against God due to their position(s) in world economics, the military, and politics. Needless to say, these conflicts offered ammunition for critics of religion. Atheists argued that religion was the problem without fully interrogating the fact that much of the genocide in the 20th century was led by atheistic regimes; American Christians who came out of the Scotch-Irish and southern roots of Protestantism exploited the idea that Islam, as Billy Graham's son, Franklin, argued, was an "evil religion." George W. Bush joined in by speaking of the Crusades. Bush later apologized for these remarks and emphasized that the "War on Terror" was not against Islam per se, which he argued was a religion of "peace," but that extremists had used the religion of peace for their evil ends.

In a sense, North America woke up to globalization on September 11. All the factors that facilitate a world economy focused attention on that one event. Modern transportation that allows for global commerce was affected, and modern communication that brings the world together suddenly brought the world too close. In particular, the military might and capacity of the United States had to be rethought with regard to whether or not having bases in Arab/Islamic countries was wise or expedient. Governments that supported the spread of democracy while gaining most of their energy resources from nations that lacked forms of democracy had to come to grips with these contradictions that were now on fire in front of them.

Perhaps the greatest shock to secular elites in North America was that in a world suffused with the habits of globalization—sophisticated technologies, modern markets, and split-second communication—an act ostensibly motivated by religion had arrested the world's attention and brought "business as usual" to a halt. One reaction, as we have seen, was to push for a return to a naked public square; yet this secular answer, in light of the religious traditions of North America, had little political or cultural impact. In the United States in particular, much of the populace distrusts secularists. Empirical data have shown that of all characteristics, the last thing that Americans find acceptable in a candidate for the American presidency is atheism. Indeed, instead of less religion in North America, the continent seems to be experiencing an acceleration of it. The Liberal Party in Canada has been in

disarray, as is evidenced by that fact that the recently elected prime minister, Stephen Harper, has a relatively conservative social perspective. Contemporary Canadian politics is marked by fragmentation and internecine conflict, while in the United States, some feared and others looked forward to a return to religious politics in the person of George W. Bush. So globalization, rather than pushing it to the sidelines, has empowered religion, at least momentarily.

Religious Politics and Fragmentation

Thus, two forces are headed toward one another in the globalized context of North America: a fragmented cultural scene combined with a revived religious politics. In terms of fragmentation, in both Canada and the United States regional differences now matter more than ever. Mark Silk and Andrew Walsh's work concerning these differences between religion and politics in the United States makes this point. The U.S. presidential elections show dramatic differences in the regional voting habits of Americans, with the South and, to a lesser extent, the Midwest supporting the Republican Party and the Northeast and the West supporting the Democratic Party. We know from history that the religious and political folkways of the Southern Crossroads and the South are deeply rooted in White Baptist culture and mixed with strains of the Methodist Holiness tradition along with a rising charismatic movement, which supports a resolute prosperity gospel (to be blessed both materially and spiritually). Moreover, in this hotbed of religion there is a growing and potent relationship between a conservative Christian culture and the U.S. military. Indeed, White evangelicals share a coalition of Baptists, Pentecostals, Fundamentalists, and conservative Catholics that is the most loyal coalition of the Republican Party. At its heart is an agenda of moral values, the support of family, reproduction (conservatives now outreproduce self-identified liberal families by 2 to 1), and traditional social values that advocate against abortion and gay marriage in particular. Exemplars of this movement include Southern Crossroad leaders, such as James Dobson, originally from Louisiana and now head of the organization Focus on the Family; T. D. Jakes, the Pentecostal prosperity gospel African American

megachurch pastor, originally from West Virginia, now out of Dallas, Texas; and Joel Osteen, the Houston-based megachurch pastor and best-selling author of Christian self-help books. Dobson is by far the most politically active of the three, while Jakes and Osteen rarely, if ever, comment on political topics.

Perhaps the most critical figure in the contemporary American scene is Rick Warren, the pastor of the Saddleback megachurch in California and a best-selling author. Warren has differentiated himself from the Christian Right, as it came to be called in the 1990s. Unlike Pat Robertson and the late Jerry Falwell, he does not make his political affiliations obvious. Nonetheless, he has become the American evangelical that presidential candidates from both parties seek out, having moderated a nationally televised candidate's forum on religion and politics in 2008 between John McCain and Barack Obama. While Warren does not make his politics explicit, he has stated to his constituency in no uncertain terms that a "values voter" cannot support a prochoice candidate. Thus, for Warren, the Republican Party is by definition the "moral party," and it has been shown that an anti-abortion and pro-heterosexual marriage stance is a litmus test for many conservative Christians.

Thus, the religious politics of American conservative Christianity are now what has been called a new civic gospel. This is due to a set of related beliefs: (a) the United States is a Christian nation and should protect its Christian heritage, (b) Christian conversion is the way to solve social issues, (c) it is difficult to be a Christian and a political liberal, (d) the promotion of democracy around the world should be encouraged, and (e) evangelicals should advocate for economic, religious, and political liberty as well as, by extension of these last two, the war in Iraq. This is a powerful elixir of a robust and entrepreneurial American Christian conservative culture that, due to its values, partners with a market economy and wants to open new markets for economic, political, and religious reasons. When conservative Christians speak about the war in Iraq, they speak of it in altruistic terms: They are proud that their sons and daughters are giving themselves to protect the United States, they seek to expand freedom overseas, and they want to open up Islamic lands to Christian conversion. The caveat here is that while

this is a potent political gospel—a politics that is rationalized by religious principles—evangelicals are also suspicious of politicians, surmising that politicians desire to use evangelicals for their own purposes. Evangelicals are less interested in creating theocracies and even more deeply committed to a "moral culture."

To some extent, Canada is more European than American in temper and in demographics; it reacts to the religious politics of the United States with disdain and even indifference. There are very few evangelicals in Canada, particularly in comparison with the United States, though some of the Christian conservative social values are bubbling up from the southern parts of the central provinces, where evangelicals are making inroads. Church attendance in Canada, however, mirrors the levels of Europeans rather than Americans, with 15% for Canada and 35% for the United States. Moreover, the importance of religion in Canada approximates that in Europe, with 30% of Canadians claiming that religion is important compared with 60% in America. Canadians simply take their religion less to heart and have little interest in its political implications. In this way, they are more like the liberal and progressive wings of the American Protestant and Catholic churches. Indeed, both of these latter groups strongly reject the idea that evangelicals are the only ones with moral values. To be sure, religious liberals, whether Christian or Jewish, advocate for what they call "moral choices," supporting the abortion rights of women as well as backing homosexuals and their legal rights to marriage and religious ordination. The Unitarian Universalist congregations, though very small in relative terms within the United States, mirror the United Church of Canada in supporting abortion rights and gay rights. Nonetheless, leading liberal religionists are nearly impossible to identify as public figures in North America.

In the mid-20th century, the liberal Americans Reinhold Niebuhr and Paul Tillich were on the cover of *Time* magazine, but today, liberal religious leaders are nearly invisible on the national scene. When talk shows want a representative to talk on religion, liberals are rarely represented. In part, this is because of the growing strength of conservative Christians in American culture and the growing assumption that Christianity *is* American conservative culture. Perhaps more important, despite the growing influence

of conservative Christianity, the bottom line is that North American culture has moved and continues to move toward more liberal, and indeed secular, values. The separation of church and state has continued apace despite the fact that faith-based initiatives do arise. Moreover, gay rights have gained acceptance, particularly along the coasts in the United States and in the Canadian legal structures. Abortion is legal across North America, and this right seems secure. Indeed, on public policy issues dear to their hearts, liberal religionists and secularists have won the day. In this sense, the rise of a religious politics is significant but not definitive.

The Future of North American Religion and Globalization

Predictions are always dangerous; nonetheless, it appears certain that globalization is here to stay. Open economic and cultural markets are the backbone of market capitalism; communication, travel, and technology show no signs of slowing and are bound to increase exponentially. What appears on the horizon in the North American situation is a growing fragmentation of religious subcultures and, perhaps more ominously for civic peace, the growth of conservative Christian enclaves and more aggressive secular and atheist subcultures. Neither group is dangerous in and of itself, but each shows an interest in pushing its agenda. In this sense, on occasion, they reflect a Manichean worldview that portrays the world in either/or terms, with good and evil confronting one another. In a world that is so diverse and complex, easy answers and superficial labeling are not helpful. Globalization was thought to be the solution since it would lead the world into a secular and rationalized peace. But, clearly, religion does not seem to be going away, and the forces arrayed against it seem to be growing more militant as well.

In the midst of the recent cacophony of religious conflict and civic tension, the 2008 election of Barack Obama as president of the United States was a remarkable event, in that he is widely recognized as embodying many of the cross-boundary qualities of this period of globalization. Whether as president he lives up to his label as a “transformational candidate” is yet to be seen; the religious and nonreligious subcultures of North America are difficult to reconcile, and deep tensions remain.

But the test of any culture is how it manages its divisions. North American culture continues to accommodate the waves of globalization, and some may hope that the tides of secularization are on the rise, but clearly, we have not heard the last of North American religious folkways.

NORTHERN IRELAND

Politics, religion, and society in Northern Ireland are so deeply intertwined that it is virtually

impossible to discuss issues of religion and society without constant reference to the ongoing political conflict. The creation of Northern Ireland as a six-county region of the United Kingdom (as opposed to the nine Ulster counties) in 1921 was itself based on a religious headcount, since the unionist aim at the time was to ensure a Protestant-Catholic ratio that would guarantee Protestant-unionist political domination in the long term. There had been significant political, social, and cultural differences in the past between members of the Church of Ireland, Presbyterians (who were mostly represented in the northeastern counties of Ireland and thus came to be the largest Protestant group in Northern Ireland), and members of other Protestant denominations, such as the Methodists or the Baptists, but the rise of cultural nationalism in Ireland in the 19th century and its association with Catholicism led to a strategic regrouping of a majority of Protestants under the banner of political unionism, which logically persisted in Northern Ireland when the region was created. This also had clear social implications, with the perpetuation of religious segregation in various areas of society, including housing and schooling, on the basis of a Catholic/Protestant divide.

The sectarian conflict that erupted in 1969 had essentially political and social roots related to the Protestant-unionist domination over the Catholic-nationalist minority. The measure of peace that has been achieved since the Good Friday Agreement in 1998 with the setting up of a power-sharing government has not put an end to the high degree of religious segregation in the region, with so-called mixed marriages still being quite rare and less than 5% of children attending integrated schools. In some ways, the celebration of cultural traditions and differences that came to be part and parcel of the peace process has further entrenched the division of Northern Ireland society into two communities, despite the comparatively high degree of cultural homogeneity among Catholics and Protestants in the region.

As in the Republic of Ireland, while weekly church attendance has fallen for all religions in Northern Ireland in the past decade, it remains exceptionally high by European standards, and the pace of secularization has been much slower than in Great Britain, although there has been a moderate shift toward more liberal attitudes to issues of family and sexual morality among both Catholics and

Protestants. Again, as in the Republic, there has also been a significant increase of people who describe themselves as having no religion—up to 11.5% of the population in 2005. In sharp contrast with both Great Britain and the Republic of Ireland, the number of people describing themselves as being of a religion other than either Protestant or Catholic is still very small—less than 0.5% according to the 2001 census, which did not provide for specific religious affiliations for these minorities.

NORTHERN MARIANA ISLANDS

The Northern Mariana Islands (legally known as the Commonwealth of the Northern Mariana Islands) is one of two U.S. insular areas (an area that is American territory but not one of the 50 states) that occupy an important area of the Western Pacific. It is made up of 15 islands and is approximately 75% of the way between the state of Hawai'i and the Philippines. The primary religious belief is Christian, with most believers following Roman Catholicism.

Among the immigrants moving to the Northern Marianas, most consider themselves Catholic. The majority of social pastimes focus on the Catholic Church and its sacred celebrations, including yearly holidays in reverence of each town's patron saint. In addition, there are a number of Protestant institutions, including many of the mainline denominations found within the United States, such as,

Baptists, Methodists, Presbyterians, and Seventh-Day Adventists. The Church of Jesus Christ of Latter-Day Saints can also be found in the Marianas. The Catholic diocese of the Marianas is headquartered in the United States and was originally a section of the archdiocese of San Francisco.

Although a great percentage of the populace subscribe to Christian beliefs (approximately 85%), many of the indigenous beliefs are still extant, including the worshipping of family members, or *taotaomo'na*—ghosts that are thought to dwell in specific trees and other unusual locales in the various forests. Chamorros (the natives of the Marianas) feel that their ancestral kin have inhabited the islands since time began. Moreover, they believe that the islands are the axis of the cosmos—that is, humanity originally started in Guam. Catholic priests evangelizing the natives strove to eliminate the various customs of the *makahna*, an individual who served as a mediator between this world and the spiritual one, but some may still be found throughout the Marianas. One religious conviction that has continued is the belief in the continuation of an individual's soul outside the physical realm. The Chamorros celebrate All Souls' Day in recalling their dead kin by holding commemorative activities and beautifying their burial places with plants, candles, pictures, and other reminders of the person's life on earth. Although Christianity is the dominant religion, many natives never completely gave up the traditional beliefs.

Roman Catholic beliefs have profoundly influenced life on the Northern Mariana Islands. Matrimony is a sacred relationship between two people who love each other, with both husband and wife remaining monogamous. Most adults get married and have large families. Newlyweds have the option of staying with the bride's family until the birth of their child, at which point the couple move out on their own.

NORWAY

With a population of 4.7 million, Norway has made the transition from an industrial society to an information and welfare society with an oil-based economy. The large majority of Norwegians continue to be members of the national Lutheran church, which has the King of Norway as its head, but there are trends toward more diversity in the religious landscape.

Since the 1970s, a growing number of Norwegians have moved away from the Church of Norway. From 1974 to 1999 membership went down from 93% to 87%, infant baptism from 96% to 79%, confirmation from 93% to 72%, and church weddings from 84% to 54%. Some have joined other churches, some remain outside any religious community, and others have joined the growing Norwegian Humanist Association (*Human-Etisk Forbund*), which had 80,000 members as of 2007.

Parts of the decline in church membership can be explained by changes in the Norwegian population due to immigration. In 2007, almost 9% of the population were members of faith communities outside the Church of Norway, and this number continues to grow. The Christian church that is experiencing the most growth is the Roman Catholic Church (51,508). However, the largest community of faith outside the church is Islam (79,068). Buddhists have 10,753 members; Hindus, 4,098; Sikhs, 2,444; and Jehovah's Witnesses, 14,756. The new religious diversity has led to changes in public policies. The traditional course in Christianity in public schools has been replaced by a new interfaith course. Although all registered religious communities, including the Church of Norway, receive an equal amount of public funding based on membership, the Church of Norway has maintained a privileged position in the military, prisons, and public hospitals. Thus, ties between church and state are under pressure, and there are calls for reforms.

Most Norwegians consider religion to be a private matter. According to a 1998 survey, 76% believe in God or a higher power, but only 10% attend church once a month or more. The content of the Christian tradition has changed to a more subjective turn, even among religious professionals. The older generation relates religion to duty and morality to religion and the law. The younger generation connects religion to their true inner self and morality to individual responsibility. Gender also structures religion. Women are more religious than men, and the two genders speak of religion differently. Women tend to see religion as a source of meaning, whereas many men view it as a moral factor. With the growing diversity and generational divide, the Norwegian religious landscape is undergoing change.

Norway's tolerant acceptance of multiculturalism was the target of a horrendous terrorist attack by Andres Behring Breivik on July 22, 2011. Breivik killed 8 in a bomb blast in downtown Oslo and 69 in an automatic weapon assault on a nearby youth camp. According to his 1500-page manifesto posted online shortly before the attack, Breivik imagined that he was precipitating a new Christian crusade against the rising presence of Muslims in Europe permitted by liberal social policies. During the national grief that followed the attacks, Norwegian leaders encouraged the nation to respond by

renewing its pledge to support the multicultural acceptance of people of all faiths, including Muslims.

OKLAHOMA CITY FEDERAL BUILDING BOMBING

At 9:02 a.m. on April 19, 1995, downtown Oklahoma City, Oklahoma, became the site of the largest single act of domestic terrorism in U.S. history. The bombing was planned and executed by Timothy McVeigh and Terry Nichols, both veterans of the Gulf War, who, like many reactionary domestic terrorists, believed themselves to be at war with the U.S. government. Federal workers were, in their minds, casualties in an ongoing war, not innocent victims of an act of mass murder. McVeigh followed the “cosmotheist” beliefs advocated by William Pierce, author of McVeigh’s favorite book, *The Turner Diaries* (written under the pseudonym of Andrew MacDonald), which portrayed a grand war in which a secret group of true Christians, “The Order,” would lead a revolution toward the restoration of Christian civilization in America. Acts of terrorism were meant to be the first salvos in this imagined cosmic war. The detonation of a 4,800-pound ammonium nitrate fuel oil bomb in a truck parked at the north entrance of the Alfred P. Murrah Federal Building was enacted in a way that almost exactly replicated the description of a fictional terrorist attack on the FBI (Federal Bureau of Investigation) building in *The Turner Diaries*. The blast killed 168 people, injured approximately 850, and left 30 children orphaned, more than 400 people homeless, and 7,000 people without a workplace.

The bombing immediately became a worldwide spectacle of horror, as the communications media enfranchised people to become part of an international bereaved community. In an era of deeply divisive, often violent clashes of identity politics, bereavement seemed to transcend divisions of race, class, gender, religion, and perhaps even national identity. In the aftermath of the bombing, a powerful icon, “the fireman and the baby”—fireman Chris Fields cradling the bloody and battered body of 1-year-old Baylee Almon—symbolized the particular horror of the killing of infants and children.

The bombing engendered an immediate outpouring of spontaneous memorial expression, as if memorials could somehow contain the impact of the atrocity. Memorial expression began among rescue and recovery workers during their painstaking efforts in the building’s rubble and spread to people gathered behind a fence line that separated them from the site. Eventually, the fence that surrounded the “footprint” of the Murrah Building became an important memorial site as family members offered public eulogies in posted materials of remembrance and visitors brought spontaneous and planned offerings. When it became public knowledge that materials on the fence were being archived by the Oklahoma City National Memorial Foundation, “planned spontaneity” sometimes occurred. Instead of a poem on a piece of paper appearing at the fence, there would be a laminated and copyright poem. Or a poem that contained the message “For copies, please write to . . . ” appeared. During a “fence-moving” ceremony, the day after groundbreaking for the outdoor memorial on October 26, 1998, the chain link

fence was removed, but sections of it were incorporated into the final memorial design.

Spontaneous memorialization was an important element in the democratization of memorial expression, suggesting the influence of the Vietnam Veterans Memorial in Washington, D.C., dedicated in 1982. There, visitors made the memorial their own by touching the wall, tracing names on paper from the wall to carry home, and leaving material traces of their convictions—in essence consecrating the site through individual acts of memorialization.

In Oklahoma City, a formal memorial process began several months after the bombing, even as people from many countries sent unsolicited suggestions for a permanent memorial. The process was also evidence of the democratization of memorial expression. Family members of those murdered and survivors of the bombing played a vital and influential role in the selection of the permanent memorial and in the creation of the narrative of April 19 presented in the Memorial Center.

There were numerous “razor’s edge” issues to engage: For example, should Fifth Street, a busy one-way street in front of the Murrah Building—on which several bombing victims died—be closed forever so that a permanent memorial area would not be divided by an active thoroughfare? If survivors were to be remembered by name in the memorial area, who exactly qualified as a survivor? What about those injured but not in need of hospitalization or those who worked in the Murrah Building and lost many friends but were not in the building that day? The difficulty of resolving this issue is one example of the importance of memorial hierarchies: who gets remembered, how they get remembered, and where they get remembered. Such memorial precision is seen as a debt owed to the dead.

In addition to memorial activity, the bombing was interpreted through various narratives. There were at least four narratives:

- A *narrative of civic renewal*—“Yes, it was horrible, but”: This story celebrated the courage and kindness of thousands of people in Oklahoma City and beyond. It asked people to move beyond the atrocity to recommit themselves to a reinvigorated civic culture.
- A *redemptive narrative* that mobilized various religious resources to situate the bombing within enduring responses to evil.
- A *therapeutic narrative* that spoke with the voice of a “witness” and too often transformed victims of a terrorist attack into “patients” in need of therapy, reduced to victims of posttraumatic stress disorder: The therapeutic narrative too often assumed term limits for “healthy” grieving and assured people that there was a predictable process to measure their progress toward “closure.”
- A *toxic narrative* that revealed, for example, how the bombing continued to afflict the bodies and spirits of many people—disabling injuries, intense and enduring mourning, bitter divisions within families, and harsh treatment of residents of Middle Eastern descent and African American Muslims: People “inhabited” one or more of these narratives simultaneously. As one family member observed, “All the narratives seem to live within my experience, some to greater or lesser degree, from day one to now.”

The Oklahoma City National Memorial was dedicated on April 19, 2000. Its emotional heart is situated in the 168 lighted empty chairs, each inscribed with a name, that rest on the site of the Murrah Building. The memorial is, in part, a protest against the anonymity of mass death, the reduction of a person to a number. Faces, names, and stories insist that these victims of violence will be remembered. The democratization of memorial process and practice, and the emphasis on the faces, names, and stories of those murdered, may be an enduring feature of the memorial landscape of violence.

OLCOTT, HENRY STEEL (1832–1907)

Henry Steel Olcott, as cofounder and first president of the Theosophical Society and as an advocate

for Buddhism in both East and West, was a highly influential figure in the globalization of religion.

After investigating fraudulent suppliers for the Union Army during the Civil War, Olcott became a lawyer and a journalist in New York, also maintaining a long-standing interest in spiritualistic phenomena. In 1874, he met the Russian émigré Helena Blavatsky at the site of such alleged activity in Vermont. The next year they, together with several like-minded companions, founded the Theosophical Society. Designed initially to study ancient and modern mysteries, theosophy also promoted a primordial ancient wisdom believed to underlie the religions and philosophies of the world. In his 1875 inaugural address as president of the Society, Olcott referred to the great battle of his day between science and religion, proposing as a third way a return to the wisdom of the ancients, which better integrated spirit and matter.

In 1878 to 1879, Olcott and Blavatsky sailed to India, a land in which they believed that hidden wisdom still lived. There they launched a magazine, *The Theosophist*, and established an international headquarters for the Society. As Olcott tirelessly traveled and lectured, he and Blavatsky, with their respect for the spiritual heritage of India in the heyday of imperialism and Christian missionary endeavors, gave a definite early impetus to the “Hindu Renaissance” and the independence movement. In Sri Lanka, Olcott and Blavatsky “took *pansil*” in 1880, formally becoming Buddhists (the first known Westerners to do so). Olcott was soon advocating on behalf of Sinhalese Buddhists before colonial authorities in both Sri Lanka and London, at the same time seeking to modernize that faith. He wrote a *Buddhist Catechism* (1881), designed a Buddhist flag, and journeying as far as Japan sought to encourage Buddhist ecumenism. While his understanding of the Asian faith and his efforts to update it have been characterized as “Protestant Buddhism,” they certainly helped the ancient religion to become a contender in the world marketplace of ideas. At the same time, the Theosophical movement under Olcott’s guidance did much to advance Western knowledge of, and appreciation for, Hinduism and Buddhism. Olcott remains a national hero in Sri Lanka.

Called “the White Buddhist,” Olcott was a sort of reverse missionary who brought Yankee energy and Victorian single-mindedness not to Western expansionism but to the cause of global respect for the spiritual East. Though more an activist than an intellectual, he was definitely a pioneer in the globalization of religion.

OMAN

Oman is an Arab country located in the southeastern part of the Arabian Peninsula, surrounded by the Arabian Sea, the Gulf of Oman, the United Arab Emirates, Saudi Arabia, and Yemen. It has been an independent state since the 18th century and ruled by a sultan—Qaboos Bin Said al-Said—since 1970.

Almost the whole population (2,904,165 in 2004) is Muslim, consisting of the Ibadi, Sunnī, and Shi’a communities. The Ibadi Muslims constitute the largest group—between 40% and 75%. They were named after Abdallah Ibn Ibad al-Tamimi, an early Muslim scholar. Ibadi Muslims, seen by the Sunnī Muslims as an evolution of Kharijism, an early schism in Islam, have been present in Oman since the end of the seventh century. They also live in small communities in Algeria (Mzab) and Tunisia. Omani traders introduced *Ibadism* in east and central Africa (Tanzania, Kenya, Burundi), where they have built their own mosques.

The Ibadi Muslims give particular importance to the way of selecting the leader of the *Umma*—the Muslim community: In theory, any Muslim can be a candidate if he is a male, is mentally and physically fit, and has a good knowledge of religion and politics. According to tradition, the selection should be done by consensus among the community. Their rituals, mosques, and institutions are, however, very similar to those of Sunnī Muslims.

The Sunnī Muslims in Oman follow the Hanafi rite. The Shi'a Muslims (*Ithna'ashariyya*, or "Twelvers") are mainly of foreign descent and have been present for centuries in the Sultanate: 'Ajam (Iranians), Bahraini, Lawatiyya (from Sind, Pakistan). They are now called Omani.

Besides the Omani population, there is a large community of immigrants, coming mainly from Asia: India, Bangladesh, Pakistan, Sri Lanka, and the Philippines. The majority are Sunnī and Shi'a Muslims, but there are also some Hindus, Christians, Buddhists, and Sikhs. A smaller community consists of European expatriates working in the petroleum industry and the military; most of them belong to the various Christian communities. The foreigners have relative religious freedom, and several churches and temples are to be found in the city of Muscat as well as in the important cities of the country.

Among the non-Muslim cults, Hinduism occupies a special place, historically speaking, since the country has sheltered Indian communities for centuries—for instance, the Banyan, who had their own temples in the country, were an important component of Omani economy until the end of the 19th century, funding some of the Omani trade caravans going to east and central Africa.

OPUS DEI

Opus Dei (or "Work of God") is a contractual association within the Roman Catholic Church dedicated primarily to the spiritual formation of laypersons who feel called to sanctify the secular world through their everyday occupations. Founded by the Spanish priest Josemaría Escrivá in response to a vision in 1928, the association has grown to more than 80,000 members worldwide. The vast majority of the members are laypersons, both male and female. The source of considerable controversy within the Catholic Church and sensational publicity outside it (e.g., in Dan Brown's novel *The Da Vinci Code*), Opus Dei has nonetheless enjoyed the support of both Pope Benedict XVI and Pope John Paul II, who approved its designation as a personal prelate in 1982 and canonized its founder in 2002.

As a personal prelate, Opus Dei is a new type of legal entity under canon law that can include clergy as well as both laymen and laywomen. Members are designated, following Spanish academic nomenclature, as supernumeraries, numeraries, and associates. Nonmember supporters are referred to as cooperators. Numeraries, about 20% of the membership, are celibate and live in Opus Dei centers. Male and female numeraries receive the equivalent of a seminary education and are the only ones eligible for key leadership roles within Opus Dei. Supernumeraries, who make up the majority of the members, live in their own homes. Many, but not all, are married. They receive spiritual direction from a numerary and typically go to an Opus Dei priest for confession. A small minority of both numeraries and supernumeraries are priests. The numerary priests typically provide full-time pastoral care to Opus Dei members; the supernumerary priests most often serve as diocesan priests.

Opus Dei members typically perform a series of traditional Catholic devotional practices, including daily Mass, the rosary, examination of conscience, visiting the Blessed Sacrament, and meditation on spiritual readings. These practices support their overarching spiritual goal of sanctifying their ordinary work in professions or in the home. In the understanding of Opus Dei, the religious is not set

off from the secular, life is viewed as a unity, and all of life can be viewed as prayer. Although numeraries have received the most popular attention, supernumeraries in many ways most fully exemplify Opus Dei's commitment to fostering lay spirituality in the world.

Although most Opus Dei members pursue work with no formal connection to Opus Dei, members sometimes come together to found institutions, known as "corporate works," that contract with Opus Dei for theological and spiritual guidance. Corporate works, such as hospitals, business schools, primary and secondary schools, vocational-technical schools, and student residences, have been established in Europe (Spain, Italy, England), Asia (Japan, the Philippines, Taiwan), Africa (the Congo, Nigeria, Kenya), and Latin America (Guatemala, Peru, Brazil). Though more than 40% of Opus Dei's membership are concentrated in Spain, there are substantial numbers in Mexico, Argentina, Italy, the United States, the Philippines, and Colombia as well. Opus Dei centers have been established in more than 60 countries. As an international association that promotes an intensified form of Catholicism within the context of everyday life, it wields influence beyond what its numbers might suggest and is one of a number of new ecclesial movements that promise to have an outsized influence on the shape of Catholicism in the 21st century.

ORIENTALISM

The term *Orientalism*—the study of the cultures of the East—has no single fixed meaning and historically has gone through various phases. In earlier discourse, it had a wider scope and was seen in a positive light. It was associated with the substantial contributions made by Western scholars in the field of Arabic, Turkish, Indic, Hebraic, Chinese, and Persian studies. It was the late Edward Said's groundbreaking 1978 work *Orientalism* that led to the term becoming a highly contentious one. In Said's view, Orientalism is not simply about the study of the East, it is about the West having power over the Orient by representing, codifying, and classifying knowledge about other cultures. Although there were other European and Islamic scholars who highlighted this aspect, it was Said who was largely instrumental in creating an awareness that the Western study of other cultures and production of oriental knowledge was not an innocent activity and that it was not free from political ramifications. Said was highly critical of classical Western portrayals of Arabic culture and Islam as depraved and effete. Although Said's study has mainly to do with the Near and Middle East in the context of colonial domination in the 18th and 19th centuries, its application extends to South and East Asia and has made an enormous impact on various academic disciplines, including religion. Said's own views underwent subsequent revisions and take note of the heterogeneity of cultures and the active agency of the indigenous people.

There are several marks of Orientalism. First, it is discernible in the assumption that the Western notion of "religion" is a universally applicable category and that Eastern religious traditions could be situated within it. Such a conception of "religion" is deeply rooted in Enlightenment notions such as rationality, modernity, and linear progress as well as in 19th-century Western Protestant theological presuppositions. For instance, Buddhism is seen as a version of "Hindu Protestantism" and Jainism as a form of "Hindu Calvinism."

Second, it is seen in the privileging of certain ancient texts as authentic representations of religion, to the exclusion or marginalization of other legitimate forms of expression of religion through mediums such as dance, music, and art. In the case

ORDER OF THE SOLAR TEMPLE

See Solar Temple Order

of Hinduism, Sanskrit texts were given preference, and other significant texts such as the Tamil Veda were ignored, and in the case of Buddhism, Pali texts were regarded as more genuine than Tibetan or Chinese Buddhist texts. Orientalists believed that true “Hinduism” or “Buddhism” was embedded in the ancient texts and a restoration of their original purity would cure these traditions of their current degenerate state. They also assumed that an accurate knowledge of ancient classical texts would give them insight into religious customs and practices and would assist in the governance of natives. A clear case of textualization was apparent in the publication projects commissioned by the East India Company, such as the translation and codification of Hindu laws by the Orientalist judge William Jones and the production of the *Sacred Books of the East* series by Max Mueller. The underlying assumption behind these textual ventures was that the written word was superior to orality and signified modernity. These textualization enterprises signified the link between knowledge and power, which, although it had been explored by earlier scholars, has become a crucial issue since the publication of Said’s *Orientalism*.

Third, Orientalists advanced the notion of binary thinking—the East as mysterious, passive, effeminate, irrational, ahistorical, and decadent and the West as comprehensible, active, masculine, rational, historical, and progressive. Such classification continues to be replicated in current geopolitical discourses.

Most Orientalists worked on the premise that they were more capable of representing the Orient than the natives themselves. Ironically, the Orientalist “discovery” of a glorious past had an unexpected result: It provided the cultural ammunition that led, in many cases, to anticolonial resistance and religious nationalism.

OTHER (THE OTHER)

The idea of “the other,” sometimes capitalized as the Other, and the closely associated idea of a “primary” or “constitutive” other entered scholarly discourse through continental philosophy and is a core concept of critical theory and cultural studies, especially subfields such as race theory, sex and gender studies, postcolonial theory, queer theory, and animal studies. To speak of the other is to imagine an opposition between “the same”—for example, the same kind of subjectivity, person, group, gender, sexual orientation, and so on—and “the other” (kind of subjectivity, person, group, gender, sexual orientation, etc.), in which the other plays a crucial role in constituting the same. Thus, one can speak, on the one hand, of the other in general—meaning any being who confronts “us” (the same) as different—or, on the other hand, one can speak of particular, historical others: the black American as the other of the white American, the Jew and Muslim as the other of the European Christian, woman as the other of man, and so forth. As the examples in this list suggest, discourses on the other are frequently deployed to identify and critique the way in which a dominant group justifies the subordination of those designated other. Thus, “the other” is often, though not necessarily, an oppressed other.

Simone de Beauvoir’s analyses of woman as other and Emmanuel Lèvinas’s theorization of the other as one who precedes me and calls me into being through an ethical relation are two of the most influential treatments of the other. Both

de Beauvoir and Lèvinas are critiquing and developing an understanding of otherness developed by Hegel in his well-known account of the master-slave dialectic. In de Beauvoir's *The Second Sex*, a foundational text of feminist thought, she argues that the relation of woman to man can be likened to the relationship Hegel imagines between the slave and the master in that men, like the master, understand themselves as the absolute human type, thus judging women by the standard of the male human and thereby finding them inferior.

Lèvinas takes up the theme of otherness or alterity in part to argue that ethics rather than a theory of being should stand at the beginning of philosophy. The other as theorized by Lèvinas is not simply a historical other (say, my literal neighbor) but a phenomenological structure situated in a "dimension of height" that issues the primordial expression "You shall not murder." For Lèvinas, the "I" does not first appear and then go out into the world to encounter others, nor is there an inner self free of obligation to the other. Rather, to be a human being is already to be obligated to others.

De Beauvoir's, Lèvinas's, and other reflections on the other have informed a number of influential philosophical categories, including Judith Butler's treatment of gender, Jacques Derrida's articulation of "*différance*," and Julia Kristeva's theorization of "abjection."

OTTO, RUDOLF (1869–1937)

Rudolf Otto was a German Protestant theologian and philosopher of religion active in the first third

of the 20th century. He is best known for his book *Das Heilige* (1917), translated into English as *The Idea of the Holy*. He also compared Indian religions with Christianity, translated religious texts from Sanskrit to German, founded a museum of the world's religions, and was active in both state and ecclesiastical politics. Although a systematic theologian by profession, he had his greatest impact on scholars of the comparative study of religions.

Intellectually, Otto was indebted to the theologian Friedrich Schleiermacher and the Kantian philosopher Jakob Friedrich Fries. Like Fries, he stressed the cognitive role of "feeling," an intuitive awareness of truth. According to him, the distinctive mark of religion was "the holy," a complex category involving human conceptualization but also transcending it. Insofar as the holy transcended human powers of thought, it was nonrational and accessible only to intuition. For this aspect of the holy, Otto coined the term *numinous*, and interest in his thought has centered largely on it.

As a category of understanding, the numinous has three characteristics: *mysterium*, *tremendum*, and *fascinans*. It is intuited—corporeally as well as emotively—as "wholly Other," terrifying or awe inspiring yet nonetheless attractive. Each of these characteristics has a rational counterpart: the absoluteness of divine attributes, the holy wrath of God, and divine grace. As a category of value, the numinous is intuited as possessing absolute worth, in contrast to the utter unworthiness of human beings.

According to Otto, both the numinous and the rational aspects of the holy as well as their conjunction are given a priori. That is, awareness of the holy is a universal mental capacity or predisposition merely awakened by sensory experiences. It is impossible to explain where this capacity comes from; it is only possible to clarify the category, so that on encountering it, people immediately recognize its truth. The history of religion consists of the progressive rationalization and moralization of the numinous, leading to its supreme embodiment, Jesus, and the supreme religion, Christianity.

In Otto's day, Protestant theologians actually preferred Karl Barth's emphasis not on universal mental structures but on a wholly other God who addressed human beings through His word. Otto's

successors in the comparative study of religion largely rejected his Kantian framework and adopted his thought as a variety of phenomenology: It provided a highly insightful description of religious experience. In this form, Otto's thought remained highly influential through the 1960s. It is occasionally still encountered today.

At the end of the 20th century and the beginning of the 21st century, cognitive scientists worked in the opposite direction. They rejected Otto's account of the numinous as a necessary component of religion but returned to the topic of the universal mental structures from which religion arises, seeking to explain how these structures produce religion.

OTTOMAN EMPIRE

The Ottoman Empire arose in the beginning of the 14th century and ended with the abolition of the Sultanate in 1922 by the founders of modern Turkey. The establishment of the Ottoman state coincided with the collapse of the Seljukid Empire around 1300 following the Mongolian invasion of Anatolia. The Ottoman state began as a frontier principality of the Turks of Anatolia and became an empire one and a half centuries later with the conquest of Constantinople by the armies of Sultan Mehmed II. The founders, Osman and his son Orhan, and the ruling elite of the state were Muslims, and the state adopted the Seljukid Islamic traditions and cultures in the beginning and used the services of the men of religion in the Seljukid mosques, madrasas (schools), and *evqafs* (religious endowments) for the unification of the people of Anatolia around

the Ottoman state. Religious matters were carried out by the Islamic scholars (ulema) who were trained in the high cultural centers of the Seljukids. The first viziers of the state were also from among the Ottoman ulema.

Although, owing to a paucity of primary sources, there is ongoing debate among scholars about the foundation philosophy of the Ottoman Empire, most historians claim that a holy war (*gaza*) spirit moved the Ottomans to expand their domain toward the Byzantine Empire, the center of Orthodox Christianity. The *gaza*, the war for the expansion of Islam, outlined the foundations of legitimacy of the Ottoman sovereignty in the Balkans. Therefore, it was ultimately natural for the Ottomans to implement Shari'a (divinely ordained Muslim law) in their legal affairs, since the expansion of Islam was the basic ideology of the state. The Ottoman Turks identified themselves as Muslims, and their Muslimness became more powerful than in the previous Islamic empires, especially as the sword was unified with faith when the Ottoman sultans acquired the Caliphate. The Ottoman expansion toward the west provided them with the title of Turks, the sword of Islam. As the Ottoman rulers adopted the term *sultan* from the 'Abbāsids and the terms *padishah*, *shah*, and *hudavendigar* from the Persians, they established the sultan's sovereignty over the Caliphate's domain after the conquest of Egypt and the capture of Caliph Mutawakkil in 1517.

Foundations of Ottoman Social and Legal Structures

Having been influenced and shaped by the old Turkish customs and by the Islamic empires' traditions, the Ottoman worldview depended largely on Islamic principles. The Ottoman sultans were obliged to provide justice to their subjects, since, according to religious thought, the subjects were entrusted to the sultan, and the sultan, as the religious authority, was the shadow of God on earth. The authority, legitimacy, and highness of the sultan depended on his just exercise of power. Ottoman documents elaborate this relationship with the principle of the circle of justice, according to which justice can be provided by power; if the sultan is just, then the subjects are provided with

order, which prepares the ground for the subjects to produce more, and as such, the subjects attain well-being; those better-off subjects pay more taxes, taxes increase the power of the treasury, and the sultan can have a bigger army and more power. The foundation of the circle of justice was the full obedience of subjects to political authority, since this was a religious duty as well. For both the complete obedience of subjects and the justice of the sultan to be mutually provided, Ottoman society was separated into communities according to their settlements in different spaces, occupations, religious denominations, and sects.

The Ottoman political structure, its legal system, and social organization had a dual formation. On the one hand, these structures were bounded by religious law (the Shari'a), and on the other, the Ottoman sociopolitical organization was ruled by the Sultanic law and its institutions. The religious law provided rules and regulations in the civic affairs of Ottoman society, as it had done with the other political organizations in the Muslim world; the Islamic Shari'a organized social and family affairs and had inheritance and penal codes. The Ottoman legal system depended on Islamic law, based on the Qur'an, the holy book of Islam, and the Hadith, the Prophet's sayings and doings in his lifetime. The Qur'an and the Hadith are the two most important sources, implying certainty over legal issues. Another source, the resolutions and interpretations of the Prophet's colleagues and the first four Caliphs over theological, moral and ethical, private, legal, and administrative issues, provide Islamic law with additional and mostly interpretative doctrines. Finally, the legal principles and resolutions established by Islamic scholars by comparing issues against original sources and cases are also among the sources of Islamic law. Ottoman positive law depended on the sources of Islamic law. Molla Husrev Efendi, an Ottoman scholar of law, codified Islamic laws in his *Dürrer-ül Hükkam fi Şerh-i Güreer-il Ahkam* in 1472 and submitted his work to Sultan Mehmed II to be implemented together with the Sultanic law. Among the basic sources of the Ottoman Islamic law is the *Multak al-Abhur*, written by Ibrahim Halebi during the reign of Suleyman the Magnificent in the 16th century. The book provided Islamic sources for the political order of the state and its legal and organizational structure and became a

classical source for Ottoman law. *Multak*, defined in the 18th century as the *Corpus Juris Turcicum*, was the basic book of the Ottoman courts. The judges also used to use the collections of fatwas, the codes that were prepared by the legal authorities, the muftis, or by Şeyhülislam, the top official in legal matters.

Ottoman law moved from the pragmatism of the early period of its foundation to the scholasticism of its classical age. Classical Islamic law was basic in legal affairs of the private sphere, but it had limited procedures and rulings in the public law. The public law was ruled by the codes (*kanunnames*) issued by the sultan according to the circumstances. The origins of the Sultanic codes were the old Turkish laws, customs and traditions, and the legal procedures and customs of the communities under the Ottoman jurisdiction. There were three types of canons: (1) the Sultanic legal decrees issued for specific matters constituted the main body of Ottoman codes, (2) the *firman*s (legal regulations) for a certain group of people or for a specific region were used to make the second type of Sultanic codes, and (3) those laws that could have been applied to all were the third type of imperial legal regulations.

Education

Ottoman education was also organized along religious lines. The sciences were classified according to the theory of genesis in Islamic mysticism. Mysticism provided four basic steps in Islamic sciences: first, written sciences referred generally to writing, the styles of writing, and writing instruments; second, verbal sciences were composed of Arabic, Arabic grammar, phonetics, etymology, syntax, lexicology, rhetoric, literature, poems, prose, and history; intellectual studies, formed of logic and dialectics, constituted the third category of educational sciences; and the fourth category, clerical sciences, was divided into two, logic and religious studies. The two types of logic studies were theoretical rational studies and applied logic; religious studies were formed by religious logic and applied logic. Religious logical studies were the most important of all religious studies, since the Ottoman madrasas generally taught the knowledge of the Qur'an, the Hadith, and their interpretative sciences—exegesis and the analysis of hadiths,

euphemisms, Islamic law (*fiqh*), and legal principles. Applied religious studies consisted of mores, morals and ethics, forms of worship, forms of etiquette, public regularity and decorum, and Islamic lifestyles. Knowledge in the Ottoman Empire was strictly religious, and the source of knowledge was religion, since the objective of all knowledge was the knowledge of God. Ottoman scholars were expected to achieve full acculturation, which could be reached through wisdom and self-examination, the two basics of Sufism.

Nicea became the home of the first Ottoman madrasa in 1331, a school that was given to the Muslim scholar Davud of Caeseria as his center of education. Education was carried out in lower and higher level schools. Religious education formed the basic curriculum in the madrasa system. Students who started their Arabic and math basics in the first level would obtain permission to pursue their higher level degrees from certain scholars for their education in Islamic law and interpretation in the higher school levels; therefore, the scholar was more important than the school they attended. The highest two levels of madrasas established in ca. 1550 in Istanbul were for Hadith and medical sciences. The students who completed their education with permission from certain scholars would enter into the hierarchy of scholars formed by teachers, muftis, and judges. The sultan's palace mostly brought scholars to its schools from Kayseri, Aksaray, and Konya or from religious centers as far as Iran, Turkistan, Egypt, and Syria. Among those religious scholars were Alaaddin Tusi and Fahreddin, from Iran, as early as the 15th century. Anatolian scholars such as Mehmet Fenari, Ali Fenari, and Şeyh Bedreddin went to Arab, Persian, or Turkish centers of knowledge to complete their studies in Islamic law and interpretation of religious issues. Ottoman scholars generally visited the Turkish scholastic centers in central Asia, mostly Samarkand for mathematics and astronomy; some of them, like Sadeddin Taftazani and Sayyid Şerif Curcani, were already living in Turkistan under the Timurids. *Shaykhulislam* and the Anatolian and Rumeli *kazaskers* were the highest ranks in the Ottoman ulema, the officials dealing with legal and religious affairs. *Shaykhulislam* was not only the highest representative of religious law as the head of the religious scholars, but he was also the head of the Muslim community in the

empire; however, he exercised his authority in the name of the sultan. Schools, religious institutions, charity organizations, and public services were funded by the religious endowments (*evqaf*).

The Millet System

The Ottoman social organization, incorporating various religions, ethnicities, and languages, depended on the *millet* system. The millet order, like those of any other past multireligious empires in the region, was mainly based on the separation of different religious groups from each other and a legal status granted to each denominational community with specific communal rights and privileges. The members of monotheistic religions were considered *millet* (religious community; *ehl-i zimmet*) and gained legal status with an *ahidname* (permission) granting them protection within the social and political organization of the country. The Ottoman Empire also inherited its form of social organization from Islamic codes of life and adapted Islamic rules and principles of social life to its imperial system. The term *millet* (*milla*) was used to refer to religion, and the people of *milla* meant the true believers of Islam—the Muslims. The religions and religious communities of non-Muslim groups (Jews and Christians) were also recognized as *milla* in the Islamic as well as Ottoman traditions, since the term *milla* is used in the Hebrew Bible and in Aramaic texts in the sense of *word* or *utterance* and in some Christian texts as the Greek *logos*, the word of God, or science. The Qur'an also uses the term in this sense—the people who follow the divine word, the word of holy religious books. Therefore, the Ottoman tradition conceptualized non-Muslim groups as the people of *zimma*, which referred to non-Muslim groups under the protection of Islam. The religious communities protected their own respective identities and legal rights over other groups in the empire and practiced their religious, civic, economic, and social relations under the surveillance of the state.

The millet system was initiated as the social order by Sultan Mehmet II in 1454, immediately after the conquest of Istanbul by the Ottoman armies. With the expansion of the area under Ottoman rule and the establishment of the empire, various communities and many religious and

linguistic groups were unified under imperial jurisdiction. The Greek, Bulgarian, Serbian, Albanian, Vlah, Moldovan, Rutenian, Karaman Turkish, Croatian, Assyrian, and Arab Christian communities were placed under the authority of Patriarch Gennadius Scholarius as the Orthodox millet. The Armenian, Assyrian, Nestorian, Coptic, Georgian, and Abyssinian communities were placed under the Armenian millet in 1461 under the Patriarch Joachim. The exodus of the Jewish population from Spain and Portugal into the Ottoman Empire at the end of the 15th century required the empire to establish the Jewish millet under the authority of Chief Rabbi Moses Capsali. The Ashkenazi Jews and the Sephardic community, including the Balkan Romaiots and the Crimean Karaim Jews, established the Jewish millet of the Ottoman Empire. The millets were the basic administrative units within which Orthodox, Armenian, and Jewish communities carried out their administrative affairs within the state through the heads of their community organizations. This social order also provided the Ottoman communities with protection of their own culture, customs, language, and religions.

The millet system depended on religious faith, therefore it was ultimately comprehensive; it covered all the people of the same faith in the empire regardless of territorial distance. Thus, the Orthodox millet was composed of all Orthodox Christians, including the Greek, Arab, or Romanian communities. The Armenian community was divided into the Gregorian, Protestant, and Catholic churches. As such, the millet organization was simply based on religious faith, not on ethnic and/or national identity. Orthodox Greeks, Bulgarians, Arabs, and Serbians identified themselves, above all, as Christians, and Turks, Albanians, and Kurds, as Muslims. As all Christians and the Jews in the empire had religious and cultural connections to their own church or to the synagogue, all Muslims recognized the Shaykhulislam as their religious authority. But all the millet members were the political subjects of the sultan, who was the basis of the political order and had the right to tax them. Therefore, the common political identity was ultimately defined by state authority, though the base for the religious identity was the millet organization.

The religious communities were represented at the state level by the communal religious leaders at

the Patriarchates. The religious councils and local leaders were elected by their community members with the approval of the sultan. The election process gained more importance in the 19th century, when the representatives of local communities also became members of the local (municipal and provincial) assemblies. The millets had autonomous rights in their religious, cultural, and civic relations; however, all millet members were under the juridical power of the public judge (*kadi*) in matters related to public law, such as the penal code, security issues, or taxation. Sometimes in civic matters also, when the parties could not reach a compromise through their own communal leaders, the issue used to be solved by the *kadi*. The system created a unique relationship between the sultan and his subjects. The sultan was Muslim, but he was not a religious authority over his non-Muslim population, since all religious issues were dealt with by the religious leaders and religious institutions (the Patriarch and the Holy Synod) within the millet organization. The sultan, therefore, differentiated his own secular authority from the rights and duties of religious institutions and, thus, created a social order that depended on a kind of separation of powers. This separation prevented any conflict of interests among the millets. The sultan was not a religious authority for the members of the millets, but they accepted him as the lay ruler who guarded the just order, implemented the law, and even protected their interests within a Muslim empire at large.

The millet system remained as the basic foundation of the Ottoman social structure from the mid-15th century to the mid-19th century, when a new form of relationship was established between the subjects and the state by the new legislation of nationalities. The Ottoman Tanzimat (Reformation) regulations provided equality to Ottoman subjects regardless of religion, and the new legislation for each religious community was realized about a decade before the first modern constitution of the empire in 1876. The political, legal, civic, economic, and social affairs of the Ottoman communities were governed by modern laws. The Mecelle, the new civic code, and the new penal and commercial codes replaced the Islamic law in 1869. Non-Muslim subjects of the empire greatly benefited from the provisions of the new legislation for commerce, finance, and criminal issues during the

Ottoman modernization period. In the middle of the century, the non-Muslim religious establishment gained semiofficial status, the entry of non-Muslims into the Ottoman military service was recognized by a decree, and non-Muslim citizens of the empire took full advantage of serving in the palace and in the civil bureaucracy, especially in the foreign ministry, the courts, and the local administration. When the 19th century became the age of nationalisms within the Ottoman domain, the Serbian, Greek, Macedonian, Bulgarian, Romanian, Syrian, and Lebanese churches and their millets became the cradle of the development of nationalism in these communities. Islamism as a political ideology emerged in the 1870s not only to unify the Muslim communities and keep the empire intact against European political and economic expansionism but also to challenge the nationalist uprisings of Ottoman Christian subjects and to confront Russian Orthodox and Austrian Catholic influences over the Ottoman communities.

Conclusion

The Ottoman Empire was a theocratic state with Islam as its basic law, which covered all aspects of lives of the subjects from the socioreligious to individual and family affairs. Non-Muslim communities were under the protection of the Islamic law, and their status was tolerated unless their religions and lifestyles posed a threat to Islam. The change in the status of religion in the society, politics, and culture of the empire came with the modernization efforts of the Ottoman bureaucracy in the mid-19th century. The 1908 Young Turk Revolution did create a change in the identity of the Ottoman subjects from religion to citizenship; however, religion was still dominant in the political, social, and economic spheres of Ottoman society. The secularization of Turkish politics and society came with the removal of the Caliphate and religious institutions including the courts, schools, and ulema and with the adoption of secularism as one of the basic tenets of the early reform age of the Turkish republic.

OUR LADY OF GUADALUPE

Our Lady of Guadalupe is one of the most revered female sacred images in Mexican Catholic tradition and culture. Her following is not limited to Mexico, however, but has transcended national boundaries throughout the Americas as well as parts of Southeast Asia. In 1935, Pope Pius XI declared her patroness of the Philippines, and in 1946, Pope Pius XII named her patroness of the Americas. Her following is largely due to the message of empowerment that is embodied in the context under which tradition tells us she appeared.

In 1521, Tenochtitlán, now known as Mexico City, fell to Hernán Cortés after Cuauhtémoc, the last Aztec ruler, surrendered. During and after the conquest, Catholicism was used to justify the physical, emotional, and spiritual enslavement of the indigenous people. The vanquished people were dehumanized and lived without hope. Popular tradition tells us that in the midst of this devastation, an event occurred that was viewed as a miracle that helped restore a dying people's dignity and desire to live.

According to the Nahuatl account, *Nican Mopohua*, in December 1531, the Virgin Mary (in the image and likeness of a *mestiza* woman) appeared to an indigenous man named Juan Diego several times on the hill of Tepeyac. The hill had been an ancient Aztec sacred site for a goddess whom people referred to as Tonantzin. Each time, she asked Juan Diego to tell Bishop Zumarraga

that she wanted a temple in her name to be built on the top of the hill. Though Juan Diego was faithful in repeatedly taking the message to the bishop, the bishop refused to believe the story until Our Lady of Guadalupe imprinted her very image on Juan Diego's *tilma* (cloak) on December 12.

Today, while many scholars have attempted to prove that the apparition never took place and/or that Juan Diego is not a historical figure, others have devoted extensive research to demonstrate that the miraculous event did take place in history. Still others (most notably Chicana feminist artists) have visually reinterpreted the image in feminist ways. Despite the scholarly debates, for her followers, she is a sacred figure that exists through the miracles they claim she has granted. Many make financial and/or physical sacrifices to travel to the Basilica de Nuestra Señora de Guadalupe in Mexico City, where the *tilma* with her image is housed. Some devotees walk on their knees for miles to give thanks for a miracle granted or to fulfill a *promesa* (promise) or *manda* (a type of religious mandate).

Last year, on her feast day, her sanctuary received more than 7 million followers from all over the world. In fact, the Basilica de Nuestra Señora de Guadalupe is the most visited Catholic sanctuary in Latin America and the second most visited Catholic pilgrimage site in the world after

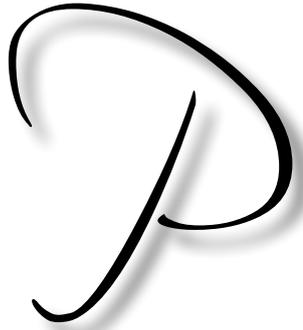

Saint Peter's Basilica in the Vatican. Her popularity has resulted in the commodification of her image, which can be found even on mouse pads, stuffed animals, and dog T-shirts. Yet to those who believe in Our Lady of Guadalupe, her image is not simply a product that can be bought and sold in the international marketplace; she is a Catholic symbol that transcends geographical borders, making her a global sacred image that embodies the survival, hope, and self-affirmation of those at the margins of society.

PACIFIC ISLANDS/OCEANIA

The Pacific Islands region encompasses most of the island nations, territories, and states in the southern part of the Pacific Ocean. The term *Oceania* includes this region and may also refer to Australia, Indonesia, Brunei, Singapore, and the island parts of Malaysia. The terms *Oceania* and *Pacific Islands* usually do not refer to the Aleutian islands of Alaska or to the islands that are off the Pacific coast of Russia, China, and North and South America, nor do they include the island nations of Japan, Taiwan, and the Philippines.

Usually, the Pacific Islands are grouped into three main clusters that have common historical and ethnic characteristics. The largest is the Polynesian (“many islands”) triangular group that spans much of the South Pacific and includes native New Zealand, the American state of Hawai‘i, Samoa, Tonga, Tuvalu, the Cook Islands, French Polynesia (including Tahiti), and Easter Island. The other two clusters are in the western South Pacific. One is the mountainous islands of Melanesia (“black islands”) that include Papua New Guinea, Fiji, Vanuatu, the Solomon Islands, and New Caledonia. The other is Micronesia (“small islands”), which is north of the equator and mostly flat and includes Guam, Wake Island, Palau, the Marshall Islands, Tokelau, Niue, Nauru, Kiribati, and the Federated States of Micronesia. There are some 20,000 to 30,000 islands in the Pacific Islands region, spanning thousands of miles. The population of the region (excluding

New Zealand and Hawai‘i) was around 7 million at the end of the 20th century.

The religious history of the Pacific Islands is roughly divided into pre- and post-European colonial contact. Beginning in the 16th and 17th centuries, European explorers, traders, exploiters, and settlers traversed the region and made an enduring impact on its cultural life. Perhaps the best known was the 18th-century British explorer Captain James Cook, who came to an unhappy end in the Hawai‘ian islands. In the 19th century, cargo cults emerged in some areas of Melanesia and Micronesia as a result of cultural contact. Indigenous people in the islands thought that their ritual and spiritual activity would hasten the return of godlike foreigners with abundant material blessings and visions of salvation.

By the 20th century, most of the population of the region had converted to Christianity, and what remained of the traditional religious culture of the Pacific Islands is found in some of their local lore and customs. In some cases, indigenous religion and ritual artifacts have been integrated into the practices of Christian churches. In Hawai‘i, the Congregational churches of New England missionaries were often built on the stone altars of traditional Hawai‘ian religious sites (*heiau*). In the second half of the 20th century, large-scale conversions to the Mormon faith added a further layer to the religious complexity of the region. The religious character of each island’s culture is unique, however, and must be examined in its specificity.

PAJELANCA OF THE BRAZILIAN NORTH

Pajelanca refers to several forms of shamans among indigenous and peasant populations of the region from the northwestern to the northeastern borders of Brazil. They include healer shamans, priestly shamans, assault sorcerers, and prophets.

The first have as their main objective the healing of the sick. Sickness is widely conceived of as the detachment of "soul" elements from a person's body for whatever reason, such as a sudden fright or the appearance of an omen of death. The detached soul becomes lost in any one of the multiple layers of the cosmos, which are all full of traps, snares, and demons who take the souls as prey. The shaman thus undertakes in trance a perilous journey, which he or she has been trained to do in the many years of his or her apprenticeship. The shaman has allies scattered throughout the universe, which assist in the search. Once the soul is found, there may be a process of "payment" to regain the soul or obtain the remedy; if the payment is accepted, the shaman is authorized to perform the cure of the person, returning the soul to the sick person and extracting by suction the material

representations of the sickness (whatever these may be—a wad of gum, a bunch of hair, thorns, or pebbles).

The priestly function derives from cosmological principles that are both complementary and antithetical to the healer shamans. The training of a priest takes much longer than that of a shaman, given the scope and depth of knowledge that the priest is expected to acquire. Generally speaking, where the shamans derive their power from direct knowledge and experience of the deities and places of the cosmos, the priest's power is based on the accurate recall of canonical and esoteric knowledge, which is essential for rites of passage—that is, for the reproduction of society and the renewal of the cosmos. While the shamans are relatively more egalitarian or "democratic" in their internal organization—that is, anyone can become a shaman who accepts the years of arduous training and perilous experiences—the priests come from a specific class—the elderly men or women of the society. Traditionally, priests are organized into hierarchies and sometimes into sacred societies.

The assault sorcerers are sometimes called "dark shamans." In many cultures, the shamans who cure are the same as those who practice sorcery, like two sides of the same coin. During the shaman's apprenticeship, they learn all of the art and practice of curing first, and then, when they are at a point when they can withstand the harmful effects of assault sorcery, the master instructs them in killing and defending oneself against enemies. Where shamans practice both healing and sorcery, they are considered highly ambiguous figures. True dark shamans are distinct from healers and derive their powers from cosmological principles that are the complete opposite of the healers'.

Prophets are the most powerful of the healers and, in the northern region of Brazil, have emerged among Arawak and Tukanoan-speaking peoples to the west (borders with Colombia and Venezuela) and Carib-speaking peoples to the east (borders with the Guyanas). All prophets about whom there is written documentation have appeared in post-contact times, although oral histories have also referred to precontact prophetic movements, the dynamics of which were grounded in creation mythology and primordial conflicts. Often, the

prophets have joined indigenous cosmologies and shamanic practice with powerful symbols of Christianity. Some prophetic movements have emerged as antiwitchcraft campaigns. All have sought utopias, spatial or temporal, in which native peoples' cultures and religious traditions could be revived or in which cosmic cataclysms would eliminate sickness and death for the followers, and social harmony would be restored. It is notable how many peoples have evaluated millenarian Christianity (Pentecostalism) to resonate with these beliefs.

The same person can be a shaman, priest, and prophet at different stages of his or her career when the appeal of their messages becomes universal; the dominant themes concern the eradication of witchcraft, moral reforms internal to society, and the inversion of power relations between Whites and Indians.

PAKISTAN

The Islamic Republic of Pakistan, a nation born from the partition of the South Asian subcontinent by the British at the end of their colonial rule, was founded in 1948 on the idea that a nation should be carved out of South Asia to protect the region's Muslim population. Hence, it has had an

Islamic character from the beginning. It is also home to several important Sufi shrines, including the Data Ganj Baksh Shrine in Lahore, and to what was for three centuries—until another surpassed it in 1986—the world's largest mosque—Lahore's Badshahi mosque. As of 2009, Pakistan contained more than 174 million Muslim citizens, making it the second largest Muslim country in the world, after Indonesia.

Though Islam unites the country, it is separated along several distinct ethnic lines: Punjabis and Sindhis in the eastern side of the country and Baluchis and Pashtuns in the mountainous areas adjacent to Iran and Afghanistan. More than 96% of the population are Muslim; most are Sunnī, and approximately 20% are Shi'a. Hindus account for an additional 2% of the population and include many who have lived in the region before the partition of the subcontinent into India and Pakistan; Christians constitute an additional 1%. Many Pakistani Christians come from the lowest castes, known as Dalits or untouchables.

History Prior to Independence

The Pakistan region was populated by members of the Pashtun ethnic group as early as 2000 BCE, though their origins have yet to be fully documented. What is now Pakistan was the region that was for many centuries the gateway to the Indian subcontinent for invading armies, traders, and explorers from the west, including the Aryans in 1500 BCE and Alexander the Great and his Greek armies in the fourth century BCE. Islam came to the region as early as the eighth century CE through traders and *pirs*, wandering Sufi mystics, and some units of the Umayyad dynasty. The Umayyads did not achieve great success in Islamicizing the region, but the settlements that remained following their retreat slowly made progress and gained assistance from the 10th-century Turkish and Afghani conquests. From the 12th through the 16th century, the region was governed by Islamic Turko-Afghan dynasties, which imposed taxes known as *jizya* on non-Muslims and oppressed the Hindus who constituted the majority of the population.

The high point of Muslim rule in the subcontinent came with the Mughal Empire in the 16th and 17th centuries. The imperial government

allowed wandering Sufis to convert many Hindus and Buddhists to Islam while neither explicitly supporting nor prohibiting the proselytization. As the Mughal Empire declined, the British East India Company claimed substantial control over the trade routes to the subcontinent and paved the way for the British Raj—colonial rule over the entire Indian subcontinent. By the end of the Mughal Empire, a quarter of the population of the subcontinent was Muslim.

In 1893, Sir Mortimer Durand in cooperation with the Afghan Amir Abdur Rahman Khan fixed the boundary known as the Durand Line, designating the Afghani and British spheres of influence along an imaginary border running from Chitral to Baluchistan. This action would have repercussions reaching into the 21st century, as the threshold passed through the middle of traditional Pashtun lands, thereby effectively dividing a single ethnic group into two separate nations. The area was still under tribal governance under the British (who required a buffer territory to the Russian Empire more than more subjects), and the resiliency of tribal identity would prove problematic for both countries' attempts to create nationalist sentiment.

In the 19th century, a reform Muslim movement based in the Deoband seminary tried to purify Islam and rid it of indigenous and extraneous elements. The Deobandis were the spiritual ancestors of 20th-century activists of Islamic movements, including the Taliban movement in Afghanistan and Pakistan. Muslim political thought was being refined by thinkers such as Maulana Mawdudi, who advocated a kind of Islamic politics different from the secular rule promulgated by the British. New Islamic parties were created, including the Jamaat-ul-Ulama-i-Islam party. Wealthy and educated Muslim leaders established the All-India Muslim League in 1906 to provide political representation for Muslim communities in the emerging parliamentary politics. Demands were successfully made to the British for separate electorates for Muslims that would guarantee seats in the legislature. The Khilafat movement after World War I added to the conversation by repudiating Muslim loyalty to British rule and received support from the Deobandi movement and the champion of Indian independence, Mohandas Gandhi. Though the movement served only to exacerbate tensions between Hindus and Muslims,

the first steps toward an independent Pakistan had been taken.

An Independent Pakistan

Between 1937 and 1940 Muhammad Ali Jinnah, the leader of the Muslim League, set about promoting the Two Nations Theory, leading to the Lahore Resolution in 1940, which stated that the areas of Muslim majority in India should become independent and autonomous. It is important to note that while the proposed nation was a nation of Muslims, it was never intended to be an Islamic state. During World War II, the movement for Pakistan was subdued, but at the end of the war, the Muslim League boycotted the Indian Congress, which carried favor with the British, and on June 3, 1947, when the British Parliament introduced the bill for the independence of India, it successfully campaigned for the partition of the subcontinent into two new states: India and Pakistan. More than 8 million people relocated from different areas of the subcontinent—Muslims moving into Pakistan and Hindus and Sikhs moving out—creating a situation of turmoil and violence in which perhaps 1 million people were killed.

Pakistan was established as two parts: The western one consisted of the Punjab-Sind-Baluchistan region, which later became known simply as Pakistan; eastern Pakistan was in the Bengal region, which in a later war of separation in 1971 broke away from the western wing and established itself as a separate country, Bangladesh. The region of Kashmir was contested between India and Pakistan, and a war between the two countries over the disputed region in 1948 ended in a stalemate with a UN-patrolled line of demarcation between the two sides of Kashmir, one controlled by Pakistan and the other by India. Part of the problem was that the leader of the region, the Maharaja of Kashmir, was Hindu, while the majority of the population were Muslims.

Jinnah became the leader of the new nation of Pakistan. Though the country was intended for Muslims, Jinnah's vision of politics was decidedly secular. One group of opponents were members of the Jamaat-e-Islami, a political party founded by Maulana Abu'l-a'la' Mawdudi. Though it and other religious parties in Pakistan were never successful at the ballot box—they never received more

than 10% of the vote—their political influence has been significant. Mawdudi's idea that the country should become an Islamic state and accept traditional Muslim Shari'a law became the law of the land under the leadership of Zia al-Haq in 1977. His political opponent at the time was Zulfikar Ali Bhutto, father of Pakistan's later Prime Minister, Benazir Bhutto, who was toppled from power, arrested, imprisoned, and later executed by Zia's government. Zia himself died in 1988 in a mysterious plane crash.

Zia's rule was propped up by Islamic ideology, and he did much to bring Islam into political life. Zia installed members of the Jamaat-e-Islami and the Muslim League in his cabinet and declared that all Pakistani laws must conform to Islamic law. In 1979, he established Shari'a courts in the nation and even tried to implement a new financial system based on the Islamic prohibition of *riba* (interest or usury). The year of his death, Zia introduced a bill written by the Jamaat-e-Islami party, which placed Islamic law above the courts and laws of the country. Later, Prime Minister Benazir Bhutto blocked the bill in 1988, but it was passed in a revised form in 1991. Persecution of the Ahmadiyya sect also began to increase at that time. Among Zia's other legacies was Pakistan's nuclear program and the development of close ties to Islamic nations in the Middle East.

Pakistan, Afghanistan, and the Taliban

Pakistan played a notable role in the repulsion of the Soviet Union from Afghanistan in the 1980s, providing financial and military support for the mujahideen fighters in cooperation with the Reagan administration of the United States. It is estimated that approximately 40% of the mujahideen were trained in Pakistan. Later, some of the fighters who received this support joined the Tehrik-i-Taliban Pakistan (TTP), which gained control over the Swat Valley area of Pakistan in 2009.

When the United States invaded and occupied Afghanistan following the terrorist attacks on September 11, 2001, Pakistan, led by a military regime headed by General Pervez Musharraf, became America's ally in the "War on Terror." Funds were channeled through the Pakistani military organization to fight the remnants of the Taliban and Osama bin Laden's (d. 2011) al

Qaeda movement, which had sought refuge from Afghanistan in the mountainous regions of Pakistan. The Pakistani complicity with the American military presence also helped fuel the growth of radical Muslim groups within Pakistan, especially in Baluchistan, Waziristan, and elsewhere in Pashtun regions along the border with Afghanistan. A Pakistani Taliban emerged with a program of violence aimed at both the U.S. military and the secular Pakistan administration.

It was a Taliban militant, Baitullah Mehsud, who was thought to be behind the assassination of Benazir Bhutto as she campaigned to be elected again as Prime Minister in 2007. Her widower, Asif Ali Zardari, took her place and was elected as Prime Minister. Also in 2007, a siege against protesting Muslim students in the Red Mosque in Islamabad resulted in the death of the radical mullah of the mosque and more than a hundred others. Pakistani Muslim extremists associated with the jihadi movement, Lakshar-e-Taiba ("the army of the pure"), were also involved in clashes with the government, and individuals said to have been associated with this movement launched a brazen series of attacks in Mumbai, India, in 2008, killing 164 and wounding more than 300. In 2011, the governor of the State of Punjab, Salman Taseer, was assassinated by his own bodyguard. The assassin was said to have been influenced by jihadi ideology and persuaded that Taseer was violating Islamic principles in defending a Christian woman who was sentenced to be executed for allegedly violating Pakistan's blasphemy laws. The secret American military raid on May 2, 2011, that uncovered Osama bin Laden's hideout in Abbottabad, Pakistan, and killed the al Qaeda leader revived anti-American sentiments when it was revealed that no Pakistani officials had been consulted or notified in advance about the raid.

The political culture of Pakistan remained moderate, however, even though extremist activists in Pakistan in the first decade of the 21st century instigated a series of attacks on each other, American diplomats and journalists, and government officials. Though Pakistan is officially an Islamic republic, there is no clear consensus on what that means or to what degree religion is expected to permeate public life.

PALAU

Palau, an archipelago of approximately 300 volcanic and coral islands in the northern Pacific Ocean, has a religious character that has been shaped by both colonization and missionary forces, often in collusion. Heavily Christian today, Palau boasts a large number of Roman Catholic (49%) and Protestant Christian (21%) adherents as well as a significant proportion of Seventh-Day Adventists (7%). While small Jewish and Muslim communities are also present, the syncretic religion Modekngai is practiced by approximately 9% of the population (with the recognition that many reported Christians may engage in syncretic practices). Modekngai was founded in 1915 and recognizes Jesus Christ as savior while concurrently seeking to appease an ancient Palauan goddess. Centered in the city of Ibobang, in the state of Ngatbang, Modenkgei has established schools to ensure the continuation of the Palauan tradition.

Loosely part of the Spanish Pacific in the 19th century, Palau was sold to Germany in 1898 and occupied by the Japanese in 1914. Both Germany and Japan supported missionary activity to Palau, building on the base established by the Jesuits who arrived on the islands as early as the 17th

century. During the colonization period, the churches in Palau acted as a proxy for the government, administrating for the colonizing powers through religious networks in the absence of officials on the ground. After World War II, the United States took possession of Palau, which in 1947 became a United Nations Trust Territory. In 1981, Palau finally established itself as a self-governing nation.

In 2009, 13 Muslim men of Uighur descent were released from the U.S. facility at Guantanamo Bay to live in Palau. The men, originally from the region of Xianjiang, China, had been detained by the United States on suspicion of terrorism. Although the detainees were found not to be enemy combatants, many countries refused to take them in, and the United States refused to send them back to China owing to the high likelihood of their arrest and incarceration as dissidents. The men were supporters of independence movements in Xianjiang province, where approximately 9 million Uighurs live. Due to the small size of the Muslim community in Palau, there were concerns about the Uighur men's ability to adjust to their new home, but Palauan president Toribiong stressed Palau's hospitality and their alliance with the United States to quell these worries.

Freedom of religious practice generally prevails in Palau, although certain exceptions exist, mostly revolving around labor issues. In 1998, for instance, Palau's Division of Labor declined requests for work permits to Bangladeshi citizens on religious grounds. The Division of Labor justified its denial by a supposed conflict between the non-Christian customs of the Bangladeshis and the work practices and living conditions in Palau. While it has mostly been seen as an ethnic conflict rather than a religious one, religion was again used as a pretext to justify the exclusion of immigrant workers in 2001, this time aimed at Sri Lankan and Indian citizens.

PALESTINE

Palestine is a geographical region on the eastern Mediterranean coast. The exact dimensions of the region vary by account but geographically are typically regarded as the area containing Israel and the Palestinian territories. The region has a long, rich history, and numerous important religious sites lie within the boundaries. Throughout the region's extensive history, the desire for control of the land has been highly connected to religious sentiment. In the 20th century, Palestine has become known primarily as the contentious site of the Israeli state and the ensuing conflict over the land between Palestinians and Israelis. This current state of affairs resulted in the emergence of a unique Palestinian identity, which is markedly transnational. The majority of those people who identify themselves as Palestinians are Sunnī Muslims, with a minority component of Christians, typically Catholic. Beyond the conflict, Palestine as a region hosts important religious locations for Christians, Muslims, and Jews, as well the headquarters of the Baha'i Faith.

Early History Until the 19th Century

The name *Palestine* is a derivative of *Philistine*, from the people that migrated to that region, which was originally known as Canaan. The Kingdom of Israel was established in this area after the Jews conquered the other inhabitants of the region, including the Canaanites and the Philistines. The unified Kingdom of Israel fractured in approximately 927 BCE. At this point, it divided into a northern and southern kingdom. The northern

kingdom, Israel, was captured in 722 BCE by the Assyrians and the southern kingdom, Judah, in 586 by the Babylonians. During these periods, most of the Jewish population was forced to migrate out of the area. After the Babylonians fell to the Persian Achaemenids in 539 BCE, many of the exiled Jews from Babylon were allowed to return to the region. They were permitted to rebuild their temple, marking the start of the Second Temple period in Jewish history. There was a relative peace during this time in Palestine, until 140 BCE, when a Seleucid ruler rededicated the Temple to Zeus, triggering the Revolt of the Maccabees, which was followed by nearly another 100 years of Jewish control over the region, until the Roman conquest in 63 BCE.

Palestine became a part of the Roman Empire, though it was granted autonomous status. During the period of Roman control, there was some degree of Jewish resistance, which came to an initial climax in 70 CE, when Roman forces razed the temple in Jerusalem. A second resistance culminated during the Bar Kokhba revolts of 132 to 135 CE, which resulted in the revocation of Jewish autonomy in the region, which then became an official Roman colony known as Syria Palestina. Though the restrictions were reduced shortly thereafter and the Jews were granted increased self-government following the revolt, they were still banned from Jerusalem. As Rome became Christianized, Palestine, as the home of Jesus, became a prominent holy site to the Christian population, and under Byzantine rule, the remaining Jews in the region were subjected to further restrictions. There was a short intermission in Byzantine rule in 617 CE when the Sassanids captured Jerusalem, but the Byzantine emperor Heraclius restored imperial control of the city.

Byzantine control of Palestine was then supplanted by the invasion of Arab Muslims of the Umayyad dynasty during the 7th century. 'Abbāsīd and, later, Fatamid rule replaced the Umayyad rule of Palestine. Jerusalem also holds particular importance to Muslims as the third holiest city (after Mecca and Medina) and is also the primary holy site for both Jews and Christians. Thus, Palestine became a contentious region, fought over for religious control. European Crusaders began numerous campaigns to free the Holy Land and were successful in capturing Jerusalem in 1099. Under

the military leadership of Saladin, Muslims recaptured the city, and other than a brief period of permitted Christian governorship in the first half of the 13th century, it remained under Muslim control. For around 250 years, the Mamluks, centered in Egypt, controlled Palestine, until the start of the 16th century, when the Ottoman Empire claimed the region. The Ottoman period of rule in Palestine lasted until 1914. During this time, Palestine was assimilated into the province of Greater Syria for governing purposes. *Dhimmi* (non-Muslim minority) communities were treated moderately well under Ottoman rule. As Europe grew in power, the various empires began to take a more active interest in the Christian subjects living in Ottoman territories.

The 19th Century Onward

The Ottoman Empire officially collapsed in 1917. The years leading up to the collapse were marked by significant colonial European maneuverings in the greater region. As Ottoman power weakened, British, French, and Russian powers vied for stake in the future of the region. Eventually, the British claimed Palestine and used it as a buffer zone between the French in Lebanon and Syria and their own affairs in Egypt.

Beginning in the latter half of the 19th century, Zionist settlers began immigrating to Palestine in a series of waves (referred to as *Aliyah*, from the Hebrew, meaning “to rise”). Zionists insisted on the necessity of a Jewish state. Several locations were considered for the viability of such a Jewish state; the Zionist decision to “return to” Palestine was at least in part a historical-religious decision. Zionist Jews argued for the reestablishment of *Eretz Israel* (the historical name for “Land of Israel”) and, in doing so, brought some resolution to the problem of the Jewish Diaspora that had begun with the loss of Jerusalem in 135 CE. Though the official Ottoman policy forbade Jewish settlement in Palestine, the imperial policy was not enforced. Zionist settlers purchased large amounts of land from the existing Palestinian Arabs and began to settle and develop communities. There was some resistance to their immigration by the local populations, but for the most part, it proved to be ineffective and unorganized. The Zionist settlers organized militias to defend their interests in Palestine. The most notable of these was Hagana (“defense”), which

eventually formed the basis for a national army, the Israel Defense Force, after the achievement of statehood.

During the interwar period, British policymakers waffled on the course of action regarding Mandate Palestine. This indecisiveness can be seen in the following policy decisions: The McMahon-Husayn correspondence of 1915 to 1916 promised an Arab state including Palestine; the Sykes-Picot agreement in 1916 divided Ottoman lands between the British and French; the Balfour memorandum of 1917 encouraged the idea of a Jewish homeland in Palestine; and the White Paper of 1939 established restrictions on further Jewish immigration. Despite these mixed intentions, Israel was officially ratified and established as a national entity following World War II, sparking the 1948 to 1949 wars between the fledgling country and the surrounding Arab nations. The defeat of the Arab nations in these first two wars was a crushing blow to Pan-Arab morale and also allowed the territorial expansion of Israel. The expansion forced the dispersion of a large population of Palestinian Arabs from the region into neighboring Arab countries. The result of this was the creation of a transnational diaspora of Palestinians with national ambitions.

Some emigration from Palestine occurred prior to the establishment of Israel. These voluntary migrants were predominantly Palestinian Christians seeking to avoid Ottoman military conscription; they often emigrated to Europe or North America. Migration en masse was a reaction to the defeats of the Arabs in 1948 to 1949, which Palestinians often referred to as *al-nakba* (“the Catastrophe”). The majority of these refugees remained in the Arab world, particularly in Jordan and Lebanon. These Palestinian refugees have mostly been unwelcome in these countries, which has helped preserve and ensure a distinct Palestinian identity. The Arab nations encouraged the formation of the Palestinian Liberation Organization (PLO) to provide a secular nationalist leadership for the dispersed Palestinian population. In 1964, the PLO held its inaugural conference. However, the PLO’s nationalist goals and tactics often proved subversive to the political framework of its host countries, which resulted in general resentment and sometimes violence toward Palestinians. The majority of refugees settled in Jordan, whose policies toward Palestinians were more generous. This was in contrast to the

controversial policies that the Palestinian communities faced in southern Lebanon, as epitomized in the conflicts between the PLO and the Shi'i militia Amal in the late 1970s and early 1980s.

One of the key demands of Palestinians is the “right of return.” The identity of Palestinians has become inseparable from the region of Palestine. Though Palestinians are scattered across numerous countries around the world, they maintain a general consensus of a desire to return. There is some disjunction in the “Palestinian identity” among those living in different areas. The discourse and sentiments vary between refugee Palestinians living in neighboring countries—the West Bank and Gaza—and those with Israeli citizenship (Arab-Israelis). Though the PLO was formed as a secular nationalist organization, numerous Islamic organizations have emerged in recent years hoping to reestablish Palestine as an Islamic state. This has created a second front in the identity conflict among Palestinian nationalists, primarily represented by the dominant secular nationalist party, Fatah, and Islamic parties, most notably represented by Hamas.

The overlapping religious and national competition for control of the region has created a relatively unique situation and one that cannot be easily resolved politically. Palestine as a geographic region possesses a religious bonding that transcends national identity.

PĀLI

Little is known about the origin of the term *pāli* (lit. a “line”) or how, in its diffusion from northern

India to south-southeastern Asia over the course of several millennia, it came to be synonymous with the language of, and texts comprising, the Theravāda canon of Buddhist scriptures. Called Māgadhī, in Buddhist literature the composite language of these texts bears witness to a lengthy and complicated development insofar as they preserve archaic linguistic features associated with several Middle Indo-Aryan vernaculars, known as Prākṛit, that appear to have come under the homogenizing influence of Sanskrit, the language of classical Indian culture. Because these dialects are from the northwestern region of India and the itinerant Buddha lived and taught in the northeast, it is not known where Pāli was originally spoken, if at all. Recent developments in Western scholarship surmise that Pāli was never an actual vernacular of India but an artificial language that flourished after the death of the Buddha (ca. fourth century BCE) as an ecclesiastical *koiné*.

The Pāli canon (Tipitaka) is the oldest and only canon of Buddhist scriptures extant in its entirety in any Indian language. Although no Pāli script was ever developed, these texts were transmitted orally by reciters (*bhānaka*) from about the fourth or third century BCE onward. Included among the Buddha's disciples or “auditors” (*śrāvaka*) were prominent monks and nuns who played a vital role in the dissemination of Pāli. Around the beginning of the Common Era, with the advent of writing on palm leaves, scribes at Aluvihāra in Sri Lanka initiated the gradual process of transliterating these texts. This was not a massive shift from an oral to a manuscript culture. Indeed, the oral tradition of chanting Pāli was never dispensed with and remains a central feature of monastic life down to the present. It did, however, facilitate a translocal expansion of Buddhist literary production that inspired new possibilities for classification, exegesis, redaction, commentary, chronicle, and narration. The order of magnitude in this shift from practice to literacy and scholarship intensified dramatically in the modern period through print, which gave rise to a new and unprecedented sense of the Pāli canon as “fixed”—that is, as an orderly, continuous, multivolume manuscript of complete texts closed off from other so-called extra canonical or noncanonical texts, including popular vernacular narratives and the commentarial literature with which it has otherwise had a long and intimate association.

While familiarity with and access to the Pāli canon remains preeminently the preserve of elites, which today includes a cosmopolitan network of scholar monks and intellectuals, the vast majority of Buddhists historically and presently have had comparatively little knowledge of or experience with the canon as such. Yet the version printed in roman characters by the Pāli Text Society of London, since 1881, as well as the version recited and settled at the Sixth Council held in Rangoon from May 1954 to May 1956, and subsequently released in 1999 as a CD-ROM edition, have accorded the Pāli canon a form and status hitherto unprecedented in the history of Buddhist cultures.

PANA WAVE LABORATORY

Pana Wave Laboratory (PWL) was the former research branch of a Japanese new religious movement known as Chino Shoho, or True Law. Chino Shoho was an eclectic form of spiritualism that adopted doctrines from the Abrahamic religions, self-medicating traditions of Hinduism and Buddhism, New Age concepts, theosophy, and parapsychology as well as a host of pseudoscientific conjectures about physics, environmental warfare, and space exploration. Chino Shoho's mystic leader Yuko Chino was said to possess supernatural powers of clairvoyance, frequently communicating with the deceased, extraterrestrial beings and a number of heavenly figures and gods.

In a peculiar twist, Chino began making claims of being the target of a communist guerilla conspiracy to have her assassinated through the

use of electromagnetic wave weaponry. Chino then commissioned an intellectual vanguard from her spiritual following to research the harmful effects of these electromagnetic waves. This group would come to be known as the *Pana Wave Laboratory*, and its objective would be to prolong Chino's life through the scientific analysis of electromagnetic wave warfare.

In their research, the PWL members concluded that the color white was the most effective defense against the communists' attacks, and thus, as a safety precaution, PWL members began clothing themselves from head to toe in all-white material. In addition to their appearance, members also erected a physical compound that they referred to as their research laboratory, where they would act out a popular version of scientific research.

Chino Shoho and the PWL were adamant about the dangers of globalization. In their view, Japan's history and autonomy had been compromised by the influx of liberal ideologies from the West. Their imperial heritage was waning in the face of this cultural, economic, and political encroachment. This position, however, was largely selective, as Chino Shoho and the PWL managed to adopt a variety of religious traditions that originated from beyond Japan's borders.

Engaged in this struggle to combat the communist assassination conspiracy and the threat of globalization, Chino Shoho and the PWL may be best known for their tendency to make extraordinary claims and activities, including two failed prophecies about the end of the world, an unsuccessful attempt to build a spacecraft, and, most recently, the anticipated arrival of a flying saucer that would rescue them from the ills of this planet. However, much of their activity ended when Yuko Chino died on October 25, 2006. At this point, it is unclear how the group as a whole has operated since Chino's death.

PANAMA

The narrowest country in Central America has more than 3 million inhabitants. Table 1 shows the main global religions present in Panama: Roman Catholicism, Protestantism, marginal Christianity, other world religions, and new religious movements.

Roman Catholicism

The Roman Catholic Church entered with Spanish colonization, establishing Darién as its first diocese on the mainland of the Americas in 1513. A shortage of priests curtailed the strength of the Church for centuries. Panama won independence from Spain as part of Colombia (1821), whose conservative dictators supported the Roman Catholic Church, whereas the political liberals were anti-clerical and annexed Church properties. With President Theodore Roosevelt's initiative, Panama

became independent from Colombia in 1903. The Panama Canal was finished in 1914, with the Canal Zone under direct U.S. control until 2000.

The Panamanian Bishops' Conference

The Bishops' Conference, founded in 1966, was a conservative body and was hardly influenced by the Second Vatican Council (1962–1965). Relations between the state and the Catholic Church were strained after the 1968 military coup and the subsequent regimes of General Torrijos (1968–1981) and General Noriega (1983–1989) but improved after the return to democracy. This happened after a U.S. invasion of Panama during which hundreds of civilians died. General Noriega surrendered to U.S. troops on January 3, 1990; he was later convicted for drug trafficking.

Catholic Charismatic Renewal (CCR)

The CCR movement arrived in Panama in 1973, stressing a personal relationship with the Holy Spirit and a strict morality. The CCR had more than 205,000 participants by 1995, representing the majority of active Catholics. The Bishops' Conference has supported the CCR since 1976 to retain membership.

Table 1 Main Global Religions in Panama: 1995 and 2000

Main Religion	1995	2000
Roman Catholics	2.05 M (77.8%)	2.21 M (77.4%)
Protestants	0.396 M (15.1%)	0.413 M (14.5%)
Jehovah's Witnesses	21,500 (0.34%)	Not available
Latter-Day Saints	26,000 (0.97%)	37,133 (1.3%)
No religion	60,760 (2.3%)	72,300 (2.5%)
Other world religions		
Buddhism	20,100 (0.8%)	21,800 (0.8%)
Judaism	3,550 (0.1%)	3,800 (0.1%)
Islam	116,000 (4.4%)	126,550 (4.4%)
Transnational new religious movements		
Spiritualists	12,500 (0.5%)	13,600 (0.5%)
Baha'i	32,000 (1.2%)	35,300 (1.2%)
Chinese religions	3,850 (0.2%)	4,200 (0.2%)
Other religions	2,440 (0.1%)	2,600 (0.1%)

Sources: Compiled by author from data in Barrett, Kurian, and Johnson (2001) and Holland (2002).

Mainstream Protestantism

After Panama's independence from Colombia in 1903, the U.S. government supported the arrival of U.S. missionaries. The Salvation Army arrived in 1904, followed by the Church of God (Anderson, Indiana), Southern Baptists, American Methodists, and Adventists in 1905; U.S. Episcopalians in 1906; and Nazarenes in 1953. They had modest success in converting the Panamanians.

Pentecostalism

Missionaries from the U.S. Foursquare Gospel arrived in 1927, followed by the Church of God (Cleveland, Ohio) in 1935, the Church of God of Prophecy (1962), the Assemblies of God (1967), and many others. Between 1970 and 1995, Pentecostals increased from 3.6% to 9.0% of the population in Panama.

Marginal Christians

The Jehovah's Witnesses arrived in 1929 and had 21,500 members by 1995. The Church of Jesus Christ of Latter-Day Saints sent its first missionaries to Panama in 1941. Mormons claimed 41,640 members in 2006, but only about one quarter were active.

Other World Religions and Transnational Religious Movements

Other global world religions in Panama are Buddhism, Judaism, Hinduism, and Islam. All arrived with immigrants, and none proselytized beyond their own ethnic group. Since the construction of the canal attracted many immigrants, most ethnic religions have large memberships (see Table 1).

Since the 1980s, globalization influenced the arrival of transnational new religious movements in Panama. These include Baha'i, the Family, Hare Krishna, and Soka Gakkai. They have experienced moderate to greater success in membership growth.

PANIKKAR, RAIMON (RAIMUNDO) (1918–2010)

Raimon Panikkar was an influential scholar of comparative religion who was born in Barcelona, Spain, on November 3, 1918, the son of a Catalan Roman Catholic mother and a South Indian Hindu father. His cross-cultural and trans-religious background is matched by multiple intellectual achievements, including degrees in the humanities and natural sciences. His early studies were in chemistry at the University of Barcelona and the University of Bonn. After becoming a priest, he completed his PhD in chemistry at the University of Madrid in 1958, with a thesis on the concept of nature—*El concepto del naturaleza*. Earlier, in 1946, he earned a PhD in philosophy at Madrid and eventually a doctorate in theology from the Lateran University in Rome (1961).

In 1955, when he was 37, he first went to India, to search out his father's cultural and religious roots and to formally study Indian philosophy and religion. There, he was attached to the diocese of Varanasi, where he combined priestly duties with study and meditation. He later described his spiritual and intellectual growth during this period in India as having "left" as a Christian, "found" himself a Hindu, and "returned" a Buddhist, without having ceased to be a Christian. From 1967 to 1971, he was Visiting Professor of Comparative Religion at the Center for the Study of World Religions, Harvard University, and from 1971 until his retirement in 1987, he was Professor of

Comparative Philosophy and History of Religions at the University of California, Santa Barbara. Raimon Pannikar died at his home in Spain on August 26, 2010.

Panikkar published some 40 books and hundreds of articles in several European languages that contribute critical methodological reflections on interreligious and intrareligious dialogue, the “rules of the game” of religious encounter, and a vision of religious pluralism beyond exclusivisms, inclusivisms, and parallelism—a pluralism that does not see religions as isolated, self-sufficient wholes or parallel ways to the same goal but paths that intersect and ways of life that in some sense need one another to be complete.

Building on scholastic categories of Hindu, Buddhist, and Catholic Christian philosophy and theology in books such as *The Unknown Christ of Hinduism* (1964; 1981), *Silencio del Dios* (1970), *The Trinity and the Religious Experience of Man* (1973), *The Interreligious Dialogue* (1978), *Myth, Faith, and Hermeneutics* (1979), and *The Cosmotheandric Experience* (1993), Panikkar coined many neologisms that enrich the vocabularies of cross-cultural religious studies and comparative philosophy of religion, including *cosmotheandricism* (the interdependence of nature, human persons, and the divine); *sacred secularity* and *tempiternity*, terms that mediate eternal and temporal modes of being and experience; *radical relativity* beyond mere agnostic relativism; humane *techniculture*, as distinct from agriculture and in contrast to global “technology” and monolithic power-and-money culture; *ontonomy*, a radical mutuality and “mutual fecundation” beyond *autonomy* and *heteronomy*; and *homeomorphic equivalent*, a “geometric model” that emphasizes religions as transformations of certain topological invariants emphasizing both unity and difference, the particular and the universal. Panikkar also pursued distinctive readings of faith and belief, mythos, logos, and “experience” and of Hindu Advaita and Christian Trinity, in the *fluxus quo*, the dynamic “unfinished” process-governed fields of human religious encounter.

PANJABI

Panjabi is the language of the people of Panjab, a region that was divided into two parts and apportioned one each to India (East Panjab) and Pakistan (West Panjab) at the time of partition in 1947. The Panjabi-speaking population is, however, not confined to the political boundaries of the two Panjabs. As a matter of fact, Panjabi is a major world language, spoken by 80 million people in South Asia and other British Commonwealth countries. Furthermore, Panjabis were the first people from India to enter North America in the beginning of the 20th century as immigrants. Furthermore, Panjabi has been in use as a literary language since the 11th century. It is the language of the sacred scriptures of the Sikhs, the official language of the State of Panjab in India, and a language of Sikh and Sufi mysticism and of regional literature among Panjabi Muslims in Pakistan. In Canada, Panjabi is the fourth largest spoken language after English, French and Chinese, while in the United States, it is mostly spoken by about 0.5 million Panjabi and Sikh immigrants.

Panjabi is an Indo-Aryan language closely related to earlier forms of Hindi and Urdu, and these languages are, to some extent, mutually intelligible even today. Panjabi is usually written in a different script known as Gurmukhi (“from the mouth of the Guru”), since it was devised by the second Guru of the Sikhs, Guru Angad (1504–1552), under the supervision of Guru Nanak (1469–1539), the founder of the Sikh tradition. The original Gurmukhi script was a systematization of business shorthand (*lande/takari*), of the kind Guru Nanak doubtless used professionally as a young man. This was the script that was certainly familiar to the merchants of the Panjab. To the Panjabis, the idea of spiritual truth inscribed in their own native language must have created a sense of empowerment that had been conspicuously absent until Guru Angad popularized the Gurmukhi script among the masses. It is, however, instructive to underline the fact that the Panjabis in Pakistan use Shahmukhi (a kind of Arabic script) for writing purposes.

The Panjabi language is intimately linked with Panjabi culture. It is difficult to have access to

Panjabi customs, myths, art, literature, music, and other cultural moorings without understanding the Panjabi language. The famous Panjabi authors are Bhai Vir Singh (poetry, fiction, drama, and prose), Puran Singh (poetry and fiction), Mohan Singh (poetry), Amrita Pritam (poetry and fiction), Dhani Ram “Chatrik” (poetry), Ishwar Chander Nanda (drama), Teja Singh (literary criticism), Sant Singh Sekhon (fiction and literary criticism), and Harbhajan Singh (literary criticism). The cultural activities of folk songs, movies, and the internationally acclaimed *Bhangra* (“Panjabi folk dance”) become accessible only when one has learned at least the spoken Panjabi language. The *gurdwaras* (Sikh places of worship) in North America, the United Kingdom, East Africa, and other East Asian countries offer Panjabi language instruction at Sunday schools. Introductory courses on the Panjabi language are also offered at academic institutions such as University of Michigan (Ann Arbor), University of California (Berkeley, Santa Barbara, and Riverside), and San Jose State University.

PAPUA

Papua (also known as Dutch New Guinea, West Papua, Irian Jaya, and Irian Barat) is the Indonesian region on the western half of the massive island of New Guinea; the independent nation of Papua New Guinea makes up the eastern half. Papua’s flora and fauna are among the most diverse in the world, with interior mountains capped with equatorial glaciers. Containing the world’s second largest rainforest (next to the Amazon), Papua’s natural resources include the world’s largest gold deposit, the second largest copper deposit, and

massive amounts of natural gas, along with valuable hardwood forests, all of which are being extracted and harvested for primarily Asian and Western nations.

Papua contains roughly 250 distinct languages and many more cultures. Ethnically, Papuans are Melanesian, marked by what many Papuans self-describe as “black skin and kinky hair.” Papua was colonized in a separate act of Dutch colonization from the Dutch East Indies, after conflict between English and Dutch forces ended with the signing of the Treaty of London (1824), giving the Dutch sovereignty over Papua. Indonesia annexed Papua in 1963 following the so-called Act of Free Choice, a vote that Western and Asian newspapers affirmed immediately was illegitimate, in part because the UN representative responsible for the vote had not arrived until after much of the voting had taken place and the intense pressure that voters received at the hands of members of the Indonesian military to vote for incorporation into Indonesia. Indonesia changed the name from Dutch New Guinea to the province of *Irian Jaya* (1973) and then again named it *Papua* (2000).

Following the annexation of Papua by Indonesia, which most Papuans interpret as an act of Asian colonization, Papua has been an arena of ongoing contests between the global forces of religions, multinational extractive industries (e.g., gold, copper, and natural gas), and nation-making strategies that have left Papuans increasingly socially, culturally, and economically marginalized in their own land. The challenge for Indonesia has been to incorporate Papua, whose indigenous people are overwhelming Melanesian and Christian, into the Republic of Indonesia, a Southeast Asian nation with more Muslims than the entire Middle East. World religions have played a critical role in the social and cultural transformations that have unfolded in Papua since the mid-1960s. Western Christian missionaries, from the Dutch period onward, have tried to encourage the conversion of Papuans from their traditional religions to Christianity. Likewise, Muslim missionaries from other Indonesian islands and the Middle East have sought to convert Papuans to Islam. A vigorous government-sponsored transmigration program, seen by many as a malevolent experiment in social engineering, has moved high numbers of Muslims

from overcrowded Indonesian islands (e.g., Java) to Papua, radically changing the Papuan social, cultural, and religious landscape to one dominated by Asian Muslims, to the extent that Papuans currently make up a minority in their own land, with Papuans being roughly 48% and non-Papuans 51% of the overall population.

What is striking in Papua is the rise in the numbers of global religionists, due mostly to the transmigration of Muslim communities to the island, yet the globalization of religious pluralism is conspicuously absent. That is to say, although there has been a massive burgeoning of the presence of global religions since the 1960s, with the escalation of religionists, including Christians, Muslims, Hindus, and Buddhists, and an increase in the globalization of those religions, whereby each religious group increasingly builds support and financial networks expanding from Papua to distant countries such as the United States and Saudi Arabia, such changes have failed to translate into a full globalization of religious pluralism, where religionists from various faith traditions coexist in civic harmony and peace. Papuans have sought a Pan-Papuan identity that transcends disparate tribal identifications, and Christianity has been a robust ally in formulating and articulating a Papuan identity rooted in and continuous with the Old Testament biblical narrative, where Papuans declare that they worship the “God of Abraham, Isaac, Jacob, and the Papuans.” Islam has advanced through *da’wah* (Arabic “mission”) activities even into highland Papuan villages, where Papuan Christian conversion to Islam is encouraged by the social prestige and national identification such religious change engenders.

PAPUA NEW GUINEA

Papua New Guinea (PNG) occupies the eastern half of the island of New Guinea, which it shares with the Indonesian Papua. When PNG gained independence in 1975, its constitution proclaimed Christianity as the national religion, a move that connected the emerging nation to the global community of Christians and acknowledged an important shift in local worldviews. While the constitution served to highlight the historical importance of mission contact, at the beginning of the 21st century, religion in PNG is far from homogeneous. In some parts of the country, Christianity resembles overseas forms; in others, it is more aptly described as an indigenous religion, and conversion has not always involved a complete rejection of pre-Christian socioreligious practices. Coupled with the diversity of PNG cultures, this has meant that religion is often a significantly localized tradition.

With more than 800 languages and nearly as many cultural and religious traditions, PNG before independence was generally described in terms of the so-called primal religions of oral cultures, although Christian missions had been active in some areas since the late 19th century. Early anthropological studies gave primacy to religion as an organizing feature of life, highlighting complex

connections with economic and sociopolitical spheres. It was generally seen to be grounded in practical concerns. Rituals connected to ancestor cults and spirit cults ensured well-being and fertility, and the widespread use of “magic” and “sorcery” (misinterpreted terms introduced during the colonial period), which were part of the religious traditions, continues to influence the lives of many PNG people. Mission commentaries have emphasized the importance of celebration and the maintenance of abundance in pre-Christian religion. Yet all these generalizations belie the richness of local religious expression.

The variety of Christian practice in PNG has resulted as much from particular mission histories as it has from its cultural diversity. By 1890, French, British, and German missions were working in coastal and island areas. The highland regions were contacted much later, by which time American-based fundamentalist and Pentecostal/charismatic churches were spreading across the country. At first, particular missions worked in discrete, carefully selected areas, but more recently, there has been competition for church membership, even among relatively small populations.

Different Christian denominations have brought an array of influences. Even within the individual missions there were different interpretations and styles of teaching. This has meant that for some societies, the changes brought by Christianity have been dramatic, while for others, Christianity is now perceived as part of their tradition. For example, in some coastal areas, the London Missionary Society employed Polynesians as mission teachers, believing that similarities in language and culture would make the work of conversion easier. As well as a new religion, these teachers brought new forms of material culture, both Western and Polynesian, and their influence contributed to the formation of the first Independent Church in PNG, the Papua Ekalesia, in 1962, which later merged with the Methodist Church to become what is now the United Church of PNG. In other PNG societies, the tensions between Christianity and traditional religious practices are far more apparent.

PARAGUAY

Paraguay, a landlocked country in South America, has 6.8 million inhabitants according to the 2002 national census; the main global religions present in Paraguay are Roman Catholicism (89%), Protestantism (11.7%), marginal Christianity (1%), other world religions (>1%), and new religious movements (<1%).

Roman Catholicism

The Roman Catholic Church entered with Spanish colonization, establishing the Asunción diocese in 1547. The institutional presence of the Church, however, remained weak for centuries.

Jesuits and Franciscans

From 1609 until their expulsion in 1767, the Jesuits baptized 1 million Indians. When the Treaty of Madrid (1750) transferred ownership of the Jesuit missions from Spain to Portugal, the pope supported their closing.

The Bishops' Conference and Liberation Theology

After independence (1811), dictators kept the Roman Catholic Church under tight control, annexing its lands and directly appointing clergy and bishops.

The Second Vatican Council (1962–1965) and the Medellín Bishops' Conference (1968) strongly affected Paraguayan bishops. In 1967, Archbishop Mena Porta ended the patronage system, pulling clerical appointments back into church power. Dictator Alfredo Stroessner's cruelty made bishops sympathetic to liberation theology, which proposed an active role for the church in establishing a just society.

Pope John Paul II's 1988 visit stimulated a successful popular uprising against Stroessner (1954–1989). The current president, Fernando Lugo, is the former San Pedro bishop (1994–2005) and a liberation theologian.

The Catholic Charismatic Renewal

The Catholic Charismatic Renewal (CCR) arrived in Paraguay in the 1970s, stressing a personal relationship with the Holy Spirit and a strict morality. The CCR had 106,480 participants by 1995, representing one third of all active Catholics. The Bishops' Conference supported the CCR to retain membership.

Mainstream Protestantism

The first British missionaries—Methodist Episcopalians and Anglicans—entered Paraguay in 1886. German Lutherans arrived in 1893, followed by U.S. Seventh-Day Adventists in 1900. American Disciples of Christ and Baptists entered the country in 1916 and 1920, respectively. The Orthodox Church arrived in Paraguay with Russian and Ukrainian immigrants in 1918 and 1925. Russian Mennonites arrived in 1930, followed by Mennonites from Canada and Europe during World War II. None converted Paraguayans in great numbers.

Pentecostalism and Neo-Pentecostalism

U.S. Assemblies of God missionaries arrived in 1945, while the Church of God (Cleveland) opened its mission in 1954. Until the 1990s, Pentecostal success was limited. What was more successful was a local brand of Pentecostalism, El Pueblo de Dios (The People of God), founded in 1963. Brazilian neo-Pentecostal churches, emphasizing faith healing and prosperity, started using old cinemas in the mid-1990s as meeting places. The Universal Church of the Kingdom of God and God Is Love attracted a modest membership.

Marginal Christians

The Jehovah's Witnesses arrived in 1924 and had 11,805 members by 2002. The Church of Jesus Christ of Latter-Day Saints opened its mission in

1950. They claimed 50,256 members by 2002, but only 9,374 self-identified as Mormons in the census. Both eagerly seek to proselytize and with some degree of success.

Other World Religions and Transnational Religious Movements

Other global world religions in Paraguay are Buddhism, Judaism, Islam, and Hinduism. All arrived with immigrants, and none proselytized beyond their own ethnic group. The Jews established their first synagogue in 1917.

Since the 1990s, globalization has led to the growth of transnational new religious movements in Paraguay. These include Baha'i, the Unification Church, Umbanda and other African Brazilian religions, Hare Krishna, and Soka Gakkai. Their membership is modest but growing.

PENTECOSTAL MOVEMENTS

Pentecostal movements form a relatively recent stream of Christianity, currently comprising about

a quarter of Christians worldwide. Significantly, Pentecostal movements account for a large share in the enormous growth of Christianity in the 20th century. Pentecostal movements—also known as Pentecostalism—should be seen as a type of Christianity rather than as a denomination or a single religious movement. As such, Pentecostal religiosity takes many different forms; both insiders and outsiders use the term *charismatic Christianity* as a synonym.

In their theology, the majority of Pentecostals acknowledge the classical evangelical doctrine of repentance from sin and conversion to Jesus Christ and a view of the Bible as the fully inspired and authoritative word of God and have a strong missionary zeal. Pentecostal spirituality is also strongly affective, stressing the relationship with Jesus and/or the Father God after conversion as something that is very real. Similarly affective and distinctive for Pentecostal spirituality is the emphasis on the reality of the Holy Spirit—God the Spirit of the Christian Trinity—who gives the believers “gifts” that empower them, such as *glossolalia* (“speaking in tongues,” i.e., the utterance of an incomprehensible spiritual “language”), prophecy, and healing. Here, Pentecostals follow and reenact what Karla Poewe has called a “first century schema,” exemplified in the outpouring of the Holy Spirit on the disciples of Jesus Christ on Pentecost (Acts 2). The gifts of the Spirit are also called *charismata*—hence the adjective *charismatic* in *charismatic Christianity*. A central doctrine of classical Pentecostal denominations is that the gift of glossolalia is the sign that a believer is “baptized” in the Spirit. Classical Pentecostal theology similarly sees a difference between being born again and being baptized in the Spirit, the latter being a separate stage in the spiritual growth of a believer. In later Pentecostal movements, this relation is understood as less strict, and the intrinsic link between Spirit baptism and glossolalia is loosened. Distinctive for Pentecostal praxis and piety is this emphasis on experiences of the Spirit. Pentecostal believers thus see the reality of the Spirit in their lives and in the church demonstrated through the gifts of the Spirit. Characteristic for Pentecostal piety is the central role of the emotional body as a “channel” that receives and transfers the Holy Spirit. Through the emphasis on the direct inspiration of the Holy Spirit and the spiritual empowerment of believers,

Pentecostal spirituality is often highly creative and versatile, adapting to local cultural circumstances, which is one of the reasons it is an extremely viable form of Christianity worldwide.

Historical Development

Pentecostal movements have their roots in the Azusa Street Revival of Los Angeles, in 1906, led by the African American preacher William Seymour. However, this revival, albeit significant for its experiences that would define the new Pentecostal movements of the 20th century, was preceded by several streams of earlier North American revivalist evangelicalism of the Holiness movements. At the turn of the 19th century, more believers from the Holiness stream were convinced that a new visitation of the Spirit was at hand, finding evidence in experiments with glossolalia and other gifts of the Spirit. Pentecostalism stems for a large part from Anglo-Saxon revivalism, incorporating Methodist ideas of spiritual regeneration as a consequence of being “born again.” As such, Pentecostal movements fit into a pattern of revivalism and “awakenings” that has been part of American history in the past three centuries. The “awakenings” provided Pentecostalism with what can be called a revival structure, in which individual salvation, intense religious experiences, and the expectation of the dawning of a new era are central. The revival structure of Pentecostal religiosity provides an endemic charisma to the movements, which causes them to constantly reinvent and revitalize themselves.

At other points in history, and in a number of cases unrelated to Western church history but rather occurring in missionary contexts, other Christian movements saw Pentecostal-like experiences that were understood as visitations of the Spirit. Several authors have also pointed to the influence of African American spirituality in the emergence of Pentecostal religion. Walter Hollenweger, the father of contemporary Pentecostal studies, has summed up this African American influence as follows: an oral liturgy, a narrative theology and witness, a reconciliatory and participatory community, the inclusion of visions and dreams in worship, and an understanding of the relationship between body and mind revealed in healing by prayer and liturgical dance. The African

American heritage may also account for traits of social liberation that can be found in the theology and praxis of Pentecostal movements.

The Azusa Street revival indeed was successful in claiming that the church was experiencing a new Pentecost, available to all people in our time. Moreover, the revival spread rapidly, not only in North America but in other parts of the world as well: No later than 1907, the Pentecostal movement had reached the European continent. What was striking about this revival was not only the occurrence of unusual religious experiences and the unprecedented growth of the movement but also its inclusive character, giving room to interaction between people of different racial descent as well as the granting of authority to women in the revival meetings. Both racial integration and the role of women became controversial issues in Pentecostal movements, however. Early Pentecostal denominations in the United States divided along racial lines, actually creating ethnic churches. In several Pentecostal churches, women acquired leading roles, one of the most notable being Aimee Semple McPherson, founder of the International Church of the Foursquare Gospel in 1927. In general, however, Pentecostal churches have chosen to restrict leadership of women, often excluding them from teaching and church administration. More recent Pentecostal streams are more open to the leading role of women while still maintaining very outspoken gender distinctions, which are believed to be biblical.

Pentecostal Expansion

The real expansion of Pentecostal movements started after 1940, through an increase of itinerant ministries and missionary initiatives from Pentecostal denominations. A significant development in this respect is the spread of Pentecostal religiosity to the mainline churches. In 1960, the Episcopal priest Dennis Bennett of Van Nuys, California, testified to his church that he had been baptized in the Spirit and was blessed with the gift of glossolalia. Although there is evidence of similar experiences happening earlier in other places, this event is usually seen as marking the rise of what came to be known as the Charismatic Renewal, a movement that sought to incorporate Pentecostal experience within the mainline churches. Since the

1960s, the Charismatic Renewal has spread to a wide range of churches, including the Roman Catholic Church (1970). After the 1970s, different varieties of Pentecostal movements have emerged, often labeled as *neo-Pentecostalism* but in fact comprising different doctrines and practices. An important U.S.-derived form of neo-Pentecostalism was introduced in the 1980s by the Vineyard movement, which infused a middle-class, “feel-good” element into intense religious experiences. At the other end of the neo-Pentecostal spectrum, we find various movements active with a so-called prosperity-type of belief and practice. Although controversial within the Pentecostal world, prosperity Pentecostalism has become very popular throughout the world, and “health and wealth” preaching has even become a common image of Pentecostal religiosity. The most important recent development of Pentecostal movements is the fact that Pentecostalism has become the religion of the Southern Hemisphere. In particular, Latin America, sub-Saharan Africa, and East Asia have become regions where Pentecostal religiosity has become an extremely visible form of Christianity, in some cases being even the dominant form of Christendom. It is expected that this explosive growth of Pentecostal movements in the Southern Hemisphere will continue for some time. On a global scale, we see that Pentecostal religiosity spills over into different churches and denominations more and more, making the categorization of Pentecostalism as a distinct religious form less evident.

PENTECOSTAL MOVEMENTS IN LATIN AMERICA

See Latin America

PEOPLES TEMPLE

The Peoples Temple was a socialist religious sect that rocketed to international prominence in 1978, when more than 900 members of its intentional community in Guyana, South America, took their own lives by drinking cyanide-laced Flavor Aid or were shot for their refusal to do so. The group was led by the charismatic self-styled prophet Jim Jones, whose lifelong battle for racial integration and social equality won him accolades from civil rights organizations but who, in the years leading up to the mass suicide, demanded increasingly authoritarian control over his followers and ratcheted up his rhetoric against what he saw as a conspiracy by a coalition of the U.S. government, the media, and a group of ex-followers to undermine his vision and destroy his movement.

Jones was born into the fractured landscape of racial and class tensions that would become his central concern. His birthplace was the racially segregated Lynn, Indiana, and while Jones attributed

the beginnings of his political and theological radicalism to his outspoken mother, he claimed that his father was a member of the Ku Klux Klan (although there are no records of his membership). Jones as a child and adolescent was drawn to the emotionalism and progressive social values of the various Pentecostal churches he attended with his mother, but he complained that the churches tended to pay more attention to a style of worship than to furthering the egalitarian sociopolitical values of the faith.

As a young man in the early 1950s, Jones began to discover his sizable talents as an evangelical faith healer. Word of these healings spread, and Jones began appearing in churches in Indiana and beyond, manifesting Pentecostal gifts of the Spirit and laying his hands on the sick to great fanfare among parishioners. Even as his reputation as a faith healer grew, however, Jones saw the practice as simply a means by which to advocate for racial integration and socialism. He required that churches in which he appeared be integrated and even asked that Black parishioners sit up front, which sometimes angered the local community or church elders. As the associate pastor of the Laurel Street Tabernacle in Indianapolis, Jones encountered strong resistance to integrating the congregation. Consequently, he left with a chunk of the membership to start his own church, Wings of Deliverance, which in 1956 he renamed the Peoples Temple.

Jones was significantly influenced by the charismatic Black preacher and self-proclaimed messiah Father M. J. Divine, whose Philadelphia Peace Mission Jones visited several times in the late 1950s. As was the case with Divine, Jones's followers began referring to him as "Father" or "Dad," and the People's Temple was increasingly organized in a strict patriarchal fashion with Jones as its messiah who would deliver the flock out of the harsh racial and class inequalities of this world and into a utopian Promised Land. In Indianapolis and afterward, Jones began to more openly replace Christian theological tropes with socialist or communist ones, such as rejecting what he called the "Sky God" of Christianity in favor of communist principles. In 1960, the People's Temple was accepted as a Disciples of Christ congregation; however, Jones continued to elevate socialism as the true ideal and to view the Bible as a "paper idol" that had supported discrimination.

In 1965, the group emigrated to Redwood Valley, California, spurred by Jones's acute fear of nuclear apocalypse (he believed that parts of California might be spared) and by the racial and political resistance they encountered in Indianapolis. In California, the Peoples Temple put into action its communitarian ethos—many of its followers living together on the land in Redwood Valley—and underwent a period of success and expansion, opening satellite churches and establishing income-producing “care homes” for kids and the elderly. After relocating headquarters to San Francisco in 1975, Jones began to mix socially with progressive luminaries and politicians, but the group's success was eventually counterbalanced by media scrutiny and by a vocal coalition of critical ex-members dubbed the “Concerned Relatives.” Numerous scholars have argued that these external pressures, along with scrutiny from the Internal Revenue Service over the group's tax practices, deepened Jones's sense of impending collision with the corrupt outside world and spurred the group's exodus to the intended Promised Land in Guyana.

The beginnings of Jonestown in Guyana involved hard work, clearing land and building infrastructure, but by some accounts, the community was generally, in the beginning at least, in good spirits and optimistic about the project of creating a utopia devoid of class and racial stratification and bigotry. However, pressure from the United States continued—and continued to be foregrounded as a concern for Jones—most significantly in the guise of the Concerned Relatives, who sought the aid of the media, courts, and politicians and portrayed Jonestown as a concentration camp that had imprisoned its members against their will.

In 1978, Congressman Leo Ryan led a fact-finding delegation to Guyana that consisted of relatives of Jonestown members and the media. Ironically, Ryan seemed mostly impressed with the community until a member botched an attempt to stab him. The delegation left hurriedly thereafter, taking with them 15 Jonestown members who wanted to leave. Jones secretly dispatched gunmen to the airstrip who opened fire and killed Ryan and four others as they attempted to board their planes. Back at the community, Jones announced that hostile forces would inevitably respond with a vicious attack and that the most valiant course of action for Jonestown members was “revolutionary

suicide.” There was some argument and resistance, but most members appear to have taken the cyanide-laced drink willingly. Jones himself died of a gunshot wound, likely self-inflicted.

Scholars of new religions, particularly of new religions and violence, continue to view the People's Temple as perhaps the paradigmatic example of violence spurred by escalating hostility between a new religion and its adversaries in the outside world (the government, ex-members, the anticult movement). Such theories of “extrinsic causation” lead to explanations of violence in which the opponents of the new religion are implicated, by virtue of their emphatic opposition, in the violent culmination. It is also worth mentioning that Jonestown remains, for anticultists and those broadly antagonistic to new religions, a paradigmatic “brainwashing cult.” While theories of “brainwashing” have systematically been rejected by U.S. scholars and courts as unscientific attacks on civil liberties, anticult movements still exert a wide-ranging influence in Europe and internationally; in this context, the specter of Jonestown aligns with other violent groups more well known in Europe, such as the Solar Temple and Aum Shinrikyô. In an increasingly diverse globalized world, Jonestown throws a long shadow and continues to influence responses to and interpretations of religious belonging and conflict within plurality.

PERENNIAL PHILOSOPHY

The perennial philosophy, or *philosophia perennis*, may be understood as a self-consistent metaphysical

and ultimately soteriological doctrine regarding the nature of reality, which has been re-adumbrated in various formulations both historically and cross-culturally. In popular use, it has come to imply the common philosophical themes that underlie the diversity of the world's religious traditions.

The Term *Philosophia Perennis*

Historical Origin

The first historical use of the term *philosophia perennis* has been traced to the 16th-century Vatican librarian Agostino Steuco, who authored a seminal work of that title. It has been more popularly thought to originate with the celebrated philosopher of the Enlightenment, Gottfried Wilhelm von Leibniz, who made occasional use of the term in private correspondence.

Steuco was influenced by the Renaissance Platonists Marcilio Ficino and Giovanni Pico della Mirandola, themselves influenced by Platonic, Neoplatonic, and Hermetic philosophic currents, who made use of the closely related term *prisca philosophia* or *philosophia priscorum*—the venerable philosophy—emphasizing the continuity of the philosophic tradition from ancient quasi-mythical figures such as Hermes Trismegistus and Pythagoras through Neoplatonic philosophers such as Plotinus and Proclus. Ficino's views were also shaped by his earlier contemporary, the Byzantine Platonist Gemistus Pletho. Another earlier contemporary, the Christian cardinal Nicholas of Cusa, similarly sought to articulate a conciliation encompassing different faiths and was to bear a further, independent influence on Steuco.

Variant Uses

The fundamental intuition supported by the notion of the perennial philosophy is that of a single unified principle encompassing all things, ascertainable through a single wisdom variously known by all peoples. This precisely conforms to Steuco's understanding, in company with those who preceded him in its articulation. In its narrowest sense, it implied a conciliation between Platonism and Christian theology; more broadly conceived, it sought a vision encompassing a multitude of philosophical understandings and religious faiths.

Leibniz's engagement with the notion of the perennial philosophy was much in keeping with earlier articulations, particularly as developed in his philosophy of harmony. More recent European and American philosophers—most notably Martin Heidegger, Karl Jaspers, and Wilbur Urban—predominantly influenced by Immanuel Kant and Georg Wilhelm Friedrich Hegel, used the term *perennial philosophy* to alternatively indicate certain common conclusions, widely recurrent problems, or persistent polarities within the history of Western philosophy. The term was also appropriated by neoscholastics in the early 20th century, most notably the Thomist philosopher Maurice De Wulf, to designate the common and enduring patrimony of high medieval scholasticism.

The notion of a common perennial philosophy in the context of modern Western philosophy is difficult to extensively support, simply given the divergence of philosophical positions and schools to be found therein: Little conjoins idealism and nihilism or dualism and physicalism, for example. Furthermore, whereas the original use of the term *philosophia perennis* did not divorce wisdom from piety or philosophy from theology, its use in this latter context is almost wholly constrained to the domain of philosophical ratiocination. In particular, it has no necessary bearing on the quest for the knowledge of God, which is central to the original conception of the *philosophia perennis*. The use of the term by modern neoscholastics to apply solely to St. Thomas Aquinas and his school may be seen as a narrowing of its original intent, while the appropriateness of this conception in light of the differences between medieval scholastics has been largely discredited, most notably by Étienne Gilson.

Philosophia Perennis et Universalis

Cross-Civilizational Implications

The universal intuition inherent in the perennial philosophy could only be broadly articulated in the context of the increased accessibility in the modern era of the intellectual and spiritual heritage found across civilizations. In this sense, the original expression of the *philosophia perennis* was a promise imperfectly realized, necessarily limited by a constrained knowledge of civilizations other than Christianity and Hellenism. A number of figures in the 20th century have argued for a

broader expression of the perennial philosophy that is truly cross-civilizational. The eminent Indian philosopher Sarvepalli Radhakrishnan recognized such a universal philosophy, while the brilliant English writer Aldous Huxley broadly popularized this wider notion of the perennial philosophy in his celebrated work of that title.

A school of thought that was to provide the most extensive articulation of the perennial philosophy constellated in the early 20th century around the French metaphysician René Guénon, the Anglo-Ceylonese scholar Ananda Coomaraswamy, and the German-Swiss philosopher Frithjof Schuon. Termed the *Traditionalist* or *Perennialist School*, its most significant scholarly expositor of the perennial philosophy was Coomaraswamy, considered by eminent figures such as Heinrich Zimmer and Mircea Eliade to be one of the finest scholars of the 20th century. In numerous later essays, Coomaraswamy explored various themes of the perennial philosophy, displaying a consummate mastery of Indian, Patristic, Platonic, and other sources. While his primary concern was to elucidate commonalities across multiple historical expressions of the perennial philosophy, Schuon and especially Guénon were more concerned with elucidating the doctrine of the perennial philosophy from metaphysical first principles.

Although Coomaraswamy nowhere attempted an extended systematic treatment of the perennial philosophy, such a compendium was completed under his inspiration by the American traditionalist Whitall Perry—a magisterial work that at once complements and supersedes Huxley’s earlier work. Perry’s work also displays in both commentary and organization its indebtedness to Schuon, whose “stations of wisdom”—his schema of spiritual virtues—form its architectonic structure.

Related Terms

Given the universal intuition inherent in the perennial philosophy, it should not be surprising to find closely related terms for the same conception across various civilizations. These include the Greek *prisca theologia*, *prisca sapientia*, *theosophia*, *hagia Sophia*, and *sophia perennis*; the Latin *lex aeterna*; the Arabic *din al-ḥaqq*, *ḥikmah ‘atīqah*, and *al-ḥikmat al-khālīdah*; the Persian *jāvīdān khīrad*;

the Sanskrit *ṛta* and *sanātana dharma*; the Pāli *akālika dhamma*; and the Chinese *li* and *dao*.

The Doctrine of the *Philosophia Perennis*

Origin

Although the lineaments of the perennial philosophy may be traced through comparative study of the world’s scriptures, mystics, and sages, its essential tenets may be derived from first principles. One necessarily and axiomatically begins with the metaphysical Absolute, that Ultimate Reality or Supreme Principle, indicated by terms such as the *Gottheit* or Godhead of Meister Eckhart, *Hyperousios* or Super-Essence of Gregory Palamas, *Ein Sof* or unmanifested Deity of the Zohar, the *Good* of Plato, the *One* of Plotinus, Ibn al-‘Arabī’s *al-Dhat* or Divine Essence, Śaṅkarācārya’s *Nirguṇa Brahman* or attributeless supreme Reality, the eternal Dao or Principle of Lao Tzu, and, with certain clarifications, Nāgārjuna’s *Śūnyatā* or Voidness.

The Absolute, as such, is necessarily without limitation, restriction, or determination and further is unique, all-encompassing, and an absolute totality. It is necessarily partless, as the finite and relative could have no common measure with its infinitude. Manifestation arises in consequence of its infinitude or universal possibility, yet manifestation is neither separate from nor identical to the Absolute. Ultimately, there are not two realities—the Absolute and manifestation; rather, the Absolute alone is real, and yet manifestation is the Absolute.

The Return

Man, as part of manifestation, participates in the inherently ambiguous relation between manifestation and the Absolute. Just as manifestation is not other than the Absolute, so man shares this indivision: Although man is not the Absolute, the Absolute is present in man. “There are two [selves] in man,” as Aquinas witnesses—higher and lower, principial and contingent, and real and relatively unreal. The Spirit, the trace of the Absolute within, is the Hebrew *ruah*, Arabic *ruh*, and Greek *pneuma* as well as the *daimon* or immanent genius of Socrates, Plato’s *hegemon* or leader within, the *funkelein* or divine spark of Meister Eckhart, St. Paul’s inner man, neo-Confucianism’s *liang-chih* or

inner sage, *ka* or spiritual essence of the Egyptians, and atman or Self of the Vedanta.

The Spirit is the essence and highest aspect of man; through it, man derives his entire existence, and through it also, man is not other than the Absolute. Man's realization of his identity with the Spirit is at once his perfection, his liberation, and his return to the Absolute, from which he has never been apart. This realization—the *theosis* of Hesychasm, *fanā* and *baqā* of Sufism, moksha of Vedanta, and nirvana of Buddhism—stands at once as the fulfillment and the final proof of the *philosophia perennis*.

can be divided into three periods: Inca, colonial, and national. Prior to the arrival of the Spanish conquistadors in the 16th century, the Inca Empire (Tawantinsuyu) spanned most of western South America. Inca religion was a state religion centered at the Temple of the Sun in Cuzco. As the Inca Empire expanded, new deities from conquered peoples were incorporated into the pantheon of gods and goddesses, while Inca religious beliefs and practices were implemented in conquered territories. The primary deity or creator god for the Inca is called Viracocha. The god's first offspring was the Sun; he created the moon, stars, earth, and human beings.

Although the Spaniards arrived in 1532, warfare against the Inca and neo-Inca empires, as well as civil war among the Spanish, delayed for roughly 40 years the spiritual conquest or Catholic conversion of the indigenous peoples of what the Spaniards called Peru. After the establishment of relative peace throughout the country in the 1570s, Catholic missionaries began to convert the indigenous population to Christianity. At first, these efforts were successful; however, by the 1600s, it became clear to church officials that many native Peruvians were not going to put aside their traditional beliefs and practices easily. In the 17th century, the Catholic Church pursued a number of anti-idolatry campaigns in an effort to destroy the indigenous religious traditions of the non-Spanish population.

The main targets of the Church were indigenous religious leaders who were considered to be direct competition to the missionary priests who desired to Christianize the natives. Although brutal and systematic, the Church and its extirpators were not completely successful in destroying the indigenous religions. Many indigenous Andean traditions are still in existence today. Sometimes these traditions are at odds with Christianity, and sometimes they are not. Throughout the colonial period, Spaniards relied on African slave labor. These slaves brought to Peru religious traditions from West Africa. Many of these traditions persist today in certain communities, though mixed with many Catholic elements.

With independence from Spain in 1821, Peru became a sovereign nation-state. The Catholic Church, staffed with Peruvian-born instead of Spanish-born clergy, maintained itself as the dominant religious institution of the territory. Although in the past half-century various Protestant

PERU

Peru, which lies on the Pacific shores of South America, has an extensive religious history that

denominations have come to play a more active role in the religious lives of individual Peruvians, Catholicism remains the preferred religion of a majority of Peru's citizens.

PHILIPPINES

The Republic of the Philippines contains more than 7,000 islands in the Pacific Ocean north of Indonesia. It was a Spanish colony that was ceded to the United States after the Spanish-American War in 1898 and received full independence in 1946. The population of more than 90 million people is 84% Roman Catholic, making it the largest Christian majority country in Asia. It is the third largest Catholic country in the world, after Brazil and Mexico; 9% of the population is Protestant Christian, and 5% are Muslim. Many of the Muslims are concentrated in the southern island of Mindanao, where the Moro Liberation Front has spearheaded a sometimes violent separatist movement.

Dissolution of Indigenous Culture

Originally, the main islands (Luzon, Visayas, and Mindanao) were not under a central or national government before the coming of the Spaniards in

the 15th century. As individually separate territories, they existed with their own simple form of government, peaceful economic activities, and naïve systems of worship. When the Spaniards came, the Indo-Malay tradition was totally replaced by a European orientation. Society became far more patriarchal and elitist. The islands were lumped together under the new name “Philippines” (after the Spanish king, Philip II). Persons, towns, cities, streets, vessels, and schools were named after saints, priests, Spanish kings or queens, or the Holy Family. The indigenous *barangay* (unit of government ruled by a *datu* and composed of 30–100 households) was changed into the rigidity of *pueblos* (towns) ruled by autocratic friars. The Bible was a secret book exclusive to the friars. Roman Catholicism as the state religion buried in oblivion the *Bathala* (“God”), the *anito* (“spirit of dead ancestor”), and nature worship of the indigenous communities. Sacraments and fiestas became important parts of the faith. Mass conversion of the early people was done by force. Muslim leaders in Manila were converted to Christianity, except for the Muslims in Mindanao.

After the Philippines became an American colony in 1898, Protestant Christianity helped disestablish Roman Catholicism as the state religion and introduced the ideas of liberalism and secularism: religious liberty, lay ministry, justice, democracy, public education, equality, and a democratizing religious tradition, namely, Methodism. The occupation by the Japanese in World War II, on the other hand, had little religious impact in terms of the variety of religions since the Japanese control was primarily an expansion of territory and power. The Japanese imperial army did desanctify the religious traditions of the Filipinos, however, by not allowing them to practice their faith.

At the end of the 19th century, the aspirations of the Filipinos for independence from the Spanish colonizers and a desire for the Filipinization of the Catholic Church helped foment a series of revolts led by Emilio Aguinaldo and Andres Bonifacio. Gregorio Aglipay, a Catholic priest, joined the revolt and, later, at the beginning of the 20th century, founded his own religious movement—the First Filipino Catholic Church, also known as the Philippine Independent Church or the Aglipayan Church.

From the early colonization up to the Japanese period, the islands were in indescribable chaos, as

manifested by a series of evacuations of people, summary execution, revolts, the death of innocent civilians, and religious prejudices among the Christian converts, Muslims, and folk religionists.

Islamic Insurgency and Government Response

The peoples of the southern island region of Mindanao consist of two ethnoreligious groups: Christians and Muslims, setting aside other residents who have also their own systems of worship and communities. Mindanao has been claimed as the ancestral land of the Muslims in the region, where at the same time Christian settlers are in the majority. The Muslim (Moro) separatist movement has been stimulated by the creation of independent Muslim states in the adjacent areas of Indonesia and Malaysia, and in the last decades of the 20th century, it was encouraged by a rising global Islamic activism.

Confronted by the rise of student activism, Muslim insurgency, and underground movements, the government opted to use militarism to wipe out the enemies of the state. President Ferdinand Marcos declared martial law in 1972 following the rekindling of Islamic nationalism caused by the Jabidah massacre committed by his regime. This ignited bloody wars against the Muslim rebels and the proliferation of insurgent movements. Christian vigilante groups were strategically formed and heightened the prejudice of the Muslims against the Christians. Together with the armed forces of the Philippines, these vigilante groups unleashed their might against the Muslim insurgents and the New People's Army in the countryside.

From 1970 to 2000, a series of wars and terroristic activities plagued the southern island region of Mindanao. Hostilities on a grand scale was the concern especially of the Mindanaoans, who sought the cessation of conflict on the island. In 2000, President Joseph Ejercito Estrada declared an all-out war with the Moro Islamic Liberation Front (MILF). Rebel camps were destroyed and military attacks in the surrounding areas left thousands of innocents dead in the battlefield.

The desire for justice and equal opportunities for Muslims propelled Muslim progressives to struggle for self-determination. This developed into efforts for autonomy led by Nur Misuari

through the establishment of the Moro National Liberation Front (MNLF). The goal of the MNLF is the establishment of an autonomous region with 13 provinces as stipulated in the 1976 Tripoli Agreement and the Final Peace Agreement in 1996. The autonomous region is still part of the territory and is under the sovereignty of the Philippine government. The controversies attached to some violations of the peace accord accounted for the escalation of violence in Mindanao.

Ustaz Hashim Salamat rejected the partial autonomy that the MNLF accepted in 1987. He proposed the secession of Mindanao from the national government and the establishment of an independent Islamic state. He separated from the MNLF and founded the MILF. And after the MNLF accepted partial autonomy in 1987, one of its council members, Hashim Salamat, broke away from the MNLF and founded the MILF. Salamat, an Islamic teacher (*ustaz*), proposed that Mindanao secede from the national government and establish an independent Islamic state. In 2001, the MNLF and MILF were reunited through a formal signing of a unity pact favoring the realization of the Bangsamoro (Moro nation) homeland.

The rise of the Abu Sayyaf Group (ASG), a third force, claimed to espouse the Muslims' quest for genuine independence and struggle for self-determination. A series of kidnappings of foreign nationals and killings and bombing in the archipelago were the major notorious activities of the group described by the MNLF and MILF as being contrary to the teachings of Islam. The ASG was viewed by some political analysts as an instrument of the military to sabotage the peace process and to intensify arms trade in the area. The military operations against ASG added to the litany of violence in Mindanao and the rest of the islands.

The implementation of the 1976 Tripoli Agreement remains controversial. The Muslims in Mindanao became violent and rebellious. Both Christians and Muslims tend to live in uncomfortable zones of antagonism and mistrust. The Government of the Republic of the Philippines (GRP) had formulated guidelines for peace talks to realize a genuine peace process in Mindanao. Often, the peace talks failed.

In 1997, a ceasefire agreement signed between the Ramos Administration and the MILF called for the cessation of hostilities in Mindanao. After

President Estrada's all-out war with the MILF in 2000, President Gloria Macapagal-Arroyo countered it by declaring an all-out peace in Mindanao. A series of peace talks followed, but alleged violations by both the government and the MILF of ceasefire agreements led to another war between the GRP and MILF in 2003. However, in July 2003, the GRP and MILF signed a bilateral ceasefire, and formal peace talks were reopened. However, Muslims, Christians, and indigenous peoples suffered from the escalation of violence and hostilities caused by the war. This again intensified the prejudices of Christians, who tagged the Muslims as terrorists.

The Memorandum of Agreement for Ancestral Domain (MOA-AD), which was supposed to be signed by the GRP and MILF on August 5, 2008, in Malaysia, was rejected by the Supreme Court as being unconstitutional because of a lack of consultation to the people by the two parties involved. The MOA-AD was supposed to contain the principles for the establishment of the so-called Bangsamoro Juridical Entity. Perceived as a better formula for the solution of the Mindanao conflict without a need to secede, it aims to expand the areas for the Autonomous Region in Muslim Mindanao by the addition of more towns and cities in North Cotabato, Sultan Kudarat, Lanao del Norte, Zamboanga del Sur, and Zamboanga del Norte. This was strongly opposed by the provincial governors and mayors. There was political disarray, and both Christians and Muslims in remote areas evacuated. Wars killed many civilians. The Muslims blamed the rejection of the MOA-AD on Christian politicians.

The quest for genuine peace in Mindanao has been enhanced by the establishment of the Autonomous Region in Muslim Mindanao through the Republic Act 6734 in 1989; the series of peace talks between the government and the Moro fronts and ceasefire agreements since the 1990s; the creation of zones of peace (demilitarized areas), also referred to as sanctuaries or spaces for peace, by civilian communities in the late 1990s; the conduct of interreligious dialogues through the Bishop-Ulama Forum (composed of Christian and Muslim religious leaders) since 1996; and the inclusion of peace education, Islamic studies, and Mindanao studies in the curricula at all levels. These are some of the major efforts of the government and civil

society aimed at understanding the real issues facing Muslims in Mindanao so as to enhance collaboration, unity despite diversity, and harmony among all parties. These and other future efforts, however, require all Mindanaoans and the entire Filipino community to transcend historical prejudices, religious resentment, and ethnic differences and to enter into the wider social field of acceptance and empathy.

PILGRIMAGE

A pilgrimage is a ritual journey to a sacred or otherwise special place. Pilgrimages are undertaken for a variety of reasons, including the search for physical or spiritual healing, as the fulfillment of a vow, as a prescribed act of religious piety, for commemoration of significant events, as the expression of national or ethnic affiliation, to memorialize the dead, and for acquiring the spiritual blessing of a particular holy figure or holy place. In addition, pilgrimages may be made to

secular or quasi-spiritual sites, as in a pilgrimage to Elvis Presley's home at Graceland, to war graves, or to Lenin's tomb. While pilgrimage may be an important part of spiritual practice within particular religions, it can be interdenominational as well. Pilgrimages enjoy a continuing and even increasing popularity in the contemporary world, ranging from localized journeys to national and international ones. Even localized pilgrimage sites may acquire national and international reputations through contemporary means of communication such as television and the Internet.

Pilgrimage as Journey

The idea of journey is central to pilgrimage, even when the journey is only metaphorical (as in the idea of life as a pilgrimage). Leaving home and traveling to a different place is the heart of a pilgrimage journey. And while the site to which a pilgrim journeys is important, and generally the focus of ritual, the journey itself is often significant as well, ritually, psychologically, and socially.

Pilgrimage is one way of entering into a relationship or connection with the spiritual world and spiritual beings. These beings are most often saints or deities who play a role within a particular religious tradition or to whom the pilgrim wishes to make a request or prayer. But pilgrimage may also be to sites of the dead, such as European war graves, or to sites where mass death or tragedy has occurred, such as the site of the 9/11 terrorist attack in New York City. Or it may be to a place where the body or relic of a holy person is entombed or that person's spirit is believed to reside.

Reasons for Pilgrimage

While a pilgrimage may be undertaken in response to life difficulties or situations of crisis, it is often engaged in voluntarily and undertaken according to the needs and desires of individuals. There are exceptions to this, however. In medieval times, for example, pilgrimage to Rome or other holy places was sometimes imposed as a penance, and pilgrimage to Mecca is one of the Five Pillars of Islam, enjoined on all devout Muslims as a journey to be made at least once in a lifetime, if possible. Drawing Muslims from around the world, it

reflects both the global spread of Islam and the diaspora of specific Muslim populations.

While the often voluntary nature of pilgrimage means that it can usually be undertaken at any time, certain days are especially attractive for pilgrimage to particular places—days that may be related to specific events associated with the pilgrimage site or with the holy figure with whom the site is connected. Thus, the central Islamic pilgrimage to Mecca occurs during the 12th month of the Islamic calendar. Veterans who participate in the Run for the Wall, a motorcycle pilgrimage to the Vietnam Veterans memorial in Washington, D.C., time their arrival for Memorial Day weekend. And Greek Orthodox pilgrimage to the shrine of the Madonna of the Annunciation (Evangelistria) on the Aegean island of Tinos is heaviest on two major holy days dedicated to Mary—the Day of the Annunciation on March 25 and the Day of the Dormition (Assumption) on August 15.

The participation in, and motivation for, pilgrimage varies widely with time, place, and religious tradition. In some cases, pilgrimage is especially appealing to the marginal, as it offers a chance for direct connection to the sacred world and sacred figures whose power can be used to address the problems and difficulties of life. In other times and places, pilgrimage has special appeal for certain ethnic groups, such as the Mexican Virgin of Guadalupe for Indians. In some religious traditions and at certain pilgrimage sites, it is women who are especially prominent, seeking support and help from divine figures such as the Virgin Mary or local Muslim saints.

Pilgrimage as Ritual

Anthropologists Victor and Edith Turner focused attention on the ritual dimensions of pilgrimage, likening it to a rite of passage during which important transformations take place. In such rituals, the participants are separated from normal life, go through a period of transition and transformation (in the case of pilgrimage, this period is the journey itself), and then return to their normal life in a new status or transformed condition. Such transformation may be in the physical or spiritual state of the pilgrim, such as being cured of illness or being in a renewed spiritual state. It may also be reflected in one's social status. Muslims who have made the

pilgrimage to Mecca, for example, acquire the status of hajj.

While the site itself may be associated with such transformations, the journey is also important. The Turners saw the journey as what they called a "liminoid" time, a period "betwixt and between," during which transformation takes place and/or receptiveness to the messages and to the transformation to come occurs. Hardship plays a role in creating such psychological and spiritual receptivity, and a hallmark of many pilgrimages is that some degree of difficulty is involved. In the past, especially, the difficulty was often simply undertaking the journey itself, as travel was hard, often dangerous, and certainly time-consuming. (Muslims from Asia and Africa, for example, might travel for months to reach Mecca.) In today's world of easier and faster transportation, the difficulty might simply be financial or a matter of finding the time for the journey. But the journey may also be deliberately made more difficult by the pilgrim. For example, while one might go directly to Santiago de Compostela, in Galicia, Spain, thousands of pilgrims every year make the journey on foot, beginning their journey in southern France. In Nepal at the Manakamana temple, although pilgrims may now take a tram to the temple at the top of the mountain, many pilgrims choose instead to make the 4- to 5-hour hike to the top. Fasting and other physical disciplines may be part of a pilgrimage journey, or one may perform arduous acts at the site itself, such as going inside a church on one's knees. Such acts represent the personal sacrifice that is often considered a necessary part of pilgrimage. In addition, as psychological studies have shown, suffering in the course of a rite of passage (such as initiation or pilgrimage) makes the status achieved thereby more valued by the participant. Even in the contemporary world, in which suffering is less glorified, such difficulties and acts of sacrifice serve to set pilgrimage apart from ordinary journeys.

While pilgrimage itself may be considered a rite of passage, as Turner and Turner suggest, it may also be associated with other rites of passage. Greek women whose prayers to the Madonna for children have been answered may bring the child to a Marian shrine for baptism. Young Soviet couples used to make pilgrimages to Lenin's tomb after their wedding. Death is another occasion for

pilgrimage, as in the case of the holy Indian city of Banaras, where many Hindus go to make their final passage into death.

Turner and Turner also emphasized what they referred to as *communitas*, the state of social equality that they saw as a characteristic of groups of people who share the liminal period in a rite of passage such as initiation or pilgrimage. During the journey, they suggested, social differences and social hierarchy are erased or suspended as participants share in this common experience. Other analysts have disagreed, however, pointing out that ethnic and other social differences among pilgrims may continue to play important roles both during pilgrimage and at pilgrimage sites. Moreover, pilgrimage sites themselves are often locations of conflict and contestation, not only among groups of pilgrims who may lay differential claims to a site but also between pilgrims and religious authorities, who may have views different from those of the pilgrims regarding a site's purposes.

Pilgrimage Sites

Pilgrimage sites can be established in a variety of ways. In some cases, the origins are lost in time, as with the holy wells of Ireland, while in others, they are associated with specific historic events. Some are associated with the lives of holy figures, as places where they have manifested or that are associated with significant events of their lives. Pilgrimage may connect with the mythology of a site, as when Christian pilgrims come from all over the world to Jerusalem during Holy Week to reenact the drama of Christ's crucifixion. Pilgrimage sites may be in places that are central to a religion, such as Rome or holy cities such as Banaras in India, but often, they are in more marginal places, away from the centers of religious and secular power.

In the Christian tradition, a number of pilgrimage sites have been established through apparitions or visions, holy figures appearing to ordinary human beings, usually humble or marginal persons such as children, shepherds, or the elderly. Marian apparitions are particularly common, and several major Catholic pilgrimage sites such as Lourdes in France and Fatima in Portugal were established in this manner. Often in such cases, the founding of these pilgrimage sites came through popular belief

and practice, with official recognition by church authorities only coming later and sometimes reluctantly, reflecting the importance of popular belief and practice in pilgrimage generally. The reputation of such sites becomes established through word of mouth and, especially in the contemporary world, through the media, including the Internet. A recent example of this is the apparition site of Medjugorje in former Yugoslavia. Sites that are not officially recognized by religious authorities may still be important to pilgrims, even when their power is officially denied or downplayed. The practice of pilgrimage itself bestows power on the site and on whatever holy being is connected with it. As Turner and Turner suggest, pilgrims often “vote with their feet.”

There may be some particular thing that is the focus at a pilgrimage site—a church, a tomb, or an icon. Or a material object may be the consequence of pilgrimage, as when a church is built at an apparition site or a memorial is erected to commemorate some other event. Sometimes, the terrain gives rise to a pilgrimage site as part of an animate landscape. In traditional Chinese spiritual practice, for example, mountains have a sacred quality and become pilgrimage destinations. And the energy vortexes of Sedona, Arizona, draw many pilgrim/tourists to the area’s red rocks to experience their energetic power. Even living people may become the object of pilgrimage, as with some holy figures in India. While pilgrimages are usually connected in some way to special physical locations, it is important to note also that some pilgrimages are wanderings, which may or may not connect with specific sites. “Peace Pilgrim,” for example, the woman who covered thousands of miles on foot for peace in the United States, had no particular destination. Her pilgrimage itself was both the reason and the message of her journey.

Pilgrimage sites may be viewed as having “catchment areas”—that is, a geographical range from which pilgrims to the site are drawn. Some pilgrimage sites, such as Irish holy wells, are localized. Other sites are global in their reach, such as Mecca, which draws Muslims from all over the world, and Lourdes, which has a similar draw for Catholics. Others sites have nationalistic associations and can also connect diaspora populations to their homelands. The site of Our Lady of Czestochowa in Poland, for example, is a powerful

symbol of Polish nationalism, drawing not only Polish pilgrims but also Poles from outside the country.

Time and Boundaries in Pilgrimage

While the movement through space and the sacred spaces formed by pilgrimage sites are obvious elements of pilgrimage, a less obvious element is time. Not only do pilgrims partake of a “liminal” time during their journey, but there is also time in the sense of history and myth associated with pilgrimage sites—a time that the pilgrim encounters and participates in during contact with the sacred site and with events that are believed to have occurred there. Past thus meets present at such sites in the objects and rituals that are part of the site, and the mundane world meets the spiritual as the pilgrim makes contact with holy figures and events. At the same time, such sites are places in which it is often believed that miraculous or powerful events may happen again. And in turn, the occurrence of such events further legitimates a pilgrimage site and adds to its power and attraction. By its very nature, a pilgrimage site thus transcends notions of boundedness, blurring or erasing the boundaries between past and present and between the material and the spiritual world. But pilgrimage sites blur boundaries in other ways as well, for although they often seem concretely located, the pilgrims who come there travel from numerous places and then disperse, carrying home with them something of the power of the sacred site, whether in the form of healing or spiritual blessing, objects that have acquired the power of the site, or images of the site or holy beings who are believed to manifest at the site.

In this sense, at pilgrimage sites, the spiritual both connects to the physical and is made manifest and inheres in material objects. This can be seen in the power of circulating images, such as the images of Our Lady of Fatima, which may travel far from her pilgrimage site, and while never being mistaken for the original, nonetheless participate in the power of the pilgrimage site from which the image is derived. A pilgrimage destination is thus a web, with the site at its center and multiple strands that connect pilgrims and the site, to each other, to other sites, to local communities, and to larger global political and social institutions and forces.

Pilgrimage and Tourism

Some analysts, rather than focusing on the ritual nature of pilgrimage, have emphasized instead pilgrimage as movement, which ties pilgrimage to travel and tourism. Pilgrimage sites may draw visitors who, rather than being motivated by spiritual goals, wish to participate in “traditional” culture or colorful events, as with the “yupeez” who come to the Andalusian pilgrimage site of El Rocio in Spain. Some who come to established pilgrimage sites may have their own spiritual agendas, as do New Age pilgrims, who make international journeys to places such as Lourdes in France and to ancient sacred places such as Stonehenge, Macchu Pichu, or the ancient Greek ruins of Eleusis. In addition, pilgrimage forms a continuum with other, less dramatic visiting of sacred places such as local churches.

There have been recent discussions regarding the differences between pilgrimage and tourism. Some have used the term *spiritual tourism* to refer to travel to religious sites for the sake of sightseeing rather than for the experience of sacred or special power. Distinctions between pilgrimage and tourism are not always easy to maintain, however. Both historically and contemporarily, pilgrimage not uncommonly involves some degree of sightseeing as well as spiritual purpose. In addition, a journeyer whose intent is not necessarily to make a pilgrimage may find that, in the end, her or his journey has actually become one. Nonetheless, it might be argued that a focus on the journey, on a purpose, and on the site or sites to be visited, and particularly with some goal of transformation, is the hallmark of pilgrimage proper.

Some analysts have also challenged the category of pilgrimage itself, pointing out that in many languages, there is no exact equivalent to the English term and that, moreover, some traditions distinguish several kinds of ritual journeys. In modern Greek, for example, the term *proskinima*, which is used to refer to pilgrimage, is also used to refer to the conventional devotional acts one performs when visiting any church. In Islam, there is a distinction between the hajj, the obligatory pilgrimage to Mecca, and *ziyara*, a journey to a religious shrine such as a saint’s tomb. Thus, to refer to certain kinds of religious activities or certain kinds of travels as “pilgrimage” may obscure their

connections to other kinds of ritual behavior, on the one hand, and may blur the significant differences between the various activities we term *pilgrimage*, on the other.

Pilgrimage and Modernity

Some see pilgrimage as premodern or antimodern, whereas others see it as exemplary of the modern or postmodern age. Clearly, pilgrimage, far from dying out in the contemporary world, enjoys a widespread and even increasing popularity, whether it takes the form of traditional religious pilgrimage, New Age pilgrimage to ancient sites, or “religious tourism,” aided and promoted by improved means of transportation and by media, such as the Internet, that disseminate knowledge about pilgrimage and pilgrimage sites. The flexibility of pilgrimage and the focus, especially in the West, on pilgrimage as a means of individual transformation as well as the ability of pilgrimage to draw together diasporas and far-flung populations of believers may make it particularly suited to a contemporary age. This flexibility is part of pilgrimage’s popular appeal and is also related to the fact that it need not be overseen by any religious authority or confined to a particular religious tradition. At the same time, while it is facilitated by the forces of modernity, pilgrimage is a counter to secularism, insofar as it posits, and promotes, the idea of a nonmaterial world that can be encountered by a journey to a special place.

PLURALISM

Through intensified flows of people, material objects, and ideas between different parts of the world, globalization has prompted the dispersion of cultural forms and created new senses of community and loyalty. In some areas, this has led to increased diversity, while in others, it has spurred processes of homogenization. Regardless, the resultant confrontations with the new, strange, or different have made pluralism—and the proper ways to respond to it—a pertinent issue. The entry provides a conceptual outline of the term *pluralism*, and it addresses the logical premises as well as the normative implications inherent in the concept. It further addresses the relationship between globalization and pluralism and gives examples of how intensified communication and migration as key features of globalization contribute to religious pluralism and the pluralization of religious traditions.

Conceptual Outline

The term *pluralism* is used in a variety of ways, depending on context and interests: Sometimes it designates a state of affairs, sometimes an ideal for a hoped-for future, and at other times, again, a feared scenario. These different uses can be classified into two main categories, described below.

Pluralism as the Existence of More Than One of a Given Kind Within a Delimited Space

The word *pluralism* here connotes plurality or diversity, and it is mainly used as a mode of description. Religious pluralism understood in this sense can be identified at different levels:

1. *Religious pluralism understood as the co-existence of more than one religious tradition within a given society:* In this sense, most societies have a certain degree of pluralism, even though such an assessment might run contrary to official representations and state policies on religion (e.g., in societies where strict mono-religiosity is promoted). Such diversity might be the result of historical processes of state formations and the drawing of boundaries, it might be the result of waves of conversion or of revivalist movements, or it might be the result of migration. Often, this will also imply a certain degree of pluralism regarding the coexistence of differing types of religious organization within a given society. Furthermore, if one wants to assess the level of pluralism from the perspective of a given state—that is, the number of publicly recognized religions—the focus will often be on organizations as many states do not recognize abstract traditions but only specific types of organizational structures and polities.

2. *Religious pluralism understood as the coexistence of different institutional or interpretational forms within a given religious tradition:* This perspective addresses the pluralism that exists within broader categories such as Christianity, Islam, Hinduism, and the like. Christianity, for example, encompasses diverse and sometimes conflicting traditions and/or structures, such as Protestantism, Pentecostal Christianity, Catholicism, and the Coptic Church, and each of these might encompass a range of different institutions, practices, and beliefs.

3. *Religious pluralism as the commitment to and/or combination of beliefs and practices from different religions at an individual level:* The existence of such diversity may be seen as part of a process where overarching dominant religious authorities collapse, leaving room for individuals to build their own religion without restrictions from certain institutions and traditions.

Pluralism as a Value or a Moral Principle That Asserts Diversity as a Positive Thing That Should Be Supported and Protected

Understood in this sense, pluralism designates the norm that people of different backgrounds and orientations can peacefully coexist within the same society. Here, the diversity is inscribed in a normative system that asserts diversity and the toleration of differences as intrinsic to “the good society”; discussions of religious pluralism can thus also be seen to intersect in different ways with discussions of, for example, multiculturalism. Religious pluralism as a value is reflected in some of the following themes:

1. Religious pluralism as a human rights issue:

The right to religious freedom can be perceived as an intrinsic precondition for religious pluralism as it simply implies the right to differ. The positive affirmation of religious pluralism is stated in, among other places, the various human rights documents, such as the Universal Declaration of Human Rights (1948), the European Convention of Human Rights (1950), the International Covenant on Civil and Political Rights (1976), and the Declaration on the Rights of People Belonging to National or Ethnic, Religious or Linguistic Minorities (1992). These documents are the foundation of different kinds of monitoring activities, as for example, the annual *Report on Religious Freedom*, issued by the U.S. Department of State or the work of the United Nations (UN) special rapporteur on freedom of religion or belief. They also form the basis for the work of a range of human rights and minority rights nongovernmental organizations (NGOs) such as Minority Rights Group International or the International Association of Religious Freedom. The Buddhist organization Soka Gakkai may also be mentioned here as it has an NGO consulting status at the UN on issues of religious freedom and diversity.

2. Religious pluralism as inscribed in state legislations: Many states have the right to freedom of religion and, thus, a formal recognition of religious pluralism inscribed in their constitution. Such legal frameworks for recognition can appear both as individual freedom rights (to belief, to practice, or to apostasy) and as the recognition of various religious organizations, often related to

certain privileges such as tax exemption, marriage license, birth registration, or even citizenship.

3. Religious pluralism as linked to interfaith dialogue and ecumenical work: Religious pluralism here implies the assumption that one religion is not the sole and exclusive source of truth and that some level of truth and value exists in other religions too. Therefore, diversity in religious expressions should be respected. Often, interfaith and ecumenical work is Christian based; it evolves around notions of peace, tolerance, and understanding in a global perspective, and it focuses on dialogue between “world religions.” It might be expressed both through specific organizations such as the Institute of Interfaith Dialogue, IFCO (InterFaith Cultural Organization), or the World Council of Churches and through broader international political projects such as the ASEM (the Asian-European Meeting), which has the promotion of religious pluralism as one of its objectives.

Pluralism as a Way of Observing the World

In one perspective, these two categories of pluralism can be seen as representing a split between a descriptive approach that simply presents the fact of diversity and a normative approach that supports this diversity as a good and valuable thing. There is, however, also some shared logical premises underlying both kinds, since the notion of pluralism can be seen to imply the simultaneousness of (1) *difference* that distinguished the many instances (for example Buddhism/Islam/Christianity/Hinduism), (2) *identity* that asserts that they are of a certain kind (here religion), and (3) a *shared space* that frames the coexistence as exactly that—*coexistence* (e.g., a state, a community, or a country). To illustrate, the term *pluralism* would seldom be used to describe the fact that most people in Japan claim adherence to Shinto while most people in the United States occasionally eat burgers, as this implies neither the identity of instances (Shinto and burgers) or a shared space in which they take place (Japan and the United States). The term can more readily be applied to the fact that, according to a 2008 estimate, roughly 100 million people in Japan identify themselves as practicing Shinto while maybe 90 million people claim adherence to Buddhism—numbers that suggest (1) the existence of different religious traditions within the same

society and (2) that many people in Japan feel an affiliation with more than one religion (the total population of Japan is roughly 128 million).

In this example, the shared space is the Japanese state, but in another perspective, people living in the United States and Japan might very well be perceived of as part of a shared transnational or global space in which various instances can be identified as coexisting. An example of this could be the Soka Gakkai International, which has its base in Japan and branches in 190 countries, among other places in California. As a communicative space shared by its members, the Soka Gakkai and its concept of “world citizen” frames different kinds of pluralism among its members—for example, national and ethnic pluralism.

Pluralism can thus be perceived of as a certain mode of organizing the world that implies the “bringing together” of phenomena as being of the same kind, and since this “bringing together” is always performed by someone who asserts the premises of identity, this is where the more subtle normative implications of the concept can be seen. To align oneself with others as being of the same kind is thus a much used strategy for obtaining recognition and access to power, as when private Muslim universities in The Netherlands currently seek to adapt to institutional structures of the formal European model for higher education (the Bologna-model bachelor’s, master’s, PhD) in order to become publicly recognized educational institutions. Oppositely, being of the same kind may rigidly be refused, as when Hindu nationalists reject the notion of Hinduism as one religion among others alongside Buddhism, Sikhism, and Jainism and instead promote the notion of *Hindutva* (Hindu-ness) and *Hindu rashtra* (Hindu polity or Hindu nation) as an overarching category for them all. So inscribing different phenomena as instances in a structure of pluralism is by no means a neutral effort but can be seen as part of negotiations of influence.

Globalization and Pluralism

An important characteristic of globalization in relation to pluralism is that it implies an intensified flow of people, objects, money, and knowledge, and these flows bring into contact elements that were previously relatively isolated. Through this,

globalization has facilitated the creation of new shared spaces and new senses of loyalties and community that frame new kinds of pluralism. One of the shared spaces frequently used to frame the assessment of religious pluralism (as also indicated in the examples of pluralism above) is a country or a state, often the nation-state, understood as the demarcation of a geographical territory under a distinct juridical-political control. But a crucial feature of globalization is that it challenges this framework as the most natural one, and this contributes to different kinds of religious pluralism.

The Creation of Transnational Communities

The sense of national belonging has traditionally been communicated through a number of avenues such as the school system, national broadcast media, and various state institutions, but because of the increasing importance of international mass media, transregional satellite media, and not the least the Internet, other communities that cut across previously dominant boundaries have been empowered. Such transnational communities have of course also existed previously, for instance, in relation to various religious diasporas (such as the Baha’is, Tibetan Buddhists, Jews, and Copts), some of which have developed group identities based on the geographical dispersion. But the speed, accessibility, and not the least the visual/spatial character of the new media have increased their potential to create new imagined communities. Such imaginaries might constitute the world as a single place, which is seen in the outlook and scope of many religions—especially those with missionary activities—but they can also be of more limited reach.

An example of the latter could be the growing use of transnational Islamic websites such as www.islamonline.net, www.zaytunacollege.org (website for Zaytuna College), www.islamicacademy.org (website for the Islamic Academy), or www.islamweb.net by Muslims living in Europe and North America. The websites themselves represent a pluralization of the media landscape that provides news, background knowledge, counseling, chat forums, and the like according to people’s differentiated lifestyles, but the sites also represent new means of creating religious community by framing a certain Muslim identity for the users that is not

necessarily related to the national context in which they live. As such, the sites contribute to a pluralization of possible religious identities in countries where belonging to the national community and to the majority religion (Christianity) have often been intertwined. The sites also contribute to a pluralization of religious authority and ways of interpreting religious texts, especially among the younger generation, because they challenge the authority of the local imams, the parents, and the institutions of teaching in Muslim majority countries.

The Pluralization and Relativization of State-Societies and Majority Religions

Even though globalization produces transnational and global identifications, the states still work as a pertinent framework for the ways in which different religions can exist: The state often provides the legal framework for religious organization, and many societies are still dominated by one majority religion. However, globalization has, to some extent, challenged this state of affairs and increased the occasions of meeting “the Other”: the new, the strange, or the unknown. Such meetings hold the potential for relativization: They foreground the particularity of one’s own worldview and challenge in this way what has previously been conceived as natural.

One way of responding to this relativization is to embrace diversity by incorporating the strange or different into known structures. This can be seen in much state legislation on the recognition of religions where deviant religious practices and organizations are incorporated into the state as publicly recognized phenomena, whereby the official or public category of religion is pluralized. A general tendency, which is seen in several Asian countries such as Japan, Indonesia, China, and India and in most European countries, is that it is easier to obtain recognition if the religious agents in the case are seen as adherents of a world religion (Christianity, Islam, Buddhism, Judaism, or Hinduism). The state might also itself create religious organizations with the specific purpose of serving as a recognized cooperation partner, as has been the case with several Muslim organizations in Europe, such as CFCM (Conseil Française de Culte Musulman) in France and CMO (Contactorgaan Moslems en de Overheid) in The

Netherlands. These are mainly top-down examples of incorporation, but incorporation may also be a bottom-up strategy, as has been the case with parts of the rapidly growing neo-Pentecostal movement in Brazil. Here, churches such as Brasil para Cristo, Nova Vidam, or the IURD (Igreja Universal do Reine de Deus)—themselves representatives of the pluralization of the Protestant tradition by their various combinations of Protestant, Catholic, and Umbanda elements—have sought political influence and recognition through the establishment of organized churches, news media, and tapping into existing political networks to become allies of the state alongside the Catholic Church.

Another way of responding to relativization is to reject the identification and incorporation implied in the process of pluralization and insist either on the radical difference of “the Other” or the supremacy of one religion over all others. This might be expressed in political projects promoting a mono-religious community, such as the Bharatiya Janata Party in India, the Shi’i party in Iran, the Zionist movements in Israel, and the many nationalist parties emerging in Europe, of which many promote a Christian-Protestant heritage as central to their respective national identities. It can also be expressed in claims of separation of different groups pointing in the direction of parallel societies within the same state. Examples include the growing legal pluralism in England, where the Arbitration Act (1996) has opened the door for religious conciliation boards such as the Jewish Beth Din and, recently, the Muslim Shari’a Councils to rule in matters of civil law.

Translation of the Concept of Religion

A crucial feature of globalization is that it enforces various kinds of translations. Translation literally means “to carry across” or “to carry over,” and in a broad sense it refers to the processes whereby meaning, people, concepts, and material objects are moved across time and space, from one context to another. One of the translations that have been enforced by globalization is the translation of the term *religion* itself, which has created a pluralization of the concept. The concept of religion has grown out of a western European, more specifically ancient Roman, context and has

undergone drastic semantic changes over time. The term *religion* has moved from designating a certain kind of sincerity in ritual observance into a Christian context, applied over the centuries to the proper ways in which humans could relate to divine reality. After the Reformation, this notion was gradually supplanted by a conceptualization of religion as a distinct domain of human life—a proposition that expresses itself in different, mutually identifiable and comparable “religions.” The construction of the modern concept of religion is intrinsically related to the establishment of sovereign nation-states in 18th- and 19th-century Europe, but the categories of “religion” and “religions” have spread to many parts of the world, often as an element in the adaptation to Western standards of state building with certain legislative structures on, for example, civil rights. For example, in 1889, Japan adopted a written state constitution, which entailed the freedom of religion. As a translation of the English word *religion*, the Buddhist term *shukyo* was chosen—a term that mainly carried connotations of beliefs and teaching and that was most readily applied to Christianity and Buddhism, while its application to Shinto has been more problematic. The translation of the category to various parts of the world both represent a pluralization of the use of the category (what can be counted as religion) and an expansion of the shared space in which the term is considered meaningful. The export of the concept thus has as long a history as missionary work and European colonialism, but globalization has speeded up the process of making religion a widely used framework for social organization, claim making, and the interpretation of conflicts.

POLAND

Poland is a postcommunist country in eastern-central Europe (population 38.2 million in 2002) and has been a member state of the European Union since 2004. It is well known as a strongly Catholic country and together with Ireland forms the “Catholic Fortress” in a mostly unchurched Europe. According to the latest accessible data on church membership from 2005 (based mainly on the number of baptisms), 89% of Poles were Catholics, 1.3% belonged to the Orthodox Church, and less than 1% were Protestant (one half of the latter being members of traditional Protestant denominations and the other half, Jehovah’s Witnesses). The number of Poles who declare themselves as nonreligious is well under 10% and is certainly one of the lowest in Europe.

Catholicism is deeply rooted in modern Polish history. In the late 18th century, Poland was divided between neighboring Prussia (Germany), Russia, and Austria. The country thus effectively ceased to exist and was reestablished only in 1918, after World War I. During that period, Catholicism was the main source of national identity as the invaders were Protestant (Germans) and Orthodox (Russians). A similar situation arose again in the 20th century in the face of the atheist Russian communists; so successive Polish governments usually had to maintain a gentler stance on religion than other communist rulers. The Catholic identity of Poles was greatly strengthened by the 1978 election of Karol Wojtyła (1920–2005) as Pope John

Paul II, the first non-Italian pope since 1523. The Polish pope highlighted the Church's anticommunist position, supported the Solidarity movement, and is believed to have greatly contributed to the fall of communism in Eastern Europe.

The Catholic Church entered the free, postcommunist era with enormous social credit, but its influence was subsequently challenged as democratic parliaments began passing many pro-Church bills that were not received favorably by the population (including many Catholics); the most obvious example of this is the strong antiabortion law that was introduced. According to a 1999 poll, 53% of Poles felt that the Church's political influence had grown too large. The ultra-Catholic *Radio Maryja* was established in 1991, dividing society over the issues of abortion, tolerance of homosexuality, and attitudes toward Jews. It initially broadcast with the Catholic Church's approval but later lost much of that support. Another controversy occurred during the European Union (EU) accession process, when a portion of the clergy adopted a strong anti-European position, fearing the effects of secularization on Poland as a member of the liberal EU.

The position of the Catholic Church in Polish society has nonetheless remained strong, and Poland is even a major "exporter" of Catholic priests to other parts of Europe.

of a potentially nuclear Iran, and the conflict between Hindus and Muslims in India, involve an interplay between politics and religion that one cannot afford to ignore. Politics have been a central aspect of most religions in the past and, despite predictions to the contrary, continue to be so today. The precise form of this interplay varies across states as well as across religious traditions.

Secularization Theory

Until the 1980s, a widespread assumption in the social sciences was that the influence of religion would gradually decline as societies became modernized (i.e., became industrialized, acquired a capitalist economy, and democratic institutions). According to this assumption, which is often referred to as "secularization theory," the decline of religious influence would first be observed at the societal level (various spheres of social life, such as the state, the economy, etc., would become autonomous from religious institutions) and then gradually spread to people's consciousness as well; that is, people would stop believing in the dogmas of their religions.

History did not confirm these predictions. A significant decline in people's religiosity has so far been confirmed only in some countries of western Europe. The United States, one of the most industrialized and democratic countries in the world, is still fervently religious, and the rest of the world continues to be as religious as it always was. Religious *political* influence does not seem to decline either. In the 2000 U.S. presidential elections, both George W. Bush and Al Gore appealed to their religious faith as a strong component of their political philosophy. In some parts of the world, it even seems that religion is more political today than it was in the 1960s or 1970s. The Iranian Revolution of 1979 brought Islam into the heart of Iran's political life. The Palestinian authorities, which used to rely almost exclusively on secular political principles, have been increasingly using Islamic symbolism and rhetoric in the past 15 years.

Most social scientists have thus either abandoned or seriously amended the traditional "secularization theory." But they have different explanations for its failure. Some argue that religions have always been political and will continue to be so. Others interpret the politicization of religion in modernity

POLITICS AND RELIGION

Some of the most important global issues of today's world, such as Islamic terrorism, the threat

as a reaction against modernity—that is, an attempt to revert to the past. Finally, some see in modern political religion the expression of other, nonreligious, forces such as nationalism, ethnicity, or class. Each of these approaches certainly captures part of the phenomenon. Only by taking them together can we hope to adequately understand it.

Definitions and History

Religion

One of the difficulties that we have in understanding the interplay between religion and politics comes from the ambiguity of the very terms that we use. For instance, the notion of “religion” is Western and may not be applicable in non-Western contexts. We typically associate it with some belief in transcendence (whether one God or many), an organized church, and a set of rituals. Some of these elements would not apply to Hinduism. Buddhism doesn’t even have gods, and neither does Confucianism. A famous theorist of religion, Émile Durkheim, suggested that we view religion primarily as a sacralization of the values and beliefs of a given community—a sort of social cement—with the existence of gods being only secondary. While this definition certainly captures an important aspect of religion, it has the disadvantage of being too broad, since it would include every set of social values that may be held as sacred, including human rights, Marxism, or nationalism. In practice, we have no choice but to work with a loose definition and to use the word *religion* to refer to what commonly passes for religion, while at the same time acknowledging that this conceptual vagueness adds to our difficulties.

Politics

The notion of politics is, in a sense, easier to define. From the Ancient Greek word *polis*, it originally refers to what is common to the whole city—therefore, what is *public*, as opposed to what is private. For Plato, the political was the sphere of the common good, which, Plato thought, could be objectively defined. Today, we still use the term *political* to refer to what concerns the collectivity as a whole, but we express serious doubts as to the very possibility of a common good and tend to

conceive of the political arena as a space of conflict and negotiation of particular interests.

In modern times, the primary space of politics is the state. Even though globalization has somehow challenged its absolute supremacy during the past decades, it is in the state that political power is mostly concentrated. When we speak of “political” questions, we often mean questions that have to do with the state, and the interplay between religion and politics is typically reflected in the relationship between religion(s) and the state.

The Interplay

Traditionally, religion and politics could hardly be distinguished. The French historian Fustel de Coulanges has shown that even in ancient Greece, which we tend to think of as the model of our modern, secular democracies, there was a religious dimension that permeated political life. In Judaism, the Ten Commandments regulate both people’s relation with God and their political life. And Muhammad, the religious prophet of Islam, was both a religious and a political leader.

Christianity is no exception to that rule. Despite Jesus’ instruction to “render unto Caesar what belongs to Caesar and to God what belongs to God,” which implies a sharp distinction between the political and the religious realms, the Christian church had a constant involvement in political affairs throughout the Middle Ages. In some cases, it is difficult to distinguish conflicts over dogma from political conflicts. Such was the case of the Holy Crusades of the 11th century. The religious reason given by the Holy See was the necessity to capture the Holy Lands that had fallen to the Muslims, but its political purpose was to send the most violent and troublesome groups out of Europe and thus to establish peace and security inside Western Christendom.

Religion has historically served the function of legitimation of political authorities. This could either mean that the heads of state were seen as divine, as in the case of the Hellenistic emperors, or that they derived their authority by the will of God, as in the case of the French kings of the 17th century. Sometimes, this legitimation came late in history. Such was the case in Japan; the emperor and his family were not considered to be divine until the Meiji period (1868).

Types of Differentiation and the Modern State

If modernity has not seen a disappearance of religion, it has seen a *differentiation* between the functions of the state and religious institutions. The paradigmatic case in this regard is France. The French Revolution was established on the ideas of popular sovereignty, as opposed to the Divine Right of kings. The law of 1905 separated the French state from the churches. In practice, this meant that religious symbols would be banned from schools, universities, and political assemblies; it also meant that religious discourse would be absent from political debates. The radicalism of this separation in France can be explained by the fact that the Roman Catholic Church had for a long time refused to accept the legitimacy of the French Republic and systematically supported the Old Regime. This conflict was also, in a sense, a continuation of century-old tensions between the Roman Catholic Church and the French state.

The French model, which is often referred to as “secularism,” had many imitators. In Turkey, even though the state was not officially separated from the religious establishment, political parties appealing to religion were banned in the 1920s. Some communist states, such as the Soviet Union or Albania, have even established state atheism.

Both secularism and state atheism are highly contested today. The collapse of the Soviet Union saw a remarkable resurgence of religious practice in the 1990s. An Islamist party has governed Turkey since 2002. Even in France, the banning of public expressions of religion is contested by a number of second-generation Muslim immigrants who do not understand why their daughters would not be allowed to go to their schools or universities wearing their Muslim scarves.

More often than not, some accommodation is found between the state and religion(s), on the basis of state neutrality rather than “secularity.” The United States is an example of such accommodations. The state is supposed to be religiously neutral, but religions are allowed in the public sphere. Sometimes religions participate in the public debates through political parties. This is the case in Germany, where the Christian Democratic Union (CDU) has been a central component in the country’s political life since World War II. In such systems, religious practice is often recognized as a

right. In the United States, religions also benefit from tax exemptions.

The principle of *state neutrality* has its own difficulties. First, because of the conceptual vagueness of the term, it is difficult to decide which associations should have the status of a religion and which ones should not. Scientology is officially recognized as a religion, but many critics claim that it should rather be treated as a sect. Second, some argue that by supporting all religions and exempting them from taxation, the state is implicitly discriminating against atheists—unless, of course, it decides to treat atheism as a religion too. Third, sometimes the laws of the state may contradict the demands of some people’s religions. In this case, religious groups often claim some kind of special treatment, in the name of their religious rights. In India, following a 1985 trial for alimony, divorce cases were removed from Indian civil law; they are judged according to the principles of religious law, which is different for each religion. Many object that such differential treatments undermine the very principle of equality before the law.

Finally, there are states that have official religions. Such is, for instance, the case of Greece. The Greek constitution, written in 1974, states that the Greek Orthodoxy is the “prevailing” religion in the country; priests are paid by the state and depend on the “ministry of education and cults,” and the government officially intervenes in the election of archbishops. Until the 1980s, civil marriage did not exist, and marriage between a Greek Orthodox individual and a member of another religion was not recognized by the state. This absence of separation between church and state often happens when a religion is clearly majoritarian (in Greece, more than 95% of the population are Greek Orthodox) and expresses the identity between the nation and its religion.

This identity between nation and religion needs careful study as it can mean two very different things and is thus linked to two very different types of phenomena. In the first type, which Mark Juergensmeyer refers to as “religious nationalism,” religion forms the basis of the life of the nation. This is the case in Iran, where the Islamic Revolution established a regime of theocracy, where the political powers are ultimately dependent on the religious ones and where the Islamic Shari’a is the official jurisdiction of the state. Such regimes are

anti-Western, when, in the national imaginary, the West is perceived as synonymous with secularism. In the second type, which one may call *ethnic religion*, the community perceives its religion as an ethnic characteristic and thus uses it for self-differentiation but does not allow religion to influence its political agenda. As many observed at the time, the Yugoslav wars of the 1990s were fought mostly by atheists and agnostics; the religions they claimed to be fighting for were understood by them as nothing more than ethnic attributes. Needless to say, most of them were quite unaware of their precise dogmas as well as of the condemnation of their war by their respective religious authorities. Ethnic religion is thus a camouflaged expression of ultranationalism; it is a major source of ethnic conflict in the modern world.

In practice, however, most instances of identification between a religion and an ethnic group will involve some mix of both these types. This is the case in India, where the Bharatiya Janata Party (BJP; Indian People's Party), which since 1998 has been a part of governmental coalitions, sees Hinduism as the basis of Indian national identity—at the expense of other religious cultures and especially Muslims, who represent 20% of the country's population. The conflicts between Hindus and Muslims led to the death of 2,000 people in 1992, when the Hindus decided to destroy an old mosque (the Babri Masjid) because it had allegedly been built on the birthplace of a Hindu god. In such cases, it is difficult to distinguish the religious from the ethnic dimension of the conflict.

Religions and Pluralism

Most religions are old and have grown in a traditional environment. They have had ambivalent views toward modernity in general and especially toward the notion of pluralism, which is often associated with modernity. It has often been suggested that some religions may be, by their very nature, more fit to modernity than others. It has also been claimed that some political settings may be more conducive to violence and others to democratic dialogue.

Samuel Huntington has suggested that Western Christianity may be more suitable to modernity than other religious traditions. According to this view, elements such as democracy, free market, or

pluralism are fundamentally Western values—that is, values that have grown out of the history of the Western world. Western religions have been part of this process. But these values may, according to the author, be profoundly incompatible with the values of other regions—and religions—of the world. To try to impose them there is, according to this view, both unpractical and arrogant. While this argument certainly captures some truth, one should never forget how difficult the implementation of democratic values has been in the West as well. For instance, it took the Catholic Church more than two centuries to adapt to modern democracy. Even as late as the 1970s, it supported many dictatorial regimes in Chile and Spain. And yet the Catholic Church has also been one of the main actors that guided the democratization of communist Poland in the 1980s. Other important factors are the profound malleability of religions as well as the discrepancies that often exist between religious dogmas and their political instrumentalization. The Catholic Church has been associated with both liberation theology, which speaks for social justice using many elements from Marxism, and the Opus Dei, an organization that has been associated with right-wing authoritarianism and social conservatism. Buddhism, a religion that advocates spirituality and indifference toward politics, has been used as the basis of national identity in countries such as Cambodia, Sri Lanka, and Thailand.

The political behavior of religions differs according to their own structure. The Catholic Church, for instance, is highly centralized. The official doctrine is determined by the Holy See and spreads down to the smallest parish. This contrasts with other Christian churches, Protestant but also Orthodox, that lack this hierarchical structure, as well as with Islam. In the latter case, administrative decentralization as well as the multiplicity of interpretations of faith have allowed for the emergence of multiple forms of Islamic movements, including the type of fundamentalism of al Qaeda. The centralization of the Catholic Church has so far prevented extremist or fundamentalist groups from emerging and has often been used to explain the success of its adaptation to modernity. On the other hand, it may also be argued that the sort of polymorphism that exists in decentralized religions makes them more compatible with modern democratic pluralism.

Finally, as noted earlier, religions are often old and have long histories. These matter too. The conflict between Israelis and Palestinians has very much to do with the fact that Jerusalem is central to the history of both Islam and Judaism.

The world as it is shows no sign that religion is going to play a less important role in politics in the years to come. One way or other, most states have to take into account the fact that religion influences people's political choices. The secularism of the 19th century, which tried to ban religion from public life altogether, does not seem very successful—or democratic. On the other hand, bringing religions (by nature, absolute) to participate in the democratic discussion, which involves negotiation and compromise, may prove very difficult too, especially in multireligious societies. Facing this challenge may be one of the central tasks of modern democracies.

POLYTHEISM

At its root, the term *polytheism* (from the Greek *poly*, meaning “plural,” and *theos*, meaning “god”) not only acknowledges a plurality of gods but in its current usage implies the worship of a plurality of gods. The complexity of meanings in the term invites an interrogation of our understanding of what *god* refers to as well as the characteristics of divine and human plurality involved.

The dominant ethos in the Abrahamic religions and corresponding cultures asserts a monotheism that has sometimes been deployed as a means of distinguishing it from polytheism. In this dynamic, it is not unusual to find a tension between divergent traditions and allegations of superiority of the preferred option.

In the Hebrew scriptures, references to plurality in association with divinity are not unknown. For instance, one of the Hebrew terms used to refer to the one true God is *elohim*, wherein *el* is “lord” and the suffix *im* denotes plurality. In some Christian denominations, the one true God is addressed as a Trinity of persons. In these traditions, mention of plurality is not understood to detract from the professed monotheism. For what may be more political than theological reasons, sometimes these same traditions have difficulty acknowledging that other traditions may have similar usages and denounce any reference to plurality in traditions different from their own. In some Hindu Advaita traditions, the ultimate reality is not that which is termed *god* but that which is beyond the differentiated plurality in which one encounters gods. The counterallegation by polytheists has been that monotheist traditions

cannot succeed in maintaining monotheism while retaining an internal plurality.

In practice then, polytheism has multiple meanings rather than one understanding common to all. In a functional sense, the perception of polytheism may not require a belief in a plurality of divinities, and a functional polytheism may or may not correspond to an actual belief in a plurality of divinities. A functional plurality can be present where each allegedly distinct divinity is understood as a means of relating to the divine for particular circumstances and reasons. In some respects, a functional polytheism may be expressed as a belief in a multiplicity of avatars, all of which originate from a common, ultimately monotheistic understanding of divinity. A single divinity appearing in multiple incarnations and being worshipped through those incarnations may or may not be perceived as polytheism and may be more accurately described as *polyentheism*.

Polytheism in the sense of the Greek pantheon of gods may also be encountered in more contemporary contexts with different names for divinities. In a secular world, devotion to higher powers may not be expressed as polytheism but could manifest common characteristics. In this sense, polytheism may be more prevalent in practice and may not be as alien or primitive as some may think.

Appreciation for the forces unleashed by geological events has been seen in recent catastrophes such as Hurricane Katrina, the earthquake and tsunami in Japan, and the earthquake in Haiti, where the human capacity to “subdue nature” has been relatively insignificant in the face of such events. For some in the environmental movement, there is a renewed appreciation for the directive or influential role that the earth or Gaia may have over human actions. Understood as a singular divine being, the earth or the cosmos may be encountered in the phenomena of the environment. In this appreciation of phenomena, polytheism may present itself as an economic plurality of powers or may be contextualized by cosmic unity. The issue in such a discussion, as with references to divinity generally, necessarily includes a consideration of the position of human beings.

Where human beings consider themselves as the supreme beings in existence, they may be understood as occupying the role of divinities. To the extent that such beings are a plurality, they may be

described as members of a pantheon, and their subordinates may worship one or more of several such divinities. The concept of human as divine is seen in the emperor of Rome, who considered himself a god to be worshipped by Romans. The emperor of Rome was not the only one with those views. Worshipers who seek to please the gods are also not a feature of distant history, and not all who demand worship title themselves as God. In this respect, the operative function of divinity may not require or possess the title of god for effectiveness.

Where a polytheist may recognize a plurality of divinities in a context of unevenly distributed power, each would have hierarchical value. In the Greek pantheon, for instance, Zeus may be described as having a superior position among the gods. The dominant cultural discourses can have a similarly distinguishable valuation between them in socially acceptable polytheism. In European and American contexts for instance, where Christian monotheism was replaced by secularism and scientific views as the dominant discourses, polytheism has been widely viewed as inferior and primitive. Conversely, where nature-based religious beliefs are valued, monotheism would be considered heretical and deficient in the face of obvious variety.

The capacity to anthropomorphize divinity is not the exclusive domain of either monotheism or polytheism. The counterpart to this capacity in secularism and scientific valuations is the converse allegation of absolutized objectivity as distinguished from subjectivity. In practice, these forms may coexist in social groups. Contemporary usage of the terms *monotheism* and *polytheism* has been seen as having political connotations. However, as seen in contemporary Ukrainian pagan spirituality, these allegedly anachronistic and antagonistic categories have been found to operate in negotiating present identities in debate with dissimilar visions of the future.

In a religiously pluralist social and political contemporary world, the concept of polytheism presents a means for some to assert greater tolerance of diversity. This tolerance is described against the discourses of monotheism as well as the sole authority of science and technology. Analyses of science fiction entertainment shows such as *Battlestar Galactica* have been used as a forum to investigate the competition between monotheistic Cyclons and polytheistic humans.

It is possible that the view of polytheism as more tolerant of diversity is actually more of a rejection of a certain understanding of monotheistic intolerance. Tolerance of diversity need not be the sole prerogative of any one view of divinity. For instance, the monotheist Hebrew scriptures include a command that forbids the believer to have other gods before the God of Abraham, Isaac, and Jacob. This command could be the basis for intolerance as well as for tolerance. The implication of the command is that a plurality of gods is acknowledged and that a choice exists. While it clearly represents a preference for one God, there is no meaning to the command without the possibility of and tolerance for the worship of other gods. Similar preferences in tolerance can be asserted in favor of scientific objectivity as well as polytheism, where believers can demonstrate similar intolerance for views other than one's own.

Contemporary views of ancient Greek thought need not be restricted to a view of polytheism as pantheon. A deeper understanding of Greek philosophical traditions can provide a more intellectual approach to contemporary discourses about polytheism. Neoplatonic theology related to statements by Proclus in his *Cratylus* commentary has been used for its polycentric features to develop a foundation for a polytheistic philosophy of religion.

A functional polytheism has also been considered valuable in psychological analyses. The psychological perception of the self as multiple and at the same time unified and continuous has been held to have equal psychological significance. The clinical appreciation of the multiplicity and unity of the self has sought a common ground from which persons may operate while attending to states of self and divine multiplicity.

Pluralist contexts or more properly contexts of more even distribution of power between diverse views in contemporary society have permitted a wider discussion of divinity and humanity. Along with a new appreciation for environmental realities, there is a resurgence of pagan religions, some of which draw on premodern traditions. In doing so, they provide contemporary alternative understandings of polytheism and self-identity. The availability of opportunities to express divergent views has enabled practitioners of traditions in Druidry, Ásatrú (old Norse for "belief in the gods"), and Wicca, among others, to develop self-identity from

reflection on the traditions they draw on as well as intellectual and behavioral experiences.

The development of identity at the intersection of received tradition and achieved understanding has contributed to the continuing practice of all religious and secular traditions. With current global developments, emergent understandings seek a variety of paths, some of which are exclusive and others inclusive of polytheism as it is now understood.

POPULAR RELIGION

Popular religion refers to a general, global, and omnipresent cultural and social aspect of religiosity. The notion has a somewhat ambiguous character since it designates (a) traditional forms of religiosity of the "common" people, also known as "folk" religion, and (b) mass cultural and (c) contemporary forms of late-modern or postmodern

religiosity, both in churches as well as among lay persons. Since in both cases the popularity of religiosity is defined in relation to “popular culture,” the apparent ambiguity can be explained by the historical transformation and global interspersions of popular culture.

“Folk” Religion

Popular religion includes forms of beliefs, actions, and material objects adapted, transformed, or created by lay people and sometimes seen as survival of more traditional customs. Examples of such forms in Western contexts include traditional cults, such as the veneration of saints and thanksgiving; marginal beliefs, such as water spirits or astrology; marginal practices, such as water divining or magical healing rituals; and material culture, for example, healing waters, religious decoration in private rooms, or advent wreaths.

The reason for the marginality, and often dismissal of popular religion is that it differs from and presupposes the official religion of religious experts, be they priests, preachers, prophets, or monks. “Official” religion refers to those forms of religion represented by religious experts legitimated by political, economic, cultural, and other societal institutions. Popular religion can be taken to designate the heterodox elements of religious beliefs, actions, and objects, whereas the “official” religion of religious experts and organizations constitutes the orthodox pole of the religious field.

Despite its marginality, popular religion ranges from private or individual rites, such as private spells and charms, to religious mass phenomena, such as pilgrimages, popular religious feasts, and global ceremonies such as St. Nicholas Day or Christmas. Popular religion varies with the social groups and their culture. Thus, different social classes (e.g., peasants and the petite bourgeoisie), regions, language areas, ethnicities, races, and communities (e.g., rural or urban) are linked to different types of popular religion.

Mass Culture

As popular religion depends on the societal form of popular culture, it is also subject to its historical changes. Particularly, the rise of mass communication, the dissemination of mass culture, and the

widening relevance of market mechanisms had serious effects on popular culture in general and contributed to the development of a modern popular religion with its specific religious goods and services. At the beginning of the 19th century, industrialization led to the mass production of religious material culture (such as *l’art Saint-Sulpice*, the industrial mass production of Catholic devotional objects) and to the increasing use of mass media for the transmission of religious goods and services. The increased use of means of mass communication (books, newspapers, radio, and television) required new forms and genres of communication, which have been diffused globally. To the degree that the modern popular culture became a “mass culture,” popular religion developed its own modern forms. While the electronic mass media (radio and television) led to the creation of an “electronic church” with its concomitant media formats (Bible shows), marginal contents (e.g., as Spiritism, astrology, and witchcraft) also became “reinvented” traditions distributed widely by television, radio, newspapers, and so on.

Late-Modern or Postmodern Religiosity

The recent change from mass media to interactive media of digital communication affects popular religion. Interactive means of digital communication weaken the control of large religious organizations over the means, infrastructure, and role of mass communication and enforce the active role of the believers, who turn into communicators. Thus, the knowledge about religious forms of actions, beliefs, symbols, and events is accessible to everyone and globally. As a consequence, the rituals, cults, and beliefs of popular religion are increasingly syncretistic and “glocalized” internationally, for example, Halloween rituals, yoga practice, and belief in reincarnation. Since the means of communication are highly individualized, popular religion tends toward topics of strong relevance to subjective issues, such as personal health, spirituality, and well-being. Still, despite this tendency to individualism (angel cults and individual pilgrimages), popular culture also includes collective (individually selected) forms such as musical genres, visual imageries, and large spiritual events such as papal visits and lectures by prominent gurus.

The loss of control over the means of religious communication by “official” religious organizations and the enforced possibilities of lay people to actively adapt, search, and syncretistically vary religious knowledge result in the increased transgression of the boundaries between popular culture and “official religion”: First, religion itself is influenced by and draws on the forms, formats, and genres of popular culture (e.g., popular events, popular music, comics, and so on). Second, popular culture adapts forms of religious communication (e.g., the material culture of “Gothic” music, forms of pop idol veneration, or sports fan culture). Third, popular religion itself contributes to the dissemination of topics that are marked as religious in the collective memory, such as the popularity of near-death experience testimonies or the new *ars moriendi* rituals in Europe, which, despite their roots in Christian culture, are almost exclusively communicated in popular culture. The transgression of the boundaries characterizing popular religion results, on the one hand, in the extension of religion into less demarcated forms (such as the spiritual) and, on the other hand, to enforced forms of “boundary work” by the official actors in the religious field reclaiming fundamental notions of religion. Sociologically, the recent changes in popular religion reflect the transformation from preindustrial and industrial society to a knowledge society based on information technologies with its specific forms of work and communication, its new class formation, and its new forms of control and self-control.

PORTUGAL

Located at the westernmost point of southern Europe, Portugal has a long history of cultural and religious pluralism. When King Afonso Henriques proclaimed independence from Castille in the 12th century, Christianity, Islam, and Judaism already coexisted within Portuguese territory. However, this threefold religious society was not to last. In the following centuries, Muslim communities were gradually absorbed into Christianity or fled to North Africa. The Jewish population grew in size and political and economical status until the last decade of the 15th century, when it was confronted with the choice between forced conversion to Catholicism or expulsion. By 1496, as in Spain 4 years earlier, the policy had been fully implemented. The establishment of the Inquisition in 1536 and the regularization of relationships between the Portuguese Crown and the Vatican ensured that Portugal remained a strictly Catholic country for nearly 400 years.

The liberal revolution of 1820 inaugurated the establishment of several Protestant denominations in Portugal. In 1926, however, a military coup initiated a 48-year dictatorship that reestablished a privileged relationship between the state and the Catholic Church, one that was openly prejudicial toward minority religions, forcing some of them, such as Jehovah’s Witnesses and Kardecian Spiritualism, to go underground.

The democratic revolution of 1974 that led to the independence of most Portuguese colonies brought in the right of religious association and freedom of religious choice and initiated a series of migratory flows that would dramatically change the country’s religious landscape. The end of the Portuguese overseas empire led to the influx of more than 500,000 Portuguese from the former colonies during the 1970s. In terms of religious impact, this led to the foundation of the first Muslim community in Portuguese territory since the late Middle Ages. Mainly composed of former residents of Mozambique and Guinea-Bissau, this

community grew with subsequent waves of immigration from Portuguese-speaking African countries. Today, there are an estimated 50,000 Muslims in Portugal with 35 places of worship. The late 1980s saw the implantation of Brazilian (and Brazilian-inspired) neo-Pentecostal churches. Igreja Universal do Reino de Deus, a Brazilian church that targeted Portugal at the early stage of its transnational expansion, and Igreja Maná, founded by an ex-Portuguese emigrant in South Africa, entered Portuguese society with an openly proselyte approach and were received with hostility from virtually every quadrant, especially from the media. Ten years later, a second mass influx of immigrants led to a very different mutation in the Portuguese religious structure. From the late 1990s onward, Portugal has received hundreds of thousands of immigrants, totaling 400,000 by 2002. The most significant qualitative change of this immigration wave was the sudden influx of Ukrainians and other eastern European nationals. Within a few years, Ukrainians became the largest immigrant community in Portuguese territory, and as a consequence, Orthodox Christianity suddenly became the second largest religious faith in Portugal.

Portuguese society is still predominantly Roman Catholic (93%, according to the 2001 Census) but also, due to immigration flows in the last three decades, considerably multireligious. Given the lack of contact with religious diversity during the last 500 years, it is perhaps surprising that, except for the neo-Pentecostal churches in the late 1980s, these new religious faiths are well tolerated by mainstream society.

POSTCOLONIAL THEOLOGY

Postcolonial theology is an umbrella term for the study of the relationship between empires and theologies that have erased specific peoples' histories, identities, and agency. Postcolonial theology assumes that there has been a colonial theology. All global religions have had a role in this colonial construction and/or postcolonial decolonizing project as either enablers or silent spectators. Postcolonial theology's recent meteoric disciplinary rise conceals the evolving character of a multidecade endeavor grounded in indigenous, anticolonialist struggles. The lack of definition of postcolonial theology in many reference works may mislead readers new to this field to assume that the field itself is new. This entry takes into account the dating of postcolonial theology as a means to reveal its complex origins, the stakes for its critical analytical task, and its emergence into decolonizing theologies.

Dating of Postcolonial Theology

Recognition of anticolonialist struggles would locate postcolonial theology with indigenous, colonized peoples in preindependence periods. Anticolonialist struggles and emerging theologians writing in India and Africa, First Nations peoples in Canada, and Aboriginal peoples in Australia have not often found their way into the postcolonial theologies (see Joy, 2008, pp. 11–60). Western scholars write the majority of postcolonial theologies, perpetuating a Western bias as to what defines postcolonial theology. Postcolonial theology has been dated as concurrent with postcolonial theory, as an outgrowth of postcolonial biblical studies, and as a brand new phenomenon produced by postcolonial theologians writing in North America after 2000. Each such dating of postcolonial theology brings with it a host of interpretative challenges.

A strong association between postcolonial theology and secular theories has produced religious-secular suspicions postponing broader engagement by the theological community. As an outgrowth of postcolonial biblical studies, postcolonial theology has inherited a methodological framework sometimes perceived to be at odds with theological needs and thus in need of revision. When perceived as a new field of study, postcolonial theology often

has been associated with Western liberal theologies that privilege narrow categories of inclusion. These three ways of approaching postcolonial theology demonstrate that it perpetuates sequential and historical evolution. The missing piece is the contribution of anticolonialist struggles and the way in which these writings questioned categories of unity and order. Canonical and epistemological understandings of unity have provided the basis of Christian theology. If the fundamental categories of Christian theologies questioned by the anticolonialist struggles remain outside the purview of Western theologians, then postcolonial theology will not be heard in the cadence of anticolonialist struggles.

Scholars must be careful, therefore, not to create a false binary division between indigenous, anticolonialist struggles and Western-based postcolonial theologies. Anticolonialist struggles, postcolonial theories, postcolonial biblical criticism, and contemporary postcolonial theology written in North America are all important dimensions of postcolonial theology. These four dimensions do not singularly define postcolonial theology. The anticolonial struggles must be recovered to restore authenticity from these earlier origins of postcolonial theologies. Without this integration step, indigenous voices and experiences continue to be sanitized out of postcolonial theologies.

The Critical Analytical Task

By properly dating the origins of postcolonial theology with the writings of anticolonialist struggles, it becomes clear that this is not a new field of study but rather one that is just beginning to enter the West's consciousness. Postcolonial theology will remain in its infancy until anticolonialist struggles are integrated and engaged by Western theologians in ways that decenter the predominance of Western theologians. It is necessary to bring together postcolonial theology as a comprehensive and integrated work of postcolonial theory, postcolonial biblical interpretations, anticolonialist struggles, postindependence theologians in former colonies, and new emerging indigenous theologians so that, together, it will be possible to critically question the once historical and canonical fundamentals of Christian theologies that enabled colonialism.

Decolonizing Theologies

Postcolonial theology is on the cusp of dramatic change. The Internet offers free-use technologies that potentially bridge separated peoples and cultures who were previously the filtered-out powerless without a voice. Through, for example, the Postcolonial Theology Network group on Facebook, more people around the world have access to each other's alternative memories. Technologies intersect with theologies complementing texts but with virtual speed of correction that produces a multivariant theology shaped by different histories and historical lenses. Postcolonial theology as an engagement of difference is a methodological conduit that remakes colonial theologies.

POSTCOLONIALISM

Postcolonialism refers to the social order or culture of a colonized society after the end of colonialism, when the former colonizers have left or have granted independence and sovereignty to the native society. A postcolonial order bears the legacies of both the colonial and the precolonial structures, and because modernity was often introduced with colonialism, postcolonialism must also deal with survival in a globalized modernity. Whether the precolonial order was a small-scale society with flexible shamanistic traditions or a long-standing monarchical order with powerful religious institutions and organized clergy, such as in India, China, or the Middle East, will have a bearing on the particular ways in which it accommodates or repels the religious or secular impositions of the colonizers. Also shaping the postcolonial religious terrain are issues such as the manner in which the colonization process took place (military conquest,

economic domination, cultural imperialism, or missionization) and the particular discourses and strategies through which the nationalist independence struggle was mounted and achieved. A further factor is the presence of neocolonial interests, which may pressure postcolonial orders to accept the Western path to modernity and trigger the deployment of religion as an anticolonial movement. Most of the literature on colonialism and postcolonialism focuses on modern European and American colonialism, and there are fewer studies of modern Japanese, Soviet, Chinese, or other colonialisms.

Colonial and Postcolonial Knowledge

Since the European Enlightenment, Western knowledge has played a key role in both colonialism and postcolonialism, alongside military and economic domination. Edward Said has analyzed a European American colonial discourse and knowledge system he called *Orientalism*. Originating in 18th-century European travel accounts, literary imaginings, and academic scholarship of the Middle East, this discourse positioned the Orient in a binary structure of knowledge vis-à-vis the modern West, whereby the West was always assigned the favored and superior position in the binary: rational/emotional; materialist/spiritualist; scientific/superstitious; advanced/backward; active/passive; mature/childlike; male/female; egalitarian/hierarchical or despotic; dynamic/unchanging; and so forth. Through *Orientalism*, the West was able to define itself, shore up its sense of superiority and self-confidence, and see itself as assuming the “White Man’s Burden” of “liberating” and converting the rest of the world. When *Orientalism* was adopted by people from the Orient, they often reduced their sense of cultural self-worth, which hampered their imaginations of what their native religious traditions could offer to postcolonial modernity.

The anthropologist Johannes Fabian has critiqued the construction of time in Western depictions of the Other, calling it a “denial of coevalness.” The Other is denied historicity; it is represented as frozen in the past. Even though every society in the modern world has been undergoing great social transformation, importing new cultures and technologies that mix with, displace, or enrich traditional religious life, the denial of

coevalness ignores these deeply ingrained habits and suspends these societies as being outside the modern present.

Another powerful discourse of knowledge and power in colonial and postcolonial eras was *social evolutionism*. Nineteenth-century European American social evolutionism taught that societies evolved through a “survival of the fittest” in a linear path to “progress” through stages of development. It was thought that the modern West, with its science and technology and superior social institutions, was more evolved and advanced, while weaker societies would fall by the wayside or be absorbed by the strong. Typical of such thinking was that of the German evolutionary biologist Ernst Haeckel, who in 1905 outlined an evolutionary history of religions in which the lowest stage of “savages” (“the Veddahs of Ceylon, Andaman Islanders, Bushmen, Australian negroes, Hottentots,” etc.) worshipped “fetishes” and the next stage of “barbarians” who possessed agriculture and cattle had progressed to “animism,” worshipping gods in the forms of men and animals and holding notions of the immortal soul. Finally, with the “highest stage of civilization,” religion evolves with the subordination of all the gods to a chief god, found in the achievement of “monotheism,” the Reformation, and then modern science. Both Christian and secular Westerners subscribed to social evolutionism in the 19th and early 20th centuries, with many believing that Protestantism was the highest form of religious development and that science was the most advanced human attainment. These evolutionary discourses spread quickly to the colonies, justifying European colonization but also gaining currency among many native elites and nationalists.

The inheritor of social evolutionism’s mandate of authority in the mid-20th century was a new discourse known as *modernization theory*. Its major exponent was Walt W. Rostow, of the liberal school of economics, who propounded a five-stage theory of modernization (1960) as a guide for developing nations:

1. Traditional society—prescientific in the belief that procurement of goods is facilitated by gods or spirits
2. Preconditions to takeoff—secular education and establishment of banks, currency, and an entrepreneurial class

3. Takeoff—a society driven more by economic processes than by traditional culture, no longer oriented toward subsistence but toward comparative advantage in the international market
4. The drive to maturity—diversification of economic production and reduction of poverty
5. The age of high mass consumption

Modernization theory was especially influential among national elites in postcolonial societies, persuading them that economic development can only be accomplished by subsuming “traditional” religious orientations.

Christian Missionizing and the Globalization of Christianity

Christianity today claims the largest number of religious followers, ranging between 1.5 and 2 billion people around the globe. Global Christianity’s recent 400-year history is intricately tied up with the history of Western colonialism, beginning with the Spanish and Portuguese conquering of Central and South America in the 16th century, when missions were established to convert the natives. Today, Latin American nations continue to have the highest proportion of Christians—87% to 100% of these nations’ population. Christianity has also been making rapid inroads in Africa, where about 50% of the population today are Christians. Except for the Coptic and Orthodox Churches in Egypt and Ethiopia, whose histories trace back to the first centuries CE, Christianity in sub-Saharan, eastern, and southern Africa dates to modern European colonialism and its missions and, more recently, to African evangelization. In Asia, Christianity’s dominance in the Philippines (92% of the nation) is due to Spanish colonialism, and South Korea’s large Christian population (30% of the nation) derives from Korean Christianity’s alliance with anticolonial forces against the Japanese occupation of 1910 to 1945. What is significant today is the clear demographic shift of Christianity from an increasingly secularized Europe, Canada, and Australia to the developing world of Latin America and Africa, where there is also a growing trend of evangelical Protestantism making inroads into Catholicism and mainline Protestantism.

Noting that colonization does not rely merely on military, economic, or political domination, the anthropologists Jean and John Comaroff introduced the phrase “colonization of consciousness” in their social history of Protestant missionizing in colonial South Africa. They show how 19th-century Protestant missionaries colonized the Tswana people through the introduction of Western “civilization” in the prosaic rhythms of everyday life. The missionaries instilled shame in nakedness and introduced a Western dress code, modern medicine and sanitation, the virtues of agricultural cultivation and labor, a currency and market system, and European architectural and housing principles, and they replaced a communitarian ethos with a dual sense of individualized personhood and obedient ethnic subject of a sovereign British order. These reconfigurations of how to be human and “civilized” were crucial in both the expansion of Christianity as well as European colonialism.

As Christianity was introduced around the world, a big issue it encountered was how much it was willing to accommodate indigenous religious life. In China, an ancient civilization that was never fully colonized by the West, Christianity met with an early setback, known as the “Rites Controversy” of the 18th century. Due to their scientific and astronomical knowledge, and their willingness to accommodate Chinese gentry-official lifestyles, Catholic Jesuit missionaries had gained high positions at the imperial Chinese court. However, rival religious orders such as the Dominicans and Franciscans were horrified at the Jesuits’ accommodation of “idolatrous and heathen” Chinese rituals to honor Confucius and local ancestors. The Jesuits argued that Confucianism was not a religion but a philosophy and that ancestor and Confucian rituals were civil, not religious, in nature and thus could be accommodated by Catholicism. From the Vatican, Pope Clement XI issued a papal bull in 1715 condemning the Chinese rites as “heathen” and prohibiting Chinese Catholic converts from participating in Confucian ceremonies and ancestral rites. The Kangxi Emperor of China took offense and banned further Christian missionizing in China. Even though the mid-19th century later saw increased Christian evangelism, aided by a weaker Chinese imperial government, Christianity did not make great inroads into China, and its missionaries had to cease operations

with the Chinese Communist Revolution of 1949. Had Pope Clement been more accommodating of ancestor worship, Christianity might have gained an early foothold in China.

In North, Central, and South America and Australia, the demographic catastrophe suffered by indigenous populations meant that the question of accommodation was seldom an issue. So much of the native populations were wiped out by the European diseases for which they had no immunity and by massacres that the dominant population has been European and Christian, with virtually no accommodation to indigenous cultures until the late 20th century. In the United States, Canada, and Australia, many indigenous children were forcibly taken away from their parents and brought up in White families or residential schools run by churches, with the intention of "saving" them from their "backward" religions and assimilating them into White society. At these schools, they were clothed in Western dress, taught Christian values, and often beaten for speaking their native languages or practicing their native rituals. Only recently have the governments of Canada and Australia issued formal apologies for these practices, which some have called "cultural genocide."

Although most Latin American countries had won their independence from Spain and Portugal by 1825, their populations were primarily mestizo and deeply Catholic, and the concentration of wealth and power was in the hands of a tiny landed elite, caudillos (local military strongmen), oligarchical families, and military dictatorships, with indigenous peoples living in impoverished marginal rural areas as peasants. Often, these arrangements had the implicit acquiescence or support of the Catholic Church of each country. It was not until the mid-20th century that some priests and theologians in Latin America rallied to a movement known as liberation theology, which combines ancient Christian teachings on helping the poor with Marxist critiques of capitalism and class society as a sin against God. Liberation theologians not only wrote theological treatises but also took direct social action, championing the poor in the urban slums and indigenous rural areas of Latin America, helping them fight for social justice and human rights. This movement has met with mixed response from Vatican authorities:

Liberation theologians have been barred from several Catholic bishop conferences, and both Pope John Paul II and Cardinal Ratzinger (now Pope Benedict XVI) have rejected most of their tenets, saying that talk of revolution and criticism of private property were incompatible with Church catechism. Although Liberation theologians have been committed to the socioeconomic plight of indigenous people, they have mainly been interested in accommodating Marxism, and not indigenous religions, within Christianity.

The accommodation of a native religious ethos and local social concerns within Christianity has better chances when Christian priests and leaders are natives themselves and enjoy autonomy from European church leaders. The Comaroffs show how in South Africa, as White mission churches increasingly had to rely on native interpreters and assistants and as Black independent churches increased, Christianity in Africa entered a new phase of hybridity that was responsive to African cultural sensitivities and concerns for rebuilding communities, winning national independence, and constructing Pan-African linkages. Whereas European missionaries feared racial miscegenation and the dilution of Christianity with "heathen" practices, in independent African churches, the image of the supreme divinity became more merciful, less threatening, and more life-affirming. Whereas British Protestantism inherited from the Reformation a "modernist ideal of a self-contained, self-controlled, self-willed Christian subject" (Comaroff & Comaroff, 1997, p. 87), South African Christian converts developed a more dynamic and corporeal sense of divinity and were open to spirit possession by ancestors. Whereas White Protestants focused on individual prayer and the sanctity of words (the Scriptures and endless sermons), which left most Africans indifferent, African Christians resisted the Reformation belittling of ritual and bodily inspiration and developed their own forms of religiosity in music, dance, rousing oratory, and energetic rituals such as initiation of youths.

Indeed, the receptivity to corporeal expressions of religiosity may help explain why Pentecostal/charismatic Christianity is the most dynamic and rapidly growing Christianity in the Third World, where two thirds of their 523 million global followers currently reside. Pentecostal Christians

belong to the evangelical branch of Protestantism that emphasizes conversion and personally choosing the faith. The Pentecostal movement was founded by the African American preacher William Seymour in Los Angeles in 1906 and has since spread to Africa, Latin America, and Asia. Central to Pentecostal teachings are the ecstatic and physical experiences of receiving the Holy Spirit: speaking in tongues, faith healing, spirit possession, prophesying, dance, and so forth. Charismatic Christianity refers to those who also believe in the ecstatic corporeal reception of the Holy Spirit but do not join Pentecostal churches, instead remaining in mainline Protestant or Catholic churches. Although Pentecostalism attacks indigenous religions, it also tends to keep the social memory of them alive. Pentecostal churches are highly localized institutions with little administration by Western churches, and their leadership is usually drawn from local constituencies, most of which are poor. Thus, Pentecostalism has begun to break away from the older colonial structures of Christianity.

Secularization, Nation-State Formation, and Religious Nationalism

Most anticolonial struggles were led by nationalists who received some form of Western-style education, so that in the process of nation building after independence, many of these leaders looked to Western models of economic and military development that involved processes of secularization: in public education, in the discouragement of large and extravagant public religious rituals, in new limits placed on the power of traditional religious institutions and clergy, in bringing women out of the domestic sphere, and in the drafting of new constitutions and legal systems that encroached on the terrain ruled by religious or customary law in the past. Of course, those former colonies or semi-colonies, such as China, Cuba, Vietnam, and Ethiopia, that underwent communist revolutions looked to Soviet rather than Western models of development; however, in these cases, secularization was much more systematic, involving expropriation of land and property held by religious institutions, the banning of public rituals, the closure of temples and monasteries, and the forced return of clergy to lay life.

Examples of how nationalist elites from the colonies absorbed Western social evolutionism and modernization theory and went on to implement them in postcolonial state policies or social reforms can be found in modern China, Turkey, and Iran. In China, nationalistic educated elites attacked and dismantled Confucian values and institutions, and their scientism also disparaged the popular religion of the common people in the iconoclastic May Fourth movement of the 1920s. First the Guomindang Party and then the Chinese Communist Party, with its Marxist and Stalinist social evolutionism, embarked on the path of radical state secularization and persecutions of traditional Chinese religious practices and organizations.

In a comparative study, Prasenjit Duara seeks to explain the contrast between modern India's continued religiosity and critiques of modernity, on the one hand, and modern China's systematic secularization and relative absence of critiques of modernity, on the other. Whereas the religio-political terrain in precolonial India was structured so that the religious domain encompassed and subsumed the political power of kingship, in late imperial China, the political domain of universal emperorship encompassed the religious, in that it was the ritual center and apex of both the celestial and earthly polities and served as the pivot around which local ritual communities revolved. Thus, when the Chinese imperial order collapsed in 1911 and the political pivot of sacred emperor that undergirded religious communities was abandoned, the new Chinese elite easily switched to a new secular political order, now released from its entanglements in the religious, cosmological, and ritual domains. Since China, in contrast to India, never experienced full colonial occupation and administration, Chinese elites did not feel their language, culture, and religions to be directly threatened by the West, but as modernizers or revolutionaries, they embraced Western linear historical narratives to radically overthrow their religions. For occupied India, however, traditional culture and religion were felt to be imperiled by foreigners, and adherence to them was often taken as an anticolonial act.

Under Mustafa Kemal Atatürk, Turkey in the 1920s and 1930s suddenly became a secular society that abolished the Islamic courts and the Ottoman Empire's sultanate, which had served as

the religio-political leadership of global Sunnī Islam; banned the male head dress (*fez*) and discouraged women from wearing veils (*hijab*); and replaced many Islamic madrasas, or religious schools, with a secular state public education system. Similarly, modern Iran under the Pahlavi Dynasty (1925–1979) of father and son (Reza Shah and Mohammad Reza Shah) embarked on a path of state secularization: Islamic shrines were violated, women were made to go out in public without a veil or *chador*, religious rituals were curtailed, and public places (including schools, universities, and hospitals) were forced to allow the mixing of the sexes. Although the two Shahs' modernization drives did rapidly develop the national economy, the economic polarization of cosmopolitan elites and middle class, on the one hand, and a vast impoverished mass of urban and rural poor, on the other, and their attempts to diminish the social influence of Islam and improve the position of women too quickly meant that these drives were widely regarded as anti-Islamic. The second Shah's autocracy and secret police, his ready accommodation of Anglo-American neo-colonial interests, and his promotion of Western values and the pre-Islamic Persian civilization all paved the way for the backlash: the Islamic Revolution of 1979 that overthrew the Shah.

The Iranian Revolution marked the shift to a new questioning of the secularization thesis. Linked to modernization theory, the secularization thesis held that as societies of the world became more developed, industrialized, urbanized, and educated, the role of religion would naturally decline or retreat into its own specialized or privatized realm. The consensus now is that, except for western Europe, Canada, and Australia, the secularization thesis is not persuasive in any other part of the world.

Underscoring the problems of the secularization thesis is the prominence of *religious nationalism* or politically engaged religiosity in so many postcolonial contexts. According to Bruce Lincoln, modern nation-states, especially postcolonial ones, possess a structural tension between the nation—the “unitary collective identity” of a people—and the state—“the governmental apparatus that manages the political affairs” of the country (2006, p. 62). In the history of nationalism in the modern West, religiosity did not play a big role in the construction of

nationhood, but ethnic markers such as common “blood,” “soil,” “language,” and “history” served to culturally unify the population against an adversary. The modern Western state was forged out of Enlightenment principles of rationality and a fear of the destructive religious wars that had raged across Europe in the 17th century. Thus, the Western model of the nation-state that was exported to the colonies was a secular one, where the state was seen as an adjudicator of religious conflict and a modernizing force against the Dark Ages and wars of religion.

A common problem that this model of secular nation-state encountered in the postcolonies was that, apart from communist nations, native religions were often an important medium for strengthening the collective identity of emerging new nations and differentiating them from their colonizers. Precolonial religious culture has often helped galvanize anticolonial struggles, and it serves as a mode of national integration across regional, class, and ethnic divides after independence. Even the secular Congress Party, which led the Indian independence struggles, relied on the saintly figure of Mahatma Gandhi, who spoke and enacted the Hindu religious language and inspiration of the common people to great effect. Sometimes, the integration of indigenous religion with modern nationalism can be highly coordinated, as in modern Japan, when Buddhism was persecuted and Shintoism was transformed from a localized community religion into a highly state-centralized system of national shrines and the sacred figure of the emperor. Since many new non-Western nations did not experience the traumas of religious wars but the trauma of colonization, they often did not share the Western Enlightenment value of secularism. As Bruce Lincoln notes, where postcolonial national elites aligned themselves with Western secular modernization, they are often seen by the common people and the religious clergy as betraying the nation to Western values and continued Western colonial interests. This describes the recent examples of populist Islamism in Iran, Egypt, Indonesia, Pakistan, Afghanistan, Turkey, and American-occupied Iraq that have risen up against secular-leaning states supported by the West. Indeed, Saba Mahmood shows how secularization can directly serve Western neocolonialism, such as in the Middle East today, where

Western interest in its oil reserves has led to American state campaigns to reform and secularize Islam, so as to curb the religious passions of these anticolonial movements.

In postcolonial contexts with a plurality of religious traditions, there is often competition for the religious identity of the nation or resentments among minority religious groups who may try to secede, resulting in civil strife or war. South Asia has seen many clashes of postcolonial religious nationalisms: Hindus versus Muslims in India and Pakistan; Hindus versus Sikhs and Jains in India; and Tamil Hindus versus Sinhalese Buddhists in Sri Lanka. In India, the Congress Party inherited the British secular model of the state and has tried to mediate between different religious constituencies. Growing resentments in the 1980s that the secular state was not serving the religious majority propelled a popular movement to link national identity or Indianness with the Hindu religion, known as *Hindutva*, which also produced the Bharatiya Janata Party. These religious-nationalist energies were unleashed in the dramatic destruction by a Hindu mob of the Babri Masjid Muslim mosque in Ayodhya in 1994. This 16th-century mosque had been built on the site of a Hindu temple marking the birthplace of the Hindu god Rama, and the mob that demolished the mosque wished to erect a new temple to Rama. The resulting religious violence claimed thousands of lives, mostly Indian Muslims, and foreshadowed later religious retaliations. It would seem that the postcolonial situation of many new nation-states exhibits this tension between a religious national identity and a state focused on secular modernization.

POSTMODERNISM

Postmodernism may be one of the most cryptic and confusing perspectives in history to have grown out of the modern era. The distinction between terms associated with postmodernism demonstrates this complexity. The term *postmodernity* often describes a period of time that succeeds—or even shadows—modernity, while *postmodernism* may denote a distinct cultural tenor running through art, literature, and other forms of popular culture. Where the former implies a break with modernity, the latter indicates an outgrowth of different and perhaps novel forms of distinguishable cultural activities and products. In contrast, *postmodernization* is a reference to movements associated with either postmodernity and/or postmodernism. In short, there are no clear or precise explanations as to what the conceptualization of postmodern and its derivatives actually constitute; yet this lack of clarity is indicative of the type of challenges to objectivity and absolutism found within postmodern

themes. What is certain is that the Information Age has provided a stage for which social institutions within an era of globalization can be interpreted through postmodernism.

Modernism Versus Postmodernism

The distinction between modernism and postmodernism can be most readily viewed through their characteristic differences. In its most general meaning, the term *modernism* refers to a period in which principles extending from the European Enlightenment gave rise to systems of logical thought and rationalism. These principles were said to have provided hope for a better future and a variety of ideological means for attaining those ends. However, history has shown that modernity proved to be fraught with foibles and shortcomings.

Conversely, postmodernism emerged as a reaction to modernism by challenging, above all, universal perceptions pertaining to the functions of a social world. Where modernism relied on a search for truth and knowledge, postmodernism dealt more with the futility of truth and a perceived misconception that knowledge must perform a useful function. In addition, modernism brought about a sense of optimism that was informed by the growth in industry and progress; postmodernism possesses a pessimistic tone and is more attuned to concerns about an abundance of information.

Within the context of modernism, classifications were extrapolated in an attempt to manage and make sense of the social world at large. One of the most pronounced characteristics of the postmodern condition is the fragmentation of institutions that arose from modernity. Where postmodernity implies a break with modernity, the fragmentation of the latter becomes the infoscape for the former. That is, fragmented institutionalized material found within the postmodern condition allows for only faint interaction with truncated images that reflect an incomplete version of their original form.

This fragmentation can also be applied to one's image of self. Where identity was once the instrument for defining oneself and one's sociological classifications, those categories have now been blurred and fragmented within the postmodern condition. One way of resuscitating these divisions is by borrowing from mass media, the one institution

that still holds—albeit artificially constructed—reality as its model. Mass media, through the mechanism of consumption, offers a series of spectacular and limitless audiovisual and literary materials to choose from.

Another distinctive feature of postmodernism that highlights the break with modernism is the critique of grand narratives. These grand narratives refer to large value-laden explanations of the workings of the world and are largely the basis for which modernity has gained legitimacy. Grand narratives among modernity included Marxism as a way of explaining social inequality and providing a solution through class struggle, psychoanalysis as an enterprise of mental liberation through excavating repressed psychosexual feelings and events, structural-functionalism as an analysis of social institutions and their necessities within society at large, and feminism as criticism of a historical system of patriarchy and the subordination of females in general. However, some critics have argued that postmodernism has also posed yet another grand narrative and thus fails to distinguish itself from modernism based on such tenuous criteria.

Pioneers of Postmodernism

Although the term *postmodernism* may have been used previously, some scholars of postmodernism contend that one of the first known uses came from the Spanish literary critic Federico de Onís, who used *postmodernismo* in a critical description of modernity. However, any single definition of postmodernism falls short of capturing the trajectory of development that such a term embodies. Individuals who have interacted with the postmodern discourse have, perhaps inadvertently, crafted metalanguages—or paradigmatic modes of interpreting. At least two of these metalanguages—structuralism and deconstructionism—are considered to be the foundation on which the concepts of postmodernism have been built. In addition to these metalanguages, theoreticians from a variety of fields have, perhaps even unknowingly, contributed to the ideas of postmodernism, including Friedrich Nietzsche, Richard Rorty, Roland Barthes, Michel Foucault, Jacques Derrida, Jean Baudrillard, Jean-François Lyotard, and Fredric Jameson.

Structuralism and Deconstructionism (Poststructuralism)

Much of the theoretical concentration on meaning during the 20th century dealt with the expression of ideas rather than the mental functions that went into creating such ideas. As some of the most advanced thinkers of that period were focusing on the structures of language, linguistics played a major role in the development of postmodernism. On the way, a mid-20th century sociolinguistic idea known as structuralism emerged as an interpretation of meaning based on language. Beginning first and foremost with a revival of the Swiss linguist Ferdinand de Saussure's (1857–1913) work on the structure of language, structuralists began to focus on languages void of their historical meanings. With some variation, structuralists argue that language is a social construction and the rules that govern its expression—found within literary texts—serve to provide meaning for otherwise meaningless experiences. Through the Saussurian model of a system of signs, structuralists suggested that much of this interpretation was based on the relativity of this linguistic/literary production of meaning.

Deconstructionists, by contrast, have rejected this notion of linguistic relativity. Though many of the same individuals who developed structuralism later became deconstructionists (e.g., Barthes, Foucault, and Derrida), they still advanced their interpretations by locating a multiplicity of realities that emerged from audiences themselves. That is, rather than affirming that linguistic structures held definite similarities across cultural boundaries, they opted to regard language as an entity open to interpretation.

Friedrich Wilhelm Nietzsche

Friedrich Wilhelm Nietzsche (1844–1900) is considered a vital forerunner of postmodernism. His cynicism toward the legitimacy of truth and knowledge culminated in one of his most popularly cited phrases, *Gott ist tot* (“God is dead”), where Nietzsche expressed a transformation toward a world no longer invested in God as an adjudicating entity of one's purpose and morality. As man is capable of manipulation and deception, Nietzsche cautioned that regarding man as the adjudicating source of purpose and morality would

require that one go beyond the common weaknesses that religion serves to ameliorate. Nietzsche's solution—however cynical—was to cultivate the *Übermensch*, or the superman inside oneself. Straying away from traditional institutions and reorganizing one's life around personal potentials are among Nietzsche's thematic contributions to postmodernism.

Richard Rorty

The ideas of Richard Rorty (1931–2007) and postmodernism revolve around challenges to the concept of truth. Bound to the subjective notions of the mind and knowledge, truth is constructed through supposed logical explanations within analytical philosophy. Rorty suggests that interpretation and the continuation of conversation through discourse serve to resolve epistemological problems of truth. In this way, Rorty maintains the tone of scrutiny toward objectivity found within postmodernism.

Roland Barthes

Roland Barthes (1915–1980) advanced the ideas of structuralism through a semiological analysis of material culture. For Barthes, culture too was susceptible to coding and decoding in the same way in which language could be analyzed through codes and its structural continuity. In a series of essays compiled in his 1957 book *Mythologies*, Barthes draws on the decoding of culture by demonstrating the production of modern mythologies. In a particularly well-cited chapter titled “The World of Wrestling,” Barthes argues that choreographed wrestling poses a modern myth that reaffirms the morality and values of the audience. Given this, culture is invested with structural codes intended to convey meaning. In a deconstructionist fashion, Barthes' 1967 essay “Death of the Author” illustrates an absence of writers' command of meaning and the multiplicity of interpretation. Barthes' insight is considered paramount to critical mood within postmodernism.

Michel Foucault

Michel Foucault (1926–1984) is one of the more widely recognized contributors to postmodernism. Much of his work revolves around the

interplay of language and power. Focusing on language, Foucault examines the pretexts of knowledge as institutionalized agents of control—a concept he termed *epistemes*. These epistemes operate through a system of inclusion and exclusion, whereby certain categories of exclusion (e.g., madness) serve to establish and legitimize certain discourses of a given society. For Foucault, language ties into this legitimizing process, whereby assigning terms and explanations to beliefs or practices is actually a form of instituting power and control.

Overall, Foucault's ideas expose the presuppositions of modernity and thus offer more insight into the contentious world of postmodernism.

Jacques Derrida

The origins of deconstruction are often attributed to the work of Jacques Derrida (1930–2004). Derrida indignantly challenged the pretense of Western reasoning by arguing that it was a project of arbitrarily constructing correctness yet devoid of any real basis. Despite other uses of the term, Derrida described this pretense as *logocentrism*, where reason was presumed to yield certainty. Effectively arguing that all forms of such reasoning throughout history had been conceived through teleologically establishing the legitimacy of a reasoning project, Derrida contested the certainty of these structures of knowledge through locating assumptions that undergird so-called factual claims.

Jean Baudrillard

Jean Baudrillard (1929–2007) is considered one of the major contributors, if not the originator, of postmodern “hyperreality.” Focusing on the abundance of images in the 20th and early 21st centuries, Baudrillard argues that reality has been compromised by a process of simulation, where the representation of images has replaced the reality of the images themselves. According to Baudrillard, before arriving at the point by which an image is replaced by its own representation, it first moves through the following four stages: (1) the image is viewed as a reflection of reality, (2) the image obscures reality, (3) the image marks the missing qualities of reality, and, finally, (4) the image no longer resembles its original form or reality and has

transformed into a simulacrum. Baudrillard uses the term *simulacrum* to describe a reproduction of items that no longer retain their original referent. As the Information Age is in part characterized by a bombardment of images through a multitude of technological mediums, the distinction between what is real and what is not is blurred.

In one of his more famous accounts found within his 1995 book *Simulacra and Simulation*, Baudrillard challenges the image of Disneyland as an entertainment park and has instead argued that it is, in fact, reality. According to Baudrillard, Disneyland is a hyperreal setting that is viewed as more real than the reality of the American cities that surround it. That is, the artificial setting that provides a fantasyland of an ideal city in the United States has surpassed the reality of an actual city. For Baudrillard, examples such as these within postmodernism have blurred the fine line between reality and hyperreality.

Jean-François Lyotard

Jean-François Lyotard (1924–1998) contributed extensively to the development of postmodernism. In his widely cited works, he emphasizes the state or quality of operating within what he called the “postmodern condition”—a condition that Lyotard defined as the “incredulity toward metanarratives” or grand narratives. Lyotard criticized these grand narratives as discourse that justifies logic, rational interpretation, and the application of science, which are inaccurate methods of assessing reality. For Lyotard, these grand narratives have a legitimizing quality that preserves the domination of the ruling class. Lyotard resolves the threat of dominating grand narratives by suggesting that the creation of smaller narratives cultivates a multitude of structures that cannot be consumed or evaluated by a larger one.

Fredric Jameson

Fredric Jameson (b. 1934) is considered both a critic of and contributor to postmodernism. In his 1991 book titled *Postmodernism, or, the Cultural Logic of Late Capitalism*, Jameson argues that features attributed to the description of postmodernism are actually indications of a condition associated with late capitalism. Within this view,

Jameson has commented on the fluidity of the individual image, where a feature of homogeneity ironically emerges through “pastiche.” In much of its postmodern references, this concept of pastiche refers to an artistic, literary, or social imitation that, in Jameson’s interpretation, fails to deliver any real political or effective message. The fragmenting of modern institutions within the postmodern condition is accompanied by the presence of pastiche, which, in a unique fashion, provides agency to the actors that subscribe to a hodgepodge of items from popular culture.

Postmodernism, Religion, and Popular Culture

Ideas emerging from the intersection of postmodernism and religion concentrate on issues of fragmentation, authenticity, and expression. Although one of the main currents running through postmodernism is the decentering of knowledge based on the authority of religious precepts, this does not preclude the existence of religion within a postmodern condition. Instead, religion might be said to have transitioned, transformed, or adapted to the new condition while adhering to certain references from the religious traditions of modernity.

Fragmentation

Issues of fragmentation within instances of religion and postmodernism refer to the phenomenon of piecing together portions of religious beliefs and practices from larger faith-based traditions and compiling them into a different form of religious doctrine. Bearing a resemblance to the process of *bricolage*, some sociologists of religion have introduced the concept of the “religious marketplace” perspective, where spiritual seekers metaphorically shop for religion, or its parts, creating an often eclectic version of the original tradition.

New religious movements during the 20th century demonstrated this marketplace phenomenon. The tenets and actions of the *Ordre du Temple Solaire*, or Order of the Solar Temple, exhibited a mixed assortment of fragmentation. Among this fragmentation were Christian historical referents and textual concepts such as an association with the late-medieval Knights Templar crusaders, fraternity-based liturgical practices that drew

connection to rituals from Masonic ceremonies, and New Age/eschatological belief systems, including hyperreal notions of the second coming of Christ and “rapture” through immolation, resulting in multiple instances of murder-suicides in 1994, 1995, and 1997.

Authenticity

The concept of authenticity emerging at the crux between postmodernism and religion refers to an exploration of meaning in relation to religious material. In this area of study, the works of Walter Benjamin have been cited extensively for his concern with visual art and its autonomy within a period where technology became capable of manufacturing infinite copies of originals. In his 1936 essay “The Work of Art in the Age of Mechanical Reproduction,” Benjamin suggests that authentic qualities of a given artistic item lose their aura when produced in mass.

In addition to Benjamin’s writings, the notion of authenticity also draws on concepts from hyperreality, whereby the imaginary has merged with reality and replaced the authentic with fakes. Crises of authenticity within postmodernism may also be seen with regard to apparitions of religious images. Cases include the profile of a pope-like figure on a pancake, a glistening outline of the Virgin Mary on a window, the face of Jesus Christ on a mandolin, the name “Allah” found on the scales of a fish, or even an image of Satan atop a turtle’s shell. These apparitions contribute to the dilemma of what is authentic or fake in relation to institutions of modernity and postmodernity.

Expression

Postmodern expressions of religion are most visible through popular culture. As consumer culture and the use of technological mediums of communication assume a greater presence in daily lives, popular culture garners an increasing amount of influence over reality. An instance of postmodern expression of religion within popular culture emerged in 2008, when a Christian group launched an Internet website that began marketing a notification service for those taken to meet Jesus Christ during the Rapture. The title of the website, “youvebeenleftbehind.com,” offers e-mail

notifications 6 days after the Rapture to inform one's chosen recipients of his or her whereabouts. Such use of technology demonstrates the innovation of fusing religious doctrines and postmodern innovations to express one's commitment to faith.

Postmodernism and Globalization

Perhaps through the proliferation of the information society, postmodernism has also facilitated a global consciousness in contrast to the former nationalistically centered worldview. As postmodernism explores ideas beyond the Enlightenment project of modernism, it also nurtures a sense of exploring beyond oneself. Rather than viewing one's group as part of an ambiguously defined nation, a localization of identity occurs that promotes thinking of one's self as part of a larger whole. The sociologist Roland Robertson has used the term *glocalization* in his description of this increasingly conscientious interconnectedness of the local and the global worlds. Though this view does not assume global harmony free from conflict, it does suggest recognition of an ever-growing diversification of the world, notions of autonomy, and a consideration of historical and cultural differences.

PRABHUPADA, BHAKTIVEDANTA (1896–1977)

His Divine Grace A. C. Bhaktivedanta Swami Prabhupada was the founder and spiritual preceptor of the International Society for Krishna Consciousness (ISKCON, popularly known as the “Hare Krishnas”). Author or translator of more than 60 volumes of Vedic texts, including the *Isopanishad*, the *Bhagavad Gita*, the *Bhagavata Purana* (*Srimad Bhagavatam*), and a host of other sacred literature, he performed the impossible by transplanting India's sacred Gaudiya Vaishnava tradition onto Western soil.

Born Abhay Charan De, in Calcutta (now Kolkata), West Bengal, Prabhupada studied at the Scottish Churches College, which was administered by the British and functioned under the auspices of Christian missionaries. Still, his parents raised him as an orthodox Vaishnava—a devotee of “the Supreme Personality of Godhead”—and he claimed that there was never a time in his life when he forgot Krishna.

He married young to a beautiful woman named Radharani, who bore him several children. For some time, he served as a responsible family man and owned a small pharmaceutical business, which did quite well.

On a fateful day in 1922, however, he met the great Vaishnava saint, Srila Bhaktisiddhanta Sarasvati Thakur, and this rekindled something deep within. As a result of this meeting, he eventually decided to devote his life to propagating the mission of “Krishna consciousness in the English language,” which is what his teacher instructed him to do on their first meeting. He took initiation from Bhaktisiddhanta in 1933.

He later took *sannyasa* (a vow of renunciation) in 1959, and with this latter initiation, he became determined to travel to the Western world—to fulfill his guru's order of spreading Krishna consciousness in English. After several failed attempts, at the advanced age of 69, he finally arranged a passage West on a ship known as the *Jaladuta*—“messenger of the sea”—which was more prophetic than anyone at the time could possibly know.

He suffered a series of heart attacks on that month-long arduous journey, but he finally arrived at Boston and then New York Harbor. He then

traveled to Butler, Pennsylvania, where several Indian contacts were waiting to host him during his initial stay in the Western world.

Testing the waters in Pennsylvania, lecturing, communicating with Americans for the first time, and working on his translations, he left for New York City after 1 month. Spending a hard winter in New York finally bore fruit as he incorporated the ISKCON in 1966, with numerous hippies and celebrities coming to his aid. With the burgeoning hippie movement and “flower power” in full swing, the time was right for Krishna consciousness in the West, and young spiritual seekers flocked to Prabhupada’s movement.

After his initial temple was established in New York, another one was started in San Francisco, California. From there, Prabhupada traveled throughout America with his disciples, popularizing the movement through street chanting, book distribution (*sankirtan*), and public speeches. Prabhupada was relentless, eventually traveling the globe—opening centers, lecturing, translating, and training students—with the energy of a man half his age.

In the 12 years from his arrival in New York until his final days, he

- circled the globe 14 times on lecture tours that took him to six continents;
- introduced Vedic gurukul (children’s education) to a Western audience;
- directed the founding of the Bhaktivedanta Book Trust, which claims to be the world’s largest publisher of ancient and classical Vaishnava religious texts;
- founded the religious farm community New Vrindavan in West Virginia;
- authored 60 books on Vedantic philosophy, religion, literature, and culture, which are now available in numerous languages; and
- watched ISKCON grow into a confederation of more than 100 schools, temples, institutes, farm communities, and ashrams.

Prabhupada left this world on November 14, 1977, but his disciples carry on his mission to the present day.

PRAMUKH SWAMI (B. 1921)

Pramukh Swami (Narayanswarupdas Swami) is the leader of the Bochasanwasi Akshar Purushottam Sanstha (BAPS) subgroup of Swaminarayan Hinduism. He is revered as the chief devotee of Swaminarayan in a lineage that goes back to Gunatitanand Swami, a companion of Swaminarayan in early 19th-century Gujarat. Pramukh Swami was born on December 7, 1921, to Motibhai and Diwaliben Patel in Chansad, Gujarat, India. BAPS Swaminarayan temples celebrate his birthday with elaborate ceremonies each year. He took full initiation as a sadhu in 1940 and soon became manager of the temple at Sarangpur and then, in 1947, private secretary to Shastri Maharaj, who had founded BAPS as a reform movement in 1908. Narayanswarupdas Swami was appointed president of BAPS in 1950 by his predecessor, Yogiji Maharaj, and people called him *Pramukh* Swami, which means “President Swami.”

According to BAPS theology, the chief devotee of Swaminarayan in every period is the *Akshar*, the abode of *Purushottam*, the highest manifestation of the divine. Pramukh Swami assumed spiritual leadership of BAPS at the death of Yogiji Maharaj in 1971. Followers believe that he is the perfect devotee who follows all the sadhu disciplines perfectly. Hence, the more humble, world renouncing, and self-effacing he is, the more reverence and devotion followers bestow on him. Images of him and his predecessors are objects of worship in BAPS temples. He is the guru for BAPS followers, who accept his teachings as divinely inspired, and they seek his counsel when making decisions about marriage, employment, business, and family. His decisions are final regarding all BAPS institutional matters.

BAPS has grown dramatically under Pramukh Swami’s leadership. He has personally dedicated 713 temples and initiated more than 700 men as sadhus. In 1981, he established a Sadhu Training Center at Sarangpur, Gujarat, where, prior to initiation, young men go through a 4-year curriculum that includes Hindu and Swaminarayan scriptures and philosophy, devotional music, public speaking in three languages, Sanskrit, priestly skills, and world religions. Pramukh Swami then assigns each sadhu to tasks in the institution.

Followers meet in more than 3,300 BAPS centers in India and abroad, especially where Gujarati migrants have settled in East Africa, the United Kingdom, and the United States. He dedicated Akshardham in New Delhi in 2006 as the largest Hindu temple complex in the world. Other BAPS temples of marble and sandstone in London, Toronto, Chicago, Houston, and Atlanta attract large numbers of worshippers and tourists. Pramukh Swami has been active in hosting large international cultural and religious festivals, including the centenary celebration in Ahmedabad in December 2007. The growing size and wealth of BAPS supports eight hospitals and clinics and more than 30 educational institutions.

BAPS has gained a reputation as one of the wealthiest and fastest growing Hindu groups. It has been a leader of the neo-Hindu reform movement emerging from the colonial period and has become a strong transnational movement among Gujarati Hindus in India, East Africa, Britain, and North America.

PRAYER BEADS

Prayer beads are looped strands of wood, stone, berries, or glass beads that are used for chanting or recitation of prayers, hymns, or meditations. Practically, they allow the devotee to keep count of the repetition of prayer without losing focus on the prayer itself. Often prayer beads are held as sacred, and the number of beads relates to a tradition's theology: Muslim prayer beads—*misbaha*—for example, have 99 beads representing the 99 names of God.

Although the use of beads for religious practice is believed to have its earliest roots in India, the

practice is global, and humanity has invariably tended toward iteration of prayers in repetition. Mainstream orthopraxy in Christianity, Islam, Buddhism, and Hinduism uses prayer beads, as do many new religious movements. On the Indian subcontinent, prayer beads, or *japa mala*, typically have 108 beads and are used by Sikhs, Jains, Buddhists, and Hindus. For some, the base is mathematical—for example, the product of self powers of 1, 2, and 3 equals 108 ($1 \times 4 \times 27$); for others, it might relate to ideas such as Krishna's 108 consorts or the 108 Hindu Upanishads or all of the above; and for still others, chanting on prayer beads is not simply a method of keeping a spiritual score, it is the core practice of faith. The Gaudiya Vaishnava tradition is especially telling in its orientation toward *mantra yoga* and the use of prayer beads for meditation. The Gaudiyas craft their beads out of the sacred *tulasi* ("holy basil"). After reciting a round of 108 prayers, the practitioner arrives at the "Godhead" bead, which separates the smallest bead from the largest and is not supposed to be crossed; this is the marking point for a completed round of prayer, to start the next in the opposite direction.

This tradition shows reverence for the beads that is noteworthy: They are never placed on the floor, taken into the bathroom, or touched by the feet. If any such events occur, a devotee will touch the bag to the head to indicate penitence and respect for the sacred beads. Moreover, the beads themselves are characterized as living and requiring food, which takes the form of prayer. When a devotee has not chanted on the beads for a substantive time, the beads are said to be "fasting." In the early Gaudiya tradition, initiates would strive to complete 64 rounds of *japa mala* a day, which amounts to about 8 hours of meditation. However, the number can be altered, as in ISKCON (International Society for Krishna Consciousness), which cut the number to 16 rounds as the movement spread to the Americas and Europe.

Although using prayer beads is seen as a generally acceptable practice, there is also resistance. In Christianity, Catholics, Anglicans, and even Lutherans have rich traditions with rosaries. Yet this practice is not acceptable to Baptists or Presbyterians, who shun their use and, like the

Wahabbis do in Islam, even proactively encourage others to do the same.

PRISON RELIGION

Prison religion refers to the faith and religiosity embedded in the experience of incarceration. For some prisoners, religious narratives seem to speak directly to their existential predicament, and so stories such as that of the Exodus in the Bible can occupy a special space in a believer's worldview. For others, the practice of religion in prison may be for less devout reasons or may even be something of a con game, a temporary or transitory appropriation, used for protection, perks, or simply to get out of the cell or to socialize. Sincere converts and practitioners have been distinguished primarily according to whether they continue practicing after release; some abandon religion, while others keep the faith.

Religion in prison, despite its contemporary prominence, is an understudied topic, which seems even stranger given the long and intermingled history of prisons and religious narrative. Although the Hindu deity Krishna was born in prison and Jesus Christ suffered imprisonment by Roman authorities, the modern prison or penitentiary was conceived in the United States

by 18th-century Quakers as a corrective period of solitude for a sinner to pay penitence for his crimes and to reconcile with God. Today's prisons, in contrast, are governed by secular principles and suffer from overcrowding, racial schism, and violence. Accordingly, prisons have been hotbeds of legal action, including battles for religious rights that have raged all the way to the Supreme Court.

Since the early days of the penitentiary, the legend of the born-again Christian has poured through prison walls: A man goes to prison, is broken to the core, and resurrects himself with the power of Christ. Over the past 50 years, however, led by the likes of Malcolm X, the Christian legend is being rivaled by converts to Islam. As his case and countless others show, religion is a force that is perhaps better at reforming than prisons themselves.

Despite the reformatory influences of religion, as dens of social and political vengeance, prisons have tended to serve as havens for radical religious thought, whatever the tradition. A telling example is Sayyid Qutb, who is often cited as one of the chief ideological architects of al Qaeda and whose fundamentalist ideals were cemented in books written during his 10-year incarceration in Egypt. Such works have had a tremendous impact on contemporary global politics, and their continued influence is surely to be the subject of further study, especially as American-style supermax prisons continue to be expanded and exported throughout the globe.

PROPHECY

The term *prophecy* is rooted in the 12th-century French term *prophécie*, which was derived from the Latin *proficio* (“advance”) and the Greek *prophetia* (“what is written or spoken by a prophet”). Prophecy refers to the disclosure of concealed knowledge of the most crucial kind: the will and intentions of a transcendent power, for whom a prophet is authorized to speak. A prophet’s message involves an image of community that is of divine origin, and it generally brings the prophet into confrontation with cultural elements that contradict this image. Thus, prophecy generally has political and social ramifications. Prophets traditionally emerge from contexts of social crisis, and their messages promise to transform society through a revitalization of relationships with covert sources of power.

Globalization has posed distinct challenges with respect to prophecy. Globalization often refers to what economists view as the integration of national economies that began in the late 20th century, resulting from the international circulation of capital, technology, and people. Modern globalization, however, can be traced to the 15th-century voyages of discovery that laid the foundations for European colonialism, through which the flow of wealth, technology, and human beings brought most of the world into a matrix of political, cultural, and economic relationships. Through this globalizing enterprise, large numbers of people would ultimately be subjected to displacement, genocide, and other forms of domination. Within this particular context of social crisis, prophecy has been a common occurrence.

Among the most fascinating instances of prophecy in recent years are Melanesian cargo cults that emerged at the time of contact with Europeans in the late 19th century. They continue to the present day. These movements have developed around individuals with prophetic insight into the meaning of Western commodities. They invoke preexisting frameworks of social organization and exchange, motifs of recreation and rebirth, and mythological expectations of ancestral return to interpret the significance of Europeans, the imbalanced distribution of wealth, and the lack of reciprocity in the contact situation. Prophets promote

collective labor (e.g., building of airstrips, warehouses, or radio towers) and rites of purification and transformation (destruction of livestock or gardens, altered sexual practices, or spirit possession) to secure the arrival of cargo (commodities), which colonials are perceived to have misappropriated from Melanesian ancestors. The issues cargo cults confront as well as the religious meanings they ascribe to contact and a market economy are, in many respects, emblematic of prophecy in a global context. Cargo prophets proclaim a message of redemption from domination that is framed in relation to commodities, human reproduction, the need for reciprocity, and new relationships with sacred power. While prophecy is traditionally associated with situations of crisis, prophecy in a global world is marked by these kinds of conspicuously modern features. A brief overview of three prophets here will serve to highlight these features: Dona Beatrice Kimpa Vita, Antônio Conselheiro, and Louis Riel.

From the time of contact with the Portuguese in 1482 until the late 19th century, the Kingdom of Kongo in west-central Africa was racked by wars involving rival kings and Dutch and Portuguese colonials. Refugees and captives created by these conflicts fueled a lucrative slave trade involving the Dutch, Portuguese, English, and French. Dona Beatriz Kimpa Vita emerged as a prophet in this turbulent context. In 1704, a 20-year-old Kimpa Vita experienced visions through which she came to believe herself possessed by St. Anthony and destined to die every Friday, travel to heaven, and return with God’s directives each Monday. She began a peaceful crusade for the unification of the Kongo, the expulsion of Europeans and an end to colonial ventures, and the abolition of slavery. Denouncing traditional African and European religious practices, she instituted an indigenous Catholicism in which Mary, Jesus, and the saints were Kongolese. Her Antonian movement attracted thousands of peasants who followed her to São Salvador (present-day M’banza-Kongo) to restore the city as the Kongolese capital, which they believed to be the true site of Bethlehem. The movement was censured by Catholic and civil authorities, and Kimpa Vita was convicted of heresy in 1706. Although she and her child (believed to have been divinely conceived) were burned at the stake under the Kongolese King Pedro IV, the Antonian

movement ultimately provided Pedro with a foundation for uniting the Kingdom of Kongo.

Kimpa Vita's persecution is not unique among modern prophets. In 1888, by order of the Emperor Pedro II, slavery was abolished in Brazil. Millions of former slaves joined an underclass of impoverished indigenous and Mestizo peoples, while the disruption in agriculture resulted in thousands of farmers losing their land. The situation led to the overthrow of the monarchy by elites, and it provided the setting for the emergence of Antônio Conselheiro (born Vicente Mendes Maciel) as a prophet and messiah among the poor. In the 1870s and 1880s, Conselheiro traveled throughout northeastern Brazil preaching against slavery, restoring churches and cemeteries, and building dams in poverty-stricken communities. In 1893, fueled by a mystical vision of the end of the world and a prophetic message of a coming millennium in which the poor would become wealthy, Conselheiro established the community of Canudos. Thousands of landless peasants, destitute indigenous and Mestizo peoples, and former slaves joined him there in a life of austerity, reformed Catholicism, physical labor, and strict sexual regulation. At its height, 35,000 people lived there together, awaiting "Santo Antônio's" millennium of prosperity for the dispossessed. Regarded as hostile toward the church and the new republic, the community was destroyed by government forces in 1897. Conselheiro never raised a weapon during the confrontation. Rather, he prayed and fasted until he died (of malnutrition and dysentery).

A contemporary of Conselheiro, Louis Riel, led a Métis (peoples of European Aboriginal ancestry) resistance against Canadian expansionist forces in Rupert's Land (now Manitoba) in 1869. While the resistance was successful in many respects, Riel was forced into exile for a number of years. During this period, he began to experience visions in which the Holy Spirit anointed him a prophet and directed him to lead the Métis of the District of Lorne (present-day Saskatchewan) in creating a multinational state of new indigenous ethnicities (e.g., German Indian), each located on unalienable land, and a New World Catholic Church. During the period, the territory's Métis and native peoples were suffering deprivation and were being forced from their land, and settlers were struggling under severe trade restrictions. Riel was asked to lead a

multilateral resistance, but when formal negotiations broke down in 1885, the Métis found themselves alone and confronting federal military forces. They were summarily defeated. During their final confrontation, an unarmed Riel led women in reciting the rosary while his colleagues who were fighting pleaded with him to perform a miracle, which did not happen. He was convicted of treason and hanged by the government.

There are significant commonalities among these prophetic movements that reflect issues and practices that figure overtly in cargo movements. In each case, social, political, and economic marginalization directly resulted from cultural contact. Long-standing relationships with place were disrupted through economic expansion, dispossession, or enslavement. Bodies became sites of transformation, not only in the emergence of Métis and Mestizo peoples in Canada and Brazil but through possession (Kimpa Vita's experience of St. Anthony), sexual restrictions (Conselheiro), human reproduction (Kimpa Vita's divine child), physical labor (Canudos), and other efforts to create new communities that redefined traditional religious (Catholic) structures and subverted dominant political orders. Like prophecy more broadly, these movements were enmeshed in situations of crisis, but they related expressly to crises particular to a global modernity: disequilibriums of power resulting in widespread alienation from wealth and land; the unavoidable defining presence of commodities and especially the commoditization of human beings (slavery) and land; and individual and social transformation. In this context, prophecy has served to reestablish relationships with ultimate sources of power that address the lack of reciprocity underlying the situation of crisis. In so doing, it has given rise to new discourses and new forms of collective action that redefine the person and society while acknowledging a locus of authority that exceeds that of dominant forces. Prophecy points to the disruption of global contact situations, the need for reciprocity, and the religious significance of commodities and wealth. It also reveals strategies for affirming the integrity of community within a global world.

PROTESTANT BUDDHISM

Protestant Buddhism refers to a certain genre of Buddhist beliefs and practices that developed in the mid- to late 19th century, particularly in Sri Lanka (Ceylon), among middle- and upper-class urban Buddhist laity as a result of contact with European and American Protestant missionaries, colonial officers, and Orientalists. The term *Protestant Buddhism* was first coined by the Sri Lanka historian/anthropologist Gananath Obeyesekere in 1970 as constituting a theoretical ideal type, and it represents an early form of global religion in two senses: On the one hand, the historical phenomenon that Obeyesekere describes, the collaborations and contestations between Theravada Buddhists and Western Protestants, constitutes one significant 19th-century type of transregional religious encounter. On the other hand, the theoretical category that Obeyesekere creates represents an important early attempt to theorize global influences on religion. Since Obeyesekere's coining, the phrase *Protestant Buddhism* has increasingly been scrutinized by scholars who question the appropriateness of the term because it gives Protestants and Protestantism too much agency in the development of modern Buddhism and neglects important reform and revival movements within Buddhism itself.

In coining the term, Obeyesekere saw *Protestant Buddhism* as the result of two processes: cultural

borrowing and cultural protest. In terms of borrowing, *Protestant Buddhism* described certain new forms of Buddhism in Sri Lanka, which resulted from the mingling of traditional Buddhist practices and beliefs with those of European and American Protestant colonists and missionaries. Under the heading of Protestant Buddhism, Obeyesekere grouped a number of borrowings from Victorian British Protestant colonial officers and other English-speaking Christians such as Henry Steel Olcott, the American cofounder of the Theosophical Society. These features included a stress on certain moral ideals, including sexual morality, monogamy, temperance, hard work, economic independence; the adaptation of certain organizational forms from Christianity, such as the Young Men's Buddhist Association, Buddhist chaplains in armies and hospitals, Sunday Schools, and missionary organizations; and the development and reformation of certain ritual and textual forms, including the elimination of astrology and deity worship from religious practices, a more socially engaged role for Buddhist monks, a more religiously engaged role for lay men and women, an emphasis on the authority and centrality of Pāli texts, and the creation of new liturgical texts such as the *Buddhist Catechism* (authored by Olcott) and the *Daily Code for the Laity* (authored by Anagarika Dharmapala). In terms of protest, Obeyesekere points out that *Protestant Buddhism* not only refers to the fact that new Buddhist features derived from Protestantism, but it also referred to the fact that many of these new religious forms were part of a *protest* against Christianity. Thus, the Buddhists adopted some of the rhetorical and organizational features of Christian missionaries to fend off missionary challenges. They developed their own Buddhist printing presses to counter missionary pamphleteering, their own schools to counter proselytizing missionary schools, and even their own missionary organizations to compete with Christian missionaries, such as the Society for the Propagation of Buddhism (a direct appropriation of/protest against the missionary Society for the Propagation of the Gospel).

In the years after 1970, Obeyesekere's category of Protestant Buddhism has been used by a number of other scholars, mainly to describe changes to Sri Lankan Buddhism in the late 19th and 20th centuries. Historians of Buddhism, including Kitsiri

Malalgoda, George Bond, and Richard Gombrich, have built on and further nuanced this category. Malalgoda describes the 19th- and 20th-century history of monastic schisms, which contributed to the development of Protestant Buddhism. Bond outlines the way in which Protestant Buddhist idioms, cultivated in turn-of-the-century Sri Lanka, fed into the mid-20th-century Buddhist “revival,” in particular into engaged Buddhism and lay meditation movements. In a collaborative volume with Obeyesekere, *Buddhism Transformed*, Gombrich traces the trajectory of Protestant Buddhism in modern, urban Sri Lankan religiosity. In addition to these works, a number of studies have focused on major historical events, organizations, and personages that have influenced the encounter between Buddhism and Christianity and, thus, shaped the development of Protestant Buddhism. A significant study by Richard Fox Young and G. P. V. Somaratna, *Vain Debates*, examines the missionary-monk debates on the southwest coast of Sri Lanka during the mid- and late 1800s. Similarly, stand-out studies have been written on influential figures in the development of Buddhism in Sri Lanka during the 19th century, particularly Henry Steel Olcott, T. W. Rhys-Davids, and Anagarika Dharmapala.

Although Obeyesekere coined the term *Protestant Buddhism* with reference to Sri Lanka, it is important to note that many of the characteristics of 19th-century Buddhism, which he attributes to missionary and colonial influence, are actually visible in areas that had not been colonized, such as 19th-century Thailand (Siam) and 18th-century (pre-British) Kandy, Sri Lanka. In Thailand, between 1851 and 1910, King Mongkut (Rama IV) and his successor King Chulalongkorn (Rama V) enacted very similar reforms to Buddhism as was seen in Sri Lanka during the same period. They developed new lay and monastic Buddhist organizations, reformed Buddhist rituals purged of “superstitious” practices, asserted the centrality and authority of Pāli texts, and wrote new Buddhist liturgical and educational texts. However, unlike in Sri Lanka, there was no colonial authority in place in Siam during this time. While there was certainly a great deal of European influence in the Siamese court, changes to Buddhism in Thailand cannot be attributed primarily to a borrowing from or reaction to Protestantism.

Similarly, in the late 18th century, one sees dramatic revisions of Buddhist practices, texts, and organizations in the development of a new monastic fraternity in the Kandyan kingdom of Sri Lanka, the Siam Nikaya. In her study of the Siam Nikaya, Anne Blackburn argues that certain features that Obeyesekere attributes to Protestant Buddhism in Colombo in the late 19th century were actually present in monastic reform movements in Kandy 100 years earlier. In particular, a new emphasis on the authority and centrality of Pāli for Buddhist practice and new types of Buddhist liturgy and preaching can be traced to the work of the founder of the Siam Nikaya, Valivita Saramkara. Blackburn draws from the work of Charles Hallisey to critically revise Obeyesekere’s concept of Protestant Buddhism. In this revised vision, 19th-century Buddhists are seen as having a type of relationship to Western civil servants, missionaries, and scholars that is different from what Obeyesekere described. Rather than a relationship of cultural borrowing where Sri Lankans adopt Protestant mores, Blackburn and Hallisey describe a situation of “intercultural mimesis” in which European American scholars, missionaries, and administrators favored and developed certain characteristics of Buddhism that were already present in the tradition itself. That is, in their understandings of Buddhism, European Americans simply mimicked and amplified certain strands of thinking within Buddhism itself. In turn, these visions were institutionalized and authorized in influential 19th-century Sri Lankan organizations that were funded by European Americans, such as the Pāli Text Society and Buddhist Theosophical Society.

Regardless of its label or its origins, the cluster of attributes that Obeyesekere identified in late 19th-century Buddhism have come to characterize Buddhism in many countries. In particular, one might say that many Buddhist converts in America and Europe understand the faith in terms that cohere closely with Obeyesekere’s and others’ descriptions of 19th-century Protestant Buddhism—as a sober, contemplative, moral tradition centered around a well-defined canon of Pāli texts, consisting of simple, austere ritual practice, including meditation, which lay men and women can engage in with or without monks. Thus, the characteristics grouped under the rubric of

Protestant Buddhism are not only important for interpreting Buddhism's encounter with the West in turn-of-the-century Asia, but they also remain influential, even dominant, qualities foregrounded in popular conceptions of Buddhism in modern non-Asian societies around the globe.

PROTESTANT CHRISTIANITY

Protestant Christianity is an umbrella term for a broad range of Christian churches and movements that are neither Catholic nor Orthodox, most of which have their origin in the Reformation, a 16th-century western European reaction against Roman Catholicism. Although there are wide variations in structure and doctrine, their beliefs are typically characterized by an emphasis on grace as the means of salvation, scripture as the source of authority, and an expanded role for laity. Having spread from western Europe to all continents, Protestantism is now second only to Catholicism as the dominant strain of Christianity in the world.

Origins

Although it had earlier roots, the Reformation is traditionally said to have begun in 1517, when Martin Luther, a German priest and professor of theology, issued his 95 Theses against perceived abuses within the Roman Catholic Church, such as the sale of indulgences. Luther soon began to formulate key doctrines, such as salvation by faith alone and the sufficiency of scripture as the source of Christian authority, and strongly criticized Catholic notions of sacramental priestly authority. By the time Luther was formally excommunicated from the Catholic Church in 1521, a wide variety of other reform movements, labeled "Protestant" by the Vatican, were springing up in western Europe. John Calvin wrote the *Institutes of the Christian Religion* in 1536, espousing the absolute sovereignty of God, who offers salvation only to a predestined elect of a totally depraved humanity. His theological ideas and reforms of church structure became normative for a wide range of Calvinist or Reformed Churches. Anglicanism arose at this time in the context of the English monarch's break with Rome, retaining many of the trappings of Catholicism but gradually gaining a more Protestant character. The radical Anabaptists saw church as a free association and held to doctrines such as absolute pacifism; they suffered severe persecution as a result from their fellow Christians.

These various groups dissenting from the Roman Catholic Church formed churches of their

own, leading to the present-day diversity of Protestant denominations. Most early Protestants accepted close ties between church and state. But to some of the more radical reformers, such as the Anabaptists and some English Puritans, the Christian church was not a matter of coercion by a secular authority or a clerical hierarchy but a voluntary association of believers responsible to God alone. Based on this principle, the English Nonconformist Free Churches broke from Anglicanism, spawning major Protestant movements such as Congregationalists, Baptists, and Methodists and their innumerable subdivisions. The trend toward sectarianism eventually spawned marginal groups, not generally considered Protestant but arising in a Protestant framework, such as Unitarians, Mormons, and Christian Scientists.

Protestantism in the Western World

Protestantism was initially confined largely to northern Europe and later North America; it was a North Atlantic phenomenon until the 19th century. Early Protestantism (leaving aside the initial reformist wave) was less interested in spreading the faith through missionaries than seeking the support of political leaders and gaining an established status. The geographical expansion of Protestantism began with English colonization in the New World. The American colonies became a haven for nonconformist groups such as the Puritans, and denominations and sects proliferated following American independence, aided by the constitutional prohibition on religious establishment. Immigration added to the diversity of Protestantism in America, adding Anglicans, Calvinists, and Lutherans to the mix; this trend continues with the arrival of Asian and African Protestants as well as Latin American Pentecostals. Major trends in the 20th century include the ecumenical movement, which has reduced the importance of denominations, and the divide between liberals and evangelicals, which has become more salient than other divisions. Protestant Christianity has had a great deal of influence on American politics throughout American history, having both conservative and progressive impulses, and today, a strong Religious Right contends with a less recognized but still active Religious Left. In North America, Protestants of all kinds represent around

a third of the population—a less dominant position than was previously the case; evangelical groups have held their ground, but the more liberal mainline denominations have declined in recent decades. In its original homeland in western Europe, although it is still the state religion in some places, secularism has greatly diminished the influence of Protestantism.

Missionary Expansion of Protestantism

Since the 19th century, missionaries have spread Protestantism around the globe, with varying rates of success. From 142 million in 1900, it has been estimated that Protestant Christians grew in numbers to 821 million by 2000. With the new wave of European colonialism subjugating much of the world to European (particularly British) control, new missionary fields opened up. Missionaries had varying degrees of attachment to colonial powers; Americans grew more and more prominent in the missionary movement, and the most successful evangelical efforts were often conducted by the early waves of local converts. The prime focus of early missionary efforts was Asia, in particular the countries of India and China. Facing competition from previously established religions such as Hinduism, Buddhism, and Islam, they won relatively few converts. By 2000, Protestants numbered at most 5% of the population in India (appealing especially to the lower castes), 1% in Japan, and 6% in China (all of these estimates appear to be rather overoptimistic). However, missionaries have had more success in the Philippines and Korea (where Protestantism increased from a handful of adherents in 1900 to 35.7% of the population by 2000), both of which have been receptive to American influence.

As Africa was divided between the colonial powers, so it was divided into missionary spheres of influence, with Protestant missionaries having more influence in British and German colonies than in those areas ruled by Catholic France. Africa was not the most popular destination for missionaries, but they won success through their support of educational institutions and mobilization of Africans who did much of the work of spreading the faith. Today, African Independent Churches, blending Protestant and indigenous

elements, have a great deal of influence, although they are often considered to be inappropriately syncretistic by conservative theologians. The original Protestant denominations established by missionaries also thrive and in some cases outnumber their Western parent denominations. This is particularly true of the Anglican communion, in which African provinces have exerted increasing influence in debates over debt relief and homosexuality. Protestants (including the Anglicans) number 150 million in Africa as of 2003, and the related African Independent Churches command 86 million adherents.

Protestantism in Oceania has followed a similar course to that in Africa, with colonialism encouraging the spread of Protestantism and Protestantism also spreading via European immigration. During the wave of missionary expansion, there was some desire to evangelize Latin America as well, but resistance from some quarters to missionary efforts in a Christian (albeit Catholic) land meant that missionary efforts were limited. In Latin America, the greatest success of Protestantism was among liberals opposed to the power of the Catholic Church, but when such political concerns faded, so did traditional Protestantism in favor of Pentecostalism.

Protestantism has played a role in destroying local cultures, particularly as this involves traditional religious practices. For this reason, and because of the often close relations between missionaries and imperial governments, Protestantism in the Global South is often derided as a tool of colonialism. However, its local manifestations have developed local stamps as Christianity has sought to define itself in terms relevant to Asian and African cultures, leading in some cases to new religious movements. In Africa, Protestant Christians have often been at the forefront of anticolonial and antiapartheid movements.

Pentecostalism

Pentecostalism, defined by the idea of charismatic gifts of the Spirit (speaking in tongues, prophecy, healing, etc.), is among the fastest growing movements within Protestantism. American in origin, it is traditionally dated to the 1906 Azusa Street Revival in Los Angeles, after which a wide variety of new churches began to be founded. The related

charismatic movement has had success working within traditional denominations to encourage reception of the “gifts of the spirit.” From a global perspective, it has had particular success in Africa and Latin America. Within Latin America, it has had particular success among the poor and marginalized, women, and those disaffected by the dominant cultural Catholicism. Pentecostals in Latin America by far outnumber traditional Protestants, with as much as 47% of the population in Brazil being affiliated with the movement. Pentecostals and charismatics in Africa number as many as 147 million. In Africa, the movement appeals to the aspiring middle classes with its affirmation of prosperity and prestigious links to American missionary efforts. Pentecostalism’s spread in Africa (and to some extent elsewhere) is often said to reflect the growing influence of the American Religious Right. Others see in the movement a more grassroots, indigenous character; the African Independent Churches may contain Pentecostal elements as well.

PUBLIC AND PRIVATE RELIGION

The classic dichotomy between public and private religion is at the heart of numerous attempts to analyze and locate religion, even if often only one element is included in the analysis, such as exploring public religion-state relations or analyzing the links between private religion and altruism. Modern societies are committed to the increasing independence of social systems (societal differentiation), one example of which is the privatization of religion, or religious individualism. For instance, the majority of the American baby boomers are religiously privatized. The overall societal differentiation is gained and maintained by the public-private distinction. This dichotomy is, however, rooted in the traditional way of looking at social relations and institutions (domestic life vs. the public and third sectors) and has been challenged.

Still, this dichotomy is also useful today, particularly in empirical survey research (e.g., in trying to detect and measure interconnections between the parts of religiosity and various phenomena, acts, and attitudes). Public religion then refers to expressions of religious faith or behavior in the public sphere, and what is important is that the agent of such expressions may be individuals, communities, or public institutions. Private religiosity then refers to all individual-level private expressions of religious faith and behavior, such as prayer or the importance of religion or God in an individual's life. Various other elements of individual-level religiosity (such as attendance at religious services) are, however, examples of public religiosity. Overall, expressions of individual-level religiosity and the general question of why people become religious have been analyzed from various perspectives, including deprivatization theory, socialization theory, rational choice theory, and the theory of the search for meaning and belonging.

Many classic studies (and a few even today) took it for granted that religion would be doomed to (above-noted) privatization and away from public life. However, since the late 1970s, religion has increasingly appeared in the public sphere in various contexts in Latin America, Asia, the Middle East, North Africa, and Europe. The first prominent scholars to analyze this process have been

Robert N. Bellah and José Casanova in particular, arguing that religion is indeed still a force for collective action and togetherness as well as political mobilization. Bellah has scrutinized the question of civil religion: religious factors existing and functioning independently of churches and states. Casanova modifies the public-private dichotomy by focusing on the mediating category of civil society. He has analyzed the role of the Catholic Church in different democratization processes, showing that the Church and Catholic groups that have previously resisted democratization have become positive and even proactive in the processes of democratization. Thus, the role of religion does not imply privatization but a modern public religion. Indeed, our time is witnessing a rise in both the public and the political roles of religion. Casanova focuses on the deprivatization of religion, through which religions refuse to adopt a detached and privatized role previously assumed to be a consequence of modernization (secularization).

Casanova argues that deprivatization of religion may take place in three ways. First, religions have begun to defend the traditional lifeworld against modern processes, which disrupt things such as the patriarchal family model. Religion enters the public sphere and raises public discussion on these issues. Second, religions enter the public sphere to question the action of states and markets. Religions can use their position to remind societies and individuals of the need to subordinate such institutions to the common good and to regulate them to become more responsive to human needs. Third, religious traditions may maintain the principle of the common good against the claims that reduce it to an aggregated sum of individual rational choices. Religions can bring issues of private morality into the public sphere and force societies to confront the task of reconstructing their own normative foundations. Various scholars have used Casanova's perspective to explore national cases. Broader trends are obvious too; religion in Europe has been unexpectedly prominent during the last two decades in public debates and actions over welfare and in combating social problems. Another example is that religious organizations in the United States are involved in care in very substantial ways, through both informal partnership and their own programs. Indeed, and as noted by Casanova in a 2001 article, even though organized religion in the

United States is very different in its history and composition from that in Europe, it has similar public functions in society.

There may be various public religions at three levels of a society (with examples from Casanova's 1994 study):

1. State (e.g., the Spanish Catholic Church)
2. Political society (e.g., the Catholic churches in Brazil)
3. Civil society, including both civil religion (e.g., Protestantism in the 19th-century United States) and the public interventions of religious groups (e.g., pastoral letters by Catholic bishops)

Privileged monopoly churches, not only Christian ones, can also relocate from the state and political society to civil society since the levels are not static.

Notwithstanding the usefulness of the public-private dichotomy, various social- and individual-level phenomena indicate its blurriness. Social institutions are becoming increasingly porous, particularly in late modernity, and their boundaries less rigid. For instance, although individuals have been seen increasingly as independent free agents (individualism) during recent decades, complex social and societal factors are central to individual lives and to their happiness. Moreover, autobiographical stories always mix individual narratives and collectively constituted public stories and are built on both. Various religious phenomena also illustrate the interrelatedness of public and private in individual lives, as shown by increasing spirituality, various modes of popular and alternative religions, and the links between religion and health (both in individual experiences and, increasingly, in public health care). As discussed by Grace Davie, the notion of vicarious religiosity, typical in Europe, also indicates the blurriness between private and public religiosity: Churches take care of religious matters on behalf of the population and are respected and trusted for it by individuals. Religion may then be a form of collective public cultural memory, even if people are passive in public and/or private participation in religious activities.

Explorations of the blurry intersection between public and private religiosity would aid us in

understanding and transcending this dichotomy. As noted by Linda Woodhead, the old paradigm in the sociological study of religion focused on public, and privatized, religion, while the more recent paradigm focused on private religiosity; the emerging paradigm sees religion as multilocalized. Further studies on the subtle complex line between public and private in the understanding and practice of religion are called for.

PUERTO RICO

The Caribbean island of Puerto Rico is an example of a territory that has been greatly influenced by numerous distinctive cultures. Since the Age of Discovery, the island has been an object of the imperial ambitions of great world powers, which has caused its colonization and an inflow of vast numbers of diverse groups of people. These circumstances have converted Puerto Rico into a multicultural and interconfessional place where various customs, traditions, and beliefs coexist. This feature is reinforced by the processes of globalization, which favor the diffusion of cultural elements and religious syncretism.

An unincorporated territory of the United States, Puerto Rico is a predominantly Catholic region. Roman Catholicism was instilled into the majority of the Puerto Rican population during Spanish rule over the island from the 15th to the end of the 19th century. When the United States took control of Puerto Rico in 1898, Protestant churches were gradually introduced. Today, about two thirds of Puerto Ricans remain adherents of Roman Catholicism, and more than one fourth are Protestants. Puerto Rican Christians have not only adopted incoming denominations but have also established their own churches (such as the Mita Congregation, founded in 1940 and since having spread to numerous Latin American countries, the United States, Canada, and Spain) and religious traditions (e.g., Clamor a Diós, originated by Jorge Raschke and held annually in San Juan). Apart from Christianity (proclaimed by 97% of the population), several other religions are practiced in Puerto Rico. Some traditional African religions brought by slaves centuries ago still prevail. The

most popular are Santería, rooted in Yoruba beliefs (found in the towns of Loiza and Carolina) and Mayombe Palo, deriving from Congo basin tribes (found in the city of Guayama). Indigenous Taíno beliefs were also rediscovered toward the end of the 20th century. Moreover, the island hosts minor groups of adherents to non-Christian world religions, such as Muslims (predominantly in Ponce, Vega Alta, and Río Piedras), Tibetan Buddhists, and representatives of major movements within Judaism (Reform, Conservative, and Orthodox).

This crossing of traditions is by no means a recent phenomenon but began with the arrival of European settlers in America. Nevertheless, the clash of cultures is facilitated and accelerated in the era of the “global village.” Globalization has influenced the Puerto Rican religious scene by encouraging a revival of indigenous traditions, the import of rival world religions, and the spread of new denominations and churches. Nevertheless, Puerto Rico in contemporary times serves not only as a receptive field for external influences but also as the source of new systems of belief and cultural elements. In the era of globalization, Puerto Rico is assuming a far more active role in the cultural distribution chain than it has been assigned in the past.

PURE LAND BUDDHISM

Pure Land Buddhism, sometimes also called Shin Buddhism, is one of the most popular forms of

Buddhism throughout East and Southeast Asia. The beliefs and practices of the Pure Land tradition focus primarily on the person of Amida Buddha (originally venerated in India by the Sanskrit name Amitabha) and the Pure Land he created to refresh those who struggle to attain nirvana. Originally an outgrowth of the Mahayana tradition, Pure Land has achieved varying levels of independence as a tradition across Southeast Asia, most notably in Japan, where it is both an independent Buddhist tradition and the nation's most popular one. By evaluating the simplicity of Pure Land's devotional practices and the inclusiveness of its soteriology, one can better understand this tradition's far-reaching popularity.

According to Pure Land origin narratives, Amitabha, in the form of a monk named Dharmakara, made a series of vows to help end the suffering of all beings. Because of his compassion, Dharmakara succeeded in creating the Land of Bliss, or *Sukhavati*. Recognizing that attaining nirvana had become difficult in times of war and unrest, Dharmakara intended his Land of Bliss to become a place where seekers could take respite after death and from where nirvana would be attainable. When the sutras containing the stories of Amitabha's exploits and his Land of Bliss reached Han China in the first century CE, the Sanskrit *Sukhavati* became translated as "The Pure Land."

Though some scholars believe Pure Land ideas and texts arrived in China as early as 150 CE, the tradition failed to develop formally until a monk named Hui-yuan formed a Pure Land monastery atop Mount Lushan in 402. For his efforts to establish the tradition, later masters of the Pure

Land tradition named Hui-yuan Pure Land Buddhism's first patriarch. Hui-yuan's efforts to preserve Pure Land practices and teachings were systematized in the 7th century CE by Shantao and other monks. In the 12th century, Hōnen took Pure Land to Japan and established it as an independent tradition there. Shinran, one of his students, later founded Jōdo Shinshū, or "the True Pure Land School."

Across South Asia, many practitioners are drawn to Pure Land because of the simplicity of its practice: Though various groups add additional practices, most groups focus on the recitation of the *nembutsu*, spoken as "Namu-amida-butsu," or "I take refuge in Amida." This recitation offers the practitioner an opportunity to clear her mind. Before gaining the mass appeal it currently enjoys, this simplicity and openness prompted people at society's fringes to devote themselves to Amitabha as many other Buddhist traditions deny salvation to all but certain groups of individuals.

QATAR

Qatar is a peninsular Gulf state bordering the eastern side of Saudi Arabia. Since the lifting of the British protectorate in 1971, it has functioned as an independent constitutional monarchy governed by the Al-Thani family. The majority of Qatari residents are actually noncitizens, both Arab and non-Arab foreigners, nearly 20% of whom are Shi'i Muslims, mostly from Iran. Virtually all native Qataris, however, are Sunnī Muslims, as are slightly more than three quarters of the total population. Wahhabi ideology permeates the Sunnīs' religious outlooks in Qatar, and the largest religious minorities consist of Hindus, Christians, and Buddhists, predominantly from South and Southeast Asia, and Baha'is from Iran.

Despite Qatar's geographic situation in the heart of one of the most conservative regions in the world and its reliance on Islamic law (Shari'a) to shape government policy, its emir, Sheikh Hamad Bin Khalifa Al-Thani, has instituted various liberal reforms, such as giving women the right to vote and creating and enforcing a constitution designed to cultivate pluralism and social justice. Doha, the capital, is home to Al Jazeera, the 24-hour international broadcasting corporation founded by the Emir, known internationally for its diverse array of news and talk shows that air controversial political, social, and religious issues, and that provides a voice for otherwise unrepresented points of view.

In 2008, the Doha International Center for Interfaith Dialogue officially opened as a locus for

advocacy of understanding among faiths, the promotion of religious values in approaching humanitarian issues, and authoritative education and training for spreading the culture of dialogue. The center hosts annual conferences for interfaith dialogue, publishes a scientific periodical journal, and provides other programming such as youth camps and cultural field trips.

Additionally, in 2008, Qatar inaugurated its first contemporary public space for Christian worship, the 2,700-seat St. Mary's Roman Catholic Church, or the Church of Our Lady of the Rosary, built on land donated by the Emir. Despite the Qatari government's gesture of promoting religious pluralism, it required architects to omit a cross, steeple, and bell tower from the building's exterior design but allowed crucifixes and paintings depicting biblical scenes inside. Qatar also planned to construct several other buildings to house services for Anglican, Coptic, and Greek Orthodox Christians and various Indian communities, leaving Saudi Arabia as the only Gulf country that does not permit the construction of non-Islamic houses of worship. Although Christians have historically worshipped in Muslim lands without such restrictions, Qatar's building regulations reflect the influence of modern ideologies rather than traditional Islamic practices.

Qatar also distinguishes itself from the neighboring kingdom by allowing Wahhabi ideology to influence its public displays of religion in a tangibly more relaxed manner. Unlike in Saudi Arabia, Qatari women are allowed to drive and vote, and foreign women are not expected to don

a full-length black gown when traveling in the country.

The global social network and grassroots activist organization the Muslim Leaders of Tomorrow hosted its 2009 international conference in Doha and invited 300 young leaders from around the world to debate critical issues such as violent extremism and effective media engagement and to compose “An Open Letter to the World Leaders of Today From the Muslim Leaders of Tomorrow,” a compilation of policy recommendations proposing solutions to contemporary challenges facing Muslims around the globe.

QIGONG

Qigong (lit. “breathpractice”) refers to a Chinese system of body cultivation that involves the circulation of somatic energy (qi) by means of breathing techniques, mental concentration, and set sequences of movements. Practitioners expect it to strengthen the body, heal diseases, lift the mind to higher levels of awareness, and possibly even produce extraordinary abilities and powers. Though it is a part of traditional Chinese practices, it became popular in the last decade of the 20th century through the Falun Gong religious organization, which was banned by the government. Qigong was systematized in the 1940s as a cost-effective approach to medical care and health

maintenance in communist-controlled areas of northern China; after the establishment of the People’s Republic of China in 1949, the propagation of qigong became part of a government program to modernize traditional Chinese medicine and integrate it into the public health care system. Qigong is thus a recent invention, but it is based on traditional callisthenic, martial, and meditation practices. While these were taught and cultivated in religious (especially Daoist) milieus, qigong was designed as a more “scientific” version of these traditional systems, devoid of their many “superstitious” elements.

During the 1950s and early 1960s, qigong was researched and taught only at selected medical centers. As China was heading toward the Cultural Revolution in 1965, these centers were closed down, and the practice of qigong was banned as a remnant of the old culture that needed to be swept away. However, some individuals continued their practice privately, as did practitioners of the various traditional body cultivation systems from which qigong was derived. Already in the early 1970s, qigong had resurfaced as a grassroots phenomenon being practiced and taught in public parks. With the end of the Cultural Revolution in 1976 and the beginning of the reform period in 1978, official interest in the practice of qigong revived. A confluence of official patronage, scientific study, and popular demand led to the “qigong craze” of the 1980s and 1990s. Numerous masters emerged and gathered a following for their own qigong systems, which were increasingly enriched with religious content. Resacralized qigong thus became the basis for what were in effect new religious movements that filled the vacuum of social disorientation created by the Communist Party’s loss of ideological credibility. A well-known example of this trend was the Falun Gong (lit. “practice of the dharma wheel”) movement, which was banned by the authorities in 1999 as an “evil cult.” While the practice of qigong itself was not prohibited, the Chinese government has since then severely restricted the ability of qigong groups to achieve the mass mobilization potential that they had demonstrated in the 1990s, though banned groups such as the Falun Gong continue to operate outside the People’s Republic of China. Qigong itself has proven to be a successful export product and is nowadays

taught in many places worldwide both as a health and as a spiritual regimen, not unlike the global spread of Indian yoga practices.

QUEER THEORY

Queer theory was coined in the early 1990s to name a growing body of scholarship that analyzed the experiences of lesbian, gay, bisexual, and transgender (LGBT) people and theorized the power dynamics that situated those identities as abnormal in relationship to heterosexuality, marriage, and procreation. This literature has emphasized that sex, gender, and sexuality are historically and culturally defined. Its approach is to “queer” or to destabilize the presumed naturalness of heterosexuality and conventional gender performance. In doing so, queer theorists have challenged both conservatives’ claim that heterosexuality is the only natural expression of human sexuality and mainstream LGBT activists’ counterassertion that sexual orientation and gender identity are inborn.

As scholars have taken up these insights in the study of global religion, they have conveyed that, to quote Elizabeth Stuart, “religion is a queer thing.” Religion scholars have shown, first of all, that all mainstream faith traditions include LGBT practitioners, many of whom have claimed those traditions in the face of condemnation. There is now a robust literature on the ways in which queer people of faith negotiate the intersection of religious affiliation and gender and sexual identity.

These studies have shown, in contrast to queer theory’s emphasis on cultural definition, that many queer people of faith claim LGBT identities as inborn—even divinely created—to counter the condemnation of homosexuality and gender variance. Queer studies of religion have also shown that “religion is a queer thing” by demonstrating the historical and cultural complexity of religion in its relationships to sex, gender, and sexuality. While many religious beliefs and practices buttress normative formations of marriage and family, religious traditions have also subverted conventional roles and have authorized alternative practices of sexuality and kinship. For example, even as Christianity has predominantly censored nonmarital sexuality, it has also given religious sanction to forms of same-sex kinship within monastic traditions. Various forms of Christian-influenced new religious movements, including Oneida Perfectionism and the Church of Jesus Christ of Latter-Day Saints, have also sanctioned nonmarital or nonmonogamous sexual practices. Adding to these complex dynamics in Western faiths, studies of non-Western cultural practices further complicate the picture of religion in its relationships to sex, gender, and sexuality. Work on Hinduism in contemporary India, for example, has considered the tradition of the *hijra*, and investigations of precontact Native American cultures have documented the role of the *berdache*, or “two-spirit” figure. Both of these figures seem to challenge binary models of sex and gender by offering a ritual role for a “third sex” (though this topic has been heavily debated). Understood broadly, these and other investigations have “queered” the study of religion by showing its complex place in the power dynamics around sex, gender, and sexuality.

QUM

Qum (pronounced as “ghom” and rarely as its Arabic form “qumm”) is a city located 150 kilometers south of Tehran and the second most important religious center in Iran, enshrining the tomb of Fāṭima, the sister of the eighth Shi’ite Imam, ‘Alī al-Riḍā (d. 202 AH/817 CE), and containing a number of important seminaries connected with prominent Shi’ite scholars. The city, which has grown from a small provincial town to the capital of the central province, is home to a number of ethnic and linguistic groups that continue to settle in its traditional and religiously vibrant setting. Although the natural environment is in general unfavorable in terms of weather, water, and vegetation, with the introduction of modern techniques of agriculture and water drawing and distribution, Qum enjoys a constant flow of pilgrims and students from all over Iran and around the world.

Historically, Qum has been known for its strong undercurrent of religious sentiments. Even before their conversion to Islam, the people of the city were known for their rebelliousness and resistance to unjust rulers. When Arab conquerors established their rule (in the ninth century) and began exacting high taxes, the people rebelled frequently, and the caliphal authorities had to crush the rebellions, which led to the massacre of its inhabitants. By the end of the ninth century, Qum had become a bastion of Shi’ism. A number of prominent Shi’ite scholars who had settled in Qum and were teaching there increased the city’s importance as a center of Shi’ite theology and tradition. In 817, Fāṭima passed through the city on her way to visit her brother, ‘Alī al-Riḍā, in Ṭūs (Mashhad). She fell ill, died, and was buried in Qum. Her mausoleum increased the reputation of the city and

actually proved to be its most attractive feature in its future development as the “Vatican” of Shi’ite Islam. While its seminaries provided high-quality religious education, the shrine of Fāṭima functioned as a spiritual cement that bonded various competing religious leaders and saints in a unique solidarity. The shrine also became the pivot around which the city developed in different directions, inducing the rulers and dignitaries to expand the sanctuary through their pious endowments and lavish gifts adorning the edifice.

The sanctuary of Fāṭima is richly embellished, and its four courtyards are adorned with seminaries and a hostel for pilgrims. Among the famous scholars who came to study and to teach are Mullā Muḥsin Fayḍ, Mullā Ṣadrā Shirāzī, and Qaḍī Sa’īd Qūmī. The cemeteries around Qum extend over an enormous area and include the tombs of many well-known scholars and distinguished people. The city is also known for its crafts, especially its hand-woven carpets. The tradition of seeking refuge in the shrine also attracted a large number of exiles and persons escaping from law enforcers. Among the contemporary Shi’ite scholars who have left a deep mark on the city, contributing to its importance as the leading center of Shi’ite learning and leadership, are Ayatullah Burujirdī (d. 1961), Ayutollah Mar’ashī Najafī (d. 1990), and Ayatullah Khomeini (d. 1989). Qum also witnessed rivalry with Najaf, Iraq, based on activist and conservative interpretations of the Shi’ite tradition, with major implications for both the political and the intellectual life of the Shi’ites in Iran, Iraq, and Lebanon and around the world.

QUR'AN

The Qur'an is the holy book of all Muslims. The prophet of Islam, Muhammad, is believed to have received the Qur'an through direct revelation (610 CE). According to adherents of the religious tradition of Islam, Allah revealed the Qur'an to Muhammad through the angel Jibreel (Gabriel) during a period of 23 years.

There are 114 chapters, or suras, in the Qur'an. Traditionally, the suras are of two types: the Meccan Suras and the Medinan Suras. Each begins with the words, "In the Name of God, the Merciful, the Compassionate." These suras often center on the theme of faith. The Meccan Suras center on issues of faith, creed, and belief, and on stories of previous prophets and nations; the Medinan Suras concentrate on legislation and law. The Qur'an asserts that the goal of every human being is to live to worship Allah and obey his commands. Following Allah in obedience, according to the Qur'an, leads to heaven, while not following Allah leads to hell. Hence, reading, studying, memorizing, and believing the Qur'an, while adhering to its teachings, are some of the most important aspects of life for a Muslim.

The Qur'an includes the stories of prophets including Abraham, Moses, and Jesus. However, unlike other scriptures, Muslims do not recognize any human involvement in the Qur'an, such as authorial influence or human error, but insist that it is inerrant direct revelation and the true word of God. Since tradition holds that Muhammad was illiterate, the emphasis is on the divine miracle of the Qur'an's revelation and not on Muhammad as creator of the text.

The Qur'an does not unfold in only a linear narrative pattern or flow in a chronological manner. The suras concern themselves with issues of politics, economics, and law. The voice in the Qur'an frequently changes. Allah is at different times talked about in the plural first person, the singular first person, and the third person. Additionally, Arabic relies on gendered grammar, and this allows for interesting and complex gender dynamics with the words themselves that often cannot be well understood by non-Arabic speakers.

The Qur'an is considered to be the word of Allah and thus cannot be truly translated. The

Qur'an is considered the true Qur'an, in the strictest sense, only in Arabic and no other language. Any translation of the Qur'an from Arabic to another language or text is considered an interpretation of the Qur'an. This, however, does not mean that there are not different analyses of the meaning of the Qur'an. Interpretation of the Qur'an constitutes a discipline among Islamic sciences that is known as *tafseer*, and religious scholars, Qur'an interpreters, and religious communities have always played a large role in helping decipher what the Qur'an means for the followers of Islam. The rise in schools of interpretation of the Qur'an has generated much new literature.

The Qur'an is looked to as an ethical guide (*akhlaeq*) for many Muslims and comprises instructions on holy living. It is considered the ultimate source of teaching that affirms many values, such as hospitality, honor, justice, honesty, and kindness. The five pillars of Islam—namely, (1) affirmation of the oneness of God, (2) almsgiving, (3) ritual prayer, (4) fasting during Ramadan, and (5) pilgrimage (hajj)—are emphasized as ways of living ethically.

Human beings, as presented in the Qur'an, live their lives before Allah and are not evil but forgetful. To remember Allah, the Qur'an must be engaged constantly. By engaging in the religious tradition of interacting with the Qur'an, humans are reminded about the meaning of life and how Allah wants all human beings to live.

Muslims around the world have memorized the Qur'an. The Holy Book is also recited, and its rhythmic recitation in Arabic is part of the holiness of the book. The recitation process is central to learning the Qur'an. In fact, the lyrical pronunciations and rhythmic beauty of the Qur'an are almost as important as the words themselves. As a result of the importance placed on recitation, professional Qur'an reciters play a central role in many Muslim communities. Additionally, Qur'anic quotes are so important and beloved to many Muslim communities that they are found inscribed on buildings, monuments, and mosques. Moreover, the purity of a Muslim who wants to learn or approach the Qur'an is insisted on because the Qur'an is considered holy and not to be denigrated. Therefore, anyone who approaches the Qur'an must be in a state of moral cleanliness.

The history of the translation of the Qur'an is complex and varied. Though the availability of the Qur'an in English is often taken for granted today, it is important to note that Qur'anic translation has a history of its own. The translation of the Qur'an from Arabic to English is difficult for many reasons. First, the Qur'an employs end rhymes and rhythm interplay that are almost impossible to mimic in other languages. Second, the gendered nature of Arabic is lost when translated into English and other nongendered languages. Finally, the use of punctuation is limited, and therefore, it is difficult to translate the appropriate tone and speed at which the Qur'an is meant to unfold.

The first English translation of the Qur'an was written in the 12th century, at the urging of Peter the Venerable, and was finished in 1143. It was not until many years later, in 1647, that André Du Ryer, a Frenchman, presented a translation of the Qur'an in French, which was translated into English shortly thereafter. The most notable English translation was by George Sale, who created a new translation from Du Ryer's earlier work. This translation was prominent for almost 150 years and was the most widely read English interpretation of the Qur'an. From then onward, a new interest in style emerged, and translators became aware of the rhythm and rhyme of the Qur'an, which led to an increase in translations.

QUTB, SAYYID (1906–1966)

Best known for providing an ideological basis for militant Islamic political resistance, Sayyid Qutb

has come to be known as the intellectual father of modern-day jihad. His writings have influenced Islamist radicals such as Abd al-Salam al-Faraj, Mustafa al-Shukri, and Ayman al-Zawahiri. Born in the village of Musha of Asyut in Upper Egypt, reared in a pious home, and educated in a traditional rural religious school, Qutb received a BA at the Teacher's College of *Dar al-Ulum*. Having excelled in the study of literature, he was appointed instructor at the same college on graduation and was soon employed in the Ministry of Education. Qutb's early writings were secular and nationalist oriented. They earned him fame early on as a political dissident and ardent social critic. Because of increasing friction with the government, he was sent to the United States between 1948 and 1951 to visit various teachers' colleges, undoubtedly in the hope that he would be impressed by America and thereby become a moderate. Instead, he became further convinced of the depravity of the West, which he saw as immersed in consumerism and godlessness. On returning to Egypt, he joined the Muslim Brotherhood and thus began his career as the pioneering intellectual of contemporary Islamist radicalism.

Combining themes of Islamic theology, anticolonial popularism, and socialist sentiments, Qutb's *Social Justice in Islam* was written prior to his departure to the United States and exhibits the early stages of his thinking. Many of his ideas were further developed in his multivolume *In the Shade of the Quran*, in which his literary erudition offers a distinctly modern and aesthetic commentary on the classic text.

Many of his ideas were then distilled into *Milestones (Ma'alim fi-l-Tariq)*, which has come to be regarded by many as the "communist manifesto" of contemporary global Islamic jihad. Written during his imprisonment by Gamal Abd al-Nasser in the early 1960s, it is a concise account of his vision for sustaining long-term Islamic resistance to the secular state, with the ultimate goal of establishing a government based purely on the Shari'a, or Islamic law. In *Milestones*, Qutb introduced three Islamic jurisprudential novelties that would later inspire some of the most radical Islamist groups in the world, including the assassins of Egyptian President Anwar Sadat in 1981.

The first advocated the creation of a vanguard of committed Muslims that would implement a

long-term campaign to challenge non-Islamic laws and practices in society. However, this vanguard was predicated up the belief that modern-day society was directly comparable to the “Age of Ignorance,” or *jahiliyyah*, of pre-Islamic, polytheistic Arabia. Concomitant with the conventional Islamic narrative wherein Prophet Muhammad steadily fought pagan Arabs until Islamic rule was established over Mecca and Medina, Qutb envisioned the vanguard as a direct parallel to Muhammad’s early companions, or the pious ancestors, *al-Salaf*. The last of Qutb’s innovations declared Muslim rulers and state administrators who presided over non-Shari’a laws, for example, secular law, to have abandoned Islam, making the murder of such rulers a legitimate and religiously obligatory act. This last position was a significant departure from the conventional Islamic tradition

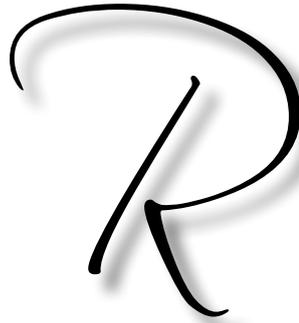

that strictly prohibits revolt against Muslim rulers, be they oppressive or religiously negligent.

RACISM

Systemic racism refers to the practice of unjustly bestowing enrichment and privileges on certain groups in society on the basis of their ethnicity or race while simultaneously discriminating against and belittling other groups. While racism need not be associated with religion, racist views are often a part of a broader cultural pattern that has religious dimensions.

Racism on both a personal and a societal level is found in many cultures and has been a feature of American society since its early years, when White people were regarded as the only legitimate citizens within society, to the exclusion of Native Americans and African Americans, the latter being brought to the United States as slaves.

The trajectory of racism in the United States has encompassed a broad range of social and psychological dimensions related to racism on the part of Whites: racist ideologies, attitudes, perceptions, emotions, habits, and institutions of U.S. society. Systemic racism has solidified privileged material, social, and ideological realities that are reproduced across generations of White communities while simultaneously disadvantaging and alienating communities of color.

The systemic racist foundation of the United States was secured through the genocide of indigenous peoples and theft of Indian lands, combined with a capitalist economic system that generated wealth through the enslavement of people of African descent. The initial unequal trajectories of

the White and Black communities have resulted in a persistent reality where White Americans have sat at the top of a castelike social hierarchy with Black Americans and the relatively few remaining American indigenous communities disproportionately represented the bottom.

The reformed Christian thought preached by the Pilgrims and their descendants was used later in history in the White conception of “manifest destiny,” to simultaneously rationalize slavery and anti-Indian genocide and to teach enslaved workers and indigenous peoples that their oppressed status in the New World was “God’s will.” Because the enslaved workers were stripped of all cultural attachments and personal identity, they assimilated on a marginal basis into a dominant White society that dictated their spoken language, religious teachings, and interpretations of the New World around them. Still, exposure to biblical interpretations preached by White church members that all people are equal in the eyes of God ironically provided a divine authority that served as a powerful source of counterframe development for those African Americans held in bondage. Resistance counterframes are those that reject inequalities and refuse to recognize unjust surroundings and circumstances as morally acceptable.

While initially, religious thought was the primary means used to develop and reinforce anti-racist counterframes among the enslaved, later inspiration from the secular and political realms came during the Revolutionary War, on the proclamation of the Declaration of Independence. Governed by civil rulings explicitly separated from

the church, the political doctrines of this era held that all citizens of a new United States should be guaranteed inalienable rights and freedoms. Though in the same exclusionary vein as the religion preached by oppressors, only those who were socially defined as “free persons” across the next century would be counted as U.S. “citizens,” entitled to the privileges, rights, benefits, and freedoms declared by the Declaration of Independence and the U.S. Constitution. Those rights and protections did not extend to indigenous peoples or enslaved workers, who were nonpersons. Despite the racist barriers, the first Black Christian churches emerged in the late 18th century, after the Revolutionary War and the proclamation of the Declaration of Independence.

Following the Revolutionary War, many Black ministers contributed to the growth of the Black theology tradition. John Saillant highlights the Revolutionary War soldier, New Divinity theologian, and Black Christian minister Lemuel Haynes, who combined New Divinity, revolutionary republicanism, and New England federalism to generate a Christian theology synthesized with a North American ideology that vehemently opposed slavery. Haynes ministered to congregations largely composed of Whites and fervently preached that slavery was immoral and that all people are equal in the eyes of God. Dr. Jeremiah Wright, the pastor of the Chicago church where President Barack Obama once worshipped, follows in the footsteps of early Black Liberation thinkers such as the Black ministers Richard Allen and Absalom Jones, who in 1787 attended a service in Philadelphia at St. George’s Methodist Episcopal Church, only to be expelled when they knelt down at the altar next to White worshippers. This event led the two men to establish the Free African Society, which accented a Black liberationist theology.

Soon, Whites in leadership created yet another key institutional barrier that served to protect the systemic racism forced on enslaved workers and other people of color. Scientific racism was reinforced by a new eugenics ideology backed with pseudo-scientific assertions, which gained force during the late 19th century. For example, Cesare Lombroso (1835–1909) held that some people were born criminals and could be identified through physical characteristics. Other theorists built on Social Darwinism that was shaped by

Thomas Malthus (1766–1834), Herbert Spencer (1820–1903), and Henry Herbert Goddard (1866–1957), arguing that the “socially deficient” and poor should receive no societal support. These White men held that providing assistance to the socially oppressed preserves artificial societies, which in their view should not survive. Their “expertise-based” scholarly authority influenced political leaders who incorporated eugenics ideologies into public policies. As late as the early 20th century, people of color were sterilized, institutionalized in prisons and mental wards, or otherwise segregated from White society. During this time, people of African and indigenous descent were not defined as human by the standards of “scientific racism.”

Despite the multifaceted racist hurdles and social barriers, Black theology continued to flourish in this era. Black churches served as resistance organizations and sanctuaries where members could tap into support networks. In contemporary times, Black churches continue to serve the same purposes. A segment of Black theology has transitioned into an extended theological body of thought that Wright has termed the prophetic tradition of the Black church. Wright has explained that this theological orientation traces the origins of Black thought to the prophetic tradition of the Hebrew Bible.

Thus, Black theology was born out of the brutal oppression of slavery and segregation colliding with the influence of inspirational Christian religious and political doctrines promulgated by people of European descent during that long era. Christianity’s liberation doctrines contributed to the development of Black antiracist counterframes and resistance strategies used to challenge White supremacy. Three primary institutional components working in concert sanctioned the civil statuses and definitions of what constituted a person eligible for U.S. citizenship:

1. Religious bodies that dictated biblical interpretations and religious laws
2. Local, state, and federal governments operating through laws engineered by oppressors
3. Scholarly institutions claiming ownership of expert knowledge that generated racist definitions of what constitutes a human being

Based primarily on skin color, the systemic long-term generational trajectories varied tremendously for Black and White Americans. In contemporary times and in the tradition of Black theology, scholars and ministers like Wright have developed a Christian-based prophetic tradition of the Black churches, one that ties directly back to the first religious congregations founded by the radical Europeans, the Pilgrims.

RADHAKRISHNAN, SARVEPALLI (1888–1975)

Born near Chennai in South India, Hindu philosopher Sarvepalli Radhakrishnan achieved distinction in several fields. He studied and eventually taught philosophy at several universities, including the universities of Mysore, Kolkata, Delhi, Oxford University, and Banaras Hindu University. He was also vice-chancellor of Andhra University and Banaras Hindu University and chancellor of Delhi University. His diplomatic career included positions as ambassador to the former USSR and leader of the Indian delegation to and president of UNESCO. He became the second president of the Republic of India, serving from 1962 to 1967. He has been characterized as a philosopher, religious thinker, educator, and statesman. Much of his scholarly work sought to bring an understanding of Indian thought to the West.

Schooled in his childhood by Christian missionaries in India, he developed a deep understanding of Western values and philosophies, which led him to an appreciation of Indian philosophies and a particular interest in Vedanta. As an adult, Radhakrishnan was encouraged by the thought and actions of the leaders of the Indian independence movement, including Mohandas K. Gandhi, Rabindranath Tagore, and Jawaharlal Nehru.

In his own view, Radhakrishnan's thought and position were the result of personal spiritual experience rather than an expression of the views of others. His experience of the world as he saw it prompted him to propose what he termed the religion of the spirit. In this endeavor, he advocated a type of experience that was consonant with the inductive thinking of science and Western philosophies. At the same time, he advocated the use of intuitive knowledge, as has been used in several Hindu philosophies. Intuitive knowledge in his view was superior and also crucial in the creative thinking evident in great scientific breakthroughs. In Radhakrishnan's view, inductive logic is helpful but inadequate to achieve the certainty that can only be supplied by intuition. In this, intuition includes, and is not limited to, logic and reason.

For Radhakrishnan, there was an imperative to overcome the barriers that divide people. To the extent that heroes break down the barriers between people and between the individual and the universal, they are religious. Religion in this sense is based not on dogma but on intuitive insight that recognizes spiritual values. The values he promotes include a sense of tolerance, in which it is necessary to actively seek out and recognize truth wherever it is found. It is insufficient for one to simply live and let live. Extending this thinking into the political realm, Radhakrishnan relies on a sense of the secular not as an opposition to the religious but as cooperating with all religions.

As a professor of philosophy, religion, and ethics, Radhakrishnan's contribution to reconciling the religions into a global community brought modern Hindu thought to the attention of the West. His extensive publication record provides a detailed exposition of his thinking, and his achievements document his actions. His deep interest in promoting a universal community is also evident in his extremely limited disclosure of personal details. In 1931, he was knighted in London for his

work, almost 30 years before he became the second president of India.

RADHASOAMI

Since it was established in the 19th century, the Radhasoami religious tradition has spread from India around the world, creating a global religious movement. It has more than 1 million adherents worldwide, especially in North India, but it also has significant numbers of followers in the United States, United Kingdom, South Africa, and elsewhere. It is based on a lineage of spiritual masters (gurus) that has branched off from the founding movement in Agra, North India. The main centers are at Dayalbagh, near Agra; Beas, in the Indian state of the Punjab; and Kirpal Ashram in New Delhi.

The movement was founded in 1861 by Swami Shiv Dayal Singh, who taught a new form of spiritual practice, Surat Sabd Yoga (“the discipline of the sound current”). This yoga is a form of meditation that can be practiced by all, including the modern businesspersons, householders, and administrators, who make up much of the movement’s followers. The term *Radhasoami* is a Vaishnava phrase for God (lit. “the Lord [*swami*, or *soami*] of Radha, the consort of Krishna”). The movement does not believe in an anthropomorphic God, however, so the term *Radhasoami* is construed to mean the

master of spiritual energy. The movement is known as the Radhasoami Satsang (The Fellowship of the Lord). It advocates social service as well as personal meditation, and the movement is organized in communal quarters—some of which have become sizable towns. New branches of the community emerge when the death of a guru produces more than one successor and the community breaks apart as some adherents follow one successor and others follow another.

By the beginning of the 21st century, there were more than 20 branches of the movement. The largest, the Beas branch, has constructed a small city on the banks of the Beas River near Amritsar, where it has established a large hospital as well as quarters for the followers to stay during large fellowship events. In Agra, at the location of the founding master’s meditation grounds, Soamibagh, the community is involved in constructing a large cathedral-like memorial to the original master. Across the street, the Dayalbagh branch has supported various industries in the 20th century, including textile factories, model farms, and dairies; in the 21st century, it promotes computer-based information technology. It houses the Dayalbagh Educational Institute, which is a federally approved “deemed university” in India’s educational system.

Radhasoami is primarily based in India’s cities, appealing to urban businesspeople and administrators. The Beas branch has a sizable outreach to lower-caste villagers, but the leadership is largely urban and middle class. The movement has often encouraged initiates from Europe, the United Kingdom, and the United States, and the spiritual masters frequently travel abroad to appear before large rallies. During the 1960s and 1970s, Radhasoami became a part of the explosion of interest in Hindu-based guru movements in the West, and movements such as the Divine Light and Eckankar are based on its teachings. Increasingly, the followers abroad have included a substantial number of expatriate Indian immigrants, who find in the Radhasoami fellowship a more accessible and modern form of spirituality than is provided by traditional Hindu rituals and customs.

RAHMAN, FAZLUR (1919–1988)

Fazlur Rahman was one of the foremost Indo-Pakistani scholars and educators of the late 20th century in the field of Islamic studies. He was born and raised in the Hazara district of the Punjab (now part of the North-West Frontier Province of Pakistan) and educated under his father's tutelage, which provided him with both a solid grounding in the Deobandi tradition of Islamic learning and an abiding appreciation for Western thought. After attending Punjab University in Lahore, where he obtained a master's degree in Arabic in 1942, he went to England to study Islamic philosophy at Oxford University. There, one of his teachers was the prominent Orientalist scholar H. A. R. Hamilton Gibb.

Having completed a doctoral dissertation on Ibn Sina (Avicenna, d. 1037), the medieval Islamic philosopher and physician, Rahman took an academic post in Islamic philosophy at Durham University. In 1958, he joined the faculty of the Institute of Islamic Studies at McGill University in Canada, but in 1961, he accepted an appointment by the Pakistani president Ayyub Khan (r. 1958–1969) to direct the newly formed Islamic Research Institute in Islamabad, the purpose of which was to help the government develop and implement national religious policies based on a modern understanding of Islam, particularly in the areas of education, women's rights, family law, and economics. Political opposition became so vehement that Rahman was obliged to resign and emigrate to the United States in 1968, where he joined the faculty of Near Eastern Languages and Civilizations

at the University of Chicago as Professor of Islamic Thought. It was during this latter phase of his career that he became most widely known in North America and Europe.

Rahman's thought spanned a variety of subjects in Islamic studies, but at the heart of his endeavors was the development of a hermeneutic that would make the Qur'an's ethical message both relevant to the project of modern Islamic reform and more comprehensible to non-Muslims. In particular, he was concerned with showing how the Qur'an could be used to bring about egalitarianism and greater socioeconomic justice for both women and men in today's Muslim societies. He traced the problems that confronted these societies not to European colonialism but to the intellectual stagnation and irrationality that arose in the medieval era and obscured the original teachings of the Qur'an. He brought to the task of remedying this situation a keen intellect and a critical perspective that pointed out the strengths and weaknesses in his own Islamic tradition as well as in the West's understanding of it.

The Qur'anic hermeneutic that Rahman espoused called for bypassing centuries of cumulative scriptural commentary and situating Islamic revelation in its original sociohistorical context during Muhammad's life so as to distinguish between its contingent and universal commands. Once this original situation had been fully grasped, reform-minded Muslims could then appropriate the universal essence of the Qur'anic message and apply it to improving conditions in their own settings. Rahman saw this undertaking as a kind of "intellectual jihad." Expressly identifying himself with the modernist school of Islamic thought, Rahman argued against Muslim conservatives, who he felt only sought to preserve religious tradition, and he rejected the anti-Western, literal neofundamentalism of men like Ayatullah Ruhallah Khomeini (d. 1989), the leader of the Iranian Revolution of 1978 to 1979. On the other hand, he also maintained that modern secularism, both in the West and in Islamic societies, involved at best an artificial separation of religion and the world, and at worst led to atheism and moral decline.

Rahman was respected and known to many intellectuals and religious leaders around the world. His influence has been especially marked in North America among his students, Muslim and

non-Muslim, and among Muslim feminists. Students from abroad carried his influence back to their native lands, particularly those from Indonesia and Turkey.

RAMAKRISHNA

See Reform Hinduism

RAMANUJA (CA. 1077–CA. 1157)

The famous saint and philosopher Ramanuja, also known as Ramanujacharya, was born in India near Chennai at Perumbudur in 1017 CE and was the son of the Brahman Kesava Somayaji and Kantimath. Traditional accounts had given his lifespan as stretching to 120 years. This has not been accepted by modern scholars, who have attributed to him a lifespan from 1077 to 1157 CE. From an early age, he was attracted to the deeper realms of philosophy. Abandoning the life of a householder, Ramanuja became an ascetic. He was very well versed in the Vedic texts and

soon fell out with his teacher, Yadavaprakasha, over matters of interpretation. Referred to as *Yatiraja* (King of Ascetics), he established a *math* (monastery) near the Vaishnavite temples at Srirangam. People belonging to all classes came to him. Ramanuja also undertook pilgrimages throughout India, preaching salvation through bhakti (devotion).

Ramanuja brought a rapprochement between the Vedanta philosophy based on metaphysics and the tradition of bhakti. One of the most prominent thinkers of devotional Hinduism, his fame spread all over India through his sermons and writings. A philosophical outline of resurgent Vaishnavism occurred. God was the highest reality, and within Him were the individual soul and the material world, which possessed qualified reality. Ramanuja differed from another great thinker preceding him, Sankaracharya (788–820 CE), who had propounded the Advaita Vedanta (the doctrine of nondualism). The latter believed in monoism and that perceived duality was due to *maya* (illusion). In contrast, Ramanuja's philosophy of *Vishishtadvaita* (qualified nondualism) emphasized spiritual experience of God through intuition. Salvation could be attained through devotion. The God of Ramanuja was full of devotion and love. His Bhakti Yoga was a form of sublime surrender to one divine being: Lord Vishnu or Narayana, the highest Brahman.

Ramanuja authored important texts, which formed the intellectual framework of his devotional worship. The *Vedanta Sangraha* (Resume of Vedanta) was the first work delineating theism and existence of reality. The commentary on the Brahma Sutra titled *Sribhasya* was his magnum opus. Lord Vishnu was the highest Supreme Being, protecting devotees who worshipped with full sincerity. *The Vedanta Sara* (essence of Vedanta) and *Vedanta Deepa* (Light of Vedanta) were the two other commentaries. He also wrote a treatise on the Bhagavad Gita called *Bhagavad Gita Bhashya*. Ramanuja also authored a book on the ritual of daily worship, *Nityagrantha*. His three prose works called *Gadya Traya* were the *Sharanagati Gadya*, *Shriranga Gadya*, and *Vaikuntha Gadya*.

Ramanuja had to leave Srirangam around 1098 during the reign of the Chola king Rajendra II (r. 1070–1120), who was an ardent worshipper of Siva. The tradition maintains that Ramanuja was

persecuted and left for Mysore. The Hoysala king became his patron, and Ramanuja set up a monastery in Melkote. He returned in 1122 to Sirangam. The intellectual tradition created by Ramanuja was carried to centers of learning and pilgrimage in India. His philosophy exerted a great deal of influence on successive bhakti movements down the centuries. Ramanuja's prescription of daily worship is followed in many of the Vaishnava temples of India, where he is worshipped as an avatar (incarnation).

RASHTRIYA SWAYAMSEVAK SANGH

The Rashtriya Swayamsevak Sangh (commonly referred to by its acronym RSS) is a Hindu nationalist organization that is the ideological mentor of a large number of loosely affiliated Hindu nationalist organizations in India referred to as the *Sangh Parivar* (or the RSS family). Among those organizations is the Bharatiya Janata Party (BJP), currently India's largest opposition party and formerly a core group in the country's coalition government (1998–2004).

The RSS defines itself as a cultural organization whose prime goal is to train young men for service to the country. (There is a loosely aligned group for girls and women, the Rashtra Sevika Samiti, about 1/10 the size of the RSS.) The RSS rejects the notion that it is a religious organization in the conventional sense in that it focuses exclusively on the world and leaves metaphysical considerations to others. From the time of the RSS's formation in the mid-1920s, its leaders have argued that this training process, referred to as "character building," is its most important activity. That training has not changed significantly over the past eight decades. It is rooted in daily attendance at neighborhood-based groups, referred to as *shakha*, and participation in RSS-affiliated social organizations. There are several levels of leadership in the RSS, and the key position is the *pracharak*, a full-time worker who has been selected to go through a prescribed training program for young men judged to have leadership capabilities. Most of these full-time workers are bachelors who have committed their lives to the RSS and its Hindu nationalist ideology. Many *pracharaks* are loaned to the various affiliated organizations, and they are the glue that provides a similarity of purpose and ideology to the RSS "family" of groups. The leadership of most of the affiliated organizations are *pracharaks*—well known among them are Atal Behari Vajpayee (BJP prime minister from 1998 to 2004) and Lal Krishna Advani, past president of the BJP.

The major tenet of the RSS worldview is the preservation of Hindu solidarity, with Hindu society interpreted broadly to mean all Indians. It is a doctrine of assimilation whose purpose is to forestall erosion of commitment to the larger community. The cultural core is drawn from the great tradition of Hinduism, and the leadership of the RSS has come predominantly from high-caste Hindus, though the organization has made a major effort to attract Hindus from the bottom of the socioeconomic ladder and recently has even begun to accept Muslims into *shakha* membership. A narrowing of economic and social distinctions is perceived as necessary for the preservation of community, which has sometimes put the organization at odds with the market reforms adopted in the early 1990s and accepted by the BJP-led coalition government that was in power from 1998 to 2004.

The surge in urbanization, mobility, and prosperity in India over the past decade has created challenges to the RSS to keep itself relevant and continue to attract support. RSS publications talk about a loss in participation of about 20% in urban areas since the late 1990s, though with simultaneous gains in rural areas, participation in the daily *shakha* is still about 1,500,000 in some 49,000 *shakhas*. The RSS has sought to attract members in rural areas and remote tribal areas through social and educational programs. Equally challenging has been the rise of the BJP as a significant political force. The BJP has diluted the more controversial aspects of its Hindu nationalist agenda, such as the proposal to abolish the Shari'a-based civil code for Muslims, to attract allies necessary for it to remain a competitor for national power. Still another source of criticism of the BJP within RSS circles is the alleged level of corruption when the party was in power. Despite this criticism, there is no sign of significant loss of RSS support for the BJP, at least among the leadership.

RECONSTRUCTIONISM (JEWISH)

See Judaism

REFORM HINDUISM

Reform movements have risen up within the Hindu tradition from the late 18th century to the present. Prior to these movements, the religious life of Hindus consisted of a localized folk religion, alongside a high Sanskrit tradition, shaped mainly by the learning of the Brahman caste and expressed in a centuries-old high culture of Vedantism and other related philosophical traditions.

The Brahmo Samaj

The rise of Reform Hinduism began with the impact of colonialism. By the early 19th century, new currents in imperialism, paradoxically shaped by a civilizing mission, utilitarianism, liberalism, and evangelism, influenced Hindu society, and Indian philosophers responded to this challenge. There remains a debate as to whether this response was indigenous and came from the modernity of tradition or was derived from the challenge from without. Its most powerful expression, the Bengal Renaissance, was in the area most exposed to British influence, but there were parallel movements elsewhere, in Maharashtra and in Tamil Nadu. Most significant was the *Brahmo Samaj* ("Society of God," sometimes described as the "Society of Friends"), formally set up in 1828 by a former civil servant of the East India Company, Ram Mohan Roy (1772–1833). He shared the liberal imperialist opposition to certain social practices in India such as sati (suttee) or widow burning; it was on a visit to Britain to contribute to a debate in the Privy Council on sati being made illegal that he died prematurely and was buried in Bristol. Roy seemingly appropriated Unitarian ideas in his understanding of Hinduism to affirm the monotheism of the Vedantic tradition. Intriguingly, though, it was Roy who converted his Baptist friend William Adam to Unitarianism, and his monotheist beliefs were made clear in his early work *Tohfah al Muwabbiddin* (A Gift to Deists,

1804). Under the charismatic leadership of Keshab Chandra Sen (1838–1884), who worked for the Bank of Bengal, the Samaj, much influenced by evangelical Christianity, became something of a missionary organization, but its Christian style of worship and its radical social program, attacking caste and favoring intercaste marriage, imposed strains on the Samaj, and it split in 1866 into a conservative branch under Debendranath Tagore—he kept the Samaj going after Roy’s death—and Sen’s more radical wing.

Subsequently, in 1878, the more committedly social-radical Brahmos broke away to form the Sadharan Brahmo Samaj. They felt betrayed by Sen for marrying off his daughter at a young age to the Maharaja of Cooch Behar and using a traditional ceremony they did not accept. But all these various expressions of the Brahmo Samaj always remained an elite formation, though Sen had attracted a following from the villages and towns of East Bengal and extended the Samaj outside Bengal. A loner who should also be cited as a Hindu reformer was Vidyasagar (1820–1875), who built on Roy’s campaigning against sati to bring about the Widow Remarriage Act of 1856. The plight of Hindu widows, a concern of the high castes, remained a touchstone of the reform movements throughout the 19th century.

The Arya Samaj and the Theosophical Society

By the late 19th century, more populist reform movements had emerged. The *Arya Samaj*, centered in the Punjab, founded by Swami Dayanand Sarasvati (1824–1883), was a proto-nationalist response. In his early life, he had undertaken an extraordinary journey through the sacred landscape of North India in search of moksha, or release. Subsequently, he became an expert on Sanskrit grammar, but it was a meeting with Keshab Chandra Sen in 1872 that drew him into the reform movements. In his key text the *Satyarth Prakash* (The Light of Truth, 1875), Dayanand made claims for the revealed authority of the Vedas every bit as polemical as the Christian evangelicals did for the Bible. Here was a populist movement that reached out to the lower castes with its anticaste agenda—it saw caste as the basis for a meritocratic society rather

than as an ascriptive phenomenon—and also through its championing of Hindi and attack on cow slaughter. This was to inspire an increasingly communal program that prompted a defensive response from the Muslim community and led to Hindu-Muslim tensions in the 1890s, which were the first signs of the Hindu-Muslim conflicts in India that would mar the 20th century. The Arya Samaj was the movement that the disaffected truth seekers of the Theosophical Society, set up in New York in 1875, under Colonel Olcott and Madame Helena Blavatsky (1831–1889), first turned to when they came to India in 1879, prior to transplanting their international headquarters to Adyar, Chennai. Here was a society relevant to the history of the international occult that was to mesh with the Hindu reform movements, though it rapidly fell out with the Arya Samaj. Its most extraordinary presence was Madame Blavatsky, of Russian aristocratic background, who had immersed herself in Gnostic beliefs on her leaving Russia in 1849, possibly in western Tibet, possibly in the Middle East, and who quickly made her mark on her arrival in New York in 1873 as a leading player in the spiritualist movement. But in its early years in India, Theosophy privileged Buddhism over Hinduism; Blavatsky in her childhood in Saratov had lived near the Kalmuch Buddhists, and hers was a claim for a Gnostic religion over and above all religions in her *The Secret Doctrine* (1888–1889). It was left to Annie Besant (1847–1933), another of the extraordinary personalities who shaped the movement, who became the society’s president on the death of Colonel Olcott in 1907, to emphasize its Hindu associations. Prior to her being converted to Theosophy by a reading of *The Secret Doctrine*, she had been a passionate supporter of atheism, socialism, and birth control. Given the Indian affront at the Christian missionary attack on Hinduism—and it cannot be emphasized enough that there was a strange symbiosis between Christian missions and the Hindu reform movements—here was an intellectual outlook highly attractive to Indians, and lodges of the society quickly spread. But Besant’s was a conservative and romantic view of Hindu society and tended to endorse the caste system. And Theosophy was always more an international movement, appealing to all faiths and reaching out to those seeking spiritual answers in a post-Darwinian world. This

international appeal only faded when J. Krishnamurti reneged on his training to become the world teacher of Theosophy in 1929.

The Ramakrishna Mission

A more autonomous response to the sense of flux in Hinduism, and one radically contrasted with that of the Arya Samaj, came through the mystic Ramakrishna (1836–1886). An illiterate village Brahman, in time he joined his brother in 1856 as a priest in the Kali temple at Dakshineswar. He described himself as having an extraordinary tantric battle with the goddess Kali, followed by a threat of suicide leading to a mystical encounter, and a passionate engagement with the world's religions—with Buddha, Muhammad, and Christ. Keshab Chandra Sen first drew attention to Ramakrishna, but there would never have been a Ramakrishna Mission but for the charismatic leadership of his successor, Vivekananda, born Narendranath Datta (1863–1902). Ramakrishna's conversion of this Sadharan Brahmo was his most brilliant recruit from Calcutta's Anglicized elite. Vivekananda's appeal was a mix of promoting the virtues of Hinduism abroad, famously at the World Congress of Religions in Chicago in 1893, and an unsparing critique of the social life of Hindus at home. Here was a patriotic reform movement, committed to social reform and, while pluralist in outlook, confident of the truths of Hinduism—above all Vedantism. In fact, Vivekananda was no administrator, and it was left to Swami Brahmananda to fashion an effective organization, centered in its new headquarters at the Belur Math. Here was to be a role reversal concerning missionary activity, with Ramakrishna monks opening monasteries in America, the most successful ones in New York, Boston, Washington, D.C., and San Francisco. It was to the Hollywood Vedanta Center in Los Angeles that Christopher Isherwood came as trainee monk in 1943, and even if his vocation failed, he was in his *Ramakrishna and His Disciples* (1965) to write the most lucid account of the whole movement.

Aurobindo Ghose

The most intensely intellectualized spiritual response within Hinduism to the dual challenge from

Western thought and internal flux came from a highly Westernized Bengali, Aurobindo Ghose (1872–1950). Educated at St. Paul's and Cambridge, he was an outstanding candidate for the Indian Civil Service—but he failed the horse riding test! On his return to India, he worked in the administration of the Maharaja of Baroda. Aurobindo was the first of the leading Hindu reformers to break a self-denying ordinance on political participation; Sister Nivedita (Margaret Noble), a disciple of Vivekananda, flirted with Bengali terrorism, and Annie Besant only turned political in 1909 and became a leading extremist in the Indian National Congress (INC). His was a messianic nationalism—he came to see nationalism as an expression of *Sanatana Dharma*; he was acquitted of terrorist charges in 1909 and, in 1910, fled to the French colony Pondicherry to escape further arrest and to pursue as a *karmayogin* a yogic quest for the Divine. In the same way as Ramakrishna's, it was a spiritual quest rooted in worship of Kali, the Mother. Vivekananda, he later claimed, had shown him the way while he was a prisoner in Alipore jail in 1909. He named his philosophy supramentalism. On November 24, 1926, he claimed a direct experience of the overmind. Only Ramana Maharshi rivals him as a spiritual leader in 20th-century India. Following his death, his partner, Mirra Alfassa (1878–1973)—she met Aurobindo in 1914 and later became known as the Mother—persisted with his experiment in direct, physical absorption in the Divine. In February 1968, she set up a new religious center in Auroville, adjacent to the Aurobindo ashram. This has proved an awkward mix of European disciples of Aurobindo and Indian villagers.

Mohandas Gandhi

Most reform movements had kept out of politics through fear of the repressive power of the colonial state. Besant, always politically minded, took Theosophy into the Home Rule movement and at one stage was a leading player in nationalist politics, when she was elected President of the INC in 1917. But she was rapidly outshone by the more charismatic Mohandas Gandhi (1869–1948), following his return to India from South Africa in 1914. Theirs was always an uneasy partnership. One could interpret Gandhi as being less the

nationalist and more one of the spiritual reformers of Hinduism, though he failed to meet Vivekananda in 1902—he was too ill—and his career runs parallel to that of Aurobindo. In South Africa, he began his experiments in alternative living—his two ashrams, Phoenix near Durban and Tolstoy Farm near Johannesburg. In such communities and in his ambulance brigade during the Boer War, he sought to fashion a new Indian social community out of its disparate regional and caste groupings. On his return to India, continuing his ashram experiments, he became a critic of the sanatanists, defendants of Hindu orthodoxy, taking up on a national scale the plight of the untouchables and insisting on their right to be integrated within the Hindu community and to have access rights to temples. While rejecting the materialism of Western civilization, Gandhi had learned much of this vision of a revitalized Hinduism from contact with Christians, in particular the White Fathers in South Africa. His ashrams were run like monastic communities.

Hindutva

The merger of Hindu reform and Indian cultural politics is expressed in the concept of Hindutva. This idea that Indian society is united by an underlying Hindu cultural tradition was advocated by the Hindu Mahasabha, founded in 1915, and by the even more ideologically committed Rashtriya Swayamsevak Sangh (RSS), founded in 1925, which also advocated *seva*, or “social service.” M. S. Golwalkar, who took over as leader in 1940, had briefly worked under Swami Akhandananda of the Ramakrishna Mission. A key figure was V. D. Savarkar, whose text *Hindutva: Who Is a Hindu?* (1923) became the bible of Hindu nationalism. Though not personally pious, Savarkar embraced Hinduism as a cultural rather than as a religious force. But Hindu nationalists left it to the noncommunal and secular INC to lead India to independence and remained eclipsed till Mrs. Indira Gandhi’s Emergency regime of 1975 to 1977, in part through the Congress Right usurping its pro-Hindi agenda. The RSS was allied with other groups, such as the *Vishva Hindu Parishad* (World Hindu Council), collectively known as the *Sangh Parivar*. They exploited the belief that a mosque in the small town of Ayodhya, in Uttar Pradesh, was built over the birthplace of the god

Ram. With the vandalism of the Babri Masjid mosque in December 1992, a new landscape on the role of an exclusivist Hinduism in India came into view.

The Hindu Diaspora

The extent to which this internal development took place with the active encouragement of the Indian diaspora is open to debate, but it is self-evident that a sense of being an embattled minority, which so strangely moved the Hindu majority in India, would also have been the experience of Indians abroad. Some Indian religious organizations such as the Swaminarayan sect were to exercise quite some influence. The question for all diasporas is whether to assimilate into the host culture or retreat into the comfort zone of their own cultural tradition. On the evidence of the Swaminarayan movement, which has erected imposing Hindu temples around the world, including the well-known Glen Ellyn temple in Chicago, theirs was the latter strategy. The sect in India closely identified with the Hindutva movement and the BJP (Bharatiya Janata Party) and was to pay a heavy price with the massacre by Muslim terrorists in the cultural center near Ahmedabad in 2002.

Communalism

The question has to be asked of these new religious movements whether they in any way contributed to the rise of communalism. The Arya Samaj, through its *shuddhi* or reconversion mission to rural untouchables, may have played into the hands of Hindu communalists, for anger against Muslim landlords could be redeployed into communal hostility against Muslims at large.

Under the pressures of globalization, Hinduism underwent a radical transformation. But the religious reform movements that tried to steer this in the direction of social change and religious pluralism have become increasingly eclipsed by a more exclusivist Hinduism. It can be argued that some, such as the Arya Samaj, colluded with this process. The RSS claims to be dedicated to *seva* or service, the leitmotif of the Ramakrishna Mission, and has appropriated great Reform Hindu names such as Vivekananda and Gandhi to its cause. But it is also an agency for Hindu cultural nationalism. Important

social service is still undertaken by reform movements such as the Ramakrishna Mission, which played a huge role in relief work following the Orissa cyclone. Meanwhile, the Ramakrishna Mission Institute of Culture, the Belur Math, the Aurobindo Ashram in Pondicherry, the international headquarters of the Theosophical Society at Adyar, all remain welcoming, highly civilized communities.

REFORM JUDAISM

Reform Judaism emerged as part of a larger Jewish response to modernity. The term *Reform*

Judaism is used today to refer to a movement or “stream” of Judaism that involves institutional leadership, universities with rabbinical and other training programs, and a particular approach to Jewish living in the modern world. It is also known as Liberal Judaism and Progressive Judaism. The movement began in western Europe, and the majority of its leaders, institutions, and practices developed in Germany. Historically, the movement’s cohesion evolved only gradually and with much internal debate. Due to the extreme differences between eastern and western Europe in Jewish legal emancipation and its accompanying social changes, Jews in western Europe encountered the challenges of assimilation much earlier than did their counterparts in the East. As a result, western Europe became the geographic center of Jewish reform. Reform depended not only on the expansion of legal rights and social mobility but also on the desire to maintain Jewish life and practice in the face of such developments. Reformers were acculturated Jews who aimed to retain their connection to Jewish religiosity and tradition but in a modified way that would accommodate their status as citizens of a nation-state. They often chose to relinquish rituals and practices that they found “outdated” or incompatible with life in modern societies while maintaining what they identified as core beliefs of Judaism.

Emancipation in Europe

Legal emancipation occurred at different times for European Jews, depending on a variety of factors within each nation-state. French Jews obtained the rights of citizenship in 1791, but Jews in the Russian Empire did not gain the same rights until 1917. Prior to emancipation, European Jews lived in semiautonomous communities in which they observed Halakha (Jewish law) and were beholden to the decisions of their local rabbis. The government of the state in which they resided imposed laws as well, including taxes, fines, and restrictions in terms of where Jews could live and what occupations they could hold. Jews exercised some “group rights,” in that their own leaders governed their daily lives, but they could not exercise many of the individual rights granted to their fellow non-Jewish citizens. Emancipation provided for the same individual rights accorded to non-Jews but

eliminated group rights. State governments intended that Jews would assimilate into the larger national culture. Many Jews converted to Christianity to obtain the social benefits associated with Christian identity. Reformers, however, struggled to counter these conversions by offering a form of Judaism that would retain Jewish tradition and some practices but allow for social adaptation and mobility.

Catalysts for European Reform

The beginnings of the reform movement were interwoven with the Haskalah (Jewish Enlightenment). The proponents of the Haskalah, called *maskilim*, advocated the adoption among Jews of Enlightenment values, such as rights and liberties based on common law, as well as Jewish interaction with the wider society. The Haskalah, like the reform movement, emerged first in western Europe and only gradually moved to the east.

Moses Mendelssohn (1729–1786), a founding figure of the Haskalah, did not support the broader institutional reforms later advanced by the Reformers, but his translation of the Hebrew Bible into High German allowed Jews with waning knowledge of Hebrew to read the text and encouraged the use of German. Knowledge of Hebrew had decreased as German Jews increasingly emphasized secular education at the expense of Jewish learning. The translation provided a resource for Jews who desired to know the Bible and to live as modern Germans.

Some *maskilim* focused their attention on the relationship between Jewish history and modern culture. *Wissenschaft des Judentums* was a movement comprising Jewish thinkers who attempted to apply the same objective standards esteemed in other secular subjects to the study of Jewish texts. Many of the members of this German collective became the earliest proponents of the Jewish reform movement. These thinkers were influenced by the contrast between the scholarly approaches employed in the German universities where they studied and the traditional, nonhistorical approach to Jewish law. Their experiences in German universities and the wider German society also differed greatly from their upbringing in traditional Jewish homes. Significantly, these thinkers varied widely in their personal assessment of what became

the reform movement. Whereas, for instance, Zacharias Frankel (1801–1875) advocated historical criticism of Jewish law, he rejected Abraham Geiger's (1810–1874) position that the Talmud could therefore be abandoned. Leopold Zunz (1794–1886) disagreed with what became reform positions on Jewish observance, but he initiated much of what was unique to *Wissenschaft* thinking. Frankel became the ideological father of the Conservative movement in the United States, and Geiger, though not the *originator* of reform ideology, integrated existing concepts into an overarching approach to Judaism then embraced by the reform movement. Samuel Holdheim (1806–1860) served as a model for radical Jewish reform in the United States. Holdheim asserted that to be Jewish no longer required ritual observance, and he even agreed to perform interfaith marriages.

Beginning of the Reform Movement in Germany: Religious Changes

In 1810, Israel Jacobson (1768–1828) built the first Reform synagogue in Seesen, although he transferred his rabbinical leadership to Berlin in 1815. Meanwhile, another Reform synagogue was established in Hamburg—in a direct challenge to the traditional Hamburg rabbinate—and used its own *siddur* (prayer book). Three rabbinical conferences in Brunswick (1844), Frankfurt-am-Main (1845), and Breslau (1846) declared the permissibility of interfaith marriages (as long as states allowed the children to be considered Jews), expressed the loyalty of Jews to the laws of their home nations, and laid the groundwork for future reforms. Frankel established a seminary in Breslau in 1854, and Geiger opened another, called the Berlin Hochschule, in 1872. Although they differed from each other in their interpretations of reform, they claimed the name “Liberal,” because they associated “Reform” with more radical reformers like Holdheim. The Union of the Liberal Rabbis of Germany was founded in 1899, adapted 9 years later as the Union for Liberal Judaism. The union supported a set of reforming guidelines at its conference in 1912.

Reformers aimed to modify Jewish observance such that it would exist compatibly with the modern culture of the nation-state. They responded to charges of sectarianism from both within and

outside the Jewish community by taking care to frame the changes they proposed in the context of an ever-evolving Judaism. They specifically cited transformative moments in Jewish history as the pretext for their own ideas. In some ways, however, the changes that they adopted did depart markedly from earlier evolutions of Judaism that occurred historically. For instance, many reformers advocated the abolition of *kashrut* (dietary laws), an unprecedented move, so that Jews could eat with their Gentile associates. On a broader scale, the reform movement approached the relationship between Jewish communities and the external environment in an entirely new way, in that the movement generated questions about the unity of Written Law (Torah) and Oral Law (Talmud and other commentaries) and the process of halakhic development. Until the emergence of Reform Judaism, the Oral Law—believed to have been transferred from sages to students since the time of Moses and Joshua—had been uniformly viewed as an accurate and true accompaniment to the Written Law revealed to Moses by God at Mt. Sinai. Certainly, many Jews continue to view the Oral and Written Laws as unified, but significantly, the reformers questioned the ultimate truth of Oral Law. Some argued that Written Law was of divine origin while Oral Law was of human origin. For traditional Jews, such claims were heretical.

As what became Reform Judaism took shape in Germany and then in France, England, the Austro-Hungarian Empire, and Denmark, followers of the movement adopted changes in observance, dress, and practices at prayer services. These new practices emerged, in part, due to the *Wissenschaft* arguments compiled by Abraham Geiger, that Jewish law is located within history and is thus subject to the revisions of a new historical era. Jewish reformers adopted rules of decorum, organ music, choirs, and the use of the colloquial language. In some reformed synagogues, women sat together with men. Traditional synagogue services, in contrast, separated men and women into different sections of the synagogue and allowed people to wander in and out, daven (pray) at their own speed, and talk with each other while others continued to pray. In traditional services, davening was the only source of music, and it occurred in Hebrew. Reform services also sometimes included

sermons, similar in structure to their Protestant counterparts, in which the rabbi spoke and congregation members listened. Traditional Jewish services, on the other hand, included sermons only twice a year, and the sermons began active discussions regarding topics in the Torah.

Traditional Judaism involves regular rituals, including specific blessings before eating different foods, washing hands, and many other regular practices. Men are obligated to pray three times a day and to lay *tefillin* (phylacteries) every morning. On a monthly basis, married women visit the *mikveh* (a purifying body of water). *Kashrut* (dietary law) is strictly observed. Prior to the reform movement, the laws of *kashrut* generally prevented Jews from eating with Gentile colleagues, thus separating the Jewish community from the wider society. Sabbath observance, which involves many restrictions on normally acceptable activities, inhibited Jews from working on Saturdays.

Many reformers aimed to omit these practices from Jewish observance, since they viewed the practices as restrictive to proper Jewish participation in the society of the nation-state. Jewish law, they argued, had evolved over the ages, depending on the requirements of each era. In this era of the Enlightenment and the Haskalah, reformers struggled to present Judaism as a “universal” religion that offered moral values and theology applicable to all citizens. Not all reformers sought to dispense with the Halakha, however, and a number of more traditional rabbis were willing to modernize prayer services by including a sermon or making other changes as long as no violations of Jewish law occurred. Therefore, the reformers’ critiques and innovations ultimately fostered a new vision of what it meant to be a Jew.

The Reform Movement in France and England

Although the reform movement in Europe gained adherents and established synagogues in several countries, radical reforms were only adopted in Berlin and in several congregations in England and in France. In France, the rabbinical leadership remained hierarchical, and rabbis who applied for the leadership position of “grand rabbi” were required to state their positions on various reforms.

Reformers looked to Germany for leadership, but attempts to assimilate were modeled on French Catholicism rather than German Protestantism. As a result, Jewish services remained in Hebrew just as Catholic masses were held in Latin.

The Jewish community in England reemerged in the 17th century for the first time since Jews were expelled in 1290. Like their non-Jewish counterparts, British Jews were not very religiously observant. They also exercised most of the same legal rights as non-Jews. Perhaps for these reasons, the reform movement did not immediately gain much strength. Claude Montefiore (1858–1938) did attract some followers among acculturated English Jews to “Liberal Judaism” at the end of the 19th century. Lily Montagu (1873–1963) then developed the institutional structure of Liberal Judaism in England into what became the Jewish Religious Union. Montefiore chose Israel I. Mattuck (1883–1954) to serve the Liberal Jewish Synagogue, the first new, reformed synagogue, in 1912.

At the turn of the century, some French Jews found Liberal Judaism compelling as well, since most of them were acculturated yet dismayed by the anti-Semitism of the Dreyfus Affair in 1894, in which the French Jewish army captain Alfred Dreyfus (1859–1935) was erroneously arrested for treason. This event marked a turning point for many Jews, who realized that their identity as Jews made them suspect despite their acculturation and loyalty to the French state.

The Reform Movement in the United States

The reform movement was very successful in the United States, because whereas in Europe the reformers encountered many obstacles due to restrictions both in government and in rabbinical leadership, in the United States few such barriers existed. The emphasis in the reform movement on individual authority in religious matters was immediately compatible with American individualism.

The reform movement traveled to the United States with German immigrants in the 1840s and 1850s, but it was largely dependent on European intellectual developments until the turn of the century. Reforms had already occurred in the United States by the mid-19th century, beginning with the division in the Charleston, South Carolina, synagogue Beth Elohim. In 1824, a number of members

signed a petition requesting moderate reforms, such as Hebrew prayers read in English, a weekly discussion of Jewish texts and principles in English, and a shorter service. These members decided to form a separate congregation the following year, after their requests were repeatedly denied. In the resulting society, services were mostly in English and included a choir and instrumental music, and men were no longer required to wear *kippot* (head coverings).

In the United States, the reform movement grew in response to both American and German influences. The majority of Jewish immigrants to the United States during the mid-19th century came from Germany, and most of them were already familiar with the religious changes brought about by the reformers. Isaac Leeser (1806–1869), a German immigrant, became the *hazan* (cantor) of the Sephardi Mikveh Israel congregation in Philadelphia. He was an orthodox Jew, and hence rejected many Reform beliefs, he but adopted modern practices, such as a regular English sermon during Sabbath services and a Sunday school formed on the Christian model. He also translated the Hebrew Bible and *siddur* into English.

Reform Judaism began to spread in the United States during the 1840s. Existing synagogues revised their services, and new congregations emerged, forming around Reform ideals, so that by 1855, one could find synagogues with various degrees of reformed ritual in Charleston, Baltimore, New York, Albany, and Cincinnati. Congregation Har Sinai in Baltimore adopted Reform services in 1842, and Temple Emanu-El became New York’s first Reform synagogue in 1845. Isaac Mayer Wise (1819–1900) became the foremost figure in American Reform during this period. Wise was born in Bohemia and studied in a yeshiva in Prague before emigrating to the United States. He was a rationalist yet believed that the entirety of the Torah had been revealed to Moses at Mt. Sinai. He became a national Jewish leader from his synagogue, Bene Yeshurun, in Cincinnati. Wise founded a weekly Jewish paper, the *Israelite*, and in it urged a national unified Jewish conference. However, division plagued both the movement and relations between Reform and Orthodox communities.

Although Wise had hoped to unify American Judaism and succeeded in convincing nine rabbis to sign a statement to that effect at a conference in

Cleveland in 1848, Reform and Orthodox perspectives were too disparate. Wise, however, accomplished a great deal in terms of establishing an institutional structure for Reform Judaism. In 1857, he wrote the first American *siddur*, titled *Minhag American*. He founded the Union of American Hebrew Congregations in 1873 and the Hebrew Union College in 1875, both formative institutions in American Reform Judaism.

One of Wise's toughest critics was another Reform rabbi, David Einhorn (1809–1879). Einhorn emphasized the universalism of Jewish ideals and embraced a more radical position of rejecting traditional observance and the binding nature of Talmudic law. Einhorn wrote his own *siddur*, titled *Olat Tamid*, in 1858. Whereas Wise's *siddur* included a traditional Hebrew service, Einhorn's *siddur* seriously modified the Hebrew prayers; used his own, loose translation; and included German prayers that he wrote himself. Einhorn also rejected the attempts to placate Orthodox rabbis at the Cleveland conference, such as the affirmation of Talmudic authority. In response, Einhorn called another conference in Philadelphia in 1869, inviting only reformers. Wise attended for fear that his views would be excluded.

Wise presided over a conference of Reform rabbis in Pittsburgh in 1885, and the resulting document, deemed the "Pittsburgh Platform," explained the opinion of the majority of attending rabbis but caused a split between them and the more traditional rabbis who also attended. The latter group founded their own movement, which became Conservative Judaism.

The reform movement's eight-point Pittsburgh Platform became the core doctrine of Classical Reform Judaism but was eventually revised in 1937 with the Columbus Platform and then again in 1976, 1997, and 1999. The eight-point platform was intended to establish the definitive principles of Reform Judaism. It affirmed the significance of monotheism and moral laws but rejected dietary restrictions and other practices deemed incongruent with the modern age. The platform also relinquished the hope of returning to Zion as a vestige of the past and affirmed a commitment to economic justice. During the 1890s, most congregations further unified by adopting the *Union Prayer Book* as their official *siddur*.

In the United States, the Columbus Platform of 1937 accounted for changes in thinking that had occurred since the Pittsburgh version. It reveals the influence of Mordechai Kaplan's (1881–1983) Reconstructionist movement in terms of the absence of Jewish chosenness and the significance of Jewish art and music to Jewish identity, but it also rejects Kaplan's de-emphasis on the synagogue as the main site of Jewish tradition and defines Judaism as a *religious* tradition. This Platform, however, is most known for its endorsement of political and cultural Zionism, a vast shift from the position upheld in Pittsburgh.

In the 1940s, the reform movement in the United States began to focus more intensively on American society, specifically the issues of free speech, and then in the 1950s and 1960s, civil rights and the American presence in Vietnam. Changes occurred within the movement as well. Sally J. Preisand, ordained by the Hebrew Union College, became the first female rabbi in 1972, marking an important leap forward for gender equality among Reform leaders. The movement had nominally supported women's equality for decades, although prior to 1972 all rabbis and the majority of synagogue leaders were male. By May 2001, however, 373 women were ordained. Also in 1972, gay and lesbian Jews established the Metropolitan Community Temple in Los Angeles, the first openly inclusive synagogue in the United States. In 1975, many congregations replaced the *Union Prayer Book* with a new *siddur*, *The Gates of Prayer* by Chaim Stern, which offered a variety of Sabbath prayer services. The San Francisco Platform in 1976 reflected on 100 years of the reform movement and its impact on Judaism and Israel. It outlined commitments to God, the people of Israel, the Torah, and religious practice and obligations to the State of Israel and the Diaspora, to survival and service, and to hope in the face of the Shoah (Holocaust). In 1978, Rabbi Allen B. Bennett was the first rabbi in the United States to come out as gay. The Central Conference of American Rabbis (CCAR) determined in 1983 that Jewish identity could be inherited through one's father as long as one is raised in a Jewish household, modifying the traditional view of matrilineal descent. The CCAR passed a resolution in 1990 that explicitly approved the ordination of gay and lesbian rabbis. In 1997, at the centenary of the

World Zionist Congress, the Miami Platform addressed the relationship between Reform Judaism and Zionism. Then in 1999, the reform movement adopted a new Pittsburgh Platform that revised much of Classical Reform Judaism in that it emphasized the religious significance of traditional practices, such as dietary laws and wearing the *kippot*, although it did not require them. In 2003, the Union of American Hebrew Congregations changed its name to the Union for Reform Judaism, and in 2007, a new *siddur* was published, titled *Mishkan T'fillah*.

Reform as a Global Movement

Jewish reforms became a truly global phenomenon between the two World Wars. The reform movement particularly expanded in Europe. In 1926, English Reform Jews, led by Lily Montagu, organized a London conference that established the World Union for Progressive Judaism. The World Union's first official conference was held 2 years later in Berlin. Although the World Union did not greatly influence American Reform, it significantly unified European progressive Jews and strengthened emergent institutions in Russia, Poland, the Netherlands, Sweden, and Israel. Progressive Judaism also drew interest and support among communities in Bombay, South Africa, Australia, Canada, Brazil, Argentina, Chile, and Uruguay. In all countries except Israel, the Jewish community is a minority group, and thus, Reform Judaism has sometimes experienced obstacles such as anti-Semitism. In Israel, however, the reform movement has faced religious challenges, since Orthodox rabbis officially govern religious rites, such as marriage, divorce, and conversion. Reform rabbis in Israel lead congregations as in other countries but are not granted religious authority by the state.

REFUGEES

Escape from violence is one of the oldest motivations for people to migrate. Within the modern world of sovereign territorial nation-states, various kinds of forced migrants are captured by the category of "refugees." The standard definition is given in Article 1 of the Geneva Convention Relating to the Status of Refugees, adopted by the United Nations in 1951, according to which a refugee is a person who

owing to a well-founded fear of persecution for reasons of race, religion, nationality, membership of a particular social group, or political opinion is forced to migrate involuntarily across an international boundary and remain outside his country of nationality.

While this (legal) categorization of refugees might obscure similarities with involuntary migrants who seek refuge from interstate or civil wars, humanitarian crises, climate catastrophes, or economic shortage, it seems useful to reserve the term for those who, fleeing direct or indirect violence of their own state, seek refuge within another state.

Religion is intimately related to the refugees' experiences of flight, migration, and integration. Although largely understudied within the interdisciplinary field of refugee studies, religion is not only a root cause of flight, but as discussed in the following sections, it also shapes social networks and identity formation during flight, resettlement, and repatriation. In addition, religion has played a crucial role within the emerging international refugee protection regime.

Religion and Forced Migration

Religious nonconformity has always been the prime reason for persecution and exile. The pre-modern history of the Jewish Diaspora since the destruction of the Second Temple is archetypical for the plight of religious refugees. Expelled from England (1290) and Spain (1492), Jews were, next to heretics, a particularly vulnerable group in the "persecuting society" of medieval Christian Europe. What distinguishes modern religious persecution from its medieval predecessors is its intricate relationship with the sovereign power of territorial states. Emerging out of the European Wars of Religion, early-modern territorial states attempted to ensure confessional conformity among their populations. For instance, the revocation of the Edict of Nantes in 1685 forced hundreds of thousands of Huguenots to flee France in what at the time was known as *Le Grand Refuge*. Throughout Europe, Anabaptists, Mennonites, Methodists, Quakers, and many other dissenting Protestant minorities were denied freedom of religion, and they emigrated to neighboring states or to the British colonies in North America. With the upswing of nationalism in the 19th century, religious nonconformity gave way to ethnic distinctiveness as a major motif of state persecution. However, as a marker of ethnic or national identity, religion continued to be a ground for persecution as shown by the massacres of Armenians during the breakup of the Ottoman Empire and, of course, the genocide of Jews.

The varieties of religious, or ethnoreligious, persecution at first received only scant attention when in response to forced migrations after the two World Wars the international refugee protection regime was founded. The United Nations' (UN) Geneva Convention (1951) had the rather circumscribed

purpose of protecting and assisting refugees who had fled the Holocaust. The millions of Muslims and Hindus who had to cross borders between West Pakistan, East Pakistan (now Bangladesh), and India after the partition of the subcontinent as well as many other forced population movements resulting from postcolonial nation building in the South were included under the mandate of the UN High Commissioner for Refugees (UNHCR) only in 1967 with the First Optional Protocol to the Geneva Convention. During the period of the Cold War, when socialist states widely pursued antireligious policies, there was little interpretative guidance as to when fear of persecution for reasons of religion was a well-founded ground to claim refugee status. In 2004, in light of rising global religious fundamentalism, the UNHCR adopted the "Guidelines on International Protection: Religion-Based Refugee Claims Under Article 1A(2) of the 1951 Convention and/or Protocol Relating to the Status of Refugees" (HCR/CIP/04/06). Embracing a broad definition of religion that covers belief, identity, and ways of life, the "Guidelines" name restriction of religious freedom, discrimination, forced conversion, or forced compliance as major forms of religious persecution, either by states or by nonstate agents where states fail to provide effective protection. They also call on states to assist religious refugees and prevent religious persecution by respecting the human rights of minorities.

Whereas the UNCHR collects detailed statistics of its total population of concern, which includes legally recognized refugees, asylum seekers, internally displaced persons (IDPs), stateless persons, as well as returned refugees and returned IDPs, the precise number of religious refugees is hard to estimate, since data are typically not collected by ground of persecution but by country of origin. However, the fact that almost half of the 11.4 million refugees in 2007 consist of Afghans (3.1 million), Iraqis (2.3 million), and Sudanese (523,000) shows that the enormous increase in refugees that has occurred after the end of the Cold War is not the least due to religious cleavage structures.

Religion and Identity Formation Among Refugees

The UNHCR distinguishes three durable solutions for refugees: host country integration, resettlement

in a third country, and voluntary repatriation. That in each of them religion needs to be taken into account is increasingly recognized by scholars in anthropology, sociology, and law.

Often sustaining the social networks along which flight occurs, religion plays a key role in the dynamics of acculturation, assimilation, and reactive ethnicity among refugees in situations of both host country integration and resettlement. While these dynamics are similar to those known from migration studies more generally, they take a specific form among refugees. First, the experience of violence leaves refugees particularly traumatized. Thus, among Muslim refugees from Somalia, Christian refugees from Sudan or Iraq, Buddhist refugees from Cambodia, and many others, religion has been found to provide strong psychological support in coping with trauma and sustaining individual personhood. Second, due to the involuntary character of their migration, refugees typically retain a stronger homeland orientation than other migrants. Hence, religious community formation among refugees is closely interwoven with a struggle for authenticity and ethnic maintenance and the emergence of long-distance nationalism. Third, religion may provide an explanation of the refugees' experience by situating it within divine history. Thus, as in the case of Cao daists from Vietnam, flight may be interpreted as divine will to spread the religious truth, an interpretation that gives rise to a de-territorialized transnational diaspora with strong proselytizing motivations.

Refugees' religious beliefs and ritual practices do not leave the new host country unaffected. The best known example is the emigration of Protestant dissenters to North America, which formed a pluralistic society in which religious liberty eventually became a prime constitutional principle. In many other cases, such as the flight of Tibetan refugees to the Indian border region, the presence of a refugee community with strong religious identities may, by altering the religious field, induce new potential for conflict. The social impact of refugees' beliefs and practices is perhaps greatest in situations of repatriation. For instance, Uzbeks who had fled the communist regimes in the 1930s and 1950s and had adopted Wahhabism in Saudi Arabia became key players in the re-Islamization of Central Asia, when they returned after 1989. The repatriation of religious refugees may thus

induce far-reaching cultural change within their home country.

Religious Refugee Aid Organizations

While religious, or ethnoreligious, persecution seems endemic to the modern system of territorial nation-states, it was for religious nongovernmental organizations (NGOs) to take the lead in providing assistance to refugees. First, faith-based organizations, notably Jewish and Quaker charities, pressured states to create an international refugee protection regime and have ever since lobbied the UN for the cause of all forced migrants. Second, faith-based organizations are among the major actors assisting refugees in situations of host country integration, resettlement, or repatriation. In many Western states that have subscribed to the Geneva Convention and its principle of *nonrefoulement*, governments cooperate with religious organizations in catering to refugees, both domestically and in foreign policy. Within member states of the Organization of the Islamic Conference (OIC) who are currently host to several million refugees but often have refrained from ratifying the international refugee instruments, Islamic humanitarian charities even substitute state action in providing assistance to forced migrants.

Together with other international religious organizations, such religious refugee aid organizations form an integral part not only of global governance but also of the global religious system. To the extent that a key motif for assisting religious refugees is solidarity with fellow believers, they translate the imagined communities of world religions into viable social networks. Where refugee aid is considered an instrument of proselytism, they additionally increase competition among globalizing religions. In contrast, the more they adopt the human rights principles underlying the international refugee protection regime, for instance, by assisting refugees without discriminating on grounds of belief, faith-based refugee aid organizations become important sites of inter-religious contact.

RELIGION AND STATE

Rather than attempting to develop a typology of the relations between church and state—at the risk of comparing situations without taking into account the often profound discrepancies between their components—this entry addresses a specific form, the modern Western state, and its relations with religious groups and institutions. This form remains today and often is taken for a universal paradigm, especially in developing countries that have looked to the West for models of political organization. It was the Western concept of the secular nation-state that gave rise to the worldwide adoption of the term *state* with a political connotation.

The state is characterized by an impersonal power, distinct from the person of the governor. Over time, relations of authority gradually became detached from the personal relationship of leader to subject and came to be based on preestablished rules that apply to all and whose execution is guaranteed by the administrative apparatus often described as bureaucracy.

The role of Christianity in the process that led to the development of the Western notion of the state remains one of the great questions of modern political philosophy. It should be considered with two things in mind: (1) the way in which the construction of the state is a potential development of Christianity and (2) the way in which the state has assumed its modern guise by emancipating itself from this religion and its institutions.

Religion and the Shaping of the Modern State

The expansion of Christianity occurred with the support of imperial Roman power but would never eradicate the initial duality that came from the conditions of its birth in the margins of Roman power and its structures. Both the alliance made with the Church to constitute the pedestal of the medieval monarchies and the rivalry at the highest level between religious and political powers, the Holy See and the Christian Empire, presuppose the definition of two distinct spheres: temporal and spiritual. And if the emergence of the territorial state in the Middle Ages is attributable to many other factors, first and foremost the requirements of war and its financing, its existence was reinforced by the struggle of the monarchs against Rome.

In its nation-state form, the European state also owed a great deal to the effects of the Reformation. The first reaction to the rupture of Western Christian unity was an attempt to remain loyal to the principle of a sole religion as a national cement—already one of the principal driving forces of the conversion of pagan monarchies to Roman Catholicism since the beginning of the Middle Ages. The Treaty of Augsburg in 1550 adopted the saying *cuius regio eius religio* and engaged a whole portion of Europe in the process of “confessionalization” by creating a mosaic of homogeneous political groups held together largely by an attachment to the same religion.

This homogeneity, however, never became complete, and the war continued to tear Europe apart. The Peace of Westphalia in 1648 decreed the break with the old principle. It brought to an end a century of religious wars by accepting religious pluralism among the European states. Henceforth, the main role of the state would be to guarantee the coexistence rather than the salvation of the populations

and their religions. The creation of a diversified and specialized administration and bureaucracy characteristic of the modern state would use the services of many clerics and especially their mastery of the written language, but the sphere of its activity and the increase of its capabilities were applied to domains beyond any spiritual preoccupations.

Thus began the real era of “state religions,” among which the foremost was undoubtedly the Anglican Church “established” by the British monarchy. In the 18th century, they would spread under the very firm hand of enlightened despots. Since access to the functions of the state apparatus were reserved to their members (the Test Acts of England and the American colonies), these churches thus gained control of social practices and secured their positions. In exchange, they accepted a certain submission to a state free to initiate reforms that sometimes turned out to be quite radical, such as those of Joseph II of Austria.

The proven impossibility of imposing a single path to salvation also produced a great deal of philosophical speculation. Each in his own way, first Machiavelli and then Spinoza, Hobbes, and Locke relieved the state of the burden of shepherding its members toward salvation to direct it toward other tasks. Politics became autonomous in its means and ends, while the definition of individual rights starting from natural law tended to transform the modern state into a state of laws. We have never ceased to play out the effects of abandoning the Aristotelian search for a supreme good and becoming distant from God in a world subject to decoding by science and its laws.

In the 18th century, the engagement of Enlightenment thought with the improvement of life here on earth assigned the joint missions of utility and happiness to the state while once more decisively shifting the political debate away from religious preoccupations. Meanwhile, the development of the state proceeded from the incorporation into its own domain of a series of tasks and functions, such as education, health, and welfare, long defined and provided by the churches.

Finally, it must be recalled that the equality of civic rights had often been obtained in opposition to limits and exclusions defined by religious membership, the latter often constituting the last bastion of resistance. The affirmation of individual rights has pulled the course of Western history

toward the generalization of different arrangements of separation of church and state, even if they have functioned in the past and continue to appear today in varied forms.

The Western trajectory constitutes a very specific history, marked by a sizeable dose of fortuitousness in the development of the potentiality of the dominant Christian religion. To what extent does the application of the political form of the state to the world presuppose a concomitant extension of this type of relationship between the state and religion?

The Ways of Separation Between Church and State

The separation between the “churches” (in the Durkheimian sense of the word applied to all forms of religion) and the state, or even to varying degrees between religion and politics, is an important element of the Western “process of dissociation.” This cleavage is certainly very important from country to country depending on whether a separation exists between the religions in their institutionalized form and the state. Nevertheless, it does not account for all the real and functional differences or nuances that have a considerable impact on the lives of its inhabitants, for modes of alliances or associations between these two types of structures have been adapted to all sorts of requirements, for example, to those of a more or less open or limited “tolerance,” but especially to civil equality within the state. Depending on the context and other requirements of civil society, concordats or established churches may conceal very different realities. Accordingly, the attachment to plurality by a nation such as Great Britain cannot be called into doubt.

On the other hand, one can certainly insist on the existence of a major connection when there is a concept of two different spheres, more or less separate but well identified as distinct. This virtual distinction within Christianity, historically developed in its Western version, was even integrated by the foreign element formed by Judaism, something that issued long ago from conditions of exile, dating from Jeremy’s summons to the Hebrews at Babylon (Jeremiah 29) but even more clearly and closely from the prolonged presence of the Jews in the West.

It remains true that the separation was never perfectly airtight or stable but always under tension. The American “wall” has “windows,” and that has always been the case. What is conceivable in one national context can be inconceivable in another. France and the United States are the two pioneers of separation, but they present two very different models, so different are their underlying premises.

The international adoption of the term *laïcité* cannot hide its application to very different realities. At least in France, it constitutes a qualifier or even a characteristic of politics—it is the Republic that the constitution defines as *laïque*—and not merely, as is often the case elsewhere, a regime of religions. Historically, the laicization of society preceded the separation of “the churches” and the state. The neutralization of the political public sphere is not simply neutrality in regard to different expressions of religion, but it posits the possibility of a civil morality common to all citizens regardless of their faith and denomination or absence thereof.

Today, thanks to international law and its dominant values, the world political order has made the state the unique model to which each society must conform. International structures and organizations are based exclusively on national states, to which norms presumed to be universal are applied.

However, it would appear that the economic and technical hegemony of the Western powers has not been definitively established, and moreover, the adoption of their political institutions and their values has not and will certainly never occur in many regions of the world. In those regions, there will never be a development comparable with that of the West or a convergence along other paths to the Western conception of the individual as an autonomous bearer of rights but rather the survival and even the consolidation or reformulation of other concepts of society in which religion plays an essential role.

If Western-style development had never been in the cards, it must be admitted that any chance to achieve it would have been gravely compromised by the way in which one essential stage was negotiated. The greatest moment for the spread of the Western model was undoubtedly the colonization of the 19th century. But the colonial powers subordinated the

equality of individuals to the notion of their “civilizing” task, whereas the very principle of the colonial system exempted them from satisfying the requirements of a veritable local development of the state. If they actually created public administrations and services, it was with the greatest subordination to the metropolis and its interests. Nor did they hesitate to rely on the structures, personnel, and networks of metropolitan religions or to manipulate indigenous religious differences, the better to guarantee the enforcement of the colonial order.

As long as it lasted, the Western powers’ world hegemony would have nonetheless implanted the state model in most of the regions of the world, with considerable consequences, especially on a religious level.

In certain regions, in Islamic lands for example, where *laïcité* was at one time much in demand, the laicization process in no way resulted in a separation between the church and a state that, on the contrary, counted very much on retaining its strictest control. After Turkey, in Iran as in several other Arab countries, this reform imposed by the authorities in societies that were not very secularized went hand in hand with a single-party political system largely supported by the army and with the submission of its populations: for example, the destruction of religious or ethnic particularism in Turkey, the repression of the Muslim Brotherhood by the Egyptian regime, or the frontal assault on “traditional” Islam in Tunisia.

In many authoritarian regimes, among which figure postcolonial regimes and “popular democracies,” religion became at once a refuge and a silent form of dissent, often the only one possible. Sometimes dissent was less silent, especially in Eastern Europe as the Soviet Union was dismantled, and in the Arab world laic ideologies declined after the 1967 military defeat by Israel. There, we see very diverse and unstable versions of the relationship between the state apparatus and religion: In Wahhabist Saudi Arabia, this relationship tends toward an instrumentalization of power accompanied by an intense activity of international religious advertising; in Iran, with its “clerocratic” tendencies, civil religious movements have brought a renewed horizon and increasingly substantial support. There is also, however, “re-Islamization” in contested states that have recourse to Islam to prop up their identities.

Even unrealized, the hypothesis of a generalization of the Western model carries a heavy burden. For not only was this model not adopted, its rejection was moreover accompanied by resentment carried over from the colonial past, going as far as a hostility aggravated by the religious question. Western secularization is seen as radical materialism, the reign of trade, and generalized depravity. It is from this perspective that today we hear the Chinese Communists invoke their Confucian heritage to deny any legitimacy to remarks made about their human rights practices and even to criticize the Western version. Moreover, the current dynamism of radical tendencies from within religious traditions gives rise to a will to control social practices that more and more radically lay claim to the state and its services. Examples multiply, from the condemnation by the Malaysian civil courts of a Muslim citizen who wished to convert to Christianity to the influence of religious groups in the American political sphere.

Separation and Regulation: The Needs of Today

In practice, the need for what sociologists call "regulation" of the religious has produced a demand for the intervention of the services of the state; countries that are familiar with a separation regime are no exception. Even in the case of French *laïcité*, in a regime whose attachment to separation is most unequivocal, the state has always had an interest in religious life. However, from one country to another, one observes the diversity of the forms of public function, according to preferences that may be legislative; administrative, as in a number of Latin American countries; or juridical, as is the case in Anglo-Saxon countries.

The evolution of what currently constitutes religious pluralism, its expansion in purely quantitative terms, would in any case suffice to render this task more and more delicate. To this, we must add the evolution of the nature of demands and needs and especially the affirmation of new social preoccupations related to the religious sphere in terms, most notably, of public safety, which would gain them a place on the "political agenda."

These public policies can lead to excesses. They can encourage a will to control or even shape religions according to an image more familiar to the

state or to make them conform more closely to preoccupations that the state chooses to favor in function of various types of considerations. But we must not exaggerate the omnipotence of the state. Historical examples of the limits of its influence are not lacking, even during times when it has not hesitated to resort to the most brutal means of action.

The state does not constitute a monolithic and autonomous entity, but it is a heterogeneous ensemble of political and administrative actors called to take charge of complex and interactional problems with other political and social forces in a context of uncertainty. This opens up the question of intelligence and the competence of its services.

States and their citizens are also increasingly concerned with the structures and norms edified beyond national frameworks. The European Community is undoubtedly one of the most developed examples of this insofar as it decrees norms of common requirements and gives citizens of different countries the possibility of appealing to justice in its court, the European Court of Human Rights. It has produced very diverse results: Whereas Greece renounced the inclusion of religious confession on its nationals' identification cards, some religious bodies may also be tempted to obtain on a supranational level that which they were unable to obtain on a national level. Alliances intended to obtain the limitation of certain rights such as, oddly enough, birth control in the name of religious principles are routinely denounced.

It would also seem that there is a confirmed tendency for the state apparatus to withdraw from functions on which it had once actively seized but that it now wishes to abandon to other social actors, including religious ones. This is particularly striking on the international scene. A high proportion of nonstate aid is the work of nongovernmental organizations (NGOs) issuing from a religious institution or with explicit reference to a religious discourse. They have many militants at their disposal and large budgets fed by church networks and, in certain cases, by public monies from their respective states. Their religious character can present specific problems. Some limit their help to their "faithful" or dispense it according to confessional or at least moral criteria, exacerbating local tensions between communities and engaging in, in certain fields, real missionary competition. Owing

to the debacle of postcolonial states, the situation is particularly critical on the African continent. During its civil war, Sudan thus saw itself divided between Islamic NGOs in the north and evangelical ones in the south.

A comparable tendency is also observable on Western soil and in the former Soviet Socialist republics. The decline of the welfare state; the abandoning of social responsibilities, which are passed on or delegated to associations; and the transfer of peacekeeping missions or social control to religious authorities in certain specific territories have evoked a process of “deseccularization.” Such an evolution also comes up against the propensity for religious currents or forms to attempt to provide a moral and social framework as well as for individual well-being. The result may be to cloak economic and social problems in religious terms at the risk of compromising their diagnosis and treatment and of enclosing individuals in rigidified identities.

In religious matters, the state may constitute the greatest of oppressors, and it certainly possesses all the necessary means. Although, in spite of all its failings and limits, one can take the measure of the importance of the role of the state, which, as a priority, recognizes individuals as bearers of laws, guarantees social peace, makes sure that its requirements are respected locally, and guarantees the conditions of pluralism notably as an alternative to relations of force. In this domain, the efficacy of such a state remains unequalled, and the authority that could take its place is, at the present moment, yet to be identified.

RELIGIONS AND WORLD FEDERATION

Stimulated by a desire to reduce war and political tensions through global governance, some religious groups have advocated the creation of a world federation of nations. Noting how democratic federal governments have advanced peace and justice within countries, many religious people have advocated the creation of a democratic federal government at the global level in addition to national, regional, and local governments.

They have concluded that global problems are not being solved under the existing United Nations (UN) organization, a confederation of national governments based on the principle of unlimited national sovereignty. The UN has often been ineffective because of these reasons: The General Assembly can pass only nonbinding resolutions based on the nondemocratic system of one nation one vote, each of the five nations that are permanent members of the Security Council has a veto, there is no adequate system of enforcement for international treaties, and the organization has a limited budget based on dues that are not always paid by national governments. One solution that is advocated by the supporters of a world federation is that the UN be transformed into a democratic world federation of nations—based on the principle of subsidiarity—that would create, enforce, and adjudicate world laws as well as having the power and authority to arrest and incarcerate individuals who violate them.

Under an effective world federation, war as a means of settling disputes between and within countries would be outlawed, and verifiable disarmament of the weapons of war could take place. In contrast to the present war system, thousands of

innocent civilians would not be bombed or suffer under international sanctions because of the decisions of their leaders. Conflicts would be settled, and global problems could be solved through a nonviolent democratic process. A world constitution would make explicit the powers and limitations of the world federation; the rights, powers, and limitations of national governments; and the rights and responsibilities of all citizens of the world.

Roman Catholic bishops at the Second Vatican Council called for outlawing war by international consent and creating a universal public authority that would safeguard security, justice, and rights. In their encyclicals, Pope John XXIII and Pope Benedict XVI have stated that there is an urgent need for a true world political authority that would be regulated by law, observe the principles of subsidiarity and solidarity, promote human development, manage globalization, and establish the common good.

According to the teachings of Baha'u'llah and the Baha'i Universal House of Justice, acceptance of the oneness of humanity is a prerequisite for establishing a world federation. According to Baha'is, every national government will need to give up every claim to make war and should only maintain armaments for purposes of maintaining internal order. Baha'is and many others also believe that understanding between all people and the facilitation of a world federal democracy would be enhanced by the universal use of a common auxiliary language in addition to the national languages.

Many individuals from religions that lack a central teaching authority have also promoted the goal of a world federation. For example, many liberal Protestant Christians and many Unitarian Universalists are world federalists. Hindus such as Swami Satprakashananda, Buddhists such as Nikkyo Niwano, and many individuals from other major religions have emphasized the need for a global system of enforceable world laws.

Before the legal and political superstructure of a world federation can be created for world peace, the advocates of a world federation believe that the world's religions have the responsibility of building a firm foundation for it by emphasizing their versions of the Golden Rule, common ethical commandments, "humatriotism" (loyalty to the human family), world citizenship, and the stewardship of

creation. They are urged to participate in local, national, and international forums for interreligious dialogue and cooperation as well as act according to the principles of the "Declaration of a Global Ethic," which has been developed by the Parliament of the World's Religions.

RELIGIOUS DIALOGUE

Dialogue among religious traditions is challenging, since traditions vary enormously, and especially from one societal context to another. Some constitute all the spiritual insights, reflections, observances, and practices that have been part of a community's life over many centuries. Other religions originate as the result of an intense religious experience of a prophet or leader who becomes the founder of a new religious tradition. Still others begin as protest or reform movements within an existing religious tradition and gradually evolve as separate religious entities. Historically, religious traditions have, by and large, been in mutual isolation or at times seen themselves as mutually exclusive or even rival communities. In some periods, religious communities have been at war with each

other. In some places, as in India, for instance, many religious traditions have coexisted for centuries in mutual tolerance and peace. Throughout history, there are also numerous instances where individuals and communities have tried to build bridges of understanding across the religious divide.

Religious dialogue, also often referred to as interreligious dialogue, as a conscious activity and a recognized discipline within the religious field, became prominent as more and more communities worldwide began to feel the impact of religious plurality. Vast population movements of refugees, migrants, and displaced peoples in recent centuries, as well as enormous advances in travel, communications, and the economic interdependence of nation-states, have resulted in bringing peoples of numerous religious communities to live together as neighbors. Almost all major cities of the world now have multireligious communities. Most of these communities practice their own religious commitments, build their own places of worship, and look for ways to find their place within the plurality of religions. It is in this context that religious dialogue has emerged as a concept that defines the relationship between religious communities in pluralistic environments.

The Concept of Dialogue

Mutual respect, mutual openness, and willingness to accept the other in their “otherness” are the hallmarks of interreligious dialogue. Religious dialogue begins when religious plurality is accepted as a given and is not seen as a threat to life in community. It does not expect any religious community to change or give up its own religious convictions, but it expects all religious communities to be open to building relationships across the religious barriers despite the differences. “Different does not mean wrong but different” is one of the slogans within interreligious dialogue. This means that one should be open to living with what is different even if one does not necessarily accept what the other believes or practices as something one would embrace. Also accepted within this discipline is the conviction that each community should be allowed to define itself so that relationships are not based on the prejudices, misunderstandings, and misconceptions that have marred much of the interreligious relations of the past.

The concept, however, also has elements that go beyond simple mutual respect. It is believed that when religious communities do engage in relationship with genuine openness and respect, they would be able to grow in appreciation of one another’s faith, begin to see their own faith in a new light, and understand the ways in which others have perceived their own faith and practices. They would also begin to understand the prejudices and misgivings that had led to some of the tensions and conflicts that had been part of their common history. Therefore, it is held that interreligious dialogue can also lead to mutual enrichment, mutual correction, and mutual self-criticism. Another common saying within interreligious dialogue is that “we not only need to know the other, but we need to know the other to know ourselves.” In other words, it is believed that interfaith dialogue helps a community to see itself as others see it, so that it can have a chastened understanding of its place within the larger social context.

Kinds of Dialogue

Those who have observed the interreligious dialogue activities that have gone on over many decades in the past identify five different types of dialogue. The first is the recognition that not all interfaith relations are formal or organized. Religious communities have been in conversation with each other for centuries at the grassroots level. In all pluralist situations, people have been in contact with each other in their ongoing life, sometimes with religious awareness and at other times over issues, concerns, and problems that affected their common life. In fact, in all religiously plural situations, men and women have found ways of relating to one another and respecting each other’s religious traditions, often without consciously intending to do so. This first kind of dialogue has been called the “dialogue of life” and is considered basic to all other forms of dialogue.

In new pluralistic environments where the forces of globalization have brought religious communities into close proximity, there are formal processes to bring the different religious communities into conversation so that new relationships can be built. This kind of dialogue, called “dialogue of discourse,” is also helpful to bring together communities that have been alienated from one another

because of the tensions and conflicts that have marked their history. Jews and Christians, for instance, have had a very difficult history from the very beginning, which was accentuated since the Second World War. Similarly, Jews, Muslims and Christians have also had tensions and conflicts in their history. These traditions also suffer from mutually exclusive religious teachings that had troubled their relationships. In these situations, opportunities for religious dialogue are organized so that representatives of these traditions could sit down to look at their common history. They benefit from the opportunity to study together the matters over which there had been conflicts in the past and to examine ways in which as contemporary followers of these traditions they might overcome some of the barriers that keep them apart.

The dialogue of discourse has sometimes been criticized as elitist; the representative character of those who participate in them is questioned; some view it as overly intellectual and not related to the real issues that people face in their day-to-day relationships. In reality, however, the dialogues of discourse do have an important contribution to make. Many who participate in them begin to write and speak about their own religious traditions and those of others in new ways that build community. These dialogues create communities of conversation and of heart and mind across religious barriers. Some of those who participate in these dialogues are opinion makers within their own communities and have the ears of the religious leaders of their respective groups. Many of them teach in their religious communities and have the opportunity to influence the thinking of emerging future leaders who study with them. Thus, while the dialogue of discourse certainly is not fully adequate to address the issue of interreligious relations, it is deemed to play an important role in the overall process.

Many who doubt the effectiveness of the dialogue of discourse highlight the importance of the "dialogue of spirituality," which is based on the conviction that whereas communities might have insurmountable difficulties in agreeing on doctrines and teachings, they should be able to come closer on the basis of spirituality. Even though spirituality is a difficult concept to define, those who advocate this mode of dialogue hold that there is a dimension to activities such as meditation, worship,

prayer, and spiritual practices that transcends religious labels. In reality, there are aspects of worship and prayer life that are deeply rooted in particular religious traditions and use much symbolism that is particular to those respective religions. Yet the willingness to engage in prayer and meditation together, to study one another's scriptures together, and to engage in one another's spiritual practices is seen as a significant way to promote interfaith relations. In fact, there are today many groups in all parts of the world that engage in this form of dialogue. Intermonastic dialogue also belongs to this mode. For instance, there is an annual exchange of monks between Zen monasteries in Japan and the Benedictine monasteries in Europe so that they may be enriched in their spirituality by learning and practicing spiritual disciplines that belong to each other's monastic communities.

Yet another mode of interreligious dialogue places the emphasis on action and is called "dialogue of action." Here, attempts are made to bring groups from different religious communities together to engage in common action on issues that are important to the larger community. Issues of peace, justice, human rights, the environment, rights of children, and so forth have been the subjects around which interfaith coalitions have been created. It is believed that engagement in issues that are of common concern is one of the best ways to promote interfaith dialogue. Adherents of all religious traditions easily find teachings within their traditions that support the matters advocated, and in the course of common action the doctrinal differences begin to take a back seat. At times, those engaged in such actions are asked to explain the religious motivation for their engagement, which gives them an opportunity to learn from each other.

The last mode is called "institutional dialogue." This relates to the numerous local, regional, national, and international instruments and institutions that have been created to bring religious traditions together for dialogue, reflection, and action. International interfaith organizations such as the World Conference of Religion and Peace, the World Congress of Faiths, the International Association for Religious Freedom, the Temple of Understanding, the International Interfaith Initiative, and the Parliament of World's Religions regularly hold international assemblies and conferences in which

leaders of all religious communities participate. These have great symbolic value insofar as the faithful followers of the several religious communities see that their leaders support the growth of the interfaith movement and its objectives.

In addition to these modes of dialogue, there are also dialogue events and movements that put the emphasis on youth and women to ensure their presence and participation in the interfaith movement and to harness the specific perspectives they bring to the dialogue.

Brief Historical Survey

Many consider the World Columbian Exposition of 1893 held in Chicago as the occasion of the birth of religious dialogue and the interfaith movement. So many people were coming to the Exposition from all parts of the world that it was decided that the Exposition must provide the opportunity to hold consultations, conferences, and parliaments on many subjects, such as labor, medicine, commerce, and so on. As part of this process, it was decided that a Parliament of World's Religions would be held from September 11 to 27, 1893. This turned out to be the largest event related to the Columbian Exposition and the very first global engagement of the Western and Eastern religious traditions. Of the many leaders of the Asian religious traditions Ven. Anagarika Dharmapala of Sri Lanka, representing the Theravada school of Buddhism, and Swami Vivekananda from India, who represented Hinduism, stood out. The eloquence of Swami Vivekananda to his audience of some 7,000 was a historic moment that would introduce deep interest in Hinduism in the Western world.

Even though the impact of the Parliament should not be minimized, one should say that religious dialogue, as we understand and practice it today, evolved over a long period of time and is one of the unintended consequences of the global Christian missionary expansion from Europe into other parts of the world. While most Christian missionaries engaged in the traditional mission of preaching their message, some began to take a deep interest in the religious traditions of those to whom they had come to preach. In some cases, interest in other religious traditions turned to deep appreciation. Gradually, some of the missionaries

began to question the assumptions about other religious traditions that underlay Christian missionary activity.

An outstanding example of the growing dissatisfaction concerning Christian assumptions about other religious traditions was manifest in the first World Missionary Conference held in 1910 in Edinburgh, Scotland, which is seen as the beginning of the modern Christian ecumenical movement. The conference was called to develop strategies and to harness resources to try to evangelize the whole world in that generation. However, one of the commissions of the Conference (Commission IV) that was charged with reflecting on "The Missionary Message in Relation to Non-Christian Religions" began to question the Christian approach to other religions. It advocated that Christian missions should seek greater understanding of the spiritual values in other religious traditions and look for points of contact for the sharing of their own message.

This subject became a hotly debated issue in the subsequent World Missionary Conferences in 1928 in Jerusalem and in 1938 in Tambaram in South India. Several Western missionaries and Christian thinkers from Asia began to raise serious doubts about the prevalent Christian approach to other religious traditions, resulting in the International Missionary Council and the World Council of Churches (WCC, formed in 1948) instituting a lengthy study of the issue. Out of these struggles emerged the concept of dialogue between Christians and peoples of other religious traditions, and it received an institutional expression with the formation of a WCC program on "Dialogue With People of Living Faiths and Ideologies." This program subunit of the WCC began to hold Christian-Jewish, Christian-Muslim, Christian-Hindu, and Christian-Buddhist dialogues in many parts of the world and brought out publications that promoted the concept and practice of these religions. In 1977 at a meeting in Chiang Mai, Thailand, it drew up the "Guidelines of Dialogue," which inspired the development of many local and national guidelines for the relationship between religious traditions.

While these developments were taking place within the WCC, which represented the Protestant and Orthodox families of churches, important

advances were also being made within the Roman Catholic Church. The Second Vatican Council, which opened under Pope John XXIII in 1962, undertook an extensive review of the Roman Catholic Church's relationship to other Christian churches and to other religious communities. A papal encyclical, *Ecclesiam Suam*, and three of the documents of the Second Vatican Council, namely, *The Declaration of the Relationship of the Church to Non-Christian Religions* (*Nostra Aetate*), *Dogmatic Constitution of the Church* (*Lumen Gentium*), and the *Decree on the Church's Missionary Activity* (*Ad Gentes*) between them chartered a new approach to other religious traditions. This was fortified by the creation of a Secretariat for Non-Christians, which later became the Pontifical Council for Interreligious Dialogue. These instruments of the Roman Catholic Church also promoted interfaith dialogue and published guidelines and other publications that promoted the notion and the practice of religious dialogue.

Other Initiatives

Even though the new approach among Christians to other religions and the programmatic activities that stemmed from them played a very significant role in moving the religious dialogue forward, Christians are by no means the only ones who saw the need for interfaith dialogue and cooperation. As mentioned above, in 1893 the Parliament of World's Religions broke new ground in interfaith relations. The centennial of the Parliament was held in Chicago in 1993, and since then, the Parliament meets periodically in different parts of the world and has become one of the significant arenas for interreligious dialogue. In 1961, some of the religious leaders from around the world came together to consider how religious communities could work for peace, resulting in the creation of the World Conference of Religion and Peace (WCRP) in Kyoto in 1970. WCRP also holds regular assemblies to bring religious leaders and adherents together and has some 75 national WCRP chapters affiliated to it. Several Buddhist-sponsored international interfaith initiatives for dialogue and cooperation have come out of Japan, Korea, and Taiwan, and numerous local and national bodies seek to promote interreligious dialogues at local levels. The Muslim World League, The World

Council of Muslims for Interfaith Relations, and other such organizations support, encourage, and initiate interreligious dialogues. A number of Islamic states have also begun to sponsor conferences and events that seek to promote Islam's relationship with other religious traditions. In view of religious tensions in India, there have also been several Hindu-initiated programs to promote interreligious dialogue at local levels. All these have led to a proliferation of programs, events, publications, and institutions that seek to promote dialogue among religious traditions.

Issues and Concerns

Even though migration, globalization, and the increased interdependence of human communities have pushed forward the need for religious dialogue, the very same forces have also increased the tendency among many religious communities to withdraw from engagement into forms of conservatism and fundamentalism. The reentry of religion into the public space has also led to extremist and militant forms of religious expressions and to violence in the name of religion. These developments present new challenges to interreligious dialogue. Religious dialogue is also criticized for the noninvolvement of the native (indigenous) and traditional religions, which do not have religious expression analogous to the major world religions. There has also been justified criticism from subaltern groups that in the interest of promoting interreligious harmony, many dialogues do not take up the oppressive side of religions as matters for conversation and dialogue. Thus, interreligious dialogue also creates deep divisions within the religious communities that fear syncretism and compromise. Many, therefore, hold that interreligious dialogue needs to be accompanied by intra-religious dialogue so that religious traditions work out their own attitudes to the challenge of religious plurality.

Despite these reservations, interreligious dialogue has been on the increase because many see dialogue and engagement as the only way forward in a world that is increasingly pluralistic. Some insist that "the only way to be religious today is to be interreligious." In fact, there is growing awareness that if the religious traditions are able to work together, they would be able to play a significant

role in the struggles for reconciliation, justice, and peace in a fractured world.

RELIGIOUS FREEDOM

The modern era of religious freedom began in the 17th century in 13 American colonies that later rebelled and became the United States of America. In the middle of the 20th century, “freedom of religion or belief” became a human right under international law after the United Nations (UN) was created. It is not a coincidence that generally it has taken secular legal systems to protect what many describe as “the right of conscience,” for religious organizations are generally more concerned with maintaining discipline among their members than with protecting their rights. This entry compares the meaning of religious freedom in the United States as well as in international law. It then examines the development of religious freedom in various religious communities and nations. Finally, the entry considers how the concept of the right of conscience has been shaped by federal

legislation and judicial rulings in the United States.

Two Meanings: Religious Freedom in the United States and International Law

In the American tradition, religious freedom is defined by the First Amendment to the Constitution, which begins thus: “Congress shall make no law respecting an establishment of religion, or prohibiting the free exercise thereof.” Religious freedom in American law has been described as the “separation” of church and state, although this language (attributed to Thomas Jefferson) is not in the Constitution. The First Amendment prohibits the federal government from establishing a particular religious tradition or practice, and after the Civil War the Due Process and Equal Protection Clauses of the Fourteenth Amendment were interpreted as applying to state governments the rights affirmed by the First Amendment.

The “freedoms” of the First Amendment, including the freedom of speech, freedom of the press, and the right to assemble and petition the government, are distinguished from the “civil rights” asserted in other amendments to the Constitution, which reflect the social contract theory of law that justifies governmental authority. The liberty rights of the First Amendment are affirmed as inalienable “natural rights” inherent in our humanity.

Article 18 of the 1948 Universal Declaration of Human Rights (UDHR) reflects this tradition:

Everyone has the right to freedom of thought, conscience and religion; this right includes freedom to change his religion or belief, and freedom, either alone or in community with others and in public or private, to manifest his religion or belief in teaching, practice, worship and observance.

The International Covenant on Civil and Political Rights (ICCPR), which came into force in 1976 as the main treaty implementing the civil and political rights affirmed in the UDHR, asserts in Article 18.1,

Everyone shall have the right to freedom of thought, conscience and religion. This right shall

include freedom to have or to adopt a religion or belief of his choice, and freedom, either individually or in community with others and in public or private, to manifest his religion or belief in worship, observance, practice and teaching.

Article 18.2 states, “No one shall be subject to coercion which would impair his freedom to have or to adopt a religion or belief of his choice.”

Five years later, the UN General Assembly approved the 1981 Declaration on the Elimination of All Forms of Intolerance and of Discrimination Based on Religion or Belief. Article 1.1 of the 1981 Declaration reaffirms, “Everyone shall have the right to freedom of thought, conscience and religion.” Article 2.2 states,

For the purposes of the present Declaration, the expression “intolerance and discrimination based on religion or belief” means any distinction, exclusion, restriction or preference based on religion or belief and having as its purpose or as its effect nullification or impairment of the recognition, enjoyment or exercise of human rights and fundamental freedoms on an equal basis.

Freedom of religion or belief under international law differs from the U.S. right of religious freedom in two respects. First and foremost, international law does not prohibit a national state from having an established religion. In the middle of the 20th century, there were many European nations with established religious traditions that, without reservation, accepted the legal obligation to ensure nondiscrimination. Today, nations with an established religion by law or practice include largely Catholic countries in Europe and Latin America; several primarily Eastern Orthodox or Lutheran countries in Europe; a few, mostly Buddhist, countries in South Asia; and more than 30 Islamic countries in Africa, the Middle East, and South Asia.

Second, the freedom to change one’s religion is central to the U.S. tradition and was included in the UDHR because Protestant leaders persuaded the dominant Western governments that this assertion was required to protect the right of Christian missionaries to seek converts from every other religious tradition. Not surprisingly, the governments of many nations have sought to limit this freedom.

In the ICCPR and the 1981 Declaration, the affirmation of the UDHR that “this right includes freedom to change his religion or belief” has been replaced by statements prohibiting coercion, intolerance, and discrimination. This shift in language largely reflects the power of communist governments in the UN prior to the collapse of the Soviet Union and the increased number of nations with Islamic traditions that were admitted to the UN by the General Assembly between 1948 and 1981. Article 18.3 of the ICCPR and Article 3.1 of the 1981 Declaration each assert the following: “Freedom to manifest one’s religion or beliefs may be subject only to such limitations as are prescribed by law and are necessary to protect public safety, order, health, or morals or the fundamental rights and freedoms of others.”

International Religious Freedom Act

In response to reports of increasing religious persecution in other countries, in 1998 the U.S. Congress passed the International Religious Freedom Act (IFRA), which created the Office of International Religious Freedom in the Department of State to promote religious freedom as part of U.S. foreign policy.

As described on the U.S. Department of State website, the Office of International Religious Freedom seeks to

- promote freedom of religion and conscience throughout the world as a fundamental human right and as a source of stability for all countries;
- assist newly formed democracies in implementing freedom of religion and conscience;
- assist religious and human rights nongovernmental organizations (NGOs) in promoting religious freedom; and
- identify and denounce regimes that are severe persecutors of their citizens or others on the basis of religious belief.

Since 2001, the Office of International Religious Freedom in the U.S. Department of State has issued an annual report on the status of religious freedom in each of the 195 countries (i.e., all

countries other than the United States). U.S. embassies prepare initial drafts, gathering information from a variety of sources including government officials, human rights monitors, journalists, NGOs, religious groups, and scholars. The Office of International Religious Freedom consults with experts on issues of religious discrimination and persecution, religious leaders from diverse traditions, and experts on legal matters. The Department of State submits this annual report to Congress.

The IRFA authorizes the President to designate a nation that has “engaged in or tolerated particularly severe violations of religious freedom” as a Country of Particular Concern (CPC). The IRFA defines “particularly severe violations of religious freedom” as

systematic, ongoing, egregious violations of religious freedom, including violations such as torture, degrading treatment or punishment, prolonged detention without charges, abduction or clandestine detention, or other flagrant denial of the right to life, liberty, or the security of persons.

The president’s authority to designate CPCs has been delegated to the secretary of state. When noneconomic policy options are not effective in ending particularly severe violations of religious freedom, the secretary of state may impose economic sanctions on a CPC. A CPC designation generally lasts 2 years but may be ended at any time if the secretary of state certifies to Congress that the foreign government has “ceased or taken verifiable steps to cease particularly severe violations of religious freedom.” In the 2010 report, the secretary of state designated the following nations as CPCs: Burma, China, Eritrea, Iran, North Korea, Saudi Arabia, Sudan, and Uzbekistan.

The Office of International Religious Freedom sponsors reconciliation programs for religious groups in conflict, offers educational programs for American religious communities, and collaborates with the Commission on International Religious Freedom (also created by the IRFA). The commission makes recommendations on international religious freedom to the president, the secretary of state, and Congress.

European Court of Human Rights

In 1998, the European Commission of Human Rights and the Court of Human Rights, which were founded in 1953 with authority to hear individual complaints concerning violations of human rights, were joined into the European Court of Human Rights (ECHR). In 2003, the ECHR ruled that member states of the Council of Europe should not recognize Islamic law (Shari’a) that violates religious freedom under international law, as asserted by the European Convention on Human Rights.

International Efforts

International efforts to resist religious intolerance include implementation of the ICCPR by the Human Rights Committee created by the treaty, the UN High Commission for Human Rights, and the UN Human Rights Council, which in 2006 replaced the UN Commission on Human Rights (UNCHR). Special rapporteurs have been appointed to assess problems and recommend ways of realizing the standards of the 1981 declaration. A 1998 report on the United States praised the free exercise of religion in general but criticized the lack of protection for Native American practices and land consecrated by religious ceremonies.

Religious Support and Resistance

Religious communities that are minorities in a country support the right to religious freedom for every group, but religious communities that represent the majority of a nation often claim preferential status. Thus, it is inaccurate to say simply that Christians support religious freedom, as the Orthodox Church in several countries and also many evangelical Protestants in the United States defend governmental support for their Christian beliefs. Furthermore, although many Jews support religious freedom, Israel is a Jewish state in which Orthodox rabbis regulate religious practice. Also, Muslim minority communities in Western nations generally support the human right to freedom of religion or belief, whereas Islamic states do not fully endorse this right.

Religious History

The Protestant Reformation asserted the right of conscience in opposition to Catholic authority,

but reformers often suppressed dissent within their own communities. Religious freedom was not effectively institutionalized among Protestants until, in the middle of the 17th century, Roger Williams established Rhode Island as an independent colony. In the 18th century, many individuals who embraced the idea of “natural rights” (including religious freedom) were members of Protestant churches in Europe and the United States. The legal protection of civil and political rights, however, was largely the result of a successful political and economic rebellion and the experience of freedom that inspired and sustained it.

Protestants did take the lead in urging that the Charter of the UN and also the UDHR affirm human rights. Twenty years later, during Vatican II, the Catholic Church endorsed international human rights law, including the right to freedom of religion or belief. Of the nations with largely Muslim populations that were UN members in 1948, the pro-Western governments of Afghanistan, Iran, Iraq, and Pakistan voted for the UDHR. Saudi Arabia and Yugoslavia were unwilling to do so but were persuaded by Eleanor Roosevelt (who chaired the UDHR drafting commission) to abstain rather than vote against it.

The World Council of Churches (WCC) has always promoted freedom of religion or belief and other human rights, and since Vatican II, the Catholic Church has supported international human rights law. Both of these Christian organizations support missions but reject proselytism. In 1961, the WCC asserted, “Witness is corrupted when cajolery, bribery, undue pressure or intimidation is used—subtly or openly—to bring about seeming conversion.” In 1965, the Catholic Church adopted a similar clarification: “Proselytism is a corruption of the Christian witness by appeal to hidden forms of coercion or by a style of propaganda unworthy of the Gospel. It is not the use but the abuse of the right to religious freedom.”

Nonetheless, international law does not make this distinction, and many Protestant missionaries do not abide by it. Therefore, to protect the public welfare against proselytizing that denigrates and undermines traditional religious practices, many countries impose restrictions on foreign missionaries.

Restraints on missionaries often conceal a double standard. India limits Christian activity in certain

areas to protect indigenous traditions, yet groups promoting Hindu teachings take advantage of the right to proselytize in Western societies. Muslims in western Europe and North America expect protection for their right to seek converts in historically Christian societies, but Islamic governments deny non-Muslims the right to seek converts.

Religious Nationalism

Anger at proselytizing fuels nationalistic resistance to religious freedom. For many in central and eastern Europe, religion is inextricably related to culture and national heritage. This is very different from the Protestant conception of a religious community as a gathered congregation of individual believers, a notion that is reflected in the emphasis on the right of conscience in the U.S. tradition of religious freedom. Most Orthodox churches identify strongly with the particular ethnic and cultural history of a nation, and so an Orthodox national church expects the state that governs “its” people to promote the interests of the church.

For example, the 1990 Russian Law on Freedom of Conscience and Freedom of Religion was passed when U.S. influence on the new government of Russia was at its peak. In 1997, to limit missionary activities, the Moscow Patriarchate backed amendments to the 1990 law requiring registration and organizational requirements by foreign religious groups.

Nationalism, of course, is not limited to Orthodox confessions. The constitution of India mandates a secular government, yet there is considerable political support in India for a government that favors Hindu cultural and religious traditions. In Sri Lanka, the attempt by the majority Sinhalese community to create a political order reflecting its Buddhist tradition has been resisted violently by the minority Tamils, who are mainly Hindu. In Japan, Soka Gakkai fields political candidates espousing a Nichiren Buddhist vision of Japanese government. In the struggle to control the government in Sudan, conflict between tribes that are Muslim or Christian contributed to a protracted civil war.

Nationalist movements in some of the autonomous republics of the Russian Federation are hoping that new movements for democratic government

will support the recovery of religious traditions that were suppressed under a half-century of Soviet rule. For instance, the Chuvash National Congress is promoting a return to the Chuvash pagan tradition and resisting efforts by the Orthodox Church to establish itself as the national religion. In Mari El, the parliament has legislated protection for traditional “religious cult zones” (sacred groves of trees). It is not hard to understand why these peoples now support laws, in the name of religious freedom, that give preference to their ancient religious and cultural heritage.

Islam, in theory, does not recognize any nationality but only the community of the faithful. In reality, Islam has been used to bolster nationalistic movements. Pakistan is an Islamic state, and criminal laws enforcing Islamic prohibitions are applied to Christian and Hindu Pakistanis as well as Muslim citizens. Hamas proclaims through the mosques of Gaza a jihad to achieve Palestinian national independence. The U.S. International Religious Freedom Report for 2010 confirms that there are numerous violations of religious freedom in Pakistan, but verifies that in the Occupied Territories administered by the Palestinian Authority (PA), where Islam is also the official religion, “the PA sought to protect religious freedom in full and did not tolerate its abuse by either governmental or societal actors.”

Religious Beliefs

Contemporary Jews assert that Pesach (Passover), Succot (Tabernacles), and Shavuot (Pentecost), the three major festivals in the Jewish year commemorating aspects of the exodus from Egypt, provide support for religious and political liberty. Purim (Lotteries), which recalls the danger to the Jewish people portrayed in the story of Esther, is said to affirm the rights of minority peoples. In remembering martyrs to their faith on Yom Kippur (Day of Atonement), Jews affirm the fundamental right of conscience.

Jewish scripture, however, is also used by many Jews to claim the land once governed by ancient Israel exclusively for the Jewish people and to interfere with the rights of Palestinians to live and practice their religious faith where their ancestors have lived for centuries. Members of an extremist Jewish Israeli group, the Gush Emunim

Underground, even tried to blow up the Dome of the Rock, the sacred Islamic shrine in East Jerusalem. Other Jewish organizations, such as Rabbis for Human Rights, defend the human rights of Palestinians, as well as of every other human being, including the right to freedom of religion or belief.

Muslims affirm that their government has a responsibility to enforce the Islamic teaching that God alone is sovereign. Equality of rights regardless of skin color or ethnicity is a firm tenet in Islam, and for centuries, Muslims have been better at putting this ideal into practice than Christians. Religious freedom, however, has not historically been embraced in Islamic teaching, although Christians and Jews have had a protected status as “peoples of the book” because the Qur’an recognizes the revelations given to Moses and Jesus and thus reveres them as prophets.

When Asians or Africans from Hindu, Buddhist, or indigenous traditions argue that international human rights law embodies the principles of Western culture, they are making an accurate historical observation. When they claim that each culture has the right to practice its religious tradition in its own way, they are challenging the affirmation of international law that freedom of thought, conscience, and religion is a natural and universal right and must be protected by law to ensure the necessary social conditions for human dignity.

Right of Conscience

Before the 18th century, religious communities did not recognize freedom of conscience, and many today deny this right. This was the position of the Catholic Church until Vatican II, and it continues to be the policy of many Orthodox churches in eastern Europe. Native American leaders have gone to court to enforce tribal rights against the rights of individual members. All new religious movements affirm the right to religious freedom, but in practice, many deny freedom of conscience to their members.

Muslim teaching continues to reject the right of an individual to convert from Islam to another religion, on the grounds that God has constituted the Islamic community to rule on earth. To convert from Islam is seen as rejecting God and those

charged to rule for God. Some Muslims support the right of conscience by pointing to the *sura* in the Qur'an that reads as follows: "Let there be no compulsion in religion." The dominant historical interpretation of this text, however, is that no one should be compelled to convert to Islam.

Religious freedom in the United States presumes that protecting the right of conscience requires disestablishment. But establishment problems arise concerning the accommodation of religious practice (prayers in Congress, chaplains in the military and in prisons, etc.). Free-exercise claims challenge the government's authority to enforce general laws that do not concern religion but adversely affect an individual's religious practice.

The U.S. Supreme Court in *Sherbert v. Verner* (1963) emphasized the right of conscience in its ruling that the government may not "substantially burden" the exercise of religion unless it demonstrates a "compelling interest." This was the legal standard until *Employment Division v. Smith* (1990), a decision involving the religious use of peyote by Native Americans. *Smith* holds that the free exercise of religion does not mean that "an individual's religious beliefs excuse him from compliance with an otherwise valid law prohibiting conduct that the state is free to regulate." *Smith* asserts the presumption that laws "of general applicability" do not deny the free exercise of religion.

This decision prompted the U.S. Congress in 1993 to pass the Religious Freedom Restoration Act (RFRA), which made the standard of *Sherbert* the law until the U.S. Supreme Court declared the RFRA unconstitutional in *Boerne v. Flores* (1997). At least five states have passed RFRA laws, but courts have reaffirmed the *Smith* standard.

International law asserting "freedom of thought, conscience and religion" presumes that states with established religious traditions are able, nevertheless, to ensure nondiscrimination. Everywhere, minorities within a country of every religious tradition claim their human right to manifest their religion "in teaching, practice, worship and observance." Yet governments with established religious traditions—especially Eastern Orthodox churches, Orthodox Judaism, and Sunnī or Shi'a forms of Islam—significantly restrict the exercise of the right of conscience.

RELIGIOUS IDENTITY

Religious holidays, celebrations, community commemorations, rites of passage, foodways, artistic and musical styles, types of dress, and modes of speech are all aspects of culture that can become enmeshed within the makeup of a religious identity. Religious identity correlates to a number of social factors: age, gender, economic status, national and ethnic identities, educational background, social standing, sexual orientation, and personal identifiers. Religious identity is also molded by a set of carried beliefs: dogmatic principles, moral standings, coded mythologies, highly esteemed parables, social taboos, and understandings of God or divinity, the supernatural, and the cosmological universe. As adopted ideas transform patterns of thought, ways of identifying self become linked to external actions shaped by internal, belief-based realities: Within this meaning-making process, religious identity becomes individuated as practices become solidified. As local access to global traditions and spiritual worldviews exponentially increases with technological

access, the boundaries between religious identities must be individually and communally redefined.

Idiosyncratic personality factors can greatly affect not only how one thinks about religion but in what ways one enacts one's religious identity through religious experiences, practices, and ceremonies. As a person's thinking capacity, personality, and emotional maturity develop, his or her religious identity will generally become more integrated. Times of transition, traumatic events, and highly charged conversion experiences can dramatically alter a person's religious identifiers as questions of doubt, certainty, and confusion arise within the individual's mind. Likewise, hot-button social issues such as war, abortion, interreligious marriage, homosexuality, divine law, and social justice can raise questions about or alter one's religious identity, at either the individual or the communal level.

Religious identity is often linked to ethnolinguistic, geographic, and national affiliations as well as the social expectations tied to these: vocational and spousal selection, gender roles, migrational patterns, models of community service, and normative emotive behaviors and interpersonal interactions. While more individually centered, pluralist societies promote a greater focus on personal stories of divine connection or disbelief, based on self-reliance and independent decision making, societies with a higher percentage of single-religion practitioners have a greater expectation for community members to uphold civic duties through respecting family and ethnic religious affiliations, the bedrock of most close-knit communal identities. Indigenous traditions, for example, may not distinguish between a religious identity and a communal identity because religious practices are so embedded within social realities that the two are virtually inseparable: religion is life, and life is religion.

While some practitioners externalize their religious identities to be recognized within a public social milieu, other practitioners, due to fearful circumstances, social ostracization, or personal preference, may keep religious identities more private. Religious minorities may hide identity markers, often externally formulated and defined by the nonpracticing majority, as a protective community measure.

RELIGIOUS MINORITY-MAJORITY RELATIONS

A religious majority may be constituted by its numerical preponderance or by its dominant power, or both. Normally talk of religious majority-minority relations concerns relations between different religious communities, but in many modern societies, it is also salient to consider majority-minority relations between religious and secular constituencies.

Majoritarian status fluctuates not only over time but also by geographical scale. As globalization has progressed and religious groups and individuals have become linked by high-speed global communication networks, a religious minority on a local or national scale may also be a majority at a larger scale. For example, in Denmark, Muslims are a minority, but on a global scale, they greatly outnumber Danish Christians and secularists. When Danish Muslims were offended by the publication of insulting cartoons of Prophet Muhammad in 2005, they were relatively powerless at the national level. But when Muslims across the globe joined in the protest and boycott of Danish goods, their power was greatly enhanced.

Global Level

On a global scale, Christianity is the largest of the world's religions, followed by Islam. The total numerical size of a religion—the number of its followers worldwide—is not, however, a particularly salient measure of majority or minority status

because none of the “world religions” operates as a unified whole. Internal divisions within religions militate against such mobilization and, historically, are often as important as those between different religions. For example, divisions within Protestant Christianity, let alone between Protestants, Catholics, and Orthodox Christians, are as socially and politically significant as those between Christians and Muslims or Christians and Hindus. This point is often obscured in talk about clashes of “civilizations.”

In practice, the power of a religion depends not only on its size but also on its relations with other forms of social power, including political and military power and economic power. For example, a religion that has official support from a polity may function as a majority religion even if other religions in the same political territory have more followers in aggregate. When a religion has such a status, however, it will often win over a majority of adherents as well. Majority religions in this sense often exist at supranational scales (and it is important to remember that the nation-state is in any case largely a modern phenomenon). Such majority religions are often tied up with political formations that have extensive and expansive territorial control, as in the case of many historic empires. For example, Christianity became the official religion of the Roman Empire, and Islam was integral to a number of empires.

By their very nature, imperial religions “create” minority religions. They may treat the latter in various ways—ranging from toleration to harsh repression—but not as having equal status. Secular empires (e.g., the USSR) have also been repressive of religion in many instances. Minority religions enshrine views, identities, values, and priorities that differ from the majority and may serve as seedbeds of social and political resistance and change. Global alliances between minorities that share a common religious commitment may greatly enhance their power and the opportunities of their members.

National Level

The creation of modern nation-states often involved the drawing of boundaries around territories that included more than one religion. This sometimes led to a religious and/or ethnic “cleansing,” in which minority religions were proscribed

and expelled (e.g., Protestantism in France, Islam in Spain) or discriminated against (e.g., Catholicism in Great Britain and Northern Ireland). The United States was unusual in being founded on the principle of freedom of religion and nonestablishment of a majority religion, even though in practice it has a “civil religion” with a Christian flavor. Modern India also has a secular constitution that enshrines neutrality toward religions and offers some special privileges to religious minorities to protect their interests.

The principle of religious freedom is now widely accepted by nation-states—in theory if not in practice. In Europe, for example, where human rights law enshrines the principle of religious freedom and toleration, Islam nevertheless has the status of a minority religion in practice, and in some countries, limits are placed on the freedom of Muslims to express their religion (e.g., to wear Muslim dress or erect minarets). Here, Islam finds itself a minority in relation to both Christian *and* secular majorities. The more it is challenged by majorities, however, the more religiosity may grow among Muslims as they attempt to defend their identity.

Local Level

The relative status of religious majorities and minorities is often clearly evident at the local level, not the least in the way in which it is displayed in the built environment. Majority religious groups often occupy prime locations and display their distinctive architecture and symbols prominently. Minority religions may have no dedicated space at all or may have only a few, much poorer buildings. Similarly, the rituals and calendrical cycles of majority religions impose themselves on society in a way that those of minority religions do not and may force the latter into a defensive or countercultural stance.

Contemporary Pluralism

Modernization has tended to increase the degree of religious pluralism in local, national, and supranational areas, and religiously homogeneous societies are now rare. The challenge of governing religious pluralism and respecting the rights and freedoms of religious minorities—without alienating religious or secular majorities—has become a pressing

issue in many societies. Although religious majorities are often the enemy of religious minorities, they can also exist in harmony with them or even become their defenders. In contemporary Western societies, for example, religions may band together to oppose secular initiatives or mobilize in a common cause. In some situations, state churches have become defenders of the rights of religious minorities. The causes of cooperation or conflict between different religions rarely lie in the religions alone but also have to do with wider social, political, ethnic, and economic factors and alliances.

RELIGIOUS NATIONALISM

Events of recent years have caused a resurgence of interest in both nationalism and religion as forms of political identity and sources of collective solidarity. This has been particularly true of, though not limited to, instances of political conflict and, in some cases, collective violence that to some observers appear to be motivated by nationalist and/or religious aspirations. These instances of religious politics and politicized religion include conflict in the Middle East between Israelis and Palestinians; the rise of a Hindu nationalist party in India and repeated instances of interreligious strife there; the increasing scope and power of the Religious Right in the United States from the late 1970s through the early 2000s; conflicts between

the Chinese state and minority religious movements such as Falun Gong; a genocidal campaign in Sudan, in which both nationalist and religious motives seem to play a role; a long-standing war in Russia between the state and Chechen separatists, in which religious boundaries are interwoven with nationalist ones; a rise in western European nativism in the face of unprecedented immigration by religious minorities; complex internal and religious conflict in Iraq following the removal from power of Saddam Hussein; the rapid spread of Pentecostalism in Latin America and other parts of the developing world; and, perhaps above all, the rise of global networks of terrorists who claim to carry out their violence in the name of Islam—and who at the same time harbor political aspirations. All these examples have caused scholars and policy makers to revisit earlier views of secularization that saw unilinear modernization processes as leading to a reduction in religion's scope and influence over collective life. Though several decades ago, social scientists widely expected both nationalism and religion to wane as modernization proceeded, the consensus has now shifted, and both are recognized as among the most potent forces in the contemporary world.

Yet while there is scholarly consensus that to understand the contemporary world there is a need to understand the sometimes interconnected phenomena of religion and nationalism, there is little consensus indeed about basic conceptual and definitional approaches to them. Above all, there is a need to understand what forms relationships between nationalism and religion can take and, especially, whether or not the generalized phenomenon of “religious nationalism” can be said to underlie some or all of the recent global developments noted above. What would it mean for nationalism to be “religious”? To a considerable extent, this question depends on how scholars define “religion” and “nationalism.” While these issues may seem to be “academic,” they are an unavoidable starting point for the questions under consideration here.

Defining and Conceptualizing Religion and Nationalism

As can be seen in other entries in this volume, myriad definitions of “religion” and “the religious”

have been formulated. While not all can be surveyed here, it is worthwhile to note several characteristic types of definitions relevant to the questions at hand. Some approaches are “Durkheimian” (meaning that they are derivative from or share an affinity with the work of the pioneering sociologist Émile Durkheim, and here we use this categorization loosely so as to include some approaches that differ on some points from Durkheim’s own approach). These approaches tend to see religion as pervasive and deeply embedded in all of social life. From a Durkheimian point of view, all “collective representations” or symbols ultimately have religious roots, and thus, any social order is religious. Such approaches, it is worth noting, treat the terms *religious* and *sacred* as essentially synonymous. It is also worth noting that Durkheimian conceptualizations and definitions of religion and the religious tend to be *functionalist*: They typically attempt to include claims about the fundamental purposes or social needs served by religion. For example, such approaches might define religion in part by its capacity to engender and maintain social solidarity or by its ability to engender symbolic images of the social order and the social world outside it that make society possible. Viewing religion in broad, Durkheimian terms has a number of advantages. At the same time, it has the potential to gloss over some distinctions that might be useful for research purposes.

Others take views of religion that we might loosely label “Weberian” (meaning that they are derivative from or share an affinity with the work of the sociologist Max Weber, and, as above, I use this categorization loosely). That is, they see religion as fundamentally a system of beliefs that serve to create “meaning,” in a world that is in and of itself meaningless. Weber himself did not offer a specific definition of religion, and he, like Durkheim, regarded it as a pervasive feature of most societies (though, unlike Durkheim, he saw modernity as characterized by “rationalization” and “disenchantment” and established the theoretical groundwork for later theories of secularization).

Much—though by no means all—of 20th-century social-scientific research on religion, and accordingly research on religious nationalism, saw it in terms that drew on both Weberian and Durkheimian views. This can be most clearly seen in the influential approach of Clifford Geertz, who

offered perhaps the most widely cited definitional approach to religion, treating it, like Durkheim, in functional terms but stressing, like Weber, the core function of meaning generation. It is worth noting that Marxian views of religion, which treat it as a form of “false consciousness,” have also been common. These, like the Weberian and Durkheimian views of the classical tradition, treat religion as a generalized phenomenon, roughly interchangeable with other forms of “ideology.”

At the same time, a wide variety of definitional approaches aim to escape from the one feature that unites most Durkheimian, Marxian, and Weberian conceptualizations of religion: The implication of these views is that religion is pervasive and largely universal and inseparable from other basic features of any given culture (or, in the case of Marxian and Weberian views, inseparable from such features in most historic societies). This can only be done by focusing on and drawing distinctions about the content or nature of religious belief, as opposed to other beliefs within a culture. The most common approach here is to focus on the allegedly “transcendental” or “supernatural” elements posited by religious beliefs. From this point of view, religion, whatever else it is, can be distinguished from alternative cultural systems by virtue of the fact that it is ultimately oriented to concerns that go beyond the sensual experience of the world. Critics of this kind of approach—and particularly of definitions of religion that build in belief in a deity as a necessary feature—have pointed to cases such as Daoism, Confucianism, and Buddhism (though this is a more complex case in this regard) that do not, strictly speaking, evoke gods. Some argue that some of these traditions are characterized by “immanence” rather than “transcendence” as their basic orientation. While it is quite clear that the notion that all religions must posit “gods” is unnecessarily limiting, the notion of religion as pointing to specifically *transcendent* sources of meaning, its defenders argue, holds up and, more important, allows for analytically useful distinctions to be drawn. We shall return to these issues and their specific implications for the study of religious nationalism below.

As with religion, defining “nationalism” has been a source of conflict. According to Anthony Smith, major theoretical approaches to nationalism can be divided among the “primordialists”

(those who believe that nationalism is ancient or perhaps a human universal), the “perennialists” (those who advocate a kind of intermediate category of theories that treat nationalism as not a universal feature of human experience but as one with a long historical trajectory and deep roots), and the “modernists” (or those who see nationalism and national identity as only emerging in the modern period). Clearly, these different theories center on the question of when nationalism emerged and developed, and this, in turn, depends on what one takes nationalism to be. Primordialists tend to conceptualize national identity as identical with other forms of collective identity. It is worth noting that figures like Geertz, who, as noted above, treated religion as a pervasive feature of human existence, are likewise proponents of the view that nationalism and national identity are pervasive, and they are thus identified as primordialists. Their primordialism is a Durkheimian inheritance: Religion and nationalism, for such scholars, are essentially built into the human experience. Perennialists often conceptualize nationalism and national identity as bearing a strong similarity to earlier bases of collective solidarity but with added features, for example, the political form of the modern state or the development and consolidation of a common vernacular. Proponents of such views tend to see a strong continuity between religious and national culture. Modernists define and conceptualize nationalism and national identity in a variety of ways, and it is worth noting that most contemporary research on nationalism takes place within this broad camp. This camp has been further subdivided into those who see nationalism and national identity as largely a consequence of the social structural features of modern societies and those who see nationalism and national identity in cultural terms. In general, though with notable exceptions, “modernists” see nationalism as inherently secular, and thus, the predominant view in the field remains one that sees nationalism as consistent with a secular, “modern” world.

Nationalism, Religion, and Secularization

Many have observed that nationalism and national identity, at least from a modernist perspective, seem to share an affinity with a secular world. In part, this oft-noted observation may derive from

the core of the “modernization theory” that was prevalent in American social science in the 1950s and 1960s. Modernization theory tended to see social-structural change as fundamental and as underlying both a decline in religious belief and the emergence and development of national identity. Likewise, the belief that nationalism and secularization are somehow linked could, for many, be a result of simply noting the temporal simultaneity of nationalism’s seeming rise (again, from a modernist perspective) and religion’s seeming decline.

Yet some see more to the connection. Indeed, modernist theories of nationalism and its relationship with religion tend to take one of several forms: (a) what we might call “vacuum” theories, which see nationalism as filling a cultural space produced by religion’s demise following secularization, which is a product of independent causes; (b) theories that treat nationalism as a distinctly modern form of religion; and (c) theories that see nationalism as actively displacing religion and thus fomenting a kind of secularization. Each of these perspectives has its own implications for the concept of religious nationalism.

Those theories that we are calling vacuum theories presuppose some degree of prior secularization (the alleged causes of the said secularization vary from theory to theory and range from the rise of science and related forms of rationalization to, in Benedict Anderson’s famous account, the transformation of print technologies and the commercial market for printed products). They tend to argue that nationalism fills the gap left by religion’s decline. Different theories argue for the centrality of different sorts of gaps. Some, for example, think of the fundamental impact of religion’s decline as a reduction in its ability to generate a coherent image of the broader cosmos and to provide meaning. Nationalism might thus be seen as a functional equivalent at least insofar as it can provide an alternative structure of meanings. Others point to religion’s decline, creating a systemic need for new sources of and justifications for political authority—and nationalism as providing that authority: The projects of the state and the duties it imposes, which would have been rationalized before in religious terms, are now presented as binding on members of the nation by virtue of their membership.

A view that is at least superficially similar takes nationalism to *be* a religion. Some theorists, such

as Josep Llobera, argue that nationalism, in essence, *deifies* the nation, and a number of other scholars note that nationalism has the potential to “sacralize” the nation. It is important to remember here, though, that the religious/secular distinction and the sacred/profane distinction are identical only if one accepts an essentially Durkheimian view of religion. If one does not, then it is perfectly consistent to see nationalism as sacralizing elements of social life while remaining an essentially secular force. The most fundamental divide among scholars who treat nationalism as a kind of religion is between those who are modernists as defined above and those who are primordialists—that is, between those who see nationalism and religion as seamlessly linked cultural dimensions of any society and those who see nationalism as distinct from what they judge to be other forms of religion. Among the modernists are those who see nationalism as a form of “civil religion,” though, it should be noted that Robert Bellah, the most influential author on the subject of civil religion in the context of the United States, is careful to specify that though related and overlapping, American nationalism and civil religion are not identical.

Yet another view resembles the vacuum theories perspective in so far as it posits a strong link between nationalism and secularization but differs from it in that it posits an active causal role for nationalism in *fomenting* secularization. Liah Greenfeld—a modernist theorist of nationalism—has argued that what distinguishes national identity from earlier forms of identity is that it posits that the members of a nation are fundamentally equal and that, moreover, the nation itself is declared sovereign. Rather than simply filling a gap left by religion’s alleged decline, this suggests that nationalism may play an active causal role in displacing religion from some of its most important functions. Such a view has a good deal to recommend it. First, it accords well with recent turns in the literature on secularization. Scholars have in the past several decades criticized and debated earlier approaches to and conceptualizations of secularization, and several have notably argued for drawing distinctions between possibly distinct processes such as the alleged decline of religious belief and the differentiation of a variety of social spheres and/or institutions from religion’s

influence. In different ways, José Casanova, Mark Chaves, and David Martin have been particularly significant in pushing these developments. Recent research that chooses to focus on a particular form of secularization—essentially the secularization of the state and the variety of forms that this process takes—would do well to consider nationalism as a potential causal factor in producing these transformations. Indeed, if national identity is a fundamentally modern phenomenon, if this form of secularization is likewise taken to be modern, and moreover if the process of the spread of nationalism and the spread of at least partial secularization of the state are chronologically consistent with each other, this is highly suggestive. This is indeed the case in the major European cases and in Latin America, and it seems to be true of much of Africa, Asia, and the Middle East. Of course, state secularization takes a variety of forms—general patterns of variation being extant both within and between these regions—and it seems likely that a variety of factors influence the extent and shape of church-state differentiation following the rise of nationalism. The major factors seem to be the following: (a) the degree of religious pluralism in the society in question, (b) the institutional forms of the major religious groups present in the society in question, (c) the type of nationalism in each case (e.g., ethnic vs. civic, individualistic vs. collectivistic), (d) the position of the social groups that first import nationalism into a given society vis-à-vis other groups within that society (i.e., the position within a given society’s internal stratification system of nationalism’s *carriers*), and (e) the alliances between those groups, their opponents, and religious organizations during the conflicts that inevitably arise when a society’s identity becomes national rather than purely religious in character.

At the same time, a great deal of empirical research in this area remains to be done.

Religion and the Nation in a National World

It is worth remembering, though, that even if the rise of national identity may cause a particular kind of secularization, this does not mean that national societies are not religious or that, as noted above, fully national societies’ political worlds lose touch with the sacred, or even that *religious* elements of their political worlds are entirely eliminated or

privatized. The relationship between nationalism and religion can take many forms. Some of the common patterns are as follows:

1. The *anticlerical or "laicist" form*, in which nationalists in control of the state aim to eradicate or otherwise to severely circumscribe religion and religious institutions. The classic case here is revolutionary France, though one sees less successful efforts in this connection throughout Latin America, and it is clearly present in the anticolonial, "modernizing" nationalist projects of Egypt and Turkey, among other places. While we do not know for sure, this seems a likely outcome when (a) religious monopoly is present and the form of organization prior to the emergence of nationalism is the church form (as defined by Max Weber and Ernst Troeltsch), (b) nationalism is carried by a group that does not find itself in a strategic alliance with the ecclesiastical hierarchy, (c) the nationalism in question is of the collectivistic variety, and (d) the church or other religious organization in question aims to confront nationalism, reduce its spread, and avoid its implications for the reorganization of political life.

2. The *denominational form* (as analyzed by Niebuhr, though not specifically in relation to national consciousness), in which the state takes on a stance of at least de jure neutrality vis-à-vis religious organizations and national membership does not presuppose any particular sort of membership in one religious organization or another. It is important to recall that this is an ideal type, and in actual empirical cases, there may be limits to the pluralism that is culturally recognized as consistent with national unity. It is also worth noting that the kind of civil religion discussed by Bellah is only possible given this type of settlement of the conflict between national and religious conceptions of sovereignty. Here, the classic case is the United States. The United Kingdom, though it does technically have an established church, among several others that formally adhere to the "national church form," falls in this category.

3. The *national church form*, in which religion is given a central symbolic place in the national imaginary. Ideally, the boundaries of the nation and its chosen religion are isomorphic: One essentially cannot be a member of the nation without

being a member of the religious group in question. In actual point of fact, though, there is often tension between this settlement, which aims to render religious identity and loyalty subservient to national identity and loyalty, and the broader churches or other religious organizations, whose boundaries extend beyond any given nation-state and which often have universalistic goals. Conflict with the Roman Catholic Church is paradigmatic here, though similar problems can be found in other arenas of church-state relations, such as in the world(s) of Eastern Orthodoxy. In some cases, though, schismatic national churches have been developed. These were attempted, among other places, in various parts of 19th-century Latin America and again very recently on a small scale in Venezuela, though it is unclear how influential this will be. Frequently, there is also conflict between the ideal/typical vision of a pure isomorphism of religious and national boundaries and the presence of religious minorities. This can be resolved in a variety of ways, and social reality in this case—as in others—does not correspond perfectly to the pure type. Yet even a latent or potential conflict of this sort—in a way analogous to the presence of minority ethnic groups in secular nationalist societies that construct their boundaries in ethnic terms—has the potential to serve as a point of cleavage in the event of economic or political difficulties. Political entrepreneurs can and sometimes do exploit such points of cleavage to demonize and scapegoat religious minorities under such conditions. This form, which is very common, is often conflated with religious nationalism as such, although it is worth stressing that it is only one of several possible forms of religious nationalism.

4. The *separatist religious nationalism form*, in which a group that feels in some way alienated from the power of the state or the mainstream society that the state represents attempts to establish boundaries between itself and (a) other religious or ethnoreligious groups and/or (b) the secular order of the state itself and to then use those boundaries as a wedge for political action. This type is considerably varied. For example, there is considerable variation between majority- and minority-group religious separatist nationalism as well as between nationalisms that aim to carve out a distinct geopolitical space for themselves and those that aim to

achieve revolutionary change within an existing geopolitical space (in short, between those who aim to create their own religious-national state and those who merely seek to increase their influence over an existing state). Finally, there are important analytical distinctions to be drawn—discussed in more detail below—between cases of religious nationalism and movements that seem to be forms of religious nationalism but actually are not nationalisms at all, and between different types of “transnational” religious action.

Nationalism, “Religious Return,” and the Contemporary World

Perhaps the most important scholar working in this area has been Mark Juergensmeyer, who treats the current frequency of radical religious engagement in politics as a wave of religious nationalism, itself formed in response to the prior development of secular nationalism and the secular state, to which secular nationalism gives rise (or which, at least, secular nationalism seeks to create). In much of the world, the path of transmission of national identity to begin with was via colonialism, which, as a carrier of Western “modernity” more broadly, defined both colonizing and colonized populations as nations, essentializing this contingent and particular way of conceptualizing human communities and rendering it normative. Thus, when anticolonial independence movements spread throughout much of the world over the course of the 20th century, they did so, in part, through a process in which their elite leaders framed their action in relation to Western-derived ideas of the nation and its sovereign rights. This means that they framed the political projects of these newly independent states in secular terms (and, very often, it is worth further noting, they approached nation-religion relations through the French-derived anticlerical/“laicist” model noted above). As Juergensmeyer’s analysis suggests, this produced a situation in which, potentially, disaffected members of these societies could critique the modernizing projects of their own elites as more subtle extensions of the colonial rule of their former oppressors, particularly when the secular projects of independent national states were sullied by their own apparent hypocrisy (e.g., corruption and clientelism, widespread abuse of human rights).

The potential for religiously framed social movement activity and even revolutionary action against secular nationalist regimes became only clearer in cases—such as that of Iran under the Shah—in which such governments were openly supported by foreign powers, particularly the United States (though it is worth remembering that the intellectual trajectory of much of contemporary radical jihadism has its roots in Egypt, where it thrived even under Nasser’s radical anti-Americanism).

Beneath this general pattern lurks considerable variation. Indeed, it is fairly difficult to discern the extent to which many of the best known cases of contemporary religious militancy deserve the label of religious *nationalism*, evidence a traditional (prenational) orientation, or constitute the emergence of some new form of political identity. More to the point, each of the best known political-religious movements of the contemporary world is likely made up of a variety of subgroups and individual actors who think of themselves, their movements, their societies, and the basic sources of political authority in starkly different terms. At the ideal/typical level, we can try to disentangle and clarify some of these strands.

1. First, one is likely to find some traditionally religious actors, meaning those who never fully internalized national identity and its basic implications. Such actors, therefore, never internalized the notion that the ultimate basis of political authority is or ought to be the sovereign will of the people. This idea, for such actors, would have been encountered only in oppositional terms: The idea served as the basis for those very social actors who they believe to have sold out or colluded with the West. For such actors, the entire “national project,” identified with secularism, can be rejected in favor of a traditional religious identity. The Taliban of Afghanistan would be a reasonable approximation of this ideal/typical case.

2. Second, and probably more often, particularly among leaders of “religious nationalist” movements, social actors would have first internalized the basic tenets of secular nationalism and then reconsidered them, rejecting key elements. The Iranian Revolution, among many others, gives ample illustration of this pattern,

particularly given that the revolution itself, as scholars such as Saïd Arjomand and Charles Kurzman have pointed out, was made not just by a multiclass coalition but by one evidencing considerable ideological heterogeneity, including Marxists, secular nationalists, and religious devotees. Even religious leaders such as Khomeini began their political careers deploying the concept of the nation in what seems to be a secular sense. In such cases, one is likely to find that though nationalism's basic structure is upheld, a particular conception of the nation and its boundaries is disputed, to be replaced by another, religious, conception. The fundamental point of contention, of course, as in different ways the work of both Greenfeld and Juergensmeyer suggests, concerns where ultimate authority is imagined to derive from. From an ideal/typical nationalist point of view, it is imagined to derive from "the people." From an ideal/typical religious point of view, it is supposed to derive from some transcendent source. Yet the seeming contradiction can be dealt with in a variety of ways. First, cognitive dissonance is only generated if the social actors in question are conscious of the distinction and see clearly the ideal/typical poles. If, however, it is believed that the will of the people and that of the deity coincide, either in actual point of fact (e.g., it is believed that "the people" actually favor a more robust role for religion in public life, against the wishes of those who have betrayed both the nation and the deity) or at the level of logical possibility (e.g., it is believed that "the people" cannot truly will anything that is not righteous and that the individual wills that seem to conflict with the deity's imagined will are in error—a view not so distinct from Rousseau's notion that the general will "never errs" and is not reducible to the wills of individuals), then this is not a problem. Thus, while it may be difficult to reconcile religious nationalism with the kind of pluralist democracy that one finds in individualistic and civic nationalisms, it is not necessarily inconsistent with collectivistic nationalisms and the kinds of democratic (or nondemocratic) practice with which they are associated.

3. Third, a broad group of actors are sometimes referred to as "transnational." What is worth stressing here is that transnational identities can take either of the two forms discussed above.

That is, transnationalism can be bound to traditional religion or can be "postnational" (and thus carry nationalism with it). The Catholic Church's engagement with and opposition to nationalism (most notably over the course of the 19th century) was "transnational" in character, given that the Church as a universal community was defined as more important than the particularistic communities tied to the temporal powers of the nation-state. This same kind of universalism was present in many, though not all, traditional religions before their engagement with nationalism. To the extent that some transnational actors mirror these earlier forms of universalism, they can be considered traditionally religious. Yet most of the transnational actors of concern to students of contemporary religious nationalism seem to fall into the second category. That is, their thinking is "postnational": Even if it formally rejects the idea of the nation and the nation-state, it carries with it key nationalist ideas. Indeed, the question of whether the critique of secular nationalism as neo-colonialism can be made outside a nationalist framework is a legitimate one.

Conclusion

While much of the contemporary interest in questions of religious nationalism has been focused on it as a source of conflict and even collective violence, in closing this entry, it is worth stressing that not all religious nationalisms inevitably lead in this direction. Indeed, recently scholars such as José Casanova have pointed to a variety of attempts at the reconciliation of religious politics with pluralist democracy in the contemporary world, and the exemplary case of religious nationalism in Poland expressing itself through the peaceful and democratic solidarity movement has been masterfully analyzed by Genevieve Zubrzycki. In any case, it remains clear that both religion and nationalism—sometimes in tandem and sometimes in tension with one another—remain among the most potent ideological forces in the contemporary world, and their further study, at the levels of both theoretical clarification and empirical analysis, is in order.

RÉUNION

On a visit to this Indian Ocean island in 1989, the pope noted Réunion's reputation for racial and religious harmony. The landscape, dotted with Hindu and Buddhist temples, mosques, and Catholic and Protestant churches, matches this reputation for hybridity. As a French overseas department, Réunion is classified as mostly Catholic, and religion is considered mainly a private matter, as in the French tradition. However, a 2008 survey confirmed growing religious syncretism, especially among younger and poorer Réunionnese. *Métissage* (mixing) through religion and marriage first started with colonization, which officially began in 1665. African and Malagasy slaves and, later, Indian contract laborers and Chinese "coolies" were obliged to become Catholic. They were thus creolized, or welded together—their own ancestors' religious beliefs and practices forced into the background. Ironically, the dominance of Catholicism helped lay a common basis for more religious syncretism recently, especially among younger and poorer people. Réunion does not have its own syncretic religion, such as Vodou in Haiti, but its population have many shared religious practices, as in neighboring

Mauritius, where the dominance of Catholicism has historically been much less than in Réunion.

During the colonial era, the religious beliefs, rituals, and faith-based practices of immigrant groups took mainly cultural forms. The *maloya*, a dance of Malagasy origin, for example, was originally performed in honor of the dead. Animist beliefs and devotion to the dead have remained widely shared and are expressed in *servis malgas*, a recent revival, for example, where people “speak” with ancestors. People’s religious identities in Réunion are more mixed than the following separate identity categories of Creole society imply: Kaf is a person of African origin, descended from former slaves, and is distinguished from the Metis (mixed people). A Malbar or Tamoul person is of Indian, but not of Muslim, origin and can be called a Hindu. Ti Blancs (from *petits blancs*, or “poor whites”) now mostly live in mainland France or the mountainous interior. Chinois are descended from Chinese laborers and mostly run corner shops; like the Malbars, many Chinese converted to Catholicism while maintaining some beliefs, in their case from Confucianism, Daoism, and Buddhism. Hindus, from Malabar, Bengal, Kolkata (formerly Calcutta), and Puducherry (formerly Pondicherry), similarly were forced to adopt Catholicism and were thus similarly creolized. Only economically independent and more recent migrant groups, such as the Zarab (Muslim traders, not “Arabs” as the term suggests) and the metropolitan French (*Zoreil*), who arrived in the past century, could resist creolization through conversion to Catholicism. Retaining their distinctive culture and beliefs, Muslims remain a distinctive faith-based group in Réunion, even though they share some ancestral and animistic beliefs with the rest of the island’s population. It is interesting—again according to the 2008 survey—that younger and poorer Réunionnese tend to be more syncretic than wealthier and older people. Among low- and middle-income groups, it is more common to practice two or even three religions, with just one religion the norm among wealthier people, including mixed people, those from mainland France, or the Zarab. Syncretic religious practices in Réunion today are as much a matter of social class as of community or ancestry.

RITES OF PASSAGE

Rites of passage are rituals that mark what are conventionally agreed to be critical or landmark stages in the life of an individual, such as birth, puberty, marriage, and death. The Belgian anthropologist and ethnographer Arnold van Gennep (1873–1957) used the term *rites of passage* to categorize the rites of what he described as “life crises,” the accompanying stages that mark the transition of individuals from one stage of life to another. In his seminal text *Les Rites de Passage*, which was first published in 1909 (with the first English translation, *The Rites of Passage*, appearing in 1960), van Gennep considered rites from within the standpoint of their religious and social context.

A rite of passage usually accompanies a change in biological or social status. The shift from childhood to puberty is an example that cuts across both domains. The biological changes that occur during puberty are also accompanied by social changes, where a girl becomes a woman or a boy becomes a man. Rites of passage are often marked by ceremonial acts, such as naming, circumcision, and puberty rituals.

In the above cases, the rites of passage are specific to an individual’s life and do not correspond to calendar time. However, the term *rites of passage* is also used with reference to the changes of the seasons or marking the New Year. In these examples, the same pattern can be applied—so the “death” of the old year is replaced by welcoming the New Year.

van Gennep argued for the anthropological importance of rites of passage as a regulatory mechanism to ensure the functioning nature of society. With a rite of passage, it is not simply the individual who is affected but also the family and the wider community. And it is often high-standing members of the religious community or tribe who are involved in the implementation of the rite of passage. van Gennep conceived of life in society as

a house with many rooms, where the individual moves from room to room. The spatial separation of rooms reflects van Gennep's understanding of the stages in life as operating as definitive passages that do not happen gradually but abruptly and through a series of ritualized actions that demarcate the passage from one to the other. He also describes the ritual process in geographical terms, with recourse to the metaphors of entrances or exits, crossings and journeys, and crossroads and thresholds. Many rites of passage are one-way and so cannot be reversed—you cannot return to boyhood following manhood. An exception is the annulment of a marriage.

Some religions recognize the significance of rites of passage within their philosophies. Hinduism, for example, recognizes four stages or *ashramas*: the youth or student, the householder, the hermit, and the renouncer or ascetic. Van Gennep identifies three major stages or phases that occur in all rites of passage irrespective of culture or religion. These are separation, transition, and incorporation. He also stated that some rites might focus on or develop one of the stages more than other stages in the ritual act. So while the stage of separation may be more central in funeral ceremonies, incorporation is often more significant in marriages. However, all rites involve some degree of experiencing each of the stages before they are fully accepted into the society or culture. In the case of death, the three stages aid the community in coming to terms with the deceased. These are complex stages that are clearly demarcated by separation, transition, and incorporation. Some theorists describe the last phase as reincorporation because the individual is returning to the community, albeit in a different status after a period of separation.

From Separation to Transition to Incorporation

In the first stage of separation, the individual experiences separation from his or her current affiliation. One is removed from normal social life and is stripped of former ties and affiliations. One is singled out, is often physically separated from the group, and is regarded as outside the group. One is, to use a phrase employed by the British anthropologist Victor Turner, “betwixt and between.”

In the second stage, the individual is suspended between the old and new states. One is regarded as an outsider and is marginalized within the community. One is in a state of limbo or liminality, at the threshold between different states. In this liminal state, roles are often suspended or reversed. Turner (1969) modified van Gennep's three-part structure into structure, antistructure (which corresponds with the transitional or liminal phase), and revised structure, and he focused on the importance of the liminal phase, which, he argued, demonstrated *communitas*. The ambiguous and amorphous status of the individual in this stage means that he or she is vulnerable. The British anthropologist Mary Douglas has argued that there are dangers surrounding an individual in this state of indeterminate identity. The individual transgresses boundaries and is capable of polluting others. Another way of framing the differences is to think in terms of the sacred and the profane—where the community represents the profane, while the individual undergoing the rite of passage is sacred. The etymology of the term *sacred*, to set apart, refers to the position of the individual who is suspended between two states. In the liminal state, the sacred individual has to be kept apart from the profane.

The third and final stage involves the reincorporation of the individual into the group, culture, and society. One has completed the process and now has a new status within the community. This is often marked symbolically with the giving of gifts, feasting, and other communal actions.

From the first to the third stage, the old status of the individual is removed and the new status conferred. The third stage can be viewed as the reversal of the first stage; instead of being stripped away, new meaning and identity are given to the individual, and he or she is welcomed back into the community. From the first stage to the third stage, there is a preponderance of symbolic rituals, many of which involve bathing or washing and the putting on of new clothes. This symbolizes the shift from the old to the new, where the physical changes mirror the psychological changes that the individual has undergone and the social shifts of status. Some rites of passage involve assessment or examination. The explanation for this is that the initiate is under surveillance and is being tested for his or her worthiness. This might require one to

perform an activity, such as reading from sacred texts, or to give a testimony. In more extreme cases, such as in African rituals of scarification, pain is inflicted on the initiate.

Although generalizations can be made with regard to what are regarded as landmark occasions in the life of an individual—birth, puberty, marriage, and death—the importance attributed to certain rites of passage varies. In some cultures where importance is given to ancestry, such as in East Asian religions, funeral rituals are often lengthy. Death is structured according to a complex series of ceremonies that mark the transformation of the dead person into an elder. Maximum attention is paid to ensure that the soul of the deceased leaves the body and joins the ancestors.

There is also enormous variation in the particular rituals that mark these various rites of passage. In some religions, there is an equivalence or similitude between the puberty rites of passage; so, for example, in Judaism the Bar Mitzvah denotes the passage from boyhood to manhood, and the Bat Mitzvah marks the transition from girlhood to womanhood. There are slight differences in the ritual ceremonies or in the implications of the rituals: After the Bar Mitzvah, the initiate is counted in a minyan of 10 Jewish adults for prayer, but the same does not apply after the Bat Mitzvah, where, particularly in the Orthodox tradition, girls cannot be included in a minyan. It should also be noted that the Bat Mitzvah has not been completely accepted in the Orthodox Jewish tradition, compared with its practice in the Reform, Conservative, and Reconstructionist traditions originating around the 1920s. In Hinduism, there is a coming-of-age rite for Brahman boys, known as *Upanayana*, which in translation means “a sacred thread ceremony”; however, there is no equivalent for girls as a separate ceremony. The marriage ceremony is regarded as significant for girls and marks their transition from girls to women and also from a daughter to a wife.

In contemporary culture, with changes in the social structure, as with regard to women’s rights, some rites of passage have been modified and modernized. There are also greater choices in many societies for individuals—the institution of marriage is not a necessity in many societies and cultures. Conventions too have changed with

regard to a variety of social and cultural traditions and have led to the expansion, or in some cases the dilution, of rites of passage. Particularly in Western societies, rites of passage have become more individualistic and less a matter for the community.

ROMAN CATHOLICISM

The Roman Catholic Church is the largest branch of Christianity and is a global institution, headquartered in the city-state of Vatican City in the heart of Rome, Italy. It has a presence in more than 220 countries, numerically most pronounced in Brazil, Mexico, the United States, and the Philippines, and is currently experiencing fast-paced, exponential growth in Africa and Asia. The Church’s multinational presence; the cultural and economic diversity of its population; the expansive range of its institutional services (e.g., education, health, social welfare) and interinstitutional relations; its active public engagement with issues of economic development, social justice, and human ethics; and its increasing attention to the socioeconomic and geopolitical challenges of globalization consolidate its core relevance to any discussion of globalization. This entry provides a selective overview of critical historical developments in the evolving history and identity of Catholicism and discusses its current demographic composition, its ethnocultural and interpretive diversity, its social doctrine, and its response to globalization and religious pluralism.

Critical Historical Events

In one sense, Roman Catholicism exists only in distinction to Orthodox and Protestant branches of Christianity, and the earlier history of Christianity that is common to all three branches is a separate historical narrative. In another way of viewing the history of Roman Catholicism, it can be merged with the history of Christianity itself, thereby spanning close to two millennia. It is understandably, therefore, a complex and multi-layered narrative encompassing wide-ranging theological debates, political events, intra-institutional reforms, and diverse philosophers (e.g., Thomas Aquinas), prophetic thinkers (e.g., Jacques Maritain), and charismatic figures (e.g., Pope John XXIII, Pope John Paul II, Dorothy Day). In terms of understanding the institutional evolution of Roman Catholicism in the modern era, a few transformative events stand out. One salient event is the Council of Trent (1545–1553), convened in response to the emergence of Protestantism following the Reformation spearheaded by the German theologian Martin Luther (1511) as a protest against certain aspects of Catholic theology (e.g., the mediating authority of the pope, bishops, and priests between the individual believer and God) and specific institutional practices (e.g., the granting of indulgences or a remission of sins in exchange for money from wealthy families). The Council condemned Protestantism and affirmed several tenets of Catholic teaching (e.g., the centrality of the sacraments, Eucharistic transubstantiation, the importance of the saints and the Blessed Virgin Mary, the sacred authority of priestly ordination and of the Church hierarchy, the importance of faith and good works for redemption) that sought to sharply differentiate Catholicism from Protestantism.

The Council of Trent's legacy was not only significant in establishing a well-demarcated, authoritative outline of Catholicism and what specific beliefs and practices Church membership entailed, it also contributed to consolidating the religious-geographical-political divide set in motion in Europe following the Reformation, whose contours intertwined the subsequent political and militaristic conflicts that dominated Europe into the early decades of the 20th century. Amid this drawn-out turmoil, Catholicism became associated with a regressive stance, whereas Protestantism

was seen as accelerating the march of modernity economically (e.g., industrialization and the growth of capitalism), politically (e.g., the consolidation of the authority of the nation-state), and culturally (e.g., the emphasis on the values of individualism, pluralism, and scientific reasoning). Amid the transformative changes of the late 19th century, the Church's official assertion of its long-held presumption of papal infallibility (at the First Vatican Council, 1869–1870) and its condemnation of Americanism (by Pope Leo XIII, 1899) and modernism (by Pope Pius IX, 1907) conjointly crystallized what was seen as its failure to adapt to modernity and solidified the perception of it as a tradition-bound, immutable institution whose relevance belonged to an earlier, pre-Enlightenment and antidemocratic era.

The idea that Catholic doctrine and institutional practices were set in stone was radically undermined, however, by the church hierarchy itself at the Second Vatican Council (Vatican II; 1962–1965), when the Catholic bishops of the world convened in Rome for an unprecedented, comprehensive, open-ended, and deliberative evaluation of Church doctrines and traditions. In the long sweep of the Roman Catholic Church's history, Vatican II is considered revolutionary. Its overarching commitment was to open the Church to the modern world, and this it accomplished through several wide-ranging reinterpretations of Church teaching and major reorientations in the Church's institutional identity and practices. Among its many transformative changes was a new emphasis on the active role of the laity in the life of the Church (e.g., embracing the ethos of the Church as the "People of God"), the affirmation of religious freedom and personal conscience in moral choices, and the importance of reevaluating knowledge and personal and institutional decisions in light of historical consciousness and social-scientific research.

Vatican II also marked a new departure in the Church's and Catholics' understanding of their role in civil society. It affirmed the validity of religious and cultural pluralism, the necessary importance of a differentiation between the functions of Church and state, and the obligation of Church leaders and laity to become a publicly engaged Church—civic actors who advocated in particular for equality and social justice—and thus for

Catholics to collectively work with others to remedy unjust social institutions. Vatican II redefined the Church from a rigidly hierarchical, authoritarian, imperialist, and antimodern institution to one that became more relevant to and highly engaged in the modern world, a church whose leadership is not afraid to assert itself in complex public debates and to claim moral authority not just among Catholics but in society at large.

Demographic Composition

There are many strands in the multifaceted and highly diverse character of post-Vatican II Catholicism. Changing demographic patterns across the globe is a major component of the dynamics of contemporary Catholicism. Population growth since the 1950s has led to a doubling of the world's Catholic population (from approximately 437 million to more than 1 billion). As noted by Bryan Froehle and Mary Gautier, population increase in Africa coupled with population decline in Europe and concomitant trends in the geographic distribution of the Catholic population have given greater visibility to the Church in Africa, even though Catholicism continues to be a dominant religion in Europe (approximately 40% Catholic) and even more so in North and South America (approximately 50% Catholic). In South America, according to the 2006 Pew Forum, Catholicism remains strong but has increasingly to compete against a post-1970s surge in the popularity of Pentecostalism (from approximately 4% to 28% of the region's population), a trend especially evident in Brazil, Chile, Argentina, and some Central American countries. In the United States, the percentage of Catholics has remained remarkably steady since the 1960s; currently, Catholics constitute 24% and Protestants 51% of the population. Despite the stability in the proportion of U.S. Catholics, there is much fluidity in the composition of the Catholic population. As noted by the 2008 Pew Forum, Catholics are far more likely than those affiliated with other denominations to switch from their childhood religion in adulthood, but this net loss (of approximately 7.5%) is largely offset by the inflow of Latin American immigrants—close to half (46%) of all U.S. immigrants are Catholic. Therefore, just as European immigrants were critical to the substantial growth in the U.S. Catholic

Church in the late 19th and early 20th centuries, current immigration trends are bolstering the Catholic population and at a time of attenuation of Protestantism's historical dominance.

Ethnocultural and Doctrinal Diversity

The ethnocultural diversity of Catholicism translates too into a diversity of doctrinal views. Catholic identity is far from being a monolithic or one-dimensional phenomenon. Although the Church strongly emphasizes the transnational universality of its liturgy and doctrine, Church practices and Catholics' beliefs are highly contingent on the specific local—and not just national—context in which they are expressed. While many see interpretive diversity in any institution, tradition, or society as a sign of vitality and engagement, it is, nonetheless, not without tension. In Catholicism, this tension shows itself in several varied ways. One of the biggest internal challenges for the Church is how to craft an authentic global Catholic community amid and out of its geographical and cultural diversity. Most visibly, this tension is seen in Church leadership—although a global universal church, all of the modern popes have been Italian until the election of the Polish pope John Paul II (in 1979) and his German successor, Pope Benedict XVI (in 2007). In recent years, American and some non-Western cardinals and priests have gained greater access to the levers of Vatican decision-making power. Nonetheless, the Church's historical Eurocentrism (and its legacy in establishing U.S. Catholicism) tends to slow down its response to the changing currents in the Church. In the United States, for example, there are several local tensions over the accommodation and assimilation of new Hispanic immigrants and their particularistic rituals (e.g., special devotions to Mary and other popular figures) in churches founded by earlier generations of European immigrants, whose ethnic offspring have long since moved elsewhere.

The unity of purpose of a global Catholicism is also challenged by the variation in the pressing issues confronting bishops and laity in different regions of the world. Whereas majorities of American and European lay Catholics want priority given to changing Church teaching on women's ordination and celibacy, African bishops are

focused on meeting the most basic material, health, and literacy needs of their communities. Similarly, issues pertaining to AIDS and to birth control have much greater practical urgency in Africa and Latin America than in the West, notwithstanding their relevance here too.

Political context also matters and cautions against any assumption that the Church speaks or can speak with one voice. In Europe, Church leaders negotiate a highly secular civic society, where it is strongly presumed that religious voices and religion-based arguments should not impose on political debates; in the United States, Catholic bishops compete with several other religious and nonreligious groups to make their moral teaching and policy views known (e.g., against abortion and stem cell research and in favor of immigration reform), and they do so even against the views expressed by substantial numbers of their own members. In many South American countries, Catholic leaders are negotiating the new legitimation challenges emerging from their loss of government support and the attenuation of long-standing political alliances between the Catholic Church and the state. In China, Church leaders defend an underground church; and in many African countries, Catholic bishops feel obliged, but not always empowered, to stand up to highly corrupt and authoritarian political leaders.

This broad portrait of Church differences and dilemmas across the globe necessarily sweeps over the many nuances and differences in Church political/civic relations within any one nation or region. By the same token, there is also remarkable diversity of doctrinal beliefs and of Church-related and other attitudes across, and among, Catholics within any one national, ethnic, or cultural context. In part, this diversity stems from the multiple strands and interpretive traditions that constitute the large body of Catholic theology and from Catholicism's core commitment to the coupling of faith and reason, an ethos that legitimates the application of an informed and reasoned assessment in the practical interpretation of Catholic teaching in a particular lived, social context. Interpretive diversity is especially apparent regarding Church teaching on gender and sexuality. For example, although American Catholics (along with the Irish and the Poles) are among the most

frequent churchgoers in the Western world (approximately one third of U.S. Catholics report monthly Mass attendance), their doctrinal and Church-related views frequently deviate from official Vatican teaching. Large majorities of U.S. Catholics favor the use of artificial contraception (banned by Pope Paul VI in his 1968 encyclical *Humanae Vitae* [Of Human Life]), oppose celibacy for priests (a Church rule dating back to the fourth century), and favor women's ordination (despite the Vatican's theological opposition to women priests). Similarly, a majority favor the legal right to abortion, a stance that is a particular ongoing frustration to Church officials, who have made opposition to abortion a core part of the Church's moral and social teaching on the right to life, and Catholics increasingly favor same-sex unions (despite the Vatican's natural law-based declaration of homosexuality as an objectively disordered condition). On all of these issues, American Catholics' views are essentially echoed among European Catholics, whose increasing secularism since the 1970s, as highlighted by the legalization of contraception, abortion, and same-sex relations in even the most culturally Catholic of countries (e.g., Italy, Spain, Ireland), is of particular concern to the Vatican.

The Church's Teaching on Social Justice

Economic and social justice is the second major axis in the Church's sociomoral teaching. Since the late 19th century, notwithstanding criticisms then of the Church's irrelevance to the modern world, the Vatican has actively argued in favor of greater economic equality against the backdrop of industrialization and the excesses of capitalism. As in its teaching on gender and sexuality, the Vatican grounds its analysis of economic justice largely in natural law and individual reason (rather than Scripture alone). In a major encyclical coinciding with the early impact of industrialization, *Rerum Novarum* (Of New Things, 1891), Pope Leo XIII affirmed the right to private property and condemned socialism but also affirmed the rights of workers to a fair wage, the social value of labor unions, and the moral obligation of governments to buffer individuals and families from the harsh conditions of competitive, profit-driven capitalism. These themes have been variously elaborated and

nuanced in several successive encyclicals and, most notably in a time of further economic and political transformation, by Pope John Paul II in 1991, in *Centesimus Annus*, coinciding with the 100th anniversary of *Rerum Novarum*.

Additionally, Catholic leaders have devoted significant attention to denouncing war (e.g., outlining strict grounds as to when war might be morally justified) and have also offered a trenchant critique of the superficiality of the consumer culture. The Vatican's emphasis on a significant role for government in ensuring the economic and social welfare of all in society, with particular attention to the needs of the underprivileged, has been a cornerstone of Catholic teaching. It is also one that frequently pits Church leaders against politicians and members of its own laity who favor free market economic policies, notwithstanding the social problems they exacerbate (e.g., unemployment, homelessness, health underinsurance). Overall, however, Catholic laity in the West are far more likely to agree with official Catholic teaching on peace and economic justice than with the Church's stance on sexuality and women's roles.

Globalization and Religious Pluralism

Catholicism's long-standing concern with human dignity and the expansion of human rights informs its approach to the emerging processes and consequences of globalization. In 2009, coinciding with the G8 Summit in Italy, Pope Benedict XVI issued an encyclical, *Caritas in Veritate* (Charity in Truth), in which he argued that there was an urgent need for a global political authority to manage the economic crisis effects of global capitalism and to institute policies that would transform what he termed the unethical and perniciously sinful economic practices that perpetuate inequality and trample on social justice. Specifically, Pope Benedict stated that "business management . . . must . . . assume responsibility for all the other stakeholders who contribute to the life of the business: the workers, the clients, the [production] suppliers . . . the [larger] community" (No. 40). The encyclical also emphasized human responsibility for stewardship of the environment and discussed the challenges encountered in a globalizing society by a wide range of issues including migration, sexual tourism, terrorism, energy use, and bioethics. These issues and

the dilemmas associated with implementing more economically equal and nonexploitative social relations are known to Church officials firsthand as a result of the Church's long missionary and institutional presence (including its global Catholic Relief Services) on the ground in many poor communities, particularly in Africa, Asia, and Central and South America.

Although the Catholic Church is well attuned to the economic and social issues surrounding globalization, it continues to struggle in its negotiation of the politics of religious pluralism. Although there have been significant strides made by the Vatican to bridge its historical differences with Jews (e.g., papal visits to Israel and to symbolically rich synagogues in Rome), some of its actions—such as its promotion of the sainthood of Pope Pius XII despite some Jews' concerns that he did not do enough to condemn the Nazi deportation of Jews during World War II—continue to fuel tensions in Catholic-Jewish relations. Similarly, although the Vatican emphasizes the importance of interfaith dialogue, Pope Benedict XVI offended Muslims in a theological speech whose remarks were widely interpreted to imply that Islam was not open to reason and change. Nonetheless, the Pope has also emphasized that Catholics and Muslims—and members of other faiths too—are obliged to meet with one another and to overcome their differences while not diluting the tenets of their own faith. The practical demands this entails have been further broached by him in a dense intellectual dialogue with the eminent German social theorist Jürgen Habermas, as both seek to address—especially in the context of European post-Christian society characterized by significant numbers of Muslims of immigrant descent—how the demands of Western civic republicanism can reasonably accommodate non-Western religious and cultural differences. The bridging of differences is, clearly, a requirement of multicultural society and one that, irrespective of religion, is difficult to achieve. Nonetheless, it is understandable that as human society seeks to craft a global moral community, we might look to global religions to lead the way. Whether Catholicism and other world religions can play a prophetic role at this critical time in world civilization remains to be seen.

ROMANIA

According to the 2002 census, in the eastern European country of Romania the dominant Orthodox Church claims the allegiance of 86.7% of the country's total population of 21.7 million. Other large religious groups are the Roman Catholic Church (4.7%), the Reform Church (3.2%), and the Pentecostal Church (1.5%). The Greek Catholic Church United With Rome represents 1%, Jews 0.1%, Muslims 0.3%, and atheists another 0.1%. The Roman Catholic and Reform churches attract many of the ethnic Hungarians living in Transylvania. Like Poland, Romania is a religiously and ethnically homogeneous country and registers significantly higher levels of religiosity than other European countries. Unlike the predominantly Catholic Poland, Romania is predominantly Orthodox.

Historians have discovered proof of the existence of Christianity in Romanian lands beginning in the fourth century. By the Middle Ages, the southern and eastern parts of what is now Romania were predominantly Orthodox, and Slavonic was the official language in both church and state affairs. Greek Catholicism resulted from the conversion by the Jesuits of some Romanian Orthodox faithful in Transylvania in 1698. Many Transylvanian Hungarians and Germans were initially Catholic, but they converted to Protestantism starting in the 16th century. The Orthodox Church was recognized as the dominant church in 1866, became autocephalous in 1885, and was elevated to the rank of an autonomous patriarchate in 1925. Like other eastern European Orthodox kingdoms liberated from Ottoman rule in the 19th century, the nation-state of Romania embraced the concept of *symphonia*, whereby the church and the state collaborated for the good of the society and the state supported the preservation of an Orthodox Christian culture. *Symphonia* placed all other religious groups at a great disadvantage.

An antireligious campaign was launched after the country turned communist in 1945. The Greek Catholic Church was dismantled; anticommunist church members were imprisoned; the Concordat with the Catholic Church was revoked; and the state nationalized church property, severely restricted the training of priests, closed down confessional schools and monasteries, ceased religious instruction in public schools, and banned public religious celebrations. A dedicated secret political police department penetrated the rank and file of religious groups and marginalized unreliable clergymen. While initially the Communist Party saw religion as a capitalist remnant expected to wither away as its social basis disappeared, during the 1970s and the 1980s, it forged a special relationship with the dominant Orthodox Church, which agreed to support its policies.

Since the collapse of the communist regime in 1989, the Orthodox Church has reasserted its dominance, remaining the country's most trusted institution. New legislation allowed religious groups to be autonomous from the state and offered protection to religious minorities and non-registered groups, which can worship freely.

ROME

Rome is famous for being the headquarters of the Roman Catholic Church, a world city of pilgrimage and religious tourism. The primacy of the pope and the centrality of Rome are the product of a long history of pilgrimages, principally those of the "Holy Years." Moreover, the case of the first Global Jubilee, held in the year 2000, shows what kinds of challenges the Roman Catholic Church is facing today.

Rome has also a history of pluralism, which is often overlooked. Contemporary immigration has increased dramatically this historical-religious diversity of Rome and brought profound cultural changes. There are important signs that religious pluralism is under construction.

Rome and Catholicism

Rome is known as the center of global Catholicism. No other city in the world has a higher number of Catholic churches or institutions than the capital of Italy: more than 330 parishes, 1,700 diocesan clergies (with more than 3,500 members of religious orders), 50 new churches built just for the Jubilee 2000 celebrations, a cardinal who is the general vicar of the pope, and seven auxiliary bishops. It hosts pontifical academies, biblical and theological research institutes, a solid structure of charitable and immigrant services, the headquarters of dozens of male and female religious orders, congregations and ecclesiastical movements, and

many of the most important sacred works of art in Christendom.

Every year, millions of pilgrims arrive from all over the world. According to tradition, the martyrdom of Peter occurred in the Circus of Nero between 64 and 67 CE. His tomb became a place of pilgrimage for the early Christians. The emperor Constantine built the first basilica over the tomb, a huge building completed in 349 CE. The basilica fell into ruin with the passing of time, and it was rebuilt many times by the greatest architects of the Roman Renaissance and Baroque periods. The church today contains 45 altars and 11 chapels embellished with innumerable works of art, among which the "Pietà" of Michelangelo stands out. Under the basilica lie the tombs of many popes. Bernini's square (1656–1667), consisting of a great elliptical arcade with 284 columns and 88 pillars in travertine was designed to express the symbolic value of the square as "Christianity's port." The right-hand door of Saint Peter's Basilica only opens during the Holy Years (it is usually walled), symbolizing the passage from sin to grace.

Holy Year or Jubilee

Within its Jewish origins, the Jubilee was a holy time that occurred every 50 years. The celebration was set by rules to be found codified in the Book of Leviticus (25:1–13), and the meaning stood for the acquisition of freedom by all those who lived in misery, oppression, and slavery. The Jubilee year originally represented an expected and joyful occasion to balance social inequalities. The introduction of Jubilees or Holy Years within the Catholic Church came later, and their key elements are the "plenary indulgence" (remission of the sins through which the believer could regain a state of perfect innocence) and the pilgrimage to Rome. In the 11th century, the use of "general remissions" was widespread, granted by the pope or the bishops and related to visits to certain sanctuaries. Saint Bernard referred to the Jubilee on the occasion of the plenary indulgence granted to the participants in the Second Crusade (1144–1149). At that time, the crusaders brought from the Holy Land a huge number of relics, and the cult of these "spiritual treasures," gathered in Rome in the most important basilicas, attracted many pilgrims. The first and real Christian Jubilee is dated to

1300, when Pope Bonifacio VIII granted the plenary indulgence to all those who came to Rome “with reverence” to visit the basilicas of the apostles Peter and Paul. In 1350, Clemente VI added the Basilica of Saint John in Lateran as a goal of pilgrimage. Through the centuries, the Christian Jubilee changed in its rituals and habits, but the constant thread was the reinforcement of the centrality of Rome and the supremacy of the Pope.

In contemporary society, concerning pilgrims’ experiences, differences with the past are evident. In former times, the pilgrim’s journey was individual. The journey took longer and could be so dangerous that many died in the effort of reaching the goal. Today, mass tourism permits easy and cheap access to places of worship and museums, ranging from penitence pilgrimage to religious travel aiming at reconstruction of the sacred within the standards of a secularized society. However, yesterday and today, the Jubilee is also an occasion of socializing and meeting of people of different social backgrounds, nationalities, and ages.

The Jubilee 2000 Celebration

The year of the bimillennium of the birth of Jesus was a real global Jubilee. The Pope described it as the “first in the media age,” and the coverage by the mass media was unprecedented. Another difference concerns the territorial extension of the possibility to attain remission of sins to places other than Rome—the Holy Land (Israel/Palestine) and local churches assigned by the bishops on a global level. Notwithstanding, an estimated 25 million people arrived in Rome during 2000. It is true that besides being a spiritual event, it must also be considered as a mass touristic event. The support of the civil and political authorities (both national and from the municipality of Rome) was unconditional and included provision of funds, with major commissions for the restoration of historic churches and monuments.

Numerous empirical studies of the 2000 Jubilee showed that effectively 60% of pilgrims expressed a strong interest in the art of Rome. Moreover, as researchers have pointed out, another strong wish was “to see the pope,” consistent with predilection of the Christian narrative toward charismatic examples and the contemporary need to feel strong emotions in order to adhere subjectively to the

Divine. Furthermore, the pilgrims interviewed in Rome during 2000 suggest an emergent heterodox ethos of Catholicism. For example, regarding the priesthood for women, 47% of those interviewed were favorable, in opposition to the official position of the Catholic Church. In 2000, Rome also hosted street “oppositions to the Jubilee,” which aimed at triggering a debate about the presumed universality of the principles of Catholic morality. In a speech in St. Peter’s Square following an international gay pride march, the pope labeled it as a clear offense to Christian values.

The Rome 2000 Jubilee is also to be considered as an exceptional test for *pluralism*, both inside and outside the Catholic Church. The strong image of John Paul II, but more generally the dogma of papal infallibility and the believers’ subordination to his will, fostered conflicts that seemed irresolvable. Empirical research on the “Jubilee of others” showed the difficulty of ecumenism, starting from the words used. For example, the response of Protestants to the expression *lucrare l’indulgenza* (“to earn indulgence”), still officially in use by the Catholic Church, offers little ground for surprise; the same expression was a matter of debate even during Luther’s times. The Jubilee 2000 campaign for debt cancellation in “the poorest countries” (an initiative close to the original purpose of the Jewish Jubilee) has found support among the Baptists, Waldensians, and Seventh-Day Adventists. The dialogue is proceeding, since such debt cancellation is still a distant goal.

Rome and Other Religions

Jewish Romans

It is estimated that in Rome during the first century, there were approximately 50,000 Jews, 10% of the total population. But the long history of the Jews in Rome is marked throughout by persecutions. Already by 1215, the IV Lateran Council of the Catholic Church imposed on the Jews the obligation to wear a distinctive symbol and prohibited them from accepting public office; in 1555, Paul IV, following the example of Venice, instituted the Ghetto, which was only “opened” in 1870, when the Papal State fell. The end of the Ghetto and even the mayoral election of a Jew, Ernesto Nathan, in 1907 seemed to open a new era for Roman Jews. But the advent of fascism meant

institutional racism (Race Laws of 1938) and, later, deportation to the extermination camps. Today, the Jewish community of Rome has approximately 13,000 members, of the 35,000 Jewish Italians.

Waldensian Protestant Church

The first Waldensians arrived with the end of the Papal State (1870) that also marked the recognition of freedom to non-Catholic Christians. In 1883, they opened their first church, and a second church was opened in 1914. Today, there are approximately 1,000 members in Rome's community, plus there exists an important Waldensian Faculty of Theology.

Immigration

Today, Rome is becoming more and more a pluralistic city from a religious point of view. Migration is now a structural phenomenon, with 290,000 immigrants in the municipality of Rome and 141,500 in other municipalities of the surrounding province (January 2007 estimate). The religious and national origins of the migrants in Rome are various. The most numerous are 58,000 Muslims (Moroccans, Algerians, Tunisians, Egyptians, Somalians, Iranians, Pakistanis, Bangladeshis, etc.), 52,000 Orthodox Christians (including Romanians, Ukrainians, Moldavians, Russians, Serbians, Greeks, Egyptians, Eritreans, and Ethiopians), more than 18,000 Protestant Christians of various nationalities (Filipinos, Nigerians, Congolese, Brasilians, Peruvians, Chinese, and others), 8,500 Buddhists (Sinhalese, Japanese, and Koreans), 8,000 Hindus (Indians and Sinhalese), about 5,000 Sikhs (Indians), and about 3,000 animists from different African countries. Furthermore, the adherents of Roman Catholicism have become more diversified: 103,000 migrants of the Catholic faith come from the Philippines, Poland, Peru, Ecuador, Brazil, Colombia, Romania, Cape Verde, and Moldavia. These communities celebrate the Mass in their mother tongue and according to their own traditions. An incremental number of Catholic migrants can be seen in the autochthonous parishes; the phenomenon is even more significant among the second generation of immigrants.

Pluralism

The institution of the Advisory Council of the Religions of the City of Rome (within the special Councilor to the Mayor for Multiethnic Policy Bureau) is a significant index of dialogue and a pacific coexistence. The following communities participate in this Advisory Council: the Jewish Community of Rome, Cultural Islamic Centre of Italy, Orthodox Ethiopian Confession, Adventist Christian Church, Rome Baptist Church, Methodist Church, Waldensian Church, Lutheran Community, Pentecostal Evangelical Association, Salvation Army, Christian Science, Baha'i Centre, Italian Soka Gakkai Buddhist Institute, Italian Buddhist Union, and Italian Hindus Union Sanatana Dharma Sangha.

Within the Catholic Church can also be found people committed to interreligious dialogue and to solidarity among citizens of different faiths. Caritas of Rome is emblematic of this commitment, and among its latest publications is the fourth edition of its guide to places of worship in the city. For immigrants to Rome and the surrounding province, places of worship now number 233, of which 148 are Catholic churches, 35 Protestant churches, 28 Orthodox churches, 12 Muslim mosques, 5 Jewish synagogues, 5 Buddhist temples, 1 Hindu temple, and 1 Sikh temple.

RUDOLPH, ERIC ROBERT (B. 1966)

Eric Robert Rudolph, the convicted bomber of Atlanta's Olympic Park, provides an interesting example of the Christian justification for violence as a response to globalization and multiculturalism. Like many Muslim terrorists who are members of isolated groups that do not represent the Islamic tradition as a whole, Roberts expresses an extreme position in Christianity that is not embraced by most other Christians.

On April 13, 2005, Rudolph pleaded guilty to the Olympic bombing in Centennial Park on July 27, 1996; bombings of abortion clinics in Atlanta and Birmingham; as well as the bombing of a gay and lesbian nightclub in Atlanta. He was sentenced to four consecutive life terms. Born in 1966 in Merritt Island, Florida, he served in the 101st Airborne Division of the army and trained at the Air Assault School. Rudolph has ties to Protestant anti-abortion activists and perhaps the Christian Identity movement, though he considers himself a Catholic.

Rudolph continues to develop and disseminate his critique of contemporary American civil society and American government through his writings from prison and publications on the web. "Eric Rudolph's Homepage" is hosted by The Army of God, known for its religious justification of violence in the fight over abortion, as well as for its secrecy: "Members" remain anonymous in their writings.

Rudolph made sentencing statements in both Atlanta and Birmingham. The Atlanta statement asserts that his ineptitude and poor planning resulted in "innocent civilians" being hurt and killed. He claims that his goal was to disrupt the

Olympics, costing multinational corporations huge sums of money and embarrassing the U.S. government. He also claims that he had intended to give sufficient warnings to ensure that people would be evacuated but in the confusion failed to do so. While asserting that he still believes in the "justice of [his] cause," he concludes with an apology, saying that he "would do anything to take back that night." In the Birmingham statement, Rudolph develops his justification of violence against persons by elaborating the category of "innocent civilian." He explains that the deaths of two abortion clinic employees were the legitimate result of their own actions and that abortion being murder, "deadly force is indeed justified to stop it."

More broadly speaking, Rudolph's various essays include an assertion that he is not an anarchist opposed to government in general but, rather, a critic of the current U.S. government. His hope is for a government in line with what he regards as the virtues of a Christian society. He details some of his survivalist exploits while in hiding and discusses his essentialist views of gender and feminism, which he claims are the basis for a stable civil society.

Many will dismiss Rudolph's views, claiming that they are the views of one man, an example of a rarefied combination of Christianity and conspiratorialism, which finds no place in "authentic" Christianity. It is therefore perhaps most interesting that he evaded capture for 5 years, living in the Appalachian wilderness around North Carolina, relying on, it is suspected, a rather broad network of supportive sympathizers.

RUSSIAN FEDERATION

Fifteen years after the collapse of the atheist Soviet state, the Russian Federation is a country with a

diverse and dynamic religious profile, in which religion has become an important factor in the creation of a new, post-Soviet national identity. But the role of religion in Russia is highly contested, as a resurgent Russian Orthodox Church seeks to secure a dominant cultural and social position in the face of competition from other faiths, both indigenous to Russia and imported from the West and Asia after the fall of communism.

In two important ways, the religious situation in the Russian Federation is conditioned by globalization. First, globalization has facilitated the growth of non-Orthodox faith communities across the country, contributing to the increased diversification of religious choice while provoking a protectionist reaction from the Russian Orthodox Church. Second, the Russian Orthodox Church is working out its own theological position in regard to the social effects of globalization in Russia while functioning as a global actor itself with parishes—catering primarily though not exclusively to the Russian diaspora—in more than 50 countries around the world.

Throughout this entry, the distinction is made between the “Russian Orthodox Church,” as the community of faith that encompasses millions of believers in the Russian Federation, and the “Moscow Patriarchate,” which is a term referring narrowly to the church’s administrative structures.

The Religious “Map” of the Russian Federation in a Globalized World

The Moscow Patriarchate lists 27,393 parishes under its jurisdiction; of these, approximately half are in the Russian Federation. Various Protestant groups have the second largest number of registered communities, at approximately 5,000; of these, the Baptist and Pentecostal communities constitute at least half. By far the largest growth can be seen in the number of registered Pentecostal parishes: Between 1991 and 2003, they expanded at an astonishing rate of 2,000%. There are perhaps 3,500 Islamic communities; the Jewish, Buddhist, Old Believer, and Roman Catholic communities number in the hundreds.

Even though the Russian Orthodox Church appears to dominate, the reality speaks otherwise. Most Russians identify themselves as “Orthodox”—through the 1990s and 2000s, this number has

vacillated between 60% and 80% of respondents. However, of this same majority, nearly 20% do not believe in God. Surprising numbers are not aware of the basic tenets of Orthodox Christianity. Even more significantly, even the most optimistic assessments acknowledge that only at most 10% of Russia’s population actually attend Orthodox services on a regular basis (most estimates place this number at 3%–5%). Ostensibly, most of the Russian Orthodox population attends at parishes under the jurisdiction of the Moscow Patriarchate, but even here, the numbers are questionable. Even assuming that each of the approximately 15,000 parishes in the Russian Federation were able to accommodate 10,000 people at a liturgy (which, given the size of Russia’s churches, is extremely unlikely) and were full to capacity each Sunday (again an unlikely scenario), this would account for at most 1,500,000 active Orthodox Christians.

Thus, the reality on the ground in the Russian Federation does not fit the image of a predominantly Orthodox country. This is further underscored by the fact that in the other religious communities, self-identification appears to more clearly correspond to actual practice; thus, it has been said that in Russia the majority of practicing Christians are not Orthodox but rather Protestant. Though not usually interpreted as such in the literature on the subject, the expansion of religious missions—from the United States, Europe, Asia, and the Middle East—in the Russian Federation throughout the 1990s can be considered to fit into the broader globalization process, in the sense of transnational movement of people and ideas. While some of the Protestant communities trace their roots to the pre-*perestroika* and even pre-Revolution era, many of them—in particular the Mormons, Jehovah’s Witnesses, and Pentecostals—arrived in the Russian Federation primarily after 1991. Especially in the beginning, Protestant missionaries brought with them the full material and moral support of their home organizations (this concerns, e.g., the Mormons and the Methodists). Across the North Caucasus, Islamic communities dealt with the lack of educated clergy by either sending their own members to the Middle East to study or inviting Islamic teachers from outside countries such as Saudi Arabia. Many of the new religious

movements that flourished across Russia during this time period—for example, Scientology—had discernible foreign sponsorship.

The backlash was not long in coming. In the context of the Soviet collapse, the arrival of missionaries, their material support from foreign religious organizations, and their apparent immediate success was interpreted by the Russian Orthodox Church as unfair competition, part and parcel of the package of Western ills that poured across the suddenly open Russian border. This led the Moscow Patriarchate to lobby for a federal law restricting the ability of “nontraditional” religions to register on Russian territory; such a law was passed in 1997, assisted in no small measure by the nationalist majority in the Duma and the widespread sentiments against foreign missionaries within Russian society at the time. The 1997 law has had an ironic effect, in the sense that many communities prefer simply not to be registered, in order to avoid the onerous process; this, in turn, contributes to the difficulties of accurately describing the religious demography of the Russian Federation. At the same time, some of the religious organizations with long historical roots in Russia (e.g., the Baptists) have retreated from their international ties, preferring to present themselves as indigenously Russian, national communities.

Theological Approach of Russian Orthodoxy to Globalization

Given the role of the Russian Orthodox Church in restricting the activities of “non-Russian” religious groups, which were associated in Russia with the diminishing salience of national borders, it might be tempting to conclude that the Moscow Patriarchate is in principle antiglobalist. This is not the case, however. In August 2000, the Bishops’ Council of the Russian Orthodox Church published a document titled “The Basis of the Social Concept of the Orthodox Church,” in which the prelates expressed their consensus view of a number of contemporary social, political, and economic issues. Among other things, the “social concept” presents the Moscow Patriarchate’s normative assessment of globalization. This position is relatively neutral in its formulation. For example, while viewing sovereignty and territorial integrity

as central to the protection of the interests of specific nations, the document recognizes that, in the Christian worldview, any human constructions—including the sovereign power of the state—are relative in the face of God’s omnipotence. Moreover, the “social concept” acknowledges the economic, political, and security benefits that may arise from international integration, whether through the creation of a common economic space, the unification of political structures, or both. For example, deepening globalization—in the form of the creation of institutions of international governance—is seen as positive if it contributes to the resolution of conflicts between states.

On the other hand, these same international institutions (presumably the United Nations and the North Atlantic Treaty Organization [NATO]) may become a tool used by powerful countries to dominate the weak, an aspect decidedly condemned by the “social concept.” Moreover, in the view of the Moscow Patriarchate, globalization is accompanied by attempts to establish the dominance of certain cultures and worldviews over others (the subtext here referring to the United States and the West in general); in the Orthodox view, this is a negative phenomenon since it is equivalent to the building of the Tower of Babylon. And yet, for the Russian Orthodox Church, the response to globalization does not lie in isolationism: According to the “social concept,” the response must be to “remain ourselves” and at the same time actively cooperate with the outside world, bringing to it the spiritual richness of the Russian people. In particular, recognizing the spread of Islamist terrorism as a product of globalization threatening humanity in general, the leadership of the Russian Orthodoxy has been consistent over the years in calling for international cooperation and in insisting that the Russian Federation can and should serve as a bridge between East and West because of its centuries-long positive experience with the coexistence of various cultures. In any event, the official attitude toward globalization of the Russian Orthodox Church, as expressed by its Council of Bishops, may be summarized as follows: acknowledgment of the phenomenon’s positive effects, concern about its excesses, and willingness to critically engage the process in order to mitigate its negative social effects on the Russian population.

Russian Orthodox Antiglobalism

At the same time, despite the inherently hierarchical nature of the Orthodox Christian religion, the pronouncements of bishops often have very little effect on the worldviews of the Russian Orthodox laity. Despite the evenhanded approach of the hierarchy toward globalization, a significant segment of the flock is quite actively antiglobalist, a tendency that has been growing in intensity over the past decade. In this case, antiglobalism is tightly woven with anti-Westernism—that is, the perception that the collapse of the Soviet Union and the subsequent economic and social turmoil were part of a larger pattern of Western (American and Jewish, primarily) conspiracy against Holy Russia. “Globalization” is, for the Russian Orthodox antiglobalists, particularly pernicious since it is presumably aimed at destroying Russia’s unique culture through the import of Western mass culture and, simultaneously, at economically enslaving the country’s population.

Furthermore, antiglobalist sentiments among this part of the Russian Orthodox population are reinforced by an apocalyptic interpretation of reality. In this perception, the Antichrist is either about to appear or, in some more extreme versions of the ideology, has already done so; terms such as *global governance* and *economic integration* are viewed in light of St. John the Theologian’s prophecy in his Book of Revelation that under the Antichrist’s rule the planet’s population will be under complete state control. Orthodox Russia stands as the last bastion of Truth in the oncoming onslaught of apocalyptic evil; globalization is therefore to be resisted at all costs.

Such an understanding of the globalization process has direct consequences both for Russian politics and for the internal cohesion of the Russian Orthodox Church as a whole. For example, at the turn of the millennium, the government of the Russian Federation decided to introduce electronic taxpayer numbers (equivalent to U.S. social security numbers) in order to facilitate tax collection. Known in Russian as *individual’nyi nalogovyi nomer* (INN), the electronic codification process set off a chain reaction across strongly antiglobalist segments of the Orthodox population, which interpreted the INN as being the proverbial “mark of the Antichrist.” Numerous important monasteries

across the country declared their opposition to the INN, in effect proclaiming what observers in Russia termed an “anti-INN jihad.” The monasteries were seconded by many priests who forbade their parishioners from adopting the INN on pain of excommunication. Church kiosks were filled with anti-INN—and more generally antiglobalist—pamphlets and cassette tapes.

In the meantime, the ecclesiastical leadership refused to declare officially that the INN was the mark of the Antichrist, since this would be inconsistent with the general official position that globalization is a neutral phenomenon. In response, the Orthodox antiglobalists began to openly assert that the bishops were apostates who had sold out to the globalist West and, ultimately, to the Antichrist himself. For 3 years—between 1999 and 2001—the Russian Orthodox Church found itself perilously close to a schism over the issue. The problem was resolved, at least for the time being, only after a series of diplomatic maneuvers on the part of the Moscow Patriarchate, which involved the convocation of a Theological Commission that studied the issue and declared once again that the Church’s position on globalization is neutral and that the electronic numbers are not the mark of the Antichrist prophesied by St. John. Perhaps more important, the Moscow Patriarchate had to turn to the Russian government for help, specifically to the Tax Ministry, which ended up promising that those citizens who did not want to adopt the INN for religious reasons would be provided with an alternative method of registering with the tax authorities. The hierarchy’s inability to handle a significant internal problem without outside assistance only served to underline the severity of the division of the Russian Orthodox population along increasingly incompatible ideological lines, with globalization as the lightning-rod issue.

Even though in 2001 the Russian Orthodox Church was able to avoid a schism, antiglobalism exacerbated by apocalyptic expectations continues to pervade many parishes, particularly in the regions far from Moscow. To some extent, these sentiments are stoked by literature from monasteries in Greece, particularly Mount Athos, and Romania and Moldova, where the monastic communities are exporting their own apocalyptic

vision to receptive Russian antiglobalists. While a significant portion of this movement has not cut official ties with the Moscow Patriarchate, preferring to remain as a highly vocal opposition to the hierarchy, some priests and laity have drifted into what is known in Russia as “Alternative Orthodoxy.” Briefly, this term refers to about half a dozen splinter groups that have presented themselves as a purer version of Orthodoxy than the Moscow Patriarchate, which is seen as corrupt because of its association with the communist past and, more recently, with globalization. While numerically marginal in the overall picture of Russian religiosity, these groups have been increasingly in the focus of the secular media as their zeal for the faith has led to unusual and disturbing episodes. In 2008 in the Penza region, a group of 30 people claiming to belong to the True Orthodox Church barricaded themselves inside a system of caves, where they intended to sit out the arrival of the Antichrist. (A partial collapse of the cave forced their emergence 6 months later.) Reports of similar episodes across the Russian Federation support the picture of a religious community subject to the excesses of antiglobalist fears and apocalyptic expectations.

Global Russian Orthodoxy

Finally, a central reason why the Moscow Patriarchate has trodden carefully in articulating its attitude toward globalization lies in the fact that the Patriarchate itself is an organization with global reach. Prior to the collapse of the former USSR, all of the Orthodox parishes in the Soviet Union fell under the jurisdiction of the Moscow Patriarchate; the creation of 14 new countries outside the Russian Federation meant that the Russian Orthodox Church was now international, as many of the parishes continue to owe ecclesiastical loyalty to Moscow. Crucially in this respect, more than 50% of the parishes of the Russian Orthodox Church are actually to be found in the Ukraine. Thus, the Moscow Patriarchate has positioned itself as the spiritual home of thousands, if not millions, of ethnic Russians stranded outside the Federation borders; the picture is complicated by the fact that by far not all of the Patriarchate’s parishioners in these countries are ethnic Russians.

Moreover, the migration of Russians around the world over the past 100 years has been accompanied by the foundation of Orthodox parishes as far away from the Russian Federation as Brazil and Australia; currently, most of these parishes are jurisdictionally subject in ecclesiastical matters to the Moscow Patriarchate. Here again, however, the situation is complex since many of these parishes have attracted non-Russian converts, thus making it difficult to associate the Moscow Patriarchate’s interests abroad solely with the specific concerns of the ethnic Russian diaspora.

In the final analysis, then, globalization has conditioned the religious landscape of the Russian Federation in several related ways. First, the relative openness of Russia’s borders after the collapse of the former USSR led to the proliferation of foreign missionary groups with financial and other material ties abroad; as a result, the dominant confession in the country, the Russian Orthodox Church, found itself unexpectedly facing serious competition. This, in turn, led to a backlash in the form of legislation restricting “nontraditional” religious activity; paradoxically, to survive in the new environment many religious communities have sought to disassociate from foreign organizations and present themselves as indigenous and part of the Russian national narrative. In the meantime, the Russian Orthodox Church has had itself to struggle with a theological assessment of globalization. In this regard, the Moscow Patriarchate has developed a relatively neutral attitude, praising globalization’s positive aspects and expressing the need for critical engagement to mitigate the phenomenon’s negative excesses, particularly in the realm of social and economic justice. However, a vocal fundamentalist portion of the Orthodox flock has reacted extremely negatively toward globalization, interpreting it in apocalyptic terms; the issue continues to be of concern to the Russian Orthodox Church as a possible cause of a schism. Finally, the Moscow Patriarchate’s neutral stance toward globalization may be understood to reflect the Patriarchate’s acknowledgment of the fact that it is itself a transnational religious organization with thousands of non-Russian parishioners.

RWANDA

The population of Rwanda, a small landlocked state in East Africa, is more than 90% Christian and 2%–4% Muslim. Many people simultaneously continue to practice aspects of Rwandan indigenous religion, particularly veneration of ancestors and traditional healing practices. A small percentage of the population observe Kubandwa, the worship of the heroic figures Nyabingi and Lyangombe.

Catholic missionaries arrived in Rwanda in 1900. Focusing on proselytizing the elite, they were highly successful at winning converts and gaining political influence. The missionaries favored the minority Tutsi, who dominated the political system, and their policies helped solidify ethnic identity and consolidate Tutsi power. In the 1950s, however, the missionaries switched sympathy to the Hutu majority. Many people blame the Catholic Church for instigating the 1959 uprising, which drove the Tutsi king and chiefs from power and drove thousands of Tutsi into exile in neighboring countries.

German Protestant missionaries began work in Rwanda in 1907, but their efforts were disrupted by World War I. Seventh-Day Adventist missionaries next came to Rwanda in 1919, and Belgian Protestants took over the abandoned German mission stations in 1920, establishing the Presbyterian Church of Rwanda. Anglicans arrived when the eastern region of Gisaka was incorporated into Rwanda in 1932, and Anglicanism quickly became the predominant Protestant denomination in Rwanda. Both Danish Baptists and American Free Methodists expanded mission work into southern Rwanda in the 1930s from Burundi. Swedish Pentecostal missionaries arrived in Rwanda from Congo in 1940. The Protestant presence in Rwanda gradually grew, so that in the 1991 census, 27.2% of the population was Protestant compared with 62.6% Catholic.

After independence in 1962, the new government had close ties with the Catholic Church. The first president, Grégoire Kayibanda, had served as editor of a Catholic newspaper and directed a church consumers' cooperative. After the 1973 coup, the new president, Juvénal Habyarimana, maintained a close relationship with the Church. Although some Protestant and Catholic groups were in opposition to the Habyarimana regime that emerged in the early 1990s, both Catholic and Protestant leaders supported the regime.

In April 1994, after President Habyarimana was assassinated in a plane crash, a policy of ethnic scapegoating the minority Tutsi culminated in genocide. The Christian churches became deeply implicated in the violence, as church leaders urged the population to support the government even as it was massacring civilians. Churches became

Rwanda's primary killing fields, as Tutsis were lured to church buildings with promises of sanctuary and then systematically slaughtered.

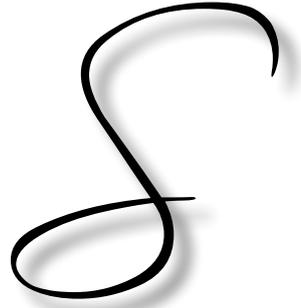

Rwanda's religious landscape evolved significantly after the Rwandan Patriotic Front, a mostly Tutsi rebel army, took control of the country in July 1994 and ended the genocide. Because of their culpability in the violence, the established Catholic and Protestant churches lost much of their influence and many of their members. Tutsi refugees who returned to Rwanda after 1994 brought a diversity of new denominations to the country, and many new independent evangelical and

Pentecostal churches emerged. Islam also became more public and prominent.

SACRED PLACES

Sacred places are locations that give religious meaning and identity to communities and individuals. While some have been constructed as ritual arenas, others have been selected from nature and are associated with the history and myths of a religion. Indeed, the great religious traditions display a wide variety of sacred places, varying in shape, location, and purpose. A sacred place can be an entire land, such as India, or a city such as Jerusalem; or it can be a sanctified structure such as the Kaabah in Mecca; or it can be a natural site such as a mountain, lake, or river, such as the Ganges, that is believed to have special qualities. Sacred places concretize a religion, giving it a material and earthbound feature. Although many sacred places are ancient and historical religious shrines, others such as the Mormon Temple in Salt Lake City are of more recent existence. This entry discusses the functions of sacred places; institutionalization, protection, and access to sacred places; and conflict over sacred places.

According to the historian of religion Mircea Eliade, sacred places fulfill three primary functions for believers: first, they act as places in which worshippers can communicate with the divine, whether through prayer, ritual, or contact with an image of God. Second, sacred places contain a permanent divine presence that draws people, with the expectation of receiving blessings, healing, forgiveness, spiritual merit, or salvation. Third, the layout and design of sacred

places in terms of the art, architecture, music, and drama represent an ideal of a particular religion in its purest form. In identifying these functions, Eliade's theory brings out three different attributes of sacred places: behaviors attributed to gods, the behavior of the worshippers at these sites, and the physical design of these sites. From this angle, sacred spaces can be defined as religious centers at which the heavenly and earthly meet, where sites act as bridges between the human and divine worlds.

Sacred places provide the opportunity for worshippers to communicate with the divine, receive gifts, and gain insight into greater meanings and, as such, become religious centers for many believers. The Himalayan Mountains and Ganges River, for example, are sacred to Hindus. Mount Kailash in the Himalayas is sacred to Hindus, Buddhists, and Jains. It lies near the source of several of the most sacred rivers in the region and is believed to be the home of the God Shiva and his consort Parvati. Mount Kailash is believed to be too sacred to climb, but the area around it is a major site for a holy pilgrimage. Similarly, Mount Gerizim is sacred to the Samaritans, and the Temple Mount in Jerusalem is holy to the Jews. These are all historical, spiritual, and cosmological centers and are associated with the act of creation, the beginning of time, or the end of days. Pilgrims who journey to such sacred places therefore travel toward the center, seeking in the sacred space the microcosm both of the universe and of the specific religion it represents.

Places of worship, such as temples for Hindus and Buddhists, gurdwaras for Sikhs, synagogues

for Jews, churches for Christians, and mosques for Muslims, are considered sacred places. Yet these places of worship are often not the primary sacred places of a religion. In fact, many sacred sites that constitute a central aspect or component of the religion stress links with the founder or other important figure in the history of the religion. At such sacred sites, believers hope for the clearest and most direct exchange with God. Mecca (Makkah), for instance, is a historically significant sacred place for Muslims, whereas the mosques where they worship on a day-to-day basis have a different level of significance, despite the fact that all worship takes place facing Mecca. Mecca, in Saudi Arabia, is the birthplace of Prophet Muhammad. It houses the great Masjid al-Haram and is the holiest city in Islam and a place of pilgrimage for Muslims all over the world. The Jewish tradition of placing notes with prayers between the stones of the Western Wall in Jerusalem rests on the belief that this wall, which is a retaining wall of the former temple, contains remnants of the *shekhinah*, which is the divine presence that once resided in the temple. The construction of the Sikh shrine in Amritsar is believed to have been started by Guru Amar Das. The pool in Amritsar has been a sacred place from antiquity and is believed to have been visited by the Buddha; it is also believed that the Hindu deity Ram and his sons fought at this site. Such sacred places carry a much higher level of reverence than other places of worship that have been consecrated in more recent times.

Reports of a prior revelation as well as healing and miracles at a sacred site provide a high degree of support for the centrality of the site, especially if there is physical evidence for that revelation. For example, Muslims worship at the Dome of the Rock in Jerusalem because they believe that Prophet Muhammad prayed on that rock and ascended from it to the heavens. Believers point to his footprint and headprint in the rock as confirmation of that event. In Kashmir, the Hazratbal Mosque is considered to be the most central Muslim shrine because it holds the *Moe-e-Muqqdas*, which is the Sacred Hair of Prophet Muhammad. In Sri Lanka, the Dalada Maligawa temple in Kandy contains what is believed to be the Buddha's tooth. In India, Gaya is sacred to devotees of the Lord Vishnu as he is believed to have visited and left a large footprint at the site.

Christians also revere the footprint of Christ in the Church of the Ascension in Jerusalem, whereas Buddhists venerate Buddha's footprints across Asia. Other sacred places and shrines have become places of mass pilgrimage due to the apparition of God or other divine forms. The apparition of the Virgin Mary in a number of locations around the planet has led to these areas being designated as sacred places and shrines being built at these locations. Examples include the Basilica of Nuestra Senora de Guadeloupe in Mexico City, Lourdes in France, the Shrine of our Lady of Fatima in Portugal, and the Shrine of the Holy House in Loreto, Italy.

Institutionalization, Protection, and Access to Sacred Places

Sacred places are attractive and coveted because they offer access to the divine; however, at the same time, they pose the risk of desecration. A sacred site therefore carries with it a whole range of rules and regulations regarding access and people's behavior in relation to it. Such restrictions or prohibitions on behavior become necessary as these sites are often prone to destruction. Moreover, they define the relationship between god or gods and the people, and offending deities is believed to carry danger. In Judaism and Sikhism, for example, people are required to cover their heads when entering sacred places; in Islam, Hinduism, and Sikhism, shoes need to be removed before entering places of worship; and Muslims are required to wash their feet and faces and Hindus must bathe before entering a place of worship or a shrine.

Control of access to and behavior toward sacred places has resulted in these places being managed by priests and the religious community, leading to the institutionalization of sacred places. Some sacred places have been consequently transformed into shrines by religious authorities. A permanent structure, in the form of a place of worship, is erected on or in the immediate vicinity of the sacred place. For example, the monastery of St. Catherine in Sinai is the oldest Christian monastery and is believed to enclose a shrub claimed to be the burning bush through which God spoke to Moses. The presence of a formal structure and place of worship also formalizes the presence of

religious actors at sacred sites in a permanent way. In British India, the government helped establish a board of control in which Sikhs could manage their own religious sites; members of the Shiromani Gurdwara Parbandhak Committee are selected by the general population in an election overseen by the state government. The control of sacred places by religious figures is intricately linked to gender, status, and role, as different ranks of people have been given differential access to sacred sites. In many traditional cultures, women were believed to be impure but with great capacities for creation and destruction and were therefore subject to a wide range of taboos restricting their behavior. Moreover, in India, only men of the Brahman caste could be priests, and access to sacred places was often denied to the lower caste groups. In the Babukusu shrines and burial sites in Kenya, all Babukusu graves are venerated, but men's graves are revered more than those of women. Many sacred places have been controlled or managed by men because of gender prejudices in religious beliefs and practice. Access to certain sacred places is also denied on grounds of religion. Only Muslims are allowed to visit Mecca and Medina. In the Mormon Temple in Utah, only members in good standing of the church are permitted to enter the temple. Historically, access to sacred places has been controlled based on a number of social factors, and such control still exists.

Conflict Over Sacred Places

Some sacred places not only have religious significance but also carry historical or political importance. In Poland, for example, religious sanctuaries served as sanctuaries for people fleeing from political persecution. Sacred sites offer believers the possibility of communing with the divine and achieving deeper insight into their faith. However, the spiritual and cultural importance of these sites has led to competition, as religious groups have tried to exclude rivals from practicing potentially sacrilegious rituals in this revered space and tried to assert their own claims. Holy spaces therefore create the potential for military, theological, or political clashes, not only between competing religious groups but also between religious groups and secular actors. Around the globe, disputes have erupted over the ownership of sacred sites;

the desecration or destruction of tombs, temples, churches, mosques, and shrines; and demands for freedom to perform controversial rituals on pilgrim routes or in burial grounds. These disputes afflict sacred places irrespective of location and religious traditions.

Sacred sites are still at the source of bitter conflicts not just between but sometimes within religious groups—for example, the destruction of the Ayodhya mosque by Hindu fundamentalists in India and the competition for the sacred site of Jerusalem, an ongoing dispute not only among Jews, Christians, and Muslims but also between various Christian churches. However, conflict over sacred spaces is not generally recognized as a separate category of disputes requiring specific attention. Such conflicts are unfortunately difficult to resolve because these sites pose an indivisibility problem. In fact, they are indivisible because the religious prerequisites for safeguarding these sites from desecration require believers to have complete and exclusive control over them. Also, the more central the space in the religious landscape of the community, the greater is the divine power vested in the place, and the community has a bigger obligation to defend the sanctity of the sacred place. The risk that foreign presence or conduct will be interpreted as an offensive act will be even greater. As such, competing groups resort to violence to gain control of such sites. The mitigation of conflicts over sacred places requires consultation between political leaders and religious experts who can shed light on how the religious meaning, value, and parameters of a sacred site affect the political needs of a religious community.

Because believers place high value on sacred sites, they become attractive targets for politicians as the latter try to control believers, their religious movements and leadership, and assets through control of sacred places. Political leaders and rulers have barred access, desecrated and destroyed sacred sites, and have also funded the construction or restoration of sacred sites as a means for either penalizing or rewarding subjects. In 2001, for example, the Taliban regime in Afghanistan destroyed the 2,000-year old Buddha statue carvings in the central province of Bamiyan in their endeavor to establish a true Islamic state. Political control over sacred shrines and spaces is highest when these shrines attract mass pilgrimage and

carry great historical value. Pilgrimage in fact offers the host regime opportunities to sanction rival regimes or to demonstrate widespread generosity and hospitality. The Chinese political control of Tibet, for example, has led to the decline of Tibet as the world center of Tibetan Buddhism. Tibetan Buddhism is now more focused on the person of the Dalai Lama himself as he helps define and constitute the sacred element of this religion.

Native American and Australian Aboriginal cultures have different beliefs about the sacred. These native people believe that all natural parts of the world contain a life force and are therefore living entities. Such belief systems consider plants, animals, rocks, and all of nature to be conscious and willful and as entities that need to be treated with respect. They consider all land to be sacred. The Mescalero Apache, for example, consider plants, animals, and earth materials to be powerful and sacred. They consider the land itself to be sacred. Examples of such natural sacred places include the Grand Canyon, Devils Tower, Kasha-Katuwe, and Crater Lake in the United States. In Australia, one finds sites such as Uluru/Ayers Rock and the Katajuna/the Olgas among others. However, Eurocentric beliefs and perceptions of true sacred places as those that are associated with Christian belief often work against the understanding and conservation of sacred sites of other cultures, especially those of indigenous people. The Aboriginal people of Australia, Native Americans, Maori, Saami, Inuit, and other indigenous population groups are deeply concerned about the destruction of and intrusion into their sacred places. However, the protection of sacred places is often part of the larger issue of environmental conservation, especially since many sacred sites are historical sites or natural places. Yet population growth, commercial development, technological development, and the ever-growing demand for mineral and other resources threaten the existence of many sacred places. Mining at important archaeological and sacred sites has been practiced on Hopi traditional homelands in Arizona despite knowledge of the fact that the Hopi have a spiritual covenant to take care of their desert environment. The beliefs and spiritual and religious practices of native people are thus under increasing challenge from national parks, private property boundaries, and the demands for resources.

Sacred places therefore have different levels of meaning to people, depending on historical factors and the presence of great saints, miracles, and healings at these places. Moreover, different religions and beliefs employ different and distinct definitions of sacred places. This has led to conflicts in different countries between native people and other sections of the population over resources, especially over land that natives believe is sacred. Sacred places have thus been at the core of conflict between different religious groups, and such conflict is still ongoing in many parts of the world, fueled by unscrupulous actions of political leaders. A fine balance in perspectives and respect for and deep appreciation of sacredness are crucial for the preservation of sacred places and for peace in the world.

SAINT LUCIA

Saint Lucia is a small island country in the eastern Caribbean. It has fewer than 200,000 inhabitants, many of them descendants of slaves brought by the British to work in sugar plantations in the 19th century. The French were the first European colonizers; they made a pact with the native Carib people in 1660 and soon thereafter began to cultivate sugarcane for export. For the next 150 years, the control of the island changed hands between

the French and British until the war of 1814, when the island became firmly a part of the British Empire. It remained in the empire until Saint Lucia's independence in 1979. It is still part of the British Commonwealth.

The native Carib people died off, largely due to their susceptibility to diseases brought by the Europeans. In their place, the British imported enslaved Africans to work on the sugar plantations. Most of the present-day inhabitants of Saint Lucia are descendents of these African laborers.

The French left their mark on the culture of the island. Though the official language is English, most people speak a form of Creole that is based on French. Because of the French influence, the majority of residents are Roman Catholic.

About 70% of the population is Roman Catholic, and most of the rest are Protestant Christians, including Anglicans, Baptists, Seventh-Day Adventists, and evangelical Protestants. A few record their religion as Rastafarian, and a small number of East Indian immigrants are Hindu and Muslim.

SAINT VINCENT AND THE GRENADINES

The religious history of the island nation of Saint Vincent and the Grenadines in the eastern Caribbean Sea is complex and indelibly linked to

issues of migration, displacement, colonization, slavery, and the search for nationhood and freedom. The first inhabitants were the Taintos (Arawaks), a group of agricultural people who originated from the Orinoco Basin in South America. They were replaced by the Callinagoes (Caribs) who also migrated from South America. The religious beliefs of both the Taintos and the Callinagoes are characterized as Amerindian shamanism: having a Supreme Being, who did not directly interact with the people; lesser divine being(s), who exerted power over their daily lives; and priests, who functioned as spiritual intermediaries between the deity and humans.

With the arrival of the Europeans and Africans, the religious terrain of the islands began to undergo dramatic changes. First, there was the introduction of Christianity in the form of Roman Catholicism. For many Spaniards and the French who followed them, the servitude or enslavement of the Amerindians and Africans was justified in the context of civilizing and evangelizing them. As a result, their Christianization efforts took the form of making sure that the Amerindians and slaves received Catholic instruction and were baptized. However, this baptism was to have no bearing on their subordinate status as part of the *encomienda*. They were laborers or slaves in this labor system that the Spaniards implemented during their colonization of the Americas.

Second, there was an emergence of indigenous religious expressions. Throughout much of the 17th and the 18th centuries, St. Vincent remained a site where Callinagoes actively resisted European colonization. However, it also functioned as a refuge for African slaves who had either been shipwrecked or escaped from the islands of Barbados, St. Lucia, and Grenada. The offspring of the miscegenation between African slaves and Callinago women was a group called the Black Caribs. For some of these offspring, their religious beliefs are the product of the syncretism of various aspects of their African and Callinago religious heritage.

When the British gained ownership over the islands in 1763 and again in 1783, another phase in the religious history of the islands of St. Vincent and the Grenadines was inaugurated—the coming of Protestant Christianity and emergence of Afro-Christianity. Unlike their Roman

Catholic predecessors, the established Protestant churches made very little attempt to Christianize the slaves. Thus, the work of evangelizing the slaves did not become a priority until the arrival of nonconformist denominations—primarily the Methodists. The century and a half of inattention, however, created an environment in which the slaves continued to practice their African religions—albeit in a modified form that suited their current environment. When the slaves eventually interacted with Christianity, they found a religious faith that resonated on several levels with their modified African religious heritage in terms of the veneration of saints, style of worship, and other beliefs. As a result of this resonance, they were able to use the interpretive framework of their previous religious experience to decode and understand the Christian message; the result of this process was the emergence of Afro-Christian religious traditions such as Spiritual Baptist.

shrines are built for their enduring veneration. In Christianity, these holy people are called saints; for this reason, this entry will focus on the Christian veneration of saintliness.

Christians around the world have prayed to saints, deceased humans who have been posthumously deemed holy by church authorities and lay persons alike, since the early days of Christianity. Saints function as intercessors and mediators who deliver the faithful's prayers and requests to God in heaven. They are seen as role models for humans on earth to look to and to emulate. Christians, especially Roman Catholics and the Eastern Orthodox, have forged intimate relationships with saints for centuries, turning to them in times of need and distress. Whether these saints are officially recognized by religious authorities does not always matter, as the faithful forge relationships with those saints declared holy by church hierarchies as well as those they unofficially deem to be saints. From the earliest cult of the saints in Western Christendom to more contemporary devotions to saints, believers have looked to saints as special mediators between their earthly selves and heaven. Since the days of early Christianity, saints have been thought to have extraordinary qualities and are beseeched by the faithful and are asked to help them in their lives on earth. Yet saints are also believed to be human and to have lived human lives not always free from sin. Saints have extraordinary qualities as well as human ones. Since the early days of Christianity, men and women have turned to saints for guidance and protection, and today, with increasing globalization, transnationalism, and all the challenges associated with these lived realities, women and men around the world are turning to saints for help.

The Institutionalization of Sainthood

The earliest saints were popularly declared as such; women and men unofficially canonized by Christians who took it upon themselves to venerate men and women they believed to embody heroism. Thus, the earliest devotions to saints were popular and lay run rather than institutionally directed. Always alert to an imbalance of lay-official church power and seeking to assert clerical authority, clerics moved to institutionalize the process of making a man or woman a saint. The institutionalization of

SAINTS

Virtually every religious tradition has the custom of venerating the spiritually adept, holy men and women whose memory and spirit live on within the community's sacred memory. In Buddhism, there are *boddisattvas*; in Hinduism, there are medieval *sants*, the poet-saints who have fostered religious movements of their own; and in Islam, there are Sufis and other holy men for whom

sainthood began in 1170, when Pope Alexander III declared that it was the pope, not the people, who would control the process of canonization as well as the devotions to the saints. Thereafter, in the Roman Catholic Church, from the 12th century to the present, the path to sainthood includes a three-step process of discernment:

1. *Examination*: This is the preliminary process, during which a commission examines the candidate's life on earth and determines if she or he is a worthy candidate.
2. *Beatification*: If the candidate is shown to have one miracle attributed to her or him, the church beatifies the individual, in effect recognizing the saint in question as blessed.
3. *Canonization*: If the candidate in question is shown to have one additional miracle attributed to her or him, the person is officially made a saint and recognized to reside in heaven.

The Catholic Church sees its saints as those who possess heroic virtue and who are special in the eyes of God. Both Roman Catholic and Orthodox Church hierarchies recognize saints as humans who are not exempt from sin but who have led overwhelmingly holy lives. The saint's lifetime of good deeds, heroic virtue, and special holiness distinguishes him or her from mere mortals. The process of institutionalizing devotions to saints continues to evolve. Since 1588, the Vatican has had a specially designated department for saint candidates—the Congregation for Causes of the Saints—which sorts through the documents that have been submitted. The Roman Catholic Church hierarchy's definition of who should be canonized as a saint has changed with the times, sometimes paralleling public opinion and at other times diverging from it.

In the earliest days of Christianity, saints were those who endured intense amounts of bodily suffering, of the self-inflicted or external variety. Some of these early saints were martyrs, and the bloodier the martyrdom the better. Take for instance St. Stephen, considered the first Christian martyr who was stoned to death, or Perpetua and Felicitas, two North African women who were gored by wild animals in the year 202 before being stabbed by soldiers in the town's amphitheater.

Like Stephen, Perpetua and her slave Felicitas were known for enduring incredible amounts of torture, pain, and bodily anguish. Yet another famous early Christian martyr, Polycarp, was burned alive in 155. Early Christian martyrs' bodies were bloodied, burned, stretched, racked, and torn. Their anguish and refusal to renounce their faith in the midst of incredible amounts of pain and agony is honored by Christians today, who see them as exemplars of faith. Other early Christian saints renounced their bodies and suffered, fasting to diminish the flesh for a higher, ascetic purpose. These men and women were able to transcend the evils of their flesh, as viewed by Christian theology, and served as models of discipline and piety. Their sufferings could be internalized by the devout, who honored the saints' sufferings and saw them as idealized versions of themselves. And it was the saint's body—fragments of bones, hair, flesh—that captivated the faithful, who saw these remnants as markers of divinity. It was through sensory engagement—touching, smelling, and seeing the saints' relics—that the early Christians felt a deep connection to God.

By the time we get to the 14th century, clerics and everyday Christians alike wanted their saints to perform miracles as evidence of special extratemporal powers and connectedness with the divine. Unlike the average believer, a saint possessed a special ability to carry believers' requests and prayers to God, and this belief in a saint's intercessory powers resulted in intense devotionism to saints. Private and publicized prayers to saints had an end in mind—that the saint would intercede on the believer's behalf and perform a special request for the individual, a family member, or other loved one. The concept of reciprocity flourished—that the devotee would make a promise of sacrifice to the saint if the saint granted the devotee's wish. The cult of patron saints flourished in medieval Catholicism; believers prayed to and petitioned saints they deemed especially efficacious.

Yet not all Christians have nurtured relationships with saints. Martin Luther and other Protestant Reformers of the 16th century did away with invocations and devotions to saints, which they regarded as detracting from devotion to Jesus Christ. Throughout medieval and modern church history, Protestants were adamantly opposed to the invocation and veneration of saints, reflecting

their reformation goals of rooting out what they viewed as the man-made excesses of religion. Today, many Protestants are open to the idea of saints. Since the late 1980s and the rise of ecumenicism, many Protestant denominations have adopted a more open stance toward the veneration of saints, seeing them as role models and as visible signs of the Holy Spirit. Episcopalians, for example, honor saints and do not require miracles as does the Roman Catholic Church. Examples of saints named by the Episcopal Church in the United States and honored in their calendar include the Italian Catholic saint Catherine of Siena, the Underground Railroad pioneer Harriet Tubman, the civil rights leader Rev. Martin Luther King Jr., and the Civil War nurse and social reformer Florence Nightingale. The Episcopal calendar includes a wide range of men and women who may or may not have performed miracles. The common denominator is that they led exemplary lives and are worthy of emulation. And even Lutherans, not known for their devotion to saints for historical reasons dating back to the Reformation, have their own patron saint. Every December, Swedish and American Lutherans in churches across the United States and Sweden merge Swedish folklore and fourth-century Sicilian devotions to Lucy, creating a Protestant veneration of a female saint known for her piety, suffering, and generosity.

Other Protestant Christians see themselves as saints on earth, as specially designated by God himself. Since the early 20th century Pentecostals, fundamentalist Protestants, have striven to live as saints on earth, in some ways akin to the 17th-century Puritans, who emphasized living lives of visible sainthood. Pentecostals who are saved are called saints, visible signs of the Holy Spirit and God's grace. Pentecostals, whether they are members of the Assemblies of God or the Church of God in Christ, see all believers as possessing divine virtue and have no formal process of canonization, in contrast to Roman Catholics and Orthodox Christians. Pentecostal Christians see the process of sanctification—the process of becoming holy—as an intimate relationship between them and God. They do not believe in the theology that surrounds saints, preferring to believe that men and women can be saints on earth and live in a community of saints.

Pentecostalism is primarily a Third World phenomenon, and its emphasis on healing and renewal

and deliverance from the sufferings of this world make it especially attractive to men and women gripped by poverty, the transition from a rural to an urban economy, and social problems exacerbated by swift changes and dislocations, especially in Zimbabwe and Nigeria. Pentecostal theology offers a chance for men and women, particularly those who are poor and oppressed, to be saints on earth and to live empowered, fulfilled lives. As saints on earth, Pentecostals are equipped with the theological tools to cope with the changes and disruptions of the 21st-century world and seize on the opportunity to find salvation in this life. Unlike official Eastern Orthodox and Roman Catholic saints, Pentecostal saints are not necessarily heroic or virtuous but are everyday men and women who have been anointed by the Holy Spirit in this life. Pentecostals around the world need no other authority than God to deem them saints.

Mormons, members of the Church of Jesus Christ of Latter-Day Saints, believe that they are saints on earth, linking themselves to New Testament tradition that followers of Christ were saints. Mormons call themselves latter-day saints to denote that they are living in the latter days of Christ's second coming. Like Pentecostals, Mormons refer to themselves as saints and embrace a theology of Christian empowerment in which men, women, and children on this earth are living saints.

The Orthodox Church, like the Roman Catholic Church, has a formal process of canonization that dates back to the ninth century and that is organized by the territorial synod. While the Roman Catholic Church's process of sainthood is handled by a special Vatican office, Orthodox Christians have a more localized process. Orthodox Christians acknowledge that their saints may not have always been perfect but that it was the striving toward perfection that matters most. In Orthodox Christianity, canonization does not make a person a saint; rather, it recognizes that a man or woman was a saint on this earth. Like Roman Catholics, Orthodox Christians are given saint names at confirmation, thus signifying a relationship between the temporal and heavenly realms and their occupiers.

Unofficial, Popular Saints

Saints who have been canonized by the Roman Catholic Church or Orthodox Church are granted

official legitimation, and devotions are institutionally supported and encouraged. Many countries, particularly those in Latin America, can boast their own national saint and host annual celebrations in honor of their patron saint. The Virgin of Guadalupe, Mexico's national saint, is celebrated on December 13 each year in Mexico and in Mexican American communities throughout the United States. Another national Virgin, the Virgin of El Cobre/Our Lady of Charity, is celebrated in Cuba and among the Cuban American diaspora in Miami, Florida, each September 18.

In addition to these larger national celebrations, more locally held devotions are celebrated in churches and backyard shrines throughout the world. While officially recognized saints can have strong devotions, not all canonized saints do: For example, while officially recognized saints such as Juan Diego and the Virgin of Guadalupe have strong followings in Mexico and on the U.S.-Mexico border and in places with large numbers of Mexican residents, other canonized saints such as Josemaria Escriva de Balaguer, the founder of the conservative Roman Catholic group Opus Dei, have more limited followings. Time will tell if another recently designated Roman Catholic saint, Gianna Beretta Molla, who died in childbirth knowing that she had terminal cancer, will attract a large following. Others who are on the path to sainthood, such as Mother Theresa, have not yet been canonized but have a large following among Catholic and non-Catholic devotees who have unofficially deemed her a saint and who anticipate her canonization.

Other saints have been officially canonized by the church and unofficially by the people.

St. Thérèse de Lisieux, the 19th-century officially canonized French Carmelite nun, also happens to be one of the most popular saints in the world. Fondly called "The Little Flower" by the Roman Catholic Church as well as the devout, the 1997 to 2002 world tour of her remains was met enthusiastically by millions of devotees.

While the canonization of a saint most certainly helps increase devotions, it does not always serve as the final legitimator as there are hundreds, if not thousands, of unofficial saints—saints of the people, for the people, and by the people. These popularly proclaimed saints tend to flourish among men and women who are oppressed, marginalized, and experiencing the pains of social dislocations and

upheaval around the world. These unofficial, syncretic saints live among the poor and in the homes of those whose lives are not marked by empowerment and privilege. Haitians, for example, have merged *vodou lwa* ("spirits") with official Catholic saints to form syncretic saints that are deeply informed by two or more religious traditions. Ogou, the warrior *vodou lwa*, is merged with the Catholic Saint James to form a distinctive cultural deity that embodies cultural and religious identities and that reflects the social situatedness of its believers. The Vodou spirit Gede is especially important in immigrant Haitian communities as he is seen as a "survival artist," according to Karen McCarthy Brown, one who can help them adjust to life in a new country. Gede, an immigrant himself, helps followers of Vodou maintain ties to Haiti and even farther back to Vodou's origins in Africa (Brown, 2001, p. 379).

Like practitioners of Vodou, who merge Catholic and Vodou cosmologies to form syncretic saints, practitioners of Santería and Candomblé, two syncretic religions that draw on African and Caribbean belief systems, merge Catholic belief in saints with indigenous spirits. In African Cuban Santería, *orishas* are merged with Catholic saints much like *lwa* are merged with Catholic saints in Haitian Vodou, and spirits are merged with Catholic saints in African Brazilian Candomblé or, as it is also called, Macumba.

Like other places in the world where we find social dislocation, poverty, and the stresses of urban living, the U.S.-Mexico border is home to active devotions to unofficial, popular saints such as Juan Soldado, Don Pedrito Jaramillo, and Jesus Malverde. These men do not meet the Catholic Church's requirements for holiness, but institutional legitimation does not matter to the faithful who have deemed these men saints. Soldado, convicted and killed by a Mexican firing squad for his alleged rape of a young girl, is revered by Tijuanaenses and Mexicans along the border who believe that he was wrongly convicted and that he is a martyr who intercedes on their behalf. Men and women pin slips of papers and photographs, along with their hopes and dreams, inside the walls of Soldado's shrine, praying to him to intercede on their behalf. Soldado's lack of official Church canonization has done nothing to dampen popular devotion to this saint, and the Tijuana cemetery

where he is buried is a pilgrimage destination for Mexicans.

Like Soldado, Jaramillo and Malverde are unofficial borderland saints. Jaramillo, a South Texas *curandero*, a healer, is considered a saint to those men and women living on the Mexico-Texas border. Up to his death in 1909, thousands of Mexicans and Anglo Americans sought his curative powers. For his part, Malverde, a Sinaloa Robin Hood character, is believed to have robbed rich hacienda owners to give the money to the poor. He is believed to have been killed, or martyred by the state, in 1909, and a shrine was built by devotees in his honor not long after his death.

Heavenly and Human Intercessors

Devotion to saints has been around for centuries. Whether the saint has been officially canonized by the church does not always matter as men and women have forged relationships with these human and divine intercessors since the beginning of Christianity. While popular and official devotions may indeed overlap, as they do for countless saints deemed holy by the Church and by the devout, the U.S.-Mexican borderlands saints show that this is not always the case.

SAMOA (AMERICAN AND INDEPENDENT STATE OF)

The islands of Samoa in the central Pacific Ocean are divided between an independent state of Samoa and the American territory of Samoa. Their religious cultures, however, are similar. God is prominent in the Samoan way, a culture known as Fa'a Samoa. The Samoan way has three key elements, including the village chief, the extended family, and Christianity. Christianity was adopted in the 20th century into this ancient code of Samoan conduct. Samoans are typically Christian and believe that Sunday is for worship and family. The public seal for Samoa states that "God be the Foundation of Samoa" (*Fa'avae i le Atua Samoa*). Many Samoans begin public speeches and written communications by thanking God and recognizing His influence in their life (*Muamua ona si'i le fa'afetai i le Atua*). On

Sundays, most businesses are closed, and Samoans in Sunday dress are seen parading down the streets to services.

Today, Samoans are divided between American Samoa and the Independent State of Samoa (formerly Western Samoa), but they share a common heritage. The German protectorate of Western Samoa was occupied by New Zealand at the outbreak of World War I in 1914. Germany continued to rule the islands until 1962. Western Samoa was the first Polynesian nation to establish independence in modern times. In 1997, the country dropped the term *Western*. American Samoa is an unincorporated territory of the United States. The constitutional preamble reads that Samoa is “an independent State based on Christian principles and Samoan custom and traditions.” There is, however, no official state religion.

People of the Samoan Island chains share a common religious history. The Samoan Islands were originally inhabited as early as 1000 BCE. Before Christian missionaries arrived in the early 1800s, the Samoan Islanders worshipped in a polytheistic manner. They differentiated between nonhuman (*Atua*) and human (*Aitu*) gods and incorporated ancestral spirits in their religion. The Samoan people worshipped animals, earth, stone, oceans, and rivers as their gods. These early Samoans had no external signs or symbols of religion, and outsiders may have considered them as godless. According to legend, the war goddess Nafanua prophesied about a new religion to end the rule of the old gods. Some consider that this prophecy enabled the early Christian missionaries to convert many followers.

In the late 1700s, the first European sailors arrived and shared Christianity. In 1828, Peter Turner, a Methodist missionary, visited Samoa and discovered that there were already Methodists in the islands. The Methodists had established a Tongan mission, and family ties between Samoa and Tonga spread the religion. In 1830, John Williams arrived, representing the London Missionary Society. When he departed in the same year, he left several missionaries. He returned to Samoa in 1832 and found that the missionaries had converted a high-ranking king, Malietoa, to Christianity. The first Samoan version of the New Testament was printed in 1848. In 1848, Catholic priests arrived and established a foothold on the

island. In 1857, a Methodist mission was opened. In 1863, the Church of Jesus Christ of Latter-Day Saints missionaries began their ministry in Samoa. By 1885, all islanders were considered nominally Christians as indicated by a news article in the *Te Aroha News*.

Today, the religions of Samoa encompass a range of denominations, with nearly the entire population professing Christianity. According to the World Christian Database, more than 98% of the population of American Samoa, a territory of the United States, is Christian. As of 2010, the *CIA Factbook* indicated a total population of about 66,000, with 50% being Christian Congregationalist and 20% being Roman Catholic. The Church of Jesus Christ of Latter-Day Saints website claims a membership of 23%.

The Independent State of Samoa, the former colony of New Zealand that became an independent country in 1962, is also overwhelmingly Christian; according to the World Christian Database, more than 98% of its population is Christian. As of 2010, the *CIA Factbook* indicated that the country has an area of 1,133 square miles (1 mile = 1.609344 kilometers) and a population of 192,000. The major religious groups are Protestants (45%), Mormons (28%), and Roman Catholics (20%).

SAN MARINO

In this tiny republic nestled between Emilia Romagna and the Marche regions of Italy off the Adriatic Coast, the religious situation is not very different from that of the Italian society that surrounds it, with 95% of the population belonging to the Catholic Church. Yet myth and history have created a distinctive situation characterized by a close connection between faith and freedom, and religion and politics, which is not, however, immune to the growing pluralism and secularization of society.

San Marino is the oldest and second smallest republic in the world, with a territory of 60 square kilometers and a population of 24,000. Legend has it that it was founded around 300 on Mount Titano by Marinus, a stonecutter from Dalmatia and a group of early Christians fleeing persecution for their faith. Protected by its geographical isolation and the strong faith of its inhabitants, San Marino developed over the centuries as a self-reliant community convinced that its freedom had been bequeathed by the founder whose motto *Nemi Teneri* (“not dependent on anyone”) successive generations strove to implement against feudal lords, popes, emperors, and neighboring Italian states. In 1600, San Marino declared itself a republic, claiming that its sovereignty and liberty were guaranteed by the presence of the relics of its patron saint.

Each year on September 3, the Sammarinesi celebrate together the death of their saint and the foundation of their republic, and most official ceremonies are held in the Basilica and opened by a homily by the Catholic bishop of the Diocese of San Marino-Montefeltro. Yet Roman Catholicism is not the country’s official religion, and the law guarantees freedom of conscience and religion and prohibits discrimination based on religion. Roman Catholicism is, however, the religion of the majority of the population, with only 5% belonging to other faith groups, among whom are Jehovah’s Witnesses, members of the Waldesian Church, and small numbers of Baha’is, Muslims, and Jews. Under the law, citizens may allocate 0.3% of their income tax to Catholic Charities, and in 1992, this privilege was extended to the Jehovah’s Witnesses and the Waldesian Church.

The close integration of religion and politics is no longer as universally accepted as in the past. In *Buscarini & Others v. San Marino* (ECHR 7, February 1999), the European Court of Human Rights ruled in favor of three newly elected members of parliament who refused to make the required reference to the Gospels in taking the oath of office in 1993. The Court found that “requiring elected representatives of the people to swear allegiance to a particular religion was not compatible with article 9 of the European Convention,” which guarantees freedom of thought, conscience, and religion. Since then, the law has been amended to include a choice between the traditional oath and one in which the reference to the Gospels has been replaced by the words “on my honor.”

SANGHA

The sangha is a monastic organization that has been an integral part of Buddhist and Jain traditions throughout recorded history. As Buddhist and Jain traditions spread across the world, so did their monasticism. One of the sanghas of the Mahayana Buddhist tradition traces its migration from India to China, China to Korea, Korea to Japan, and most recently Japan to the United States and Brazil. In contemporary times, the largest sangha is of the Thai Theravada Buddhist tradition and has members in more than 28 countries. Overall, ordained sangha members in the Buddhist and Jain traditions number more than 1.5 million

worldwide. Jain and Buddhist traditions contain different definitions for the term *sangha*. For some of the more liberal minded, *sangha* simply implies its direct Sanskrit translation, “community.” In this broad definition, the scope of *sangha* is representative of globalization. As technology pulls people together, the term *community* becomes broader in context than that of a specific physical locality. In other definitions, *sangha* is meant contextually as a Buddhist or Jain community. However, most commonly, *sangha* is used as a referent for a monastic organization.

The founders of Buddhist and Jain traditions in the fifth century BCE formed *sanghas* to assist people in their spiritual development. Both the Buddha and Mahavira were princes before they embarked on their religious paths. As a result, each could draw on his experience with statecraft. *Sanghas* were styled after the *gana-sanghas*, regional oligarchies that were endemic to the politics of South Asia. In both Jain and Buddhist traditions, people renounce their householder lifestyle and ordain into the familial ascetic environment of a monastery. Traditionally, newly ordained members of a *sangha* shave their heads and relinquish all ties to their former lifestyle as a symbol of devotion to their new calling. Jain monks (Sanskrit *muni*) and nuns (Sanskrit *sadhvi*) are known for adhering to ascetic guidelines that are stricter than those in the Buddhist *sanghas*. Both Jains and Buddhist monks (Sanskrit *bhikṣu*) and nuns (Sanskrit *bhikṣuṇī*) follow a set of rules that dictate their livelihood. In this manner, *sangha* members act as role models for their communities. In Buddhist traditions, the *sangha* is considered one of its three most sacred elements, the other two being Buddha and Dharma (teachings). The monastic organization is the bearer of the Buddhist teachings, and Buddhist laws derive from the monastic order called the *vinaya*. Historically, *sanghas* have legitimated different states and rulers, and more recently, Buddhist *sanghas* were involved in nation building.

Sanghas in the 21st century include a greater diversity and number of peoples than ever before. This diversity reflects the growth and change within communities worldwide. Thus, *sanghas* are a global infrastructure for Buddhist and Jain diasporas around the world.

SANSKRIT

Sanskrit is a member of the Indo-Iranian branch of the Indo-European language tree. Although commonly associated with ancient India, Sanskrit represents a global language, historically appearing in diverse contexts and scripts across a wide range of regions. It continues to be an important liturgical language for Hindu and Buddhist practitioners across Asia.

Origins

Two prevailing theories have been proposed to explain the origins of Sanskrit. First, proponents of the Aryan invasion (also referred to as the Aryan myth) argue that Sanskrit, along with other elements of Indian culture, entered India during the invasion of the Aryan people, sometime between the second and first millennium BCE. Regarding Sanskrit nomenclature, they point out that the lexis found in the earliest Vedic texts overlaps considerably with Iranian sources, most notably the Zoroastrian Avesta. Throughout the Vedic corpus, a number of Iranian loan words have been identified as well as terms that can be traced to the broader Indo-European branch.

The second theory holds that Sanskrit arose from within the Indian subcontinent and subsequently was exported to other Asian regions. Supporters of this theory argue that a large portion of vocabulary in Sanskrit texts is indigenous to India and not attested elsewhere.

In reality, both theories have some truth to them. It is clear that there has been, beginning with

the ancient period, continuous contact and exchange between India and Iranian regions. This contact and exchange did not end in the Vedic period but can be found in almost every major historical period and political dynasty. The exchange was not unidirectional or a one-way diffusion either from some “Aryan” civilization to India or from India outward. Rather, Sanskrit, like most cultural phenomena, developed over time through a joint process of cross-fertilization and regional innovations.

Regardless of the origin, the Sanskrit language clearly was not limited to the Indian subcontinent but, rather, extended across a wide geographical area.

Sanskrit Manuscripts

The earliest known form of Sanskrit, Vedic, can be traced to the Vedas, with portions of the Rig Veda being dated to approximately 1500 BCE. The Vedas include a vast corpus of manuscripts, including the *Sambitās* (“hymns”), *Brāhmanas* and *Āranyakas* (“ritual commentaries”), and the Upanishads (philosophical speculations). The four Vedic schools, *Rig*, *Sāma*, *Yajur*, and *Atharva*, are far from homogeneous and collectively record a diverse range of beliefs and practices. The Vedic manuscripts were composed by multiple authors and in various geographical, historical, and cultural contexts.

In the fourth century BCE, Pānini, a grammarian from the Indo-Iranian region of Gandhāra, marked a transition between Vedic and classical Sanskrit. Pānini is best known for his voluminous work on Sanskrit grammar and morphology titled *Ashtadhyayi*. Auxiliary texts include the *Shiva Sūtras*, *Dhatupatha*, and *Ganapatha*. Although similar to Vedic Sanskrit, classical Sanskrit differs significantly in nomenclature, grammar, and syntax.

Sanskrit manuscripts, both Vedic and classical, typically have been associated with the Hindu traditions of India. However, it is important to note that a large number of East Asian Buddhist manuscripts were originally composed in Sanskrit before being translated into Chinese and subsequently transmitted to other regions of East Asia. Though translators claimed that the Sanskrit texts originated in India, significant portions of these

Buddhist texts were composed in the Inner Asian regions of Kashmir, Gandhāra, and the Swāt Valley and written in scripts found most prominently in Central Asia, not in India. Given the early dates attributed to some Chinese translations, combined with the absence of extant Sanskrit originals, it is probable that some manuscripts were not only written in Inner Asia, but that they came to India only after they were translated in China.

Sanskrit Scripts

Sanskrit manuscripts were strictly transmitted orally for several centuries. Written sources from ancient India are extremely rare, and in fact, the earliest Sanskrit writings are primarily found outside India, in Inner Asian regions. The absence of manuscripts alone is not enough proof to assert that they did not exist, however. First, the palm leaf material easily deteriorated in the climate of India. Second, it is commonly accepted that Indian scholars have long preferred memorization and oral transmission of texts over the written word (a precise and effective method still employed in Sanskrit instruction today).

Beginning around the third century BCE, examples of written Sanskrit appear in multiple geographical locations and in variant scripts. The first-known form of written Sanskrit appears in the Brāmī script, recorded in Asokan inscriptions left on pillars and monuments across India and Central Asia. Ironically, Brāhmī was originally used for Prakrit, a linguistic descendent of Sanskrit, before being used as the first Sanskrit script. During the first centuries of the Common Era, Sanskrit appeared in diverse contexts, often alongside other languages. As an example, coins found in Central Asia have legends written in three scripts—Greek, Brāhmī, and Kharosthī. This is further evidence of the eclectic and widespread nature of Sanskrit during this time.

The Brāhmī script itself was not a singular or consistent script. Rather, it is a general term used to describe scripts that have yet to be classified systematically. Some refer to a threefold classification—early, middle, and late Brāhmī—while others name the scripts after political dynasties, such as Gupta or Kushāna. Certain scholars, such as Richard Salomon, have argued that the dynastic categorization is misleading and that the scripts

instead should be categorized based on regional differentiations.

The Kharosthī script represents another important Sanskrit script used for epigraphic, administrative, and literary purposes beginning around the third century CE. A significant number of Kharosthī documents have been unearthed in regions extending from Afghanistan to the Tarim Basin. Kharosthī, the only Sanskrit script written from right to left, is derived from Aramaic and likely originated in the eastern parts of the Achaemenid Empire around Gandhāra. There exist some commonalities between Kharosthī and Brāhmī, but this could be due to a common parent prototype, such as the Aramaic script, rather than a direct historical connection.

Beginning around the sixth century, the late Brāhmī script evolved into a form most commonly referred to as Siddamātrikā, or simply Siddham. Siddham represents a common script for Buddhist manuscripts that were transmitted to China, and many original Siddham mantras have been preserved within the translations. After being translated into Chinese, the texts were subsequently transmitted to Japan and throughout East Asia. Since there exists no extant Sanskrit original for most of these manuscripts, Chinese serves as the linguistic bridge between Sanskrit and other East Asian languages.

In northern India, Siddamātrikā evolved over the next few centuries into Devanāgarī, the script most commonly associated with Sanskrit today. The preference for Devanāgarī during the colonial period has led to a common assumption that Devanāgarī is the only Sanskrit script. However, prior to the 19th century, Sanskrit writing was far from consistent and tended to be regionally specific.

Sanskrit continues to be an important global language and is primarily used today in liturgical settings, though the usage varies contextually. East Asian traditions emphasize the written form of the language. The bulk of Sanskrit texts brought to China were written in the Siddham script. Given the difficulty with translating Sanskrit into Chinese dialects, translators emphasized the written form of the Siddham over the correct pronunciation of Sanskrit mantras. Thus, Siddham in East Asia gained prominence as a form of sacred calligraphy. This usage of Sanskrit is evident in contemporary Japanese temples, where Siddham mantras are often written on implements used in ritual practice.

In contrast, correct pronunciation of Sanskrit mantras is of utmost importance in Indian traditions. Comparatively little importance is afforded to written Sanskrit and, in fact, it is often consciously deemphasized.

Sanskrit has had, and continues to have, wide global significance. Though typically associated with Indian religious traditions, it has been employed for multiple purposes—including religious, administrative, epigraphical, and political—and in various regions throughout Central, South, and East Asia.

SANTERÍA

Santería, also called *Regla de ocha* or *Lucumí* religion, is a Cuban initiatic religion of African

Yoruba origin. Central features of this religion are the worship of divinities called *orichas* and the regular dialogue with these entities through different techniques. The practice of Santería is connected, in a complementary but also hierarchical way, with other local religious practices (popular Catholicism, Spiritualism, *palo monte*). The Spanish term *santería* refers to the identification between *orichas* and Catholic saints.

Originally practiced by Yoruba slaves from West Africa, locally known as Lucumí, Santería has progressively spread among the whole population. It is now widely practiced not only by Cubans from all socioprofessional and ethnic categories but also by an increasing number of foreigners in and out of Cuba.

Santería constitutes, among other religious expressions (Haitian Vodou, Brazilian Candomblé, Trinidadian *Shango*), an emblematic instance of African American syncretism stemming from slave trade and colonial history. For a long time, scholars have tried to identify continuities and discontinuities between African and African American religious manifestations, but it is now clear that the latter must be understood as a unique phenomenon. In Cuba, this dimension has long been recognized within the frame of specific discourses on national identity. Here, we will focus on Santería's historical, theological-ritual, and sociological dimensions.

Historical and National Context

Santería's ritual and mythical system developed in the second half of the 19th century, initially in the western part of the island and probably in connection with legal associations (*cabildos de nación*) that gathered slaves and freed them according to their regional origins.

Progressively, Yoruba initiatic traditions, separated from their territorial and community roots, underwent a deep process of adaptation to the new sociocultural environment: Ceremonies were altered and condensed. In addition, they integrated elements of other African and European religious traditions (e.g., before the initiation, neophytes must be baptized and "spiritualist masses" must be performed). Equally, the mythological corpus and the sacerdotal system were, to a certain extent, remodeled. This process of adaptation and syncretism,

also driven by divergent tendencies, contradictions, and dynamics of power that still endure, shaped the pattern of "modern" Santería or Santería *criolla* (Creole).

During the Cuban "pseudo-republic" (1902–1959) and the first decades of the Castro Revolution, the practice of Santería was frequently stigmatized and sometimes even criminalized. However, some of its choreographic-musical rituals were studied by local intellectuals and progressively folklorized, aestheticized, and theatricalized. Since the 1990s and the ideological reorientations adopted in post-Soviet Cuba, Santería has gained great prestige and important visibility. Today, definitely conceived as a specific manifestation of a whole historical national process, it has finally become a symbol of national identity, an element that probably plays a part in its contemporary popularity and diffusion among certain foreigners and the public.

Cosmology and Initiatic System

Santería's pantheon consists of a creator god, who allocates the *aché* (a mystic and sacred energy circulating in the cosmos), and about 20 *orichas* (deified ancestors) who have several avatars. *Orichas*, the main figures of mythological narratives, are respectively associated with elements of the social and natural world, and every human being is considered to be the "child" of one of them. Santería's cosmology and rituals also attach specific importance to *eggún* ("deceased's spirits").

The initiatic system includes different levels. During the central one, usually called *asiento*, the neophyte embodies this tutelary *oricha*, also called "guardian angel." The latter is then personalized and "fixed" in the neophyte's head and in a receptacle. This receptacle, along with others, will later constitute the initiates' personal altar.

Consecration ceremonies, which are particularly complex in their details, are based on ritual invocations sung in Lucumí (the Cuban ritual language derived from ancient Yoruba), on the manipulation of specific elements such as stones (*otá*) and plants (*ewé*) considered as powerful vehicles of *aché*, and on animal sacrifices.

The symbolic logic of *asiento* is based on the double trope of royal coronation and the most classic one of (re)birth. Indeed, people generally

get involved in the initiatic system to solve physical and/or social dysfunctions or unbalances, and initiation ideally marks a significant change in their life. In their everyday ritual practices, initiates constantly actualize the alliances sealed with the *orichas* during the different levels of initiation.

Communication Between Men and Gods

The dialogue with divine entities is a pillar of the practice of Santería, in and out of initiatic cycles. To achieve this, several divinatory techniques are widely mobilized. The basic oracle of *obi* (coconuts) marks all stages of the initiatic cycles and guarantees the consent of *orichas/leggum* to the pursuit of ritual activity. Divination sessions are also performed at each level with the oracle of *dilogún* (cowries). Through the cowries and the mediation of the diviners' interpretation and exegesis, initiates are told about their destiny and collect a set of personalized rules supposed to help them conduct their life in a well-balanced and harmonious way. Depending on the ritual tradition of the initiator, the more complex *Ifá* oracle, also of Yoruba origin but exclusively used by *Ifá* initiates, may also be mobilized. *Dilogún* and *Ifá* both rest on an extended mythological corpus and are also often consulted during private sessions held by specialized diviners. Both always result in propitiatory actions (*ebbó*) consisting of simple offerings or animal sacrifices.

Another method of communication lies in trance of possession. This may happen during the *asiento* (ratifying then the embodiment of the *oricha*) and, above all, during public ceremonies commonly called *tambor(es)*. Ritual rhythms, chants, and dances then performed to pay homage to the *orichas* also aim to provoke trance of possession and to allow *orichas* to converse directly with the assistant, giving advice or demanding offerings through the words of the "possessed" initiate(s).

In a pragmatic way, all these media of communication aim to confirm the efficacy of ritual actions or to collect personalized prescriptions and rely on a principle of permanent exchange and reciprocity between human and nonhuman beings. Ultimately, this is also reflected in the initiates' everyday practices (interpretation of specific dreams, visions, or everyday events perceived as signs) and in the care they lavish on their altars.

Ritual Kinship and Priesthoods

Initiation not only creates alliances between human and divine realms but also within the social world itself, according to the logic of godparenthood and ritual kinship. New initiates contract a filial relation with their initiator and a fraternal bond with the latter's other godchildren. All form a "religious family" gathered around and led by this single priest, called *babalocha* (for men) and *iyalocha* (for women). Religious families are organized on a basic hierarchical principle of seniority: Prestige and authority stem from initiatic age and are the privilege of the *babalocha/iyalocha*. However, in theory, every initiate can become an initiator after the fulfillment of specific ritual obligations and form his/her own religious family.

Depending on their religious destiny (*camino*), men may also specialize in more prestigious priesthoods, according to a second hierarchical principle that guides the eventual progression between initiations and ritual charges. The most important from that perspective are the priesthoods of *oriaté* (the highest specialist in initiations and *dilogún*) and *babalao* (the specialist in *Ifá* divination). The apprenticeship of any priesthood is generally based on an oral transmission of ritual knowledge and, to a certain extent, on the consultation of written sources redacted by some initiates themselves.

From a sociological perspective, the exercise of priesthood always provides individuals with spiritual and symbolic advantages but also economic benefits because of the ritual retribution prescribed by mythological narratives. In more general terms, the exercise of priesthood thus implies the acquisition of a real social capital.

Social Organization and Contemporary Developments

Santería has always evolved in a noninstitutionalized context and presents an acephalous and segmentary organization. Practitioners do not have, for instance, collective places of worship ("temples" are their own homes, with domestic space serving in fact as ritual space). Though initiates refer to a unitary notion of tradition, and despite the existence of shared common principles, ritual practice may thus vary in its details. Furthermore, religious families work in a relatively autonomous way. Ritual lineages are linked by horizontal and

sometimes competing relations, reinforced by their logic of reproduction, which implies their exponential growth.

Since the early 1990s, some attempts at institutionalization have merged and tried to modify this configuration, but in vain. All profess competing wills of unification based on the model of the organization of world religions (some of them also advocate the “reafrikanization” of the worship), but they only achieve a qualified success.

The noncentralized organization and the importance of personal accomplishment, key to the plasticity and relative flexibility of practices, seem in fact to have favored the early expansion and success of Santería outside the island. Indeed, as a result of the periods of emigration that have marked the last 50 years in Cuba, Santería has conquered new adepts in the Americas (United States, Mexico, Colombia, Venezuela, etc.). More recently, through new migrations and the emergence of mass tourism in post-Soviet Cuba, its practice has also been implanted in western European countries (Spain, Italy, France, Germany, Switzerland, etc.).

This process, which works today in parallel with the expansion of other African American and African (mostly Nigerian) religions, is now prompting increasing empirical studies and supplying theoretical debates about “transnationalization” and “globalization” in social and religious anthropology.

SÃO TOMÉ AND PRÍNCIPE

Lying off the Atlantic coast from Gabon in West Africa, the islands of São Tomé and Príncipe house a largely Catholic population, with approximately 95% of the country's people residing on the larger São Tomé. The overwhelmingly West African population are largely Roman Catholic, with the church claiming 80% of the inhabitants. Evangelical Protestants along with Seventh-Day Adventists account for 15% of residents—a number that is growing due to continued missionary work on the island—and 2% of the remaining people are Muslim—mostly migrants from Nigeria and Cameroon. Many São Toméans continue to engage in indigenous spiritual practices, but that engagement does not preclude adherence to Christian faiths, and there is likely syncretism evident on the islands. Spiritist beliefs that inform syncretic practices stem mostly from African coastal societies and revolve around ancestral spirits and spirits that inhabit sacred spaces.

Although there were many claims of “discovery” by Europeans, São Tomé and Príncipe were in fact uninhabited when Portuguese explorers sighted the islands in 1471. Disease and the hardships of life soon claimed the first settlers, and in response, the Portuguese king, Joao II, gave control of the island to Alvaro de Caminha. De Caminha populated the islands with around 2,000 Jewish children, who had been removed from their homes and forcefully converted to Christianity, along with many convicts and prostitutes (called *degradados*) whom the Portuguese were happy to have on far-off shores. The Royal Charter that directed life on the island commanded that Jewish inhabitants and *degradados* marry slave women to create the future population. That decree resulted in the lack of slave trade on the islands, which in turn resulted in the Creole population extant in the country today, though the Portuguese legacy reverberates in the official language of the country. The country served as a trading post for many years

and was well regarded for its strategic location by both sides involved in the Cold War; it was only in 1975 that the islands gained their independence. Since then, the islands have become increasingly urbanized, and the majority of the population lives in urban centers; however, the small towns outside the main population centers are important spiritual centers of São Tomé and Príncipe.

At the beginning of the 21st century, the growing adherence to a Western consumer culture has resulted in a reduced status for traditional religious societies that were previously held in high regard. Most residents belong to local religious brotherhoods/sisterhoods that aid in the social control of the country and in the organizing of the festivals of the towns and parishes, usually around patron saints. The importance of local brotherhoods notwithstanding, most of the clergy on the island are “imported” from Europe. Religious organizations have to register with the government, and religious beliefs and rituals are heavily enmeshed with the society. Ritual specialists were still accepted and active on the islands at the beginning of the 21st century, and *Forros* (a term that means “freed slave” and designates the largest ethnic group of the country) continued to hold *djambí*, where spiritual possession was conjured by drumming and dancing. Christianity can claim the majority of the population as adherents, but traditional forms of spirituality remain largely active on the island.

SĀRNĀTH

Located in the Indian state of Uttar Pradesh, 10 kilometers north of Varanasi, Sārnāth is the place where Buddha gave his first sermon and is a major pilgrimage site for Buddhists around the world.

The name Sārnāth comes from *Saraṅganātha*, meaning “Lord of the Deer.” An ancient Buddhist story, *Nigrodhamiga Jātaka* (“Tale About Banyan Deer”), describes how once in a previous life Buddha was a deer king who offered his life to the local king to save a pregnant doe from slaughter. Inspired by this act of compassion, the king created a deer sanctuary called *Mṛgadāva* (“deer forest”). In Buddhist texts, this area is also called *Ṛṣipātana* (“raining sages”) since it was a gathering place of 500 sages (*ṛṣi*), who all attained nirvana, rose into the air, and let their relics rain on earth.

Following his enlightenment in Bodh Gaya, Buddha is said to have traveled to *Ṛṣipātana* to teach five mendicants who accompanied him in austerities. In his first discourse, the Dharmachakra-pravartana Sutra, or “Turning the Wheel of Dharma,” Buddha explained the nature of suffering through the teachings on the Four Noble Truths. The Four Noble Truths define suffering, its origin, its cessation, and the Noble Eightfold Path that leads to liberation from suffering. One by one, his companions became transformed through the realization of these teachings and formed the first community of Buddhist practitioners called *sangha*. Sārnāth became the place where Buddha, Dharma, and Sangha, the three essential elements of Buddhism, or Three Jewels, came together for the first time.

The ancient town of Sārnāth grew around the place of Buddha’s first teachings with numerous stupas, temples, and monasteries built by Buddhist patrons throughout the centuries. In the third century BCE, Emperor Asoka built the Dharmarājika stupa, of which only the foundation remains. He also erected a pillar with the lion capital, which has become the state emblem of modern India. The Dhamekh stupa, built possibly in the third century CE with exquisite stone ornaments, still stands on the spot where Buddha gave his first discourse. The Chaukhaṇḍī stupa, dating back to the fifth century, commemorates the spot where the Buddha met his former companions. During the Gupta

period (the fourth to sixth centuries), Sārnāth became the center of Indian art, producing refined and elegant sculptures, some of which are preserved at the local archaeological museum. Sārnāth was destroyed by Turkish invaders at the beginning of the 11th century, partially rebuilt, and finally demolished at the end of the 12th century.

Contemporary Sārnāth has been revived as one of the main sites of Buddhist pilgrimage. A large number of temples and monasteries have been erected reflecting the styles of diverse Buddhist cultures. Foremost among these is the Mūlagandhakuṭī Vihāra, built in 1931 by Anagarika Dharmapāla and the Mahābodhi Society, where every evening, the Dharmachakrapravartana Sutra is chanted by monks and pilgrims. The town is also home to the Central University for Higher Tibetan Studies, a major research institute dedicated to educating young Tibetans in exile from their country.

SARVODAYA MOVEMENT

The term for the social movement called *Sarvodaya* is a compound, formed from two Sanskrit words, meaning the uplift (*udaya*) of all (*sarva*). The term was first used by Mahatma Gandhi and later taken up by reform movements in India and Sri Lanka. The Sri Lankan movement, Sarvodaya Shramadana, has developed a broad international reputation in recent years.

The term *Sarvodaya* was coined and popularized by Mahatma Gandhi in his 1908 translation of John Ruskin's critique of the Industrial Revolution, *Unto This Last* of 1860. Gandhi translated the work using the title *Sarvodaya*, a term that he felt Indian readers would associate with the spirit of

the text: a call for political, moral, and economic development from the ground up, focusing especially on the uplift of rural populations. Gandhi further developed the ideas he laid out in *Sarvodaya* in *Hind Swaraj* of 1909, where he further specified uplift as cultivating political independence (*swaraj*) and moral power (*satyagraha*) through creating an independent, local, village-based industry (*swadeshi*) not reliant on British consumer goods or modern, industrial techniques.

The Sarvodaya movement refers to those organizations worldwide that have taken up Gandhi's call for "the uplift of all" by means of rural development. In India, Vinoba Bhave and Jayaprakash Narayan sought to carry out Gandhi's program through land reform and social and political change. In Sri Lanka, Sarvodaya gained even greater prominence through the work of a Buddhist rural development organization started by a Sinhalese college teacher from Colombo, A. T. Ariyaratne, called *Sarvodaya Shramadana*. Ariyaratne's movement began in 1958 as a program that sent college students to rural work camps to help with various development projects, such as constructing roads, digging latrines, and building homes. These camps were originally called *Shramadanas*, meaning "gifts of work." The group adopted the name Sarvodaya in 1961 to highlight their connection to the Gandhian legacy. Yet Sarvodaya Shramadana inflects the term with a slightly different meaning to Gandhi's, translating it as "the awakening of all," a phrase meant to foreground the moral and spiritual aspect of their development projects. Ariyaratne's group understands rural development in terms of Buddhist principles and seeks to foster moral rectitude (*sīla*) and spiritual awareness (*samādhi*, *pañña*) as well as economic self-sufficiency.

Although not without critics, since the 1980s, Sarvodaya Shramadana has been regarded by many as a model grassroots nongovernmental organization. Ariyaratne has received several international awards for his work, and the group has received a steady stream of financial assistance from donors overseas. In addition, Sarvodaya Shramadana has opened offices throughout Sri Lanka and has established an international presence in the United States, where it currently runs an office in Madison, Wisconsin.

SATAN

The word *satan* appears first in the Hebrew Bible (Old Testament) as a common noun for someone or something that obstructs one's way. In the Book of Job, it is given as a name for the fierce angel who persuades God to test Job. The figure of Satan as a powerful force of evil bent on destruction derives from the combination of two ideas: the *banim* ("sons of the Lord"), who were the wicked "watcher angels" of Genesis 6, and *malakim* ("powers") who were agents of the Lord—or manifestations of the Lord—in his relationship with humans. When the Hebrew scriptures were translated into Greek about 200 BCE, *satan* was translated as *diabolos* (from which the term *Devil* is derived), meaning "adversary." The concept of a Devil, vague and marginal in the Old Testament, became much more vivid and terrifying in the period from 100 BCE to 150 CE, when many writings that were accepted neither by Jewish nor by Christian authorities nonetheless circulated widely. These works, known as *pseudepigrapha* (materials falsely claimed to have been written by ancient biblical figures such as Enoch) made the Devil a single spirit of evil whose function is to oppose the will of the good God by perverting humans. In these writings, the Devil appears under many different names, such as Mastema, Beelzeboul, Azazel, Satan, and others. The social condition for the rise of the concept of a single, huge power of evil was the fearsome

oppression of the Jews under Syrian and Roman rule in that period. There may also have been mutual influence between Jewish and Zoroastrian thought, which posited the existence of two separate gods, one of good and the other of evil.

This period is when Christianity arose, and the power attributed to Satan in the New Testament made him the source of all opposition and threat to Christ, to the Christian community, and to Christian individuals. He is tempter, accuser, tormentor, and jailer of the damned in hell. In addition to the canonical Christian writings, a number of allegedly Christian but actually Gnostic texts, mainly from about 150 to 300 CE, presented the cosmos as a battleground between the God of spirit on the one hand and the Devil, lord of matter, on the other. Thus, the Gnostics created a matter/spirit dichotomy, which they melded with the Zoroastrian good spirit/evil spirit dichotomy. Such a dichotomy was explicitly and firmly denied by orthodox Christianity, in which the Devil's power, though great and fearful, was always weaker than that of Christ. Anyone calling on Christ against the Devil would be saved, and at the end of the world, Christ would cast Satan and his fellow demons forever into hell. Belief in the existence of a Devil as the personification of evil has never been a necessary Christian dogma, but tradition, based on the New Testament, assumed his reality.

The Muslim Qur'an, believed to have been dictated word by word by an angel of God to Muhammad, affirmed the existence of Satan (*Iblis* or *Shaytan*). However, Islam differs from Judaism and Christianity in that the will of Allah prevails in every place throughout all time. This means that opposition to Allah either by humans or by spirits was limited entirely to what God wills to allow. As opposed to monotheism and Zoroastrian dualism, most religions recognize no single spirit of evil.

Belief in Satan within Judaism declined throughout the Christian Era, largely being replaced by the *yetser ha-ra*, the internal inclination to evil in each person; within Islam, his power is in every moment checked by Allah; Zoroastrianism declined and has almost disappeared. Christian belief took a middle road between the monism of Judaism and Islam, on the one hand, and the dualism of Gnosticism, on the other. The Christian Satan is a

monstrously powerful spirit who roams the world seeking the frustration of God's plan for the cosmos and the ruin and destruction of human souls; still, Christ is always the higher power, who will protect those who call on him.

In the earliest Christian communities, the social role of Satan was to support the power of pagan Rome and its persecution and execution of Christians. Once the persecutions declined, notably in the fourth century onward, there were fewer martyrs, and a sort of voluntary martyrdom arose in the form of hermits and monks who went into the wilderness (as Christ had done) to battle the Devil. In early monastic literature, Satan has huge and immediate powers. The monks believed that the evil of the pagan society had been replaced by the evil of the prosperous, lukewarm society, and they prayed, taught, and meditated for the freedom of that society from the Devil's temptations.

The monastic impulse continued, and continues today, but from the seventh and eighth centuries onward, general belief in the power of the Devil waned, and during the Middle Ages, he often became a target of mockery or mirth in legends, folklore, and theater, his foolishness and weakness against the power of Christ dominating thought. Then, in the 16th and 17th centuries, when western Europe was racked by religious and political tensions, especially those between Catholics and Protestants, Satan once again became a terrific threat. Catholics regarded Protestants as doing the Devil's work in splitting the church; Protestants regarded the pope as the Antichrist and Catholics as subjects of Satan. Both Protestants and Catholics, about equally, projected their terror of Satan onto individuals whom they persecuted as witches. In Eastern Orthodox Europe, where religious rivalry was not intense, there were virtually no such persecutions. In recent years, the figures for the witch craze have been preposterously inflated by propagandists; nonetheless, about 60,000 (an average of nearly one a day) perished in the course of two centuries.

In the 18th century, disgust with the witch craze and with the previous century of religious wars, along with the rationalism of the Enlightenment, reduced Satan to a marginal role in Christian thought. In the Romantic movement of the 19th and early 20th centuries, Satan even became a hero

symbolizing the revolt of the human spirit against secular and religious authority.

Much more dominant in the 20th century was the growth of physicalism, pragmatism, and deconstruction, which considered evil itself as only an outdated metaphor for antisocial behavior caused by genetic, hormonal, and even molecular malfunctions. Psychoanalysis, which dominated the mid-20th century, held that evil sprang from the repression of sexual and other strong feelings into the unconscious, though Jungian analytical psychology took the Devil more seriously as one of the archetypes that the universal human mind invented (or perhaps inherited) as a way of understanding evil.

The concept of Satan thus played a limited social role in the 20th century: Even churches that took his existence seriously seldom mentioned him. Toward the end of the century, partly in response to horror novels and films, but perhaps more profoundly as the symptom of a society whose values were blurring, Satan once again attracted attention. The heroic Satan of Romanticism reemerged in the late 20th century in Satanism, a cult whose followers tended not to take their beliefs seriously; those who did take Satan seriously held the meaningless view that a being whose concept was *invented* to represent evil is actually good. Although Satanism was never more than the tiniest sliver in society, a minicraze developed in the 1980s in which the public wildly overestimated the reach of Satanism. In events reminiscent of the witch craze, many people were accused of Satanism, and a few were even unjustly imprisoned. This hysteria stemmed from horror films, conspiracy beliefs, and the psychological fad of "recovery of memories," which led many children and young people to lodge false and often preposterous accusations of sexual and physical abuse against family and friends.

The first decade of the 21st century saw a broad religious revival in many parts of the world, and Christians and Muslims, true to their theological traditions, took Satan seriously as a supernatural entity or at least as a powerful metaphor of the existence of radical evil.

SATYA SAI MOVEMENT

The Satya Sai movement (also Sathya Sai movement) is a transnational, charismatic religious movement with its roots in a Hindu-Muslim syncretic faith of the Indian subcontinent. It was about 70 years old at the time of the death of its charismatic leader—Sri (honorific) Satya Sai Baba (1926–2011), called Bhagawan (“God”), Swami (“Lord”), or Baba (“Father”). He had a distinctive halo of hair and wore a long saffron robe; he was known to magically materialize healing *vibhuti* (“sacred ash”) and sacred gifts during a twice-daily *darshan* (“sacred audience”), where he received devotional petitions and seemingly effected cures.

Sai Baba’s personal prefix *Satya* (“truth”) referred both to his given name of Satyanarayana and to the sacred truth he supposedly embodied, as when he stated (at age 14) that he was an incarnation of the Hindu god Shiva and his female consort Shakti. In the apostolic literature, his religious ancestry is ecumenical: a colonial Sufi Islamic mystical sect (Shirdi Sai Baba), Advaita Hindu philosophical discourses, and contemporary Hindu and Christian liturgical practices.

The news magazine *India Today* estimated Sai devotion at 20 million in 137 countries, with one half to one third of his followers being from India. The Sai movement earned approximately 881.8 million Indian rupees (approximately US\$5 million) in 2002 to 2003 and has a net worth of US\$6 billion. Devotees come from the professional, technocratic middle classes. The spatial center of the movement is *Prasanthi Nilayam* (“Abode of Eternal Peace”) ashram in the village of Puttaparthi, South India, with subsidiary ashrams in Bangalore, Kodaikanal, and Mumbai.

The movement has a global institutional structure, active through various branches of the International Sai Organization (or ISO). The activities of the ISO are divided into three wings, all engaged in *seva* (“charitable work”): the educational, spiritual, and service wings, which distribute aid to the poor, establish educational institutions, and support medical facilities. The ISO also projects the Sai mission abroad, through a network of Sai Centers. The movement is globally mediated; audio/video sermons play on the radio (Sai Global Harmony) and on the Internet (Heart 2 Heart).

The rise of the movement has not been without critics. Accusations of corruption, pedophilia, and murder have been made by a group of disaffected “former devotees” self-titled “JuST”—Just Seekers for Truth—and have attracted global publicity, but Sai Baba himself has never been accused in an Indian court of law.

SAUDI ARABIA

Situated between the Red Sea and the Persian Gulf on the Arabian Peninsula, the Kingdom of Saudi Arabia is the birthplace of Islam and home to two of its holiest cities, Mecca (Makkah) and Medina. Deriving its name from the regnant Al-Sa'ud family, Saudi Arabia was founded in September 1932, but the ruling family's legitimacy dates back to an alliance brokered in 1744 with the Sunnī theologian Muhammad Ibn Abd al-Wahhab (1703–1792). al-Wahhab's sociomoral revivalist form of Islam continues to inform governance, culture, and commerce in the predominantly Sunnī Muslim kingdom.

Conjoining temporal and religious authority, the modern Kingdom of Saudi Arabia represents the third state formed by the Sa'ud family. The first state (1744–1818) cemented the Sa'ud's partnership with al-Wahhab and his adherents, the *Muwahhidun*. The first Saudi-Wahhabi state collapsed in September 1818 after capitulating to the Pasha Muhammad Ali's Egyptian army (backed the Ottoman sultan Mahmud II), but a second state was reestablished shortly thereafter (1824–1891). Beset with internecine struggles and local opposition (from the Ottoman-supported Rashidi family), the Sa'ud Dynasty could not sustain political control during the second state beyond the Ottoman *eyalet* of Nejd.

By 1902, 'Abd al-'Aziz ibn 'Abd al-Rahman Al Sa'ud, or Ibn Sa'ud (1880–1953) rallied Bedouin tribes and Wahhabi *Ikhwan* soldiers, and over the next 30 years, he consolidated territories and spread Wahhabi doctrine across the Arabian Peninsula. By the 1920s, restive *Ikhwan*, who sought a more aggressive campaign of proselytizing, fomented rebellion, which Ibn Sa'ud eventually quelled with British assistance.

From its inception in 1932, Saudi Arabia integrated Wahhabi clerics into government institutions. The most powerful Wahhabi consultative body, Council of Senior Ulama, continues to vet the monarchy's policies for adherence to Shari'a law. Moreover, the Saudi state invests clerical police, *Mutawwa*, with legal authority for ensuring the promotion of virtue and prevention of vices.

Since the discovery of oil in 1938, the kingdom has balanced economic interests and concomitant

geopolitical implications as the world's leading petroleum exporter with historical commitments to Wahhabi devotional strictures. Complicated by petroleum's strategic importance, this equipoise has conflicted with political and religious fidelities to the kingdom's citizens as well as Muslims residing outside Saudi Arabia. During the 1990 Gulf War with Iraq, the government was criticized by clerics and citizenry for allowing the United States to station troops in Islam's birthplace. In response, the government reaffirmed its obligations to Islam in the Basic Law (1992). To emphasize the king's role as *fidei defensor*, Saudi monarchs since 1986 have taken the honorific "Custodian of the Two Holy Mosques," thereby accenting the kingdom's historic importance for Islam.

SCAPEGOATING

Scapegoating is a process by which blame for an in-group's misfortunes is transferred to a "goat": a person, animal, inanimate object, or an out-group, which is then eliminated. Through it the in-group "escapes" from its woes and is rejuvenated. The term itself is derived from the central rite in the Jewish feast of Yom Kippur, described in the Bible (Leviticus 16). In this, a priest confesses the sins of Israel over the head of a goat, which is then led outside the city gates to wander in exile, carrying with it those sins.

Comparable ceremonies have been reported elsewhere. Ancient Babylonians celebrated an annual *kippuru*, involving the transfer of guilt

onto, and subsequent murder of, a so-called Year King, followed by an orgy in celebration of the community's redemption. During the feast of Thargelia in Greek antiquity, the ritual murder of a human victim known as a *katharma* was believed symbolically to "kill death." In the Roman Saturnalia, a human effigy of the vegetative god, Mamurius Veturius, was killed, ensuring a bountiful harvest.

To defuse the violence of the scapegoating impulse, Christian mythology replaced the goat with a so-called perfect victim, the unblemished lamb, Jesus. Now, the sacrifice of God Himself was said to cancel the world's sins, presumably rendering further efforts at symbolic riddance unnecessary (Hebrews 10). Nevertheless, scapegoating persists in Christian nations. René Girard has concluded from this that scapegoating is an unavoidable, elemental engine of social and psychological order.

The scapegoat *complex* refers to how scapegoater and goat feed off each other's "shadows." These are the psychic energies that neither can permit to come to consciousness: lust, vengeance, envy, greed, slovenliness, and so on. The scapegoater represents the righteous partner in the complex. It eliminates what is forbidden and experiences catharsis after being cleansed of its own toxicity. Scapegoats take in the refuse of the scapegoater. They "eat crow." They become "people of the crow," as the untouchables of India are known: the black-skinned speakers of "caw-caw" (*cakka*), who labor in sewers and in garbage pits, consume beef, and have sex during menstruation.

The persecution of untouchables helps sustain the Hindu caste (purity) order. Other goats serve comparable functions. This is why they are occasionally lauded as heroes, as was the Maize Goddess of ancient Mexico or the adolescent boy chosen to dress in plumes and play the sacrificial victim, Tezcatlipoca. (The "sacred nectar" from their still-beating hearts was believed to nourish the gods in their cosmic struggle against chaos.) Or, like Christ, the goat may be worshipped as a god himself, whose death is said to redeem the entire human race. It is precisely the negative celebrity accorded them that sometimes attracts volunteers to serve as scapegoats. In this role, they are the *pharmakon* (Greek for "scapegoat"), the poison whose elimination from the body politic magically heals it.

The pernicious qualities of scapegoats are typically experienced as inherently given. However, in reality, scapegoats are social artifacts. They are manufactured through a four-step process that uses the standard tools of defamation: pulpit, pamphlet, and pep talk.

1. *Labeling*: A person or group is identified as an instance of a blameworthy category. Lest their subsequent murder incite in-group tensions, which would undermine the purpose of scapegoating in the first place, these are typically drawn from an out-group.
2. *Myth making*: Defamatory tales are devised to justify the assignment of the label. Here, the goat's pathology is attributed to a combination of its nature and/or nurture. In this way, the scapegoater's complicity in the goat's production becomes veiled to the producers.
3. *Public degradation*: Acting only out of concern for the group's interest, not for themselves, accusers testify to the goat's iniquity. Often the indictment described involves transgressions of the in-group's symbolic zones of vulnerability—that is, its members' bodily orifices: bestiality, homosexuality, race mixing, cannibalism, evil intoxicants, and alien music. Everything in the goat's life, including suggestions of its piety, intelligence, and sanity, is reinterpreted as an indicator of its "actual" impiety, stupidity, and madness.
4. *Embedment*: The labels, myths, and judicial findings are passed on to the next generation in the form of school lessons, sermons, and family chats. Being absent at the moments of identification, legend making, and public hearings, children experience scapegoats naively.

Azazel, the deity to whom the scapegoat in Yom Kippur is offered, was originally honored as a god of small herdsmen in the ancient Semitic pantheon. Under the influence of Zoroastrianism, however, during the period of Israel's exile (587–458 BCE), Azazel was transformed into a demon. He became a fallen angel, the cloven-hoofed "hairy one," Satan. As this occurred, his alter ego, Yahweh, was shorn of his wildness and came to stand for the communal virtues of justice and righteousness. This mythical bifurcation eventually became part of the cultural

inheritance of Judaism, Christianity, and Islam. Today, in a perverse and deadly ménage à trois, each of these religions uses the other two as scapegoats.

Breaking through the enchantment of the scapegoat complex requires binding the split that preconditions it. Insights into how this can happen are found in epic tales of shocking, humiliating recognitions by scapegoaters of their kinship with their scapegoats. In the Hindu *Mahabharata*, after the white-skinned Pandus use evil means to subdue the dark-skinned Other, the Kurus, they awaken to the fact that they and the Kurus are in reality step brothers. In the medieval story of the Fisher King and his quest for the Holy Grail, a similar thing happens. While locked in a death grip with an Arab Muslim—this genre was composed during the Crusades—both are made aware that they are first cousins. With these insights, tearful reconciliation becomes possible.

SCHLEIERMACHER, FRIEDRICH (1768–1834)

Theologian Friedrich Daniel Ernst Schleiermacher was born in Breslau, a city located in the Prussian province of Silesia (today known as the Polish city of Wrocław). After having been educated in the Protestant pietistic tradition of a Moravian sect, Schleiermacher studied theology at the University of Halle. As a preacher and theologian, he contributed to the organization of the Prussian church

and to the reformation of Protestant theology but also took part in the consolidation of the independent new University of Berlin, a model for future universities. He is considered to be one of the precursors of comparative studies of religion.

In 1799, *On Religion: Speeches to Its Cultured Despisers*, was published. In this book, Schleiermacher postulates the autonomy of religion and defends it from the skepticism of the enlightenment. Schleiermacher states that religion must be released from theoretical reason and also from practical reason to show its particular shape. Beyond knowledge and behavior, religion is based on feeling, and its horizon is broader than the perspective of morals, science, and metaphysics.

Rather than a person, God is the one and all. This totality can be reached by the individual through nature and humanity, which lets the self overcome its own limits to reach eternity in the present. In this sense, religion is the subjective participation of the human being in God's life, an embedding of the finite in the Infinite.

In 1821, his major theological work, *The Christian Faith*, was published, which presents faith in God as the certainty about the feeling of absolute dependence of the believer on a superior being posited beyond the believer himself. At the same time, faith is the relationship to that eternal being. From this perspective, sin and redemption are conscious experiences that enable the communication between human beings and God.

Against the rationalism of natural religion, Schleiermacher showed that religion comes from the intuition of the universe and the feeling of absolute dependence. The ideas of God and immortality become inessential because religious experience is unmediated by concepts. Religion is closer to aesthetics than to knowledge.

For Christian believers, self-consciousness of being redeemed by Christ is an incentive to act in favor of his kingdom, though all human beings have a natural tendency to religiosity. Such a tendency assumes many forms. While Schleiermacher conceived the existence of different churches as the fragmentation of one single Church, religious diversity is for him a necessary consequence of the historical shapes taken by the internal pious fire.

The essence of religion must be found in the diversity of positive religions. For Schleiermacher, the range of valid sorts of religion is endless

because it is culturally conditioned. Fighting among particular religions is contrary to the genuine spirit of religion and makes evident their degeneration.

This German promoter of toleration and religious pluralism died of pneumonia in Berlin.

SCIENTOLOGY

Scientology, the faith of the Church of Scientology International, is a new religious movement founded in 1954 by L. Ron Hubbard (1911–1986). Spreading from the United States around the globe, it claimed membership in the millions worldwide in the early 21st century. Scientology has also attracted considerable controversy globally.

In 1950, L. Ron Hubbard, science fiction writer and explorer, published *Dianetics*, a bestselling book presenting the basic ideas underlying Scientology. Mental and behavioral problems are created by “engrams” implanted in the mind as a result of shock in this or previous lives. They can be released by a process called “auditing,” which enables the client to go “Clear.” Later developments, based on a Gnostic-type mythology, offer to free the “Clear” individual to become an Operating Thetan, or spiritual being.

Moving up the bridge “to total freedom,” as Scientology describes it, requires substantial commitments of time and money. At the same time, Scientologists, many of whom are young adults, enjoy opportunities in church centers for a full social life, including parties, entertainment, and even the hope of meeting one of the celebrities whose names are prominently associated with the movement.

The unimpressed charge the church with practicing a fraudulent form of psychotherapy, alleging that it is actually a commercial activity posing as religion, extortionate in its monetary demands, and excessively harassing critics and defectors. Scientology has not been slow to answer with countercharges and lawsuits, including contentious court and administrative cases regarding its right to be recognized as a tax-exempt religious organization under a number of jurisdictions. Recognition was eventually won in the United States (1993), the United Kingdom (2000), Australia (1983, in what is considered that nation’s landmark religious freedom case), New Zealand (2002), Spain (2007), Russia (2007, in the European Court of Human Rights), and Italy (1997, in a decision important for its legal definition of religion) but has been more problematic in France, in the wake of the government’s strict “anticult” policies, and in Germany, where Scientology has been severely criticized.

These highly publicized disputes have done much to test popular and governmental attitudes toward new religious movements and to clarify meanings of religious freedom—indeed the definition of religion itself—on a global basis. Overall, recognition appears to be feasible where freedom of religion is taken to cover religious organizations as such, despite turpitude on the part of a religion’s individual representatives or agencies, and more difficult when the government considers it has a legitimate duty to protect citizens from purveyors of religious beliefs and practices that it judges to be psychologically or materially dangerous. Scientology has had a significant role in illuminating these issues.

SCOTLAND

Religion has played a central role in the history and politics of Scotland, a region in the northern section of the United Kingdom, and has been a dominant influence in the shaping of a distinct Scottish cultural identity and society throughout the ages. Celtic Christianity as established in Scotland by Irish monk St. Columba during the mid-sixth century evolved in many ways distinctly from the general pattern of Western Roman Christianity. The peculiarities of Scottish religious life continued until the 11th century and the advent of Queen Margaret, who opened Scottish Christianity to southern European influences.

The claim that Scotland is a special nation, called by God, can be found in many epochs and in several key episodes of Scottish history—for instance, the declaration of Arbroath (1320), in the political context of the assertion of independence from England. The rise of Protestantism during the 16th century and the Reformation provided other evidence of Scotland's "obsession" with religious quest as well as of an ethos distinct from its southern neighbor.

Following the principles expressed by John Knox, Scotland has developed alongside its own variety of Protestantism—Presbyterianism. The signing of the National Covenant (1638), stating the claims of the reformed Presbyterian church against the King's Anglicanism, demonstrated both the extent of the religious enthusiasm in Scotland and its sense of a special destiny. Scotland's religious specificity was officially recognized by the Act of Union (1707) between England and Scotland, with Scotland keeping its established Presbyterian Church as one of its key national institutions despite the political incorporation of Scotland within the United Kingdom.

During the 19th century, religion in Scotland was marked by two great events. The first was the Disruption of the Church of Scotland (1843) when the Established Church split in two, leading to the restoration of the ancient democracy of the Kirk. Religious fractiousness within the Protestant umbrella has been on the Scottish agenda since then. The other process was the great immigration of Irish Catholics, which reinstated the ancient Roman Catholic hierarchy to Rome's "special daughter"

and brought with it a kind of Orange/Green sectarianism that has affected Scottish society.

During the late 19th and 20th centuries, waves of Italian, Lithuanian, Jewish, Polish, Indian, Pakistani, Chinese, and English immigrants also contributed to enriching Scotland's religious fabric. After World War I, although the authority of the churches in Scottish society declined, religion remained a major social, cultural, and political force, as demonstrated by the leading role of the annual General Assembly of the Church of Scotland or by the influence of the Roman Catholic Church via the separate and state-subsidized system of Catholic education.

In the 21st century, despite the process of secularization that has affected all developed societies over the past decades, a majority of people—nearly 6 in 10—continue to see themselves as belonging to a religion. Around one third belong to the Church of Scotland, 1 in 9 to the Catholic Church, 1 in 10 to another Christian religion, and only 1 in 100 to another religion. Around a quarter of the population goes to church at least once a week or more, and religious attendance as a whole is still higher than in England.

In the early 21st century, as regards religion, Scotland is more and more a diverse and appeased society. If the Kirk is the official church, it has no monopoly on Presbyterianism. And although it is the dominant form of Protestantism, Presbyterianism is not the only one. The Episcopalian Church is also influential. The Roman Catholic Church, the oldest religious community in Scotland, is by far the second largest one. However, like other pluralistic societies, Scotland also has its share of non-Christian faiths, including small Buddhist, Hindu, and Sikh groups; a well-established Jewish community; and a growing Muslim one.

SCRIPTURE

The academic study of scripture from the 19th century until the 1980s was almost exclusively the

domain of biblical and orientalist scholars who focused on the content and form of particular religious texts and on questions of the history of origins, the history of causes, and conditions that produced specific texts. In recent decades, historians of religions such as Wilfred Cantwell Smith and William A. Graham have advanced an alternative model of scriptural study that gives priority instead to the concept and functions of scripture as a cross-cultural religious category. Scripture as a concept in the history of religions is primarily a relational category that refers not simply to a text but to a text in its relationship to a religious community for whom it is sacred and authoritative. The term *scripture* can be defined in this context as a sacred text, transmitted in oral or written form, that has been canonized or otherwise recognized as sacrosanct and authoritative for a particular religious community.

The “human propensity to scripturalize,” as Wilfred Cantwell Smith terms it, is a global phenomenon that appears to be almost universal among the world’s literate religious traditions. Hindus, Buddhists, Jains, Sikhs, Parsis, Confucians, Daoists, Jews, Christians, and Muslims all have their sacred texts. Nonliterate traditions, such as Native American and African traditions, also generally have a circumscribed corpus of oral lore that is revered as sacred and authoritative for the community. This entry will begin with some general reflections on scripture as a relational category and then will discuss five examples of sacred texts that have been ascribed canonical authority in their respective communities: the Veda, the Tipiṭaka, the Torah, the Christian Bible, and the Qur’ān.

Scripture as a Relational Category

The relational approach to the study of scripture advocated by historians of religions provides a model that challenges in significant ways the dominant paradigms of scriptural study advocated by biblical studies scholars. The paradigms of biblical studies are “nonscriptural” in their respective approaches, in that they treat the biblical texts not as religious documents but rather as historical documents, in the case of historical criticism; or as literary creations, in the case of literary criticism; or as sociocultural products, in the case of sociocultural criticism and ideological criticism. Such

approaches, as Wilfred Cantwell Smith has emphasized, are primarily concerned with the biblical texts in their “prescriptural phase” or “postscrip-tural phase” and consequently give little emphasis to the functions of the Hebrew Bible or Christian Bible as scripture. The relational approach to the study of scripture, in contrast, focuses on the concept and functions of scripture as a religious category and a relational category and is concerned with the question of what it means for a text such as the Hebrew Bible to be regarded as scripture by a religious community. What does it mean for religious communities to “scripturalize”?

The study of scripture as a relational category focuses on a number of important issues, including issues of canonical authority, modes of oral and written transmission, reception histories of particular scriptures, and cultural modes of appropriation. The history with which this approach is concerned is not a history of origins (*Entstehungsgeschichte*) but rather a history of effects (*Wirkungsgeschichte*) understood as the tradition of interpretations and appropriations of a sacred text in the cumulative histories of the various communities that revere the text as scripture. In the study of scripture qua scripture, the primary concern is not to determine the sociohistorical conditions that produced a religious text but rather to excavate the multilayered and multivocal reception histories that the text itself has produced in the ongoing lives of religious communities in different historical periods, in different cultural contexts, and in different social locations. Such an approach is concerned with the ways in which a sacred text has been appropriated, engaged, experienced, embodied, and performed by the religious communities that cherish it as scripture, transforming it from a fixed, bounded text into a fluid, open-ended language world that finds expression in a variety of cultural forms—in ritual performances and liturgies; in sermons, orations, and exhortations; in songs, devotional hymns, and ritual recitations; in dance, drama, and film; in music, literature, and the visual arts; in educational initiatives and social reforms; in political movements and ideologies; and in various forms of popular culture.

Canonical Authority

Religious communities employ a variety of mechanisms by means of which they circumscribe a

corpus of texts and set it apart from other texts as a sacred and authoritative canon. In discussing the category of canon in the history of religions, Jonathan Z. Smith has suggested that “canon is best seen as one form of a basic cultural process of limitation and overcoming that limitation through ingenuity” (Smith, 1982, p. 52). He further suggests that the task of overcoming the limitation posed by a closed canon is accomplished through the exegetical enterprise. Smith’s model of canon will provide a starting point for our discussion of the manner in which Hindus, Buddhists, Jews, Christians, and Muslims have ascribed canonical authority to their respective sacred texts.

Veda

The Veda, which is revered by many Hindus as the paradigmatic scripture, conforms to at least one aspect of Smith’s model of canon, in that it functions within the Brahmanical Hindu tradition as a category that is simultaneously delimited and potentially unlimited. At the center of the canon is a fixed corpus of mantras that have been meticulously preserved through oral tradition in strictly unaltered form, syllable for syllable, accent for accent, for more than 3,000 years: the Vedic Saṃhitās. The canonical authority of the mantras collected in the Saṃhitās is ascribed to their sacred status as *śruti*, “that which was heard,” in which they are revered as the primordial expressions of transcendent knowledge that exist eternally as the blueprint of creation through which the creator manifests the material realm of forms. The Vedic “seers” (*ṛṣis*) are represented as enlightened sages who at the beginning of creation stationed their awareness on the transcendent level where they directly cognized—“saw” and “heard”—the primordial vibrations of pure knowledge and preserved them in the form of recited hymns through the agency of their own speech.

The domain of *śruti* is subsequently extended beyond the Saṃhitās to include the Brāhmaṇas, sacrificial manuals that are concerned with correct performance of the Vedic fire sacrifices (*yajñas*); the Āraṇyakas, “forest books” that reflect on the inner meaning of the sacrificial rituals; and the Upaniṣads, the latest portions of the Vedas that contain metaphysical speculations concerned

with knowledge (*jñāna*) of ultimate reality. While remaining delimited, the Veda is extended even further, beyond the circumscribed corpus of *śruti* texts, and through a process of “vedacization” comes to include within its purview a secondary category of sacred texts that are held to have been composed by personal authors and are therefore designated as *smṛti*, “that which was remembered,” rather than “that which was heard.” While the domain of *śruti* is technically closed, *smṛti* functions as a dynamic, open-ended category that includes the Itihāsas, or epics, the Mahābhārata, and the Rāmāyaṇa of Vālmīki; the Purāṇas, encyclopedic mythological works; and the Dharma-Śāstras, Brahmanical legal codes, along with a variety of other texts that have been recognized as authoritative by different groups in different historical periods.

Tipiṭaka

The Tipiṭaka (Sanskrit Tripiṭaka, “three baskets”), the Pāli canon of the Theravada Buddhists, is generally held to be the earliest extant, complete canon and derives its authority from its claim to be *buddha-vacana*, the “word of the Buddha,” and the repository of the *Dhamma* (Sanskrit *Dharma*), the teachings of the Buddha. The *Suttas* (Sanskrit *Sūtras*), which form the second of the three *piṭakas*, authenticate their claim to have been “heard” from the Buddha through the opening phrase, *evam me sutam* (Sanskrit *evam mayā śrutam*), “Thus I have heard.” However, the *Suttas* are not thereby ascribed a status comparable to that of *śruti*, “that which was heard” by the Vedic *ṛṣis*. In contrast to the Vedic mantras, the *Suttas* are not represented as the record of the eternal expressions of transcendent knowledge through which the creation was brought forth; they are rather revered as the record of the words of the Buddha through which the message of enlightenment was proclaimed. Indeed, the very notions of a cosmic blueprint and a primordial language are rejected, for according to the Dhamma, the world is an ever-changing flow of processes, and there are no permanent patterns or structures of reality to be encoded in language. Even if a primordial language of the gods existed, the words of the Buddha would be granted a higher, “supradivine” status, for the Buddha, as an enlightened human sage, is

held by the Theravadins to have achieved a level of spiritual attainment that surpasses that of the gods.

The Theravadins ascribe to the Buddha a conventional view of language in which language is valued for its communicative power and not for any intrinsic ontological status. The didactic content of the *Dhamma* as a universal teaching intended to enlighten human beings and gods alike, took precedence over a single linguistic form. The Buddha is said to have eschewed the use of Sanskrit, the sacred language of the Brahmanical elite in which the Vedic texts are preserved, and instead encouraged his disciples to learn and spread the *Dhamma* in their own dialects, in languages that would be accessible to the general populace. Moreover, in contrast to the Brahmanical preoccupation with accurate preservation of the Vedic sounds with little regard for their discursive meaning, the Buddha is represented as chiding those disciples who focus solely on memorizing the *Dhamma* and do not understand the meaning of the texts they recite.

Torah

The Jewish conception of Torah, like the Veda, accords with Smith's model of canon, in that it functions within the classical rabbinic tradition as a delimited corpus of texts that is also potentially unlimited. At the center of the canon is a fixed corpus of written texts that has been scrupulously preserved in unaltered form by the Jewish scribal tradition: the Sefer Torah (Book of the Torah), which comprises the Five Books of Moses, or the Pentateuch. The canonical authority of the Sefer Torah is ascribed to its sacred status as the Word of God that was revealed at Mount Sinai through the agency of the prophet Moses. Every word of the Sefer Torah is held to have been directly dictated by God to Moses, who acted as a scribe and recorded the words of God verbatim in the Book of the Torah.

The domain of Torah and its divinely sanctioned authority is subsequently extended to encompass the entire Hebrew Bible, the Tanakh, including not only the Pentateuch but also the Nevi'im (Prophets) and the Ketuvim (Writings). While remaining delimited as the Hebrew Bible, which is designated as the Written Torah (*tôrāh še bi-ktāb*), the Torah

is expanded even further to incorporate the Oral Torah (*tôrāh še be-'al pēh*), the oral tradition of interpretation of the written text. The Oral Torah functions as a fluid, open-ended category that includes the halakhic (legal) and aggadic (nonlegal) teachings contained in the Mishnah, Talmud, and Midrash, along with potentially all texts, teachings, and practices authorized by the rabbinic elite. The rabbinic sages claim that the distinction between Written Torah and Oral Torah derives from the original revelation at Mount Sinai, in which God revealed to Moses two Torahs: a written text, comprising the Sefer Torah, Nevi'im, and Ketuvim, and an oral tradition of interpretation of the written text that has been preserved in the authoritative teachings of the rabbis.

Christian Bible

The canon of Christian scriptures consists of two parts, the Old Testament and the New Testament, which together constitute the Christian Bible. The process of canon formation was gradual, taking place over several centuries. The authoritative scriptures for the early Christian community were the Hebrew scriptures, which were eventually incorporated into the Christian canon as the Old Testament. By the middle of the second century, the formal public reading of scripture, the liturgy of the Word, constituted a fundamental part of Christian worship and included readings not only from the Hebrew scriptures but also from the Gospels and the letters of Paul, which formed the basis of the still fluid corpus of New Testament writings. The boundaries of the New Testament canon were debated until the fourth century, culminating in the first official list of the 27 books of the New Testament in the Easter Letter of Athanasius in 367. The canonical authority of the Old Testament and New Testament writings is held to derive from their sacrosanct status as divinely inspired writings. While God's central revelation to Christians is in the person of Jesus Christ himself, who is celebrated as the Word of God incarnate, the Christian Bible, and particularly the New Testament, is revered as the record of the revelation and hence is also ascribed the status of the Word of God.

Alongside the category of scripture, the Roman Catholic Church upholds a second category,

“tradition,” comprising the official creeds, dogmas, doctrines, and practices sanctioned by the hierarchy of church authorities headed by the pope. Scripture and tradition together constitute the principal sources of authority for the church. Like the Jewish category of Oral Torah, the category of tradition serves as a means of interpreting, applying, and extending the teachings of the Bible. By the Middle Ages in Western Christendom, the imposing edifice of church tradition had begun to take precedence over the scriptural foundation on which it was based.

The Protestant Reformation in Europe in the 16th century sought to counter the Roman Catholic Church’s emphasis on the authority of ecclesiastical tradition and to establish the Bible alone—*sola scriptura*—as the source of authority for the church. Against the hierarchy of priests founded on the ideal of celibacy, Luther, Calvin, and the other reformers championed the “priesthood of all believers” founded on the ideal of holy matrimony. In attempting to close the gap between the clergy and the laity, they placed new emphasis on lay education, on the oral proclamation of the Word of God through preaching and teaching, and on making the biblical texts accessible to the general populace through vernacular translations.

Qur'an

Islam has been characterized as preeminently a “religion of the book,” which centers on the Qur’an as the quintessential scripture. The Qur’an is celebrated as the eternal, uncreated Word of God, which is an attribute of God. This eternal Word is held to have entered into history in the form of an “Arabic recitation (*qur'an*),” which was directly revealed by God through the agency of the prophet Muhammad. Islamic notions of the Qur’an are embedded in a broader conception of successive divine revelations, in which each nation has a prophet or apostle who transmits the revelation in the form of a scripture. Thus, God has sent down not one but multiple scriptural revelations, including not only the Arabic Qur’an but also the scriptures of the Jews and Christians—the Torah of Moses and the Gospel of Jesus. The Qur’an is ascribed the unique status of the final, culminating scriptural revelation that authenticates and

completes all earlier revelations. In contrast to Jewish and Christian conceptions of scripture, in which the process of canon formation took place over several centuries, the revelations to Muhammad were compiled in book form during and immediately after his prophetic career and were invested from the outset with the authoritative status of scripture.

The delimited nature of the Qur’an is illustrated by the Sunnī schools of jurisprudence (*fiqh*), which in determining the principal sources of *fiqh* establish a hierarchy that clearly distinguishes between the Qur’an, which is the authoritative Word of God; the Sunnah (custom) of Muhammad, which includes the words, deeds, and gestures of the exemplary human being who was singled out to be the prophet of Allah; and *ijmā‘*, the consensus of the community, in particular of the *ulamā*, the legal scholars. While the Sunnah of Muhammad ranks second to the Qur’an as the most authoritative source of Islamic law, it is not granted the status of divine revelation. Moreover, the science of jurisprudence itself, including the books of *fiqh* that classify, interpret, and apply the law, is considered the product of human intelligence. In contrast to rabbinic conceptions of the Oral Torah, the interpretations of the *ulamā* are not represented as extensions of the divine revelation. The Qur’an is a closed category, and Allah alone has the power to reopen the Book that was sealed with the last revelation to the “seal of the prophets.”

SECULARISM

Secularism may indicate a nonreligious worldview, an ideology, a political doctrine, a form of political governance, a type of moral philosophy, or a belief that the scientific method is solely sufficient to understand the world in which we live. While George Jacob Holyoke introduced the term *secularism* only in 1851, the structural reality of secularism has a longer history and has always embraced a spectrum of ideas: the emphasis on what is moral as opposed to what is miraculous in religion (Immanuel Kant); the view that the church is the caretaker of souls and ought to be separated from the state that is concerned with worldly matters (John Locke); the anticipation (often inseparable from advocacy) of a radical transformation of religions with progress (Thomas Jefferson); the call for replacing traditional religions with the new religion of humanity (Auguste Comte); the critique or rejection of traditional

religions, especially Christianity, as obstacles to human freedom and power (Friedrich Nietzsche); the predictions as well as concerns about the disenchantment of modern societies (Émile Durkheim and Max Weber); and the prophecies about the disappearance of religion at the end of history (Karl Marx).

Secularism has been a source of marginalization and sometimes even a hostile negation of religions, but it cannot be reduced to antireligiousness. It is also a moral orientation *toward* the world and *in* the world, often guided by a vision of a just society for all or developed as a strategy that should mitigate the challenges of religious pluralism. For both theoretical and empirical purposes, therefore, secularism should be thought of in the plural rather than in the singular. Defining *secularism* is additionally complicated because of its proximity to the notion of *secularization*. These terms have distinct analytic meanings and purposes but are also closely related. *Secularization* refers to processes that accompany modernization—gradual decline of religious contents and institutions or their sudden (and at times state-enforced) removal from the political, educational, or economic realms. But secularization is not some neutral and unavoidable progression toward less religious societies. It involves the intellectual and social history that brings together variables and actors as diverse as the unintended consequences of the medieval religious reforms and the Protestant Reformation, the birth of the modern nation-state, Enlightenment philosophy, and agents whose goal was to institutionalize secularity and the ideas of secularism in law, education, politics, and economics.

While secularism has origins in the West, it has long ceased to be its property. This is today a global phenomenon with an equally global crisis. Political secularism, which refers to the separation between politics and religion and between the state and religious institutions, faces challenges in almost every corner of the globe. The most immediate among these challenges are empirical—the revival of public religions, the strength of religious fundamentalisms, and the religious pluralization that accompanies new waves of immigration. They give rise to important questions about the relationship between secularisms and democracies: Is some type of secularism a necessary precondition for democratic pluralistic societies? If political secularism is

not a universal paradigm but a fragile doctrine that needs constant renegotiation, how are we to institutionalize the porous and changing boundaries between the religious and the secular? Indeed, despite an important democratic impulse of many political secularisms—the creation of a public sphere open to all individuals as equal citizens, regardless of their particular identities—the meanings, goals, and forms of institutionalization of secularism reveal much less democratic features as well. From the societies of western Europe to the United States, India, Syria, and Turkey, one traces the importance of secularism for the creation of powerful nation-states that are both homogeneous and homogenizing, for example, or the attempts to marginalize and control religions and religious institutions.

Contemporary secularisms are also contested by anthropologists, philosophers, theologians, and social theorists. Michael Sandel describes secularism as a principle that claims neutrality while in fact affirming the very particular, liberal notions of the good. Similarly, Saba Mahmood points to the impoverished understanding of human subjectivity and the parochial ideas of agency and authority that underlie liberal secular worldviews. For Talal Asad, secularism is a doctrine that claims to solve the problem of conflict while only replacing one type of violence (religious) with another (that of the nation-state and imperial wars). In many ways, the critique of secularism is an extended critique of modernity. It is also an invitation for a greater reflexivity about the politics of secularism that shapes the very foundation of the social scientific understanding of religion in the contemporary world. Some scholars propose that we should reject the secular-religious framework altogether; others suggest that we should work to develop a more dialogical and constructive approach to it. The very conversation about such questions is an indication that we are moving beyond the mere critique of secularism and beyond the dominant focus on its clashes with religions. Scholars continue to rethink the multiple faces of secularism in the context of a global world while being attentive to both its interconnectedness and its heterogeneity.

SECULARIZATION

Secularization as a notion indicating the decline of religion has a long tradition as a subject of study, with its earliest expressions to be found in 18th-century philosophy. In recent years, secularization has also been the subject of intense scholarly debate. There is debate around the term itself (How do we define secularization?) as well as around the theory—or thesis, depending on one's point of view—of secularization (Is it really happening and, if so, universally?). Both areas of scholarship flourish today, and the debates continue unresolved. An examination of the latter is instructive as regards the trajectory/trajectories of secularization and of the sociological study thereof.

Defining Secularization

The etymology of the term is worth considering. Secularization derives from the word *saeculum*, used in Latin Christendom to indicate profane time as opposed to eternal, “higher” time and synonymous with century or age—markers of time outside the sacred realm. In its earliest uses, secularization meant the transfer of certain functions from the church to the control of lay persons.

Sociologists of religion, however, are by no means bound by etymology. Some scholars define secularization as the institutional differentiation of church and state, others as the privatization of religious faith and practice, and yet others as the decline and eventual disappearance altogether of religious belief and practice. Notably, the related terms of *secular*, *secularity*, and *secularism* are likewise muddled and debated concepts.

It is useful to distinguish the multiple meanings of the term before addressing their potential

relevance to theories of secularization. Secularization is understood to mean any one, or a combination, of the following:

- A decline of religious practice (e.g., churchgoing)
- A decline of religious belief and practice
- A decline of church/religious authority over belief and practice
- Privatization, and perhaps marginalization or even complete absence, of religious belief and practice
- Division between the spheres of influence of religious institutions and the state (church-state separation)
- Absence or disappearance of religion from the public sphere

Theories of Secularization

The sociological study of religion features many shades of a general thesis or theory of secularization. That thesis assumes a decline of religion accompanying the spread of modernity. The founding fathers of sociology, including Auguste Comte, Herbert Spencer, Émile Durkheim, Max Weber, Karl Marx, Georg Simmel, and Sigmund Freud, all took for granted this inverted relationship between religion and modernity. In the 1960s, more empirically grounded studies were produced to support the secularization thesis. One of the most influential articulations came from Peter Berger in his 1967 book, *The Sacred Canopy*. Here, he describes religion's role as a kind of canopy, a social construction that projected a sacred cosmos and in so doing served to shelter individuals and society from a seemingly meaningless existence. This canopy began to fall apart with modernization, which brought secularization in a dialectical relationship with pluralism. Put simply, modernization led to the increased exposure to religious creeds different from one's own, which, in turn, undermined exclusive truth claims and, ultimately, faith itself. Other leading expressions of secularization theory in that period came from Brian Wilson and Thomas Luckmann.

David Martin was among the first to critique the secularization thesis by introducing critical nuance, first in 1969 with his *The Sacred and the Secular* and then in 1978 with his *General Theory of Secularization*. Martin focuses on the distinctions within Europe in terms of the pace and nature of secularization across different cultural contexts.

He describes a set of “universal processes” of secularization that tend to occur, other things being equal. But given that things rarely are equal, Martin explores the various factors influencing different secularization patterns.

It was not until the 1980s that the theory of secularization was more broadly contested, following a series of events that provoked its questioning. This includes the Iranian revolution in 1979, the rise of the Solidarity movement in Poland and the Catholic Church's role in the eventual fall of communism there, the role of Catholicism in the Sandinista Revolution and in other political conflicts throughout Latin America, and the public reemergence of Protestant fundamentalism as a force in American politics. Increasingly, scholars began to acknowledge that the theory was generalized on the basis of European trends. Famously, Peter Berger professed that he (and other secularizationist scholars) had been wrong: Europe was to be seen as an exception to the secularization thesis (a concept elaborated by Grace Davie in her 2002 *Europe: The Exceptional Case*) and to what was otherwise, in Berger's words, a “furiously religious world” (this in his coedited text provocatively titled *The Desecularization of the World*).

Today, secularization theory remains a lively area of study, with social scientists largely divided into two camps: those who would like to scrap secularization theory altogether and those who seek to preserve parts of it. Among the staunchest remaining supporters of the secularization thesis are Karel Dobbelaere and Steve Bruce; the main tool of this camp is the quantitative data produced by surveys such as the World Values Survey and European Values Survey. Also based on data from the World Values Survey is the “revised version” of the secularization theory propounded by Pippa Norris and Ronald Inglehart, whereby critical determinants of secularization are the factors of human security and religious culture: Human vulnerability leads to increased levels of religiosity, as do national cultures in which the values of the mass populations are infused with religion. In relatively secure societies, they argue, the remnants of religion have not disappeared, but the importance and vitality of religion and its influence on peoples' daily lives have gradually eroded. The United States, from this perspective, is the exceptional case.

Meanwhile, the U.S. case is central to one of the most powerful and sustained critiques of secularization theory, the “supply-side” perspective, voiced especially by Rodney Stark, William Sims Bainbridge, Roger Finke, and Laurence Iannaccone. This perspective applies rational choice theory to the sociology of religion and posits that religious pluralism does not lead to a decline of religion but quite the opposite: Religious competition invigorates the market as “consumers” (individuals who, the argument goes, are naturally religious) seek out religious options and make choices that maximize “gain” for them. Certainly, the thesis is derived from and applies well to the American case. But its proponents argue that it also applies to the European situation: European secularization is due not to a lack of interest in religion on the part of Europeans (low demand) but rather to deficiencies in religious supply due, in turn, to Europe’s religious monopolies, which have bred “lazy” churches and, hence, empty pews.

Several scholars, in fact, question the account of European secularity. Danièle Hervieu-Léger, for example, argues that Christianity maintains a presence in Europe through a “chain of memory,” linking individuals to a community through memory of a shared past, with religion deeply rooted in tradition lived in the present. Through a process of bricolage (or tinkering), individuals pick and choose aspects of their faith, and religion is no longer simply embedded in culture. Grace Davie argues that people in Europe *believe* but in different ways that are not necessarily quantifiable through religious affiliation; rather, many in Europe “believe without belonging.” Many also experience religion vicariously, not participating directly themselves but still expecting their religious institutions to offer certain services (e.g., baptisms and funerals) and to play certain roles.

Other critiques of secularization theory highlight its normative nature, indicating that the theory has dominated the sociology of religion through the wishful thinking of secular-minded scholars whose rationalism seeks a world free of religious myths and mysticism. In other words, secularization theory has been criticized (e.g., by the sociologist of religion Jose Casanova) as not only descriptive but also normative enlightenment thinking with elements of a self-fulfilling prophecy.

Current Developments in Fact and Theory

Regardless of academic debates, clearly, a glance around the world today does not offer a picture of a secular and secularizing world: The continued intensity of churchgoing in the United States, the rapid growth of evangelical churches in Latin America, the spread of New Age spirituality through western Europe, the renewal of faith in postcommunist eastern Europe, and the rise in fundamentalist Islamist movements in the Middle East and beyond suggest a reenchantment of the world in some cases and/or a desecularization of the observer’s lens. All of the above have led to discussions of a postsecular world—discussions taking place in many different domains (political, media, education, etc.), in various academic disciplines, and involving a broad range of scholars, including Jürgen Habermas, John Rawls, Charles Taylor, Francis Fukuyama, and Talal Asad. A popular resistance front is held—via their best-seller books—by authors such as Richard Dawkins (*The God Delusion*) and Daniel Dennett (*Breaking the Spell*).

Just as the concept of multiple modernities has been increasingly taking root in modernization theory, so too has secularization theory been yielding to an acknowledgment of multiple secularizations, recognizing the different trends and forms of secularization in various contexts as well as countersecularization in others. Moving beyond what many consider not only a European but also Christian and, in fact, Protestant bias in the secularization thesis, today, scholars are exploring the characteristics of European Muslim, Jewish American, and Christian Orthodox secularizations.

SELF-REALIZATION FELLOWSHIP

The Self-Realization Fellowship (SRF) is a non-denominational, global religious organization founded in 1920 by Paramahansa Yogananda (born Mukunda Lal Ghosh). The SRF mission is to disseminate knowledge of scientific techniques for attaining direct personal experience of God as set forth by Paramahansa Yogananda. SRF emphasizes the practice of a particular technique called Kriya Yoga, which draws the practitioner's attention inward, away from outer stimuli, and can lead to the experience of cosmic consciousness. This Kriya Yoga technique has been handed down through a line of gurus from Mahavatar Babaji to Lahiri Mahasaya to Swami Sri Yukteshwar and to Paramahansa Yogananda, who brought it to the West. In *The Second Coming of Christ*, Yogananda discusses a link between Kriya Yoga and the teachings of Jesus Christ.

Yogananda was well suited to be a successful teacher and guide for Western culture, having been trained by his guru Swami Sri Yukteshwar as a young boy for the divine mission of bringing Kriya Yoga to the West. The International Congress of Religious Liberals invited Yogananda to serve as the delegate from India at its 1920 convention in Boston, and he delivered an address titled "The Science of Religion."

By 1925, the SRF had established a headquarters in Los Angeles on Mount Washington Estates. Yogananda traveled and lectured throughout the United States and initiated thousands of followers in the practice of Kriya Yoga.

Legally affiliated with SRF is the Yogoda Satsanga Society of India, founded by Yogananda in 1917 in Dakshineswar. One of the unique features of the fellowship are the printed lessons, which give detailed instructions in SRF energization, concentration, and meditation techniques that constitute the

preliminary practice for more advanced instruction in Kriya Yoga.

After Yogananda's passing, or *mahasamadhi* (the conscious exit of a yogi from his body), in 1952, Rajarsi Janakananda, born James Jesse Lynn, served as president of the organization. He was an American businessman and self-made millionaire who became a close disciple of Yogananda. Janakananda served as president of the SRF until his passing in 1955. Sri Daya Mata, born Faye Wright, was president of the SRF and Yogoda Satsanga Society from 1955 until her passing on November 30, 2010.

The Kriya Yoga technique is based on the science of the breath. All living creatures must perform *pran-kriya*, or the action of breathing. So the flow of the breath is intimately connected to the life force, without which no other bodily functions are possible. According to the Kriya technique, by focusing one's attention on the flow of the breath and ultimately controlling the breath, one can consciously connect to the life force itself. Because Kriya Yoga is a technique that anyone can practice, it has universal appeal. Indeed, SRF members come from every corner of the world and all the major religions.

Paramahansa Yogananda, along with other prominent figures from India, has had a profound influence on Western culture as well as religious and educational activities in the West, and though the exact number of SRF members is not known, a Harris Poll study revealed that by 2004, 7.5% of U.S. adults, or 16.5 million people, practice some type of yoga. Yogananda lived in the United States and taught his students and followers for more than 30 years, and his work has been carried on by his monastic disciples.

SENEGAL

The westernmost country in Africa, situated on the Atlantic coast south of Mauritania, Senegal has contained a majority Muslim population since the 10th century. Approximately 94% of the populace are practitioners of Islam, with around 4% of the population reporting as Catholic or Protestant Christians. The remaining 2% or so of Senegalese practice some form of animism or traditional African religion. There is also a good deal of syncretism evident in both Islamic and Christian practices, and many ethnic groups engage in some form of ancestor worship.

Islam was introduced to Senegal by Arab and Berber traders in the 10th century who intermittently invaded the country looking for converts. The nation's colonial history began with the Portuguese, who set up a lucrative slave and gold trade on the coast in 1444. The French would establish settlements in 1638, and those settlements would serve as a launching point for most of the French activities in West Africa. Senegal was declared a permanent possession of the French government in 1840, and this led to the abolition of slavery in the country. Major wars against the colonial powers post-World War II helped precipitate the decolonization process, which resulted in Senegal merging with French Sudan into the independent Mali Federation. Soon after the merge occurred in 1959, however, the countries announced their individual independence, and Senegal was declared an independent nation in 1960. The first president of Senegal, poet president Léopold Sédar Senghor, was a Roman Catholic who was able to develop strong ties with the Sufi Muslim brotherhoods that continued to play a significant role in the country's governance into the 21st century. The three principal Sufi brotherhoods to which a majority of the population belong are the Murīdiyya, the Tijaniyya, and the Qadiriyya, with the Tijaniyya claiming dominance among the three.

Senegal is exceptional because its diverse ethnic groups and religions coexist in peace. It has not been without conflict, however, and the anti-Moor protests of the 1980s resulted in the mass exodus of the group in 1989. At the beginning of the 21st century, a separatist movement that began in 1982 in the forest area of Casamance continues. The movement is both ethnic and religious in character;

the Diola population, who seek separation, are less Islamic than the majority Wolof ethnic group, which comprises the bulk of citizens in the northern part of the nation.

The Senegalese government actively supports the religion of its populace, maintaining a fund to support religious festivals and the revitalization of places of worship, and sponsors the annual hajj pilgrimage for hundreds of Senegalese Muslims and annual journeys to the Holy See for its Catholic citizens. There was a noted growth in the popularity of religious schools at the end of the 20th century, and the government allowed up to 4 hours of religious education in its public schools. The steps the government takes to create an environment that is respectful of all religions has created a society that boasts of peace and harmony amid many other societies that have succumbed to ethnic strife.

SEPTEMBER 11, 2001

The date of September 11, 2001, is largely recognized for a series of violent attacks on the World Trade Center in New York City and the Pentagon

in Washington, D.C. The events of “9/11,” as it is often referred to, have changed the overall makeup of global and international relationships in virtually every segment of political, economic, and civil society. Moreover, a latent effect of 9/11 has created a greater global awareness of the intersection between religion and violence. On the surface, the attacks appeared to be driven by radical “Islamic fundamentalism”; yet a closer examination would hold that 9/11 was a mere instance of a particular form of religious extremism and was neither exclusive to nor representative of the larger Muslim community.

On that day, a total of 19 men hijacked four commercial airliners and rerouted them toward the World Trade Center towers, the Pentagon, and the White House. The first plane, American Airlines Flight 11, bound for Los Angeles, departed from Boston’s Logan International Airport at 7:59 a.m. After irregular communication between Flight 11 and Boston Center occurred, including a phone call from a flight attendant alerting American Airlines of a stabbing on board the plane, Boston Center notified Otis Air Force Base in Massachusetts and the Northeastern Air Defense Sector of the possible hijacking. Despite the scrambling of two F-15 fighter jets from Otis Air Force Base, Flight 11 was not intercepted, and at 8:46 a.m., it crashed into the North Tower of the World Trade Center.

The second plane, United Airlines Flight 175, also bound for Los Angeles, departed from Boston’s Logan International Airport at 8:14 a.m. At 8:52 a.m., United Airlines received a call from a Flight 175 attendant confirming that their plane had been hijacked, both pilots killed, and a flight attendant stabbed. At 8:58 a.m., Flight 175 flew off path toward New York City, where it crashed at 9:03 a.m. into the South Tower of the World Trade Center.

At 8:20 a.m., American Airlines Flight 77, again bound for Los Angeles, departed from Washington Dulles International Airport. Within 25 minutes of its departure, Flight 77 flew off course over Ohio, returning toward Washington D.C. At 9:37 a.m., Flight 77 crashed into a western portion of the Pentagon.

Just prior to the impact from American Airlines Flight 11 into the North Tower of the World Trade Center, United Airlines Flight 93 departed from Newark International Airport at 8:42 a.m. After a series of communications between Flight

93 passengers and their relatives on the ground, there was some speculation that these passengers might have known about the other three hijackings and may have acted on this information by trying to take control of their flight. Given this, it is believed that some of these passengers stormed the cockpit to divert the plane from crashing into the U.S. Capitol. The hijackers lost control of the aircraft, and Flight 93 crashed at 10:03 a.m. just outside Shanksville, Pennsylvania.

In the end, a total of 3,017 people died and an estimated 6,300 others were injured in the attacks. In New York City, the overall physical damage, inclusive of immediate and subsequent destruction, consisted of damage to six World Trade Center buildings, a Marriot Hotel, a Greek Orthodox Church, and a Deutsche Bank, and collateral damage to the surrounding buildings. In Arlington, Virginia, a portion of the west side of the Pentagon was destroyed.

The aftermath of 9/11 has led to at least two overseas conflicts, several dramatic changes in domestic and foreign policy legislation, controversial investigations, and conspiracy theories.

The conflicts that ensued after 9/11 were part of what U.S. President George W. Bush dubbed the “War on Terror.” After arriving at the conclusion that the Saudi Arabian-born militant Osama bin Laden and his al Qaeda fighters were behind the attacks of 9/11, the United States and its allies—the United Kingdom and Canada—and later NATO soldiers invaded Afghanistan, where bin Laden was believed to be in hiding among the Taliban. But the mission known as Operation Enduring Freedom, which began on October 7, 2001, did not manage to either capture or kill Osama bin Laden. However, this mission has led to regime changes at the national and local levels in Afghanistan, despite the ongoing conflicts in that region. (Osama bin Laden was finally killed in a U.S. military raid on his hideout in Abbottabad, Pakistan, on May 2, 2011.)

In the early months of 2003, the United States was also gearing up to invade the nation of Iraq. The justification for this invasion was based on at least two allegations that held that Iraqi President Saddam Hussein was concealing weapons of mass destruction as well as providing refuge and support for al Qaeda fighters. Although the justifications for preparing for an invasion were questioned, and

met with extensive international criticism and condemnation, on March 20, 2003, the United States, along with a coalition of military forces from the United Kingdom, Australia, and Poland, invaded Iraq. Notwithstanding the ongoing conflicts in Iraq through the spring of 2008, the defeat of Iraq's conventional military was declared by President Bush on May 1, 2003.

U.S. domestic and foreign policy legislation also went through several transformations. On October 26, 2001, the U.S. PATRIOT Act was signed into law. The purpose of the act was to increase the authority of law enforcement agencies in an effort to combat terrorism; however, critics of the act argued that such an increase in authority would serve to limit civil liberties. In addition to the PATRIOT Act, a new cabinet known as the Department of Homeland Security was established on November 25, 2002, to protect U.S. citizens from terrorism within and abroad. The Department of Homeland Security has also been met with criticism about its ineffectiveness and bureaucratic constraints.

Much of the evidence that influenced such U.S. responses was actually compiled through an investigation that was not completed until well after the two conflicts in Afghanistan and Iraq had begun and the changes to legislation were implemented. In spite of calls for an independent investigation into the events of 9/11, on November 27, 2002, President Bush and the U.S. Congress created the "9/11 Commission on Terrorist Attacks." When the "Final Report of the National Commission on Terrorist Attacks Upon the United States" was released on July 22, 2004, the general conclusion was that Khalid Shaykh Mohammad, not Osama bin Laden, was the chief organizer behind the attacks and that the Central Intelligence Agency (CIA) and the Federal Bureau of Investigation (FBI) could have prevented them. The 9/11 Commission also made 41 recommendations to the president and Congress to prevent future attacks on the U.S. homeland.

Though the commission report created an official narrative for the events of 9/11, skepticism and suspicion about such a report had already emerged years before the report was completed and distributed. Michael C. Ruppert, founder and editor of the newsletter *From the Wilderness*, may have been the first to publicly speak about the perceived anomalies of 9/11 in the fall of 2001 and was later

followed by David Ray Griffin in his 2004 book, *The New Pearl Harbor*. These authors—widely decried in the public media as conspiracy theorists—have given rise to a loosely connected network called "The 9/11 Truth Movement," contending that 9/11 was effectively an elaborate scheme designed by the U.S. government to justify future wars and secure oil interests within the Middle East. Much of this movement shares the following paraphrased contentions:

1. Certain U.S. officials had prior knowledge of the attacks of 9/11.
2. Several mock security training sessions took place on 9/11 that precluded timely decision making and competent responses on the part of the U.S. military.
3. The World Trade Center towers were brought down by a controlled demolition.
4. United Flight 93 was not brought down by a heroic struggle for control of the plane but rather was shot down by the U.S. military.
5. The Pentagon was struck by a missile, not an airplane.
6. The official story presented by the *9/11 Commission Report* was complicit at best.

None of these allegations has been proven convincingly, and ultimately, these conspiratorial charges are based on broad allegations about the hidden agenda of the United States to impose military influence within the global geopolitical arena as well as to control and profit from the oil markets of the Middle East region. Several of these accusations condemned the Project for the New Century, a neoconservative think tank made up of prominent political figures, Cabinet members, and advisors within President Bush's administration. Project for the New Century's overall mission was to promote U.S. presence on a global scale. While the latter mission is not itself without critique, the conspiratorial charges surrounding it have done little to clarify the situation.

SERBIA

Serbia, in the heart of the southern European Balkan countries that once constituted Yugoslavia, has been at the crossroads of global religion since antiquity. Groups of Serbs and other Slavic people migrated from the northeast of the Carpathian Mountains to the Balkan Peninsula from the fifth to the seventh centuries and settled in Roman territories. The Roman Empire, centered in Constantinople, with Christianity as its state religion, attempted to domesticate intruders into imperial subjects. Although the Slavs adopted the political, cultural, and religious institutions of the Byzantines, they rejected and fought against imperial rule and established their own kingdoms and principalities.

Christianization of the Serbs occurred in the second half of the ninth century when two brothers from Thessalonica, Cyril and Methodius, began to preach in the Slavic vernacular, created the Cyrillic alphabet, and translated the Christian scriptures and liturgies into the Old Church Slavonic language. The early Serbian protostates of the 9th and 10th centuries coemerged with the hierarchical structure of organized Christianity.

The struggle for supremacy between the pope in Rome and the patriarch in Constantinople originated the schism between the Orthodox and Catholic churches in 1054 and was reflected in shifting ecclesiastical allegiances among the Serbs. However, in 1219, Saint Sava, the youngest son of the first ruler of the Serbian Nemanjić Dynasty, became the archbishop of the autocephalous Serbian Orthodox Church under the Constantinople patriarchy, sealing an enduring identity of Serbs as Orthodox Christians. Together with the rise of Serbian military power, conquest of Byzantine territories, and coronation of Tsar Dušan in 1346 as the Emperor of Serbs and Greeks, the Serbian archbishop was raised to the rank of patriarch. Between the 12th and 14th centuries, the Nemanjić Dynasty built numerous monasteries, giving birth to the Raška School of art, whose frescoes of secular authorities alongside Christian images adorned the walls of the churches. In turn, most of the Nemanjić kings were canonized by the Serbian church. All these events testify to the presence of state institutions pervaded by Christian religiosity and church institutions imbued with state power.

With the fall of the Serbian state to the Turks in the 1389 Kosovo battle and its incorporation into the Ottoman Empire after 1459, the monasteries, churches, and clergy became a sanctuary of Serbian cultural and social identity. Serbian priests led rebellions against the Turks and guided flows of refugees from Kosovo and Raška north into the Austrian territories. In the 1700s, the center of Serbian cultural life gradually moved to the town of Sremski Karlovci and monasteries in Srem, an area between the Sava and Danube rivers. For nearly 500 years under the Ottomans, to be a Serb meant to belong to the Serbian Orthodox Church, and this vested identity was carried over into the present.

Having regained its independence in the 19th century, Serbia managed to unify dispersed ethnic Serbs into the country of Yugoslavia following World War I and bring together fragmented eparchies under patriarchy in Belgrade. While marginalized after World War II by the Yugoslavian communist government, the Serbian Orthodox Church was once again called upon by the Serbian state in the 1990s to rouse national feelings and solidify national identity during the recent Balkan wars.

SERRA, FATHER JUNÍPERO (1713–1784)

Born Miguel José Serra on November 24, 1713, at Petra on the island of Mallorca, Father Junípero Serra gained renown as a teacher of philosophy on his home island, as a missionary and *comisario* of the Inquisition in the Sierra Gorda in Mexico, and ultimately as founder and Father President of the California missions. In 1988, Pope John Paul II beatified him, and the international Serra Cause and massive documentation support his canonization. The outlines of his life are well-known, although there are large gaps in documentation concerning his experience in Mexico, and his reticence about self-revelation in his many letters and reports renders his life history incomplete. His legacy will always be controversial, his admirers applauding his efforts at Christianizing the Native Americans, others pointing to the devastation of their way of life.

At age 15, he left for Palma, where he began his studies for entry into the Franciscan Order. At first rebuffed, he reapplied, and at age 17, he joined the Franciscans and adopted the name *Junípero*, for a companion of Saint Francis of Assisi who was known for his humility and patience. The young Serra pursued the study of theology and philosophy, obtaining a doctorate in 1742 from Lullian University in Palma, where he then assumed the chair of Scotistic philosophy. However, academic life became unfulfilling, and as a result of this and other factors, he decided to resign his professorship in January 1849 in favor of evangelizing the Indians of the Americas. He sought to follow the example of the great 13th century Mallorcan, Ramón Llull, who preached to North African

Muslims. He was also influenced by the writings of María de Agreda, who had miraculously bilocated to New Mexico in the 1620s and told of the Indians' desire for evangelizing, and by his success as a *comisario* of the Inquisition in a place with a large *converso* population from whom Serra may have descended.

Serra arrived at the College of San Fernando in January 1750, after a walk of 250 miles (1 mile = 1.609344 kilometers) from Veracruz, on which he developed a foot infection that would plague him terribly the rest of his life. He and Francisco Palóu, a former student and his first biographer, soon responded to the call for volunteers and walked the 175 miles to the Sierra Gorda. Already missionized, the area around Jalpan suffered plagues and remnant pagan spirits and witchcraft, which Serra would battle as president (1751–1754) of the missions there and *comisario* of the Inquisition. Called back to Mexico City in 1758, he served at the college and as missionary to several places near the capital.

In 1767, he assumed the presidency of the missions of Baja California after the Jesuit expulsion. In early 1769, he enthusiastically heeded the call of Visitor General José de Gálvez to initiate the spiritual conquest of Alta California. Zealously Father President of the missions, Serra proceeded to found nine missions along the California coast, beginning with San Diego Alcalá in July 1769. In spite of the freshness of this frontier territory, his efforts were vexed by Indian resistance, often the consequence of soldier outrages and by vehement disputes with civil authorities, most notably with Captain and then Governor Pedro Fages, which belied any notion that Serra's demeanor was akin to that of his order's founder or his namesake.

Serra died in 1784 at the age of 70 at Mission San Carlos (Carmel). He is the most important, and now controversial, figure in early Californian history. His supporters laud his efforts to bring Christianity to the natives; his critics hold him responsible for initiating the devastation of the Indians of the California coast.

SEXUALITY

Most religious traditions have been profoundly ambiguous about sexuality. At times, sexual acts are regarded as having almost a sacred quality, as the ancient Hindu temple architecture at Khajuraho illustrates. At other times, it is regarded as inherently sinful, as the Apostle Paul seems to imply and the early Christian bishop, Augustine, affirms. Codes of modesty (*tzniut*) in Orthodox Judaism are meant to diminish sexual desire. In Muslim mosques, women pray at the back of the room so that men will not be sexually distracted from the sight of women bending over in prostration during the prayers.

Though the subject of religion and sexuality is a topic different from that of gender roles and how they are treated within religious traditions, notions about sexuality can affect attitudes toward gender. Although there is no scriptural basis in any religious tradition for one gender being spiritually superior to the other, customs have developed within religious communities that at times have regarded women's sexuality as something to be controlled. In some African communities, this notion has become the basis for adopting practices of female genital mutilation (so-called female circumcision). It can also be a reason for enforcing codes of modesty more strictly among women than men. In Islam, for instance, the guidance given in the Qur'an for people to dress modestly is sometimes applied more strictly to women than to men and taken to extremes in the Wahhabi branch of Islam in Saudi Arabia, where women are fully covered in black cloth except for small portals for their eyes.

This entry will explore religious practices and ideas regarding sexuality in different traditions and in various parts of the world. These practices and ideas are global in two senses of the word. The phenomenon of sexuality is universal, and every

religious tradition deals with it—though often in contradictory ways. Sexuality can also be global, in the sense that practices and ideas in one part of the globe can spread to other areas, often from one tradition to the other. When early Christians accepted the Greek idea of the separation of the spirit and the body, it enabled Christians to identify the bodily function of sex as something inferior. An example of the borrowing of attitudes toward homosexuality may be found among Israeli Jews in the last decades of the 20th century when some conservative Jewish activists went on tour in the United States with pro-Israeli right-wing Christian evangelists for whom opposition to homosexuality was a major theme and who became more stridently homophobic in their public comments at home.

Sexual Images

Perhaps paradoxically, the Christian idea of the separation of the spirit and the body can lead to an admiration for the body as “the temple of the Holy Spirit” (1 Corinthians 6: 19–20). In the *Song of Songs* in the Hebrew Bible (the Old Testament), descriptions of women's bodies are provided in appreciative detail, as they are in some of the devotional poetry of India's medieval poet-saints. The blind poet, Sur Das, for example, describes in handsome specificity the beauty of young Krishna's body and the erotic splendor of his female lovers.

The Shaivite tradition in Hinduism is represented by the image of the *lingam*, found in temples and in homes and in calendar art throughout India. Though many of the Hindu faithful deny that it has any specific sexual reference, it is undeniably phallic in presentation. It is usually thought to symbolize the male sexual energy manifest by the god Shiva, who is sometimes described as the “erotic ascetic” (as noted by Wendy O'Flaherty) since he was able to stir up sexual energy and maintain an erection for eons while not discharging his sexual potency. The Shiva lingam is often placed in the center of a flat base shaped like a vagina (the *yoni*), and the union of the two—lingam and yoni—is regarded as a symbol not only of sexual fulfillment but also of spiritual union (see Figure 1). The union of the male-female aspects is also in the figure of Shiva himself or herself, since the god is thought to embody both male and female characteristics, and some

iconography shows this in literal form with one side of his body complete with a breast and female genitalia and the other side with a male chest and genitals. The union of female-male principles is also a part of the Chinese religious tradition where the image of yin and yang—in Daoist, Confucian, and Buddhist images—provides the idea of balance in life between various oppositions, including dark and light, cold and hot, and female and male.

Actual sexual unions are part of the practices of some devotees of the Tantric traditions found in esoteric branches of Hinduism and Buddhism. Tantra involves a large body of spiritual texts and practices, few of which are specifically sexual, but it does include the notion that the body can channel spiritual energy and that seminal fluid is a concentrated form of the life force. The so-called left-handed Tantra (*Vamachara*) of Shaivite Hinduism sometimes involves actual sexual intercourse in the *maithuna* ritual, though often the intention is to provide a situation of sexual excitement without actually releasing sexual fluid through ejaculation in order to redirect the spiritual energy within the body to a high level. Some practitioners of

Tantra in Tibetan Buddhism are also said to take the image of the “jewel in the lotus” in a sexual sense and apply it to the integration of sexual intercourse with ritual practices.

Attitudes Toward Heterosexuality

Male-female sexuality is recognized as a positive aspect of life in most religious traditions, though for different reasons. At the most basic is the idea that marriage provides a controlled outlet for sexual expression. In early Christianity, the Apostle Paul regarded celibacy as the preferred choice, but for those who are unable to control their passions, “it is better to marry than burn” (1 Corinthians 7:9). Religious law in some traditions makes sexual activity one of the defining aspects of marriage, and Islamic law allows divorce on the grounds of the refusal or inability of one partner to have sexual relations with the other.

Within the Roman Catholic tradition, the purpose of marriage is not simply to have sexual relations but to provide for procreation. The Church’s opposition to birth control methods is often based

Figure 1 Lingam and Yoni of Lord Shiva

on the idea that it prevents sexual relations from producing offspring and the sheer pleasure of sexuality is an insufficient moral reason to engage in sex acts. The implication is that the sinfulness of sexual pleasure is mitigated only by the productive result of progeny. The scriptural basis for this position comes from the admonition in Genesis 1:28 to “be fruitful and multiply.” Jewish ethical codes are also based on this scriptural reference and accept sexual relations within marriage as a pleasurable obligation but without the limitation that only procreative sexual relations are morally justified.

The traditional Hindu attitude accepts sexual relations within marriage as part of the expectations of the householder stage of life. The Kama Sutra texts provide a sort of detailed manual of sexual activities, and the diversity and creativity of the sexual positions described indicate that the purpose is as much for pleasure as for simple procreation, if not more. Since *kama*, sexual pleasure, is regarded by Hindu texts as one of the four great goals of human activity, to have a healthy sexual life is a religious obligation. The ancient temple at Khajuraho displays the diversity of sexual positions between male and female partners, although sometimes assisted by other people.

The joining together of a man and woman in marriage—implicitly sexual and physical—is also regarded as being a spiritual union. The statement in the book of Genesis in the Bible that “a man leaves his father and mother and cleaves to his wife, and they become one flesh” (Genesis 2:24) is regarded as a basis for the sacramental aspect of marriage. In Hinduism, the bride and groom become like deities in a fire ritual that is reminiscent of ancient Vedic rites. In most Buddhist traditions, marriage itself is not regarded as a sacrament, but the couple may go to a temple priest after the civil ceremony to receive blessings for a happy married life. Buddhist prayers are also offered for a fertile marriage and for the union to be blessed with children. Approved marriage within most religious traditions assumes that the partners are one man and one woman, though the custom of polygamy is approved within the Qur’an and is common in some Arab societies, as it has been in traditional Chinese culture. The Mormon faith allowed polygamy early in the movement’s history but discontinued the practice when Utah became a state. Polyandry—the union of one

woman and two or more men—is seldom mentioned or authorized within religious traditions.

Romantic love between male and female gods or between gods and humans is a feature in the stories and iconography of several religious traditions. In Hinduism, for instance, Krishna is portrayed as a child who likes to steal butter and later as a young man who steals the hearts of maidens in his village. He plays tricks on the herder maidens, stealing their clothes while they are bathing in the river so that they have to come naked out of the water before him, and he is able to multiply himself, so that when the girls dance together in a circle, each of them thinks that only she is holding Krishna’s hand. The devotional genre of Hindu Vaisnavism is filled with stories and images of the romantic Krishna, and devotees think of themselves as Radha, his favorite lover, in their own expressions of devotional love.

In Christianity, medieval nuns thought of themselves as married to Jesus, and the initiation rites for women joining a monastic order were similar to marriage ceremonies. Medieval Christianity also witnessed the emergence of the Cathar or Albigensian movement of Christian purists, who emphasized love over sexuality. Some scholars have argued that the Albigensian movement popularized the idea of courtship, the asexual romantic love that became characteristic of premarital relationships within the Christian tradition, although the Albigensian movement itself was virtually exterminated by the Inquisition.

Extramarital sexuality is generally forbidden within most religious traditions. Adultery is banned in the Ten Commandments of the Hebrew Bible (the Old Testament) in Exodus 20:2–17 and Deuteronomy 5:6–21. Even lusting after a neighbor’s wife is forbidden. The Apostle Paul includes adulterers among those who will not inherit the Kingdom of God (1 Corinthians 6:9). In the strictest interpretations of Islamic law, adultery is punishable by death, though the man involved is often given a lesser sentence than the woman.

At the same time, some images of illicit love between gods or between god and humans have become a part of the religious imagination. In the Hindu devotional tradition, the cowherder maidens who fell in love with Krishna often abandoned their husbands to do so. Krishna himself was pictured as something of a rogue; he would return in

the morning to his consort, Radha, after a night of lovemaking with other women, his body scratched with their passionate nail marks. One of the best known female poets of 17th-century Hindu devotional poetry, Mirabai, refused to consummate her own marriage with the claim that she was already married—to Krishna. In the stories told about her, this announcement was not favorably received by either her family or her intended spouse, and she was banished.

Attitudes Toward Homosexuality

Considering the controversy over homosexuality in many religious communities in the late 20th and early 21st centuries, it is notable that homosexuality is scarcely discussed in the texts and teachings of most religious histories. Part of the reason for this is a matter of nomenclature. The modern word *homosexuality* (and for that matter, *heterosexuality*), which indicates that sexual attitudes are a part of one's identity, is an invention in European languages that does not appear in dictionaries until the late 19th century. Prior to that in European societies and in non-European cultures, there is no single term for homosexual identity, though there are words referring to transvestites, extremely effeminate men, some same-sex acts, and those who habitually play a particular role, such as the active or passive partner, in anal sexual acts.

Transvestites and very effeminate men have sometimes been ostracized and sometimes tolerated by religious communities. In the Buddhist Vinaya, a fourth-century BCE text for monastic orders, the *pandaka* are not allowed to be monks; the term seems to refer to transvestites, possibly transvestite prostitutes. Hermaphrodites are also excluded from Buddhist monastic orders. On the other hand, bands of transvestites in India, *hijra*, appear at weddings and the birth of children to provide ritual blessings. In the Native American tradition, *berdache*, transvestite men, were commonly accepted within the communities and often thought to have spiritual power.

In some Melanesian societies, ritualized homosexuality was required of all boys as part of maturation into manhood. In tribal communities in the Papua New Guinea highlands and the southeastern coast of Irian Jaya as well as areas of island Melanesia, such as Malakula in Vanuatu, religious rituals included the requirement that all

boys coming of age perform acts of oral sex on older boys and men. Part of the idea was that ingesting semen would make the boys physically stronger, and these initiation rites were a part of the male bonding that encouraged tribal solidarity.

Though transvestites and effeminate men were barred from Buddhist monastic orders, other forms of homosexual activity appear to have been tolerated at various times within Buddhist monastic communities, as they were within Christian and other religious monastic orders. The 15th-century Roman Catholic pope Sixtus IV and his nephew and successor, Julius II, were both alleged to have had male lovers. The suggestion by the American scholar Jeffrey Kripal that the Indian mystic Ramakrishnan was involved in sexual acts with his young male disciples produced a storm of protest in India when the book was published in 1995.

Throughout the histories of most religious traditions, same-sex relations have seldom been a matter of intense moral debate. In Islam, for instance, a rich heritage of Arabic love poetry written by men about boys derives from the early Ottoman Empire from the 16th to the 19th centuries. In some branches of Judaism, same-sex activities were tolerated as long as they were not acts of anal intercourse. According to the Yale historian, John Boswell, the history of Christianity has had mixed periods of tolerance and intolerance of homosexuality, though one of the most intolerant periods is the current one, beginning in the mid-20th century. The homophobia of recent decades can be explained in part by the emergence of the idea of homosexual and heterosexual identity in the early 20th century, with the implied notion that same-sex sexual acts create a different kind of person who is outside the pale of accepted normal behavior. The labeling of homosexuality as a psychological pathology helped reinforce this impression, though the labeling was lifted by the American Psychiatric Association in 1974. Nonetheless, some conservative religious communities persisted with the idea that same-sex acts were associated with unnatural and therefore immoral behavior.

Scriptural references have been used to make credible the assertions that homosexuals and homosexual acts are immoral and religiously inappropriate. The scriptural references in every religious tradition are scarce, however, and they are often ambiguous. The original meaning of the well-known

admonition in the book of Leviticus in the Hebrew Bible (the Old Testament) to “not lie with a man as one lies with a woman” (Leviticus 18:22) is a matter of some scholarly discussion. So is the statement of Paul in the New Testament book of Corinthians 1, which lists among those who will not inherit the Kingdom of God male prostitutes and effeminate men; yet the exact meaning of the Greek terms for these words is not certain. In the Holy Qur’an of the Muslim tradition, there are isolated sentences that appear to reject homosexual acts, such as this one: “Will you approach males, leaving those whom God has created for you to be your mates?” (Qur’an 26:166). The meaning of the passage, however, is not clear. At the same time, there are scriptural references to loving same-sex relationships, as in the youthful friendship between David and Jonathan in the book of Samuel in the Hebrew Bible, where it is said that “the soul of David was knit to the soul of Jonathan” (1 Samuel 18:1) and that David lamented at Jonathan’s funeral that “his love was more wonderful than the love of women” (1 Samuel 1:26). The scriptural references are mostly about men; very few of the textual references either for or against homosexual attraction or activity relate to same-sex relations between women.

The last decades of the 20th century witnessed the rise of antihomosexual attitudes within conservative religious communities in Christianity, Judaism, and Islam. Following the Islamic revolution in Iran in 1979, homosexuality was punished, sometimes by death. Conservative Jewish and Christian leaders regarded it as sinful, and candidates for religious leadership who were suspected of homosexuality were not allowed to be ordained. The worldwide Anglican community was torn apart by the resistance, especially from African branches of the church, to the American Episcopal Church’s openness to gay and lesbian clergy, including the installation of two bishops, one openly gay and the other lesbian. In the first decade of the 21st century, antihomosexual legislation in Uganda that prescribed punishment, including death sentences, was said to have been supported by right-wing Christian activists, including some from conservative churches in the United States. At the same time, liberal Christian congregations have been vocal in their support for gay and lesbian rights, and the Metropolitan Community Church established local congregations in many American

cities, especially for members of gay and lesbian communities.

Autoeroticism

Though references are made in scriptures for the maintenance of physical health and the appreciation of one’s own body as the temple of the spirit, this seldom goes so far as to encourage autoeroticism. Male masturbation may have been a part of ancient Egyptian religion, where the god Atum was thought to have created the world through self-induced ejaculation, and pharaohs were said to have ritually repeated this act by ejaculating into the Nile River. The Hindu text on sexuality, the Kama Sutra, provides instructions on masturbation, advising to “churn your instrument with a lion’s pounce.”

In other traditions, masturbation is regarded as wasting the body’s seed and is therefore discouraged. Onan, a character in the book of Genesis in the Hebrew Bible, is said to have withdrawn prematurely during sexual intercourse with his brother’s widow, Tamar, and “spilled his seed” on the ground (Genesis 38:8). In the 18th century, this incident was connected with the act of masturbation, which was thereby called “onanism.” In Hinduism, yogic practices often insist that men involved in them do not release their semen, reasoning that sexual energy retained within the body can be redirected toward a higher, spiritual purpose. Swami Sivananda taught that 1 drop of semen was equal to 40 drops of blood and therefore should be restrained as much as possible within the body.

Celibacy

Withholding from sexual activities for purposes of spiritual purification is a fairly common feature of religious practices in many traditions, either for a temporary period of time or as a lifetime vow. During the month of Ramadan, when Muslims fast, they are also expected to forgo sexual activity during the fast period. Muslim women are not allowed to have sex during menstruation, a restriction that is also found in Judaism. In Islam, women are also not allowed to have sex for 40 days after giving birth and for 3 months after the finalization of a divorce. In Judaism, sexual activities are banned during fast days and the time of Yom Kippur.

Celibacy is a condition of monastic orders in every religious tradition where there are ascetics or monks, including Hinduism, Buddhism, and Christianity. In Islam, only Sufi practitioners have practiced celibacy. In most religious traditions, the clergy and leadership are not required to be celibate. In Roman Catholic Christianity, priests were allowed to marry until 1139 CE, when a Church council made celibacy mandatory. One reason may have been the desire to keep church property from being inherited by the children of clergy, but the reasons for this decision were likely to have been for spiritual as well as practical purposes.

SEYCHELLES

The Republic of Seychelles is an archipelago of 115 islands in the Indian Ocean. It lies about 1,500 kilometers (932 miles) east of mainland

Africa and northeast of the island of Madagascar. Seychelles was a French colony until 1814, when the British took over. Settlement began in 1778. The Seychelles became independent in 1976. During the 19th century, Chinese and Indian tradesmen, together with former slaves, settled on the island. The islands of Seychelles had no indigenous population, and the Seychellois currently living in the islands are all descendents of migrants. The population of Seychelles is about 88,340 (U.S. Bureau of Census, July 2010). Seychelles does not have any state religion, and the constitution provides for freedom of religion. The government has respected this right and has granted all religions tax-free status.

A number of religions currently flourish in Seychelles. The 2002 census shows that 82.3% of the population is Roman Catholic, 6.4% Anglican, 1.1% Seventh-Day Adventist, 3.4% other Christian, 2.1% Hindu, 1.1% Muslim, 1.5% other non-Christian, 1.5% unspecified, and 0.6% having no religion. There are no restrictions on religious practice, and diverse beliefs are tolerated and respected. With the early settlement of the French who were Roman Catholics, Roman Catholicism became the dominant religion of the country. The British tried to establish Protestantism in the islands during the 19th century, but these efforts failed to dislodge the dominance of Roman Catholicism. Seychelles was a bishopric since 1890, and mission schools had a virtual monopoly on education until the government took over such schools in 1944. Most of the Anglicans are from families that were converted by British missionaries who arrived in the late 19th and early 20th centuries. The other Christian groups include Baptists, Assemblies of God, the Pentecostal Church, the Pentecostal Assembly, Nazarites, and Jehovah's Witnesses. Evangelical Protestant churches such as the Pentacostals and Seventh-Day Adventists are very active in the Seychelles. Non-Christian groups include those of the Baha'i Faith and Buddhists. Given the large Roman Catholic population, one will find more Roman Catholic churches in the Seychelles than other churches. Sunday masses are well attended, and religious holidays, which are mainly Christian, are celebrated throughout the nation both as opportunities for the devout to practice their faith and as social events. The country also has places of worship for other religious

groups, including a Hindu temple and a mosque, and Muslims are also allowed to participate in the Friday prayer.

Apart from their official religions and in spite of disapproval from religious and civil authorities, many Seychellois also believe in magic, witchcraft, and sorcery. Sorcery was outlawed in 1958, but Seychellois still consult the seer, also known as *bonom di bwa*, for fortune telling, to obtain protective amulets or charms, or even to bring harm to enemies.

SHAIVISM

Shaivism (or Āivism) is one of several branches of the Hindu religious traditions, centered on the worship of the god Shiva (the “auspicious” one). Together with Vaishnavism (worship of the god Vishnu) and Shaktism (worship of the goddess or Shakti), it constitutes one of the three largest sectarian traditions within Hinduism. The deity Shiva has antecedents in the Vedic god Rudra, the “roarer” or “howler,” a fierce deity associated with storms and disease, dating back to the oldest period of the Vedas (1500 BCE). In one of the latest parts of the Vedas, the *Shvetashvatara Upanishad* (400–200 BCE), Rudra is elevated to the position of a supreme deity, identified as the one, omniscient lord—attributes that would later be ascribed to the classical Hindu deity Shiva.

In classical Hindu mythological literature and iconography, Shiva is traditionally portrayed as the supreme lord of yoga, an ascetic with long matted dreadlocks, covered in ash, and seated in a meditative posture with a water pot and trident. However, he is also a paradoxical deity who embodies the extremes of renunciation and sensuality, described

by some scholars as the “erotic ascetic.” In Hindu mythology, Shiva is the “destroyer,” who annihilates the universe with fire at the end of each cosmic age, returning the universe to the primordial ocean from which it will be reborn in the next cosmic age. But he is also a deity associated with creative power whose primary symbol is the lingam, or phallus. Although a yogi and ascetic, he is also a family man, who has a wife, Parvati, and two children, the warrior god Skanda and the elephant-headed god Ganesha.

Under the large umbrella of Shaivism, there are numerous sectarian traditions that developed throughout South Asia from roughly the fourth century onward. The most important of these include the Pashupatas, the Shaiva Siddhanta, the Lingayats, the Kapalikas, the Aghoris, and the Kashmir Shaivite tradition. Some of these are devotional traditions centered on Shiva as the Lord (*pati*) of his devotees (*pashus*), while others center on Shiva as the radical ascetic without fear (*aghora*) beyond human worldly society. And still others such as the Kashmir Shaivite tradition are highly philosophical traditions centered on the ultimate identity between the individual self and the supreme consciousness of Shiva. Typically, Shaivite ascetics can be recognized by the three horizontal bars drawn on their foreheads, symbolizing Shiva’s trident. Many also wear long matted dreadlocks, carry a trident, and/or a skull begging bowl in imitation of Shiva.

Unlike the Vaishnava tradition, Shaivism does not typically have a concept of avatars or earthly “descents” and incarnations of the deity into the material world. However, in modern times, there have been some noteworthy exceptions. The most famous is Satya Sai Baba, a modern Indian holy man who claimed to be the human incarnation of Lord Shiva, descended in a unique form for the last age, the *Kali Yuga*, before the end of this cosmic era.

SHAMANISM

Shamanism is a term, originally taken from a Russian word used to describe a phenomenon of the religions of Siberia, that has now become established in international usage. It means a form of culture that revolves around the central position of the shaman, a religious expert who acts as an intermediary between man in his environment and society and the forces and the spirits of the other world. The shaman of the central Siberian peoples may be either a man or a woman. Among the shamans there probably existed a division of tasks and a hierarchy that was manifested in a specialization in different shamanistic skills. The respect enjoyed by the shamans was not dependent on their sex but on what they knew and remembered. The *Saami noaidi* (in English, “nojd”) is a northern European equivalent of the Siberian shaman. Among the *Saami*, shamanism seems to have been a male institution; references to female shamans are found only in the late tradition.

The concept of shamanism became more generally known and its meanings broadened as a result of the book *Le Chamanisme et les techniques archaïques de l'écstase*, published by Mircea Eliade in 1951. According to Eliade, shamanism as an archaic technique of ecstasy is the most original form of religion. Because signs of shamanism are found in rock art, it has been considered to represent the religious culture of hunter-gatherer societies of the Paleolithic Age. A proof of its antiquity is the fact that the phenomenon is found both in the Old and the New Worlds.

The concept of shamanism is not, however, without problems. In the comparative study of religion, it is burdened by the scholarly tradition of the 19th-century Urreligion hypothesis with its emphasis on evolution or diffusion. When the word *shaman(ism)* was translated from Russian into English and German, its meaning took on a nuance reflecting the point of view of the Christian missionaries who defined it. The expression of basic pagan religion was made into an *-ism*, a primitive belief, so that the missionary work might receive greater justification. Thus, the name of the phenomenon became established as *shaman-ism*, although this term is not found in the earliest documents, such as the diary of Avvakum Petrovitch, the Archpriest of the Old Believers, which describes the activities of the shamans that he witnessed among the Evenk people in the 1650s.

Shamans commonly used monotone drumming and frenzied dancing to attain a state of ecstasy. They also sometimes used narcotic substances: For example, the fly agaric fungus (*Amanita muscaria*) was used among northern Siberian peoples. Fasting was also one of their methods of preparation. In addition to dancing accompanied by drumming, the *Saami nojd* chanted shamanistic incantations (yoiking); this form of chanting was such an important part of shamanism that it was prohibited together with the shaman's drum during the missionary crusade to Lapland in the 18th century and in the preaching of the Laestadian revivalist preachers in the 19th century.

Basic Concepts: Saman, Shamanizing, Shamanism, Shamanhood

The concept of shaman comes from central and eastern Siberian indigenous peoples, most of whom are speakers of either Mandchu-Tungusic or Nivkh. The word *saman* means “someone who knows.” This “knowing” is the basic word to comprehend the whole phenomenon in its ecological cradle in northern Eurasia. The knowledge is oral and is described as a painful and responsible capacity, as a duty or vocation that is not easy to accept by someone “chosen by the spirits” and trained to his/her office by the elder shaman of the clan. This process is described in this entry on the basis of Siberian fieldwork by the author from 1988 until the present. The concept of shamanhood, instead

of shamanism, was suggested in 1994, since the latter term is *ism*-oriented, which is not true in its cultural context. Shamanhood (parallel to the older Russian word *samanstvo*) is a kind of cultural mother tongue rather than a religion in the languages lacking the concept of “religion” in the Western meaning of the word (from Latin *religio*).

Shamanizing (Russian *samaniit*) is a word that comprehends the special skills of the shaman: those of questioning and replying, divining, and foreseeing in trance or dream events success and fate in life, death, and afterlife. It is his or her heavy duty in front of and on behalf of his/her clan or people to remember the great narratives of his or her people, singing, narrating, and acting them in the rituals, so healing the pains of the people. The importance of oral and rhythmic memory is emphasized, since almost every one of the 60 Siberian shamans the author met are illiterate. Besides the drum, there are several other instruments used by the shaman in the rituals of healing and divination.

The conceptual history of shamanism will show how the word *shamanism* was created under the influence of the Christian worldview. Shaman(ism) was identified as the “old form of paganism” and shamanic peoples (Greek *ethnos*) as the “heathens” (*ethnikos*) to be converted by Christian missions. Shamanism as the culture in the circumpolar-subarctic belt from northern Europe to Central Asia may be characterized by features like these: It is practiced by relatively small and isolated populations, and it is oral/unwritten since it lacks any kind of holy scripts or books.

In spite of the fact that the majority of Siberian cultures do not know the concept *shaman*, they are shamanic. Some of the approximately 35 northern peoples who speak Uralic languages, a family of languages that also includes Finns and the Ob Ugrians, call their shamans *noita* (Finnish) or *nait* (Mansi). There are epic songs (Finnish *runo*, *Saami leudd*) telling about the trips of the souls. Their mythologies include a number of souls or spirits, which all have their own names. It was believed that the spirit of the shaman could depart from the shaman’s body to take trips to the kingdom of death, for example. The purpose of these trips was to find solutions to the problems encountered by the community or its members. These trips to the

kingdom of death were considered dangerous. The shaman did them on behalf of the community to retrieve a patient’s soul, to seek the knowledge needed for the healing rite, or to find solutions to problems. Finnish epic poetry includes examples of shaman trips: for example, the shaman travels to meet the people’s primitive wizard, Antero Vipunen, who died long ago and who was already decomposing with spruces growing on his temples.

Transformation powers are essential for a shaman. It is believed that shamans are able to control different levels of consciousness; they are able to fall into a state of ecstasy, change their gender during the rite, or transform themselves into different animal forms. Sometimes, the shamans use intoxicating hallucinogens for inspiration when they try to reach other states of consciousness. Shamans do not operate alone. They have a number of “auxiliary spirits” to help them. One of these is more important than the others; the Nanais at the Lower Amur, for instance, talk about special “nuptial spirits” that choose the shaman. The shamans meet these nuptial spirits in dreams, and sometimes, the shaman reveals that he or she has had sexual intercourse with a spirit, which may appear in the form of a bear, a tiger, or a sea lion, for example.

Shaman equipment, such as the drum, clothes, mask, bag, belt, musical instruments, and idols, portrays the figures that the shaman has learned to control on his transmigration trips. They describe the shaman’s travel route, “shaman’s road” as it is called, and they may also be a cognitive map of earthly topography as well. More important, however, the equipment conveys myths that delineate the topography of another, invisible world for both the shaman and the community.

When an aging shaman leaves on his or her final trip, he or she often tries to drown the drum, the shaman’s soul, in a swamp. The purpose of this is to ensure that nothing disturbs the shaman’s peace in the afterlife. The death of a shaman is arctic mythology: the departure of a lonely man to his own river and to the abode of the dead to join the other dead members of the family. The decision to publicly announce the intention to set off on this journey of no return means social death for the shaman. If another person joins the shaman and helps him achieve his voluntary death, it is not

considered to be a crime that can be compared with murder.

SHANKAR, SRI SRI RAVI (B. 1956)

Sri Sri Ravi Shankar, a guru to a great many Indians and foreigners, was born into a religious family in Papanasam, Tamil Nadu, India. His mother, who was commonly known as Amma, seems to have played an important role in his life. His father, R. S. V. Ratnam, or Pitaji, as he is popularly known in the religious movement known as the Art of Living clan, was a religious man, well versed in Sanskrit, Tamil, and English—talents he passed on to his son.

According to the accounts of his life that are recalled by his followers, Shankar showed devotional powers from a very young age. At the age of 3, he was said to have been sent to a teacher, who wanted to begin her lessons with a *shloka* (passage) from the Bhagavad Gita, which to her surprise the young Shankar completed for her. Another story that is told about him involves him watching his father doing *puja* (Hindu rituals) and wanting to know all about it. His followers recall that by the time he was 9 years old, Shankar had mastered the Rig Veda, and by 17, he had completed his traditional studies and obtained an advanced degree in modern science.

After his graduation, his mother encouraged him to appear for an interview with a bank in Delhi. Shankar went reluctantly, but he ended up, in his own words, “teaching meditation to the members of the board” (Guru of Joy, p. 76). It is during this period that he met many masters and leading intellectuals in India. One such master was Maharishi Mahesh Yogi, the guru responsible for introducing meditation to the West and famous for having once had the Beatles as his disciples; Shankar joined his movement and trained as a yogi and a scholar in Rishikesh, India.

Very little is known about Shankar’s time with Maharishi. He learned to speak Hindi and English fluently and travelled with Maharishi to the West. It is said by his followers that Ravi Shankar became Maharishi’s right-hand man and one of his main teachers of Transcendental Meditation. Shankar was also said to have been put in charge of the Vedic school, which trained young Indians in the art of becoming pandits, or temple priests.

After leaving the Maharishi’s organization, Shankar traveled throughout India, and in 1982, he is said to have received enlightenment and started the Art of Living movement, beginning with a series of instructions about religious teachings and practices. The first course was held in Shimoga, India; it is said that he remained silent throughout the course. At first, the participants were baffled, but slowly, they felt that he was actually teaching them, communicating knowledge through what the movement calls “the sacredness of silence.” It is also in 1982 that he established the Art of Living Foundation as an educational organization designed to assist all levels of society in reaching their full human potential.

Today, the headquarters are on the outskirts of Bangalore in a beautiful compound. It is also the location for one of his main charitable foundations, Ved Vigyan Mahavidyapeeth, which looks after rural education and development and seeks to revive Vedic knowledge. The ashram also provides free education to 600 children, and a special attempt is made to provide aid for illiterate families. The ashram also boasts an Ayurvedic clinic; a bookshop where Shankar’s cassettes, videos, and books are on sale; and a juice center. A huge meditation hall is under construction.

SHANKARA (CA. 700–750 CE OR 788–820 CE)

The Indian philosopher, theologian, and mystic Shankara, also called Shankaracharya and Adishankaracharya, is acknowledged as the greatest thinker in the Hindu school of religious thought of Advaita Vedanta. Hardly anything is known about his life except for hagiographic matters; neither his date of birth nor the date of his death is known, but common suggestions are either ca. 700 to 750 CE or 788 to 820 CE. A number of texts claim to be biographies of Shankara. The most well-known of them is Vidyanaraya's *Shankaradigvijaya*, written in the 14th century. Shankara was probably born in the village of Kaladi in Kerala. His parents were Nambuderi Brahmans and Vaishnavas, but the later tradition made Shankara into an incarnation of Shiva. His father died when Shankara was a small child, and he became an ascetic, *sannyasin*, at a young age, perhaps against the will of his mother. His teacher was Govinda, about whom nothing is known. According to the tradition, Govinda was a disciple of Gaudapada (640–690 CE), the famous author of *Gaudapadiyakarika*, a text strongly influenced by Mahayana Buddhism. Shankara went to Banaras, where he challenged leading philosophers and theologians. Later, he taught mainly ascetics.

Shankara composed a number of Sanskrit philosophical texts and had gifted disciples. His magnum opus is the *Brahmasutrashhya*, a commentary on Badarayana's Brahma Sutra. In addition, he wrote commentaries on the classical Upanishads and the Bhagavad Gita, which together with the Brahma Sutra constitute the threefold foundation of Vedanta. He also authored the independent text *Upadeshasahasri*. Tradition ascribes his authorship to an additional 300 texts, but Shankaracharya is also a title, the name of the head of any of the four or five monasteries Shankara is believed to have founded, of which the monastery in Sringeri in Karnataka is the most important. The texts have been written by other Shankaracharyas and then ascribed to the famous philosopher. Shankara is believed to have founded the Dashanami order of monks, and he is also considered the founder of the Smarta tradition.

The basic doctrine of Shankara's philosophy is the oneness (*Advaita*) of ultimate reality, *Brahman*; the illusion of plurality; and the complete identity of the Self, *atman*, with Brahman. Knowledge of Brahman is gained through meditation on several statements of the Upanishads (another name for the Upanishads is Vedanta, which means "the last part of the Veda") such as *tat tvam asi* and *sarvam khalv idam brahman*, which Shankara interpreted as statements of the nondual philosophy of the identity of the self (atman) with the ultimate reality of Brahman. Shankara was influenced by Mahayana Buddhism and Samkhya philosophy, but he argued against both systems. His philosophy is, however, very similar to the Samkhya system, although Shankara denied the independent reality of the material principle, *prakriti*, and therefore the dualism of Samkhya.

Shankara's doctrine of monism, that all is ultimately one, was a strong influence on the development of the modern unifying concept of Hinduism. Difference and separation are mistaken approaches to reality and are based on ignorance (*avidya*). Shankara's philosophy also played a significant role in the early understanding of Hinduism in Europe and North America. European indologists compared his philosophy with that of Parmenides and Kant. During the past 100 years, the Hinduism of a significant number of those belonging to the urban

English-speaking elite in India has been influenced by Shankara's philosophy.

SHARI'A

See Halakha and Shari'a

SHARIATI, ALI (1933–1977)

Ali Shariati (aka Ali Shari'ati), a Paris-educated Iranian sociologist, was—along with the Ayatullah Khomeini—perhaps the most important ideologue and theorist behind the 1979 Islamic Revolution in Iran. Born into a religious family, he graduated from Mashhad University and moved to Paris to undertake graduate studies, where he involved himself in many political movements. In Paris, Shariati came into contact with Jean-Paul Sartre and Frantz Fanon, who soon became key political and intellectual influences in his life. Authorities arrested Shariati and briefly imprisoned him on his return to Iran for involvement in antigovernment activities while abroad. On his release, he earned his living by teaching at various schools, colleges, and universities, though his radical and popular message put him at odds with most of the

administrations. His political lectures (especially in Tehran) led to further arrests and eventual exilic confinement to his hometown.

In 1977, the government finally permitted Shariati to leave and travel through Europe. He died shortly thereafter under mysterious circumstances in Southampton, England, at the age of 44. Though the official coroner's report stated that he died of a heart attack brought on by natural causes, many observers still hold the Iranian government (specifically, SAVAK, the secret Iranian security service or police of the Shah) responsible for his death.

In essence, Shariati argued that Islam was the best—indeed, the only—way of liberating people from Western-influenced neocolonialism. He authored, among many other works, *Islamshenasi* (or “Islamology”), a Marxist-informed lecture that proposed using Islam to obtain revolutionary objectives. For all intents and purposes, Shariati wanted to make Islam activist, political, and revolutionary. Shariati broke with traditional Islam by reconceptualizing Shi'ite terminologies, concepts, and discourse in novel and revolutionary ways.

Shariati, in his quest for sociopolitical revolution, juxtaposed himself with traditional Islam and Islamic authorities. He argued for ethical, responsible, social, and political action over knowledge and personal virtuosity nurtured for their own sake. Shariati also emphasized collective rather than individual salvation. He likewise attacked the idea of Islam as simply a doctrinally oriented faith and argued instead for a socially and politically active form of Islam. Shariati was a modernizer, yet he presented his ideology in anti-colonial and specifically anti-Western language. Thus, he identified himself and his movement with proletariat liberation struggles (what has been termed *Third Worldism*) against alienation and oppression.

With the end goal of mobilizing masses, Shariati accordingly sought to impart “modernisms”—especially his desire for a just and classless society—through Shi'ite symbols and with Qur'anic references that would be immediately familiar to most Iranians. In other words, he interjected Marxist, socialist, and existentialist content or substance into a traditional Islamic form or style (e.g., as in his revisioning of the Qur'anic terms *mostaza'afin* and *mostakbarin* as “oppressed” and

“oppressors”). It is the combination of these characteristics that culminated in the Islamic revival and heralded the global phenomenon of political Islam.

SHI'A ISLAM

Shi'a Islam is one of the two major branches of Islam. It refers to a separate or distinct party of men or women who follow or conform with one another, although they do not necessarily agree with one another. In the broad sense, the term refers to the movement upholding a privileged position of the Family of the Prophet (*ahl al-bayt*) in the political and religious leadership (*imama*) of the Muslim community. When used in the specific sense of “partisans,” it designates all those who believe that 'Ali b. Abi Talib (d. 660), the cousin and the son-in-law of Muhammad, was the legitimate head (*imam*) of the Muslim polity and ultimate authority on questions of law and doctrine in Islam, having inherited the Prophet's political and religious authority, immediately following the latter's death in 632 CE. This belief in 'Ali's leadership also led the Shi'a to refuse to acknowledge the first three caliphs, Abu Bakr (d. 634), 'Umar (d. 644), and 'Uthman (d. 656), recognized by the majority Sunnī community, whom they considered usurpers of the leadership that rightfully belonged

to 'Ali and his descendants. This entry discusses the origins of the Shi'ite movement; Shi'ite ideology; religious ramifications of the oppositional Shi'ism; other Shi'ite factions; suffering, martyrdom, and shrine culture; and Shi'ite theology and jurisprudence.

Origins

The historical origins of the Shi'ite movement are difficult to reconstruct with certainty because of the unfair presentation of its beginnings by the Sunnī historians. Modern Western scholars, depending solely on Sunnī sources, have generally dismissed Shi'ism as a heterodoxy, having deviated from the majority Sunnī orthodoxy. Accordingly, the Shi'i appear as followers of a political claimant, who, having failed to establish an ideal rule, was gradually transformed into a religious figurehead. An objective reading of these tendentious sources in light of the Shi'ite accounts of their origins provide a different estimation of the Shi'ite minority, oppositional movement.

Muhammad's message, as embodied in the Qur'an, provided immense spiritual as well as sociopolitical impetus for the establishment of the ideal community of Islam. Muhammad himself was not only the founder of a new religion but also the custodian of a new social order. Consequently, the question of leadership was the crucial issue, which divided Muslims into various factions in the years following his death. The early years of Islamic history were characterized by a constant succession of victories of the Muslim army under the first three caliphs. But as this period reached its end and the civil wars broke out under 'Uthman, the third caliph, contention arose over the necessity of a qualified leadership to assume the office of imam. Most of these early discussions on the leadership took, at first sight, political form, but eventually, the debates encompassed the religious connection between the divine guidance and the creation of the Islamic world order. These debates also marked the inevitable interdependence between the religious and the political in Islam. The rise of some prominent descendants of 'Ali as messianic savior (*al-mahdi*) and the sympathetic, even enthusiastic, following that they attracted shows the tension that was felt in the awareness that the Islamic ideal lacked actualization in the external

world and that it was the divinely guided Mahdi who could and would establish an ideal, just society. Such expectations put the legitimacy of the Sunnī caliphate in question, and the conflict between the 'Alids and their opponents assumed a religious-theological dimension apart from the political one.

Shi'ite Ideology

From the early days of Islam, there were Muslims who regarded the legitimate head of state not merely in political but also in religious terms. They maintained that Muhammad himself held spiritual and temporal, moral and civil authorities. His spiritual authority included the power to interpret the message in the Qur'an without corrupting the revelation. To continue its function of directing the faithful toward the creation of a just and equitable order, Islam was in need of a leader who could perform the Prophet's comprehensive role authoritatively. The exaltation of the Prophet and his rightful successor gave rise to the concept of a messianic imam, the Mahdi, from among the descendants of the Prophet who could create an ideal Islamic community. The thrust of the Shi'ite ideology was the concept of *wilaya* ("authority" and "love") of 'Ali, who became the founder and the first teacher of the special entitlement of the Family of the Prophet to the leadership of the community. Acknowledgment of 'Ali's *wilaya* became the sole criterion for judging true faith.

The Shi'ite concept of imam that identified the legitimate head of state as God's deputy (*khalifa*) on earth was bound to meet with much resistance since it not only demanded the recognition of 'Ali and his descendants as the imams with real control of the entire Muslim polity, but it was also a challenge to the Umayyad rulers (660–748) and a rallying point for all who felt discriminated against or maltreated by the ruling house. Consequently, from its inception, Shi'ism was an opposition party that critically reviewed the performance of the government.

Religious Ramifications of the Oppositional Shi'ism

Several protest movements arose under a wide range of leaders from among 'Ali's descendants

who were able to arouse in their followers a genuine religious urge to achieve sociopolitical goals. However, the Shi'ite attempts at direct political action were met with brutal resistance from the ruling dynasty, and very early on, their efforts met with failure. The resultant frustration produced further Shi'ite factions. The radical factions insisted on armed resistance to the oppressive rule of the caliphate. These were also labeled as *ghulat* ("zealots") by the mainstream Shi'i because of the extravagant claims they made for their imams. The moderate factions, having experienced the futility of direct political action, were prepared to postpone indefinitely the establishment of true Islamic rule under their messianic leader, the Mahdi. More than any other factor, it was the murder of the third Shi'ite imam, Husayn, the younger son of 'Ali and Fatima, the Prophet's daughter, and his followers by the Umayyad troops at Karbala', Iraq, in 680 and later the failure of the revolt of Zayd, Husayn's grandson, in 739, which marked the turn toward a quietist attitude by these factions, who until then had been willing to fight for their ideals.

Shi'ite efforts until the time of 'Abbāsid victory in 750 lacked in a well-formulated doctrine of the imamate. It was then that the great Imam Ja'far al-Sādiq (d. 148/765), who had been largely responsible for the moderation and discipline of the radical elements, provided Shi'ism with a sectarian credo. In the political turmoil of the eighth century, the 'Alid imams had the opportunity to propagate Shi'ite viewpoints without inhibition and modify the revolutionary tone of early Shi'ism into a more sober and tolerant school of Islamic thought. The Shi'ite leaders encouraged and even declared it obligatory to employ precautionary dissimulation (*taqiyya*) of their faith so as to avoid pressing for the establishment of the 'Alid rule and the overthrow of the illegitimate caliphate. *Taqiyya*-oriented life also signified the will of the Shi'ite minority to continue to strive for the realization of the ideal by preparing the way for such an insurrection in the future. al-Sādiq's contribution in shaping the religious and juridical direction of Shi'ism was central. He was acknowledged by all the Shi'ite factions as their imam, including those of radical leaning who led the revolts to establish 'Alids as the legitimate head of state. He was also recognized as an authentic transmitter of the traditions in the Sunnīte

compilations. This indicates that it was under his leadership that moderate Shi'ism, with its veneration of the Prophet's family (*ahl al-bayt*), came to be sanctioned by the Sunnīte majority as a valid expression of personal piety. For the majority of the Shi'i, his attitude toward politics became the cornerstone of their political theory, which, in the absence of the imam's political authority, did not teach its followers to overthrow tyrannical rulers and replace them by their imam. They had to wait for the messianic descendant from the seed of the Prophet through his daughter Fatima and grandson Husayn to emerge as the Mahdi of the community. The doctrine of imamate clarified the dilemma that although the imam was entitled to a comprehensive political authority as the head of the state, his imamate was not contingent on his being invested as the political head. The imamate was seen more realistically as a spiritual-moral rather than as a political office.

The mainstream Shi'i continued to uphold the leadership of the descendants of 'Ali and Fatima through Ja'far al-Sādiq until the line reached the 12th imam, who was believed to be in concealment until the End of Time. He is regarded as the promised messianic Mahdi, whose return to launch the final revolution that would establish the kingdom of God on earth is awaited by his followers. The Muslim eschatology describes in great detail the return of the Mahdi with Jesus to usher the Armageddon and the ultimate defeat of the Antichrist—*al-Dajjal*—and the victory of God's justice on earth. This school of Shi'ism is known as the *Ithna 'Ashariyya* or "Twelvers." In the absence of the Hidden imam, their religious scholars, the ayatollahs, fulfill the role of functional imams and, like the Catholic pope, lead the community in all its religious affairs. They form the majority of the Shi'i in many parts of the world but mainly in Iran, Iraq, and Lebanon.

Other Shi'ite Factions

The Shi'ite movement was represented by various leaders, all members of the Hashimite clan, who represented different trends of thought. Whereas the mainstream followed the line of the 12 imams, there were others who adhered to the imam who called for political action and activist response to the unjust governments in power. The

latter groups included the extremist trend in Shi'ism calling for the overthrow of Sunnī dynasties. The extremist trend was condemned by the mainstream Shi'i, and in the course of history, such minority factions have died out. Besides the Twelvers, the two factions that were once politically activist and that have survived the vicissitudes of history are the Zaydiyya and Isma'iliyya. Their survival strategy, which is not unlike today's strategies in Iraq or in Lebanon, was to abandon political idealism and concentrate on diverting their oppositional role into spiritual and mystical paths. Zaydiyya, who live mainly in Yemen—Iraq and East Africa also have a small population of Zaydiyya—believed until recently that the imam ought to be a ruler of the state and therefore must fight for his rights.

The Isma'iliyya, so named after Isma'il, the eldest son of al-Sādiq, who predeceased his father, believed that Isma'il's son, Muhammad, was their seventh imam. The number seven derives its symbolic religious significance in Isma'ili theology from this seventh imam who was also believed to be a messianic leader. The esoteric interpretation of the Qur'an, which was an overall heritage of all Shi'i, found its sustained connection with this faction, earning them a title of *Batiniyya* (those who believe in the esoteric meanings of the Qur'an). After the initial dormant period in the movement's history, with almost three descendants of the seventh imam believed to be "concealed imams," Isma'ilism attained political and religious prominence under the Fātimid Dynasty (909–1171), which challenged the supremacy of the Sunnī 'Abbāsīd caliphate over the vast empire. The community is divided into two main branches that have survived today: the Musta'li (known as Bohras) and the Nizari (known as Aga Khanis). The Bohras today trace their origins to the religious teachers in Yemen and continue much of the Fātimid religious heritage under their present religious guide (the *da'i*), who represents the 21st hidden Fātimid imam and resides in India. Outside India, they are to be found in the Persian Gulf, southern Arabia, and Syria. The Aga Khanis trace their origins to Iran, where their leaders had established the religious order and have since pursued a mystical path as their main religious orientation under the leadership of Aga Khan. They are concentrated in Central Asia, Iran, Pakistan, and India.

Suffering, Martyrdom, and Shrine Culture

As a minority community, Shi'i suffered oppression under the majority Sunnī dynasties throughout much of their history until the 16th century, when Iran adopted Shi'ism as the official state religion. Martyrdom (*shahada*) became a religious ordeal in Shi'ite political history, sustained by a doctrine that God is just and commands human society to replace an unjust rule by a just and legitimate one. The ensuing struggle to install a legitimate political authority resulted in the murder of several Shi'ite leaders. These violent deaths were regarded by succeeding generations as martyrdom suffered to defeat the forces of oppression and falsehood.

The most powerful symbol of martyrdom is the third Shi'ite imam, Husayn ibn Ali (d. 680), Muhammad's grandson, whose martyrdom is annually commemorated with solemnity throughout the Shi'ite world. In Karbala', Iraq, on the 10th of Muharram, the day of "Ashura," Husayn and his family and friends were mercilessly killed by the Umayyad troops. The Shi'i have preserved this moment in their religious history as a tragic event reminding them of the corrupt nature of power and the way righteous ones suffer. For the greater part of Shi'ite history, the memory of the tragedy of Karbala' has been tampered by the tradition of political quietism; however, there are times when the episode has encouraged activism to counter injustice in society.

The commemoration of the tragedy has served as a principal platform of communication with the Shi'ite public through which sociopolitical-religious ideas have been disseminated by their leaders, like Ayatullahs Khomeini and Muhammad Baqir Sadr. It has also become, for instance in Lebanon and Iraq, a model in the struggle to improve the standing and increase the influence of the Shi'ite population in those countries. In contrast to Sunnīsm, in Shi'ism, special buildings constructed for the purpose of such commemoration, the *husayniyya*, have served as crucial centers for public religious education and mourning rituals. Besides the seminaries, the *husayniyya* were used by the religious leaders to disseminate either an activist or quietist ideology for their followers. The Iranian revolution in 1978–1979 used the Karbala' paradigm to mobilize the people against the corrupt rule of the Shah.

Closely related to martyrdom in Shi'ism was the shrine culture encouraged by the religious practice of visitation (*ziyara*) of *mashhad*—namely, the place where a martyr died and is buried. In Shi'ite piety, all imams are revered as martyrs, and their tombs are visited in the belief that such a devotional act will win forgiveness for their sins and a share in the final victory of the messianic imam al-Mahdi. The visitations to the tombs are extended to both male and female members of the Prophet's family. In the Muslim world, for instance in Iraq and Iran, it is common for both the Shi'i and the Sunnīs to undertake these pilgrimages. The shrines are richly endowed, and lavish gifts are bestowed by various Muslim rulers, especially those of Shi'ite dynasties. Towns have grown around them, and important centers of Shi'ite learning in Najaf, in Iraq, and Qumm and Mashhad, in Iran, are located in and around the shrines.

Shi'ite Theology and Jurisprudence

The fundamental principles of Shi'ism consist of five tenets: (1) affirmation of the unity of God, (2) belief in the justice of God, (3) belief in prophecy, (4) belief in the imamate, and (5) belief in the Day of Judgment. In four of these principles, that is, Principles 1, 2, 3, and 5, the Shi'i in general share a common ground with the Sunnīs, although there are differences in points of detail. The belief in the Justice of God is similar to that of the rationalist theologians, the Sunnī Mu'tazilites who were active in the 8th to the 10th centuries, until they were defeated by the traditionalist Sunnī theologians known as the Ash'arites. In the 9th to the 10th centuries, when the theological exposition of the Shi'ite school was being worked out, its theologians adopted an essentially rational theology in which reason was prior to both sources of revelation, the Qur'an and the Sunna. Reason is God's endowment for humanity. It guides a person to ethical knowledge and asserts that good and evil are rational categories, independent of whether revelation declares them as such. As for the fourth principle—the imamate—the Sunnītes do not consider it as a fundamental principle of religion, while the Shi'i make it their central and cardinal principle.

Shi'ite jurisprudence, using a rationalist-naturalist theological foundation, gives priority to reason in

accord with its substantive assessment of human reason. The comprehensiveness of Islamic revelation must be discovered, interpreted, and applied by the use of reason. Accordingly, in their legal theory, besides the Qur'an, the Sunna, and the consensus (*ijmā'*) of jurists, which are admitted as sources for deducing rulings of the Shari'a by Sunnī legal scholars, the Shi'i included reasoning as the fourth source. However, it was not for just anyone to undertake the interpretation of the scriptural sources rationally. Only a religiously qualified person could assume the authority (*wilaya*) that accrued to the imam as the rightful successor of the Prophet. This authority in Shi'ism was invested in a jurist (*mujtahid*), who applied his independent reasoning in issuing judicial decisions (*fatwa*). Moreover, the Shi'i included the communications of their imams as part of the Sunna, and although there was little substantive variation in juridical content from the Sunna admitted by the Sunnīs, the Shi'i had their own compilations of prophetic traditions. Following the Middle Ages, it was not until recently that religious-legal practice based on the Shi'ite school of law was acknowledged formally as valid by the Sunnīte scholars in Egypt.

SHIMAZONO, SUSUMU (B. 1948)

A Japanese sociologist of religion and one of the world's leading experts on religion in modern Japan, Shimazono Susumu has been influential in shaping the discipline of religious studies in Japan and in broadening its horizons internationally. His theoretical contributions have been important globally in advancing studies of the relationship between magic and morality and in widening understanding of the dynamics of religion in advanced modern societies such as Japan. He is currently a professor of religious studies at the University of Tokyo.

Shimazono's work on Japan's new religions especially attracted prominence through books such as *Gendai Kyūsai Shūkyōron* ("Salvation Religions in Contemporary Society"), which identified concepts of salvation as a key theme in Japanese new religions and presented a critique of Weberian notions that in modernity, magic is replaced by morality; as Shimazono demonstrated, Japanese new religions have flourished through successfully combining magical practices (e.g., spiritual healing) with moral teachings and showed that magic and morality may be concomitant themes of modern religions. He further developed these insights while enhancing ethnographic studies of Japanese new religions, via research into one new religion, Hōseikai, in *Sukui to Toku* ("Salvation and Virtue") and *Jidai no naka no shin shūkyō* ("New Religions in the Modern Age").

After Aum Shinrikyō's 1995 Tokyo subway attack, Shimazono conducted the first in-depth study of Aum's teaching, which demonstrated how

doctrinal stances underpinned Aum's violence, and his *Shûkyô no kanôsei: Oumu to bôryoku* ("The Potential of Religion: Aum and Violence") was one of the first Japanese studies analyzing the connections between religion and violence in general. Shimazono's recent work on contemporary religious dynamics highlights the decline of organized religions (including new religions) in Japan and argues that this is accompanied by a turn (especially among young, urbanized, educated Japanese) to what he describes as "new spirituality movements" (*shin reisei undô*)—a turn he relates to similar changes in Western societies. In recent books (e.g., *Seishin sekai e no yukue* [Seeking the Spiritual World], initially published in 1996, and *Spirichuariti no kôryû* [The Rise of Spirituality], published in 2007 and in 2004 in English as *From Salvation to Spirituality: Popular Religious Movements in Modern Japan*), he argues that this is creating an increasingly individualized society mirroring the consumerism of advanced capitalist societies, in which people are less committed to organized religious groups than in constructing their own individualized spiritual paths.

Shimazono has striven to assist non-Japanese scholars visiting Japan and to build bridges between Japanese and Western academic communities. As President of the Japanese Association for the Study of Religion, he oversaw the 2005 International Association for the History of Religions conference in Tokyo. Currently, he is also Director of the Centre for Death and Life Studies (*Shiseigaku*) at the University of Tokyo, developing studies of religion, medicine, and bioethics, a new area in which he is working with scholars from around the globe.

SHINTO

Official numbers published by the Japanese statistics bureau rank Shinto as Japan's largest religion, with a following that constitutes more than 80% of the population. Yet at the same time, questionnaires asking people for their religious identity consistently reveal that only a few percent of Japanese consider themselves as "adherents" of Shinto. Depending on one's point of view, Shinto may be regarded either as the largest religion of Japan or as a marginal phenomenon. To shed light on this confusing state of affairs, this entry will first distinguish between different layers within the broad category of Shinto and between different discourses on Shinto's meaning and essence and then present a brief overview of Shinto's historical development.

The term *Shinto* does not refer to a single, centralized religion but rather to a cluster of groups, organizations, and even popular practices that all, in their own ways, focus on shrines (*jinja*, *jingû*) and/or their deities (*kami*). Some 100,000 shrines are scattered throughout the Japanese islands. Most of them are very small and lack a permanent staff of priests, but many thousands have at least one dedicated priest, and several hundreds sustain tens or, in some rare cases, even hundreds of professional clergy and other personnel. There are around 20,000 registered Shinto priests; a considerable number of them take care of more than one shrine.

Since 1946, the majority of shrines (approximately 80,000) have been members of an umbrella organization called the Association of Shinto Shrines (in Japanese, *Jinja Honchô*). This association educates priests, defends the interests of shrines in the public arena, and allocates funds raised by member shrines and sponsors. Yet while the association takes the lead in giving meaning to Shinto in the public realm, it avoids defining a Shinto teaching, and it consciously makes space for many voices. It refrains from laying down a Shinto orthodoxy and only rarely meddles in the

religious or ritual policies of its member shrines. The association stresses that shrines should function as stages for community rites open for people of all faiths—not as churches with an exclusive following of dedicated believers. It is hardly surprising, then, that the “users” of shrines rarely perceive Shinto as their religious identity. To them, shrines offer an evocative and nostalgic setting for a range of traditional rituals, such as New Year prayers for happiness in the coming year, life cycle rites for children, purification rites for building sites and cars, weddings, and neighborhood festivals, often focusing on a parade. Most shrine rites deal with issues of life and live in a functional symbiosis with Buddhist rites that take care of death and mourning.

A second layer is constituted by a number of independent religious groups that identify themselves with Shinto. The oldest among these groups have histories that stretch back to the 19th century. These so-called Shinto sects have a much more clearly defined religious profile than the member shrines of the association. They can be divided into two types. The first type takes the form of a loose coalition of different groups of believers dedicated to a single shrine site, but with varying practices and backgrounds. The second typically focuses on a single deity who is believed to have revealed specific teachings to the world through the life and writings of the group’s founder. Groups of this last type may in many respects be compared with Christian church movements: They feature explicit teachings that are actively promoted by preachers, and they have a clearly defined congregation, regular church meetings, and a hierarchically organized priesthood.

The third and last layer to be commonly included in the category of Shinto consists of folk practices relating to *kami*. Many communities have annual celebrations, ranging from large-scale festivals to intimate local traditions, in which shrines and shrine priests play only a marginal role or none at all. Those celebrations that are not recognizably Buddhist in nature tend to be labeled Shinto, even if some of these practices have clear Daoist or otherwise continental origins. This categorization is significant because it has in many cases led to a gradual adaptation of local traditions to a more standardized Shinto format. Examples of such practices are *kōshin* wakes (based on the

notion—of Daoist origin—that three demons inhabiting the human body report one’s sins to the Lord of Heaven in nights marked by the calendrical sign *kōshin*) and *kagura* dances, often featuring lions and dragons.

Within these three very different organizational frameworks, Shinto is defined in a great variety of ways. Yet a few themes are common enough to be called central in most understandings of Shinto. At the basis of all of these themes is the notion that Shinto is Japan’s indigenous religion. From that starting line, Shinto is then related to imperial rule, agriculture, and nature.

The idea that Shinto represents the unchanging essence of Japanese culture has served to differentiate shrines from temples and to give direction to Shinto’s development into an increasingly autonomous tradition. It has brought new meaning to a preexisting obsession with ancient beginnings. This idea is expressed through a clear preference for (reconstructed) ancient and classical forms in the architecture of shrine buildings, in the language of prayers, in the attire of priests, and in the format of shrine rituals. The focus on an ancient Japanese essence, rather than merely a nonlocalized antiquity, gives most variants of Shinto a nationalist or at least clearly a Japan-centered flavor. Ancient Japan is held in high regard as an ideal society where the people led simple but harmonious lives, at peace with each other and with their natural environment. By consciously adopting archaicizing formats, Shinto sites and rites play out the religious ideal of a direct continuity between that golden age and the present. At times, this has taken the form of a rejection of external corrupting forces (e.g., Buddhism and Christianity) or of the dehumanizing forces of modernity.

The emperor plays a central role in most understandings of Shinto as an extension of this ideal: The emperor personifies the era of archaic harmony in the here and now. This move is made possible by the fact that the origins of Japan’s imperial dynasty are hidden in the mists of prehistory. Moreover, the oldest texts of Japanese tradition (*Kojiki*, 712, and *Nihon shoki*, 720) claim that this dynasty derives its right to rule from a divine mandate, bestowed on the imperial forebears in the Age of the Gods by their ancestress, the sun goddess Amaterasu. The imperial line, then, represents a physical link with a sacred time

beyond the historical past. The prominence of the emperor in ancient *kami* worship gained renewed importance in the 19th century, when efforts were made to establish a direct connection between imperial rites and local practice at shrines throughout the land. In 1875, a number of days on which the emperor performed central Shinto rites were declared national holidays, and priests were ordered to perform the same rites at their local shrines, acting in the emperor's name. In this way, shrines became stages for the performance of imperial rites, with the function of broadcasting the importance (or even sanctity) of the emperor among the general populace. After World War II, the Association of Shinto Shrines has continued this practice, and a range of imperial rites is still performed simultaneously at the imperial palace and at member shrines.

Another prominent theme in Shinto is agriculture, and in particular the cultivation of rice. The *kami* are commonly depicted as benevolent beings that bestow blessings of fertility and growth on the community, often in the form of life-giving water running down from the mountains. Again, behind this image is the ideal of ancient society, pictured as a harmonious community of rice-growing farmers. Rice is at the core of the main imperial rituals, which are all performed in the seasons of planting or harvesting. Both in Shinto publications and other media, the emperor is often depicted tending his own rice field, and a ritual of thanksgiving for the harvest forms the centerpiece of the imperial enthronement ceremonies.

Finally, and most recently, Shinto has become associated with ecological themes. In the course of the 1980s and 1990s, interpretations of Shinto as an ancient tradition of nature worship began to challenge the earlier emphasis on emperor-centered nationalism. In this context, Shinto is described as a form of animism and the *kami* as spirits who inhabit natural objects such as stones, trees, or waterfalls or who manifest themselves through the forces of nature—wind, rain, and thunder. The association itself argues on its website that “Shinto sees that nature is the divinity itself” and that “the Japanese spirituality inherited from the ancient ancestors” is grounded in a profound respect and gratitude for the gifts of nature. In its “message from Shinto,” the association stresses the importance of a spirit of “reverence

and appreciation to nature” as a prerequisite for solving the environmental and social problems that the modern world is facing today.

History

Both Shinto's organizational structure and its self-understanding as Japan's indigenous religion are products of a long history. Tracing this history is an intrinsically controversial project because it challenges Shinto's central notion of unbroken continuity with an ancient past.

To get a grip on the developments that produced modern Shinto, it is first necessary to distinguish between shrines, on the one hand, and the concept of Shinto, on the other. The origins of many shrines can be traced to prehistoric times, although most are much more recent. Many of the larger shrines occupy cultic sites that were dedicated to the worship of *kami* centuries before the first datable writings appeared in the early eighth century. However, the notion that the worship of *kami* at shrines constitutes an autonomous “Way” did not begin to gain ground until the 15th century—and even then only as an abstract idea. The final institutionalization of Shinto was a product of the late 19th century.

While shrines and *kami* were important to the court already in the ancient period, it was only in the 13th and 14th centuries that the first seeds of the later Shinto discourse emerge. Before this time, almost all larger shrines had been incorporated in temple-led complexes, where the *kami* were soothed by means of sutra readings and other Buddhist procedures. Within this Buddhist framework, the *kami* were typically treated as nonenlightened beings who, when angered, were ready to unleash their wrath on the community in the form of natural disasters, diseases, and killings. In a typical Tantric reversal, however, these dangerous beings gained a radically new significance in medieval times: as the essence of delusion and, therefore, as the epitome of the Buddhist truth that “delusion equals enlightenment.” In some medieval texts, the violent *kami* were chosen to represent the “original enlightenment” that precedes all Buddhist practice. It is through the worship of these *kami*, it was argued, that one can realize instantaneously the ultimate truth that the essence of enlightenment is delusion and that the realm of

afflictions in which we live is in fact the Dharma realm in its purest form. In this scheme, the *kami* were seen as direct, unadorned, and upright, in contrast to the Buddhas, who are sophisticated, bejeweled, and given to playing with relative levels of truth.

The idea that the ignorant *kami* constitute the very foundation of the enlightened Buddha realm also gave rise to a nativistic vision of Japan. Japan was a land created by the *kami* and also the land where the *kami* were born. It was ruled by an emperor who personified the powers of the sun—identified simultaneously both as the ancient *kami* Amaterasu and as the cosmic Buddha Mahāvairocana, from whom all Buddhas arise. The emperor, then, embodied the pre-Buddhist state of enlightened delusion that was associated with the violent *kami*. In this early form of Buddhist Shinto (which was the first context in which the word *Shinto* was singled out as a term for the “Japanese Way”), the *kami*, the Japanese islands, and the emperor were all combined as emblems of a sacred Japanese essence, transmitted as a self-contained body of knowledge and ritual.

In subsequent centuries, these transmissions about the *kami* went through a series of profound changes, but the fundamental elements that constituted this early Buddhist Shinto lived on: the idea that the *kami* are primitive beings but profoundly sacred for that very reason and the definition of Japan as a sacred land where the *kami* and their blessings originated and of the emperor as the born keeper of the secrets of the *kami*. From the 17th century onward, the same ideas were rephrased in Confucian, anti-Buddhist terms. A century later, nativist scholars turned to Shinto to foster a new pride in Japan’s own ancient traditions, in an age when common sense dictated that China was the center of the world and the source of the Way. In the 19th century, when Western pressure on Japan came to a head, a radically nativistic Shinto that rejected all foreign influences as impure gained broad support. This prepared the way for the Shinto policies of the Meiji period (1868–1912).

The Buddhist, Confucian, and even nativist discourses on Shinto had very little impact on shrine cults as these functioned in urban and rural communities around the country. From 1665 onward, there had been a licensing system for priests, but

even in the early 19th century, most shrines were managed by local people, monks, or mountain practitioners. All this changed in the course of a few years after the Meiji coup of 1868, when a small band of insurgents arranged for the emperor to issue an edict announcing the abolishment of the shogunate. This edict called for a restoration of direct imperial rule, as in the ancient days of the first mythical emperor. The new regime was to be based on the principle that “rites and government are one,” and the rites referred to were Shinto. These events, which drew on a wave of utopian nativism, had a large impact on shrines. In the same year, all shrines were methodically separated from Buddhism. In what was arguably one of the most radical breaks in Japanese religious history, Buddhist priests, deities, buildings, and rituals were banned from shrines. In 1871, shrines were arranged on a hierarchical scale, from imperial and national shrines at the top to prefectural shrines, district shrines, and finally nonranked shrines at the bottom. At the same time, hereditary lineages of priests were abolished, and a unified system of state-appointed priests was put in its place. In this way, shrines were appropriated by the state and designated as sites for the performance of state rituals. It was at this time that Shinto became physically and institutionally distinct from Buddhism.

As fears of Western (Christian) expansionism waned and the need for national development along Western lines became apparent, the initial enthusiasm for Shinto cooled considerably. By 1882, Shinto had been reduced to a body of national rites that were regarded as nonreligious; in fact, shrine priests were banned from engaging in activities that were defined as religious. The Shinto sects mentioned above were established at this time to make place for “religious” Shinto groups outside the shrines.

In the aftermath of wars with China (1894–1895) and Russia (1904–1905), Japan experienced a wave of patriotic enthusiasm, which on many occasions was expressed in a ritual format that put shrines center stage. The fallen from these wars were honored in newly founded military shrines, and shrine visits by the military, as well as school classes, became a new social ritual, even in the occupied territories. Soon after, a growing socialist and communist movement swept over Japan,

inspiring fear that national unity was under threat. Under these circumstances, Shinto once more became a focus of attention. Until 1945, Shinto was to serve as Japan's official state cult, propagated with increasing zeal especially after 1931 as the country headed into war.

After the war, the American-led occupation issued a so-called Shinto Directive (December 1945) to put an end to "the perversion of Shinto theory and beliefs into militaristic and ultra-nationalistic propaganda, designed to delude the Japanese people and lead them into wars of aggression" (Breen & Teeuwen, 2010, p. 13). This directive prohibited all forms of official support for Shinto rites or ideas. At the same time, shrines were offered a new lease on life as private religious organizations: "Shrine Shinto, after having been divorced from the state and divested of its militaristic and ultra-nationalistic elements, will be recognized as a religion if its adherents so desire" (Breen & Teeuwen, 2010, p. 13). In February 1946, shrines were registered under a new law as religious organizations, and the Association of Shinto Shrines was founded as a new coordinating body.

This history set the stage for the postwar development of Shinto in its various guises. Once they were freed from direct government administration, Shinto organizations developed in different directions. Some lament the separation of Shinto from the state and call for a restoration of the prewar function of Shinto rites as communal ceremonies that unite the nation under the aegis of the emperor. Others have broken with the past and seek to redefine Shinto in ways that bear little relationship with imperial nationalism—in terms of healing through contact with *kami* deities, spiritual union with nature, or community values. Yet even the new Shinto sects that have sprung up in the postwar period live within the context of the Shinto discourse that crystallized in the 19th century. This explains their failure to spread abroad, other than in places where there is a significant Japanese minority. In postwar Japan, many prewar Shinto institutions have retained a prominent presence in the public eye; obvious examples are the continued practice of Shinto rites by the emperor and the controversy around the Yasukuni shrine (where Japan's war dead are celebrated by means of Shinto rites). This makes it difficult, if

not impossible, to reinvent Shinto as drastically as in the 19th century or, indeed, as in medieval times.

SIDDHA YOGA

The Siddha Yoga path is a set of teachings and spiritual disciplines that, according to the Indian spiritual teacher and Siddha Yoga guru, Swami Muktananda, unfold the God consciousness hidden in human beings. In Siddha Yoga teachings, this divine consciousness (Sanskrit *cit* and related words) dwells within all things as the universal Self (*atman*) and is also understood to be an

effective inner power (*shakti* or *kundalini-shakti*). Experience of the Self is known to be activated through the agency of a true guru. In this context, such a guru is perfected (*siddha*) in the awareness of the divine presence within all beings and awakens that awareness in others. This awakening takes place through Shaktipat initiation (the transmission or “descent” of shakti) and is meant to be strengthened and expanded through the practice of spiritual disciplines under the direction of the Guru.

The Siddha Yoga path was founded and named by Swami Muktananda (1908–1982). Having received Shaktipat initiation in 1947 from Bhagawan Nityananda (d. 1961) and succeeding him as guru, Muktananda brought this initiation to seekers throughout India and, then, over the course of three international tours between 1970 and 1981, to thousands of people throughout the world. Shortly before his death in 1982, Muktananda conferred the power and authority to give Shaktipat awakening to Swami Chidvilasananda (b. 1955), also known as Gurumayi, who is the spiritual head of Siddha Yoga. Nityananda, Muktananda, and Chidvilasananda are the Gurus of the Siddha Yoga lineage.

Essential Siddha Yoga teachings include the following: “God dwells within you as you” and “See God in each other.” The core Siddha Yoga disciplines are meditation, chanting of sacred texts and divine names, selfless service, and giving to support the Siddha Yoga path. Other important practices include study of the Guru’s teachings and contemplation.

Siddha Yoga draws on a number of Indian religious traditions: contemplative philosophies and practices presented by Vedantic texts, the experience of divine love presented in songs and other devotional works by poet-saints, and meditative techniques and theologies presented by nondual Shaiva Tantric works from Kashmir.

The SYDA (Siddha Yoga Dham Associates) Foundation, established in 1974, is a not-for-profit religious and charitable organization that protects, preserves, and disseminates Siddha Yoga philosophy and culture.

SIERRA LEONE

With a population of nearly 5.3 million residents, most of them Muslim, Sierra Leone is a West African country on the Atlantic coast, the approximate size of South Carolina. With Guinea to the northwest and war-torn Liberia to the southeast, Sierra Leone has had a tumultuous recent history. Peacekeeping and stability have become the number one priority for the country as it recovers from causing 2 million displaced refugees to relocate after 11 years of civil war (1991–2002) between the Revolutionary United Front and the then-in-office government.

The national declarations of genocide and mass rapes, debates over the trade of blood diamonds, and snapshots of the dictatorial leader, Charles Taylor, who was recently tried by the Special Court for Sierra Leone for war crimes and crimes against humanity initiated during the civil war are still fresh in the memories of residents. From 1989 to 1997, Taylor was leader of the rebel group, the National Patriotic Front of Liberia, and became president of Sierra Leone from 1997 until 2003, when he stepped down from office under international pressure. Taylor fled to Nigeria for political asylum but was extradited in 2006 by Liberia’s current president, Ellen Johnson Sirleaf.

English is the official Sierra Leonean language, though Temne, Mende, and Krio are spoken by most residents. Arabic is read by literate Muslims. Historically, Sierra Leone was colonized or under protectorate by the British from 1808 to 1961 and before this was viewed by Europeans as fertile ground for capturing slave labor headed off to the Americas. In the late 1700s, thousands of formerly enslaved African Americans, Jamaican maroons, and African Nova Scotians emigrated, repatriated, and missionized the British colony. Settling in

Freetown with their progeny, these people saw the region as a haven for religious proselytism, enabling Protestant forms of Christianity to rise and later spread across coastal West Africa. Islam, however, has predominated in the northern regions of Sierra Leone since the 18th century and continues as the religion of choice for 60% of Sierra Leoneans. Christians constitute about 10% of the population, predominantly in the coastal south. Indigenous practices are adhered to throughout Sierra Leone and account for 30% of the population's beliefs.

Today, the Krio or Creole, the descendants of freed slaves who returned to Sierra Leone, account for approximately 2% of the national population. The majority of the population comprises Temne in the north and Mende in the southeast, with Limba, Kono, Mandingo, and foreigners also inhabiting the region. Historically, ethnolinguistic groups hold less sway in marriage selection and social contracts than is prevalent in other African nations. Ernest Bai Koroma, who was elected in a 2007 runoff and is now the nation's fourth president, is a Christian convert who has Muslim parents of both Limba and Temne origins.

Fiscally, the nation has suffered great setbacks due to more than a decade of guerrilla warfare, refugee displacement, and ill-managed allocations of large international loans. With recollections of child soldiers, suppression of the press, government corruption, and mass brutalization stifling national calls toward increased education and development, Sierra Leone's landscape holds hope but may take more than a generation to fully recover.

Founded in the early 16th century by Guru Nanak (1469–1539), the Sikh tradition is historically associated with the North Indian state of Punjab, a region that connects southern Asia with the Middle East and Central Asia. The current Sikh population is around 23 million, of which 2 million have left the Punjab and now live and work in North America, western Europe, and former British colonies. This entry discusses the history of Sikhism, touching on beliefs, sacred literature, and devotional and ceremonial life.

History

Guru Nanak was born into an educated, land-owning, influential Hindu family that lived in Talwandi, a village near Lahore, the cultural and political center of the Punjab. While in his late 20s, he underwent a powerful experience in which he describes having visited the divine court (*darbar*) and having been entrusted with the mission of spreading the divine word (*nam*). Leaving his domestic life behind, he embarked on a period of extensive travel.

In 1521, Guru Nanak witnessed large-scale violence wrought by the invasion of Babar, the Mughal chief from Central Asia. This experience resulted in a new turn in Guru Nanak's life. He acquired a piece of land in the lush plains of the central Punjab, founded a town, and named it Kartarpur ("City of God"). As the founder of the community, Guru Nanak served as the central authority at Kartarpur, and his beliefs provided structure to the lives of those who gathered there. We now know that after some years, Guru Nanak renewed his travels, seeking followers in other places.

Guru Nanak provided the early Sikh community with rudimentary institutional structures. He composed hymns of great beauty and had them recorded in a distinct script called Gurmukhi (script of "the Gurmukhs/Sikhs"). These hymns formed the core of the Sikh sacred text, which later came to be known as the Guru Granth (the book manifested as the Guru). He also instituted the communal recitation of three daily prayers at sunrise (*Japji*), sunset (*Rahiras*), and before going to sleep (*Sohila*) and established a community kitchen (*langar*) where all Sikhs ate in a manner that embodied their Guru's belief in human equality. Guru Nanak also created an initiation ceremony

SIKHISM

The Sikhs (followers) represent the youngest of the world's major monotheistic religious traditions.

(*Charanpahul*) with which people could enter the Sikh fold. At the time of his death in 1539, Guru Nanak appointed one of his followers, Angad, to be his successor and, by doing so, institutionalized the office of Guru, which continued until the death of Guru Gobind Singh, the 10th Sikh Guru (1675–1708).

By the end of the 16th century, the Sikhs had become powerful enough to be seen as a threat by the Mughal administration in both Lahore (the provincial headquarters) and Delhi. A phase of tension culminated in the execution of Guru Arjan (1561–1606), the fifth Sikh Guru. The Sikh community, under the leadership of his successor, Guru Hargobind (1595–1644), responded by declaring the Guru to be both their temporal (*duniya/mir*) and spiritual (*din/mir*) leader. In consequence, the Mughal authority forced the Sikhs to move to the Shivalik foothills, where they remained throughout the 17th century. An attempt to revive the community in the Punjab plains during the leadership of Guru Tegh Bahadur, the ninth Sikh Guru (1621–1675), ended with his execution/martyrdom in Delhi.

Given this hostile political environment, the Sikh belief in God's justice (*nian*) took the form of a declaration by Guru Gobind Singh that the Sikh community was to be understood as the *Khalsa*, "the pure." By insisting on their pure and separate identities, Guru Gobind Singh gave the community a new understanding of its special relationship to God and its mission to establish a *Khalsa raj* ("Kingdom of the Pure"), a political entity where that relationship could flourish. Guru Gobind Singh introduced a ceremony of initiation in which fresh water was transformed into nectar by reciting over it the compositions of the Gurus, the divine word as revealed to the Sikhs, while stirring it with a double-edged sword (*khanda*) symbolizing God's power and justice. Having taken the nectar, a Sikh became a *Singh* ("lion") and followed an expanded version of the existing code of conduct (*rahit*). The new code involved the carrying of five Ks on one's person—*kes* ("uncut hair"), *kangha* ("comb"), *karha* ("steel bracelet"), *kirpan* ("sword"), and *kachha* ("long shorts")—as well as abstinence from tobacco.

Guru Gobind Singh thus gave the community a sharpened sense of identity and a well-defined geopolitical vision. In the subsequent decades, Sikhs developed the powerful myth that the land of

the Punjab belongs to them, and it came to them as a gift from the 10th Guru. They waged military campaigns in the years that followed, and finally, under the leadership of Ranjit Singh (1780–1839), created a powerful kingdom in the region. The community's understanding of itself as the *Khalsa* and the special ones did not foster any concerted effort among Sikhs to convert others to their faith, although many joined the community during this period.

The death of Ranjit Singh in 1839 ushered in a period of instability, and the British eventually annexed the Sikh kingdom in 1849. After an early phase of tense reflection on the fall of their political power, the Sikhs began to work closely with the British. This revised relationship resulted in the British recognizing the Sikhs as a "martial race," and they opened the doors of the imperial army and the police to them, which created extensive opportunities for work as well as worldwide travel.

With the coming of the printing press, Western education, Western medicine, and other institutions of modernity, Sikh leadership in the last quarter of the 19th century undertook a concerted effort to make Sikhs aware of what they saw as the early Sikh beliefs and practice and the need to revive them in changed circumstances. These leaders also worked closely with the British administration and made them treat Sikhs as a political community distinct from the Muslims and Hindus.

In the prolonged negotiations that preceded the partition of the Punjab in 1947, the idea of an independent Sikh state figured prominently, but the small size of the Sikh population in relation to the Muslims and Hindus of the Punjab made this an impossible proposition. In independent India, the Akali Dal, the Sikh political party whose criteria for membership have a distinctly religious character, has historically found itself in conflict with the federal government of India in Delhi. In 1966, its sustained efforts led to the founding of the present-day state of Punjab, where Sikhs would be in a majority and Punjabi the official language. In the 1980s, a Sikh secessionist movement under the leadership of Sant Jarnail Singh Bhindranwale (1947–1984) paralyzed the Punjab and resulted in Operation Bluestar, in which the Indian army used heavy artillery to flush out Sikh militants based at the Darbar Sahib, Amritsar. The army and the police then bulldozed over the Sikh separatist

movement, creating a semblance of peace by the mid-1990s.

Although a large majority of Sikhs still live in the Punjab, approximately 10% of them have settled in other parts of the world. This migration overseas has created a new situation in which issues of religious authority, sacred language, Sikh relationship with the land of the Punjab, and social practice are being scrutinized anew in these communities away from the homeland. The positions taken on these issues will have an important impact on the future of Sikhism, not only among the overseas community but also, owing to process of rapid globalization and the sharing of Sikh leadership internationally, in the Punjab itself.

Beliefs

Guru Nanak's teachings are centered on the foundational concept of the unity of God, the creator lord (*kartar/patishih/sahib*), who governs the universe with the divine command (*hukam*) centered on the principles of justice (*nian*) and grace (*nadar*). As the creator of the universe, God is the only legitimate object of human worship and reverence.

The universe came into being as a divine decision. Being the divine creation, the world and all beings living here are assigned a high degree of sanctity, with humans positioned at the top. Irrespective of their social and gender distinctions, humans have the unique opportunity to achieve liberation (*mukti*), which means obtaining release from the cycle of birth and death and becoming united with God.

Self-centeredness (*haumai*) serves as an obstruction to attain liberation and has to be brought under control by developing a relationship with God based on love (*bhau*) and fear (*bhai*). Guru Nanak traces the movement toward liberation in five distinct stages. These include the recognition that the universe runs according to a divine plan (*dharam*), the realization of the vastness of the divine creation (*gian*), and the humility arising from an understanding of the nature of human existence in this God-created universe (*saram*). These three prepare human beings for receiving the divine grace (*karam*), which then takes them to the ineffable realm of truth (*sach*).

Other enduring assets in pursuit of liberation include commitment to hard work (*kirat*), sharing

the fruits of one's labor (*vand ke chhako*), and service to humanity (*seva*). The family and community do not simply provide a backdrop for an individual's search for liberation, but they are part and parcel of that agenda. Guru Nanak firmly believes in the individual's obligation to work toward collective liberation. A successful individual obtains liberation for himself or herself and assists in the liberation of everyone around. It is not an issue of choice but a moral imperative.

The social and ethical dimensions of early Sikh doctrine evolved into a belief in the indivisibility of the spiritual and temporal. The Gurus were seen as the master of both Sikh spiritual and temporal interests. Characteristic Sikh thinking on this issue is manifest in the proximity of the Darbar Sahib, the most sacred religious site of the Sikhs, and the Akal Takhat, the highest temporal seat of Sikh authority, in Amritsar. The *Khalsa* under the leadership of Guru Gobind Singh saw itself as the army of God (*Akal Purakh ki Fauj*), declared its mission to bring divine victory on earth, and worked on the belief that if peaceful means fail to bring justice, it is legitimate to wage a war. He also decided to discontinue the office of the personal Guru. After his death, the mantle of his authority was passed on to the Guru Panth (the community as the Guru) and the Guru Granth (the Guru in the book form). The communal decision making thus came to be centered on the Sikh leadership meeting in the presence of the scripture and reaching a consensus that will then be binding on all Sikhs.

Sacred Literature

Early in its history, Sikh literature developed along five lines: (1) the scriptural text, (2) commentaries on this text, (3) statements about practice, (4) life stories of the founder and his successors, and (5) other historically inflected texts such as court poetry. These strands are not always demarcated, but it is not too difficult to trace their evolution in early Sikh history.

Guru Nanak's compositions provided the core of Sikh scripture. There are early reports that the Guru's companions wrote down his compositions as he sang them and that these compositions were compiled in the form of a *pothi* (volume) in the opening decades of the 16th century. This corpus expanded as Guru Nanak's successors created

compositions and appended them to the earlier text. The Guru Granth attained its canonical form during the period of Guru Gobind Singh, and it includes hymns composed by six of the Sikh Gurus, alongside others composed by bards associated with the Sikh court and by 15 non-Sikh saint-poets known in the Sikh tradition as *bhagats* (“devotees”). The text plays the central role in Sikh devotional and ceremonial life.

Unlike the Guru Granth, the remaining four categories of textual production were seen to constitute an open-ended corpus, which was expected to grow as time passed. The first segment of this “open canon” was composed of the commentaries on the Guru Granth. Beliefs enshrined in the compositions of the Gurus were not only to be recited and revered but were to be understood and translated into real life. Guru Nanak’s successors attempted to elaborate on his themes, and the exegesis of Sikh sacred compositions thus began with the very inception of the community. During the 17th century, the ballads of Bhai Gurdas (d. 1638) take up themes such as the ideal Sikh (*gursikh*), the nature of relationship between the Guru and his followers (*guru-chelalpir-murid*), the nature of Sikh congregation (*sangat*), and values such as service (*seva*), explaining them on the basis of the Gurus’ writings. This period also saw the rise of commentaries that focused on the benefit (*paramarth*) of the reciting and reflecting on the scriptural verses. Into this category now fall numerous commentaries on the Guru Granth as well as its translations.

Given the Sikh emphasis on *shubh amal* (“good deeds”), it was logical that statements about practice (*rahit*) developed alongside the interpretation of Sikh beliefs. By 1600, we have a list of 10 prescriptions, which included five things that a Sikh should do and five that he or she should not do. These terse prescriptions later developed in the form of narratives of question-answer sessions between the Gurus and the Sikhs. Several statements on *rahit* were created during Guru Gobind Singh’s period. In the middle decades of the 20th century, this literature was codified into a work titled *Sikh Rahit Maryada* (“the Sikh code of conduct”) by the Shiromani Gurdwara Prabandhak Committee, the premier management body overseeing the historical Gurdwaras.

The *Janam Sakhis* (“life stories”), a genre of Sikh literature celebrating the life and mission of Guru Nanak, started during his lifetime. In the

closing decades of the 16th century, these stories developed in the form of a narrative of the Guru’s life titled *Puratan Janam Sakhi* (“Old Life Story”). Being relatively close to the founder’s life, this serves as an important source of information about Guru Nanak. The genre expanded to include stories about the later Gurus and sectarian versions of the founder’s own life. An offshoot of this genre celebrates the heroic accomplishments of Guru Hargobind and Guru Gobind Singh and is named the *Gurbilas* (“Praise of the Guru”).

This takes us to the last type of literature that emerged during this period—that associated with bards. The presence of bards at the center of Sikh activities started with Mardana, a contemporary of Guru Nanak, and developed to include Balvand and Satta (1540s), the Bhattas (1581–1606), and Abdulla and Natha (post-1606). They were all poets who composed songs in praise of the Gurus in an idiom they had acquired prior to accepting Sikh patronage. While some of them had ties with Islam, the Bhattas were Brahmans, who liked to compare the gurus with Janak, the royal ascetic (*raj yogi*) who appears in the *Ramayana*. During the period of Guru Gobind Singh, a large number of poets were based at the Sikh court. The *Dasam Granth* (“the Book of the Tenth Guru”) is an important anthology that includes the compositions of these poets. The text belonging to the last four categories enjoys a quasi-authoritative status.

Devotional and Ceremonial Life

Each day, most Sikhs recite three prayers: the *Japji* and a set of other hymns in the morning, the *Rahiras* in the evening, and the *Sohila*, a thanksgiving prayer offered just before going to sleep. On the first day of each month of the lunar calendar, the *Barahmah* (“twelve months”), a special prayer, is recited.

In addition to the texts setting out these prayers, almost all Sikh families possess anthologies of selected sacred hymns (*gutkas*), which are used for recitation that goes beyond the daily prayers. Families who can do so usually also keep the Guru Granth in their house. The text is kept in a separate room, it is opened (*prakas*) in the morning and put to rest (*sukhasan*) after sunset. The lady of the house invariably assumes the responsibility of taking care of the text. Family members often

undertake the complete reading of the Guru Granth over a period lasting from 6 months to 1 year. A reading of the text completed in a week and an unbroken reading taking 48 hours mark special occasions.

Soon after the birth of a child, the family visits the *gurdwara*, Sikh temple, offers supplication for the child's healthy and productive life, and takes "the command" (*hukam*) from the Guru Granth: The book is opened at random and the hymn that appears on the top left-hand corner is considered to be the divine reply to the family's supplication for guidance in the life of the child. The opening letter of the hymn is used as the first letter in the name of the newly born child. The Sikh marriage ceremony is preceded by an unbroken reading of the Guru Granth. In the ceremony itself, the bride and groom circumambulate the Guru Granth four times while a specific hymn of four stanzas is recited from its text, and the congregation prays, seeking divine blessings for the new couple. At the time of death, the body is cremated, the ashes are dispersed in the flowing waters in the vicinity, and the bodily remains are taken to Kiratpur, the town where Guru Hargobind died, and are disposed off in the River Sutlej. A reading of the Guru Granth is completed on the 10th day after the death, and relatives and friends offer prayers seeking peace for the departed soul.

Other Sikh community celebrations include the following: the birth anniversaries of Guru Nanak and Guru Gobind Singh, the days of martyrdom of Guru Arjan and Guru Tegh Bahadur, and Vaisakhi, the day of inauguration of the *Khalsa* by Guru Gobind Singh. These are celebrated by a pilgrimage to the Darabar Sahib, in Amritsar, or other historical sites.

SILK ROAD

The *Silk Road*, a term first coined in the 19th century, describes the network of overland trade routes connecting China, India, and the Mediterranean through Tibet and Central Asia. Caravans traveling by land across the Silk Roads were the primary mode of exchange between the East and the West from the second century BCE until the regular use of sea routes started in the 15th century CE. High freezing mountains, desolate deserts, and the scarcity of water restricted travelers to a few traversable paths, where difficult terrain was interrupted by occasional oases and towns.

Traveling the Roads

The Silk Road was regularly traveled in both directions. From China, the Silk Road begins at Chang'an, although trade was also conducted with Japan. The Silk Road passes west through China

along the Gansu corridor to Dunhuang. From Dunhuang, travelers either used the northern route around the Taklamakan Desert through Kucha and the foothills of the Tian Shan Mountains or the southern route to Khotan. From Khotan, travelers could go south across the Kun Lun and Himalayan mountain ranges to India or rejoin the northern route at Kashgar. From Kashgar, paths led south across the Pamir Mountains to Kashmir, but the main route led west to Samarkand. Beyond Samarkand, one route turned north at Bukhara, passing Khiva on the way to the Caspian Sea. Alternatively, the Silk Road continued west across Persia to the Mediterranean. Other trade routes extended through Arabia, North Africa, and Europe. Merchants generally did not travel the full length of the Silk Road. They instead acted as intermediaries who carried goods along a portion of the route and acquired different goods to trade on the return trip. Most products were exchanged between neighboring regions rather than being carried to the end points of the Silk Road.

Trade and Commodities

As the name implies, silk was an important commodity often carried by trade caravans from southern China to the Near East, Arabia, or Rome. The silk trade accounted for a substantial portion of state revenue, so the Chinese ordered all aspects of silk production to be kept secret: Anyone attempting to smuggle silkworm eggs or mulberry leaves out of China would be put to death. Sassanian Persian merchants, often middlemen for the silk trade, also understood the value of the secret and sometimes propagated disinformation about the origin of silk and the methods of its production. Despite attempts at secrecy, a fifth-century Chinese princess successfully smuggled silkworm eggs to Khotan by hiding them in her hair. In the sixth century, two Nestorian monks hid silkworm eggs in hollowed staves and carried them to the Byzantine court in Constantinople. Trading silk to the West was a lucrative business, but silk was not the only commodity traded on the Silk Road. Horses, gold, precious gems, jade, fabrics, and produce were carried by caravans between Silk Road towns. Unavoidably, travelers also spread cultures and ideas, with a noteworthy example being advances in medical science.

History Along the Silk Road

People, commodities, ideas, religions, music, and art moved along the Silk Road since the fourth century BCE, when the Macedonian empire of Alexander the Great expanded east from Greece as far as Kashmir. Aspects of Hellenistic Greek culture influenced developments in Central Asian art, architecture, language, religion, and coinage.

In the third century BCE, China was unified under the Qin Dynasty. Continuous conflicts between China and the Xiongnu nomads in the area of modern-day Mongolia motivated the Chinese to build the Great Wall for defense. In 138 BCE, the Chinese Han Dynasty court sent Zhang Qian, a military liaison, west to seek allies against the Xiongnu.

In the following centuries, China and the nomadic tribes of Central Asia and Mongolia were in constant conflict. The Xiongnu were replaced by the Xianbei, and the Yuezhi engaged the Parthians in Bactria. By the seventh century, the Gokturks had established a powerful empire (*kaghanate*) stretching along the north of China from the Korean peninsula to the Caspian Sea. The Parthians were succeeded by the Sassanian Persian Empire, which was conquered by the Arab armies in the seventh century. It was also during the seventh century that the tribes of Tibet united to form the Tibetan empire.

The Arabs, Tibetans, Chinese, and Turkic tribes in Mongolia fought over the Silk Road territories until a period of political destabilization in the mid-eighth century. The An Lushan (or Rokhshan) rebellion led to a 15-year hiatus in Tang dynastic rule in China. At the same time, the Tibetan empire was also destabilized when the emperor was killed in a revolt led by his ministers. In Damascus, the Umayyad caliphate was defeated in a coup, which led to the establishment of the 'Abbāsid caliphate. During this period, the Uighurs succeeded the Gokturks as the ruling kaghanate. The Uighurs helped the Chinese defeat the An Lushan rebels and resist a Tibetan invasion from the south. The Uighur kaghanate made Ordu-Baliq its capital (the ruins of which are called Kharabalghasun) and became extremely wealthy through a trade arrangement requiring the Chinese to pay exorbitant fees (in the form of silk) every year to purchase cavalry ponies. Advancing Kirghiz armies seized the Uighur capital in 840 and

occupied the Uighur lands. The fleeing Uighurs were initially accepted by the Chinese as refugees and made camp along the Yellow River. Three years later, the Chinese army attacked and slaughtered thousands of Uighurs, forcing them to flee south and west along the Silk Road.

In the 11th century, the Seljuk Turks conquered an area extending from modern Afghanistan to the Mediterranean. The Seljuk capital was Nishapur until the empire collapsed in the 12th century due to internal revolts. The 13th century saw the rise of the Mongol Empire under the leadership of the warlord Temujin, who would later be called Genghis Khan. By the reign of Kublai Khan, the Mongol Empire had conquered most of the continent, forming an empire that included Korea, China, Central Asia, most of the Middle East, and parts of eastern Europe. Civil wars caused this empire to disintegrate into separate khanates. Kublai Khan retained control of China, Tibet, and regions to the north beyond the modern boundary of Mongolia and ruled them as the first emperor of the Yuan Dynasty. Marco Polo's travels to the Mongol Empire lasted 17 years, from 1274 until 1291.

Use of the Silk Road declined with the establishment of the east-west sea routes. Beginning with the Portuguese in 1517, European cargo ships traveled from Europe around the Cape of Good Hope, north to India, and through the Straits of Malacca to arrive at Macao in southern China.

Religion on the Silk Road

Zoroastrianism

Although the date when Zoroastrianism was first practiced in Persia is uncertain, it was the religion of the Archaemenid Persian Empire during the sixth century BCE and may even have been carried as far as China during that time. The Sassanians codified the religion, and Sogdian Zoroastrians could be found in most towns along the Silk Road from Damascus to Chang'an.

Buddhism

In the third century BCE, the Mauryan Emperor Asoka converted to Buddhism and encouraged its propagation by sending missionaries through Hellenized Bactria and Persia all the way west to Anatolia. Missionaries were also sent south to

Sri Lanka, northeast to Nepal and Tibet, and into Southeast Asia. Asoka also sponsored the building of thousands of Buddhist stupas. Buddhism became common in Silk Road towns in Parthia, Sogdiana, Tibet, the oasis towns around the Tarim Basin, and China. A Kuchean monk named Kumarajiva contributed to the spread of Buddhist doctrine by translating sutras from Sanskrit into Chinese. Bodhidharma was an Indian monk who transmitted Ch'an (Zen) Buddhism to China and is credited as the founder of Shaolin kung fu. Fa Xian (Fa Hsien) was an early fifth-century Chinese monk who traveled to India to retrieve Buddhist scriptures, and the travels of the monk Xuanzang in the seventh century are famously recorded as the *Journey to the West*.

Manichaeism

Originating in third-century Persia, the teachings and priests of the prophet Mani were known in the Roman Empire, Persia, Central Asia, Greater Mongolia, and China. In the eighth century, Sogdian merchants from Samarqand introduced the Uighur ruler to Manichaeism, whereupon he converted and ordered the religion to be propagated among his people. His efforts were unsuccessful: Many people quickly reverted to shamanistic practices and a traditional meat diet.

Nestorianism

The Nestorian diophysite school of Christianity broke away from the Byzantine Church and was conveyed by both Syrian missionaries and Sogdian merchants east across the Silk Road. Nestorianism was popular among Turkic tribes until the 13th century. The Tang emperor permitted the construction of a Nestorian monastery in Chang'an, but except for a brief resurgence during the Yuan Dynasty, antiforeign sentiment caused Nestorianism to disappear from China by the 10th century.

Islam

In the seventh century, Islam spread with the Arab conquests across Persia and Bactria as far as Sind (modern Pakistan). Arab armies that had entered Transoxania in the eighth century confronted the Chinese armies northeast of Samarqand in 751. Although the Arab armies were victorious, they did not advance farther east along the Silk

Road. Individual traders proceeded along the Silk Road, settling and raising families as far east as China. The influence of these settlers may account for the origins of the Hui Chinese ethnic group, who can be distinguished from other groups by their practice of Islam.

SINGAPORE

Singapore is a Southeast Asian island country south of the Malay peninsula of Malaysia and north of Indonesia. Historically a commercial hub for Malays, South Asian, Chinese, and later British merchants, Singapore reflects a long tradition of transnational economic, political, and especially religious activities. One clear example of its diversity is in its name. The name Singapore was inherited from the indigenous Malay *Singapura* (“City of the Lion”) and is derived from the Sanskrit *simhapura*, which was a town in the Indian epic the *Mahābhārata*. Singapore continues to promote its Malay heritage as well as its historically diverse immigration. This section will cover briefly the historical development of Singapore’s nation-state and the religious practices of Singapore’s dominant ethnic groups.

The indigenous people of Singapore are the Malay *Orang Laut* (“Sea People”), who experienced early and frequent maritime contacts with

South Asian Hindus and Buddhists. By the seventh century, Singapore was under the political jurisdiction of the Malay Buddhist kingdom of Śrīvijaya. The Śrīvijaya thalassocracy controlled the majority of the Southeast Asian region, which included Singapore, Sumatra, and Borneo and stretched as far as the northern Philippines. During this time, many Malays practiced a form of Tantric Śaivism, worshipping deities such as *Kala* and *Durga*. As early as the 16th century, Singapore’s population began to convert to Islam along with many other kingdoms in the archipelago. The country later became an international center for Malay literature and generated a healthy amount of translations of Arabic and Persian romances and legends.

In 1819, the British Admiral Sir Thomas Stamford Bingley Raffles established a trading post in Singapore, converting the island into an international commercial hub. As with most British expeditions at the time, Raffles’s commercial interests were inextricably linked with colonial expansion. Singapore, along with the current states of Malaysia and Burma, became part of the British colonial empire. Singapore’s geographic location became a crucial military advantage for the British Empire. The British presence destabilized Singapore’s power structures and allowed Chinese immigrants to find a strong and dominant place in Singaporean society. The British occupied Singapore until World War II, when they lost it to the Japanese. The Japanese exercised brutal measures on Singaporeans. One of the islands closest to Singapore *Pulau Blakang Mati* (“Island of Death From Behind”) received its name from its use by the Japanese for torturing and killing Chinese suspects. Today, it is called Sentosa, Singapore’s internationally popular island resort.

The British regained control of Singapore in 1945 and held on to power until 1963, when Singapore gained independence. After a failed attempt to join with Malaysia and other neighboring countries, Singapore established itself as an independent Southeast Asian state in 1965. From 1959 to 1990, Singapore rose in economic power, mostly due to the policies and guidance of Prime Minister Lee Kuan Yew. Due to his efforts, Singapore joined South Korea and Japan as one of the tiger economies of Asia.

The Singaporean government prides itself on its religious diversity and promotes religious holidays

for its Muslim, Hindu, Christian, and Buddhist citizens. In its tourism packages and nationalistic pamphlets, religious pluralism is a method of promoting Singapore's status as a fully modernized and developed country. The largest Islamic festival in Singapore is *Hari Raya Puasa* ("Fasting Day of Celebration"), which is celebrated throughout Singapore, especially at the Malay Heritage Centre in downtown Singapore. Deepavali is the corresponding Hindu festival, and the focus of the celebration is in a quadrant of the city called Little India. One of the wealthiest areas in Singapore is Orchard Road, which sponsors the annual Christmas promotions and celebrations. Other festivals such as the Chinese New Year and the Buddhist Vesak Day are national holidays in Singapore and testify to the active and diverse religious population. While Singaporeans widely celebrate and acknowledge these diverse religious practices, religious communities such as the Hindus complain that there is more performance than practice of tolerance.

The different religious communities reflect previous and current immigrant movements. The largest ethnic population in Singapore is the Chinese, who have collectively enjoyed political and economic power shortly after Singapore's independence. The majority of Singapore Chinese have ancestral roots in southern China and are predominantly Cantonese, Hakka, Hokkien, or Teo Chiu. Chinese continue to immigrate to Singapore, mostly from economically challenged areas in Malaysia or China. Most Singaporean Chinese practice a form of Buddhism or Daoism, while others follow Christianity, Islam, or Tang-ki rituals and worship. One popularly venerated Buddhist tradition in Singapore is Thai Buddhism. Part of Thai Buddhism's popularity is Singapore's geographic proximity to Thailand. Thai Buddhist monks favor Singapore over Malaysia, partly due to the greater degree of religious tolerance in Singapore. The growth of Thai Buddhism and its monasteries is financially sustained through a strong Singaporean Chinese Buddhist patronage.

Singaporean Malays are the second largest ethnic group in Singapore and represent the largest population of Muslims in Singapore. For most Singaporean Malays, their ethnicity denotes their religious identity as Muslims, or as *bangsa Melayu* ("Malay race"). The Malay population in Singapore has decreased since the 1970s, and this is

partly due to the large and constant flow of Chinese immigrants to the country. One of Singapore's most famous Malays is Singapore's first president Yusof bin Ishak, whose image appears on Singapore currency notes. Malays are considered the indigenous population; however, Malays also come to Singapore from the neighboring countries of Malaysia, Indonesia, and Brunei. Travel between Malaysia and Singapore is relatively inexpensive, with many people commuting daily through trains and buses.

The third largest ethnic group is Tamil. Tamil families have roots in southern India, Sri Lanka, and Malaysia, and new immigrants continue to arrive in Singapore in search of manual labor. Singapore's Little India shops offer Bollywood paraphernalia, Hindu devotional groups, and yoga exercise classes. Singapore also boasts one of the most diverse arrays of Indian restaurants, which specialize in regional varieties such as Goa, Punjabi, and Kashmiri foods. Singaporean Tamils are predominantly Hindu or Christian, and many of their ancestors arrived as laborers for the British East India Company in the early 1800s. The Tamil language is the least well-known of the four national languages but is still present in public spaces such as sky trains and buses. Many of the Singaporean Hindu temples have Dravidian architectural motifs, a testament to the influence of southern Indian immigrants in the 1800s. The first of these temples was the Sri Mariamman Temple, which is located today in Singapore's Chinatown. The most well-known Hindu temple in Singapore is the Sri Veerama Kaliyamman Temple, which is a famous tourist spot and a landmark in Singapore.

One of the fastest growing religious practices in Singapore is Thai Buddhism. Part of Thai Buddhism's presence in Singapore is due to the Thai government's missionizing in the early 1900s. Thai king Chulalongkorn (1853–1910) visited Singapore near the end of his reign and purchased land for the purpose of promoting and supporting Thai Buddhism. However, it did not flourish until the latter part of the 20th century. Between 1986 and 2007, the number of Thai Buddhist temples grew from 6 to 100. Much of this is due to the continual Chinese Buddhist patronage and support from Thai migrant workers. One of the most popular Thai Buddhist spaces in Singapore is Wat Ananda Metyarama, which was founded in 1923 by a Thai abbot from southern Thailand. Wat Ananda

Metyarama's most venerable image is of Luang Pho Tuat, who is one of the most widely venerated Buddhist monks in Thailand. Luang Pho Tuat amulets are regularly sold throughout Singapore, and his statues are often on the dashboards of Singaporean taxis.

Christian adherents are various; they come from myriad countries and constitute approximately 15% of the population. Nearly two thirds of the Christian population in Singapore belong to Protestant denominations and follow these traditions. Many of the growing number of Catholic adherents derive from the Filipino diaspora, who are both seasonal and immigrant workers in Singapore. Filipino Catholics maintain strong ties to their extended families in the Philippines and have secured a strong religious base in Singapore. Some Filipinos will visit the customary seven Catholic churches for *Visita Iglesia*, a traditional Holy Week for Catholics, in Singapore in lieu of returning to the Philippines for the practice. Filipinos are the largest Christian group in Asia and help sustain much of Singapore's Catholic practices.

Singapore's commercial success has attracted a diverse flow of immigrants and religious practices for centuries. As Singapore continues to develop and grow financially, it will draw Christians, Buddhists, Daoists, Hindus, Sikhs, Baha'i, and Muslims from all over Southeast Asia and enjoy its place among the global cities around the world.

country within the Kingdom of the Netherlands. Until 2010, it was part of the Netherland Antilles, a conglomeration that was dissolved in October of that year. The country then became self-determinate, with the Netherlands providing for its defense, foreign policy, and financial stability. Sint Maarten occupies the southern portion of Saint Martin island in the Caribbean Sea, the northern portion belonging to France. While precise numbers are unavailable, Methodism is the most popular religious faith in Sint Maarten; Roman Catholicism comes next and is more popular in the French northern part of the island. Other faiths represented include Anglican; Seventh-Day Adventist, which is rising in popularity; Baptist; Hindu; and significant numbers of Vodou practitioners and Rastafarians. Some faiths are syncretized with African Caribbean religions, and the celebration of the dead also plays a large role in Sint Maarteners' lives.

Originally inhabited by Arawak Indians who were later conquered by the Carib tribe from which the sea takes its name, Sint Maarten's religious history began with its settlement by the Spanish after the island was spotted by Christopher Columbus in 1493. The island takes its name from St. Martin, on whose feast day it was sighted. It was not highly regarded by the Spanish, and in their absence, the Dutch founded a colony in 1631; the island was prized by them for its geographic location between Dutch settlements in New Amsterdam and Brazil. The Dutch East India company began salt mining operations soon after, and the island would violently change possession between Dutch and Spanish hands during subsequent years. The Treaty of Concordia was signed in 1648, dividing the island between the two colonizing powers—in effect, the Catholic north and Methodist south. Slaves were later imported to the island to cultivate the cotton, tobacco, and sugar plantations, and repeated slave rebellions ended only when the Dutch outlawed slavery on Sint Maarten in 1863. In the 1950s, the country became a popular tourist destination, at which time immigrants from the Lesser Antilles as well as Haitians, Dominican Republicans, and others arrived with their varied religious practices, drawn by the opportunities made available by the tourist economy.

Sint Maarten's populace is diverse, with many different faiths coexisting peacefully. The number

SINT MAARTEN

Sint Maarten is a small nation located on an island in the eastern Caribbean that is a constituent

of faithful cannot be precisely specified, but churches of various faiths are listed as popular tourist destinations, for both their function and their beauty. Interfaith conflict is rare; the island's inhabitants place the peace of the country above any religious disagreements.

SLOVAKIA

Slovakia is a central European country formerly joined with the Czech Republic to create the nation of Czechoslovakia within the Soviet bloc. Since the end of the Cold War, Slovakia has been independent. The Slovak cultural identity has been significantly influenced by the fact that it has always been part of the Western Latin culture, which brought rationalism, individualism, and eventually also humanism to people's thinking and behavior. Though dominantly Roman Catholic, contemporary Slovak religious society is distinctively postmodern, especially in its pluralism of beliefs and practices. The postmodernization of religion in Slovakia has manifested itself through a growing number of followers—particularly in the minority religions—a continual rise in the number of new religious movements, greater participation of laymen in church activities, and a

higher proportion of young people and intellectuals being part of the modern religious population.

At the same time, parallel to these trends, the conservative tendencies in the traditional churches are growing stronger. Despite the global phenomenon of secularization, religiosity in the Slovak republic is becoming more important according to census data. We can see a growing number of citizens affiliating themselves with a church or a religious group. Also, the number of the people who do not declare membership in any church or religious group and describe themselves as nonreligious has grown. The number of people affiliating themselves with a different religious group or church has risen too. This rise can be attributed to the establishment of new religious groups in Slovak society. In comparison to other former Eastern Bloc countries and considering the secular tendencies in Europe, we can conclude that the situation in Slovakia is unusual, and such a high degree of religiosity (from the quantitative point of view) in the given geographic area is exceptional. It shows that gradual pluralism is taking place, and new forms of religious practices are emerging. There are 18 registered churches and religious groups and approximately 200 unregistered religious groups in Slovakia presently. The success of small churches creates a precondition for a gradual change of the structure of Slovakia's denomination map while preserving the monopolistic position of Christianity in its various forms.

The largest section of nonregistered religious groups consists of movements of Christian origin—just below 50% compared with followers of neopagan groups and groups of oriental origin. The various messianic groups have the lowest number of members. Slovakia is one of the countries where a traditional pastoral environment and the type of traditional “inherited” religiosity connected with it disappear in proportion to the process of modernization that is in progress here. “Rustic piety” becomes marginalized, while fundamentalist and sectarian religiosities are in demand, and more personal, more sophisticated, and more individual beliefs are growing. A gradual strong shift from ritually moralizing religion to spirituality focused on meditation or mystic experience is taking place. The main reasons for this are lack of confidence in religious institutions, especially in the Catholic Church, which is due to the complicated religious development in Slovakia in the

remote past; strong anti-Catholic interpretation of the national identity as a result of the communist propaganda, which forced the church out of public life from 1948 to 1989; and the scandalous portrayal of churches in tabloids since 1989.

SLOVENIA

Slovenia is a relatively small country (20,300 square kilometers, 2.1 million inhabitants) in the Balkan Peninsula in southeastern Europe. Once a part of Yugoslavia, it is now independent and a member of the European Union. Its capital city is Ljubljana (280,000 inhabitants). The majority of the population is Slovenian (more than 80%) and from other Slavonic nations (Croatians and Serbians). There are also important minorities, Italians and Germans, in Slovenia. Given its location on the edge of the Balkan Peninsula, Slovenia has in the course of its history been influenced by many cultures and religions (Catholicism, Orthodox religion, and Islam). Slovenia was a part of the Habsburg Monarchy (since the 14th century). Due to the religious circumstances under Habsburg rule, the most important religion was and still remains Catholicism (about 58% of population). Ljubljana, the capital, is the center of Catholicism in the region, and since 1961, it has also been the seat of the Roman Catholic Metropolitan Archdiocese. Other dioceses include the towns of Koper and Novo Mesto.

Between 1918 and 1991, Slovenia was a part of Yugoslavia. It was decidedly the most developed and the most modernized region of this former Communist state. Being a part of Yugoslavia greatly influenced the religious map of Slovenia. Alongside traditional Catholicism, other religious

traditions arose, especially the Orthodox Church and Islam. According to the last census of 2002, about 2.3% of people declare themselves to be Orthodox, and 2.4% of the population are Muslims. These two religions are represented mostly in the capital city (5.5% Orthodox Christians and 5.4% Muslims). The civil war in former Yugoslavia affected Slovenia only marginally but it was the cause of increased migration from other parts of Yugoslavia and led to the growth of some religious groups, above all Islam.

Compared to other parts of former Yugoslavia, in Slovenia, there is a large number of people who are not affiliated with a religion but have some religious beliefs (about 4%). Also, the number of people who declare themselves as unbelievers or atheists is relatively high (more than 10%). Nontraditional and new religious movements are also very active in Slovenia. These groups had great difficulty in being recognized during the last decade of the 20th century. The current situation is better, but there is still much tension between these groups and the rest of society. Around 38 other religious communities, spiritual groups, societies, and associations were registered in Slovenia in 2010. In the past 10 years, the number of people sympathetic to New Age ideas has also increased. In this context, the former president of Slovenia, Janez Drnovšek (1950–2008), is an important figure as he became the supporter of ideas connected with New Age phenomena during the last years of his life. He is the author of several books with spiritual content—for example, *Thoughts on Life and Consciousness* (2006), *Golden Thoughts on Life and Consciousness* (2006), and *The Essence of the World* (2006).

SMART, NINIAN (1927–2001)

One of the most influential figures in the field of religious studies in the latter half of the 20th century, Ninian Smart's life was thrown off course by the changing fate of history. Born into a relatively privileged family, groomed for an Oxford or Cambridge education by his Cambridge mathematician father and well-born mother, Smart had been set on a path leading to a conventional academic career in the British university system like his two brothers, Alastair, an art historian, and John Jamieson, the philosopher. But World War II intervened, and Smart was pressed into military service, first to study Chinese at London's School of Oriental and African Studies and then to be removed to a remote tropical island, Ceylon, later known as Sri Lanka. Smart's encounter with the classics of China stood in stark contrast with his previous training in the Western classics; his face-to-face meeting with the Buddhism of Ceylon and with Ceylonese Buddhist intellectuals, such as the formidable philosopher K. N. Jayatilleke (who became a lifelong friend), introduced him to a religiosity quite different from his own Anglican piety and the theological establishment of the Church of England. These occasions made for intellectual reflection about the reality of global life outside the United Kingdom, which soon received deeper affirmation through Smart's marriage to his Italian Catholic wife, Libushka Barrufaldi. Ninian Smart was a committed comparativist of the world's religions and ideologies, a sophisticated proponent of developing the tools of transnational comparative analysis, *Doktorvater* for a generation of postgraduate students from every continent, recipient of international honors and prestigious lectureships, tireless world traveler in the interests of academic internationalism, and veritable citizen of the world. He set a high bar for people seeking to think of themselves as global scholars. This entry will focus on the global features of his work. First, Smart was a global scholar in that he thought about his subjects in a cross-cultural comparative way. This is reflected in his major publications in the comparative study of religion: *World Religions: A Dialogue*, *World Philosophies*, *The World's Religions*, *Reasons and Faiths*, *Dimensions of the Sacred: An*

Anatomy of the World's Religions, *World Views: Crosscultural Explorations of Human Beliefs*, *The Religious Experience of Mankind*, *Religion and the Western Mind*, *Religion and Nationalism: The Urgency of Transnational Spirituality and Toleration*, and *Buddhism and Christianity: Rivals and Allies*. Even where the titles of Smart's books do not signal a work of transnational comparison, the substance does. *Doctrine and Argument in Indian Philosophy*, for instance, is written expressly to put Western philosophy of religion into play with Indian; *The Philosophy of Religion* sets out to treat some of the perennial problems of philosophy in intentionally comparative ways; and *The Phenomenon of Religion* offers a model for doing the comparative study of religion along the lines developed by the phenomenology of religion.

For Smart, doing comparative work did not mean matching up one religion against another to assert that all religions were really one and the same. Though Smart thought globally, he thought pluralistically. For Smart, global thinking always meant thinking about religions in which distinctiveness was taken with the utmost seriousness. For Smart, comparison did mean seeking and positing analogies between and among religions, but to explain how and why things happen in religions. Take the idea of *lord* and how this notion is conceived by different religions. How might the presence of "the lord" configure with ritual acts of devotion, prayer, sacrifice, meditation, worship, and so on in one religion as compared with another? What intricate analogies might there then be between one religion and another? What if, for example, the lord in question was also incarnate and human, like Attis, Jesus, or Krishna, rather than more heavenly, like the Amitābha Buddha or the Bodhisattva Avalokiteśvara? What if the lord were fully transcendent, like Allah or Yahweh? How would these different conceptions of *lord* be reflected in a religion's mythology or the style of religious experience and emotion, for example? Would we not perhaps expect kinds of religious experience to vary as the conception of lord does? Can we likewise expect religions that emphasize the lordly qualities of their focus to express that in certain forms of concrete religious materiality, such as in architecture or sculpture? Given the generality of the terms, this same series of questions can be submitted to any particular religious

context in which lordliness figures, whether that be the religious world of Lord Krishna or Lord Jesus.

Smart cherished the lifelong, but unrealized, wish to develop a truly global analytic language of comparison, with its own lexicon of comparative terms. Such a language could be constructed in several ways. Smart worked avidly on at least two.

One of these was to strive to find a comparative language devoid of particularistic or ethnocentric taint. Smart used this kind of relatively abstract or neutral language in his phenomenological ventures. He might thus use the term *focus*, as in the phrase *focus* of worship, instead of, say, any one of a number of culturally specific terms such as *god*, *dominus*, *Brahman*, *deva*, and so on. In this way, by trying to pursue the religiously neutral path of trying to invent clean comparative terminology, Smart felt that he could talk *globally* without slighting or privileging any particular religious point of view.

Smart also thought an alternative strategy for achieving a cross-culturally comparative language of study was available. It was never clear whether this was to be used if a clean comparative language proved impossible to construct or whether it stood alone. Nevertheless, Smart's idea was to cross-pollinate the repertoire of comparative terminology by mutual adoption of different terminologies—a kind of export/import operation for religious studies. Thus, in his use of neutral terms like *lord* for comparative purposes, Smart assumes that this term could be recognized by religions other than those arising in the West as pertinent to their own situations. Smart presumed that the term *lord*, although an English one, carried no significant ethnocentric baggage. But what if he were mistaken? Smart's answer was simply to offer an alternate strategy. Instead of seeking a clean comparative language, we should mutually *import* terms from each other's religious traditions—without seeking one-for-one correspondence translations between imported/exported and “domestic” terms. In the same way that we import foreign words into English wholesale, and without translation, such as Zen or yoga, we could globalize our thinking about religion by just doing more of the same with the key terms of the comparative discourse of religious studies. Thus, instead of trying to translate a term such as the Sanskrit word

for moral order, *dharma*, into an English equivalent, we should just learn how *dharma* maps onto the world and, thus, import the term *dharma* into the Anglophone discourses of religious studies on its own terms.

Smart did not believe that the resultant polyglot, comparative religious studies language would be easy to create. He did little more than call for his dream to be made into a reality—perhaps by a succeeding generation of scholars in the study of religion. Still in all, Smart's intentions and visions for a global study of religion are stressed in this entry. If his vision were realized, each religion could deliver some conclusions of general use and supply elements of a comparative language to all the rest. Would it not be better for both understanding and for ease of thinking, for example, if we in the West gave up the clumsy practice of substituting a cluster of Western terms such as *moral-ity*, *duty*, and so on for the Indic *dharma*? Why not start a global enterprise of learning—by learning from each other what far richer terms, such as *dharma*, mean and then go ahead and import them for use in our own lexicons? Smart thought that such an export/import operation would mark progress toward furthering the globalism at the heart of his worldview.

SMITH, HUSTON (B. 1919)

Huston Smith is a public intellectual known for his work on comparative religion, notably for his book *The World's Religions*. Throughout his career, Smith has sought to educate the English-speaking world about religions, to foster respect for religious traditions, and to dialogue with modern Western science.

Smith was raised by Methodist missionary parents in a rural town near Suzhou, China. In addition to the Christianity of his parents, he was introduced to Buddhism, Confucianism, Daoism, and indigenous traditions. After primary education in China, he attended college in the United States. At the University of Chicago, he adopted the naturalistic theology of his mentor, Nelson Wieman, and married Wieman's daughter, Eleanor Kendra Wieman.

After graduating, Smith taught at Denver University, Washington University (St. Louis, Missouri), Massachusetts Institute of Technology, Syracuse University, and the University of California, Berkeley. While in St. Louis, he became a follower of Swami Satprakashananda and the Vedanta Society. He also hosted several television series, and two of these turned into publications. "The Religions of Man" later became *The World's Religions*, and "The Search for America" became a book by the same name and included chapters cowritten with Eleanor Roosevelt and Paul Tillich. Toward the end of his career, he starred in Bill Moyer's television series on world religions titled *The Wisdom of Faith With Huston Smith*.

As a public intellectual and curious inquirer, Smith met and learned from several spiritual luminaries, including the 14th Dalai Lama, Gerald Heard, Aldous Huxley, Timothy Leary, Thomas Merton, Frithjof Schuon, D. T. Suzuki, and Alan Watts. Driving these encounters was Smith's commitment to ecumenism, which for him involves developing respect for other religions' capacity to foster spiritual development. Accordingly, Smith is not a comparativist; rather, he elucidates the experiences and values of different religions. To enrich his scholarship, Smith became a practitioner of Vedanta, Rinzai Zen, and Sufi Islam, for more than a decade in each tradition. This led him to perennial philosophy and the teaching that all great religions converge at the infinite transcendent and at the deepest inward self.

Smith has been a public advocate for diverse people, religions, and religious practices. For example, as a Christian in the Civil Rights Era, he marched on Selma and participated in the March on Washington. Inspired by his encounters with indigenous peoples in Australia and the Americas as well as his experimentation with drugs, Smith testified to Congress to remove the ban on peyote

for Native Americans, cowrote *One Nation Under God* and wrote *Cleansing the Doors of Perception* (books about the religious use of hallucinogenic plants).

Throughout his career, Smith has engaged in dialogue with Western scientists. He has urged them to embrace science's inherent openness and limitations to develop more holistic theories. In short, Smith argues that religious worldviews and experiences do not have to be invalidated by modern science.

SMITH, WILFRED CANTWELL (1916–2000)

A scholar of the comparative history of religion and also a theologian, Wilfred Cantwell Smith was a prolific author, visionary educational administrator, and major intellectual force in the academic study and practice of religion during the latter half of the 20th century. Building on his roots in Islamic studies, Smith was an early advocate for taking religious pluralism and its conceptualization seriously. This entailed meticulous historical research across the range of the world's religious traditions and a willingness to address what he perceived to be the failings of modern intellectuals and the university to understand religious life. The impact of his work, both personally on those who studied with him—many of whom have become leaders in their fields—and through his writing, is enormous. Smith's work remains significant for its understanding of religious life, for the ongoing engagement with issues of global religious diversity and pluralism, and for its crisp portrayal of the moral dimension of intellectual life.

Biography

Born in Canada, Smith obtained his early education at the University of Toronto, followed by 2 years studying theology at Westminster College, Cambridge, and as a research student in oriental languages at St. John's College, Cambridge. Joined by his wife, Muriel, Smith then accepted an appointment with the Canadian Overseas Missions Council based primarily at Forman Christian College in Lahore in prepartition India, in what is now Pakistan, where he taught Indian history. Smith's 5 years in India were formative in many ways. The warm friendships that he formed with colleagues of varying religious orientations—Hindu, Muslim, and Sikh—manifested the complex and deeply personal nature of religious and cultural difference, thereby demonstrating the inadequacy of the common but facile Western view of religious life as competing belief systems. The Indian years also deepened Smith's interest in the nature of historical process, particularly as the ground for moral and sociopolitical life. This entailed an initial attraction to Marxism, later recanted in the interest of a less dogmatic and more nuanced understanding of history. Smith returned to North America after World War II and completed his PhD in oriental languages at Princeton University.

In 1949, Smith was appointed to McGill University's faculty of divinity in Montréal where, 2 years later, he became the first director of the University's Institute of Islamic Studies. This institute embodied Smith's unique vision for scholarship at the interface of different religious traditions: faculty and students drawn in equal numbers from the West and from throughout the Muslim world, working on common subjects. This vision spoke to the two key dimensions in engaging religious pluralism and diversity: the differences *between* religious traditions and the differences *within* any one tradition.

In 1964, Smith was invited to expand this vision to global horizons by becoming the director of Harvard University's Center for the Study of World Religions. The center was not itself a teaching institution but provided a nexus for the teaching of world religions at Harvard, chiefly at the Divinity School, but increasingly, under Smith's leadership, in the faculty of Arts and Sciences. The center provided residential space for faculty and students, facilitating both formal and informal

interactions and continuing Smith's recognition that the study of religious life is chiefly a matter of persons in conversation.

Smith left Harvard in 1973 to accept an appointment at Dalhousie University in Nova Scotia, which allowed him to advance an ambitious agenda of scholarly writing. He returned to Harvard in 1978 to assume oversight of both doctoral and undergraduate programs in religious studies, which increasingly took on a global and comparative perspective. Smith retired in 1984 and died in his native Toronto 16 years later.

Global Religion

Smith's work has implications for thinking about religion globally in at least four ways. First, Smith is insistent throughout his work that religious life has fundamentally to do with *persons*. Religiousness is a quality or dimension of human life that is broadly, if not universally, attested by the historical record. In making this argument, Smith is harshly critical of the modern academy's obsession with methodology, which he sees as subordinating the complex particularity of human beings to the demands of theory and, in particular, to a preoccupation with objectivity. Such a preoccupation, for Smith, misses the deep interiority with which individuals actually live their lives, not in private, solipsistic subjectivity but in fluid, ever-evolving interaction with other human beings. It is this third possibility, this personal space, that is, for Smith, the ultimate subject of the scholar's inquiry. Access to it demands humility, imagination, reciprocity, a capacity for inference, and much hard intellectual work—the very same qualities that are essential to all kinds of authentic interpersonal communication. It is possible for a scholar eventually to discern patterns of religiousness cross-culturally, but those patterns must arise inductively from the historical data and should not be superimposed on it deductively from one's prior theory. Smith's early book—now available as *Patterns of Faith Around the World*—is an engaging model of this approach to the comparative study of religion.

Second, as noted above, Smith is keenly attuned to the dynamic, ever-unfolding nature of historical processes. He is foremost a historian, and his arguments are always made on the basis of meticulous analysis of textual material in a great range of

languages. His best known book—*The Meaning and End of Religion: A New Approach to the Religious Traditions of the World*—documents the changing meanings of the English word *religion* and its linguistic counterparts in other languages. Smith's astonishing discovery is that the notion of "religion" as something that human beings *have*, and in which they *believe*, is a relatively recent development of the modern West. The most distorting outcome of this development, he maintains, is that it reifies the historical dynamism of religious life into an abstract entity called "religion" (or "Christianity" or "Buddhism" or "Hinduism"). Smith's bold proposal is that the word *religion* simply be dropped from everyday use. In its stead, he suggests a pair of complementary concepts: "cumulative tradition," which refers to the inherited circumstances in which each individual finds himself or herself, and "faith," which is the inner orientation of the individual, the pattern that he or she experiences or discovers in his or her life, as informed by the cumulative tradition.

Third, just as the life of individuals and of cumulative traditions is dynamic, so too is the interaction between religious traditions. Smith's later work pays particular attention to the theological implications of his synoptic, organic view of world history, and *Towards a World Theology* may be seen as taking preliminary steps toward "a history of religion in the singular" (Smith, 1981, p. 20). While not denying episodes of interreligious conflict, Smith is particularly interested in those historical moments—in medieval Spain, in 16th-century North India, and in classical China—that have brought different cumulative traditions into intimate proximity to one another and have been the occasion for rich and creative interchange: They are harbingers of the ready interaction between traditions that characterizes the modern world. Careful attention to historical detail, Smith maintains, shows that cultures have been much less insular and much more creatively interactive than is commonly supposed. What binds human beings with their different cumulative traditions together is not some universal essence but participation in the shared, universal historical process.

Fourth, Smith contributes, particularly in his later writings, to ongoing discussions of secularism in two ways. The first is by conceiving of the classical

humanist tradition of Greece and Rome as one of the cumulative traditions of the world that have enabled human beings to live lives of personal fulfillment and faith, with intimations of transcendence. Smith suggests that this tradition is analogous to the more overtly religious traditions of the world and is what he calls a tradition of "positive secularism." There is also a second form of secularism, emerging in the modern West and subsequently spreading widely around the globe, to which Smith gives the name "negative secularism." It includes a presumption that religious life is an unnecessary by-product of cultural life and exhibits an intolerance of alternative views that, for Smith, makes it ill suited as the foundation for the necessarily pluralistic next chapter in global history. As Talal Asad demonstrates, these views remain provocative and fruitful.

SOCIAL JUSTICE

Social justice designates the visions of—and the efforts to bring about—a just and equitable society.

Social justice movements have often been supported by religious groups and frequently have an emphasis on providing rights and resources to those subgroups that have been historically and systematically oppressed. While the term originally referred to the equal distribution of economic opportunities, social justice came to denote a wide range of political, legal, and cultural causes, including—but not limited to—rights to health care, housing, education, and legal representation. Poverty, racism, sexism, and other institutionalized inequalities are considered to be obstacles to achieving the egalitarian society envisioned by social justice advocates. Guided by the complementary principles of subsidiarity and solidarity, movements that advance social justice emphasize the inherent dignity of all human beings as well as the interconnectedness of various human rights struggles. Numerous religious groups, grassroots movements, and political associations invoke the term “social justice”; however, groups that see religious and state organizations as perpetuators of inequalities also use the term. While many social justice activists work for reform through established political channels, not all efforts toward social justice seek change through governmental reform.

History of Social Justice

Luigi Taparelli, a 19th century Italian Catholic priest and philosopher, first coined the term *social justice* in his book titled *Theoretical Treatise on Natural Law Based on Fact*. Expanding on the teachings of St. Thomas Aquinas, Taparelli espoused a natural law approach to political and economic systems as the ideal way to bring about social justice. The natural law of social organization is formed through the twin values of solidarity and subsidiarity, and the balance of these two principles results in a just society. According to Taparelli, such a just society is a reflection of eternal law, the divinely ordained law found not in scripture but in the workings of the universe. The natural law paradigm and social justice became a core component of Catholic social teaching. Those teachings were part of the inspiration for Liberation Theology, a movement started in Latin America in the 1950s and 1960s, which interpreted the Gospels as a call to liberate those suffering in unjust economic conditions.

In Protestant Christianity, social justice is understood to be the main impetus of the Social Gospel movement of the late 19th and early 20th centuries. The leaders who initiated this movement believed that the Second Coming would only occur once the world was rid of social evils by human effort. Applying Christian ethics to the social problems of the time, the Social Gospel provided Christians with a religious rationale to enact social change, including labor reform, public health reform, and outreach to immigrants and the poor.

Concepts similar to social justice have been identified in the teachings and doctrines of non-Christian faiths. Islamic scholars, most notably Sayyid Qutb, have contended that social justice is one of the most important components of Islam, pointing to core teachings of Islam that promote equity among all members of society. *Zakaat*—alms giving—is one of the five pillars of Islam and instructs followers to give 2.5% their wealth to the poor and needy. Such a mandate is reminiscent of the principle of wealth redistribution advocated by many social justice activists. In addition to alms giving, Muslims are encouraged to please God through charity (*infaq*) and to give out of generosity (*sadaqah*)—actions that purify one’s self through helping others.

In Judaism, the goals of social justice are evident in the ethic of responsibility reflected by several concepts, most notably *tikkun olam* (“repairing the world”). Some interpret this particular form of responsibility as a call to create a model society for the welfare of all. Rabbi Michael Lerner articulates a twofold vision of the relationship between social justice and religion by stressing spiritual values (those values that challenge selfishness and materialism) and solidarity (the recognition that we are all harmed by the oppression of others).

Engaged Buddhism, a form of Buddhism that actively promotes social change, challenges the more traditional practice of introspective withdrawal and encourages engagement with social and political issues. Some Buddhist scholars note that this form of engaged Buddhism is evident in the efforts of Buddhist nuns throughout Asia working to end their second-class status by reforming the hierarchal structure of the Buddhist Sangha as well as in the phenomenon of numerous untouchables of India converting to Buddhism to end the misery caused by the caste system.

The late 20th-century philosopher John Rawls further developed the concept of social justice in his book *A Theory of Justice*. Unlike religious teachings, Rawls avoids appeals to divine and natural law and stresses a secular foundation for justice based on the principle of fairness. Recognizing that all societies are composed of formal and informal structures (social, economic, and political), Rawls proposes that the legitimacy of any collectively enforced social arrangement should be determined by those who are subject to it. With this in mind, Rawls contends that wealth is a collective legacy and should be distributed equally among all members of society.

Social Justice Policies

From the mid-20th century to the present, several international and regional conventions, declarations, and treaties have been designed to promote social justice. Signed into action in 1948, the Universal Declaration of Human Rights stresses the human dignity and social protections. It makes strong accommodations and recommendations for workers rights, including protection from unemployment, safe work conditions, a living wage, health care, and “the right to a standard of living adequate for the health and well-being of himself and of his family, including food.” In 1976, two equally important covenants were passed: the International Covenant on Civil and Political Rights and the International Covenant on Economic, Cultural and Social Rights. In addition to these major accords, several multilateral treaties of the past 30 years emphasize the rights of women, including the Convention on the Elimination of All Forms of Discrimination Against Women, the Protocol in the African Charter on Human and Peoples’ Rights on the Rights of Women in Africa, the Declaration on the Protection of Women and Children in Emergency and Armed Conflict, and the Declaration on the Elimination of Violence Against Women. These pieces of legislation signify the universal concern for and commitment to social justice by a significant spectrum of members of the global community.

Criticisms of the Concept of Social Justice

Several philosophers and politicians have criticized the core assumptions of social justice. One of its

more prominent critics, Friedrich Hayek, questions the theoretical underpinnings of social justice in his book, *The Mirage of Social Justice*. His concerns are twofold. First, Hayek rejects the idealism of any “just society” founded by the imposition of authorities (governments) as compared with free individuals acting responsibly and justly (classic liberalism). A government that uses its power to enforce equalization removes the sense of solidarity and responsibility that citizens form with each other in the pursuit of their shared political interests. Hayek also points out the other side of this argument, contending that the more governments try to realize a desirable redistribution, the more they sink into a command economy and forms of despotism. For Hayek, both “equality of outcome” and “equality of opportunity” are practical impossibilities that can only come about through authoritarian dictates. The debates continue regarding the practicality and the possibilities of achieving social justice.

SOKA GAKKAI

The Soka Gakkai is a lay Buddhist association that originally began as an educational movement in Japan in 1930. Its founder, Tsunesaburō Makiguchi (1871–1944), was inspired by the thought of Nichiren (1222–1282), a Japanese Buddhist monk. Nichiren’s brand of Buddhism has exerted a diverse array of influences on modern Japanese society, and according to some interpretations, this can be partly attributed to

Nichiren's nationalistic appeals. Under these influences there emerged a number of religious figures and movements in 20th-century Japan, the Soka Gakkai being the most distinct example. It grew into a gigantic and influential religious group after World War II. In 1961, the Soka Gakkai formed a political group that eventually became a political party, Komeito, in 1964. Komeito participated in the coalition government in 1993 to 1994. It reorganized as New Komeito in 1998, advocating both peace and humanitarian policies. Since 1999, New Komeito has formed a coalition government with the Liberal Democratic Party as the major partner. The Soka Gakkai organized its international network, Soka Gakkai International (SGI), in 1975 under the leadership of its third president, Daisaku Ikeda. Ikeda was born in Tokyo in 1928, and he joined in the Soka Gakkai in 1947. He served as the president from 1960 to 1979 during the period of its most rapid growth. He has also served as the president of the SGI since 1975 and as the honorary president of the Soka Gakkai since 1979.

The postwar recovery and development of Japan paved the way for the growth of the Soka Gakkai, which taught individuals to strive for "Human Revolution" through self-empowerment by encouraging them to believe in the positive power of the Lotus Sutra. Promoting a message that individual rejuvenation will inevitably lead to improvements in one's community, society, and the world, the Soka Gakkai has been actively engaged not only in individual empowerment but also in social activities, especially those related to the peace movement. Although it was formerly known for its aggressive proselytizing and harsh remonstrations of other religions, the Soka Gakkai now seems to adopt more moderate ways in its social outreach. In 2005, the Soka Gakkai counted more than 8 million families as its members in Japan. Ikeda has been very prolific in publications and active in the fields of education and culture. He has promoted dialogue with various world leaders, both religious and secular, and he has received numerous honorary titles from academic institutions worldwide. Now, the SGI extends to more than 190 countries and areas in the world, claiming 12 million members globally.

Interestingly, there has been more academic research conducted on the Soka Gakkai and the SGI outside Japan than within the country, and

there are several publications written by leading sociologists of religion such as Karel Dobbelaere and Bryan Wilson. In sharp contrast to other Japanese religions abroad that often draw mainly Japanese residents and immigrants, the Soka Gakkai has drawn significant numbers of non-Japanese converts around the globe, and therefore, it deserves special scholarly attention, as Machacek and Wilson argue.

SOLAR TEMPLE ORDER

L'Ordre du Temple Solaire (OTS), "The Order of the Solar Temple," is a generic title for a small, primarily European religious movement that consisted of groups with various names all led, directly or indirectly, by Jo Di Mambro (1924–1994). The Francophone apocalyptic new religion was founded in 1984 by Di Mambro and Luc Jouret (1947–1994). Between 1994 and March 1997, members of this secretive neo-Templar, quasi-Catholic group died in a series of ritualized murder-suicides in Switzerland, Quebec, and France. At its zenith in 1989, it appears to have had 442 members: 187 in France, 90 in Switzerland, 86 in Canada, 53 in Martinique, 16

in the United States, and 10 in Spain. Notably, many members were wealthy and respected (e.g., Robert Ostiguy was Mayor of Richelieu; Robert Falardeau was an official in the Québec Ministry of Finance; and Guy Berenger was a French nuclear engineer).

Information about the OTS emerged in the early hours of October 5, 1994, when police were called to investigate a fire at a farmhouse in the village of Chierly in Switzerland. They discovered secret chambers and a makeshift temple within which there were 23 bodies, most of which were dressed in ceremonial robes, arranged in a circular formation, and had plastic bags placed over their heads, having first been shot in the head. Within hours of this grim discovery, an investigation into another conflagration at three holiday chalets in Les Granges sur Salvan revealed 25 bodies. The chalets belonged to Camille Pilet (a retired sales director of the Piaget watch company), Jouret, and Di Mambro. As news of these events was unfolding, police in Québec began to make connections with a similar tragedy in Canada on the morning of October 4. A fire had destroyed a condominium complex owned by Pilet, Jouret, Di Mambro, and another OTS member, Dominique Bellaton. Police found the bodies of four adults and a baby. Of the 53 who died, it was clear that some had been murdered. In 1995, the bodies of 16 members were found in France, and in March 1997, 5 more were discovered near Québec.

Di Mambro, a former member of the Ancient and Mystical Order Rosae Crucis, was a key figure in the Templar resurgence in France in 1952. He was introduced to Jouret, a charismatic physician and homeopath, in the early 1980s. Between its founding in 1984 and the beginning of its demise in 1990, there were three distinct areas of OTS-related activity. First, as *Amanta*, Jouret and others lectured and provided workshops. Second, those who expressed interest could attend the *Archedia Clubs* for further teaching. Finally, the *International Chivalric Organization of the Solar Tradition* was an advanced initiatory order.

OTS rituals mixed guided meditation, prayer, and the recitation of esoteric texts, such as Alice Bailey's *Great Invocation*, and biblical texts. OTS teaching included an apocalyptic focus on environmental catastrophe, extraterrestrial elements, Rosicrucian ideas, soul travel, and reincarnation.

Problems began to emerge in the early 1990s. The commitment and financial support of some members waned. More damaging still, Di Mambro, who had produced supposedly occult phenomena during the ceremonies, was publicly questioned by his own son regarding his teachings and exposed as a fraud. This led to the departure of a number of members. These challenges appear to have led to an apocalyptic focus on "transit" (i.e., soul travel) to Sirius where the faithful would assume glorious "solar bodies." This transit required bodily death.

The movement has ceased to exist, but there are former members who still defend Di Mambro and the OTS.

SOLOMON ISLANDS

The Solomon Islands constitute an independent country in the South Pacific north of Australia and east of Papua New Guinea. Most of the indigenous Melanesian people living there profess Anglican or Roman Catholic Christianity. Spanish explorers were the first Europeans to set foot on the Solomon Islands. In November 1567, Alvaro de Mendaña departed from Callao, Peru, to search for the storied land of Solomon's gold. What Mendaña found instead were countless islands throughout the South Pacific. He landed on a cluster of islands in February of 1568, naming them Las Islas de Solomon, and taking formal possession of the archipelago in the name of Spain. The Spanish theologian José de Acosta commented on the inhabitants of the Solomon Islands in his 1588 missionary manual titled *De Procuranda Indorum Salute*. Although the comment was brief, Acosta hinted that the conversion of the indigenous peoples of the islands would occur quickly given their

inherent docility. Acosta essentially believed that the indigenous people of the Solomon Islands had no religion that would act as a hindrance to the establishment of Catholicism.

Mendaña attempted to establish a colony in 1595 to 1596. It quickly collapsed. The Spaniards discovered that the natives practiced head hunting, cannibalism, and ritual warfare. The people of the Solomon Islands practiced ancestor worship, believed in numerous deities, and maintained small statues depicting deceased loved ones, deities, and protector spirits. There was another attempt at colonization in the early 1600s, but it failed as well. There were no large-scale missionary attempts to convert the indigenous populations to Catholicism. The Catholic priests who arrived with the colony were tasked with serving Spanish colonists. In contrast to what Acosta believed, the indigenous people of the Solomon Islands were not docile. The natives eventually repelled the invaders from their islands.

During the period of Spain's domination of the Pacific, there was talk of colonizing the Solomon Islands and systematically converting the indigenous population. However, the lack of funds, constant warfare in Europe, and a scarcity of missionary personnel limited Spanish goals in the region. The Solomon Islands would not be desired by another European kingdom until 1767. After the decline of Spanish power in the Pacific in the 19th century, British Protestant missionaries became the dominant religious forces.

The British took official possession of the islands in the 1890s, though Germany would lay claim to some. Western missionaries, most of whom belonged to the Anglican and Catholic churches, converted most of the indigenous population to Christianity. This was interrupted, however, during the Japanese occupation in World War II. The Japanese Catholic Church made no attempts to evangelize the Solomon Islands. In 1978, the Solomon Islands gained independence. Today, more than 90% of the population are Christian: Anglican, Catholic, Evangelical, and Methodist.

SOMALIA

Somalia is a troubled Muslim nation on the Horn of Africa on the coasts of the Indian Ocean and Gulf of Aden, east of Ethiopia and Kenya, threatened by quarreling Islamist movements. The overthrow of Somalia's President Siad Barre in 1991 following power struggles among clans resulted in the disintegration of central authority, and Somalia ceased to be a political national entity. Following the ousting of Barre, the region plunged into civil war with various clans jostling for power. This state of war has been exacerbated by the conflict between traditional religious groups and the more recent politicized movements for control over the future destiny of Somalia. In the ensuing mayhem, the Republic of Somaliland, Puntland, and Jubaland set themselves up as autonomous governments.

The transitional government that was set up in 2000 failed to establish order. In 2004, warlords reached a power-sharing agreement that called for a 275-member parliament and restoration of order by African peacekeepers. In 2006, fighting broke out between the Transitional Federal Government (TFG) and the Islamic Courts Union (ICU).

The ICU (established in 2000) managed to bring a semblance of order in areas under its control. Subsequently, the TFG and the Alliance for the Restoration of Peace and Counter-Terrorism (which includes government ministers and warlords), with the assistance of Ethiopian troops, ousted the ICU, which then began to engage in a guerilla war against the government.

In the meanwhile, *Al-Shabab* (founded in 2004 and suspected of links with al Qaeda), soon grew popular and went to war with the TFG; the latter remained under the protection of AMISOM (African Union Mission in Somalia), which was deployed in 2007 by the African Union. Both the TFG and its opposition claimed strong adherence to Islam and a readiness to apply Shari'a law. However, they were

not agreed on what constitutes an Islamic state, thereby adding to the conflict and tension. The majority of nations in the international community have thrown its weight behind the TFG, which is being portrayed as consisting of Islamic moderates, led by Sheikh Sharif who rejects violence as a political weapon and urges political dialogue. Scheduled national elections in 2012, however, provided another occasion for unrest.

Somalis can be classified into traditionalists, reformists, and Salafis. They have traditionally adhered to the Ash'ariyah theology, Shafi'i jurisprudence, and Sufism. This tradition of the Ahl Al-Sunna wa Al-Jama is now being challenged by Salafi-inspired groups, including Al-Itisam, Al-Shabab, and Hizb Al-Islam as well as the reformists (Islah). The Salafis condemn many traditional Muslim practices as innovations (*bid'ah*). They also consider Sufism to be a heresy. Salafi influence entered Somalia through students who studied in Saudi Arabia and migrant laborers.

The Islah movement, being tolerant of theological differences, disapproves of preoccupation with fine distinctions in doctrine. It accommodates Sufism and other traditional practices found in Somalia and focuses on social and political issues. Its adherence to principles of peaceful reform and promotion of reconciliation since the collapse of the state is attractive to Somalis. Its main aim is to create an environment of cooperation between various Islamic groups and organizations that will facilitate the Islamization of the society and the state.

SOMALILAND

The Republic of Somaliland is an unrecognized de facto state on the Horn of Africa on the coast of

the Gulf of Aden adjacent to Somalia and Ethiopia. Somaliland declared independence from Somalia on May 18, 1991, following the outbreak of the Somali civil war but is internationally considered to be an autonomous region of Somalia and is not diplomatically recognized by any foreign state. The society of Somaliland is clan based, and clan structure has a powerful effect on politics and social interaction. The population of Somaliland is almost exclusively Muslim, primarily Sunnī and Sufi, and Islam is the official state religion. Islam is an important element of Somalilander identity, and there is a high rate of adherence to the religion. Somaliland, like Somalia itself, has significant historical connections with the Arabian Peninsula, and Islam spread to the region relatively early in its history.

Excellent preserved Neolithic cave paintings in the Laas Geel cave complex in Somaliland represent the first evidence for human inhabitation and religious belief in the region. Islam came to Somaliland in the 7th century and became entrenched during the 11th and 12th centuries. Somali society was traditionally decentralized, nomadic, and pastoral for much of its history. The Ottoman Empire annexed coastal portions of Somaliland in the 16th century as it provided a strategic location on the Gulf of Aden. In 1888, Britain took control of the region and instituted the British protectorate of Somaliland, ruled from British India, and this territory forms Somaliland today. In 1899, a resistance movement led by Sayyid Mohammed Abdullah Hassan challenged British control of the region. Hassan, the religious leader of the Dervish state, known colloquially as "The Mad Mullah," waged a bloody struggle against the British for more than 20 years before succumbing to superior British military technology and force. On June 26, 1960, Somaliland gained independence from the British and remained independent for 5 days before joining with Italian Somaliland to form the Republic of Somalia.

In the late 1980s, Siad Barre, president of Somalia, who had seized power during a military coup d'état in 1969, used military forces to attack clan enemies who opposed his rule. This use of force sparked an ongoing civil war, leading to the deposition of Barre in 1991 and the collapse of the Somalian government. Somaliland declared its independence in an effort to avoid the intensifying violence in the rest of Somalia. Somaliland was then able to create a stable democratic government

with a functioning judicial system, which has decreased the necessity of Shari'a courts. Somaliland resisted politicized Islam, and unlike in Somalia proper, Wahhabism has had little effect on Somaliland, although there is some evidence that both trends are growing in the region.

SOROUSH, ABDULKARIM (B. 1945)

Considered by some as Islam's Luther, the Shi'a theologian Abdulkarim Soroush has played a central role in the religious intellectual movement in Iran. Soroush is an important figure among a new wave of modern Islamic scholars who argue that the global message of the religion should be distinguished from its local elements. Although the essence of the Islamic message is global and timeless, Soroush argues that it has taken a local shape due to various human factors, including history, culture, and language. Soroush's project is to demonstrate the role of natural, cultural, and historical elements in the religion without reducing it to a wholly natural phenomenon. In his various writings, Soroush argues that three major components of Islam—namely, the Prophet's religious experience (or the *wahy*), the Qur'an, and the believer's understanding of Islam—are affected by natural and historical elements.

Religious Experience

Soroush believes that the religious experience, in general, and the Prophet's religious experience or

wahy (i.e., revelation), in particular, lie at the heart of the religion. In his book *The Expansion of Prophetic Experience*, he argues that the Prophet's religious experience is affected by his character and life at several different levels. For example, the duration of the Prophet's experiences, and thus the length of verses revealed to him, depends on the spiritual capacity of the Prophet. Verses revealed to the Prophet at the beginning of his prophecy, when he was not familiar enough with, and was even scared by, the *wahy*, are shorter than the verses revealed later. The content of the prophetic experience, Soroush argues, is also influenced by the character of the Prophet. Moreover, the content of *wahy* changes in accordance with the events of the life of the Prophet.

The Qur'an

The theory of "essential and accidental in the religion" is developed by Soroush to demonstrate the human side of the Qur'an, which is the verbalized form of the Prophet's experience. According to Soroush, the Qur'anic message consists in essential and accidental parts. While the essential part of the Qur'an is the essence of the Qur'anic message, the accidental part is not essential to its message. The accidental part could have been otherwise without affecting the real message of the Qur'an. For example, it is not essential to the Qur'anic message that the language is Arabic. The Qur'an would be in another language were the Prophet not Arab. Not only is the language of the Qur'an Arabic, but also the culture of the Qur'an is Arabic, and so the culture of the Qur'an is accidental to the Qur'anic message.

Religious Understanding

In his book *The Theoretical Contraction and Expansion of Shari'a*, Soroush makes a distinction between the religion of Islam itself and our understanding thereof. While the religion is complete, consistent, and timeless, our understanding of the religion is incomplete, historical, and sometimes inconsistent. All we have access to, according to Soroush, is our understanding of the religion, which is human and subject to errors.

Recognizing the local and historical elements in Islam, Soroush seeks to show that the global

message of the religion is consistent with human rights and our modern global values.

SOUTH AFRICA

Predominantly Christian, the nation of South Africa at the southern tip of the African continent illustrates the extent to which religion can both articulate and oppose the political agenda of a country. Approximately 80% of the population identify with the Christian faith, with 1% reporting as Hindu, another 1% Muslim, and 1% as practitioners of indigenous religion, the last number rising quickly in the first years of the 21st century. Also, 8% of the populace recognize no religious doctrine at all, but the history of South Africa shows how even citizens not directly involved in religion can be strongly affected by it. African Independent Churches claim the largest body of Christian worshippers, with the Calvinist Dutch Reformed Church following. Due to its past of racial segregation, the Calvinist Dutch Reformed Church is predominantly Caucasian in its composition, though some Black Afrikaners also attend its services. The African Independent Churches, syncretic institutions blending Christianity with traditional African religion, include the Zion Christian Church, to which 11% of the overall population belong, and the Apostolic Church, which accounts for an additional 10%. Pentecostal churches also have large Black congregations, as does the Anglican Church, led during the end of the 20th century by Nobel Peace Prize winner Archbishop Desmond Tutu. South Africa

remains deeply religious in spite of the socialist roots of its ruling party, the African National Congress.

The earliest religion practiced in what would become South Africa was that of the Khoisan people, an ethnic group that joins the San and Khoi societies and is distinct from the majority Bantu-speaking group of the region. Khoisan religion is heavily dualistic, recognizing a supremely good opposed to an evil god responsible for the pain and suffering in the world. No canon of practices existed, and while some Khoisans looked to appease the supreme god with small sacrifices, others thought that any attempt to communicate with such a being was offensive. Ancestral heroes also provided a locus of worship, and provided examples of how to behave in times of conflict. Khoisan practices are still evident in South Africa, especially their healing dances, which are still performed in some communities.

Bantu-speaking people, by far the majority ethnic group in the southern half of the African continent, arrived in the area during the first millennium CE. The group included ancestors of Zulu, Xhosa, Swazi, and Tsonga South Africans, and their arrival brought a change in religious practices. Ancestors were likewise important to the Bantu-speaking clans, and these ancestors were specific to the communities that respected them. The male head of the household was also the ritual leader of the clan—a practice that has antecedents in the Egyptian culture on the same continent.

The first European contact came with the Portuguese navigator Bartholomeu Dias, who sailed around the Cape of Good Hope in 1488. He would erect a cross there upon his passing, foreshadowing the role Christianity would play in the country's history. Judaism was introduced to the area at the same time, as Dias employed Jewish astronomers and cartographers during his journey: Vasco de Gama, who would travel the route in 1497, did likewise. Jewish people did not begin arriving in the area in significant numbers until the 1820s, however.

The first Christian institution in South Africa was that of the Dutch Reformed Church, established in 1652 on the Cape of Good Hope. It arrived with the Dutch East India Company and would soon displace the traditional spiritualities of

Khoisan and Bantu peoples. The church would play a role in the subjection of the native people, which would resonate throughout the apartheid era. The question of racial segregation began early, with the conversion of Black Africans and those of mixed race to Christianity. Slavery was rampant in the country, and although the Calvinist synod had decreed in 1618 that any slave baptized to Christianity should be freed, those inhabitants of Cape Town who relied on slave labor for farm work refused. To bypass the decree and yet remain in good standing with the church, leaders banned religious education for slaves, so none could be baptized, and therefore none could be freed.

While religious education was not allowed for slaves, missionaries worked in the countryside on the indigenous African people. The London Missionary Society, along with a good deal of British citizens, arrived in the country at the end of the 18th century, and they were soon followed by many other groups looking to Christianize the Africans. During the next century, the results of such activity would be mixed, but the missionaries would play a role in many political situations. Sotho King Moshoeshe I attempted to use the teachings of the missionaries to solidify his own rule, claiming the training they attempted validated the rules of behavior he had long promoted. Xhosa chief Ngqika rewarded local missionaries when their prayers seemed to bring rain, much to the dismay of the missionaries. They were also in a symbiotic relationship with the colonial administration, seeking government intervention at times when a local chief's power was frustrating their attempts at catechism and in return attempting to convince indigenous Africans of the validity of European customs. This extended even into architecture; along streets in so-called native locations, missionaries erected simple, square European style houses for those Black Africans who converted.

These changes to African culture did not go unchallenged, however. One of the largest uprisings in the face of Christian inroads came from the Xhosa tribe, who were enraged when their traditional practices were outlawed by the British in the 1830s. By 1850, the situation had become unbearable, and a leading healer and diviner named Mlangeni organized a resistance army. A frontier war ensued, which ended with British victory 3 years later. Sadly, the relations would cause

more harm through a Xhosa advisor Mhlakaza, who prophesized that deliverance from British rule would come if the Xhosa slaughtered their cattle and destroyed their food stocks. He convinced many, and during 1856, they enacted the prophecy, resulting in more than 40,000 dying from starvation and the loss of many others who sought work in the colonial labor market.

By the 20th century, British forces had taken over the region of South Africa, motivated in part by the discovery of gold and diamond reserves. Until this time, racial segregation had been largely informal, though some legislation of a racist nature had been put in place. In 1948, the National Party was elected to power (though voting rights were not universal), and thereupon began the systematization of racist legislation, including the classification of the populace according to race. This began what has been known as the apartheid (from the White Afrikaans word for *apartness*) era. The Dutch Reformed Church became the official religion of the country, and the church's views on racial separation were accepted due in part to White Afrikaners' fears for the survival of their community. The Christian communities of the nation would diverge into those that supported apartheid and those that did not. The Christian League of South Africa would join the Dutch Reformed Church in their apartheid support, while Methodist churches composed of mainly Black Africans openly opposed the system. The Anglican Church of the Province of South Africa likewise spoke out against apartheid in its early years, but was restricted by the feeling among parishioners that the church should not engage in politics. That was not the prevailing view of pro-apartheid churches, who continued to blend church doctrine with the political and social issues of the time.

The Anglican Church would later take the lead in the fight against apartheid under the direction of Archbishop Desmond Tutu. During the 1980s, Tutu led the South African Council of Churches, the most active antiapartheid institution, and would use the networks available to coordinate church opposition while minimizing the exposure of particular religious leaders and parishioners. Tutu's leadership saw the growing of antiapartheid sentiments and protests in the United States and Europe, and pressure was growing on the South African government to release the popular Nelson

Mandela, a long-standing critic of apartheid, from his long prison sentence. Apartheid finally came to an end in a series of negotiations from 1990 to 1993, under then president, F. W. de Klerk, and the first universal elections in 1994 were claimed by the African National Congress with Nelson Mandela—joint winner of the 1993 Nobel Peace Prize along with de Klerk—winning the presidency.

In the 21st century, Christianity is still promoted by the government, and though no state religion exists, churches of various denominations play a role in the politics of the nation. Racial relations have taken giant strides following the end of apartheid, though occasional tensions continue to besiege the nation. While the missionary and colonial heritage continues to determine the religious nature of South Africa, the African Independent Churches, which blend traditional African beliefs with Christian devotion are the fastest growing churches in the country.

SOUTH ASIA

South Asia refers to the geographical region comprising the South Asian subcontinent, roughly corresponding to the modern states of India, Pakistan, Bangladesh, Nepal, Bhutan, and Sri Lanka. Demarcated in the north by the Himalayan and Kunlun mountain ranges and in the south by the Indian Ocean, this area is one of the most religiously diverse in the world. It has given rise to two global religions—Hinduism and Buddhism—both of which have spread outside South Asia and exerted tremendous influence on other cultural regions. Three other transnational religions—Christianity, Judaism, and Islam—were introduced to South Asia from outside, developing distinct regional characteristics through their interaction with indigenous cultures. Finally, smaller-scale traditions such as Jainism, Sikhism, and Zoroastrianism have also contributed to the unique diversity of this region. The openness to the sea in three directions as well as contact with trans-Asian trade routes such as the Silk Road in the northeast has ensured the movement of traders, migrants, pilgrims, and missionaries over millennia, making South Asia a virtual crossroads of cultures and religions. This entry will discuss Brahmanical, Buddhist, and Jain traditions; early exchanges with other cultures; classical Hinduism; the spread of Buddhism across Asia; the consolidation of Islam in the subcontinent; religions in interaction in early medieval and medieval South Asia; Judaism and Christianity in South Asia; the colonial period; the Hindu diaspora; and religion in postpartition South Asia.

Beginnings: Brahmanical, Buddhist, and Jain Traditions

Historically speaking, even the diverse traditions that came to be called *Hinduism* emerged out of a fusion of cultures: the Indo-European-speaking Aryans, on the one hand, and Dravidian and tribal peoples, on the other. While the origin of the Aryan people remains a contested issue, we know that by 1000 BCE, they had settled in the Ganges region, practicing a religion centered around ritual and the sacred Sanskrit texts that govern these rituals—the Vedas. Indeed, most of what we know about the culture of this period comes from the Vedas, precluding a wider view that would include the Dravidian and tribal communities. Vedic religion was decidedly polytheistic: The Vedas glorify gods and goddesses, among whom Agni, Soma, and Indra ranked as the most important. The task of preserving both the ritual and the Vedas was assigned to a priestly class, the Brahmanas. As their roles became increasingly specialized and the sacrificial system itself more elaborate, Vedic religion evolved into what is called Brahmanical religion.

The late Vedic or early Brahmanical period, around 600 to 400 BCE, was marked by transitions and developments that were foundational for later forms of religion in South Asia. This period saw the development of a later class of Vedic texts, the Upanishads, that reflect a process of interiorization and ethicization of ritual. *Karma*, earlier denoting ritual acts, was redefined as the logic of cause and effect inherent in any action, which binds one to the never-ending cycle of death and rebirth (*samsara*).

These terms, and the central problematic of liberation from karma and *samsara*, were shared and to some degree alternately defined by various non-Vedic *śramana* (“mendicant”) movements that emerged in the same period. Many of them challenged the ultimate authority of the Vedas and hence were labeled by the Brahmanas “heterodox” or “unbelievers” (*nāstika*). Among these wandering mendicants were two teachers whom the world would come to know as Mahavira and the Buddha, the “founders” of Jainism and Buddhism, respectively. While the exact dates of the Buddha’s birth and death are still debated, it is accepted that he lived sometime around the fifth century BCE. Mahavira was slightly senior to him and is understood by the later Jain tradition to be the 24th and

last in a long succession of teachers or “ford-makers” (*tīrthaṅkara*). Both Mahavira and the Buddha spent their lives wandering and teaching around the Middle Gangetic region, attracting disciples who ordained under them as monks and nuns.

The self-definitions of these traditions—Buddhism, Jainism, and the Brahmanical tradition—were forged through the process of their constant interaction with each other over the centuries that followed. The main topic of doctrinal contention was the nature of karma and the method of finding release from *samsara*. The Vedic tradition held that performing the correct rites would ensure rebirth in the world of the gods after death. The more contemplative and ascetic strains belonging to the fold of the Hindu tradition, reflected in the Upanishads, redefined the soteriological goal as a total release (*moksha*) from the cycle of rebirth, attained through knowledge about the true nature of the self. The Buddhists, in turn, rejected the idea of such an essential core to a person, arguing instead that release from *samsara* required the eradication of desire, the root cause of all suffering. The Jains maintained that all activity, particularly all forms of violence, affects the soul by generating karmic effects, and liberation is hence predicated on an ascetic life of tremendous restraint, aimed at eradicating existing karma and minimizing the accumulation of new karma.

Buddhist monks and nuns originally lived peripatetic lives but later settled in fixed residences sponsored by lay followers; the Jain mendicants retained more peripatetic lifestyles. After the Buddha’s passing, his disciples gathered to recite his teachings and fix them into a canon consisting of “three baskets” (*tipiṭaka/tripiṭaka*) of discourses, discipline, and doctrine. The community soon split into different schools (*nikāya*). Jainism’s split into two main sects, the Śvetāmbaras and the Digambaras, appears to have occurred later, as did the formation of their “canon.”

An important transition in Indian Buddhism occurred with Mahayana, or the “Great Vehicle.” Very little can be said with certainty about its nature and origin: While it was long believed that Mahayana was essentially lay oriented, scholars have recently postulated that it may have been, to the contrary, quite conservative in character, criticizing laxity in monastic practice. Texts called Mahayana Sutras were being composed in India in

the first centuries of the Common Era, but the term *Mahayana* was not necessarily adopted as a self-conscious designation of a religious movement or cult practice until the fifth century. Mahayana was characterized by a shift in attitude regarding the Buddhist soteriological goal, as demonstrated by the concept of *bodhisattvas*—persons who take a vow to emulate the Buddha’s path and commit themselves to cultivating the *pāramitās* (perfections), postponing their own full enlightenment while working toward the benefit of all.

Early Exchanges With Other Cultures

With the discovery of trade winds in the first century CE, maritime contact between the Indian subcontinent and the Mediterranean region increased. Greek and Roman coins from this period have been found in South Indian ports. In the northwest, South Asians came into contact with Persians and—in the wake of the conquests of Alexander the Great—Bactrian Greeks. Cross-cultural influences traveled to both directions along the Silk Road and other caravan routes. They left their marks on art, such as early Indian images of the Buddha that show considerable Greek influence; on shared narrative themes; and on commonalities between figures and their epithets, such as the Buddhist Maitreya and the Zoroastrian cult figure Mithra. This meeting ground of cultures enabled encounters between practitioners of different religions. A famous Buddhist text, the *Milindapañha*, depicts one such early—though probably fictional—encounter, a Platonic dialogue between a Greek general, Menander, and a Buddhist monk Nāgasena. At least from the fourth century CE onward, we also have records of Chinese pilgrims traveling to India in search of Buddhist learning and manuscripts.

Both Buddhism and Hinduism also exerted extensive cultural influence on Southeast Asia. Migration from India to Southeast Asia, along both sea and land routes, may have begun even before the beginning of the Common Era. By the fifth century CE, we find Sanskrit inscriptions in many kingdoms of Southeast Asia. Sanskrit names of places and rulers also attest to the significance of Sanskrit as the medium that enabled transregional communication among the elite during this period, much like Latin did in Europe. The

presence of Hindu traditions in Southeast Asia—particularly in Cambodia and Indonesia—is evident in temple architecture, rituals, and the popularity of narratives such as the Hindu epics the *Ramayana* and the *Mahabharata*, which continue to be performed. The significant presence of Hindu traditions tapered out around the 15th century, while Buddhism has retained its position as the predominant religion in mainland Southeast Asia.

Classical Hinduism

It is impossible to isolate the various components—Dravidian, Aryan, Brahmanical, and tribal—that collectively shaped what we now call Hinduism. There is no “original” Hinduism independent of the constant process of adjusting and reformulating beliefs and practices in response to changing historical circumstances. The millennium or so between the development of the Upanishads and the end of the Gupta period (ca. 500 BCE to 500 CE) was particularly formative, witnessing a consolidation of the Hindu tradition. It was during this period that an extensive literature on *Dharma*, understood as “law” or “duty,” began to be produced. It articulated, among other precepts, the important socioreligious model of *varṇāśramadharma*, the law of castes and stages of life. This schematic ideal divided society into four hierarchically ordered castes and laid out the life stages through which an ideal male householder was expected to pass.

This period also saw the emergence of new urban centers, an increase in the importance of kingship, and along with them, an urban ethic and aesthetic that highly valued patronage of the arts. As the Hindu tradition assimilated local deities and cults, it developed more theistic emphases. Some minor divinities, such as lineage deities and village deities, that had previously had only local influence or had been mentioned as minor deities in the Vedas were now incorporated into the Pan-Hindu pantheon. Representations of Vishnu/Krishna, for example, developed over time as an amalgamation of various elements and local cult figures. The rising popularity of these high gods coincided with the rise of *bhakti*, or “theologies of devotion,” that found expression in ritual worship, song, or one’s daily actions. It is hard to exaggerate the significance of *bhakti* in constituting later forms of mainstream

Hinduism. An entire *bhakti* literature exploded around the middle of the first millennium CE, first in Tamil and later in other regional languages. A related historical development was the emergence of temples as centers of cultic and social life around the same time. Later, in the medieval period, we begin to see Hindu sectarian traditions proliferating, as regional and vernacular identities were strengthened and indigenous forms of religious practice appropriated.

Buddhism Spreads Across Asia

According to tradition, the earliest Buddhist “missionaries” were sent by the Buddha himself during his lifetime. However, it was not until the reign of the Maurya emperor Asoka (r. 268–233 BCE) that the spread of Buddhism began on a global scale. According to Sri Lankan chronicles, Buddhist preachers were sent throughout Asoka’s wide empire as well as to nine neighboring countries, including Sri Lanka itself. From the northwest, Buddhism spread to the lower Indus Valley, Gandhāra, and Afghanistan. The prosperous Kuṣāṇa empire facilitated the diffusion of Buddhist communities and texts: Kuṣāṇa rulers were generally favorable toward Buddhism, and their unified domain—extending from Bactria to Bengal—enabled the exchange of material goods and ideas among Indian, Hellenistic, Iranian, and Central Asian cultures. This vibrant context enabled the transmission of Buddhism to Central Asia and onward to China.

In the south, the ports of South India and Sri Lanka became points of departure for journeys that took Buddhist monks, nuns, and texts to Southeast Asia, Indonesia, and China. In Sri Lanka and the Himalayan regions, where Buddhism continued to be practiced after it disappeared from India, the continuous interaction with Hindu traditions over centuries has fostered unique religious cultures, with a great deal of overlap between the symbols and the practices of the two.

The Consolidation of Islam in the Subcontinent

Historical evidence suggests that the emergence of Muslim communities in South Asia was a gradual process. Arab Muslim traders settled along the

west and south coasts of the subcontinent as early as the eighth century. The first Muslims to enter from the northwest, on the other hand, were tribes of Persianized Central Asian Turks in the 10th century, interested primarily in acquiring loot. While the nature of these first incursions was ethnic and political rather than religious, in an effort to uproot image worship, the settlers did demolish many Hindu and Jain temples and important Buddhist centers of monastic learning such as Nālanda. However, in most areas, Buddhists, Jains, and Hindus were granted protected subject status as *dhimmis*, non-Muslims who would be taxed but not persecuted.

In the centuries that followed, some Central Asian dynasties established sultanates and empires in the subcontinent. The most powerful among them were the Mughals, who consolidated their control over much of northern India in the 16th century. In the wake of political conquests, Iranian and Central Asian immigrants belonging to various classes followed—administrators, judges, poets, artists, and religious scholars (ulema). However, these immigrants and their descendants constituted only a small percentage of the South Asian Muslim population; the majority were of indigenous origin.

Sufism played a major role in the Islamization of South Asia. Various Sufi orders began to arrive in South Asia from the 13th century onward. Their members, particularly the charismatic *pīrs*, folk singers, and poets, introduced Islamic ideas and practices to the local populations in accessible ways. Indeed, it was likely *folk* Sufism, as opposed to elite or learned Sufism, that was most crucial in spreading Islam on local levels. Devotion to the *shaykhs* and *pīrs* and seeking blessings at their tomb shrines (*dargāh*) has been and remains a widespread practice all over South Asia and is by no means limited to the Muslim population.

Religions in Interaction in Early Medieval and Medieval South Asia

The historical relationships among various South Asian religious communities have often been portrayed in predominantly confrontational terms. There certainly were antagonisms: Defensive reactions against Muslims on the part of Hindus, for example, occurred among the Rajputs of Rajasthan

and the Marathas of Maharashtra. Yet alongside political conflict, competition over patronage, and sometimes fierce philosophical polemic, there were ongoing processes of dialogue, accommodation, and integration that were perhaps more formative. The meeting of Sanskrit and Perso-Arabic traditions led to great developments in science and medicine and the creation of new forms of music, dance, and architecture. The Mughals were active in sponsoring translations from Sanskrit into Persian; in fact, it was in their Persian form that many Sanskrit classics first became accessible to Europeans. We have already mentioned the popularity of the cult of the Muslim saints among both Hindus and Muslims. Two examples illustrate particularly well the significance of such cross-fertilization: the Pan-Indic religious system known as *Tantra* and the reciprocal relationship between Hindu *bhakti* and Sufi devotion.

With Tantra, we see for the first time textual evidence of a current that had been practiced for centuries outside the orthodox mainstream before the early medieval period. It had its roots in folk traditions and developed Hindu as well as Buddhist and Jain forms. Tantric practices were usually aimed at obtaining special magical powers. Characteristic elements of Tantra include the use of special incantations (mantra) and geometric designs (*yantra* or *mandala*), a yogic physiology of *chakras* and channels, the centrality of the goddess cult in worship, and the esoteric nature of the teachings, received from a guru only after initiation. “Left-handed” Tantric worship involves the ritual ingestion of illicit substances such as meat and intoxicants and engaging in sexual intercourse. Tantra is an excellent example of rituals transcending religious boundaries: Medieval Tantric texts attest to rituals and mantras being shared by Buddhists and Jains, and Buddhists and Shaivas.

The common ground between the *bhakti* movement, with its fervent expressions of devotion for God, and Sufism, with its focus on loving and surrendering to God, created a basis for a rapprochement between Hindu and Islamic practices. In their verses, poets such as Kabir (ca. 1440–1518) and Nanak (1469–1539) called for total inward surrender to God instead of excessive focus on outward rites and exclusive labels. Kabir’s songs combined aspects of Vaishnava devotion, *hatha*

yoga, and Sufism with a monistic vision. His message was simple: Whether a practice is Muslim or Hindu does not matter as long as it brings one closer to God.

These examples of continuity and exchange problematize the unreflective use of categories such as *Hindu*, *Muslim*, *Buddhist*, or *Jain* in the premodern era. On the one hand, as we have seen, the boundaries between religious traditions in South Asia have tended to be unfixed and porous. Historically speaking, hyphenated, hybrid identities have been the norm rather than the exception. On the other hand, each of these religious traditions is itself internally diverse; one’s sectarian identity as a Tamil Vaishnava or a Kashmir Shaiva, or a Tapā Gaccha Śvetāmbara Jain, or a Puṣṭimārga Vaiṣṇava might well outweigh labels such as *Hindu* or *Jain*. In addition to sectarian affiliation, ethnic, and linguistic identity, class, caste, or socioeconomic status have often proved to be more important as markers of identity than religious affiliation.

Judaism and Christianity in South Asia

The Jewish diaspora in South Asia has historically comprised three different groups of migrating Jews. The earliest, the so-called Cochin Jews, settled near present-day Cochin, Kerala, possibly as early as the first century of the Common Era. They came to speak a dialect of Malayālam but used Hebrew in their religious ceremonies. They observed dietary laws, the Sabbath, and religious festivals but also adopted local customs in their dress and marriage celebrations. The Bene Israel Jews, further north on the same coast, originated in Persia, the Middle East, and the Iberian Peninsula. They were more assimilated than the Cochin Jews: For example, they used no Hebrew religious texts. The last significant migration, in the 18th century, brought the Baghdadi Jews, who were primarily merchants and bankers, and they settled in Bombay (now Mumbai) and Calcutta (now Kolkata).

In general, local attitudes to these Jewish communities were tolerant, although some South Indian Jews were viewed as “low caste” due to their profession as oil pressers. In fact, the worst persecution of Jews in South Asia was carried out by Europeans during the colonial struggles between the Portuguese and the Dutch. The Jewish population of Kerala

declined over time, in part due to conversion. Since the mid-20th century, the majority of South Asian Jews have emigrated, primarily to Israel.

The earliest known Christian community in South Asia was the Syrian Christians or Thomas Christians of southwest India, in what is now the state of Kerala. They attribute their origin to the missionary efforts of Saint Thomas who, according to tradition, arrived on the Malabar Coast in 52 CE. While the historicity of this account cannot be verified, the Christian presence in the region is certainly early, as attested by mid-fourth-century CE copper-plate inscriptions documenting grants of land and other privileges to Christians. Successive waves of Christians—merchants, missionaries, and refugees—continued to arrive over the centuries. The resulting Christian population, therefore, was diverse: Besides Persian and Syrian immigrants, it included Jewish Christians and Nestorians.

With the arrival of Vasco da Gama in Calicut in 1498, India's west coast became the target of Portuguese colonial and missionary ambitions. Catholic missionaries of various orders—Franciscans, Dominicans, and especially Jesuits—soon followed, converting many Syrian Christians, as well as new converts, to the Catholic faith. They worked from enclaves on the coast, such as the Portuguese-governed Goa and the French Pondicherry. Conversions became increasingly aggressive, being sometimes accelerated by incentives from Portuguese officials and, due to the legacy of the Jesuit Francis Xavier (1506–1552), by inquisitorial methods. As a result, tensions and conflicts arose between the indigenous Christian communities and the European missionizing communities. There were controversies over both cultural and doctrinal differences: Thomas Christians rejected the veneration of images, allowed their priests to marry, and celebrated festivals and rituals that the Europeans viewed as heathen practices. The latter, in turn, offended local sensibilities through engaging in habits that violated Indian notions of purity and pollution. In the wake of these tumultuous times, an entire complex of ecclesiastical systems, with branches and sub-branches distinguished in terms of their Catholic or Syrian affiliations, eventually emerged to form the new contours of South Asian Christianity.

Christian communities in South Asia have always been profoundly indigenous, their practice

shaped by local, caste, and ethnic identities. They have come to share many customs with the Hindu population: For example, some Indian Christian women today wear a *mangalsūtra* around the neck and a *bindi* on the forehead. The Thomas Christians of Kerala incorporate umbrellas and elephants as ornaments in their ceremonies, while Catholics take out processions similar to the Hindu *yātras*.

The Colonial Period

The transformation of South Asian culture in response to global currents that had begun during the early colonial period further accelerated with the founding of the British East India Company in 1600. This venture was originally driven by military and economic gain but became, from the early 19th century onward, more imperialistic in nature: The British conquered and made alliances with local leaders, began to develop an infrastructure with policies and legal systems following the British model, built a system of roads and railroads, brought in British missionaries, and founded schools. “Orientalist” scholars studied South Asian languages and made ancient texts available to Western audiences for the first time. These enterprises were often accompanied by a critique of “native,” particularly Hindu customs. Even positive appraisals were built on fundamentally Eurocentric assumptions and resulted in misrepresentations of South Asian cultures.

Colonialism and Orientalism no doubt played a formative role in the reification of Hinduism as a single religious tradition. The term *Hinduism* itself is a colonial construction (first attested in English as late as 1829), an abstraction from the word *Hindu*, which itself originally had nothing to do with a religion but designated the inhabitants of the Indian subcontinent. Yet the process of shaping religious and community identities in the colonial context was much more complex and dialectical. High-caste, mainly Brahman, pundits played a crucial role in collaborating with Western scholars in studying ancient religious texts—the codification of “Hindu” law being one important example of this. South Asians themselves appropriated the constructs that developed as a result of their interaction with Europeans, and this, in turn, influenced the Western investigators' representation of

their culture. As Gauri Vishwanathan has pointed out, the processes of reifying or solidifying religious identities in South Asia are hardly a modern phenomenon; even in pre-Muslim India, “Hinduization” occurred in response to other communities, such as Buddhists and Jains.

The 18th and 19th centuries witnessed the emergence of various reform movements as both Hindu and Muslim communities tried to come to terms with the British political supremacy and the flood of new cultural influences. On the Hindu side, Ram Mohan Roy (1772–1833) advocated social reform and selective appropriation of Western values, while Swami Dayananda Saraswati (1824–1883) turned to the Vedas for inspiration for reformed, “purified” Hinduism. The Bengali mystic Ramakrishna (1834–1886) and his main disciple Vivekananda (1863–1902), on the other hand, played a significant role in articulating a “universalist” Hinduism. On the Muslim side, the so-called Aligarh modernist movement, led by Sir Sayyid Ahmad Khān (d. 1898), advocated higher education modeled on the British system and a rational approach to the Qur’an. The Deobandi theological school adopted a more conservative approach, insisting on upholding correct Muslim practice in spite of the changing times. These efforts to define Muslim identity under colonial rule combined with concerns regarding the political repercussions of their minority status led to the foundation of the Muslim League in 1906.

The period of British colonial rule provoked an unprecedented process of cultural distancing and alienation between Muslim and Hindu communities. The census of the 1870s and other such surveys conducted by the British forced Indians to identify themselves primarily in terms of their religion, fostering the idea of religions as mutually exclusive. Even language became an arena of religious and ideological contestation. Although colloquial Hindi and Urdu essentially constitute a single language with two standardized registers—the former being written in the Nāgari script and incorporating more Sanskritic vocabulary and the latter written in the Perso-Arabic script, with Persianized vocabulary—they became increasingly perceived as symbols of Hindu and Islamic identities, respectively. Writers would deliberately switch from one to the other or be forced to do so. Religious practices, even forms of music and dance, became similarly politicized. These developments set the stage for intensified

demands for two separate nations, resulting in the partition of British India into two countries—India and Pakistan—in 1947.

Hindu Diaspora

Migration of Hindus outside South Asia in the modern period has occurred in two main stages. The first wave migrated under the auspices of the British Empire in the 19th and early 20th centuries to other colonies, primarily the Caribbean, South Africa, East Africa, and Fiji. These migrants were primarily indentured laborers, although some were also merchants or colonial administrators. The second wave consisted of the post-World War II movement of students, businessmen, and laborers to industrialized Western countries. Presently, the largest Hindu populations outside South Asia are in Indonesia, the Gulf States, North America, the United Kingdom, South Africa, East Africa, and the Caribbean.

Given such a variety of landscapes and historical contexts, the identities of Hindus outside South Asia have also been formulated through drastically different trajectories. In many cases, Hindu temples have come to function as important community centers, although temple rites have had to be modified and negotiated in order to cater to migrants from distinct regions and with different sectarian emphases and to bridge the gap between generations. Even when immigrants do not necessarily wish to return to India, or rarely even visit, the tie to India and the imaginaire of its sacred geography remain central to shaping diaspora Hindu identity.

Religion in Postpartition South Asia

From the aftermath of the 1947 partition, it became clear that the partition was not going to provide a lasting solution to interreligious tension and communal conflict in South Asia. The constant negotiation of religious identity and the outbreaks of communal violence would simply remain a fact of life in a region so diverse and with religious issues that were so charged with politicized meanings. About 10 million people are estimated to have left their homes in the wake of the partition, and about 1 million died in the ensuing violence that left the region traumatized.

The state of Pakistan was founded to provide South Asian Muslims a state of their own where

they would no longer hold a minority status. Since its inception, Pakistan has struggled with defining what it means to be an Islamic state, with competing visions offered by secularists, modernists, and Islamists. The secession of East Pakistan and its establishment as the state of Bangladesh in 1971 was driven primarily by economic concerns and an affirmation of ethnic and linguistic (Bengali) identity. Although Islam is the majority religion in Bangladesh, the role of Islam has been a topic of debate and contention. Islam in Bangladesh has been uniquely shaped by the presence of distinct Bengali cultural elements and the historical influence of both Hindu and Buddhist traditions.

Religion has played a major role in the 20th century in the ongoing conflict between Sinhala-speaking Buddhists and Tamil-speaking Hindus in Sri Lanka and in Hindu-Muslim conflicts in India. A highly visible factor in the latter case has been the proliferation of right-wing Hindu nationalist movements that are working toward installing Hindu values at every level of polity and government to achieve a “Hindu nation.” Their campaigns have often been accompanied by anti-Muslim rhetoric and riots. Hindu-Muslim tension was exacerbated in the 1980s, culminating in the demolition of the Babri Masjid mosque in Ayodhya on December 6, 1992, and its violent aftermath. A decade later, violent Hindutva pogroms against Muslims erupted in Gujarāt.

In recent decades, South Asia has seen an unprecedented acceleration in contact with Western countries and the spread, if not “export,” of its religious heritage in new forms. Since the 1960s, Western travelers have been flocking to India, Nepal, and Sri Lanka in ever-increasing numbers in search of spiritual wisdom, gurus and swamis, and meditation and yoga traditions. As a result, many of the existing movements centered around a specific guru or teacher have grown and spread on a global scale, and new ones have mushroomed. Among those that have attracted large Western followings are the Hare Krishna movement (ISKCON), founded by Swami A. C. Bhaktivedanta (1896–1977), which has its roots in the Bengal Caitanya tradition; Siddha Yoga, drawing on Kashmir Shaivism, taught by Swami Muktananda (1908–1982) and Gurumayī (b. 1955); Integral Yoga of which Sri Aurobindo (1872–1950) is the founding teacher;

and the movement started by Amma, or Mātā Amritānandamayī (b. 1953), well-known for her charitable missions and world tours.

In addition to these teachers who draw primarily on the Hindu tradition, many Tibetan Buddhist lamas and teachers who settled in India or Nepal after China’s occupation of Tibet in the 1950s have also attracted Western followers and founded *sanghas* (“communities”) and branch monasteries in various parts of the world. The most famous of these Tibetan refugee settlements is Dharamsala in Himachal Pradesh, India, home to His Holiness the 14th Dalai Lama. Sri Lanka has been a popular destination for those interested in Theravadan Buddhist meditation practice.

Nepal, which until the 2006 revolution was the only constitutionally declared Hindu kingdom, became a democracy in 2008. The steady stream of tourists over the last few decades has left a lasting imprint on Nepalese culture. In contrast, the other Himalayan state, Bhutan, has made deliberate efforts to remain isolated in order to preserve its traditional culture and environment. As a result, Bhutan has managed to maintain its distinct form of Vajrayana or Tantric Buddhism. The impact of globalization is only now beginning to be felt in Bhutan, primarily in its urban areas.

South Asian religions continue to change with such rapidity and with such transmutations that it is impossible to catalogue them. Increasing exposure to people, ideas, and goods from other parts of the world is only one factor in this process; the intermingling of South Asians from various regional, linguistic, and religious backgrounds in large cities has also contributed to modifications to existing forms of religious practice and the emergence of new movements. Although globalization is rapidly changing South Asian culture and society, its reach and impact are uneven. Though inexpensive cell phones are found everywhere, among all economic strata of society, computers and other technological conveniences of the 21st century are not easily available to the impoverished population, especially in rural areas. As in many developing societies, the division between globalized urban areas and local-oriented traditional communities is increasing. What this will mean for religious culture in South Asia in the long run remains to be seen.

SOUTH SUDAN

One of the world's newest countries, the eastern African nation of South Sudan officially declared

its independence on July 9, 2011. After decades of civil war between the government of Sudan and the rebel forces in the south, a United Nations–brokered agreement called for a resolution of the issue through a referendum that was held in the region in January 2011. More than 99% of the population in South Sudan voted for independence.

One of the main issues in the South Sudanese independence movement was religion. The northern part of Sudan is dominantly Muslim; South Sudan is a mixture of Christianity and traditional African religion. South Sudan is primarily a rural, tribal society that practices the customs and beliefs of its traditions, which are largely animistic. The largest tribal group is the Dinka, followed by the Shiilok and the Nuer.

The region came under British colonial influence in 1842, and Christian missionaries soon followed. British Anglicans and Roman Catholic missionaries have had a considerable influence on South Sudan's society. Though some observers regard the country as primarily Christian, others regard only 10% of the population as being strict followers of church teachings. Most citizens of South Sudan practice a mixture of traditional animistic African religion and Christianity. The first president of the new nation, Salva Kiir Mayardit, is a Catholic.

SOUTHEAST ASIA

The religious diversity of Southeast Asia from ancient times to the present encapsulates the history of the global spread of some of the world's major religions. The region, which is east of India, south of China, and north of Australia, is usually

grouped into two sections: mainland Southeast Asia, which includes Myanmar (Burma), Thailand, Malaysia, Cambodia, Laos, and Vietnam, and island Southeast Asia, which includes Singapore, Indonesia, East Timor, Brunei, and the Philippines. Malaysia can be placed in either category: One part of it is the Malay Peninsula that juts southward from the mainland; the two other parts, Sabah and Sarawak, are located in northern Borneo—a large island that Malaysia shares with Indonesia. Papua New Guinea is sometimes included in Southeast Asia and sometimes in Oceania; Sri Lanka is at times listed with Southeast Asia but usually with South Asia; Taiwan is sometimes grouped with Southeast Asia as well, though far more often it is counted as a part of East Asia.

Most of the mainland countries of Southeast Asia are Buddhist, except for Malaysia, which is mainly Muslim. The island countries of Southeast Asia adhere to a mixture of religious customs: Indonesia and Brunei are Muslim, Singapore is predominantly Buddhist, and the Philippines is Christian. This simple characterization, however, masks a great deal of religious diversity within each of these countries, both at present and in the past. The southern part of the Philippines is Muslim; Indonesia has a thriving Hindu population in Bali; Cambodia hosts the ancient Hindu and Buddhist temples at Angkor Wat and its environs. The Mahayana Buddhism of Vietnam and Singapore is different from the Theravada Buddhism practiced in other areas of Southeast Asia. The history of Southeast Asia is the story of successive waves of religious cultures that left their marks in a variety of ways on the region's societies and were influenced, in turn, by indigenous religious traditions. Religion in Southeast Asia, therefore, is best described as syncretic. This entry will provide an overview of the history of religious globalization in the region: ancient Hindu and Buddhist kingdoms, the arrival of Islam, the cultural effect of European colonialism, and the religious situation in the post-colonial global era.

Ancient Hindu and Buddhist Kingdoms

The traditional animist practices of Southeast Asia's peoples were initially supplanted by Hinduism that was brought to the region from India at the beginning of the third century BCE. There are several schools of thought regarding

how Hinduism came to Southeast Asia. Some Indian historians have claimed that the spread of Hinduism was an aspect of the Indian cultural colonization of lands beyond the subcontinent—the creation of a “Greater India” or “Farther India.” Dutch scholars who studied the history of Indonesia, however, have challenged this theory and argued, instead, that it was Southeast Asians themselves, with their long history of seafaring, who more likely took the initiative to bring back to Southeast Asia elements of Hinduism that they had encountered in India during their trade voyages. Some Southeast Asian rulers might have welcomed Hinduism because the social hierarchy embedded in the Hindu worldview was useful for their practice of statecraft, but it is not clear how deeply Hinduism penetrated the world of the common people. It is notable that the caste system, a major feature of Hinduism, never took root in Southeast Asia. Some French scholars who explored the history of Indochina have offered yet another interpretation: They argued that what occurred was, more accurately, a process of “Brahmanization,” given the fact that Southeast Asian rulers adopted religious doctrines and rituals of well-educated Brahmans; these Brahmans, who knew Sanskrit and the fine points of Hinduism as well as Indian art and architecture, could have provided guidance to the royal courts. The journeys of these priests and scholars very likely followed the maritime routes that Indian merchants who traded between India and Southeast Asia were already using. After the Brahmans arrived in Southeast Asia, they joined the retinues of local rulers.

The earliest and best known Hinduized/Brahmanized kingdoms in Southeast Asia included Funan, located in today's Cambodia; Champa, in central and southern Vietnam; Angkor, which occupied a much larger area than today's Cambodia; and smaller kingdoms in the Malay Peninsula and the Indonesian archipelago, particularly in the island of Bali. The history of Champa offers a telling example of how religious and political changes intertwined. Indian influence first appeared in Champa in the fourth century; by the seventh century, Cham rulers had begun building Hindu temples dedicated mainly to Shiva and occasionally to Vishnu. A Mahayana Buddhist dynasty came to power and ruled Champa during the 9th and 10th centuries, but the kingdom reverted to Hinduism in the late 10th century.

Meanwhile, Islam began to gain some converts among the Cham people. After centuries of armed conflicts between Vietnam and Champa, the Vietnamese sacked the Cham capital in 1471, but Cham resistance continued sporadically for several centuries, even after the Vietnamese claimed the Cham territory as a part of their country in 1693. Over the years after their defeat, an increasing number of Cham converted to Islam, inspired in part by the fact that Muslim rulers and their subjects in Melaka (Malacca)—located on the west coast of the Malay Peninsula, where the ruler had converted to Islam in 1414—as well as in Aceh in northern Sumatra, supported Cham resistance. Almost all Cham still living in Cambodia and Vietnam today are Muslims, but small numbers of Hindu and Buddhist Cham can still be found. There is also a sizable Cham community in Malaysia, formed by Cham Muslims who escaped from Vietnam and Cambodia during the refugee exodus following the end of the Vietnam War in 1975; the Cham were offered sanctuary by a Malaysian government sympathetic to fellow Muslims. Hinduism's religiocultural dispersal was at its peak during the Chola Empire based in the Tamil region of south India. By 1050, the influence of the Cholas stretched all the way to Laos and Cambodia in mainland Southeast Asia and to the islands of Java and Bali in maritime Southeast Asia.

During the same historical era that Hinduized/Brahmanized kingdoms were founded in Southeast Asia, Buddhist kingdoms, most notably Sailendra, a Mahayana Buddhist dynasty that originated in the latter half of the eighth century, were also established on the islands of Java and Sumatra. Hinduism and Buddhism occasionally rivaled one another or, more commonly, became elements in a syncretized local religion that also included indigenous beliefs and practices. One example is found near Yogyakarta in Java where one of the world's great monuments to Buddhism—the temple at Borobudur with its bas relief that illustrate thousands of Mahayana Buddhist texts—is located near the imposing Prambanan temple dedicated to Shaivite Hinduism. Both were constructed in the 9th and 10th centuries. Beginning in the 8th century, Mahayana Buddhism, often inflected with Tantric mysticism, had gained a foothold in both the Malay Peninsula and the Malay/Indonesian archipelago, in contrast to the inroads that

Theravada Buddhism was making in mainland Southeast Asia. The great temple complex of Angkor in Cambodia was originally constructed in the 12th century to honor the god Vishnu. Later additions to the temples provided Buddhist iconography, most likely the efforts of successive kings for whom Buddhism rather than Hinduism was the religion of the realm.

Over time, many of the old Hindu and Mahayana Buddhist kingdoms died out, and the cultures in mainland Southeast Asian countries, except Vietnam, became dominated by Theravada Buddhism and by Islam in Malaysia, Brunei, and Indonesia. The only large contingent of Hindus remaining in Southeast Asia is in Bali, Indonesia, where a thriving community combines ancient forms of Hinduism with Balinese folk religion. In the 19th and 20th centuries, Indian migrants settled in Malaysia and Singapore (both British colonies at the time), some of them in service to the British army, but most of them worked as indentured laborers in rubber and coconut plantations. Modern Hindu temples and Sikh Gurudwaras have been constructed there by descendants of the Indian pioneers.

Though the remnants of Hindu communities in Southeast Asia are not extensive, the entire culture of the region is deeply influenced by Hinduism. Whereas most Indonesians are Muslims, the popular performances of *wayang kulit* that use shadow puppets to act out the Hindu *Ramayana* and *Mahabharata* epics are considered as central elements of Indonesian culture and society. The name of the winged Hindu god, Garuda, who figures in the shadow puppet dramas, has been adopted as the name of Indonesia's national airlines. Indian gods are found in Thai Buddhist temples as well, and the *Ramayana* legend persists not only in Indonesia but also in Myanmar (Burma), Thailand, Laos, and Cambodia. The names of Hindu gods are used as personal names throughout Southeast Asia—vestiges of a once flourishing Hinduized civilization in the region.

In the modern era, Buddhism thrives throughout Southeast Asia, though in different forms. Buddhism in mainland Southeast Asia is largely Theravada. Burma, Thailand, Cambodia, Laos, and the island nation of Sri Lanka are the world's primary locations for the Theravada tradition—the most ancient or Indian form of Buddhism that accords great respect to the monastic community.

Many young men in Theravada Buddhist societies are expected to spend a period or time, ranging from several weeks to many years, under temporary monastic discipline; in Thailand, it is said that even the King must be a “world renouncer” before he can become a “world conqueror.” Members of the *sangha* (“monastic community”) are usually apolitical, though at the turn of the 21st century, monks in Burma, Sri Lanka, and Thailand have played influential roles in protest movements against governments that they deemed corrupt.

In Vietnam, the Mahayana Buddhism that is found in China, Korea, and Japan, is the dominant religion, though the religious iconography and stories are suffused with traditional Vietnamese legendary heroes who are seen as semidivine saintly figures. A more traditional Chinese-style Mahayana Buddhism, combined with Confucianism and Daoism, is practiced in the Chinese-majority city-state of Singapore and among the large ethnic Chinese communities in Malaysia, Indonesia, Thailand, and elsewhere.

Islamic Countries

Arab sailors, who for several centuries dominated the sea lanes around the rim of the Indian Ocean, and Muslim merchants from both the Arab lands and Persia (Iran) brought Islam to Southeast Asia during the seventh century CE, when a small Muslim colony was established on the Indonesian island of Sumatra. Beginning in the 12th century, Muslim kingdoms were established in the Malay Peninsula and the Malay/Indonesian archipelago as well as in southern Thailand (Siam) and on the large Mindanao Island and in the Sulu Archipelago in the southern Philippines, which rivaled the power and glory of the Hindu and Buddhist kingdoms. In 1136, the King of Kedah renounced the Hindu faith and became a Muslim, establishing the sultanate of Kedah in the northwestern part of the Malay Peninsula. In the 15th century, the Malay Sultanate at Melaka (Malacca) became the center of Islamic thought and influence in Southeast Asia. Sufi missionaries played a significant role in the spread of Islam throughout the region. In 1520, the last major Hindu kingdom in Java fell to the rising power of a Muslim ruler. The Islamization of Indonesia, Malaysia, Brunei, and other regions was a long and complex process, however, and

there was no common pattern of conversion and transformation.

The creation of the independent country of Indonesia in 1949 brought into existence the world’s largest Muslim nation. By the beginning of the 21st century, Indonesia contained more than 200 million Muslims, mostly followers of the Sunnī branch of Islam and the Shafi’i school of Muslim thought. In the late 20th and early 21st centuries, two large Muslim organizations dominate Muslim social and educational life in Indonesia: the Muhammadiyah movement, which has about 30 million members, and is regarded as modernist, keeping up with changing global trends in Islam, and the Nahdlatul Ulama, which has 40 million adherents, is traditionalist, and more in line with local Indonesian Islamic practices and customs. In general, Indonesian Islam is regarded as moderate and accommodating of modern forms of political and social thought.

In Malaysia, the government census officially regards all people of Malay ethnicity as Muslims. Even though Islamic schools and organizations in Malaysia are moderate, as is the case in Indonesia, they serve primarily the ethnic Malay community and not the large ethnic Chinese community and smaller ethnic Indian community. In Brunei, the Islamic practices and teachings are similar to those of neighboring Malaysia and Indonesia, but since the country is a Sultanate, Islam is the state religion. In the Philippines, the first mosque was established in Mindanao in the 14th century. The 2000 census indicates that 5% of the population of the Philippines is Muslim—or “Moros” as they are called—but their political visibility is much greater than their numbers may otherwise indicate due to a long-standing Moro separatist movement in the southern Philippines. Tens of thousands of Moro dissidents have escaped as refugees to neighboring Sabah, Malaysia, a Muslim-friendly country.

The rise of radical jihadi Muslim movements around the world at the end of the 20th century has also affected the Muslim communities of Southeast Asia. A series of bomb attacks in Bali and in Jakarta, Indonesia’s capital, were aimed mostly at the Western tourist and business presence in the country. The most violent was a series of three bombs ignited in or near nightclubs in Bali in 2002 that killed more than 200 people, many of them young Australians on vacation. Members of

the militant Muslim movement, Jemaah Islamiyah, including the spiritual leader of the movement, Abu Bakar Ba'asyir, were arrested and convicted for the act. The Jemaah Islamiyah has connections elsewhere in Southeast Asia, including Singapore and Malaysia, and the operational head of the movement, Riduan Isamuddin—known as Hambali—was arrested in 2003 in Thailand. The movement is also active in the Philippines, where it works in conjunction with the Moro Islamic Liberation Front and other militant protest movements. It was in the Philippines, in Manila specifically, that al Qaeda activist Ramzi Yousef planned some of his most ambitious terrorist attacks, including an assassination attempt on the pope and a 1994 plot that would have exploded bombs in American airplanes as they flew over the Pacific. Yousef was arrested in 1995 and convicted for his role in the 1993 bombing of the World Trade Center in New York City. His uncle, Khalid Sheikh Mohammad, was later arrested and accused of being one of the chief conspirators in the September 11, 2001, World Trade Center and Pentagon terrorist attacks.

Christianity in Southeast Asia

Though there may have been Mar Thoma Christians from India who established outposts in Indonesia as early as the 12th century, Southeast Asian Christianity resulted primarily from European cultural contact under colonialism. Three countries and one distinctive region in Southeast Asia have significant Christian populations: the Philippines, Vietnam, the Maluku (Moluccas) Islands in eastern Indonesia, and East Timor. In the Philippines and East Timor, Christians form a vast majority of the population. In Vietnam, Christians—primarily Catholics—though a small minority, have played a significant role in their country's history. In the Maluku Islands, Christians stand out, not only on the basis of their religion in a Muslim-majority country but also because many Malukans served in the Dutch colonial army, thereby playing an auxiliary role in Indonesia's colonial state structure. They thus feared possible persecution after Indonesia gained its independence.

The country in Southeast Asia with the largest percentage of Christians is the Philippines, which

has a long history of Western colonial control. Spain ruled the Philippines (named after the Spanish monarch at the time, Felipe II) from Mexico City, capital of the Vice Royalty of New Spain, Spain's major colony in the Americas, from 1571 to 1821; after Mexico gained its independence, Madrid governed the Philippines directly until 1898. The United States then claimed the Philippines as its colony from 1898 to 1946.

The interplay of religion (in this case, Christianity—first Catholicism, then Protestantism) and politics profoundly marked the evolution of Philippine society. After Christopher Columbus returned from his first voyage to the Americas, both Portugal and Spain became interested in colonizing those parts of the earth that Europeans had hitherto known little about. Pope Alexander VI (of Spanish birth) issued a papal bull in 1493 that indicated how the new lands were to be explored, conquered, and colonized. The 1494 Treaty of Tordesillas and the 1529 Treaty of Zaragoza divided the globe between Spain and Portugal. The first treaty gave Spain the right to explore, colonize, and exploit all lands west of a line drawn from pole to pole located 370 leagues (1,281 miles [1 mile = 1.609344 kilometers]) west of the Cape Verde Islands, while the Portuguese had the right to carry out the same activities in the lands east of that line. The second treaty specified where the antimeridian (i.e., the line on the opposite side of the globe across from the line delineated in 1494) should be. Spanish explorers set foot on Cebu, an island in the central part of the more than 7,000 islands that became the Philippines, in 1565. By 1571, the Spaniards had chosen Manila, located on Luzon Island, as their main outpost. The islands contained numerous small political entities governed by various chieftains, whose peoples spoke dozens of languages. Given the fact that there was no dominant political or religious authority, Spain found it relatively easy to lay claim to all the islands and to convert most of the population to Roman Catholicism. When Filipinos revolted against Spain at the end of the 19th century, they initially welcomed the support of the United States until it became clear that the Americans themselves intended to colonize the country. In 1934, the United States Congress passed the Tydings-McDuffie Act promising independence to the Philippines in another 10 years,

but World War II delayed independence until 1946.

During the decades of American rule and in subsequent decades following independence, Protestant and Mormon missionaries made significant inroads among the population, but the Philippines continues to be predominantly Roman Catholic. At the beginning of the 21st century, 93% of the Filipino population was listed as Christian; its 63 million Christians make it the second largest Christian country in Asia (after China, which has 70 million Christians) and the seventh largest Christian country in the world.

The Southeast Asian country with the second largest Christian population is Vietnam. Christianity was brought to Vietnam initially by Portuguese Catholics in 1535; it was propagated more actively by French Jesuit missionaries beginning in 1614 and especially after France colonized the area. Christianity, however, has had a turbulent relationship with Vietnamese politics in the successive regimes dominated by French colonialists, North Vietnamese Marxists, and South Vietnamese leaders supported by the United States. Between 1862 and 1883, France colonized Cochinchina, Annam, and Tonkin (the southern, central, and northern sections, respectively, of today's Vietnam), and these three colonies became constituent parts of French Indochina, along with Cambodia (colonized in 1863) and Laos (colonized in 1889). Under the French colonial regime, Roman Catholicism flourished and played a role in the politics of the region, providing an ideology for some pro-independence forces, and more frequently, for those Vietnamese who supported French rule. When Vietnamese independence fighters finally defeated the French in 1954 at Dien Bien Phu, located in northwestern Vietnam, the 1954 Geneva Accords divided the country at the 17th parallel, with the future of the country to be determined by national elections to be held in 1956. However, the promised elections never took place because South Vietnam, with the strong support of the United States, refused to hold them. In the immediate aftermath of the Geneva agreements, more than 900,000 Vietnamese Catholics fled south to avoid what they feared would be religious persecution by the new Marxist regime of Ho Chi Minh. Attempts by the Hanoi regime to unify the country under a communist government brought

strong resistance from the south. According to some reports, one reason why President John F. Kennedy committed American military support to South Vietnam in 1961 was the insistence of Cardinal Spellman of New York City that he do so: Spellman said that a Catholic president must protect the Vietnamese Christian community in the southern part of Vietnam. Following the end of the U.S.-Vietnam War in 1975 and the unification of the country under socialist rule in 1976, the size of the Christian community has diminished considerably. Many Vietnamese Christians were among some 1 million refugees who escaped by land and by sea; a majority of them were resettled in the United States and the remaining numbers elsewhere. At the beginning of the 21st century, some 8% of the population of Vietnam was registered as Christian, mostly Catholic.

Portuguese traders founded a Christian settlement in the Maluku Islands (many of which gained fame in world history as the original producers of certain highly desired spices such as cloves and nutmeg) in eastern Indonesia. When the region came under the rule of Dutch colonial administrators, the Christian community in the islands continued to be protected by the Dutch. In the second half of the 20th century, immediately following Indonesia's independence, the percentage of Muslims and Christians in Maluku was roughly evenly divided, but the percentage of Maluku Christians decreased when the departing Dutch colonial government showed special consideration for two groups in the population that might suffer persecution—Indos, the mixed-blood children of Dutch and Indonesian parents, and Maluku Christians who had served the Dutch colonial administration and army. These two groups were allowed to resettle in the Netherlands as repatriates and refugees, respectively. Still, even after the exodus, tensions developed between the Christians and Muslims in Maluku: Hundreds of thousands of people were displaced and many killed, and houses were burned before the Indonesian government was able to restore order by 2004.

A different fate was in store for another Christian colony established by the Portuguese in the 16th century: East Timor. The eastern section of the island of Timor, located east-southeast of Java in the Indonesian archipelago, remained a Portuguese outpost even after most of Indonesia came under

Dutch colonial rule during the 17th century. Thus, even after Indonesia became independent in 1949, East Timor continued to be a Portuguese colony. In 1975, the Portuguese abandoned their claims, and East Timor achieved self-rule. However, the Indonesian government quickly claimed East Timor as a state in Indonesia. A protracted and often violent struggle for independence persisted for more than 30 years until the Indonesian government finally relinquished authority over the region, and East Timor became independent in 2002. Consistent with its Portuguese colonial heritage, 97% of the population in East Timor is Roman Catholic.

In addition to these four places with significant Christian populations, there are smaller numbers of Christians scattered throughout Malaysia, Singapore, Indonesia, and elsewhere. In these countries with a Christian presence as well as in Theravada Buddhist-majority and Muslim-majority countries with historic Hindu overtones, religious diversity has been an inescapable feature of Southeast Asia's intricate and fascinating history.

SPAIN

The religious life of the southern European country of Spain is characterized by a deep-rooted Catholicism and the major structural changes that have taken place in Spanish society in recent decades. This entry centers on three aspects. First, it briefly outlines the historical reasons for the hegemonic character of Catholicism up to recent times; second, it analyzes the extent to which Spanish society is becoming secularized; and, finally, it touches on two issues that are currently of great importance: the formation of a new religious plurality as a consequence of the arrival of immigration and the debate over laicity of the state.

The political unification achieved by the Catholic monarchs in the 15th century, together with the expulsion of Muslims and Jews, resulted in religious homogenization and, as a consequence, a Catholic hegemony that prevailed right up to the 20th century. It was not until the end of the 19th and beginning of the 20th centuries that the rise of socialist and anarchist tendencies led to the emergence of an antireligious (in particular anticlerical) movement. The confrontation between “the two Spains” culminated in the Spanish Civil War (1936–1939), which broke out following the military uprising of General Franco—legitimized in terms of a Crusade—against the democratically constituted power of the Second Republic. The end of the conflict and the victory of Franquist troops marked the beginning of a dictatorial regime (1939–1975) that experts have defined as *National Catholicism*. Based on the alliance between the Catholic Church and the state, it was a regime founded on the ideals of state confessionality and the complete Catholicization of society.

The democratic period that followed the Franquist era has brought about major changes in Spanish society. However, we would be making a grave mistake if, as sometimes happens, we were to attribute political change to changes in Spaniards' religiosity. In fact, the secularization of Spanish

society had essentially already begun in the 1960s during a time of industrial growth. This had reached Spain much later than the rest of Europe and was accompanied by the rise of the consumer society.

To what depth has this secularization process taken place? First, it should be pointed out that Spain has undergone a profound process of differentiation, and this has resulted in religion ceasing to be the sacred center of society and becoming just another sphere. In keeping with this, the Catholic Church is no longer a central institution; it has become an institution like any other, albeit one that has adopted the role of a strong lobby. A contributing factor to this change in the position occupied by the Church in Spanish society has been the Spanish constitution, dating from 1978, which proclaims that “no confession will have a State character.”

With respect to the secularization of individuals, the data we have available indicate that this is a process that is taking place gradually. If we limit ourselves for the time being to the native population (the immigrant population will be dealt with later), it will be noted that there has been a considerable decline in both religious beliefs and practices. Nevertheless, this has not been the case with regard to religious self-definition: According to the *Centro de Investigaciones Sociológicas* (the most important sociological research center for studying Spaniards' opinions and attitudes), the percentage of the native population who declared themselves to be Catholic in 2008 was still very high (73.5%). These data reflect how firmly rooted Catholicism is in Spain, although not orthodox Catholicism; rather, it is a cultural form that distances itself from the teachings of the Church. This is shown by the fact that a significant proportion of people who define themselves as Catholic do not believe in many of the dogmas of this religion. Fewer than 20% of Spaniards say they attend mass at least once a week, while about half say they never go.

Together with the decline in institutional religious practice, the indicators that best reflect the depth of the secularization process are those that refer to the importance individuals attach to religious beliefs and the extent to which these influence other aspects of everyday life. A look at the last 20 years will confirm that religious beliefs have become increasingly less relevant in the lives

of Spaniards. If the importance given to religion in 1987 attained an average of 6.11, in 2008, this had dropped to 4.76. In 1987, 44% of the native population considered their religious beliefs to be very, or quite, important when they had to make major decisions; by 2008, this percentage had been halved. Added to this is the fact that the vast majority of the native population considers that religious beliefs should not be taken into account when voting for a political party and that work is not a religious obligation. In the last 10 years, there has also been a pronounced drop in the percentage of those who consider religion to be very important in children's education. This fact is highly significant because it is in the domain of education where religion has historically had great prominence.

These data are in keeping with the growing distance between the native population and the Catholic Church. In 2008, most people said they had little or no trust in this institution (60.8%) and were against positions defended by the Church on issues such as divorce, abortion, the use of condoms, married priests, homosexual marriage, and euthanasia. Nevertheless, despite this distancing, the Catholic Church is still important to most Spaniards when it comes to celebrating rites of passage like baptism, first communion and, to a lesser extent, marriage. Along the same lines is the importance given to certain manifestations of “popular religiosity” in Spain, such as processions and festivities.

To understand the extent of the secularization process in Spanish society, it should be borne in mind that this is a process that advances as each generation succeeds the previous one. All indicators point to the fact that young people are much less religious than adults and that, at the present time, in some regions of Spain (the most developed economically, like Catalonia, Madrid, and the Basque Country), most young people between 15 and 24 years old describe themselves as being either indifferent to religion or as agnostics or atheists. These data may well be a good indicator for predicting the future of religion in Spain.

Nevertheless, these secularizing tendencies appear to be limited to the native population, since immigrants (who have arrived in considerable numbers during the last decade and now make up 12% of the total population) attach much more

importance to religious beliefs in their lives and are more likely to practice their religion.

It should be remembered that many immigrants define themselves as Catholics, which is essentially a consequence of immigration from Latin America. But the truth is that globalization, coupled with the secularization process, has led to Catholicism losing its hegemony in Spain, while the number of believers and practitioners of other religions, especially the Muslim, Orthodox, and evangelical faiths, is growing.

This new religious plurality—together with a series of actions such as parliamentary approval of homosexual marriage and the introduction in schools of the subject of Education for Citizenship—has recently reignited the debate on laicity of the state. The Spanish Episcopal Conference, in line with the postulates of Pope Benedict XVI, understands that laws should be subjected to “transcendental truth” and feels under attack from what it considers to be exclusive laicism. For their part, critics of the ecclesiastical hierarchy hold that in the present situation of religious plurality, the Catholic Church continues to enjoy privileges from the past (especially those derived from the 1979 Concordat, which is still in force) in matters concerning public financing, the teaching of religion in schools, and the presence of Catholic symbols at public events.

SPIRITUALISM

Spiritualism as a religious movement centers on direct contact with spirits of the departed through mediumship and similar means. In its origin in 19th-century America and its worldwide dispersion, spiritualism offered a prototype of the modern globalization of religion.

The movement began in 1848, when the young Fox sisters reported mysterious rappings—comparable to the recently invented Morse Code—in their upstate New York farm house. They attributed the mysterious sounds to spirit communication. The sensational story was widely circulated and discussed in the print media. Soon, other such incidents were reported, spirit communication largely shifted from raps to voice mediumship, and societies devoted to its practice formed.

Spiritualism was the first significant new, independent religious movement established in the United States apart from Mormonism; and it was the first of many American spiritual exports. Moreover, it saw itself as a new kind of religion, appropriate to the new republic. Spiritualists claimed that theirs was the most democratic of faiths; anyone, whether clerical elite or not, could become a medium. Spiritualism, like Theosophy, Christian Science, and New Thought after it, offered women in particular opportunities for religious leadership closed to them in virtually all traditional religions of the time. Not incidentally, mediums of the 1850s and later often delivered messages aligned with reformist and radical movements of the day: The spirits favored abolition, feminism, penal reform, dress reform, and sometimes utopian communes.

Spiritualism also called itself the most scientific of religions, claiming to be amenable to the scientific

testing of its phenomena and of the veridicality of mediumistic messages. It did not, it boasted, depend on unprovable faith in ancient scriptures or traditional priesthoods. In this way, too, the spirits were bringing a new religion to a new nation and a new and better age.

One of the first spiritualist papers in America was significantly called *The Spiritual Telegraph*, after that just invented device, and in its imminent globalization, spiritualism was in the vanguard of most traditional faiths in its eager use of new technology and its endorsement of “progress” in all fields. It appeared in the first generation of truly widespread literacy even in “developed” countries and was no doubt the first comparable movement widely publicized by mass media in advance of its itinerant preachers. As it journeyed around the world, spiritualism followed lines of commerce and immigration, from America to England and France, then to Australia, New Zealand, and Latin America. Its spread was greatly abetted by the fact that its messengers were among the first such envoys to be able to ride with the relative speed and comfort of steam ships and railways. Famous mediums and lecturers traveled around the world, their arrival always being a sensation in distant outposts of civilization. With upsurges and declines, spiritualism has survived into the 21st century.

SPORTS

Since the emergence of religious studies as a discipline in the latter half of the 20th century, the

relationship between religion and sports has proven to be a complex subject ripe for inquiry. Whether experiencing the ritual of attending a baseball game, viewing an athlete attribute her prowess to a higher power, or evaluating the social dependence of sporting and religious institutions on one another, the cultural arena of athletic life has emerged as a rich deposit of devotional significance and popular practice.

Despite this richness, however, many of the field's foundational matters remain unsettled; critics even continue to debate the meanings of the words “religion” and “sports.” Even with this and other ongoing definitional debates, two general patterns of assessment have emerged in the last three decades that continue to shape and structure the field of religion and sports scholarship: The first is a phenomenological approach, which regards religion and sports as separate and parallel cultural institutions with equivalent systems for mediating ultimate experience; the second is an historical perspective, which reveals the complex political and practical give-and-take of these spheres across myriad cultures, resulting in a variety of cultural institutions such as the Young Men's Christian Association (YMCA) and Young Women's Christian Association (YWCA).

Sports as Religious Phenomena

In his dissection of the cultural norms at work in the transition between true play, like running along the beach, and complex team sports like football, Allen Guttman framed out sports as nothing less than a central institution in human life. Nor does this elemental importance of sports escape the awareness of sports fans: A television program on an American travel and leisure network pitches its focus on sports tourism as a universal lust: to understand a culture, one must play its games.

This advertisement taps cleverly into the popular Western perspective that the institutions of sports, like the institutions of religion, are meaningful at their cores because of a subjective internal experience and the ways in which sports, whether played or watched, manage or mediate that experience. The experiences of scoring a winning goal or cheering one's favored team to victory, to hear the accounts of those who lived them, often border on the transcendent. In many ways, the rules and

language of sports already structure the lives of citizens around the globe, much in the same way that the rules and codes of religion dominate the lives of their devotees as well.

Religion and sports are similar not only in that they provide for powerful subjective experiences and provide rules that structure those experiences; the ultimacy of these experiences also bespeaks of a basic cultural similarity between these two systems. Numerous scholars have sought to establish this fundamental sameness between two supposedly different spheres. Like the church, temple, or synagogue, a football stadium is a dedicated physical structure in which intentional and “ritualized” or habitual acts are performed, both on the field and among the spectators. Many sports fans disdain even wearing the colors of an opposing team, just as they promote their own colors as symbols of a social bond.

Even the basic rules governing gameplay often mirror the codes of conduct governing devotees’ lives. Stepping onto a soccer pitch, one enters a kind of sacred time: When the clock starts and stops, the universe within those white boundaries, often painted on specially grown grass used for no other purpose, governs everything. In that world, certain behaviors become paramount and appropriate, while fouls represent punctures in the order of things. The vague concept of “sportsmanship” itself conveys a just ethic resembling the Golden Rule.

Scholars have even evaluated cultures’ schedules between sports and leagues as a kind of liturgical (i.e., ritual) calendar: In America, the cycle from baseball to American football to basketball arguably imitates or reflects the cosmic changing of the seasons. American nostalgia for spending lazy summer days at the ballpark represents a more deep-seated longing than idle leisure. Instead, time spent idling at a baseball game functions as a recentering, an opportunity to watch the universe of the game play itself out in total, reinforcing values necessary to secure victory and to avoid defeat. The complex tournament structure leading to the quadrennial celebration of the FIFA World Cup soccer championships also forms a calendar, which many soccer fans worldwide observe with the utmost dedication.

Whether evaluating the structures of sporting events; the special behaviors, clothes, and catechisms

of the athletes and fans; or the transcendently effervescent phenomenon of victory, religion and sports appear in cultures worldwide as systems that resemble, imitate, or otherwise parallel religious cultural systems.

History of Competing and Complementary Systems

This systematic equivalency, however, only yields so much insight before the process of commenting critically grinds to a halt. That the reported experience of a satisfied churchgoer is the same as that of a victorious basketball fan only illuminates either phenomenon to a certain degree. In response to this static equivalency, historians have asked the question, “How have these ‘parallel sacred institutions’ changed and interacted over time?” These narratives cross-cut the spheres of religious and sporting life in a number of ways; social, racial, economic, and religious histories have sought to further clarify just what exactly religion and sports mean to one another.

Often, of course, religion and sports have appeared in the same places and at the same times: One need look no further than the feats of athleticism staged in Olympia by the ancient Greeks to witness the fusion of cultural ideals of physical prowess and the sacred. In fact, the Olympic Games as originally conceived point to an essential historical sameness between the two spheres of human life: Both religion and sports have, in various cultures across time, served to establish the boundaries of cultural recognition, of meaning and meaninglessness at the social level. In this way, religion and sports sometimes converge in the service of making other cultures and foreign persons recognizable to one’s own.

If sports and religion frame the way a society recognizes other people, they can also play an integral role in intolerant acts against other people. Scholars of Native American religion have noted that Spanish missionaries along the Gulf Coast, in an attempt to take control of the villages they encountered, sought to dominate those cultures into submission, first, by removing the game pole, typically erected at the center of the town and symbolic of the community’s cultural fabric, and, second, by replacing the game pole with a large Catholic cross. By removing the game pole and replacing it with a

symbol of a religious institution, the missionaries succeeded in disbanding the native Americans' cultural systems and imposing their own.

Since the age of empires, religion and sports have continued to emerge at the borders where cultures collide and interpenetrate. In many places, groups viewed as foreign or threatening because of their religions transformed into familiar and valued neighbors through their participation in sports; eastern European Jews, for instance, often demonstrated their civic pride by participating at local gyms. Similarly, scholars have identified the popularity of groups like the YMCA and YWCA at the turn of the 20th century in America as the product of White Protestant interest in "normalizing" the influx of immigrants to American shores. By having these new citizens participate in the YMCA and YWCA, dominant political and cultural groups could ensure that the immigrants were immersed at once in Christian values *and* American norms for fitness and health—values and norms that have contributed to one another throughout American history.

Sports and religion also contribute to the establishment (and complication) of a culture's gender norms. Few sports permit competitors of different genders to compete on the same team and typically have entirely separate leagues for men and women. Likewise, of course, religion contributes to a given culture's gender norms, similarly assigning certain culture work to one gender or the other. Scholars observe this at work most obviously in breaches of these codes, as in the case of a female mixed-martial artist or, as Carlo Rotella observed, the peculiar "sex work" of a boy circumambulating a boxing ring with a placard identifying the next round in a female fighter's bout.

In an age of information media, the relationship between religion and sports, especially the rise of global audiences for professional sports leagues and the emergence of solitary and transcendent "extreme sports" like BASE jumping, is one of complex, sometimes overlapping social structures; that these systems have so much to offer one another is itself a gift to scholars.

SRI LANKA

Located south of India along the maritime routes in the Indian Ocean, the island nation of Sri Lanka has had a long involvement with global movements of religious and cultural forms. Sri Lanka is a multireligious country with a population that is slightly more than two thirds Buddhist, with the remaining third divided roughly equally between Hindus, Muslims, and Christians. The country has been influential in the historical development of Theravada Buddhism and has maintained ties with Buddhists in other countries, particularly in peninsular Southeast Asia. Sri Lanka has also had a long history of contact with Europeans, most notably the successive colonial rules of the Portuguese, Dutch, and British between 1506 and 1948. As a result of these encounters, various Christian missions were sent to the island. At the same time, European scholars studied Sri Lankan Buddhism with the indispensable assistance of local monks, and the country's Theravada texts and practices came to exert considerable influence over how people understood the history and purported "essence" of Buddhism worldwide.

Exchanges between Sri Lankans and Westerners, both positive and negative, helped spur the rise of what has been called "Protestant Buddhism," which signifies a rational reinterpretation of the tradition in response to modern values and institutions. The lengthy colonial history also gave rise to a nationalist response that has used Buddhism as the ideological basis for mobilizing resistance to Western rule and influence. In recent decades, an

armed conflict and civil war between the military—which mainly comprises members of the majority Sinhala ethnic community—and a Tamil separatist group called the Liberation Tigers of Tamil Eelam (LTTE) has cost tens of thousands of lives and sent hundreds of thousands into diaspora around the world as political and economic refugees. As a result, Sri Lankan Buddhist and Hindu religious communities are now found in many countries, contributing to the globalization of religious ideas, cultural forms, and political advocacy. This entry discusses religious exchanges in the premodern world, colonial religious history, Protestant Buddhism, Buddhist nationalism, and diaspora and virtual communities.

Religious Exchanges in the Premodern World

Ancient Sri Lankan Buddhist chronicles describe how the Buddhist religion was brought and established by a group of monks led by Mahinda who were sent from India in the third century BCE. This effort was initiated by King Ashoka, who ruled over a vast Indian empire and apparently sought to promote Buddhism and his influence in neighboring countries. Thereafter, as Buddhism became firmly established in Sri Lanka, a steady flow of monks, texts, and relics further linked the island to Buddhist communities in India. Sri Lanka obtained an important position in the ancient Buddhist world when the community of monks associated with the *Mahavihara* (“Great Monastery”) order began around 20 BCE to write down the discourses of the Buddha for the first time anywhere. Oral traditions of commentaries were also written down, leading Sri Lanka to become an important repository of texts for Theravada Buddhism. This collection of texts attracted Buddhist monks and pilgrims from across Asia.

In addition to its impressive textual and scholarly traditions, Sri Lankan Buddhists were active in promoting their tradition abroad. Sri Lankan monks helped establish Theravada Buddhism in Southeast Asian countries such as Burma (now Myanmar) and Thailand. Recognizing the antiquity of Sri Lankan Buddhism and the authority of its scriptures, numerous monks from Southeast Asia traveled to Sri Lanka to be ordained in the Mahavihara monastic lineage. Many of them

returned to their homes across the Indian Ocean to establish a monastic lineage that derived greater legitimacy and status from its ties to Sri Lanka. Later in the early modern period when generations of colonial rule weakened the condition of Buddhism in Sri Lanka, Theravada monks from Southeast Asia were invited to the island to reestablish the ancient monastic lineage originally founded in Sri Lanka.

Premodern transnational exchanges affecting the island’s Hindu and Muslim communities were arguably more limited. Close contact with India meant that not only did Buddhists travel across the straits to Sri Lanka but that Hindus and elements of Hindu religious culture did as well. The strong influence of Shaivism in South India, particularly among Tamils in Tamil Nadu, contributed to the adoption of Shiva worship in medieval Sri Lanka. Hindu temples were constructed out of stone and became centers for worship and offerings to the pantheon of Hindu deities linked with Shiva. Hindu influences in the forms of art, architecture, music, and literature were also keenly felt. And when a Tamil kingdom was established in the north of the island around the late 13th century CE, a base for Hindu practice with close ties to India was established.

The island’s Muslim population derives from different countries and periods, the oldest of which probably originated with Arab traders who settled around the port city of Colombo and maintained ties with Indian Muslim rulers from around the 14th century. During the Dutch period of colonial rule, Muslims from Java and the Malay Peninsula were brought in to assist the Dutch rulers. And subsequently, some Muslims arrived from India and settled in Sri Lanka when the island was under British rule.

Colonial Religious History

Sri Lanka’s colonial history had a profound impact on the globalization of its religious traditions. The Portuguese first arrived in Sri Lanka in 1506 and, in 1518, built a fort in Colombo to protect their trading interests. They annexed the coastal regions of Sri Lanka later in the 16th century and sent Catholic missionaries to convert the populace and to bring the island firmly under the control of the Portuguese crown. The missionary effort included

building churches, baptizing local inhabitants, and even destroying certain Buddhist and Hindu temples. Significant numbers of Buddhists and Hindus converted, although many returned to their previous traditions when it became possible to do so. Nevertheless, substantial numbers remained Catholics, and their descendents make up the largest percentage of Christians in the island. Ongoing ties between Sri Lankan Catholics and Catholic bodies worldwide have further sustained and developed the local church.

After about one and a half centuries of Portuguese colonial rule over the lowland territories, the Dutch expelled their Catholic rivals and governed the coastal territories while promoting the Calvinist church. Suspicious of their Portuguese rivals, the Dutch took stricter measures against Catholicism than either Buddhism or Hinduism, although the latter religions were also suppressed. The British followed the Dutch and extended colonial rule over the entire island from 1815 to 1948. Numerous Protestant missionaries set up schools and published pamphlets to promote Christianity and critique Buddhism and Hinduism. Some missionaries such as R. Spence Hardy engaged in close studies of Buddhism to undermine it. These 19th-century books on Buddhism by Hardy and others like him were published and disseminated abroad in the English language. Conversely, religious values and ideas from Great Britain were disseminated to the island's educated inhabitants largely through the network of missionary schools and Christian publications produced in the island.

Christian missions sponsored by or accompanying the island's European colonial powers generated considerable resistance among Sinhala Buddhists and Hindu Tamils. Members of the lower strata of Sri Lanka's simplified caste system were the ones most likely to embrace Christianity as a method to raise their social and economic standings in society. But numerous other Buddhists and Hindus rejected calls to convert. Laws favoring Christian converts, the annexation of temple lands, and the occasional looting and destruction of Buddhist and Hindu temples all contributed to resentment toward the colonial governments and the missions that were implicated in their rules. These colonial contests over religious identity have left a lasting legacy of distrust and hostility toward modern Christian missions.

Protestant Buddhism

Sri Lanka is generally acknowledged to have been the birthplace of what Gananath Obeyesekere earlier called "Protestant Buddhism." The term remains in use, although "Buddhist Modernism" has emerged as a popular alternative among scholars. Protestant Buddhism refers to the modern reform of Buddhism along rationalistic lines. The critiques of Western missionaries on the allegedly superstitious nature of Buddhism encouraged Buddhist reformers to emphasize aspects of the religion that complement the modern esteem for scientific truths and reasons. Reformers such as Anagarika Dharmapala (1864–1933) helped bring about distinctive changes in the practice of Buddhism in Sri Lanka. Greater emphasis on meditation, the study of the scriptures of the Pāli canon, and increased roles for laypersons became the hallmarks of Protestant Buddhism.

Although there is evidence that Sri Lankan Buddhists began to move in the direction of such reforms earlier, the polemics of British missionaries and the sympathetic support offered by the American Theosophist Henry Steel Olcott were instrumental in the reinterpretation of Buddhism in Sri Lanka in the final decades of the 19th century. Reacting to missionary critiques, Sri Lankan Buddhists began to cite the rational and empirical basis for Buddhist teachings. The Buddha, they claimed, avoided making supernatural claims and instead urged his followers to purify and develop their minds in order to analyze the causes of human suffering and to discover truth on their own. Laypersons too were encouraged to meditate and study the Buddha's Dharma, or teachings, without relying on ritualism or the mediation of clerics. This reformed version of Buddhism appealed most to urban, English-educated Buddhists like Dharmapala. As a result, their writings and advocacy for a reformed, rationalistic Buddhism were easily exported outside Sri Lanka, influencing a modernist reinterpretation of the tradition elsewhere.

At the same time, scholars such as T. W. Rhys Davids (1843–1922), the British civil servant who studied the Pāli language while stationed in Ceylon (as Sri Lanka was then known), supported the reformed vision of Buddhism by acknowledging the oldest Pāli texts as the authentic source for discerning the pristine form of "original"

Buddhism. Davids founded the Pāli Text Society in England, which gave more attention to the scriptures of the Pāli canon than Sri Lankan Buddhists themselves had given. Whereas Sri Lankans had historically relied more on anthologies, commentaries, and translations of Pāli accounts into literary forms of the vernacular Sinhala language, the Pāli scriptures took on new import as the standard by which one measured the legitimacy of Buddhism in the modern period. Protestant Buddhism also sought to return to the original form of the religion as taught by the Buddha himself. Legacies of Protestant Buddhism still exist today. Weekly “Dharma-school” classes offer religious instruction to Buddhist children; laypeople are instructed in meditation practices in temples and newly founded meditation centers; and a general discourse privileging the rational and scientific basis of Buddhism is still encountered in sermons, newspapers, and everyday conversation.

Buddhist Nationalism

Along with the phenomenon of Protestant Buddhism, the rise of Buddhist Nationalism in Sri Lanka appeared as another product of European colonialism. Earlier efforts to revive the state of Buddhism in the country became closely linked with aspirations for national independence from Great Britain. Dharmapala and other early 20th-century advocates for reviving Buddhism blamed the religion’s sorry state on Christian missionaries and a lack of British support for promoting Buddhist institutions. The Kandyan Convention in 1815 that formally handed over the kingdom of Kandy in the central highlands to British rule specifically called on the British to patronize the *Sangha*. The British, however, did not actively promote Buddhism, at least to the extent that local Sri Lankan Buddhists desired. Consequently, calls to reform Buddhism quickly became allied with calls for independence in Sri Lanka. Shortly after losing control of India, the British ceded their authority in Sri Lanka to a party of English-educated political elites called the United National Party (UNP) in 1948. Opposition to the UNP coalesced around a more left-leaning Sinhala-dominated political movement, which eventually took office in 1956 and pushed for various measures to revive Buddhism.

The year 1956 became an important period for fostering Buddhist nationalism in Sri Lanka. Buddhist monks and laypersons planned a series of celebrations in that year to commemorate the 2,500th anniversary of the Buddha’s final nirvana. Also in 1956, a government-sponsored commission issued a report called “The Betrayal of Buddhism” that linked colonial support for Christian schools, churches, and hospitals with weakening the vitality and position of Buddhism in the island. The commission’s report called for the government to take concrete steps to restore Buddhism to its “rightful place” as the predominant religion of the nation. Numerous Buddhist organizations advocated for increased state support for the religion after what in their eyes were the many years of neglect it endured under colonial rulers. Ancient Buddhist sites were restored, two monastic colleges were turned into national universities, and large numbers of monks began to canvass for political parties. Over the latter half of the 20th century, Buddhism and the Sinhala nation became closely intertwined as the symbolic roots of the island’s cultural heritage. Not surprisingly, such discourse only marginalized the minority populations of Tamils, Muslims, and Sinhala Christians, and it contributed to ethnic tensions that occasionally spilled over into riots and communal violence.

In the early 21st century, Buddhist nationalism in Sri Lanka remains a potent force. While the island’s other religions have received state recognition and varying measures of assistance, Buddhism continues to receive proportionately more government support and media attention as the religion of the majority of the population. Renowned monks from Colombo-based temples make public statements calling for the government to promote Buddhist values and institutions throughout the country. A new political party originally comprising Buddhist monks was founded in 2004 and ran for parliamentary seats. The National Sinhala Heritage (*Jathika Hela Urumaya* or JHU) party surprised observers by winning several seats, which allowed the new monastic members of parliament to emerge as power brokers in a divided parliament. The JHU presented bills to restrict sales of alcohol and cigarettes and, more controversially, to prohibit “unethical conversions.” The rapid growth of new evangelical Christian groups in

parts of Sri Lanka has motivated Buddhist nationalists to criminalize attempts to make people convert to Christianity by using financial inducements or other “unethical” means. This legislation, parts of which have been declared unconstitutional by the country’s supreme court, has been tabled but not before triggering international calls of protest by church groups and foreign governments like that of the United States. The anticonversion legislation is symbolic of the nationalists’ anxiety over the global intrusions of evangelical Christianity and foreign cultural forms such as Hindi movies from India. Global forces seen to weaken Sri Lankan Buddhists’ commitment to Buddhist morality and adherence to the Buddha’s Dharma tend to provoke strong opposition among politically active monks and lay proponents of Buddhist nationalist causes.

At the same time, Buddhist nationalists do not always simply reject globalization as a pernicious, immoral trend. Evincing more complex and ambivalent attitudes toward the global movements of religious and cultural forms, many Buddhist nationalists embrace opportunities to establish temples in countries such as Australia, Malaysia, the United Kingdom, and the United States. Some Buddhist groups sponsor the publication of English books on the Dharma for free distribution abroad. And efforts are under way to link up with overseas Buddhist foundations to establish a Red Lotus Society that could deliver relief supplies to Buddhist victims of disasters. This initiative to engage in social service is an extension of earlier nationalist efforts to uplift the nation in accordance with Buddhist principles of generosity and compassion. Providing social service on an international scale is seen as desirable since it also helps free Buddhists from their dependence on Christian aid groups who, it is widely believed, mix proselytization with disaster and poverty relief.

Diaspora and Virtual Communities

The mass migration of Sri Lankan Tamils and Sinhalese away from Sri Lanka, due largely to the social and economic instability deriving from the decades-long civil war, adds another important perspective to the country’s global religious landscape. Following a series of violent riots that left a few thousand Tamils dead in 1983, large numbers

of Sri Lankan Tamils emigrated to Canada, Australia, the United Kingdom, and Norway as political refugees. The lengthy conflict between the LTTE and the Sri Lankan military resulted in a defeat for the LTTE and the massacre of Tamil resistance forces in 2009. This put tremendous strains on Tamil citizens living in the northern and eastern provinces, which had been claimed as an independent Tamil state by the LTTE. Some well-to-do Tamils emigrated decades earlier for economic opportunities. But the numbers of overseas Sri Lankan Tamils swelled as a result of threats of violence from both warring parties and the widespread dislocation that resulted from the fighting. Large numbers of Sinhalese have sought to emigrate to Australia, the United Kingdom, and the United States among other countries to seek out better lives for themselves and their families.

Whenever these diaspora communities reach a critical mass, Hindu and Buddhist temples are established to meet the religious needs and cultural interests of Sri Lankans living abroad. Tamils in the United Kingdom, for instance, have brought consecrated images of the popular South Indian deity Murugan to be installed in British Hindu temples (*kovils*). Brahman priests perform traditional rituals, and the temples hold regular festivals to celebrate their devotion to Murugan and other deities related to Shiva. Likewise, Sinhalese Buddhists have set up numerous Theravada Buddhist temples (*pansalas*) for devotees of the Buddha in London, Melbourne, Los Angeles, and elsewhere. Such temples seek to chart a path between preserving aspects of Sri Lankan culture and adapting to their new cultural environments. Traditional rituals conducted to bestow blessings are popular with immigrants, while social service activities and meditation classes have more appeal to local Westerners. Exposure to Western cultures and technologies have also led Sri Lankan religious organizations at home and abroad to create websites to promote their activities and elicit support. For instance, the Skanda Vale Hindu Temple in Wales and the Dharma Vijaya Buddhist temple in Los Angeles maintain polished websites that inform and organize their respective supporters. Some local Sri Lankan religious organizations like the Buddhist Janavijaya Foundation have also created websites to promote their activities abroad to foreign and expatriate supporters.

Religions in Sri Lanka have experienced and reacted to global forces for several centuries. However, more recent challenges and opportunities in the political and economic spheres have increasingly led Sri Lankans to reinterpret and adapt their religious traditions to meet new and more dynamic global realities. Migration, media, foreign aid, new technologies, and other global phenomena have caused local Buddhists, Hindus, Muslims, and Christians to conceive of and practice their respective religions differently as they are confronted by new options and unforeseen pressures on traditional religions.

SRINIVAS, M. N. (1916–1999)

M(yso)re N(arasimhachar) Srinivas was India's best known sociologist, a scholar who helped clarify the links between Hindu ideas and India's social order. He obtained doctorates in sociology (Bombay University) and social anthropology (Oxford) and started his teaching career at Oxford. He returned to India in 1951 to establish a sociology department at Baroda University. Then, 8 years later, he became the first professor of sociology and department head at Delhi University. He became joint director of the Institute of Social and Economic Change in Bangalore in 1972 and initiated the sociology research program there. After retirement, he became a visiting professor at the National Institute of Advanced Studies, Bangalore.

Srinivas's first major publication in 1942, a study of family and marriage among Hindu castes of (southern Karnataka), devoted much attention to domestic rituals. A similar concern with ritual and social solidarity lay at the core of his classic 1952 study of the Coorg community of South India. Here, he focused on the key notions of ritual purity and impurity and introduced the notions of levels of Hinduism (local, regional, and subcontinental) and Sanskritization—the latter to describe how a lower caste may improve its social status by adopting selected elements of the widespread Brahmanical lifestyle. He thus broke open the imagined iron cage of status immobility in India and generated an enormous body of ethnography. Sanskritization was further elaborated by other scholars and Srinivas himself to bring out two major facts. These are described below.

Sanskritization is a two-way process: Not only do lower ranked status groups (castes and tribes) imitate upper-caste lifestyles and selectively internalize values, but the upper castes also pick up

elements of religious belief and practices of the others in a far-reaching strategy of their incorporation in Hindu society. Srinivas's critics have complained that in emphasizing the cohesive role of Sanskritization, he failed to bring out the hegemonic character of the process. Srinivas's well-known interest in the caste system was linked to religion inasmuch as he regarded it as the social framework for the articulation of upper-caste religious beliefs. Moreover, its traditional power dimension paradoxically opened the way for critical linkages with democratic politics.

Religiousness occupied an important place in Srinivas's own worldview. Affirming the same publicly late in his life ("Towards a new philosophy," *The Times of India*, July 9, 1993), he expressed skepticism about the capacity of secular humanism to cope with the emerging challenges of materialism and consumerism in India. He advocated a return to God as the creator, protector, and sustainer of human societies. Paradoxically, he also embraced the notions of free will and individual liberty, which he considered preconditions of democracy.

Srinivas was a thoughtful scholar, firmly grounded in empiricism (which for him meant fieldwork), contemptuous of the magic of quantification in the understanding of social life and suspicious of grand theorizing. Increasingly, he emphasized the social scientist's social obligations, but all through life, he maintained his distance from active politics and the state. He was undoubtedly the most outstanding sociologist and social anthropologist of his generation in India, with a worldwide reputation.

ST. KITTS AND NEVIS

Located only 2 miles (1 mile = 1.609344 kilometers) apart, the Federation of St. Kitts and Nevis is a two-island eastern Caribbean nation positioned on the Leeward Islands chain in the Lesser Antilles. With a collective land mass of 261 square kilometers and a population of around 50,000 people, it stands as the New World's smallest and least populous nation. Saint Christopher (later abbreviated to St. Kitts) became Britain's first Caribbean colony in 1623, soon establishing a slave-driven economy of cotton and sugar production.

As former British colonies, and later a Britain-associated self-governing state (with Anguilla, which seceded in 1971), St. Kitts and Nevis became an independent federation in 1983. Like Canada and Australia, St. Kitts and Nevis is a Commonwealth realm and sovereign state in the Commonwealth of Nations, with Queen Elizabeth II as monarch and head of state. The nation has a governor-general, prime minister and deputy prime minister, bicameral parliament, and separately run Nevisian assembly. The fragile twin-island nation is held together despite Nevis' constitutional right to secede and dissolve federation ties if successful in a two-thirds majority vote, last attempted via referendum in 1998.

Today, the English-speaking nation is mostly African Caribbean, with small percentages of diasporic British, Lebanese, and the Portuguese residents. The Church of England and the Catholic Church established mission parishes in the 17th century, but for more than 200 years were ineffective in mass proselytization of the majority enslaved African inhabitants. Most of the country's inhabitants today practice a form of Christianity, with about 40% being Anglicans, 10% Catholics, and many worshippers belonging to various Protestant sects. Minor populations following Baha'i and Islam exist; there are also unofficially recognized believers in Obeah, which uses folklore and African-derived root practices.

Though sugarcane is still plentifully available, the industry was shut down in 2005. Plantation homes, once a reflection of the New World economy's reliance on slave labor, have today been converted into tourist sites as inns, museums, and historical attractions. Events drawing in visitors and

locals alike include independence, music, carnival, and culturama festivals; historic ruins and churches like St. George's Anglican Church on St. Kitts and Fathergill's Nevisian Heritage Village; and UNESCO's World Heritage Site, the large fortress, Brimstone Hill, on St. Kitts. The bays, beaches, and lush tropical foliage entice tourists and support the local fishing and agricultural industries.

STUPA

Although typically associated with monuments in the Buddhist traditions, the Sanskrit word *stūpa* refers most basically to “a heap or pile of earth or bricks” (Monier-Williams, 1899). The stupa qua Buddhist reliquary derives from earlier traditions in which important bodies were placed within burial mounds. References to similar structures can also be found in Jain and Hindu literature. The prominent Buddhist practice of enshrining bodily relics within the stupa is documented in the *Mahāparinibbāna Sutta* of the Pāli canon. Ānanda, the Buddha's premier disciple, asks what should be done with the Buddha's remains after his final entrance into nirvana. The Buddha replies that, after his cremation, “a *stūpa* should be erected at the crossroads . . . and whoever [makes offerings] there with a devout heart will reap benefit and happiness for a long time” (*Mahāparinibbāna Sutta*, 5.10, p. 264).

History, Form, and Symbolism

The Buddhist tradition holds that there were eight original stupas in India and Nepal that were

commemorative of the Buddha's earthly activities and that housed his cremated physical remains. During the reign of King Asoka, however, it is said that the Buddha's relics were more widely dispersed throughout South Asia in 84,000 stupas. Early stupas—such as the circa third-century BCE stupa at Sanchi, India—were round and domed, constructed on an architectural floorplan of a wheel, while later stupas—such as the circa ninth-century CE stupa at Borobodur, Indonesia—followed the design of the mandala. The architectural features of later stupas directly influenced the East Asian pagoda.

Stupas have an elaborate symbolic structure. Their various steps, terraces, and spires represent different realms of existence, different Buddhist deities, and the various stages of the path to enlightenment. The form of the stupa is also a microcosmic representation of Mount Meru, the central structure of the Buddhist cosmos.

Sacred Space and Religious Practice

For Buddhist practitioners, the most significant aspect of the stupa is that it houses some sort of relics. The most valuable relics are of course those of the Buddha, but stupas also enshrine the physical remains or possessions of other important Buddhist figures, collections of scriptures, or religious paraphernalia that is no longer in use but requires special disposal. Making offerings to a stupa that houses the relics of the Buddha is tantamount to making an offering to the Buddha himself, as, according to the theory of the three Buddha bodies, the presence of the Buddha endures in his physical remains. Consequently, stupas produce a sacred space within which Buddhists engage in merit-making practices, primarily through the circumambulation of the stupa. Whether constructed alongside temples and monasteries or in the vicinity of sacred lakes and mountains, stupas are a ubiquitous feature of the Buddhist landscape.

Commissioning the construction of a stupa is also considered a meritorious action both for the sponsor and for those involved in its highly ritualized construction. As the Buddhist tradition was introduced throughout Central Asia in particular, the ritual construction of stupas became a means of demarcating the boundaries of Buddhism as well as of subjugating any potentially malevolent

local deities and enlisting their support of the Dharma.

SUDAN

Deriving its name from *Balad as-Sdn* (“Land of the Blacks”), the Republic of the Sudan (*Jumhryat as-Sdn*) was until 2011 the largest country in Africa and is distinguished by historically multi-variate regimes and civilizations. Encompassing the ancient northern kingdoms of Kush and Christian Nubia, Sudan’s ethnically diverse population includes the Furs in western Sudan, and it also included the Nubians and the Dinkas in the region that became the country of South Sudan in 2011. In 640 CE, the Rashidun caliphate brought Islam to northern Africa and left Sudan overwhelmingly Muslim and ethnically Arab (with Arabic remaining Sudan’s lingua franca).

In 1821, Egypt’s Muhammad Ali Pasha’s invasion of Sudan marked the beginning of the *Turkiyah* (1821–1885) or Turco-Egyptian rule, which was challenged in May 1881 by a member of the Isma’iliyya religious brotherhood, Muhammad Ahmad (1845–1885). Calling for jihad against the

khedive (the Ottoman Empire’s Egyptian viceroy), Ahmad declared himself the *Mahdi* (“the guided one”), the messianic leader whose spiritual and temporal authority would presage the end of the world. After defeating British General C. S. Gordon’s Egyptian forces and capturing Khartoum in 1885, the Mahdi and his adherents, the *Ansar*, established the *Mahdiyyah* (1885–1898), or Mahdist state, which introduced Shari’a law and urged continued jihad. Attempting to defend imperial interests and secure control of the Sudanese Nile, British confrontations with the *Mahdiyya* also sought to reclaim khedival Egyptian lands taken after 1885. In September 1898, General Horatio Kitchener, the *sirdar* (“commander”) of the Anglo-Egyptian regulars, routed the *Ansar* outside Omdurman, and shortly thereafter the *Mahdiyya* collapsed. In January 1899, the Anglo-Egyptian Condominium (1899–1955) was promulgated and placed Sudan under both countries’ indirect, *codomini* administration. Following independence on January 1, 1956, the nascent Sudanese state was beset with sectarian and regional conflicts (between northern Muslims, southern Christians, and the southern *Anyanya* insurgency).

Since 1956, multiple-party Muslim civilian governments and single-party military states have alternately ruled Sudan. In September 1983, Jafar al-Numeiri’s military regime (1969–1985) introduced Shari’a law with an emphasis on *hudud* (“moral transgressions”) punishments, but discontent prompted a coup in April 1985. Four years later, General ‘Umar Hasan al-Bashir, who was guided by the Muslim Brotherhood’s National Islamic Front leader Hasan al-Turabi, overthrew the short-lived multiparty civilian government and proscribed all political parties. Al-Bashir’s rule has evinced strong support for conservative Islamic groups outside Sudan. Beginning in 2003, the Janjaweed, who comprise Chadian and Darfurian Arab militiamen, backed by Al-Bashir appropriated land from non-Arab Darfurians while targeting those groups in a genocidal campaign. The Darfur Peace Agreement, which was negotiated in 2006, has not brokered an enduring cessation of hostilities. The 2005 peace accord between Khartoum and the southern insurgents, however, generated a tenuous peace and a separatist resolution to the conflict in the southern region. A referendum held in July 2011 resulted in a vote of more than 99% of the southern residents

to form an independent state comprising the Christian and the traditional African animistic cultural areas of the south. On July 9, 2011, South Sudan officially became the world's newest country.

SUFISM

Sufism is often described as Muslim mysticism. It is a form of Islamic knowledge and piety that focuses on exceeding the obligations of Islamic worship, into the realm of the supererogatory. In this regard, Sufis have sometimes been referred to as “greedy Muslims” due to their intense desire for divine reward. The distinction between “Sufi” and “non-Sufi” Islam is scarcely black and white, though there are a number of characteristics that typify Sufi expressions of Islam: intensified spiritual practices, emphasis on student-teacher relationships, saint veneration, tomb visitation, focus on love and union, organized communities called *tariqas* (lit. “paths,” but here meaning spiritual orders), esoteric interpretations of the Qur’an, and interest in mysticism. Sunnīs and Shi’i alike have practiced Sufism, though it is historically more common in Sunnī Islam. Shi’a teachers have been venerated by some Sunnī Sufis, however, including the revered Ja’far al-Ṣādiq, the sixth Shi’i imam and Qur’anic exegete. Despite Sunnī prevalence within the Sufi tradition, almost all traditional *tariqas* trace their lineage to Prophet Muhammad (d. 632) through Alī ibn Abī Ṭalīb (d. 661), his first cousin and the first Shi’ite imam.

This entry charts the development of Sufism from the time of Prophet Muhammad to modern

times. Particular attention is given to definitions of Sufism, its historical evolution, geographical expansion, and the role of key Sufi figures and Sufi orders.

Definitions and Origins Sufism

Sufism is an English term, developed by British Orientalists in India in the late 18th and early 19th centuries. It is derived from the Arabic word *tasawwuf*, a verbal noun meaning “to become like wool” or “to resemble wool.” The term *Sufi* (an adjectival form of “*Suf*,” meaning wool) was probably first coined referring to ascetics in Baghdad who wore wool garments to express their austerity. The word *Sufi* also implies that wool is pliable and can take many forms, rendering the spiritual aspirant like wool in the hands of God. The term can also be linked to other Arabic words and phrases, including *safa’* (“purity”), *safwa* (“elite”), and *ahl al-suffa* (“the people of the bench,” i.e., close companions of Prophet Muhammad). The first records of the term *Sufi* are from the eighth century, although it was not widely used parlance until the ninth century.

Etymology, however, is only of secondary importance when compared with prescriptive meanings of Sufism. Most important, definitions of Sufism are primarily teaching tools. Sages of the early Sufi movements often defined the path didactically: “Sufism is that you should not possess anything nor should anything possess you”; or “Sufism makes you die to yourself and makes you live in Him” (Nicholson, 1914, pp. 33–34). As teaching tools, definitions of Sufism from the tradition’s great teachers signify the importance of transcending a purely mental understanding of the spiritual path, placing emphasis on the heart, the locus of spiritual receptivity. Thus, like other disciplines in the Islamic sciences, there has always been a sense that Sufism cannot be understood through books alone. Even if books do complement the process, it is paramount to learn from a teacher and gain understanding through gnosis and prayer.

As the famous maxim of Abu al-Hasan Fushanja (d. ca. 959) relates, “Sufism used to be a reality without a name, but today it is a name without a reality.” That is, a living spiritual core of Sufism has always existed, even if people did not name it. Rabi’a of Basra (d. 801), for example, came to famously represent piety in later Sufi writings

because of her devotion and focus on love for God, but the term *Sufi* had not yet taken hold during her time nor during the time of Harith al-Muhasibi (d. 857), another influential forerunner of Sufism who emphasized the importance of introspection and love. The best Sufi, in the eyes of many, is Prophet Muhammad himself, though there is no record of him having used the word.

Fushanja's maxim should also indicate that Sufis were not afraid to criticize each other. There has been a steady tendency within the tradition to censure those who consider themselves Sufis while they are in fact hypocrites. As Zia Khan (b. 1971) has stated, there has always been a recognition that because gold is so beautiful, there is always fake gold. Subsequently, Sufi thought has been neither homogeneous nor unilaterally referred to as *Sufi*. Hasan al-Basri (d. 728), for example, known for his ascetic piety, has been counted among the progenitors of the Sufi tradition in works such as the influential treatise *Sustenance of the Hearts* (*Qut al-Qulub*) by Abu Talib al-Makki (d. 998)—even though Hasan al-Basri may not have been acquainted with the term *Sufi* himself. With the famous Baghdadi Sufi, Abu al-Qasim al-Junayd (d. 910), a contemporary of al-Muhasibi, emerges one of the first figures clearly recognized as a Sufi, and almost all later Sufism refers to his authority. He is moreover responsible for developing foundational concepts of *al-fana'* (annihilation of the self/ego in God), a key term in Sufism.

By the 10th century, there was a congealed enough tradition of something broadly construed as Sufism. It should be noted, moreover, that since the origins of Sufism, followers of the tradition aligned themselves explicitly with orthodox, tradition-oriented Islam, although this, of course, did not prevent them from being criticized, from all angles, for their innovative practices and anormative doctrines. Sufism would eventually be affected drastically, however, by one man whose influence would echo for centuries—namely, Abu Hamid al-Ghazali (d. 1111).

Abu Hamid al-Ghazali and Muhyi al-Din Ibn al-'Arabi

Originally from Tus, in modern-day Iran, al-Ghazali spent much of his life studying and teaching in Baghdad at the most prestigious institutions of his

day. In his spiritual autobiography, *The Deliverer From Error*, he reveals a turning point in his life of prestige and learning when, one day, his tongue froze, leaving him unable to speak. He realized that his lifelong pursuit of knowledge had left his heart empty. He then left Baghdad in pursuit of the deeper truth for which he longed, and after studying philosophy, theology, and other branches of knowledge, he concluded that the mystical knowledge of the Sufis alone fulfilled his longing—not at the expense of ritual, doctrine, and law but in tandem with them.

Although al-Ghazali was a prolific writer before his “conversion,” his postconversion works read differently, and he proceeded to write one of the great summits of Islamic scholarship, *The Resuscitation of the Religious Sciences*. In it, he writes on many topics, ranging from etiquette and love to proper understanding of faith and the inner dimensions of ritual worship. Without the inner significance of ritual form, he argues, the purpose and meaning of each practice is lost. Among his other famous works is *The Niche of Lights*, in which he explicates the inner meanings of the famous passage in Qur'an's “Chapter of Light” (Qur'an 24:35), in which God is compared with a light within a lamp. Using the Qur'an as a source of contemplation and spiritual inspiration, moreover, has always been important for Sufis.

Besides al-Ghazali, many famous Sufis have written structured commentaries (*tafsir*) on the Qur'an to elucidate its esoteric meanings, though not necessarily at the expense of apparent meanings. *The Subtleties of Allusions* by Abu al-Qasim al-Qushayri (d. 1074) and *The Realities of Qur'anic Exegesis* by al-Sulami (d. 1021) would become popular representations of Sufi commentaries on the Qur'an. Analyzing verses from the Qur'an that lend themselves particularly to mystical interpretations or emphases on love have also been popular among the Sufis, such as Qur'an 5:54, “He loves them and they love him,” emphasizing the primacy of God's love for the human, and Qur'an 2:115, “Wherever you turn, there is the face of God,” suggesting God's presence in all things.

Another great albeit highly controversial Sufi figure is Ibn al-'Arabi—sometimes Ibn 'Arabi (d. 1240). He was influenced, notably, by two women: Fatima Bint Ibn al-Muthanna of Cordoba and Shams of Marchena. He is most famous for his

Bezels of Wisdom and *Meccan Openings*. He attained the title of “The Greatest Scholar” (*al-Shaykh al-Akbar*) from his admirers and “The Greatest Unbeliever” (*al-Shaykh al-Abfar*) from his intellectual opponents. The Andalusian Sufi claimed to receive inspiration for his writings, sometimes in the form of dreams, and referred to himself as “The Seal of the Saints,” a phrase reminiscent of Muhammad’s position in the Qur’an as “The Seal of the Prophets.” He also developed the notion of “The Perfect Human” (*al-Insan al-Kamil*). Because of his provocative character, Ibn al-‘Arabi has been both hated and loved. Sufis such as Mansur al-Hallaj (d. 922) and Shihab al-Din Yahya al-Suhrawardi (d. 1191) were even executed because of their controversial views or ecstatic utterances. Accounts like these, however, are extremely rare.

Characteristics and Development of Sufi Orders

In the 12th and 13th centuries, *tariqas* began to take shape on the basis of teachings and prescribed spiritual practices of influential and charismatic *shaykhs*. They began to attract organized groups of *murids* (“students”) and would offer them formal initiation, known as a *bay‘a*, a customized oath of allegiance to the shaykh. Three practices common to *tariqas* included *dhikr* (“remembrance of God”), often in a group setting where formulaic Arabic phrases are recited repeatedly; *sam‘a* (“audition”), usually in the form of listening to music and/or love poetry; and *khalwa* (“spiritual retreat,” “isolation”), in which the student isolates herself or himself for a period of time to contemplate God and purify the soul. The process of purifying one’s soul came to integrally characterize Sufism. Hence, the notion of a *jihad* (lit. “struggle” or “effort”) against one’s *nafs* (“lower or base self”) became a quintessential part of the Sufi path and was known as the greater struggle, as opposed to military *jihad* (the lesser struggle).

Tariqas have continually arisen and diversified since their first formations. The shaykhs of these *tariqas* traditionally authenticate their positions by using a *silsila* (“chain of transmission”), which traces their lineage of spiritual teachers to Prophet Muhammad, although because *silsilas* are also symbols of authority, they are not always historically reliable. Although hundreds if not thousands of

different *tariqas* have appeared over the years, some have become more influential and widespread. The Shadhuliyya (or Shadhiliyya) began in the 13th century and became particularly widespread in North Africa and Egypt; the Chishtiyya, which began in the 12th century, became widely known in South Asia; and the Naqshbandiya, which developed in the 14th century, became influential in South, Central, and East Asia. The Mevlevi *tariqa* also became particularly important because it traces its genealogy to one of the most well-known and well-regarded figures of Persian Sufism and literature: Jalāluddīn Rūmī (d. 1273).

Jalāluddīn Rūmī

Rūmī is most famous for his masterpiece, the *Masnavi*, a six-volume collection of poetry that earned the title of “the Qur’an in Persian” for its eloquence, beauty, and literary magnificence. In his writings, Rūmī shows great reverence for his teacher, Shams of Tabriz, reinforcing the importance of student-teacher relationships in Sufi tradition. Rūmī’s recognition extends beyond the Persian-speaking world and other Muslim countries, including Turkey, where he spent much of his life and is buried. He has also gained great repute in the West, in particular the United States, where he has ranked among the best-selling poets in the country. Despite Rūmī’s universal appeal, due in part to his focus on love and universal access to the divine, he did not advocate a Sufism devoid of obligatory Muslim rituals and beliefs. Rather, like al-Ghazali and Ibn al-‘Arabi, he sought to emphasize the importance of penetrating the spiritual reality that lies beneath the shell of ritual obligations though not in spite of ritual obligations.

Similarly, a contemporary Sufi shaykh and author, Muhammad al-Jamal, refers to the *haqiqa* (“inner reality”) as the sap in a tree and the *shari‘a* (“external reality”) as the bark. Thus, without the bark, the sap would have no life—a common perception among Sufis of various locales and epochs. Despite the many qualities that unify Sufis of different sorts, however, bitter disputes also characterize Sufi tradition. Taqi al-Din Ibn Taymiyya (d. 1328) is often portrayed as typifying such disputes and is sometimes considered one of Sufism’s fiercest detractors.

Taqi al-Din Ibn Taymiyya

Raised in Egypt and buried in Damascus, Ibn Taymiyya devoted his life in large part to religious reform to purify Islam from harmful accretions, including certain expressions of Sufism. Ibn Taymiyya's critiques became reappropriated in the 19th and 20th centuries with the rise of revivalist movements. Ibn Taymiyya, however, believed in authentic expressions of Sufism, and evidence suggests his membership in the Qadiriyya Sufi order. He censured particular Sufis and Sufi practices, but he also espoused the virtues of a correct Sufism. al-Ghazali did not shy away from censuring these so-called Sufis either, whom he viewed as hypocrites. In this way, al-Ghazali and Ibn Taymiyya shared much in common, although many of their views regarding how Sufism should be defined and practiced are incompatible.

Ibn Taymiyya was intimately concerned with those aspects of Sufism that dealt with ethics, purification of the soul, and intensified expressions of Muslim piety, though he rejected wholeheartedly other expressions of the tradition. Forms of audible *dhikr*, tomb visitation, music, pantheistic conceptions of God, and antinomian practices were anathema to the Sufism of Ibn Taymiyya. But he believed in an otherwise pure Sufism, a praiseworthy expression of Muslim piety.

In the face of polemics, Sufism nonetheless continued to spread and develop throughout the globe from Ibn Taymiyya's time onward. During the 20th century, a new awareness of Sufism began to disseminate thanks to translations of Sufi texts, particularly into English and European languages. Studies of Sufi texts in numerous languages also became prevalent. Because Arabic and Persian have historically been the primary languages of Muslim literature, Sufi texts have generally been unavailable to readers uninitiated in Arabic and Persian. Sufism has flourished, though, outside the boundaries of the Arabic and Persian languages.

Since the early stages of Islam, there have been Sufis where there have been Muslims. Therefore, "Sufi" literature can historically be found in a plethora of languages, and Sufi orders themselves are found throughout the globe. Sufis and Sufi orders have left particularly significant imprints from West Africa, through western and eastern Europe, to Central Asia, the Indian subcontinent, and Southeast and East Asia. Geographical and

temporal diversity have subsequently and inevitably made expressions of Sufism diverse and dynamic.

Sufism in the Modern World

Since Sufism's formative and classical periods, the tradition gave birth to renowned poets such as Abd al-Rahman Jami (d. 1492), who wrote the much esteemed story of mystical love, *Yusuf and Zulaykha*, based on the 12th chapter of the Qur'an. Sufi movements of penetrating influence, such as the Tijaniyya order, would also play decisive roles in anticolonial movements in North Africa in the 18th and 19th centuries. And the revered Algerian shaykh, Ahmad al-'Alawi (d. 1934), became an important catalyst for bringing Sufism to the United States; he was the focus of a study, *A Sufi Saint of the Twentieth Century*, by the British scholar Martin Lings, also a Sufi.

Whether discussing Britain or other "Western" countries inhabited by Muslims, though, one must remember that Muslims occupied Spain in the beginning of the eighth century, which means that "Islam in the West" is not a modern phenomenon. As for the United States, however, records of Sufism are absent prior to the early 20th century. There were many African Muslim slaves during the colonial period in what is now the United States, and those Muslims may very well have had Sufi ties, but there is no conclusive evidence to support this hypothesis. Because expressions of Sufism have almost always followed Muslims, though, it would be strange if those Muslim slaves were *not* affiliated with Sufis.

The first documented arrival of Sufism in the United States dates to the beginning of the 20th century, when a musician named Hazrat Inayat Khan (d. 1927), a member of the Chishtiyya order, arrived from India in 1910. Khan gave rise to a new chapter in Sufism and espoused a movement specifically devoid of traditional Islamic ritual obligations, including fasting, praying five times a day, and pilgrimage to Mecca (Makkah). His influence has remained significant, and he retains followers primarily in the United States and Europe. More traditional expressions of Sufism have come to the United States as well, including the Shadhuliyya, Naqshbandiyya, and Qadiriyya, among others. In

some Muslim countries, however, such as Turkey, where Sufism has traditionally thrived, Sufism has become technically illegal, though Rūmī's tomb continues to be a major source of pilgrimage, even if it is officially considered a "museum" by the Turkish government. In the face of challenges, Sufism remains a globally present tradition, and in its various expressions, it continues to spread in numbers and in controversy.

As a source of both inspiration and heresy, Sufism will continue to be a relevant and significant component in the religious landscape of Islam. Aspirants on the Sufi path will without doubt continue inquiring into the depths of Islam, seeking to realize their ethical potentials and to know the meaning behind the forms, while looking for a reality that may or may not have a name.

SUICIDE BOMBING

A suicide bombing is a tactic in asymmetric conflicts, whereby an antagonist turns himself into an explosive device, via a suicide belt or vehicle, with the intent of killing himself and as many of the enemy as possible at the same time or nearly the same time without warning. Suicide bombings are rarely the work of lone agents; rather, they are implemented under the auspices of a sponsoring organization and are, typically, supported by a large network of handlers, cohorts, and publicists. They have occurred not only in Middle Eastern states and territories such as Israel, Afghanistan, Lebanon, Kurdistan, Iran, and Iraq but also in well over a dozen countries outside the region, where they are carried out by various organizations from the Tamil Tigers of Sri Lanka to the separatist groups of Chechnya and Sikh militants in India. Targets can be military, but they are most often civilian. Suicide bombings are now an institution and are increasingly employed as a standard component in unconventional warfare. Their symbolic import as antipolitical modes of expressing rage and grievance sometimes rivals their realpolitik value based on benefit-cost ratios or political efficiency.

The Japanese suicide attacker (*kamikaze*) and human torpedo (*kaiten*) of World War II seem to fit the definition of *suicide bomber* as employed in common parlance; however, unlike most present-day bombers, these agents were deployed by the official military organizations of nations. Many assassins from ancient times to the present can also be considered forerunners of the modern suicide bomber, particularly if the attacker dies or intends to die during the act or as a result of it. The assassin does not die by his own hand, however, and accordingly, the suicidal element is, technically speaking, absent. Despite some degree of historical precedence, suicide bombings are a contemporary phenomenon with global political, religious, and economic impact.

Given the simultaneity of suicide and homicide entailed in suicide bombings, the English term is inadequate, yet all attempts to replace it have failed. It is largely eschewed in the Islamic world, suicide being strictly forbidden in Islam. Muslims refer rather to acts of *istishhad* or *shahada*, "martyrdom," the latter term signifying also the testimony

of faith, one of the five pillars of the Islamic faith. The *shahid* (plural *shuhada*), or martyr, is one who dies *fi sabil Allah*, “on the path of Allah,” while the term *living martyr* refers to one who has accepted the command of martyrdom but for the moment remains alive. Although Hezbollah carried out numerous suicide attacks beginning in 1982 and lasting until the Israeli withdrawal from Lebanon in 1999, widespread usage of the term *suicide bomber* in Western media began with the 1983 attack on U.S. Marine and French barracks in Beirut. Claimed by the Islamic jihad but thought by many to have been supported by Hezbollah and Iran, the attack resulted in the deaths of 241 American service people and 58 French paratroopers. Most suicide attacks that followed in its wake took place within the Israeli-Palestinian domain and were initially carried out by Hamas, although they soon became a tactic favored also by Fatah militants.

The most deadly of suicide bombings took place on September 11, 2001, when 19 jihadists associated with al Qaeda commandeered four passenger planes and then used them as manned missiles against New York’s World Trade Center and other sites. The reasons cited by al Qaeda for the attack include the occupation of the lands of Islam and the presence of non-Muslims in Arabia, particularly their over-close proximity to Mecca (Makkah). The attack on 9/11 resulted in the collapse of the twin towers as well as numerous nearby structures, with more than 2,700 fatalities. Among the casualties were citizens from more than 90 nations. The economic ramifications of the act were vast and global, amounting to billions of dollars, and the political ramifications, greater still. The American response included the enactment of the Patriot Act and the invasion of Iraq and Afghanistan. Since 2003, vehicle-borne IEDs (improvised explosive devices) and suicide bombings in Iraq have caused thousands of deaths, and the vast majority of these have been of Iraqi civilians who are their direct targets.

There does not seem to exist a single profile for a suicide bomber, although many attempts have been made to create one in terms of age, socioeconomic position, marital status, level of education, and psychological parameters. In addition, it is difficult to ascertain precisely the reasons why some groups foster suicide bombings, while others

eschew them. Typically, there is a strong and explicit ideological or religious component in both the ideation of the attacker and the program of the sponsoring organization, and the attack is prepared for and sometimes rehearsed in highly ritualistic if not cultic fashion, particularly if suicide bombings represent a novel method within the society in question. Of the two—political ideology or religion—the latter has, generally, proven to be a particularly powerful cohesive element and motivating factor, although various mixtures of nationalism and religiosity have also shown themselves to be potent. Whenever religious imperatives are cited as the major motivation for an attack, it is likely that ambitions going beyond mere territory are involved. In the case of the Islamists, the goal of a political entity that transcends nationalism while retaining notions of sovereignty and conquest finds divine imprimatur and catalyzing force in the resurrection of the scriptural notion of the *umma*, the worldwide community of Muslim believers.

Asymmetry of power in conventional military terms is an invariant feature of all suicide bombings to date, but this element is less clear-cut than it might seem in the age of chemical, nuclear, and biological warfare. With the advent of new technologies and new media, the conventional distinction between war and terror has become increasingly blurred. The waging of war has always entailed the possibility of killing and dying at roughly one and the same time; however, the survival of the soldier has long signified in and of itself a fundamental victory. In contrast, the distinguishing mark of a suicide bomber is certain death through a radical inseparability of human agency and means of weapons delivery. Judgment of suicide bombings depends largely on religious and cultural understandings of suicide as well as attitudes toward the acceptability or unacceptability of targeting unmarked victims. In those cultures in which suicide is prohibited or frowned on, emphasis is placed on the homicidal element of the act. The use of strong explosives serves to make the religious prohibition of suicide less problematic by ensuring a virtual simultaneity of suicide and homicide; however, this type of death is also theologically problematic and must be reconciled with prevailing concepts of postmortem corporal integrity through innovative exegeses of scriptural texts

and cultural traditions, particularly in societies in which a doctrine of the full resurrection of the body remains operative.

Organizations that sponsor suicide missions utilize traditional media such as newspapers, magazines, and newscasts as well as theater and film to advertise and disseminate their goals and ideology to the general public on whose support they depend. Political ephemera and underground media, including leaflets, audiotapes, videotapes, and graffiti, are employed for the same purpose, generally with far greater efficacy, and are also used to recruit, reward, and commemorate bombers. Increasingly, sponsor organizations and their armed wings possess strong web presences and make use of a variety of social media as well. Themes of glory, *amor fati*, revenge, martyrdom, self-sacrifice, and apocalypse are, typically, encoded even in new media in highly formal historical modes of expression, including poetry, song, and scriptural exegesis.

SUNNĪ ISLAM

Sunnī is a term designating the largest sectarian grouping of Muslims today, who are sometimes identified as the “orthodox.” Sunnī Muslims, or “Sunnīs,” comprise roughly 85%–90% of the world’s Muslim population and can be found all over the globe. What can be called the Sunnī understanding of Islam gradually emerged in relation to

other Muslim sectarian groups, specifically the Shi’i (*Shī’a*) and Kharijites (*Khawarij*), and became recognizable as a distinctive orientation beginning in the third century AH/ninth century CE. The term *Sunnī* is short for *Ahl Al-Sunna wa Al-Jama* (“People of the Sunna and the Community”), indicating that the Prophet’s authoritative example and the preservation of the unity of the *umma* (“Islamic community”) are two important cornerstones of what came to constitute Sunnī Islam. Of course, Sunnī Muslims have continued to interpret and elaborate on their particular understandings of Islam, such that a truly astonishing variety of doctrines, interpretations, and practices exist among Muslims who consider themselves Sunnīs. Nevertheless, certain broad characteristics typify those who fall under the rubric of Sunnī: recognition of the first four caliphs as legitimate, refusal to attribute any special political or religious role to the descendants of Alī ibn Abī Tālib (the Prophet’s son-in-law, regarded as the first legitimate leader of Shi’i, d. 40 AH/661 CE), adherence to one of the four recognized legal schools, and broadly distinctive positions on legal theory and theology.

Historical Development

The Question of Leadership

The foundations of Sunnī Islam were laid after the death of Prophet Muhammad, though something discernable as Sunnī Islam proper would not fully mature until several centuries later and after much development. According to Islamic sources, on the Prophet’s death, disagreements surrounding the succession to Muhammad split the early Islamic community into those who supported the caliphate of Abu Bakr al-Siddiq (d. 13 AH/634 CE), a prominent early companion of the Prophet and member of the Prophet’s tribe of Quraysh, and those who regarded Alī’s familial relation to Prophet Muhammad as giving him exclusive rights to rule the Islamic community. Those who supported Alī and later looked to his family for leadership of the Islamic community became the Shi’i. After Abū Bakr, ‘Umar b. al-Khattāb (r. 13–23 AH/634–644 CE) and ‘Uthmān b. ‘Affān (r. 24–35 AH/644–656 CE), both Qurayshīs, successively led the Islamic community as caliphs before a mutiny resulted in ‘Uthmān’s killing and prompted

sections of the Islamic community to call on Alī to assume leadership. When he did assume leadership, however, Alī faced significant resistance to his rule. During this period, known as the first Islamic civil war or *fitna*, Alī faced resistance from ‘Ā’isha, Abū Bakr’s daughter and wife of Prophet Muhammad, who along with her supporters lost to Alī’s army at the Battle of the Camel in 35 AH/656 CE. Alī then faced ‘Uthmān’s kinsman, Mu‘āwiya b. Abī Sufyān, the governor of Damascus, who claimed that Alī had not punished the killers of ‘Uthmān and who refused to recognize Alī as caliph. Mu‘āwiya and his army escaped defeat at the Battle of Ṣiffīn in 36 AH/657 CE by enticing Alī to accept arbitration of the battle, an event that shortly thereafter caused a significant portion of Alī’s army to desert him. These secessionists became the Kharijites, who rejected both ‘Uthmān and Alī and elected one of their own, ‘Abd Allāh b. Wahb al-Rāsibī, a non-Qurayshī, to lead them as their imam. After a Kharijite murdered Alī, Mu‘āwiya assumed leadership of the Islamic community, ushering in the Umayyad Caliphate.

Despite the fractious nature of early Islamic history, Sunnīs came to look on the first four leaders (Abū Bakr, ‘Umar, ‘Uthmān, and Alī) as especially pious and legitimate, referring to them as the “rightly guided” caliphs (*al-khulafā’ al-rāshidūn*). Unlike Shi’i, Sunnīs did not posit any special religious or political role for Alī beyond his being one of the rightly guided caliphs. Likewise, Sunnīs did not place any extra significance on his familial relation to Prophet Muhammad or look to Alī’s progeny, known along with Alī as the imams, for religious or political guidance. The terms *caliph* and *imam*, for Sunnīs, both refer to the political leader of the *umma*. Shi’i and Kharijites, however, tend not to use the term *caliph*, and instead use *imam* as a way of distinguishing their particular leaders and their specific view on leadership, from the Sunnī caliphs and the Sunnī conception of the caliphate (for all Muslims, the term *imam* also designates a leader of prayers in a mosque or a particularly authoritative religious scholar). Moreover, Sunnī jurisprudence later codified the requirement that the caliph be from the tribe of Quraysh, in contrast to the Kharijites who accepted (in theory) any pious Muslim as leader and rejected as illegitimate ‘Uthmān and Alī. Abū al-Ḥasan al-Mawardī (d. 450 AH/1058 CE) penned the classic work on the

Sunnī view toward the caliphate, *al-Aḥkām al-Sultāniyya* (The Ordinances of Government).

Legal and Theological Foundations

Along with the issue of leadership, distinctive answers to legal and theological questions helped form what became Sunnī Islam. Mu‘āwiya, who remained unpopular with many Muslims, nevertheless bolstered his claims to legitimacy with appeals to the principle of *jamā‘a* (preserving the unity of the Islamic *umma*). In the wake of the first civil war, this approach proved effective and continued to animate (in part) Umayyad claims to legitimacy in the face of the many rebellions that transpired during their roughly 100 years of rule. When a Shi’ite-inspired revolution finally toppled the Umayyads in 132 AH/750 CE, installing the ‘Abbāsids as the rulers of Islamdom, the term *jamā‘a* came to imply the unity of the community under the leadership of the ‘Abbāsīd caliphs, in opposition to those Shi’i and Kharijites who refused to recognize their legitimacy. In this way, the concept of preserving unity came to be associated with those who would become known by the term Sunnī. Among jurists, the notion of communal unity found its reflection in the concept of *ijmā‘*, the consensus of the religious scholars on a point of law, as one of the legitimate sources of legal reasoning after the Qur’an and *sunna*.

At the same time, the ‘Abbāsīd era witnessed among the nascent Sunnī movement a narrowing of the concept of *sunna* to denote the example of Prophet Muhammad almost exclusively. The pre-Islamic concept of *sunna* originally indicated the authoritative conduct of a person: pre-Islamic northern Arabs, for example, were said to have looked to Ismail (Ishmael) as an exemplar of pious behavior as early as the fifth century. In the early Islamic period, the notion of *sunna* included a wide field of persons considered worthy of emulation: Prophet Muhammad and his companions in particular, but for some Muslims, even the Umayyad caliphs were sources of *sunna*; the Shi’a included Alī and some of his progeny among those considered worthy of emulation. In the ‘Abbāsīd era, the jurist al-Shafi’i (d. 204 AH/820 CE) restricted the notion of legitimate *sunna* to Prophet Muhammad alone (though in reality, several of his companions continued to function as sources of

emulation). al-Shafi'i's notion of Prophetic sunna became the standard for subsequent legal thinking and was adopted more or less by the four legal schools that came to be accepted as part of the Sunnī fold: the Shāfi'ī (named after al-Shafi'i), Mālikī (after Mālik b. Anas, d. 179 AH/795 CE), Ḥanbalī (after Ahmad Ibn Ḥanbal, d. 241 AH/855 CE), and Ḥanafī (after Abū Ḥanīfa, d. 148 AH/767 CE). Today, the Shāfi'ī school is prevalent in Southeast Asia, the Mālikī in Africa, and the Ḥanbalī in the Arabian Peninsula. The Ḥanafī school is perhaps the most prevalent due to its adoption by various Islamic states such as the Ottomans and Mughals and can be found throughout Islamdom.

Concurrent with changes in the concept of the sunna, 'Abbāsīd-era jurists gradually did away with the notion of personal opinion (*ra'y*) on points of law in favor of analogical reasoning (*qiyās*), a form of legal judgment (*ijtihād*) that seeks equivalences with legal principles that have been established by the Qur'an and sunna. Together with the Qur'an, Prophetic sunna, and *ijmā'*, *qiyās* became one of the four "sources of law" (*usul al-fiqh*) that form the basis for Sunnī Islamic legal thought. However, it is important to note that the "sources of law" are recognized by non-Sunnīs as well, and thus, the distinctive Sunnī approaches to law are often a matter of emphasis rather than absolute difference. For example, Shi'ite Muslim jurists look to the sunna of their imams in addition to the Prophetic sunna as sources of law and devotion. Shi'i also tend to favor the *ijtihād* of the imams, or that of a jurist considered the imam's representative, over *ijmā'*. Moreover, both Sunnī and Shi'ite Muslims practice the "five pillars" of Islam (with some minor differences in actual practice).

Along with the flowering of Islamic jurisprudence (*fiqh*), the 'Abbāsīd era likewise witnessed the maturation of Islamic theology (*kalām*). In the Umayyad period, a variety of religious questions, such as the nature of belief, the status of the unrepentant sinner who professes Islam, the character of religious leadership, and the freedom or determination of human action, arose as the result of the actions (or inactions) of various sectarian groups. As 'Abbāsīd-era theologians continued to debate these questions, one group of rationalist theologians, the Mu'tazila, enjoyed caliphal support between 189–218 AH/833–847 CE for their doctrine of the created Qur'an. In what became

known as the *mihna* (ordeal or inquisition), the caliph al-Ma'mūn questioned, flogged, imprisoned, and even tortured those who refused to accept that God's speech, the Qur'an, was created in time and separate from God's essence. Among those imprisoned and tortured was Aḥmad Ibn Ḥanbal, the eponymous figurehead of the Ḥanbalī legal school and associate of those who eschewed formal theology in favor of textual guidance in questions of practical piety. This group looked to the Qur'an but also to the reports about what Prophet Muhammad said, did, or silently confirmed—the Hadith. The People of Hadith (*ahl al-ḥadīth*), as they came to be known, reflected popular discontent with the intellectualism of the Mu'tazilites by championing a more accessible interpretation of Islamic doctrines, including the notion that the Qur'an was eternal, coexistent with God. The cruelty of the *mihna* harmed the popularity of the Mu'tazilites and bolstered the position of the *ahl al-ḥadīth*.

Yet it was the Ash'arī school of theology, founded by a former Mu'tazilite named Abū al-Ḥasan al-Ash'arī (d. 324 AH/926 CE), that gradually replaced the Mu'tazila by defending traditional Islamic beliefs using theological methodology. Al-Ash'arī argued that God created all action, including human action, but that human beings nevertheless possess the ability to act (and thus, to be judged for their actions) through a process called "performance" (*iktisāb*). Though some nascent Sunnī Muslims followed another school of theology—that of Abū Maṣū' al-Māturīdī (d. 333 AH/944 CE)—by the middle of the 4th century AH/10th century CE, the essential ingredients of Sunnī understandings of Islam were in place: the popular piety of the People of Hadith, the four legal schools, the theologies of al-Ash'arī and al-Māturīdī, and the ideal of Islamic unity promoted by the 'Abbāsīds.

Various written creeds (singular *'aqīda*) testify to the emerging (and continuing) articulation of Sunnī Islam: the *Fiqh Akbar* I and II, both ascribed to Abū Ḥanīfa; the *Waṣīya* (Testament) of Abū Ḥanīfa; *al-Ibāna 'an Usūl al-Diyāna* (Clarification of the Foundations of Religion) by al-Ash'arī; the *'Aqīda* of Abū Ja'far al-Ṭaḥawī; al-Taftāzānī's commentary on al-Nasafī's *'Aqīda*; and al-Jurjānī's commentary on al-Ijī's *al-Mawāqif* (The Stations). Also significant to the elaboration of Sunnī Islam

were works of heresiography—encyclopedic manuals that sought to identify the doctrines and practices of the “saved sect” (meaning, for Sunnī authors, the Sunnīs) in comparison to those that were to be damned. Important heresiographical works from the Sunnī tradition include al-Ash‘arī’s *Maqālāt al-Islamiyyīn wa Ikhtilāf al-Muṣallīn* (“The Discourse of the Proponents of Islam and the Differences Among the Worshippers”), al-Baghḍādī’s *al-Farq bayn al-Firaq* (“The Differences Between the Sects”) and al-Shahrastānī’s *Kitāb al-Milal wa’l-Niḥal* (“The Book of Religions and Sects”). These creeds and heresiographies attempt to create minimum standards for what constitutes Sunnī Islam and in the process seek to promote Sunnī Islam as the “orthodox” form of Islam. However, the conceptual range of what can be said to constitute Sunnī forms of Islam combined with a lack of centralized authority to ultimately fix doctrines and practices complicates the idea of “orthodoxy” as such. Indeed, the term Sunnī might more fruitfully be understood as an umbrella concept that allows for considerable leeway in its actual application.

Modern Developments Among Sunnī Muslims

Many of the central concepts of Sunnī Islam have evolved and continue to develop in light of modern conditions in which Sunnīs find themselves. Specifically, contemporary Sunnī thought has been conditioned by the experience of colonialism, which convinced many thinkers of the need to reform or revive various aspects of Islam long cherished as central to Sunnīsm. Furthermore, Sunnī Muslims now live in an age dominated by globalization: Travel and an easier flow of information have created both opportunities and crises for Sunnī Muslims. Important to Sunnī responses has been a tendency among some Muslims to look to the earliest era of Islamic history, the time of the pious forefathers (*salaf*), for inspiration and guidance. Equally important to contemporary expressions of Islam have been notions of secularism, reason, and natural law.

Final abolition of the caliphate by the Turkish Republic in 1924, for example, brought renewed attention to the issue of legitimate Sunnī Islamic government. One prominent thinker, Muhammad

Rashīd Riḍā (d. 1935), had already written in 1923 of the idea of the Islamic state (*al-ḥukuma al-Islamiyya*), which would rejuvenate the caliphate by placing a supreme *mujtahid* (legal expert) at its head, ruling in conjunction with a consultative council (*shura*). In counterpoint to Riḍā, ‘Alī ‘Abd al-Raziq (d. 1966) argued in 1925 against the idea that the Qur’an and sunna required a specific form of government, thus, leaving room for Muslims to choose any form of government that suited them. ‘Abd al-Raziq faced criticism from the scholars of Al-Azhar University, a bastion of Sunnī learning, who banned his work. In the late 1920s, al-Ḥassan al-Banna (d. 1949) founded the Muslim Brotherhood (*al-ikhwān al-muslimīn*), which aimed at the re-Islamicization of Egyptian society, culminating in an Islamic state. Although al-Banna was killed and the movement persecuted, the Muslim Brotherhood with its ideal of political transformation became ensconced in most Arabic-speaking countries. The Brotherhood’s near parallel in Pakistan, the Jamaat-e-Islami (Islamic Party) founded by Abū al-A‘lā al-Mawḍūdī (d. 1979), focused on the (re)introduction of Shari‘a through an Islamic state—a project that enjoyed state support for a time but was never fully realized.

Saudi Arabia followed an altogether unique political path, with the family of Sa‘ud establishing a monarchy based on the dramatically reformist teachings of the 18th-century personality Muhammad Ibn Abd al-Wahhab (d. 1792). The followers of Ibn Abd al-Wahhab, the Wahhabis (who were originally considered outside the fold of Sunnī Islam), saw themselves as purifying Islam of illegitimate innovations, especially Shi‘ism and the Sufi expressions of Islam, and basing themselves more completely in the Qur’an and sunna (often by rejecting *ijmā‘* and *qiyās*). Contemporary Wahhabi thought has been split between a reformist branch (associated with the monarchy) aimed at bringing Saudi society and law more in line with global norms and an isolationist wing that views these norms either as irrelevant in the face of God’s perfected law or as dangerous innovations that have no place in an Islamic society.

Since the 18th century, many Sunnī Muslims have also reinvestigated the role that reason should play in the realm of law and theology. Early Sunnī thinkers such as Rifa‘a al-Taḥṭawī (d. 1873), for example, found harmony between natural law and

the Shari'a, as did later reformers like Muhammad 'Abduh and Sayyid Aḥmad Khan. In many cases, reformers have called for a revitalization of *ijtihād* to provide religiously sanctioned solutions to modern problems, as opposed to relying on previously determined legal norms. 'Abduh, for example, advocated a reasoned comparison of the four Sunnī legal schools (as opposed to following only one) when deriving legal decisions. Intellectuals such as Muhammad 'Imāra, Fazl ur Raḥman (d. 1988), and Ḥasan Ḥanafī have argued for a new rationalism among Sunnī Muslims, with Ḥanafī rejecting theology and advocating notions of human freedom and progress.

Although Sunnīs and Shi'i have at times in their history experienced bitter polemics and intercommunal violence, on the whole, relations have been amicable. Recent decades have witnessed an increase in tensions between Sunnī and Shi'ite Muslims as the result of the Iran-Iraq and Gulf wars. While outright violence has only been advocated by extremist elements in both groups (with tragic consequences in Iraq, Afghanistan, and Pakistan), popular polemics have mushroomed in Internet chat rooms, bookstores, and on television throughout the Islamic world. Fears of a "Shi'ite Crescent" from Iran to Lebanon have found some traction among Sunnīs, and it remains to be seen whether sectarian identity will continue polarizing the Islamic world or return to its status as a secondary concern among Muslims.

SURINAME

Now a republic on the northern coast of the South American continent, Suriname was until 1795 exclusive property of the Suriname Society and then a Dutch colony. Colonization, immigration, and missionary activities determined the unique religious makeup of the country. Prior to independence in 1975, a great deal of Suriname's culture and religious practices migrated to the Netherlands. This circumstance further contributes to the relevance of Suriname as an example of the globalization of religion.

The first colonization was by the British after 1650. In the Anglo-Dutch wars later in that century, the Dutch conquered this area around the Suriname River—a location settled in 1674. Since then, Suriname has been private property. The Indian population with its indigenous religion was soon outnumbered by African slaves and marginalized by the new rulers. The religions of the slaves developed into Winti and included African and Christian elements. Among the first settlers were Sephardic Jewish plantation owners, who fled from Pernambuco (Brazil) after the Portuguese had reconquered this city; later their community gained members from Amsterdam Jews. These settlers are responsible for the first stone synagogue in the New World. Already in 1735, the Moravian Brothers (*Herrnhutters*) arrived via Zeist (the Netherlands) in Suriname, but only after 1830 did the plantation owners allow them to convert the slaves. Their pietistic message about the equality of man before God had great appeal. The Calvinist rulers suppressed Catholic missionary activities, but when the Catholics gained freedom in the Netherlands, the mission in Suriname was handed over to the Redemptorist order in 1866.

Table I Religious Composition of Suriname

Christian	40.7%
Hindu	19.9%
Muslim	13.5%
Traditional and other religions	5.8%
No religion	4.4%
No religion given	15.7%

Source: Suriname Census 2007.

After the abolition of slavery in 1863, the Dutch government recruited labor power in Northern India and Indonesia, which further contributed to the religious diversity in Suriname: The country gained a substantial proportion of Hindu and Muslim inhabitants. In the last decades of the 20th century, Charismatic Churches entered the country.

Table 1 gives the religious composition of Suriname as of 2007.

Suriname is often seen as an example of a country where religions coexist peacefully. Indeed, churches, mosques, and synagogues are situated close to each other, and various religious feasts are public holidays. The historic center of Paramaribo with its many religious buildings is placed on the world heritage list.

The religious history of Suriname is itself an example of the globalization of religion, but even more so prior to independence in 1975. Many Surinamese profited from the possibility to migrate to the Netherlands, and so did their religion. As a consequence, the Netherlands were confronted with substantial minorities of Dutch-socialized Hindus and Muslims. The Moravian Brothers transformed from a White into a Black church organization. And at a time of increasing liberalization, the Catholic Church was confronted with more traditional believers.

SUTRAS

Sutras are important texts in the Hindu, Jain, and Buddhist traditions. In the northwestern region of India, during what is commonly regarded as the late- or post-Vedic period (roughly the seventh century BCE through the fifth) and prior to the advent of literacy, there developed a method of instruction for facilitating the memorization and oral transmission of teachings of various branches of knowledge that took the concise form of aphorisms, or a collection of them, known in Sanskrit as *sutras* (lit. “thread”). By organizing teachings into a more succinct and assimilable structure, the *sutra* emerged as a new genre valued precisely for its ability to codify and distill the essence of a given subject of study into a systematic sequence of mnemonic pronouncements that made possible the progressive acquisition of vast amounts of knowledge. In and of themselves, however, these compendia of terse, formulaic statements were often far too condensed, or else too technical, to be meaningfully understood by the novice who relied, instead, on the commentarial traditions (*bhāṣya*) and exegetical insights amplified by a teacher (*guru*). For this reason, a measure of the degree by which a particular *sutra* gained authority within a given tradition or social context is the weight of commentarial and subcommentarial material attached to it. One of the foundation texts of Indian philosophy, for example, the *Yoga Sutra* attributed to Patañjali, has exercised the interpretative skills of scores of scholars and practitioners for nearly two millennia and continues to inspire new translations and commentaries, both in India and in the West, where physical, psychological, and spiritual discipline remain a perennial concern.

Ritual and juridical matters are addressed in the earliest collections of aphorisms, the *Kalpa Sutras*. They form a part of the auxiliary sciences known as *vedāṅga* or “limbs of the Veda” and are divided into three groups: The *Śrauta Sutras* outline the ceremonial guidelines attending the public performance of solemn rites; the *Gṛhya Sutras* focus on the private sacramental rites of the householder; and the *Dharma Sutras* deal more broadly with moral and social concerns attending each stage of life (*āśramas*) from conception to cremation, including duties ascribed to the various classes of

society, proper occupations, rules of conduct, hospitality protocols, daily oblations, dietary regulations, purification rites, punishments and penances, and funerary rites. These were later elaborated on in the Dharma Shastra and served as the basis of Hindu law. But it was the comprehensive linguistic work of Pāṇini, the famed Sanskrit grammarian, that elevated the sutra to its highest level of sophistication.

With the emergence of Jainism and Buddhism during this same period, the apothegmatic precision of the sutra assumed a more extended expository and homiletic style. The *Ācārāṅga Sutra*, regarded as the oldest work in the extant Jain canon, combines rhetorical lyricism with a host of trenchant observations into human nature. Similarly, the exploration of a viable lifestyle and practice for lay and monastic disciples is a prominent theme in the sutra (*sutta* in Pāli, or “discourse”) section of the Theravada Buddhist canon found in South and Southeast Asia. The technology of writing on birch bark and palm leaves coincided with the rise and development of Mahayana Buddhism and facilitated its spread to Central and East Asia, where the translation and copying of sutra literature became a major preoccupation. In this context, the manuscript itself became an object of worship. The veneration of sutras also inspired a rich and varied tradition throughout the Buddhist world of adorning and illuminating manuscripts. In modern times, expressing reverence for a sutra is central to the global appeal of various Nichiren Buddhist sects, which have popularized a vestige of the aural experience of the sutra by emphasizing devotion to the Lotus Sutra and the efficacy of repeatedly chanting its name—*nam-myōhō-renge-kyō*.

SUZUKI, D. T. (1870–1966)

Daisetz Teitaro Suzuki was undoubtedly more influential than any other single individual for the popularization of Zen in the West in the early and mid-20th century and thus an important figure in the globalization of religion. Fluent in English and other languages as well as his native Japanese, his many translations, essays, and lectures helped make *Zen* a household word by the 1950s.

Although never a Zen priest or monk in the strict sense, Suzuki received intensive Zen training early from the famous monk Shaku Soen, who also represented the tradition at the important World’s Parliament of Religions in Chicago in 1893. There, he recommended Suzuki to Paul Carus, a publisher who wanted help in translating Asian spiritual classics. Suzuki spent 1897–1909 in America living and working at Carus’ home in LaSalle, Illinois. He married the American Beatrice Lane in 1911.

After 1909, Suzuki spent the remainder of his long life teaching, writing, and lecturing both in Japan and abroad. His interests included not only Zen itself but also Shin (Pure Land) Buddhism, the Christian mystics Emanuel Swedenborg and Meister Eckhart, and the Japanese traditional Zen-related arts. It is Suzuki’s interpretation of Zen, however, for which he is best known. In his view, the keynote of Zen is nonduality, the oneness of reality, which he contrasted with a Western emphasis on duality, self and others, right or wrong, and the like. Zen oneness is beyond the power of words to define, since words are intended to make distinctions; it can only be realized, in the experience called *satori*, “surprise.” Indeed, Suzuki sometimes went so far as to claim that Zen is really this experience, and is not Buddhism, not philosophy, not religion.

Drawing on Zen’s relation to Chinese Daoism as well as Buddhism, Suzuki stressed the lineage’s naturalism: the high place it gives harmony with nature, and realization in the context of living a natural life, including manual labor, and in the

Japanese traditions of painting, gardens, architecture, and even swordsmanship. Occasionally, verging toward the chauvinistic Japanese nationalism of his times, he alleged that Zen was now more highly developed in Japan than elsewhere and was the essence of Japanese culture.

Suzuki's interpretation of Zen history and meaning is to a considerable extent his own. This has subjected him to some criticism, but others have praised him as an innovative contributor to Zen's evolution, especially as a viable spiritual path for the West. Suzuki's real legacy must be the Western Zen vogue of the 1950s, when he taught for several years at Columbia University, and his influence on distinguished writers such as Carl Jung, Thomas Merton, Erich Fromm, Alan Watts, Allen Ginsberg, Gary Snyder, and Jack Kerouac was most strongly felt.

SWAMINARAYAN MOVEMENT

Swaminarayan Hinduism is an early 19th-century reform movement in Gujarat that is a significant transnational movement in the early 21st century. Sahajanand Swami (1781–1830) was a Brahman born in Chhapi, near Ayodhya, in North India, who traveled as a youth throughout India as a spiritual seeker before taking initiation and residence in Gujarat in 1802. As leader of a small band of world renouncers, he built temples, initiated *sadhus*, and preached reforms of conduct and theology that attracted followers at a time of social and political turmoil when the British were establishing control over Gujarat.

He codified his moral reforms in the 212 verses of the *Shikshapatri*. His followers take five vows:

(1) to practice nonviolence and not to eat meat, (2) to avoid all intoxicating drinks and drugs, (3) to avoid adultery and sexual impurity, (4) to respect the personal and property rights of others and not to steal, and (5) not to defile oneself. The *sadhus* who propagated his message and practices took more stringent ascetic vows to “renounce the world”: (1) celibacy and strict avoidance of women, (2) renunciation of family and social ties, (3) renunciation of attachment to objects of the senses, (4) nonattachment to money and material possessions, and (5) avoidance of pride caused by attachment to ego. He opposed the self-immolation of widows (*sati*) and the infanticide of girls.

The *sadhus* preserved his theology in the *Vachanamrit*, which follows the basic philosophy of modified nondualism of Ramanuja and the Krishna devotion common in Gujarat. He placed images of Nar-Narayana (Krishna and Arjuna) and of Lakshmi-Narayana in the two major temples in Ahmedabad and Vadtal. He received the title, Swaminarayan, and his images were placed in the temples. He adopted two nephews and appointed them and their descendents as householder *acharyas* to administer two dioceses with headquarters at the major temples in Ahmedabad and Vadtal.

Divisions later created new Swaminarayan groups. A *sadhu* named Shastri Maharaj left the Vadtal temple in 1906 and established the Bochasanwasi Akshar Purushottam Sanstha (BAPS) in the following year. He emphasized the strict discipline of Swaminarayan and the theological principles of Purushottam (the highest divine reality) and Akshar (the abode of god in the chief devotee). Muktajivandas Swami, a prominent *sadhu* in the Ahmedabad temple established the Swaminarayan Gadi. He rejected the claims of the householder *acharyas* to be legitimate successors of Swaminarayan and built a new temple in Maninagar. He died in 1970 in Bolton in the United Kingdom while visiting his followers. Dadubhai Patel and his brother, Bapabhai, separated from BAPS in 1960 and formed the Yogi Divine Society. The group rejects the authority of the BAPS leader and maintains an order of female ascetics who follow a discipline similar to male *sadhus*. These Swaminarayan groups have institutions, temples, schools, medical clinics, and other institutions in India, East Africa, Britain, the

United States, and other countries, attracting support primarily from Gujarati migrants.

SWASTIKA

The swastika (from the Sanskrit, “well-being”) is best known in the West for its 20th-century incarnation as part of Nazi propaganda. However, images of swastikas go back to ancient times. Some scholars trace the swastika as far back as the Neolithic Period in Asia Minor; it was certainly in widespread use in Europe by the Bronze Age. The dominant view is that the swastika originated in Asia Minor, then spread to India and Europe, although there is still considerable, lively debate on the details. Variations on the image can be found in architecture, pottery, decorative and utilitarian artifacts, coins, and clothing, often as a merely decorative ornament and at other times as a religious symbol.

The swastika conveys a wide variety of meanings. In ancient Indian traditions, it was generally associated with the sun. In the *Ramayana* epic, an image of a swastika appears on a ship, and over time, it became a widely recognized aniconic representation of Vishnu. Artifacts that included the swastika were found in ancient Greece (many images were found at the great excavation of Troy); the symbol seems to have been associated with fertility, although some scholars associate the image with death. In the Far East, the swastika has meant many different things, including representing the seventh Saint in Jainism and eternity in Chinese Buddhism. In the West, the symbol has had less symbolic value, usually conveying nothing more specific than a general wish for good luck. The swastika also appears in several Native

American tribes (especially in the Southwest), with varying interpretations.

In the modern period, one commonly finds swastikas throughout India and in other parts of South Asia, with a generally positive association. In Europe, linguists in the 19th century identified connections between Indic and European language families. Certain scholars used this information to argue for a link between the ancient Aryans and certain modern European communities. These scholars, believing that the ancient Aryans invaded northern India and conquered its indigenous peoples, argued that these Aryans were the ancestors of modern Germans. A kind of “folk nationalism” began to develop around the symbol. Eventually, the Nazi party tapped into this association and appropriated the swastika for its own use. Since the mid-20th century, the swastika has been associated with Nazi ideology broadly and anti-Semitism specifically, so much so that its use has been officially banned in certain cultural settings. The negative connotations currently associated with the swastika in the West are unfortunate, because they overshadow centuries of positive meanings.

The term *swastika* first appears in the Hindu epics and was later appropriated into English in the 18th century. The same image has also been called *fylfot*, meaning four-footed, as well as *gam-madion* or *Croix Gammé*. In certain contexts, the direction of the swastika (right or left facing) is insignificant. In other contexts, however, the direction changes the meaning of the symbol. For example, in Buddhism, the right-facing image signifies strength and intelligence, while the left-facing image signifies love and mercy. It is important to note that throughout the world, particularly in the East, the swastika frequently appears in combinations with other images.

SWAZILAND

Swaziland is almost completely surrounded by the Republic of South Africa, though its eastern border touches Mozambique. It is the smallest African country south of the Sahara, covering an area of approximately 17,000 square kilometers and with an estimated population of 1,123,913. Since the 1880s, globalization in the form of the arrival of Christian missionaries had a great influence on the development of religion in the Swazi Kingdom. Legend has it that one of the early kings of Swaziland (King Somhlolo) had a vision of a strange man with long hair who would bring two things into the country: *umculu* in one hand and *indilinga* in the other hand. *Umculu* is a Swazi word literally meaning something rolled up in a bundle and was interpreted to mean a book—in this context the Bible. *Indilinga* literally means a round, disc-like object and was interpreted to mean money. A voice directed King Somhlolo to choose the *umculu* above the *indilinga*, and so it came about that Christian missionaries were allowed to settle in Swaziland to begin their labors to convert the Swazi population into Christians.

Although there has been a breakdown in the relationship between some of the former Swazi kings and the missionaries from time to time, the missionaries have in general been successful in their endeavors to convert the majority of the Swazi population to Christianity. Nowadays, approximately 35% of Swazis are Protestant, 25% Roman Catholic, and 30% Zionists. Zionism is an African blend of Christianity and indigenous ancestral worship. The remaining 9% of the population practice other religions such as Anglicanism, Baha'ism, Methodism, Mormonism, Judaism, and Islam.

In 1996, there were attempts by Christian clergy to push for the constitutional recognition of Christianity as the state religion of Swaziland, but their attempts were foiled by the current King Mswati III who confirmed the equal status of all religions in Swaziland. In line with this viewpoint, section 20 of the 2005 Swazi constitution prohibits discrimination on the grounds of, among others, religion, and section 23 of the same recognizes that a “person has a right to

freedom of thought, conscience or religion,” which includes

- freedom of thought and of religion,
- freedom to change one’s religion or belief, and
- freedom of worship either alone or in community with others.

The constitution does allow for the limitation of one’s enjoyment of his or her religion by consent, national defense, public safety, public order, public morality, public health, and to protect the rights of others. Nevertheless, to date, the exact scope and meaning of these concepts have not been interpreted, and it is foreseen that the courts would have to play an important role in doing so in the future.

The requirement that new religious groups or churches have to register as nonprofit organizations with the Swazi Ministry of Home Affairs and that this can happen only when they can demonstrate that they are organized and in possession of substantial cash reserves might also hamper future effects of globalization on religion in Swaziland.

SWEDEN

The northern European Scandinavian country of Sweden has gone through a transformation from a poor agricultural society to an advanced industrial society in the latter part of the 20th century. Although the majority of Swedes belong to the Evangelical Lutheran Church of Sweden, profound changes have taken place in church-state relations, and traditional Christian beliefs are declining in an increasingly religiously diverse society.

In 2000, a law introduced in *Riksdagen* (Parliament) defined the Church of Sweden as an open, democratic Lutheran Evangelical church, free from the state. Although membership has declined from 95% of the population in 1973 to 80% in 2003, the Church of Sweden is the country's largest organization, with 7.2 million members in 2002. A large majority participates in rites of passage arranged by the Church. In 2003, 70% of all infants were baptized, and 58% of all weddings and 87% of all funerals took place there. However, only 39% of all 15-year-olds were confirmed.

Some of the declining church membership can be explained by demographic changes due to immigration. In 2001, 3% belonged to free churches (Pentecostalism the largest with 90,000 members), and 2% to Roman Catholic (160,000) and Orthodox churches (100,000). The largest community of faith outside the church practices Islam (250,000–300,000). Other religious minorities are Jews (20,000), Buddhists (10,000–15,000), Hindus, Sikhs, and Baha'i (a few thousand each).

Most Swedes have a formal lifelong affiliation with the Church of Sweden, but church attendance is low. In 2002, 1.3% of Swedes attended church on an ordinary Sunday. The church also offers additional services (musical or thematic), so that 10% of Swedes attend church once a month or more. Private faith is widespread. In 1997, 75% reported that they had some sort of faith. More than 30% believed that God exists inside human beings; 20% believed in an impersonal power and 18% in a traditional Christian God. The remaining had serious doubts (15%) or were atheists (12%). More Swedes have faith in "something" after death (36%) than in Christian notions of heaven and hell (10%). Many seriously doubt the idea of life after death (25%) or reject it (24%). Gender and generation affect religion. Swedish women are more religious than men. Atheism is primarily a masculine affair and more widespread among persons 50 years and older. Traditional forms of religion are slowly being replaced by a more personal and subjective form, especially among younger Swedes. Religion is changing in Sweden, not by disappearing, but by finding support in new forms among the younger generation.

SWITZERLAND

The central European country of Switzerland is characterized by linguistic, ethnic, and religious diversity. The Swiss "model," if it exists in terms of religion, is distinguished by a management of pluralism inscribed in the history of the country. A biconfessional land since the 16th-century Protestant reform, like Germany and Holland, Switzerland showed its inclination for independence from the German Roman Empire very early and adopted an imposing federal system regarding religious matters.

Remarkable statistical and analytical material is available in Switzerland due partly to an official record of the population's makeup that is taken every 10 years, including data about religion, and partly to numerous studies in religious sociology, a discipline that developed late but steadily in Switzerland. The last available figures from 2000 indicate that membership in the two largest Christian churches—Roman Catholic (41%) and Reformed (33%)—is largely stable, representing by far the majority in the confederation in spite of a slight erosion in practice and affiliation, which is more evident among Protestants than Catholics. The number of Muslims and Orthodox Christians has increased as a result of migrations, specifically from the former Yugoslavia, and the number of people not belonging to any religion has increased as well, as has been the case in all Western countries.

Changes in the religious domain occur at a slower pace than in social and cultural fields.

The federal state was born in 1848 and presently acts under the constitutional rules in effect since January 1, 2000, which brought the previous constitution of 1874 up-to-date. Apart from the reference to “the all powerful God” maintained in the preamble and the guarantee of fundamental religious freedom (Article 15), the federal constitution does not deal with religion.

Unlike in Germany, church tax in Switzerland can only be levied on a voluntary basis. The Swiss “model” consists, therefore, of a double architecture, involving two principles—one touching on the protection of fundamental liberties and representing the pole of abstract universality and the other, which is communitarian, based on respect for both historical tradition and the democratic ideal, pertaining to the majority.

This system thought of by some people as a complex balanced model, leads to what some people perceive as unfair treatment of minority religions. For example, concrete shortfalls exist in the recognition of rights for religious minorities. Switzerland is an example of unsteady laicization, a strange mixture of changes in the Christian West.

SWORD

The symbol of the sword is found in several religious traditions, including Islam and medieval Christianity, but it enjoys a significant position within the Sikh belief system. When the tenth and final living Guru, Guru Gobind Singh (1666–1708), declared the Sikh community to be the *Khalsa* (“the pure”), he established a normative code of personal and collective behavior. In the process, he prescribed every Sikh to have a visible identity, which meant carrying five items whose names start with the Punjabi letter *kaka* (*k*). These items include: unshorn hair (*kes*), comb (*kangha*, to keep the hair clean), a large steel bracelet (*karha*), sword (*kirpan*), and a pair of long shorts (*kachha*). Both men and women were expected to display this identity at all times and this was seen to represent their rebellion against the political persecution of the Mughal state.

The prominence assigned to the sword at this point in Sikh history had evolved over time. In his compositions, Guru Nanak (1469–1539), the founder of the Sikh tradition, often refers to the sword of knowledge (*gian kharhag*) that could cut through the snares of an ego-centered life in the world. The sword also came to be seen as an

instrument of divine justice in the temporal world. After the execution of Guru Arjan (1561–1606) on the order of the Mughal emperor Jehangir, the office of the Guru was seen increasingly as both temporal (*duniya/miri*) and spiritual (*din/piri*). A contemporary poet sings of Guru Hargobind (1595–1644) as carrying two swords—*miri* and *piri*—as part of this dual responsibility. By the period of Guru Gobind Singh, then, the preeminence of weaponry moved to the center of the Sikh imagination, and the arms were understood as the instruments that would bring welfare, justice, and victory (*degh, tegh, fateh*) to the world.

The injunction to carry a sword has been part and parcel of Sikh identity since 1700. However, there is a great variety in the sizes and shapes of these swords, and several names were assigned to them (*bhagauti, khanda, kirapn, saif, and talvar*). While the swords of Guru Gobind Singh's period are generally 3 feet in length, the length of the sword that is carried as part of the Sikh identity was reduced to about 1 foot in response to the British Arms Act of 1912. Movement overseas has also generated a new set of concerns for Sikhs who wish to carry a sword as part of their identity. They have attempted to litigate its ban in schools, courts, and public places and sought to carry it as part of their religious expression. There are efforts at compromises as well. In one instance, the Sikhs have offered to rivet the swords with the sheath so that children cannot use it as a weapon, and some have even suggested reducing its size to a few inches and wearing it around one's neck. The history of this important Sikh symbol continues to unfold in the global era.

SYMBOL

Abstractly, symbol is understood as a representation of a thing, concept, or quality. Typical symbols might be drawings, shapes, or any kind of object that represents an idea. Many symbols can be pictorially represented, though not all symbols

are visual in nature. Human society is full of symbols and symbolic systems that help us to make sense of our experiences. Symbols are purveyors of meaning. While symbols are not necessarily religious, some scholars have claimed that religions are particularly effective at marshalling symbolic codes to grapple with complex subjects, such as the meaning of life, death, suffering, love, and forgiveness. Examples of religious symbols might include the Christian cross, the Jewish Star of David, or the Muslim crescent moon and star. These symbols are recognized by people all over the world as referring to religious traditions that carry great meaning and cultural significance. Numerous secular symbols are also internationally recognizable. The American Statue of Liberty and the Soviet Communist Party's hammer and sickle convey myriad ideas, and not just for Americans or those who lived in the Soviet Union. All these symbols—religious and secular—represent larger ideas or even systems of ideas that are laden with meaning.

Scholars working in different fields have typically analyzed symbols within the context of their discipline's unique theoretical and methodological frameworks. Thus, scholars working within the fields of structural linguistics, cultural anthropology, and symbolic interactionism would not be expected to approach the study of symbols in precisely the same way. There are, however, certain basic characteristics of symbols that are commonly accepted. To illustrate the core features and functions of symbols, it is helpful to consider how symbols are different from other conveyors of meaning, such as signs.

Humans constantly interact with both signs and symbols, but the former do not embody meaning to the same degree as the latter. Consider a simple mathematical formula such as that used to determine the perimeter of a rectangle. If

$$P = 2L + 2W,$$

we know that *P* stands for perimeter, *L* for length, and *W* for width. The letters in this formula act as signs because there is a one-to-one correspondence in meaning. We do not interpret *P* in this formula as standing for a broad array of social meanings. Signs convey what the sociologist Wendy Griswold calls "simple meaning" because they have a single

referent, and they work through denotation, rather than connotation. According to Griswold, symbols, in contrast, connote, suggest, or imply a range of complex meanings that often evoke powerful emotions.

Another way of thinking about the difference between signs and symbols is to consider what people do when the telephone rings. We generally do not stop and inquire as to what the sound of a ringing telephone might mean. Rather, we take it as a simple cue, or sign, that someone is trying to contact us by telephone. Joel Charon explains our reaction to the telephone by noting that signs are usually distinguished from symbols in that humans do not give substantial meaning to signs or reflect on them but instead habitually respond to them. If we hear the telephone ring, we habitually answer it. When driving automobiles, people habitually stop at red lights because the red light conveys a simple meaning, "stop," that is not open to broad interpretation. According to Leslie White, another distinction between signs and symbols is the fact that symbolic exchange, or the intersubjective sharing of symbolic meaning, is a human activity. Other animals understand signs, but they are unable to grasp the complex meanings generated through symbolism. According to White, a dog may comprehend basic verbal commands, such as "roll over," but no nonhuman animal can be brought to any comprehension of "holy water."

Therefore, we can distinguish symbols from signs by noting that signs tend to have a single referent and convey simple meaning; they denote rather than connote; they are usually reacted to in a habitual or unthinking manner rather than interpreted; and they are understood by both humans and other animals. Symbols, on the other hand, have multiple referents and convey complex meaning; they connote rather than denote; they are actively interpreted instead of reacted to in a purely habitual manner; and their use and interpretation is a fundamental characteristic of human interaction.

People use and interact with symbols constantly to communicate and make sense of their surroundings and experiences. In fact, it would be impossible for human society to function without symbols of all kinds. Symbols are in some ways like signs in the sense that they help us navigate the social world, but unlike signs, they are laden with complex

meaning that is often contested or at least open to interpretation. While some symbols are subtle and concrete, many others stand for complex, abstract, or multifaceted concepts in the way a flag symbolically represents a nation. Thus conflict over symbols is common.

Moreover, while many symbols are understood almost universally, many others are quite specific to their immediate social and cultural environment. Take the example of laughing. While responding to a ringing telephone is fairly simple, knowing when to laugh in an unfamiliar cultural setting is not as easy. Laughing at a certain moment or laughing at a certain subject matter may be symbolically interpreted as rude or offensive depending on the meanings conveyed by laughter in that context. In other words, laughing can be understood as a complex symbol that does not mean the same thing to all people in all cultural contexts.

It is therefore important to recognize that the meanings associated with symbols are variable; symbols do not have the same meanings across all cultures, and their meanings can change over time. In fact, if the meanings associated with various symbols remained forever fixed or constant, cultural and social change would be almost impossible. While some symbols are more or less unique to particular cultures, globalization has allowed for symbolic diffusion on an unprecedented scale. The fact that symbolic meaning can shift or completely change is true even for symbols that are almost "universally" recognized as a result of these globalizing processes.

Take, for example, the Christian cross. The cross is recognized all over the world as the primary symbol of Christianity. Despite its near universal recognition, the cross connotes vastly different meanings to different groups of people. Moreover, these meanings can change over time. Scholars of syncretic religions have documented the processes by which symbols are sometimes appropriated and then reinterpreted in light of their incorporation into new cultural contexts. For example, the anthropologist of religion Leslie Desmangles explored the meaning of the cross for Haitian practitioners of Vodou (or Vodun), a Dahomean religion with roots in West Africa. Due to the historical influence of European Catholicism on Haitian society, many scholars believed that the

use of the cross in Vodou ceremonies was Christian in character. Desmangles, however, demonstrated that Vodouists did not interpret the symbol of the cross in the context of Christian theology but in the context of Dahomean mythology. Desmangles showed that Vodouists consider the cross a sacred object because for them it symbolizes *Legba* (the medium or intermediary) through which contact can be established with the realm of the *Loas* (spirits). Desmangles went further by arguing that the cross symbol in Vodou has its roots in African mythology, not in the Catholicism that entered Haitian culture during the colonial era. Regardless of its origins in relation to Vodou, this scholarship documented the complex and variable meanings that have been associated with the symbol of the cross.

Other anthropologists of religion, such as Clifford Geertz and Victor Turner, are widely recognized for their contributions to the symbolic analysis of religion. One of the goals of scholars of religion has been to understand the symbolic system through which the religious devotee understands his or her faith and the world. For both Geertz and Turner, this kind of understanding is best apprehended through a close analysis of the role of symbols in religious and ritual practice. While Turner concentrated on the multivocal nature of symbols in Ndembu ritual, Geertz focused on symbols as extrinsic sources of information that, when combined with other symbols into symbolic systems or complexes, form culture patterns. For Geertz, a symbol is any object, act, event, quality, or relation that serves as the vehicle for a conception, where the conception is the symbol's meaning. It is through careful interpretations of symbols that we attempt to comprehend the complex webs of meaning that characterize the human condition.

SYNAGOGUE

The term *synagogue* may refer either to a building that serves as a site for Jewish prayer and study or to a collective of Jewish community members who constitute a congregation. Since the origins of synagogue buildings, likely in the first century CE, they have formed an essential component of Jewish community life. Synagogues have facilitated the preservation and innovation of Jewish practices and traditions in historical and geographical contexts in which Jews often constituted a persecuted minority of the population. Today, synagogues exist all over the world and serve as important prayer and meeting spaces for Jews both in Israel and in the Jewish Diaspora.

In Greek, “*synagogē*” means “gathering” or “assembly,” and although it is usually translated as a gathering *place*, it can also refer to a gathering of people or objects. In the Septuagint, the Greek version of the Hebrew Bible, the term is used in reference to many different Hebrew words. The Hebrew term for assembly place is “*beit kneset*,” or “house of assembly,” but other terms used for “synagogue” include “*beit tefila*,” which means “house of prayer,” and “*beit midrash*,” which means “house of study.”

In the early centuries of its existence, the synagogue referred specifically to an assembly of Jews who congregated for what scholars might today deem both religious and nonreligious purposes. Such purposes have included prayer and rituals, studying and debating texts, discussions regarding legal decisions, economic exchanges, social events, and informal meetings. Early references to synagogues exist in the writings of Josephus and Philo

and in the Gospels of the New Testament. For instance, Josephus referred to a large gathering in Tiberias, and Philo described a place where Jews met to study the law every 7th day and in every city. Philo also quoted an Egyptian official who wrote about Jews meeting regularly to sit in enclaves, read holy books, and discuss them.

Although the origins of the synagogue are ambiguous, some contemporary Jewish sources assert that synagogues originated during the Israelites' exile in Babylon after the destruction of the First Temple in Jerusalem in 586 BCE. As synagogues became an institutionalized part of Jewish life, their presence in the tradition was emphasized in texts, such as the Babylonian Talmud, as having originated at the time of Moses. Synagogues from the first few centuries of the Common Era had what were called "seats of Moses," small raised platforms at the front of the synagogue where esteemed community members sat and perhaps expounded on biblical texts.

In the archaeological record, the earliest synagogue buildings date to the first century CE. Archaeological evidence has uncovered three buildings that seem to have been synagogues that pre-date 70 CE, but these three did not have an ark that housed the Torah scrolls, which was an essential component of later synagogues. Synagogues became important meeting places after the destruction of the Second Temple in Jerusalem in 70 CE, but they did not replace the temple. The temple served as the site for sacrifices and for thrice-yearly pilgrimages, on the Jewish holidays of *Pesach* (Passover), *Shavuot* (Festival of Weeks or of First Fruits), and *Sukkot* (Feast of Booths or of Tabernacles), and it is ascribed a deep sense of holiness that synagogues do not replicate.

Some scholars argue that there is no evidence for what we now deem synagogues prior to the third or fourth century CE, because modern conceptions of synagogues involve types of structures and activities that are different from the earliest ones. Beginning in the first century CE, Jews gathered in houses and small spaces to study and pray as well as to socialize and to conduct political and economic activities. By the third or fourth century CE, many of these small buildings had been converted to or exchanged for larger structures that could house more people. By the fifth or sixth century CE, large buildings were established for

the purpose of meeting, study, and prayer. Thus, over the centuries, conceptions of the "synagogue" changed, such that the space itself became increasingly significant, and small homes and buildings were remodeled or exchanged for larger structures whose main purpose was to serve as a center for prayer and study.

According to tradition, male Jews must pray three times a day, and although Jews are not required to pray in a synagogue, a *minyan* (a quorum of 10—traditionally male—Jews) must be present to recite certain prayers. Although synagogues can be used for a variety of purposes in addition to prayer, behavior has long been circumscribed, such that people who enter them must clean their bodies first and must behave respectfully.

Synagogue buildings have no fixed form and usually resemble the architecture of the surrounding area and culture. No evidence exists that the earliest synagogues employed a particular directional orientation, included any particular items or structures, or divided congregants by sex. Beginning in the third century CE, however, particular spatial configurations and physical components appear in archaeological sites, including a Torah shrine on the eastern wall and a raised platform from which the Torah is read (*bima*). In synagogues that separate the sexes, women sit in a section either next to or behind men or in an upstairs gallery overlooking the first floor. Since Jewish emancipation in Europe, which occurred during the 18th through the 20th centuries, orthodox and some conservative synagogues retained traditional spatial divisions, whereas reform and liberal synagogues transformed them in various ways to accommodate changes in the format of prayer services.

SYNCRETISM

Syncretism is an important element of global religion, one that denotes amalgamation, exchange, synthesis, and a fusion of diverse beliefs and practices. Originating in religious studies, the term has been growingly used in history, anthropology, philosophy, and cultural studies. Until recently, it has been postulated on the assumption that civilization, culture, and religion are endowed with unity, coherence, and boundary but that their interaction produces mixed, syncretic forms. Most frequently, syncretism has been identified in religious belief and practice particularly in “heterodox cults”—for instance, African Americans who might combine Islam and the Baptist religion or the Baul singers of Bengal, whose culture brings together Vaishnavism and Islam. It is also used in architecture, in the visual and performing arts, and in the world of ideas, ideologies, and individual and cultural identities to refer to groups as Hindu-Muslim or Hindu-Buddhist.

The syncretic is identified with change produced from cultural encounter that can sometimes yield great cultural florescence as in the case of the Turko-Persian encounter with India and, to a lesser extent, the Arab-Islamic with Europe. It is associated with elite and courtly cultures imbricated in the multiculturalism of premodern empires, such as those of the Mauryan emperor Asoka, who became a Buddhist, the Chinese Tang Dynasty, or the 16th-century Ottoman and Mughal empires under Suleyman and Akbar. Syncretism is often located in folk cultures of peasants and pastoralists, in frontier regions or borderlands, and among people relegated to the margins. That syncretism can be a site of resistance for the colonial subject has been emphasized by anthropologists such as Michael Taussig, Jean Comaroff, and Aihwa Ong. In Taussig’s work, for example, spirit possession and magic suggest spaces where a

spirit queen might preside over “the amputees of history.”

Nonetheless, the critique of syncretism has been a lively one pointing out its pejorative connotations that refer to it variously as confusion, contamination, spuriousness, and deviance. Having come into currency with Protestant discourses, it had often signified the otherness, or distinctiveness, of pagan worlds.

Furthermore, the point has been powerfully made that civilization, culture, and religion are themselves grounded in forms of encounter, learning, and exchange and do not represent any presumed pure domains. This goes for the period following globalization but also for the centuries preceding. Thus, the Judaic was important for early Christianity. Popular Christianity has been the site of many “heresies”—Christians continued with folk practices in Europe and combined Christian theology with indigenous traditions in Latin America. Christianity then has evolved in a dialectical relationship with the “pagan.” Similarly, Islam everywhere encountered indigenous cultures; hence, the existence of Indonesian, Indian, and now European Islam. That is, what is presumed as pure itself dissipates on closer examination.

Officially, the Catholic Church has only recently begun to uphold the validity of syncretisms after Vatican II. The distinction it now makes between religion and culture has allowed it to introduce the notion of enculturation or the indigenization of the Gospel. Among New Age Religions and independent churches, syncretism is conceived of as reversible and even as making possible a return to “pagan origins.”

A substantial reaction to syncretism has come from the field of Muslim Studies pointing out that empirical studies of India, Indonesia, and Egypt foregrounded syncretism at the cost of identifying Islamic theologies and models of personhood and thereby reproduced images of nominal and imperfect Muslims.

The larger point is that syncretism introduces binaries of great traditional religions and little traditions of folk cultures and notions of orthodoxy and heterodoxy. The understanding of change is often mechanistic, and the label *syncretic* denies self-representation to practitioners who might define themselves as Muslim, Buddhist, or Sikh but hardly ever as “syncretic.” Moreover, syncretism

tends to homogenize and freeze group identities, obliterating temporal shifts of affiliation in these particularly fluid spaces as also the play of contestatory identities within, which might stem from social stratification, ideological influence, networks of power, and so on.

Critics point out also its imbrication in discourses of power. In India and Sri Lanka, dominant nationalisms identify a syncretistic composite culture as a defining feature of the polity. These hegemonic syncretisms often privilege assimilation into the mainstream and homogenize both the majority and minorities.

More attention has been paid to antisyncretisms of nationalist and ethnic identities as “invented traditions.” The urge to purge and purify can be seen in many “fundamentalist” reformist movements ranging from Protestant Christianity, the Islamism of the Jamaat-e-Islami, and the Arya Samaj and Brahmo Samaj. Many of these deploy a strategic syncretism as they combine reinvented traditionalist identities and histories with an emphasis on modern state and science.

The dominant perspective views syncretism as contributing to dialogue, diversity, and aspects of sharing between cultures and as promoting tolerance and pluralism. Robert Hayden has argued that syncretism does not imply tolerance and that sacred sites might exhibit competitive sharing and antagonistic tolerance and culminate in segregated spaces.

A series of alternative conceptual formulations to syncretism have been postulated. In the French political tradition, there has been a preference for the use of the terms *acculturation* and *acculturated minorities*. M. J. Herskovits was a pioneer of acculturation studies who identified a movement toward syncretism and assimilation. Nathan Wachtel points out that Peruvian Indians actually rejected the acculturation imposed on them by the Spanish. In the United States, the melting pot model of assimilation became significant in the postwar era until it was replaced by multiculturalism. Multiculturalism has likewise tended to create monolithic ethnic identities with potential consequences for national cultural unity.

Hybridity is the preferred category for poststructuralists, being identified as the celebrative counterpart of globalized diasporas. Its critics have pointed out the violent, antic cosmopolitan, nationalist politics

that can be embedded in such hybridities as also its origins in scientific genetics. Indeed, the politics of migrants often stems from fears and anxieties that can hardly be characterized as what Homi Bhabha would call transgressive or liberatory.

Other theorists have advocated *creolization*, which has etymological origins in imperialism and slavery but has been used in a good deal of work on the Caribbean. Jean Comaroff used the term *bricolage* to suggest the making of new cultural forms.

The term *liminality* has been advocated to get away from an essentialized view of culture and indicates the creative character of identities. The liminal interrogates binarism itself and seeks to transcend it. The liminality of collective identities is contextualized within ever-changing cultures—the way in which staircases are part of buildings, which are themselves composites of various types of materials, or bridges relate shores of rivers that are themselves composites of many streams. These generate new cultural spaces and highly creative theologies and hence are seen as dangerous from the point of view of state and religious authority. The “realm of the between,” then, is no syncretism of minorities and does not arise from obscure religious cults but is constituted right at the heart of cultures and relates to the multiple belonging of communities that do not see identities as singular and exclusive. Thus, for the Japanese, it was possible to be both Shinto and Buddhist, and the Chinese combined Buddhism with Confucianism, while Tibetans combined it with Bon religious practice.

The debate on syncretism is significant then for its interrogation of the idea of fixed and immutable boundaries, mutually exclusive cultures, and the effort to read singular identities back in time through ethnonationalist histories that continue to fuel violent ethnic conflict. To date, there is no theoretical resolution of the conundrum. The challenge to develop a conceptual vocabulary to capture the fluid interaction between religions and cultures and the intimacy of shared spaces that would transcend religious conflict and difference remains.

SYRIAN ARAB REPUBLIC

The Syrian Arab Republic is located in south-western Asia (the Middle East) and surrounded by Turkey, Iraq, Jordan, Israel/Palestine, and the Mediterranean Sea. In ancient and medieval times, the name *Syria* or its equivalents *al-Sham* or *Bilad al-Sham* were used to encompass a larger area that included Palestine and some parts of the present neighboring countries. The Syrian region has important historical value for both Christianity and Islam. Saint Paul, according to the Acts of

the Apostles, converted to Christianity on the road to Damascus. In spite of Muslim political domination beginning from the mid-seventh century, as early as the time of the Caliph Umar, Christians have constituted a major population in the region. Damascus, which was conquered in 635 CE by Muslims and is reportedly called by Prophet Muhammad *al-Sham al-Sharif* ("the Sacred Sham"), had been the capital of the Umayyads and the Mamluks. After several Muslim political dynasties, and for a short time the Crusaders, had taken it under control, the Ottoman era began for Syria in 1516 and lasted until the French mandate in 1925. Syria gained its independence in 1944.

Sunnī Muslims constitute the majority in Syria (74%). The 'Alawi (12%), Christian (10%), and Druze (3%) populations follow. In spite of a majority of Sunnīs, 'Alawis have been in power since the 1960s, especially after the military coup by Baathist 'Alawis in 1966. There had been a clash between the Arab nationalist Baathists and the Muslim brotherhood. This clash reached its peak with a revolt attempt in Hama, which was the biggest uprising that took place in February 1982 against the 'Alawi Asad regime. Baathist powers bombarded the whole city and killed thousands of people to decimate the Muslim Brotherhood. The event is known as the Hama Massacre. As a result of the Hama Massacre and the oppression of Sunnī Muslims by the intelligence agency, *al-Mukhabarat*, who made use of the emergency law, no significant religious conflict or other revolt attempt has taken place until the present time.

The Syrian constitution does not declare an official religion, and the political powers in charge have been trying to secularize the state as well as the society. This secularization project has to do with neutralizing Sunnī Muslim movements and internalizing 'Alawi administration to the Sunnī majority. Hence, the Asad regime has been following a balanced pragmatist approach between secularization and Islamic rule while it seeks legitimacy for its administration and tries to maintain political power based on national and international consensus. Even though religious minorities have the right to follow their legal systems in family law matters and enjoy religious freedom to some

extent, the state is determined to control the religious realm, especially the Sunnī practicing Muslims. The mosques can only be in service during the day within the restricted time declared by the state. This restriction has aimed at preventing the growing Islamic revivalism centered in the mosques through religious preaching and classes. The military is extremely secularized and is harsh toward those Sunnīs who do military service and want to practice their religion. There were a few attempts to ban the veil at universities and public offices in previous decades, but they were not successful. In 2010, the full-face veil, the *niqab*, was banned at universities, which has been interpreted as a sign of secularization in the face of Islamic revivalism. In 2011, the uprising against the Syrian government, which was part of a groundswell of protest across the Middle East, was interpreted in part as religious conflict between the Sunnī Muslim

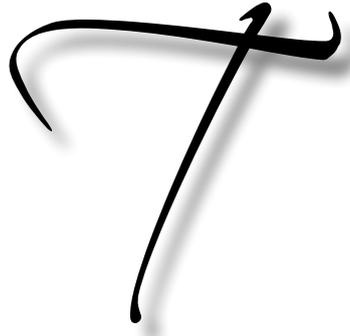

majority in Syria and the Alawite and Christian minorities.

TABLIGH

Tabligh is a name associated with one of the most important 20th-century Islamic reform movements. It is an Islamic term, a synonym of *da'wah*, referring to the call or invitation to Islam in particular and the call to good deeds in general. *Tabligh*, an Arabic infinitive word stemming from the root *b-l-'*, literally means to transmit, to deliver, or to convey. Even though this term does not exist in the Qur'an in infinitive form, its verb forms are used occasionally meaning "delivering the message of God" (5:67, 7:62–68, 33:39, 46:23).

Tabligh became known as the name of an influential Islamic revival movement, *Tablighi Jama'at*, that originated in the Muslim community in India in the first decades of the 20th century and spread elsewhere within the Muslim world. Shaikh Muhammad Ilyas Qandahlavi (1885–1944), a former cleric trained in the Deoband theological center and former teacher at Madrasah Mazhar al-'Ulum in Saharanpur, founded his movement in Delhi in 1927 with the goal of renewing the Muslim community by destroying common superstitions and calling on Muslims to adopt the "true" Islamic virtues. Although this movement has been described as a missionary movement in the West, it differs from Christian missionaries with its efforts aimed at Muslims rather than at proselytizing non-Muslims. Beside his famous motto "O Muslims! Be Muslims!"

Muhammad Ilyas declared six principles of the movement:

1. *Kalimah*: The famous article of Islamic faith, "There is no god but Allah and the Prophet Muhammad is His messenger"
2. *Salah*: Five daily prayers that occupy the center of Muslims' life
3. *Ilm and Dhikr*: Arranging public knowledge and recitation sessions
4. *Ikram-i Muslim*: Establishing good relationship between Muslims
5. *Tashih-i Niyyat*: Undertaking all actions for the sake of Allah, not for getting any worldly capital
6. *Tafri-i Waqt*: Devoting time to call people to the Qur'an and sunna

According to the sixth principle, each follower should devote at least 40 days in a group of around 10 persons for calling people door-to-door to join the movement and follow its principles. Because of its simple principles and effective method of expanding, the movement obtained great success, reaching hundreds of thousands of people in a short period and became known worldwide in the 1940s. After the death of Muhammad Ilyas in 1944, his son Mawlana Yusuf became the second leader of the movement. Mawlana Yusuf disseminated the movement around the world, especially in Europe, the United States, Japan, and Middle

East. It is still one of the most influential Islamic movements in the world.

The hallmark of the movement is that it strictly stays away from politics. It is the first Islamic movement that sees politics as unnecessary and unimportant for a religious life. Because of this feature, the Tablighi movement has not been seen as a threat by local governments and is even supported sometimes. During the British period, the leader of the movement issued a fatwa against Mawlana Abul Ala Mawdudi, who was the leader of Jamaat-e-Islami, another influential Islamic movement in India, which was effective in the sphere of politics.

TAGORE, RABINDRANATH (1861–1941)

Born in Calcutta (now Kolkata) into a wealthy, prominent, and large Bengali family, Rabindranath Tagore became one of India's greatest modern intellectual figures and the first Indian writer to attain global fame. His father, Debendranath, played an influential role in Bengali society as leader of an important modern Hindu reform movement, the Brahmo Samaj ("Society of God"); thus, the environment in which Rabindranath grew up not only was steeped in the richness of

Hindu traditions but also was one on the cutting edge of India's engagement with modernity.

Sent to study law in England, Tagore returned prematurely to India and pursued writing instead; he went on to become an accomplished and profoundly influential poet, novelist, playwright, songwriter, and painter. His ideas sparked, among other things, a sense of "national" feeling that crystallized in his compositions, later being used as anthems for what would become the independent states of India and Bangladesh. That his work could be used in this way illustrates its "international" or "global" character and that of the themes on which he wrote: a deep love of God and nature; the fellowship of mankind; the nature of freedom, both political and spiritual; and socio-religious criticism. Outside India, Tagore won international fame for English translations of his own Bengali poetry, particularly his *Gitanjali* (Song Offerings), a project that helped earn him the Nobel Prize in Literature in 1913—the first Indian, or even Asian, poet to receive the award. His literary accomplishments allowed him to travel extensively and correspond with many of the towering figures of his day, including W. B. Yeats, Ezra Pound, Bertrand Russell, Einstein, and King George V, who knighted Tagore in 1915, only to see that honor renounced in protest of British brutality during the Amritsar massacre of 1919.

His personal correspondence, as well as the impact of his poetry, which circulated in the English-speaking world generally, made Tagore a prominent and deeply articulate voice of India's cultural and religious heritage. Tagore was also an important voice in India's independence movement, but he eventually took a step back from political activism, being deeply disturbed by the violence associated with blind nationalism and religious discord. In keeping with his general humanist and rationalist ideals, Tagore believed that education of the Indian masses should be a larger part of the independence movement; only then could India attain a deeper freedom—a freedom that merely Britain's exit from the subcontinent would not accomplish. To this end, Tagore started his own university, Visva-Bharati, in Santiniketan, near Kolkata, which aimed to combine the best of both Indian and European education. Despite his global

appeal, Tagore's legacy is more deeply tied to the Bengali language, of which he is the single greatest literary figure.

TAIPING REBELLION

The Taiping Rebellion was a major uprising during the mid-19th century against the ruling Qing Dynasty in China. The rebellion was led by Hong Xiuquan, an unsuccessful candidate in the Imperial examinations, who preached socialist egalitarianism and rigorous spiritual practice based on concepts and symbols adapted from Christianity. Before the rebellion was eventually defeated, it had gained control over a large portion of southern China and established its capital in the captured city of Nanjing.

In 1836, Hong Xiuquan traveled to Guangzhou to take the imperial exams. During his stay there, he met a Protestant Christian missionary and was given evangelical pamphlets written by Liang Fa, the first Chinese Protestant Christian minister. Hong failed the examinations and experienced an illness or nervous collapse during which time he had religious visions. After spending several years as a village school teacher, Hong studied the pamphlets and then announced that his visions indicated that he was the son of God and younger brother of Jesus Christ, charged with ridding China of demon worship and establishing a heavenly kingdom on earth. Hong and his early followers destroyed ancestral tablets at Confucian temples in nearby villages. In 1850, Hong led a successful uprising in Guangxi and founded the Heavenly Kingdom of Great Peace. Hong's followers were required to participate in regular religious practice, maintain strict separation between men and women, and share their wealth

and property communally. In 1853, the Taiping forces captured Nanjing, calling the city Tianjing and maintaining it as the capital of the movement. The same year, Hong appointed his eldest son, Hong Tianguifu, as his successor. Internal political struggles and overambitious military campaigns weakened the movement.

A military unit of Chinese troops and Western officers organized by Frederick Townsend Ward prevented the Taiping forces from capturing Shanghai. Under the command of Charles George Gordon, this force was given the title Ever Victorious Army and posed the strongest opposition to the Taiping rebels. The Qing emperor appointed Zeng Guofan to form a new army made up of locally organized militias that were funded by local landowners and regional taxes. While the Ever Victorious Army fought the Taiping rebels throughout central China, Zeng besieged the Taiping capital at Nanjing. In 1864, the walls of Nanjing were breached, and the city was taken. Taiping rebels who did not escape either died in the fighting or were executed. The body of Hong Xiuquan, who may have poisoned himself or died of food poisoning, was found wrapped in a yellow cloth and left lying in a city sewer.

The Taiping Rebellion significantly weakened the Qing Dynasty and provided encouragement for other rebellions and uprisings during the following half-century, until the abdication of the final Qing emperor to the republican revolution in 1912. The egalitarian and reform ideas espoused by Hong Xiuquan during the Taiping Rebellion influenced the thought of later Chinese political leaders, including Sun Yat-Sen and Mao Zedong.

TAIWAN

The island of Taiwan is located in the Pacific Ocean 180 kilometers off the southeastern coast of China, separated from the mainland Chinese province of Fujian by the Taiwan Strait. Taiwan (including a number of outlying islands) covers an area of about 36,000 square kilometers and supports a population of roughly 23 million, 98% of which are Han Chinese, the remaining 2% being made up mostly of Austronesian aboriginal groups regarded as indigenous to the island. The political status of Taiwan is disputed, with the People's Republic of China claiming it as one of its provinces, while the island has de facto operated as a sovereign state, called the Republic of China, since 1949. A brief sketch of the island's history will help clarify this situation and prepare the background for its unique religious constellations.

History

Austronesian groups constituted the indigenous population by the time the first significant numbers of Han Chinese settlers arrived in the 17th century. At that time, both the Dutch and the Spanish had already established military bases and trading posts in the southern and northern parts of Taiwan, respectively. The Dutch ousted the Spanish in 1642, before being themselves driven off the island by Chinese forces in 1662. In 1683, the island came under the administration of the Qing Dynasty, which had taken over the Chinese Empire from the Ming Dynasty. The following 212 years of Qing rule witnessed a steadily growing immigration of Han settlers from the Chinese mainland, mostly speakers of Hokkien and Hakka dialects from the southern provinces of Fujian and Guangdong. The aboriginal population was progressively pushed back into the mountains, while the Chinese opened the fertile plains of western Taiwan for agriculture. In 1885, the Qing government granted Taiwan the status of a province but only 10 years later had to cede it to Japan following the Chinese defeat in the First Sino-Japanese War. For 50 years, from 1895 to 1945, Taiwan remained a Japanese colony, to be returned to China only after the Japanese defeat in World War II. As the Chinese civil war was about to end in a

Communist victory and the founding of the People's Republic of China in 1949, parts of the defeated Nationalist army led by Generalissimo Chiang Kai-shek (1887–1975) withdrew to Taiwan. Taipei was proclaimed the provisional capital of the Republic of China, with the explicit agenda to reconquer the mainland as soon as possible. Chiang's Nationalist party (Kuomintang, KMT) ruled Taiwan unopposed until the lifting of martial law in 1987. The KMT was dominated by mainlanders and for a long time severely restricted political participation for the Taiwanese (i.e., the descendants of Han Chinese settlers who had come to Taiwan from the 17th to the 19th centuries). Mainlander dominance also expressed itself in the championing of Mandarin as the national language and the suppression of the local Hokkien and Hakka dialects. The conflict between the mainlander elite and the Taiwanese remained a key element of the political dynamic of Taiwan until recently.

At first, most Western nations continued to recognize Chiang's regime in Taipei as the legitimate government of China, but following the rapprochement between China and the United States, most transferred their recognition to the Communist government in Beijing. At present, only a handful of smaller nations in the Caribbean, Central America, the Pacific islands, and Africa, and also the Vatican, formally recognize the Taipei government. These conditions have not, however, hampered Taiwan's economic development, which has propelled it from a largely agrarian society to a postindustrial one within a few decades. Since the lifting of martial law in 1987, the Republic of China has undergone an equally rapid process of political liberalization and democratization, with an opposition party winning presidential elections for the first time in 2000.

Religions

The current religious conditions of Taiwan can only be understood with reference to these historical lines of development. The dominant religious force for much of the history of Chinese-dominated Taiwan has been Chinese popular religion, the sum total of religious beliefs and observances integrated into the lives of kin groups and villages, focusing on the worship of gods, the veneration of ancestors, and the careful management of ghosts and

demons. Popular religion continues to remain strong to the present day, with its temples and shrines dotting the landscape. At the same time, the rapid urbanization and industrialization commencing in the 1960s have altered the social structures with which popular religious practice is enmeshed and have opened opportunities for other religious traditions.

Christian missions already began under Dutch and Spanish rule but only made a larger impact starting in the late 19th century. That impact increased dramatically after 1949, when many missionary societies were expelled from the Chinese mainland and therefore focused their activities on the island. Many converts were made among the aboriginal tribes (the majority of whom are now Christian, both Protestant and Catholic) and to a lesser extent among the Han Chinese population. However, the proportion of Christians in the overall population never exceeded the single-digit percentage range and hovers currently around 4%. In spite of their limited numbers, Christians have played an important role in Taiwanese politics, both among the ranks of the ruling KMT and in the opposition movement prior to the lifting of martial law. The Presbyterian Church in particular has long championed the interests of the Taiwanese against the once politically dominant mainlanders.

China's partition in 1949 occasioned the influx of other religious personnel from the mainland as well. The nominal head of the Daoist tradition, the Celestial Master, relocated to the island, as did many eminent Buddhist monks and nuns as well as members of various sectarian movements. Buddhism and popular sectarianism were strongly affected by this infusion of new leadership and new ideas.

Due to the frontier nature of Taiwan during the Qing Dynasty and the resulting scarcity of surplus resources, the island had never developed a strong Buddhist monastic tradition. Furthermore, during the Japanese period, Taiwan was cut off from the reform movements that shook up the Chinese Buddhist community, which produced a number of charismatic new sangha leaders on the mainland. The coming of some of these to Taiwan in 1949, together with the social changes brought about by the rapid urbanization and industrialization of the country, created the conditions for an

unprecedented flourishing of Buddhism. A number of large-scale Buddhist organizations developed around charismatic figures such as the monks Yinshun (1906–2005), Hsing Yun (Xingyun, b. 1927), Wei Chueh (Weijue, b. 1928), and Sheng Yen (Shengyan, 1930–2009) and the nun Cheng Yen (Zhengyan, b. 1937). Some of their organizations have expanded globally by founding temples and chapters across the world. Particularly noteworthy are the successes of Hsing Yun's Fo Guang Shan order and Buddha Light International Association, and Cheng Yen's charitable Tzu Chi Foundation. The global spread of Taiwan-based religious associations is closely linked to the massive development of Taiwanese diaspora communities, especially in North America, Australia, and New Zealand. Taiwanese Buddhist groups have also been very active among the Chinese of Southeast Asia.

A similar picture presents itself with regard to new religious movements. The Yiguandao (I-Kuan Tao, lit. "Way of Unity") movement shall here serve as an exemplary case. It was founded in Shandong province of mainland China in the 1920s but is rooted in an older sectarian tradition active since the 15th century. Its key teachings include the belief in an imminent apocalypse and the advent of a savior who would open up a path of salvation in this final world period. Spreading rapidly in war-torn China, the movement came under pressure from both Communists and Nationalists after 1945. While it was completely eradicated in the People's Republic during the 1950s, it survived unhampered in Hong Kong and managed to take root and flourish in Taiwan, even though it remained officially banned by the KMT government until 1987. Today, the various branches of Yiguandao make up one of the largest religious denominations in Taiwan; like its Buddhist competitors, the religion has also spread globally in the wake of Taiwanese emigration.

In the beginning of the 21st century, Taiwan-based religions are thus increasingly expanding beyond the island's shores, helping globalize Chinese religious traditions, even as these same traditions are still struggling with many political and legal restrictions in the People's Republic of China.

TAIZÉ

The village of Taizé (Burgundy, France) is the location of an ecumenical and international Christian monastic community with the same name. Founded in 1940, the community became a focal point for the renewal of Christian traditions and churches in the 1960s and has duplicated its spirituality and liturgy all over the world via regional conferences and filial communities since the 1980s. Taizé thus contributed significantly to the development of (Christian) world spirituality.

The community of Taizé was founded by Roger Schütz, a Protestant lay person from Geneva, Switzerland. At the outbreak of World War II, he realized his vision to help refugees from occupied French territories, mostly Jews. After 2 years of hiding in Geneva, he returned with several companions in 1944 and helped orphans and prisoners of war, most of them German. In 1949, the first brothers took their vows, and in 1952 to 1953, Frère Roger wrote a rule for the community. In the 1960s and 1970s, Taizé was visited by

thousands of young people searching for renewal of Christian tradition and churches in an undogmatic and ecumenical way, making Taizé a symbol of renewal. It is still visited by thousands of people, young and old, each year. In 2005, Frère Roger was murdered and was succeeded by Frère Alois. Taizé is not affiliated with a specific denomination and maintains a good relationship with Catholic, Protestant, and Orthodox church leaders alike.

The prime activity of Taizé, besides prayer and communal life, is to receive people in their community and engage with them in Bible studies, discussion groups, liturgy, and prayer. Since the 1980s, Taizé has started regional conferences in Europe and later in other parts of the world, making it easier for people to participate in Taizé's spirituality. These meetings, held in Europe between Christmas and New Year, are also attended by thousands. Third, Taizé has started filial communities in other parts of the world such as Bangladesh, Brazil, and Korea, where brothers are engaged in prayer and social action alike. Finally, Taizé spirituality is present in local groups that assemble around its spirituality and typical liturgical forms.

Taizé has contributed extensively to the formation of a world Christian spirituality and culture. Its songs—simple texts and melodies that can be sung in different languages at the same time and are meditatively repeated over and over again—have found a place in the songbooks of various denominations. The absence of preaching or Holy Communion in their services has become a model for ecumenical meetings and offers a way of participating that relativizes and at the same time respects denominational differences. Through their meetings and discussion groups, young people broaden their view and learn to respect other traditions as well as their own. The regional meetings and filial communities further contribute to the globalization of its spirituality. Not in the last place, the international and ecumenical community of brothers in Taizé is a model for the global coexistence of Christian denominations.

TAJIKISTAN

Tajikistan is one of the new Central Asian republics that emerged as an independent state in the wake of the demise of the Soviet Union. As its name implies, it is distinctive in consisting almost entirely of members of the Tajik ethnic group. The name “Tajik” is synonymous with “Persian,” and the language spoken by the Tajiks of Tajikistan and northern Afghanistan is a variant of modern Persian, Farsi. Unlike the Persians in Iran, however, the Tajiks in Tajikistan and northern Afghanistan are Sunnī Muslims rather than Shi’a. Of the 8 million inhabitants of Tajikistan (2010 estimates), 95% are Sunnī Muslims, 3% are Shi’a Muslims, and the remaining 2% are mostly Christians of various denominations, with a small number of Buddhists and Jews.

Though Islam was repressed during the Soviet period, Muslim activists have been involved in politics after the end of the Cold War. In 1992, shortly after the end of the socialist government in Afghanistan, a coalition of Muslim political activists and prodemocracy politicians attempted a political takeover. Tajikistan was proclaimed to be a Muslim state. The revolutionary Muslim government did not last long, however, and in the 21st century the involvement of religious activists in politics has been much more discreet.

Religious History

Religion has been an important aspect of the social and political life of Tajikistan, a Central Asian nation north of Afghanistan, long before the creation of the modern nation-state. In the fourth century BCE, the armies of Alexander the Great helped establish the Greek kingdom of Bactria in

Central Asia, bringing together Eastern and Western cultural influences. The Silk Road flowed through the area, carrying eastward Greek thought, Persian Zoroastrian and Manichean ideas, and later the teachings of Nestorian Christians. At the same time, Buddhist culture was travelling from India northward to Asia, and Chinese concepts were flowing west. Tajikistan and other parts of Central Asia were in the midst of this cultural ferment.

Islam came to the region in the seventh century CE from Persia in the southwest, bringing with it the ethnic people, language, and culture that became the Tajik tradition. Nearby Uzbekistan became the center of Central Asian Muslim culture, especially the cities of Samarkand and Bukhara. The Mongol Empire in the 13th century seized political control of the region, though Islam survived, and in the 14th century the Mongol leaders became themselves Muslim, and Islam again thrived in Central Asia.

Most areas of Central Asia fell to Russian control in the latter half of the 19th century. At that time, most of Central Asia was administered together under the name of Russian Turkestan. The 1917 Russian Revolution emboldened the indigenous political leaders in the region to proclaim their freedom from Russian control, and in 1918 they proclaimed the Turkestan Independent Islamic Republic. Lenin and the new Communist government did not look kindly on the emergence of an independent state in what he regarded as part of the Soviet sphere of influence, and by 1925 the independence movement had been crushed. The nascent Turkestan was separated into different ethnic countries, which became the five republics of Soviet Central Asia.

During the Soviet era, religion in general was suppressed. In the initial stages of the Soviet era, some Muslim leaders joined the Communist movement, but after 1928 the Soviet government embarked on a major effort to control religion, and some Muslim clergy were put in jail. In 1912, there had been more than 26,000 mosques in Central Asia, but by 1968, after Khrushchev’s antireligion campaign, fewer than 500 mosques remained. During the Afghan-Soviet war in the mid-1980s, Muslims were held in suspicion by the Russians. But their lot improved after Gorbachev came to power in 1985 and instituted a series of reforms. After 1988, Islam in Central Asia experienced a considerable expansion and has flourished with the establishment of independent states such as Tajikistan in the early 1990s.

Religious Politics in the Post-Soviet Period

In Tajikistan, Islamic political parties were outlawed during the Soviet era, but after the thaw in the Soviet Union's antireligious attitudes in the late 1980s, Muslim political activists came to the fore. The old Communist leader, Rakhman Nabiyev, was deposed in 1991 by a protest movement that was supported by Muslim leaders, who even supplied the materials to create a tent city for the protestors from a local mosque. Among the new political parties that emerged in post-Soviet Tajikistan was the radical Islamic Renaissance movement, which received support from the Muslim militia that had been fighting the Soviets in adjacent Afghanistan during the Afghan-Soviet war in the 1980s. The Muslim religious parties gained much of their popular strength by being presented as an alternative to the old Communist politicians, who were still trying to cling to power in the post-Soviet period. One Muslim leader in Tajikistan described this political conflict between the old Communists and the new Muslim parties as an "ideological struggle" between Islam and communism. The "Revolutionary Council," which ruled in Nabiyev's place, was a coalition between the Islamic Renaissance Party and a secular democratic movement.

One of the leaders of the Islamic movement was Qazi Hajji Akbar Turadzhonzoda, who was based in the main mosque of Dushanbe, where he communicated with his followers through a cell phone and fax machine. His vision of religious politics in Tajikistan was different from that of Iran, however. He explained that although the people of Tajikistan and Iran were both ethnically Persian, the Iranian population was largely Shi'a, a Muslim tradition that has a stronger pattern of authoritarian leadership and martyrdom than the Sunnī tradition, which most Tajikis followed. For this reason, he said, the political involvement of Muslim activists like himself would not lead to an Ayatullah Khomeini style of autocratic Muslim rule. He envisioned a Muslim politics that would be open and progressive.

Nonetheless, the Islamic political movement increased the fears of many secular politicians, who were able to mount a successful counterattack against the Muslim coalition government. As it turned out, the new Revolutionary Council lasted less than a year. It had not enjoyed the support of the whole country, particularly the Kulyab region

in the south, which became a base for the old pro-Communist activists. In December 1992, the old pro-Communist leaders were able to regroup their strength and conquer the capital, Dushanbe, and oust the Islamic coalition. In the following year, 1993, the counterattack against the Islamic opposition was so severe that many of the Muslim leaders fled to Russia and Afghanistan. They accused the government of genocide.

In the subsequent years, the conflict continued as Muslim political activists were able to restore some of their former power. Pro-Islamic parties joined forces in a coalition movement, the United Tajik Opposition, which negotiated with secular parties to establish a power-sharing arrangement in the year 2000. This allowed some Muslim leaders a role in the government and brought a certain calm to the political conflict. About a third of the government positions have been assigned to Islamic-leaning members of the United Tajik Opposition, including several cabinet posts. Since then, Muslim political groups, including the Islamic Rebirth Party, were allowed to submit candidates for the elections for parliamentary seats. Particularly since the overthrow of the Taliban in Afghanistan in 2001, the major Muslim political movements in Tajikistan have grown more moderate and have secured a comfortable place in the coalition politics of Tajikistan's governments. In 2010, however, a group of 25 imprisoned Islamic activists escaped from jail and, in a series of clashes with the Tajikistan army in the eastern part of the country, killed dozens of soldiers and raised the specter of challenges from a new Islamic extremist movement. Religion, therefore, continues to play a varied role in the public life of the country.

TALIBAN

The Taliban (Persian “Madrasa Students” or “Seekers of Knowledge”) is a fundamentalist Islamist movement that ruled Afghanistan from September 1996, when they captured Kabul, through 2001, when a U.S.-led coalition forcibly removed them from power. Though the Taliban governed all religious, political, economic, and social aspects of Afghan life, only three countries, Pakistan, Saudi Arabia, and the United Arab Emirates, recognized them as a legitimate autonomous political entity. Other nations refused to establish diplomatic relations with the Taliban after learning of their frequent institutionally sanctioned human rights abuses, particularly in reference to the harsh punishment of detractors, the execution of “criminals” without due process, the suspension of nearly all women’s rights, and the suppression of nonreligious cultural activities (music, the arts, entertainment, etc.). Ultimately, their autocratic control over the thought, will, and spirit of their constituency, long seen as brutal and unacceptable by the international diplomatic community, along with the explicit endorsement of (and direct support of) the September 11 terrorist attacks led to their ouster. In the months following their removal from power, Mullah Mohammed Omar reorganized the Taliban as an underground guerilla militia intent on conducting a sustained insurrection against any non-Islamist Afghan ruling authority.

The Taliban was formed in 1994 when Omar banded together several small, heavily armed militias in the southern Kandahar Province with the intent to restore order and discipline via the implementation and strict enforcement of Shari’a law.

At that time, after years of jihad—the Islamist resistance to the Soviet occupation (1978–1989) by the mujahideen—and violence as the Najibullah government and remnants of the mujahideen fought for control in the ensuing political vacuum, their dedication to the establishment of a totalitarian Islamic order was inspired by a combination of rural Pashtun tribal norms and a desire to reestablish a medieval Islamic theocracy. Between 1994 and 1996, the Taliban gained control over the vast majority of Afghan territory through forming alliances with warlords, conducting localized military coups, and incorporating harsh intimidation tactics. With logistical and political support from Pakistan, the Islamic Emirate of Afghanistan was created after Kabul fell in September 1996.

Life under the 5-year Taliban regime was heavily restricted by institutional interpretation of the Shari’a law. Women were not allowed to work or attend school, strict dress codes came into effect, the display of any images of living things was banned, and ownership of any nonreligious media was prohibited. These policies, among many others, were regulated by the Ministry for the Promotion of Virtue and Suppression of Vice (PVSV) and made compulsory by its “religious police.” Those deemed criminals by PVSV enforcers were subject to public beatings, amputations, and even execution in town centers and soccer stadiums. On the international relations front, the Taliban formed an alliance with Osama bin Laden (d. 2011) and al Qaeda in an effort to promote the “Talibanization” of Central Asia and beyond. Led by Ahmad Shah Massoud, the Northern Alliance of Tajik and other non-Pashtun tribal groups resisted Taliban rule in the remote northeastern corner of Afghanistan until he was assassinated, likely by al Qaeda operatives, shortly before the September 11, 2001, terrorist attacks and the subsequent invasion of Afghanistan by the U.S. coalition military forces in October 2001, which led to the Taliban’s fall from power. The movement survived, however, controlling large sections of Afghan territory, and was buttressed by a Pakistan Taliban of largely Pashtun ethnic forces that resisted U.S. military efforts to stabilize Afghan society and establish a sympathetic and democratic secular regime in Afghanistan.

TAMBOR DE MINA

Tambor de Mina is the most common name for the religion of African origin in Maranhão and the Brazilian Amazon region. From the 1950s, due to the migration of African descendants, it spread to other areas, mainly Rio de Janeiro, São Paulo, Brasília, and Paraná. The name *tambor* (drum) derives from the importance of this instrument in the rituals and *Mina*, from the former Portuguese fort of São Jorge da Mina, a warehouse for slaves established in the region where Ghana is located today, that is, West Africa. *Mina* is also the name of an African ethnic group, and many slaves brought to Brazil were known as *Mina Negroes*.

It is an iniciatic religion, meaning that one enters via rituals of initiation, and it is a religion of trance in which those adept enter an altered state and receive supernatural entities: *voduns*, *orixás*, and *caboclos*. It was brought by *jeje* and *nagô* slaves from what are today the countries of Benin, Nigeria, and other parts of West Africa; they came to Maranhão, mainly after the middle of the 18th century, to work in the cotton and sugarcane fields.

In São Luís, Maranhão, in the first half of the 19th century, two base houses of this religion were founded by slaves: the Casa das Minas (*jeje*) and the Casa de Nagô, which are still active today. The Casa *jeje* is unique, but other houses were born out of Casa de Nagô, some influenced by other African traditions (*cambinda*, *tapa*, *cachéu*, *congo*, *angola*, etc.) and also by Amerindian and European traditions.

The worshipped entities of Tambor de Mina are named *voduns* or *encantados* (enchanted); they are grouped in families and have African or Portuguese names. Many *Mina* songs are in African languages. The trance is quite discreet, and everyone uses the same clothes. The musical instruments used are drums, iron (*agogô*), and *cabaças* with strings of beads tied on; there are variations depending on the origins in Africa and the traditions of the worship center.

The participants of the religion are usually working-class women of African descent. The public rituals take place on the dates of the saints of the Catholic calendar. This syncretism is common with Catholicism, *kardecism*, and African traditions, and nowadays *umbanda* is largely found spread through the groups of Tambor de Mina.

Among the values associated with Tambor de Mina are respect for the objects in the religion, the description and preservation of the secrets of the ritual, submission to elders and valuing of the hierarchy, fulfillment of the obligations of worship, and tolerance for those who are different.

TANZANIA

The United Republic of Tanzania, located south of Kenya in East Africa, has existed within its current boundaries only since 1964. At that time, the former, largely Christian, British colony of Tanganyika merged with the Muslim island nation of Zanzibar, combining the two names into a new one, *Tanzania*. Tanzania continues to be a

Christian and Muslim nation, and its shoreline has been a part of religious exchanges in the western Indian Ocean for centuries. Christian missions have been active on the mainland since the late 19th century. In recent decades, Tanzania has, like many African countries, become a laboratory for trans-regional religious movements, both Muslim and Christian. Concurrently, indigenous religious practices persist.

While most Tanzanians—approximately 38 million in 2007—profess either Islam or Christianity, the exact proportion of Muslims to Christians is poorly known but estimated around 40:60; however, the government has not held a census since 1967, to avoid politicization of religious loyalties. Among Christians, Catholics reportedly form the largest group, and Anglicans, Lutherans, Methodists, and other Protestant denominations have substantial congregations. Most Muslims are Sunnī (of the Shafii School) with South Asian Shi'a and Bohra minorities.

Among Christians, globally connected religiosity tends to take the form of born-again/Pentecostal churches. Present since at least the 1940s, Pentecostals remained relatively weak until the 1980s, due partly to the relative scarcity of non-denominational missions. Subsequently, increased funding from U.S. Pentecostals combined with the social upheaval created by national development policies (“villagization”) aided their growth. Presently, among the most influential Tanzanian Pentecostal congregations, the Full Gospel Bible Fellowship Church, led by Zachary Kakobe, counts several thousand members. Tanzanian Pentecostals appear less interested in the prosperity gospel than west African Pentecostals and more so in healing, partly reflecting the pervasiveness of AIDS in this country. Tanzania’s Catholic Church has recently been threatened by schism over the “charismatic” activities of one of its bishops in Dar es Salaam.

Trans-regional networks among Muslims take two distinct, temporally subsequent, forms. Two Sufi brotherhoods, the Qadiriyya (imported from the Somali coast) and the Shadhiliyya-Yashrutiyya (imported from Lebanon via the Comoro Islands), gained followers between 1880 and 1960 and became instrumental in the spread of Islam beyond its coastal urban nuclei. Focused on ritual performances, they continue to operate but have lost patronage and membership due to economic

depression in their coastal bases. Politically, they are quiescent and marginal.

In contrast, loosely affiliated Islamic youth movements have emerged since the late 1970s that oppose Sufi rituals as “innovation.” Often known collectively under the term *Ansar Sunna* (also pronounced *Ansuari* or *Ansuaru*), they are influenced by Saudi Arabian Wahhabism. Besides Saudi sponsorship, the Ansar are also in contact with Islamists in Sudan and Somalia and attentive to the rhetoric of the “War on Terror.” They propose a literal interpretation of the Qur’an and accuse the Tanzanian state of discrimination against Muslims, especially in education. There have been occasional clashes between the Ansar and both Christian groups and security forces. The Tanzanian state is trying to manage these tensions and the international connections of Muslim groups, with partial success.

TAOISM

See Daoism

TATTOOING AND PIERCING

The distinction between religious rituals that involve tattooing or piercing of the body and cultural practices that include tattooing and piercing is often difficult to make as tattooing and piercing are common in rites of passage and as a mark of status and rank that may reflect spiritual prowess. Tattoos may also serve as a sign of religious devotion or as a talisman or amulet providing protection.

Tattooing is an ancient practice. Tattoos were found on the natural mummy of a man called Ötzi the Iceman, dating from 3300 BCE, which was found in a glacier in the Italian Alps in 1991. Tattooing was apparently practiced in Japan as early as 3000 BCE, as suggested by clay figurines put into tombs as attendants for the dead, which were painted or engraved in a way that resembles tattooing. However, the first written record of Japanese tattooing is from a Chinese dynastic history compiled in 297 CE. Russian archaeologists have found mummies with tattoos representing real and fantastic animals in the Altai Mountains of western and southern Siberia that date back 2,400 years. Julius Caesar reported that the natives of Britain were tattooed when he invaded in 54 BCE. Incan mummies with tattoos dating from the 11th century have been found in Peru, and the reports of Cortez and his soldiers show that tattooing was practiced in central Mexico when the Europeans arrived there. Tattooing was also common among the native peoples of North America, particularly the Iroquois and the Chickasaw. Inuit women were tattooed to mark their marital status and clan identity. In the societies of Polynesian peoples in the South Pacific, from where the word *tattoo* (Polynesian *tatau*) was borrowed, tattooing was part of a rite of passage for young chiefs conducted at the onset of puberty, and the spiritual power and status of a chief were conveyed by his tattoos. Scarification, which is related to tattooing as it is produced by cutting the skin and inserting special sand or ashes to make raised scars, is practiced in Africa.

Tattoos on the mummified remains of Amunet, a priestess of the Goddess Hathor at Thebes (ca. 2160–1994 BCE) suggest that in ancient Egypt tattoos were a sign of the tie between a particular person and a spirit or god. Consequently, in Leviticus 19:28, the people of Israel were forbidden to mark or mutilate their bodies as did the people of Canaan, Babylonia, and Egypt: “You shall not make any cuts in your body for the dead nor make any tattoo marks on yourselves: I am the LORD.” This prohibition was later reinforced by the idea that as humankind was created in the image of God, tattooing was a desecration of God’s image.

In Babylonia and Egypt, tattoos were also used to identify a slave with his owner’s mark. Similarly, in the Greek and Roman world, criminals and slaves were tattooed. While tattoos and body

piercing are not mentioned in the New Testament, in the Christian cultures of Europe also, tattooing was associated with criminal and marginal status. Most notoriously, the Nazis marked Jews at Auschwitz and other camps with tattoos.

Elsewhere in the world, tattoos were generally a mark of high status and often distinguished a warrior or person with spiritual power. Shamans and spirit mediums marked their bodies with tattoos, and some pierced or cut their bodies in states of ecstasy, demonstrating the power of the deity to stand above the normal human response to pain and bodily mutilation. For example, the Sun Dance (outlawed by the United States in 1904) was the main communal ritual of the buffalo-hunting tribes of North America—the Arapahoe, Cheyenne, and Dakota. During the dance, warriors would have hooks inserted through the skin on their chest and back. Then they were suspended from the sacred pole.

In small shrines and temples in Singapore, Penang, Malaysia, and elsewhere in Southeast Asia, Chinese spirit mediums, usually marked with tattoos that demonstrate the power they have accrued, are possessed by spirits during the Festival of the Nine Emperors. They take spikes with symbols of the deity and pierce their cheek or the skin of their arms or chest to attach powerful amulets. Others slit their tongues to obtain blood, which is mixed with ink to prepare amulets for their clients.

Ritual Tattooing

In Thailand, Laos, and Cambodia, Buddhist monks have adopted shamanic practices of tattooing clients with apotropaic symbols. These include spells composed from Pāli Buddhist scriptures called *katha*, yantra, and animal designs that enhance one’s power or protect one from danger. The tattoos that monks give are known as *yant*, short for yantra, a geometrical design from Hinduism that symbolically expresses the power of divine forces. Normally, monks tattoo only the auspicious upper half of the body of men, and they rarely tattoo women, whom they are forbidden from touching. It is commonly held that the mere presence of a woman, especially during her menstrual cycle, can diminish or negate entirely the “potency” of a protective tattoo. Lay mediums may place tattoos on the lower half of the body. These tattoos are

understood to transfer the power of the Buddha and the power that the monk has accrued through self-restraint (the observance of precepts) to the one who is tattooed. The desired power is usually protective and may include invulnerability. The power of the tattoo is like the power of an amulet, and it depends on the recipient observing precepts that the monk prescribes. In Thailand, Wat Bang Phra is particularly known for ritual tattoos. During the celebration of Wai Khru (Honor the Teacher), many come for new tattoos or to renew the power of old tattoos. Some are possessed by animal spirits, such as tigers and crocodiles, that have been tattooed on their skin.

Ritual Piercing

The Hindu festival of Thaipusam in Malaysia and Singapore (and in Tamil areas of South India, Sri Lanka, and Mauritius) provides a contemporary example of body piercing in a ritual context. On Thaipusam, which falls in January or February, devotees fulfill vows to Murugan (Skanda), the son of Siva. They may pierce their cheeks or tongue with replicas of the lance of Murugan or hang offerings of milk and limes from hooks embedded in the skin of the chest and back. This form of ritual vow fulfillment is best understood through the legends that tell the story of Murugan. After the demon Surapadma had been granted the boon of immortality because of his great austerities, he led a rebellion of the *asuras* against the high god. Realizing that only a son of Siva would be able to defeat the powerful demon, the gods conspired that Murugan be conceived. The goddess Parvati gave her son his invincible weapon, a lance with a leaf-shaped head. Murugan then set off to fight Surapadma and his allies. In the battle, Surapadma changed from one form to another. Murugan attacked each form, but he could not destroy the demon because of the boon granted by Siva. Finally, Surapadma took the form of a tree, which Murugan split with his lance. One part of the tree became a rooster and the other a peacock. In these last two forms, the demon was subdued and came to serve Murugan. The possession trance experienced by devotees of Murugan who fulfill a vow to him on Thaipusam is known as *avesha* (to alight or rest). When the god alights or rests on the devotee, his force is experienced as trance. Thus, the

devotee of Murugan, who carries a *kavadi* decorated with peacock feathers, is identified with the conquered demon Surapadma, who has become Murugan's peacock vehicle. Devotees may also pierce their cheeks or tongue or forehead with replicas of the lance of Murugan. In the theology of Shaiva Siddhanta, the demon is explicitly recognized as a metaphor for the impulses and desires that destroy the possibility of liberation and union with the divine. Devotees who are pierced with the lance of Murugan thus symbolically represent their victory over the demonic part of the self.

TELEVANGELISM

Televangelism involves the use of television broadcasting for religious purposes, especially as an outreach by evangelical Protestant groups to teach their version of the Christian Gospel. While multiple religious groups use television to share their faith, televangelism is commonly associated with conservative Protestantism. Conservative Protestants often draw on Mark 16:15, a biblical passage

known as the Great Commission, as evidence that it is their duty to spread the word of Jesus around the world. Mass media provides the opportunity for mass evangelism; however, many scholars acknowledge that televangelism is more likely to attract committed Christians than potential converts. Common themes of televangelism include “born-again” conversions, biblical literalism, conservative morality, Christ’s imminent return, and the influence of the Devil.

While televangelists tend to reject aspects of secular culture, their success relies on their embrace of evolving technologies and adaptation of nonreligious production and marketing strategies. Televangelism is part of a larger trend of evangelical technological resourcefulness, which proceeded from an era of evangelical and fundamentalist Christian radio ministries and has more recently merged with the use of the Internet to create virtual Christian communities.

American Televangelism

American radio stations were initially resistant to allowing religious programs on the air. When the Federal Communications Commission required national stations to sell airtime to religious groups, stations restricted religious time slots to Sunday-morning Catholic, Jewish, or mainline-Protestant programming. In 1944, a group of evangelicals founded the National Religious Broadcasters to fight for their right to purchase airtime.

In the 1950s, several conservative Christian ministries paid to broadcast their religious messages over local and national television networks. Rex Humbard broadcast his weekly services and built his Cathedral of Tomorrow in Ohio to accommodate his television crews and large audiences. Other pioneers in televangelism included the charismatic preachers Oral Roberts and Billy Graham. Both led numerous Christian revivals throughout the 1950s that were aired on national networks.

In 1960, a Federal Communications Commission ruling stated that paid airtime could count toward the television networks’ public service time, which made networks more willing to sell program slots to conservative Christians. Evangelical, fundamentalist, and Pentecostal Protestants eagerly embraced the new opportunities for televangelism and soon became the majority of religious broadcasters. Some

conservative Protestants, instead of paying for airtime, began their own religious television networks. In 1961, Pat Robertson started the first independent Christian television station, the Christian Broadcasting Company. The increase of televangelism was considered a major triumph for conservative Protestantism, which had been previously rejected by mainstream media companies. The 1970s and early 1980s became what has been called the “Golden Age” of American televangelism.

Popular televangelist programming showcased various television formats. Some followed Humbard’s lead and televised regular religious services. *The Old-Time Gospel Hour* televised Jerry Falwell’s services at the Thomas Road Baptist Church in Virginia. His show followed the weekly pattern of a Baptist worship service, with Gospel songs, scripture, and a sermon. Jimmy Swaggart’s program showed a traditional Pentecostal service, which included people speaking in tongues, singing Gospel music, shouting prayers, and receiving healings. His service ended with an altar call, during which individuals moved by the Holy Spirit could come forward, experience the laying on of hands, and recite the Sinner’s Prayer.

Some teleministries borrowed strategies from secular programs. Pat Robertson’s *The 700 Club* was partially in the format of a news program. Robertson presented on current social issues, including politics, science, court cases, economics, and education, while providing conservative Protestant commentary. The other format represented in his show was the talk show. Robertson conducted personal interviews with Christians. He asked them about their marital problems, job frustrations, or addictions, and then provided advice based on his interpretation of the Bible. While there was no worship service televised for his show, he did announce mail-in prayer requests. This provided viewers with a few moments of personal attention on a nationally broadcast show, with Robertson inviting thousands of viewers to support the prayer requests.

Robertson and Falwell used their shows to support conservative Christian politics. American televangelism was in its heyday during the rise of the Christian Right and significantly contributed to its emergence. In 1979, Falwell used *The Old-Time Gospel Hour* to announce the founding of the Moral Majority, an organization created to

promote conservative Christian political agendas. His show and the Moral Majority shared the same antiabortion, antipornography, and antihomosexuality stances. Falwell wedded his concern for maintaining the “traditional” family with a concern for maintaining the Christian roots of America. Robertson became a national conservative Christian political figure in the late 1980s, when he ran for president of the United States and helped organize the Christian Coalition.

While not all of the televangelist programs supported political engagement, one thing they did share was their emphasis on fund-raising. Phone-in pledges and write-in donations supported most of these ministries. However, several “telescandals” in the late 1980s cast severe doubt on the relationship between fund-raising and televangelism. In 1987, Oral Roberts told his viewers that he must raise \$8 million or God would take him from this life. He received the enormous sum from the owner of a dog track, which led some to question the ethics of ministries supported by gambling money. The more serious events of the telescandals were linked to Jim and Tammy Faye Bakker’s *The PTL Show* (which originally stood for “Praise the Lord”) and *The Jimmy Swaggart Show*. *The PTL Show*, a Pentecostal program in the format of a variety show, was the object of scandal when Jim Bakker was accused of sexual misconduct and the couple was accused of using the money raised for their ministry to support an extravagant lifestyle. Jim Bakker stood trial and was convicted of financial misconduct against some of his business partners. Jimmy Swaggart similarly was accused of sexual misconduct after being caught visiting a prostitute. The Assemblies of God preacher asked for forgiveness from his family and his viewers on his religious program, only to be caught soon after in another extramarital liaison. Robertson’s announcement for presidential candidacy entered this atmosphere of intense suspicion against televangelists, and he was criticized in the media for his association with this group.

The scandals led to a decline in religious broadcasting viewers and viewer contributions. These events not only made issues of financial and sexual misconduct public but also revived complaints that televangelism diluted or contaminated the Gospel. Another critique was that television ministries were doing more business and advertising than religion. After the scandals, stations reduced their

televangelist programming. Some shows ended. In an effort to restore the reputation of televangelism, the National Religious Broadcasters created new accountability guidelines, including statements on the proper use of donations.

The negative effects of the scandals inspired some televangelists to broaden their business strategies. Viewers could no longer be counted on to support an entire ministry, so programs sought new sources of funding. Robertson had paved the way for these strategies when he purchased the Christian Broadcasting Network to support his show. He later expanded his empire into International Family Entertainment, Inc.

Scholar Mara Einstein argues that televangelists now use the advertising strategies of infomercials. Recent televangelists promote positive messages connected to products, namely, their shows, personalities, catchy Christian slogans, books, websites, videos, and other religious goods. These televangelists often combine their television program with website product sales rather than traditional phone-in or write-in pledges. Multiple Christian business markets are used through these marketing techniques, including the thriving industries of Christian books, Christian music, and Christian videos. Examples of these infomercial televangelists include Joel Osteen and T. D. Jakes, whose televised megachurch worship services include promotions of their books, tours, and website enterprises.

International Context

America is not the only country to develop televangelism. Brazil, for example, has its own televangelist celebrities. Other countries, such as Sweden, have had fewer opportunities to experiment with television ministries. Sweden’s religious broadcasts were controlled by the state until they established the separation of church and state in the 21st century. However, even in countries that do not produce their own televangelists—because of governmental restrictions, lack of resources, or lack of interest—viewers may still have access to global televangelists. Many American televangelists have their Christian messages translated into dozens of languages and made available through international Christian networks, such as the Trinity Broadcasting Network and the Christian Broadcasting Network. Conservative Christians continue

to take advantage of the increasing sophistication and proliferation of global electronic communications for the purpose of evangelism.

TELEVISION

Like all forms of cultural transmission, television plays an important role in the communication and propagation of religion. When Constantin Perskyi first coined the term *television* in 1900 in an academic paper on selenium-based photoelectric capture and transmission systems, the Russian physicist could not have imagined that the phenomenon of which he spoke would one day achieve a place of centrality in peoples' lives the world over. To say that television has changed human life as we once knew it is to make a gross understatement. In fact, humanity still has a long way to go before we fully understand the capacities of television as a communicative, informative, and entertainment medium. There is no doubt that the human habituation to television has induced in us a peculiar set of devotions: Families gathered in front of a television eating "TV dinners" at regular times throughout the week appear eerily similar to devout religious practitioners performing rites that shape their lives. Even "secular" television

culture, some scholars claim, is distinctly religious in this respect.

That global TV audiences can unite virtually in their observance of local events (e.g., think of the New Year's celebrations in New York's Times Square) was not lost on the religious leaders of communities who welcomed the new medium into their homes. Almost since the earliest popular embrace of television in the 1950s, the shrewdest religious leaders of the era sought to take advantage of the format's potential for reaching new believers. For nearly 30 years, radio, which itself benefited from an early interest by American ministers who realized its capacity to reach "those with ears to hear," demonstrated the viability of new media technologies in the service of religion. Today, television effectively blankets the globe and plays a critical role in the phenomenon of global religion, but for reasons that will become manifest, the story of religion and television is a distinctly American one, or at least a Western one.

Popular Television's American Roots

One of the reasons why the story of religion and television, even in its modern global iterations, is such an American one is that television's technology developed using first-world technologies and perspectives on knowledge common in post-Enlightenment western Europe and America; this cultural location, in effect, determined its interaction with religious communities, notably upper-middle-class White America. American evangelical Christians, who for years had put radio and print literature to the service of getting their message out, jumped at the opportunity to reach believing audiences in new ways. Aimee Semple McPherson, the Pentecostal minister and founder of the International Church of the Foursquare Gospel and who in 1926 became the first woman granted a broadcasting license by the Federal Communications Commission, had begun investing in an experimental television station prior to her death in 1944. By 1950, more than 5 million Americans had television sets.

One of the first ministers to reach this growing audience, albeit at the regional level, was the Roman Catholic theologian Bishop Fulton John Sheen. From 1930 to 1950, Sheen had hosted *The Catholic Hour*, a popular radio show that served

in some ways as a counterpart to McPherson's evangelical Protestant performances on KFSG. In 1951, however, Sheen made the move to television and began broadcasting *Life Is Worth Living*, which often depicted Sheen seated before a live studio audience and discussing the active social issues of the time, placing Sheen in the same mold of Catholic activism as Dorothy Day. The series only lasted 6 years, but during that time, Sheen picked up an Emmy award for Most Outstanding Television Personality. As the first person of faith to use both radio and television in the service of advancing the Gospel, Sheen earned the title of "first televangelist" from most scholars of religion and media.

The social activism and Roman Catholicism of Sheen's televangelism, however, bear little resemblance to the images of emotional fervor, grand staging, and modern technology often conjured by the highly charged term *televangelist*. For while Sheen was television's earliest religious success, his style was not its most common. Instead, television largely became the domain of a distinct brand of charismatic evangelical Christianity, whose perpetual focus on finding new ways of spreading the Gospel in accordance with Christ's "Great Commission" fused itself to television only shortly after Sheen's earliest successes. The earliest television minister cut from this more effusive Christianity, and whose television presence set the standard for future marriages of religion and television on a global stage, was without doubt Rex Humbard.

Humbard began his television ministry in 1952 in Cuyahoga Falls, Ohio, when he inaugurated *The Cathedral of Tomorrow*. Humbard's early televangelism also truly globalized, broadcast at its peak on more than 600 stations to Canada and Latin America as well as as far afield as Saudi Arabia and Australia. With an audience of millions, Humbard's standard would not be bested for nearly 30 years. Preaching enthusiastically and mixing his message with staged musical performances by soon to be famous groups such as the Gaither family and Johnny Cash, Humbard captivated audiences worldwide, including a budding Memphis musician and fellow Pentecostal Christian named Elvis Presley; Humbard and Presley would become close, with the former eventually officiating the latter's funeral. To house such a spectacular performance of ministry, in 1954 Humbard

built the first-of-its-kind Cathedral of Tomorrow, also in Cuyahoga Falls. As the first religious structure expressly built for a television broadcast, Humbard's new church represented the fusion of religion and television at the material and architectural levels.

Religious Intolerance in the 21st Century

Since the late 1990s, the emergence of round-the-clock cable news service has changed how Americans see the religious traditions that predominate elsewhere, particularly Islam. If American evangelicals dominated 20th-century religious content on television through the construction of media empires, in the 21st century fundamentalist enclaves across the world have sought to dominate television and mass media through the abject acts from which the camera eye cannot turn away. Through the elaborate staging of demonstrations, acts of violence, and the shrewd release of videotaped invective, groups such as al Qaeda have revealed a new, bottom-up way of commanding the attention of the television media.

The importance of the news services' depictions of unfamiliar religious traditions has a formative effect on American conceptions of those traditions. As most public high schools do not develop religious literacy in their students, most Americans' first experiences with religions and religious groups come from the news. In their desire to depict sensationally any foreign religious groups and those groups' interest in being depicted exotically, television's multiple frames of gaze dissolve any attempt at critical engagement.

Likewise, the self-awareness that First World nations have cultivated in the so-called Information Age has proven useful to domestic intolerances as well. Consider Fred Phelps, pastor of Westboro Baptist Church in Topeka, Kansas. Notorious for dispatching his congregants to protest the funerals of U.S. soldiers in order to protest the American government's "liberal emphasis," Phelps's unrepentant insulting tone bears the marks of a television-ready spectacle; in many ways, the pastor's vitriol guarantees his message airtime, even if it is negative.

TEMPLES

See Sacred Places

TERRORISM

Terrorism is the clandestine use of violence against civilians for ideological purposes. Because the term is pejorative, its precise definition and application are contested. Disenfranchised groups employ terrorism to exert disproportionate influence by using violence in a manner that challenges prevailing social conventions. In doing so, these groups expect to elicit panic, outrage, or sympathy in their audiences.

The Role of Religion

Religion and terrorism have a longstanding relationship. As David Rapoport has shown, some of the earliest terrorist movements on record were motivated by religion: the Jewish Zealots (1st century CE), the Muslim Assassins (11th through the 13th century), and the Hindu Thugs (13th through the 19th century). The proliferation of terrorist movements motivated by anarchist, nationalist, or left-wing goals starting in the 19th century gradually obscured the role of religion as a salient influence on terrorism, a preconception that changed in the mid-1980s with the rise to prominence of several terrorist groups associated with religious movements. The attacks perpetrated by al Qaeda on September 11, 2001, have drawn increased attention to religiously motivated terrorism, with particular emphasis on groups that are associated with Islam or that use suicide bombing.

Nonetheless, political grievances, social alienation, humiliation, poverty, and mental illness

continue to form the primary focus of the study of terrorism. The challenge in discerning the relationship between religion and terrorism lies, in part, in the mixture of religious and political motivations espoused by religiously motivated terrorist groups. Even terror movements driven by an explicit religious agenda may pursue political goals in parallel or draw on a combination of politics and religion in their short- or long-term goals. Religion may provide a terrorist organization with its ultimate rationale or merely serve the proximate purpose of attracting recruits, indoctrinating members, or enhancing the group's appeal to a wider audience.

One means of disentangling these factors is to place terror movements on a continuum, ranging from those least influenced by religion, at one extreme, to those that derive most of their methods and goals from religious precepts, at the other extreme. For some separatist or revolutionary movements, such as the Shining Path (*Sendero Luminoso*), the Revolutionary Armed Forces of Colombia (*Fuerzas Armadas Revolucionarias de Colombia*, FARC), or the Earth Liberation Front, religious doctrine seems to play no role at all. In other groups, members may identify with a religious movement without drawing on religious beliefs as a rationale for their activities. Such groups include the Irish Republican Army (IRA), the Basque *Euskadi Ta Askatasuna* (ETA) in Spain, the Tamil Tigers in Sri Lanka, or separatist movements in Chechnya and Kashmir. In yet others, religion can have a significant impact on all aspects of identity and doctrine. A sampling of such groups across religious movements might include Hamas (Islamic), Kach (Jewish), the Lord's Resistance Army (Christian), Babbar Khalsa (Sikh), and Aum Shinrikyô (Buddhist).

Religiously Motivated Terror Movements

Terror groups that conceive of religion as a primary motivator for their actions rely on scripture, revelation, and theology to determine both their means and their goals. This results in constraints on action and in justifications that are absent in secular terrorist organizations. An examination of the religious beliefs that influence such terrorist movements can thus illuminate their past and future actions.

This combination of faith and violence raises a question regarding organizational decision making.

Why do some religious movements choose to adopt terrorist methods while others do not? Rapoport has argued that the path to violence struck by certain millenarian and messianic movements begins as these movements separate themselves from society to prepare for the end-time. This separation often occurs as auspicious dates draw near or in response to portents and prophecies. When this period of migration, purification, and waiting fails to deliver the results expected by members of the group, they may resort to violence in order to transform the world by means of human agency. Millenarian movements that resort to force expect their actions to bring the world into balance by ushering on a divine promise or by bringing about the end of days.

Mark Juergensmeyer has argued that these religiously motivated groups perceive of their attacks as dramatic performances that are intended, at least in part, for symbolic effect. Members of the group understand the deity to be orchestrating as well as observing these performances, which are often reenactments of the primordial violence of cosmic war documented in sacred scriptures. The group perpetrates mundane violence, but these acts are designed both to reflect and to affect a greater cosmic struggle between forces of ultimate good and their satanic opponents.

Such violence is particularly likely when the group perceives the cosmic war to be characterized by the following conditions: The struggle is mythic, but it occurs, at least in part, in this world as well; it is a war in defense of essential notions such as identity or dignity; the struggle has reached a point of crisis in which victory by conventional means is no longer possible; loss of this struggle is unthinkable, and human agency can make a difference between defeat and victory.

Rationalist Approaches

The multitude of influences shaping the goals and methods of terrorist movements, from the secular to the religious, produce substantial variation across groups, which has complicated the search for patterns. Rather than attempt to unravel these factors, mainstream political science has sidestepped ideological explanations for terrorism in favor of rationalist approaches that emphasize the cost-benefit calculations motivating even the most

religiously devoted of terrorist groups. The question motivating these analyses is thus not why religious groups espouse terrorism but rather why terrorist groups mask their actions with a religious veneer. Rationalist logic suggests that terrorists do so to achieve strictly political goals, such as obtaining financial support, coercing political concessions, or expanding recruitment. Religion may perform other relatively minor roles, such as inflaming preexisting conflicts or motivating individuals to join terrorist movements.

In this vein, Robert Pape has argued that terrorist movements do not deploy suicide bombers due to conceptions of martyrdom but because such attacks send a costly signal about the undeterrable nature of the movement. This argument is, in part, borne out by the profiles of suicide bombers. While some suicide bombers were recent converts, few hailed from religious backgrounds, underwent religious education, or displayed high levels of religious zeal. Several secular terrorist movements have used suicide bombing, and several religiously motivated movements have not done so.

The Microeffects of Religion

Even when religion is not the primary source of a terror movement's doctrine, it can influence the behavior of a movement and its members in myriad ways. Religious doctrine may specify the choice of targets or weapons, the time and location of attacks, the identity of persons immune from attack, and even how assailants are to prepare or dress for an attack. The ritualistic manner in which religious reasoning prescribes the details of terrorist action can lead to a fixity in goals and methods that distinguishes religiously inspired terrorist movements from their secular counterparts. Whereas secular terror movements can learn from their mistakes and adapt their tactics, religiously motivated terror movements are often constrained in their choices by the dictates of faith.

Religious precedents and important events in the founding period of a religious movement can influence a terrorist movement's strategy. For example, Muslim movements such as al Qaeda were inspired by Prophet Muhammad's retreat to a place of safe refuge to prepare for his military campaigns. Hezbollah, the first terrorist movement to employ suicide bombing as a tactic, drew

on the model of martyrdom offered by the imams Ali and Hussein, who died in defense of their faith. This precedent confers a religious title on participants, qualifying the actions of those who commit suicide to promote the group's goals as a form of martyrdom.

Finally, religious interests can motivate the individual activist. Whereas the organization may well be driven by political goals, individuals may sanction its actions due to a religious rationale. Religious reasoning can help a movement's leadership frame participation in terror acts as a form of religious redemption or even a religious obligation. Leaders employ religious language to channel the frustration of individuals into devotion for the group's cause. If the organization succeeds in equating personal grievances with sin, it may persuade individuals to sacrifice themselves in the hope of securing rewards in the afterlife.

of Malaysia, Cambodia, Laos, and Myanmar. Known as Siam until 1939, Thailand has been a part of transnational religious processes for centuries, including the traditions of Buddhism, Islam, and Christianity. With more than 92% of its population Theravada Buddhist, Thailand retains the highest population of Theravada Buddhists in the world and is the third most populated Buddhist country in the world, behind China and Japan. This entry will briefly cover the development of Thailand's modern nation-state, the growth of religious traditions in Thailand, and some changes to Thailand's religious landscape in contemporary times.

Thailand's population reflects its legacy of shared borders and international trade routes with various countries for more than 700 years, with its earliest inhabitants migrating from southern China and the Malay Peninsula and archipelago. Thais from southern China migrated into Thailand as well as adjacent countries and India. By 1229, Thais had traveled as far as eastern Assam and had set up their own kingdom, which remains an important religious and cultural heritage of Assam in contemporary times.

Since the early phases of globalization, the region of Thailand has served as a space for numerous transnational movements that include, among others, a long history of interchange between the people of India and China. South Asian Brahmans, Sikhs, and Muslims traveled through Thailand on their way to China, congregating in the populated northern province of Chiang Mai (Kingdom of Lanna), the central province of Ayutthaya, and the southern province of Pattani (Kingdom of Patani). Throughout the centuries, Chinese ethnic groups, particularly the Hokkien, Hakka, Teo Chiu, and Hainanese, have continued to immigrate to Thailand in large numbers. Chinese ethnic groups made a significant impact on Thailand's religious landscape, chiefly by supporting Mahayana Buddhist and Roman Catholic traditions. Malays were among the first Buddhists to live in what is now Thailand, but most converted to Islam after the 15th century.

THAILAND

Thailand is a Southeast Asian nation of 63 million people, which shares its borders with the countries

Development of the Thai Nation-State

According to Thai historians, the founding of the first Tai kingdom, Sukhothai, came into existence through its separation from the Khmer Empire

(Cambodia), which had been heavily influenced by Mahayana Buddhism and Brahmanism. Shortly before Sukhothai sought to separate from the Khmer Empire, Theravada Buddhism emerged in the region and began to gain favor at the Khmer court. When Sukhothai gained its independence, its court adopted the Khmer tradition of retaining Brahman priests while also seeking to establish the religious tradition in vogue: Theravada Buddhism. King Ramkhamhaeng (r. 1277–1317) sent emissaries to Sri Lanka (Ceylon) to establish a Theravada Buddhist sangha (Thai *Mahatherasamakhan*) in Sukhothai. This relationship with Sri Lanka continued with the subsequent Tai kingdom, Ayutthaya (1351–1767). Thai kings invited Sinhalese Buddhist monks to visit and establish monasteries, as well as purify the sangha when necessary. Sri Lanka reciprocated these gestures in 1753 by requesting Thai monks to come and purify the Sri Lankan Sangha, creating the Siyam Nikaya in Sri Lanka.

The Thai monarchies continued to hold significant power over the direction and development of the Thai Theravada Sangha. King Mongkut (r. 1851–1868) founded the Thammayut Order in 1833 prior to assuming the throne, deriving much of the order's discipline and practice from Mon and Burmese schools. King Mongkut's creation of the Thammayut Order became officially recognized in 1902 under his son Chulalongkorn's reign. This official recognition of the Thammayut Order led to the subsequent designation of the traditional order: the Mahānikāi. Thailand's absolute monarchy converted to a constitutional monarchy in 1932, altering the country's political relationship with the Thai Buddhist Sangha, which remained in effect in 2008.

Buddhism in Thailand

Thai Buddhism has many different beliefs and traditions, many of which are localized to specific places. Villages will have shrines devoted to local monk-saints and other venerated figures, which may or may not be officially recognized by the Office of National Buddhism, the governmental agency in charge of the development and health of Thai Buddhism in Thailand.

Different Buddhist traditions such as Vietnamese Buddhism, Burmese Buddhism, and Tibetan

Buddhism are present in Thailand. However, the largest minority Buddhist tradition in Thailand consists of Chinese ethnic groups that have immigrated to Thailand for centuries and follow a Mahayana-based Buddhism with a special emphasis on ancestor worship. They adopted the local customs of Buddhist veneration while building Chinese Buddhist shrines and temples and retaining specific Chinese rituals such as Tang-ki.

The largest religious tradition in Thailand is Thai Buddhism. It is more than a diverse, localized tradition; it is also a transnational effort to expand national interests. The Thai nation-state has sought to expand its influence through its expansion of Thai Buddhism. For over three centuries, Thai Buddhist monks have been sent to the countries of Southeast Asia as well as Europe. As early as 1686, there is record of Thai Buddhist monks being sent to western European countries. Thailand has continued its missionary efforts into the 21st century with the Thammathut Program. The largest movement and dispersal of Thai Buddhism occurred in the 1970s. As of 2008, the Thai nation-state had facilitated the construction and maintenance of 233 monasteries in 28 different countries.

Christianity in Thailand

Christian traditions made their way into Thailand through various channels. One of the earliest missionaries was the Portuguese Jesuit Balthazar de Sequeira, who visited the country in 1606. The Portuguese lost their religious authority thereafter. In 1669, the Roman Catholic Pope Clement IX issued a bull relegating Thailand and its neighboring kingdoms to the jurisdiction of the French Church of Ayutthaya. In addition to the missionaries of European colonialism, Japanese and Chinese Christian missionaries also made a significant impact on Thailand's Christian population. Many early Chinese and Japanese Christians immigrated to Thailand after fleeing their countries due to persecution and played a critical role in assisting the Portuguese and French missionaries. Christian missionaries reported a scarcity of converts in central Thailand and found the different nations in northern and northeastern Thailand much more receptive to their cause. In more recent years, Burmese Christians such as the Kachin have immigrated to

northern Thailand, many of whom are seeking refuge from religious persecution.

Islam in Thailand

Some of the earliest Muslims in Thailand were the product of the Malay peninsular principalities' conversion to Islam. The center of activity was the kingdom of Patani, a vassal to Thailand, which had declared itself Islamic in 1457. During sporadic wars for independence, Patani Muslims were captured and sent to the Thai capital, engendering a sizeable diaspora of Malay Muslims in central Thailand. Patani would later become portioned off to form the southern border of Thailand and the northern part of Malaysia. Malays are not the only Muslims in Thailand. Chinese and Champa traders brought Islam to the regions of Thailand as well. Persians settled in Ayutthaya in the early 1600s, and in the 1700s the Thai armies recruited Cham Muslims from Cambodia. By the 1800s, numerous South Asian Muslims traded and settled in the Thai urban center of Chiang Mai and Bangkok.

Thailand in the Global Era

Thailand's economic growth and decline has made a significant impact on its global religious outreach. After the 1997 Thai bank collapse, prompting a global economic crisis, the business decline was coupled with a slight decline in Thai Buddhist outreach—both within the borders of Thailand with the different religious communities and outside the borders of Thailand. Since the southern region's (Patani) conversion to Islam, there have been efforts to separate itself from Thailand. This effort was recently renewed in 2004 as a guerilla struggle against the Thai nation-state, which continued into 2009 with a loss of more than 4,000 lives.

In the 1970s, two new Thai Buddhist schools emerged: Santi Asoke and Dhammakaya. Santi Asoke represented a more ascetic approach to the religion. The Dhammakaya Foundation has become a massive global organization, with branches in more than 18 different countries. Another development is the Order of Nuns. Dhammananda Bhikkhuni became Thailand's first ordained nun in 2003 and has made Songdhamma

Kalayani Center—International Centre for Buddhist Women in Nakhon Pathom province into a global center for Buddhist women's issues. Without a doubt, Thailand will continue to be the epicenter of Theravada Buddhist growth and development for years to come.

THEOSOPHY

The word *theosophy*, “divine wisdom,” is ancient, but the term is now most frequently used in reference to the teachings and work of the Theosophical Society, established in New York in 1875. Its principal founders were Henry Steel Olcott (1832–1907), the first president, who served until his death; Helena Petrovna Blavatsky (1831–1891), the leading articulator, in voluminous writings, of the Theosophical worldview; and William Quan Judge (1851–1896), a later president of the Theosophical Society in America.

Theosophy was a significant agent in the globalization of religion.

Many original Theosophists had been Spiritualists, but under the guidance of Blavatsky were led to probe more deeply into ancient and cosmic mysteries of which that novel faith seemed only to scratch the surface. In particular, Theosophists believed that an “ancient wisdom” could be uncovered that underlay philosophy and religion around the globe but of which India was now a major reservoir. Among the chief tenets of this wisdom were cosmic oneness, the interactive spiritual and material evolution of the universe, karma and reincarnation, the journey of the individual “pilgrim” through life after life, and the existence of advanced souls called “mahatmas” or “masters,” who guide the evolution of the world and who can assist others in their pilgrimage.

In the East, the work of Blavatsky, Olcott, and others enhanced Hindu and Buddhist understandings of their faiths as legitimate world religions with much to offer others. At the same time, Theosophical lecturers and writings popularized awareness in the West of concepts such as karma, reincarnation, and spiritual masters not only in major cities but in smaller places as well. (In 1900, there were Theosophical lodges in towns such as Pierre, South Dakota, and Sheridan, Wyoming.)

Theosophy, like Spiritualism just before it, epitomized globalism in another sense also. Those two were among the first significant independent spiritual groups to originate in America. They claimed to be, like the new nation, democratic. They also emphasized, in a new scientific age, that they were amenable to scientific verification, not dependent on “blind faith” in traditional authority. Moreover, at home and around the globe, they popularized themselves by employing dramatic new technologies: the print media, in the first years of truly widespread literacy, and travel by trains and steamships, with their relative speed and comfort. (On their first journey to India, in 1879, Blavatsky and Olcott passed through the Suez Canal only a decade after its opening.) On another level, unusual for the 19th century, Theosophy saw the pluralism of global religion, not as grounds for missionary competition alone but as a means to the deepening of wisdom.

THERAVADA BUDDHISM

Theravada (Doctrine of the Elders) is a self-chosen label for one of three main divisions within contemporary Buddhist traditions (Theravada, Mahayana, and Vajrayana). With a global population of more than 150 million followers, it is the predominant religious affiliation in Cambodia, Laos, Myanmar, Thailand, and Sri Lanka. Theravada is also of central relevance to the religious traditions of contemporary Sakya and Vajracharya of Nepal; the Khmer Krom of Vietnam; the Baruas, Chakma, and Magh ethnic groups of Bangladesh; the Assamese of India; and the Shans of southern China. Among its most distinctive qualities are the liturgical practices of the Pāli language, the authoritative use of the Pāli canon (*tipitaka*), and rituals such as ordination lineages (*nikaya*) and the meditation of *vipassana* and *samatha*.

Theravada’s most recent transformation and globalization came in the 19th and early 20th centuries through the assistance of European colonialists who had influential posts in academics and Buddhist colonies. In the postcolonial era, Buddhist nation-states have sent monastic missions around the globe, and Theravada *vipassana* meditation centers have globalized through commercialized retreats and prison rehabilitation treatments. Nation-states such as Cambodia and Sri Lanka retain Theravada as their official state religion, and others possess robust forms of religious nationalism, which draw on Theravada Buddhist

principles. This entry will briefly review the diverse history, scriptures, practices, and politics of Theravada.

History

Early historical accounts of Theravada are contested by contemporary Buddhist scholars, with notable differences between accounts from within and outside the tradition. According to traditional accounts, Theravada derives from the Sthaviravada lineage, which formed along with the Mahasamghika after the Great Schism in the fourth century BCE. Its inchoation continued in the third century BCE, largely through state support. According to its commentaries (*atthakatha*), Theravada's earliest and most prolific advocate was the Mauryan Emperor Asoka (r. 269–232), who established Theravada Buddhist forms of governance within his South Asian empire and sent vassals to Sri Lanka (Ceylon), Myanmar (Burma), and neighboring kingdoms in mainland Southeast Asia. As one of the most powerful Buddhist rulers of his time, Asoka became a model of a just ruler (*cakkavatti*) for subsequent Buddhist kings throughout Asia.

In Sri Lankan accounts, the next early focal point for Theravada's diffusion into Asia began in Sri Lanka. Asoka convened the Third Buddhist council and sent his ordained son and daughter, Mahinda and Sangamitta, to Sri Lanka and beyond to spread the doctrine. Mahinda and Sangamitta were successful in establishing a Theravada lineage in Sri Lanka, which is sustained in contemporary times through the Mahavihara school. In the fifth century CE, the eminent South Asian monk Buddhaghosa wrote his commentaries in Sri Lanka, which remain the most authoritative commentaries in Theravada. Sri Lankan monastic lineages and Buddhaghosa's writings were subsequently transmitted to the Malay Peninsula and Southeast Asian archipelago, which had oceanic trading routes with South Asia as early as the fourth century CE.

One point of departure between historical narratives is Asoka's dissemination of Buddhism. Traditional accounts indicate Myanmar and Southeast Asia as points of destination in the third century CE. However, the earliest evidence dates from the fourth century CE, when different

Buddhist practices and scriptures existed in the Burmese kingdom of Pyu and the Thai kingdom of Dvaravati. Initially, Chinese, Indian, Sri Lankan, and Malay travelers brought their Buddhist practices to Myanmar; but it was the sustained and concerted effort of Sri Lankan missionaries in the 11th century that enabled Theravada to take root in the kingdom of Pagan.

Sri Lanka also sent forth Buddhist emissaries to the Khmer Empire (802–1431 CE) in the 13th century CE, establishing political and trade relations in the process. Similar to Myanmar, the Khmer Empire already had encountered Buddhist traditions. Its capital city of Angkor was built in the 12th century and later became an archaeological testament to both Buddhist and Hindu notions of cosmogony. By the time the Sri Lankan emissaries had made their mark on the Khmer religious landscape, the Khmer Empire had passed its zenith. However, the Khmer Empire became a second nexus of Theravada transmission. One of the lasting impressions of the empire was the introduction of Theravada to the nascent Thai kingdom of Sukhothai (1238–1438 CE) in the 13th century.

After the 13th century, historical accounts become more uniform in their narrative. From Sukhothai, Theravada practices spread to other parts of Southeast Asia. Over the subsequent centuries, the religious connections between Thailand (Siam), Myanmar, Cambodia, and Sri Lanka were sustained through the periodic purifications of monastic communities (*sangha*). These occurred wherever newly minted rulers deemed the monastic community in need of a revitalized orthodoxy. Sri Lankan monks journeyed to Thailand and Myanmar to reestablish their lineages, and Burmese and Thai monks went to Sri Lanka to rejuvenate its monastic order. Vietnam's relationship with Cambodia sustained its Theravada community, but Vietnam's relative proximity to China enabled Confucian and Mahayana Buddhist traditions to dominate its political arena.

The spread of Theravada Buddhism continued into the 19th century, but at this point the loci of dissemination emerged from the United States and Europe. The French and British colonization of Southeast Asia introduced European statesmen, theologians, and traders to Theravada beliefs and practices. Many European colonialists brought the tradition back to their mother countries to be

studied, most notably at the Collège de France and Oxford University. New centers for the study of Theravada Buddhism continued to emerge in the United States and Europe. The most notable of these centers was the London-based Pāli Text Society (1881–) by the colonialist-turned-scholar T. W. Rhys Davids (1843–1922). In 1891, the Mahabodhi Society was founded in Colombo, Sri Lanka, under the guidance of the English-educated Sri Lankan monk Anagarika Dharmapala. Among its initial goals was to help restore the Mahabodhi Temple in Bodh Gaya, which is considered the site of Siddhartha Gautama's awakening (Buddhahood). To generate international awareness, Dharmapala introduced Theravada to an international audience at the World's Parliament of Religion held at Chicago's World Columbian Exposition in 1893. In contemporary times, the Mahabodhi Society continues to support the Buddhist traditions through its branches in India, Sri Lanka, and the United States. The Pāli Text Society's work also continues in Rhys Davids's absence. Over the past 130 years, the Pāli Text Society has fostered and promoted the study of Pāli texts worldwide.

Scriptures

Theravada scriptures (*sutta*) are primarily chanted and written in Pāli; however, one can find Theravada commentaries and sermons in the lingua franca (common language) as well as the official Thai, Burmese, Lao, Khmer, and other languages. Its scriptures vary within different localities; however, in whichever locality they are found, they are collectively called the Pāli canon. Similar to other South Asian religious traditions, the Pāli canon was initially disseminated orally. The oldest surviving written version is dated from the 15th century, and the collection was first published in its incomplete form in the 19th century. The Burmese version of the Pāli canon was the first printed in its totality in 1900, with 38 volumes. Subsequently, its contents have been translated into English, Thai, and Sri Lankan. More recently, the Pāli Text Society published a digitized version of its translation of the Pāli canon in 1996.

Buddhaghosa remains the foremost scholar on Theravada orthodoxy; his commentaries place the highest priority on the Pāli canon, seconded by commentaries on the scriptures, and followed by

monastic opinions based on logic, intuition, and inference. It is partly due to his classification that the Pāli canon has provided the ethical framework for Buddhist communities (*sangha*) and the basis of law (*dhamma*) for Buddhist states for more than two millennia. The Pāli canon is classified into three sections called baskets: the Vinaya (scriptures on monastics), the Sutta (scriptures of discourses), and the Abhidhamma (scriptures of higher knowledge). While the structure of these scriptures remains consistent throughout Theravada communities, the contents vary on a nation-state and even regional basis.

The Vinaya outlines the rules and parameters of monastic life. Unlike the Abrahamic traditions, Theravada does not contain a specific section devoted to lay ethics and morals. In the Vinaya, the Patimokkha provides the basic codes for monastic men and women. Men ordained under Theravada must adhere to 227 rules, which are delineated by degrees of importance. Women ordained under Theravada must adhere to 311 rules; most of the additional rules pertain to menstruation. Ordained men and women model the behavior as bearers of the doctrine (*dhamma*). In addition, most of the rules for secular life also derive from the Vinaya.

The Sutta is the most extensive of the baskets and contains a vast array of discourses. Among the scriptures are hagiographies of monks and nuns (*Theragatha* and *Therigatha*) and the *Jatakas* (rebirth stories of the Buddha), which didactically serve Buddhist communities. The most well-known *Jataka* is the last rebirth story of the Buddha called Vessantara. The *Vessantara Jataka* has become a transcultural phenomenon, with Buddhist communities around the world performing the story as a play and integrating the story into local sermons. While the *Vessantara Jataka* is well known throughout Asia, another scripture in the Sutta called the *Dhammapada* (Path of the Doctrine) is known throughout the world. The *Dhammapada* is a collection of 423 poetic verses on the nature of truth and reality. Monastic institutions (*sangha*) highly regard its teachings; Thai Buddhist monks are quizzed on its contents during their ecclesiastic Pāli exams. It has also received readerships from around the world with a diversified amount of translations in both text and audio formats.

Theravada monks treat the third basket of the Pāli canon, the Abhidhamma, as the most authoritative. As such, this basket has served as a reference in contemporary debates on euthanasia, suicide, female ordination, and other social issues. Much of its contents pertain to phenomenological taxonomies, which possess mnemonic devices for oral transmission, but it also consists of analytical doctrine (*vibhajjavada*) that distinguishes Theravada positions from those of Mahayana and Vajrayana. Some scholars argue that the analytical doctrine in the Abhidhamma is the quintessence of Theravada.

Rituals and Practices

Buddhists place a high emphasis on ritual and practices in Theravada. Monastic rituals are especially respected in Theravada communities and range from individual dehexing rites to communal Buddha image consecration ceremonies (*buddhabhiseka*). In many monastic rituals, objects such as amulets, talismans, or even water are infused with sacred power. It is a common practice for Theravada laity to wear amulets and talismans for protection or good luck. Monks bestow protective charms on laity through the ritual recitations of *paritta*. *Paritta* are short verses in Pāli that may heal people or even ward off angry ghosts. The laity also seek out *yantras*, which are protective Pāli words and images that monks give to the laity, sometimes as tattoos.

Theravada practices inevitably involve a degree of making merit (*puñña*). Two rituals that generate the most merit are the sponsoring of *kathina* ceremonies and becoming ordained. Modeling the practices that existed at the time of the Buddha, Theravada monks restrict their movement during the Rain Retreat (*Vassa*), which is the 3 months of the rainy season. The end of the Rain Retreat is marked by the *kathina* ceremony, in which the laity honor the monks with new robes and make donations to the temples.

In Southeast Asian countries, ordinations in the Order of Monks (*bhikkhu*) can be permanent positions or a rite of passage for Buddhist men. Similar to the followers of Mahayana and Vajrayana Buddhism, Theravada practitioners seek refuge in the three jewels (*tiratana*): the Buddha, dhamma, and sangha. Ordained men and women embody

two of the three refuges. Collectively, they represent the sangha, and their primary duty is to uphold and teach the dhamma (Buddhist teachings). Temporary ordinations are typically undertaken during the Rain Retreat. In addition to accumulating merit through the performance of monastic duties, it is commonly believed that ordination grants one's mother a space in the Buddhist heavens.

Female ordination was a point of contention in early South Asia, and it is said that the Buddha's favorite disciple, Ananda, had to request three times before the Buddha granted an Order of Nuns (*bhikkhuni*). Tradition holds that the Sri Lankan Order of Nuns was formed by Asoka's daughter Sanghamitta in the third century BCE. In the fifth century CE, Sri Lankan nuns helped constitute the first Chinese Order of Nuns, which eventually led to female ordinations in other parts of East Asia. However, the Order of the Nuns was never instituted in Thailand, Laos, or Cambodia; Burmese and Sri Lankan lineages ceased to exist by the 11th century CE. Recent attempts to revive the Order of the Nuns in Sri Lanka and Thailand have met with some success. Female ordinations require two separate monastic sessions: an initial probationary status through a caucus of nuns and, after 2 years, confirmation by a caucus of monks. Unordained female nuns exist in each country, and they generally have to take 8–10 vows and observe an ascetic lifestyle.

In Theravada traditions, meditation is both a monastic and a lay practice. The Pāli canon and Buddhaghosa's commentaries divide meditation into two methods: *samatha* and *vipassana*. *Samatha* meditation is the cultivation of concentration for the purposes of strengthening and calming the mind. This is often used as a means of preparing a practitioner for the second method, *vipassana*, which is a focused insight on the nature of impermanence (*anicca*), suffering (*dukkha*), and the concept of no-self (*anatman*). It is believed that these meditation methods fell out of favor in most Theravada schools between the 10th and 18th centuries CE. However, Myanmar and Thailand have witnessed a revival of the meditation methods in their monastic traditions, which has spread to lay retreats. This recent revival of meditation methods has also become a Vipassana movement (Insight Meditation movement) in contemporary

times, with centers and retreats worldwide. It has become viewed outside Buddhist countries as a secular practice for physical and mental well-being. Also, it has been used as a successful means of rehabilitating prisoners in India and the United States.

Lay practices center on the accumulation of merit. The most regular and affordable of these is the giving of alms to monks, which occurs every morning. Monks receive their daily food from the laity through this practice, which enables them to continue to live their austere lifestyle. In this fashion, monks become a “field of merit” for the laity. One of the most fundamental of lay practices is the observance of the five moral precepts (*pancasilani*), namely, abstaining from killing of sentient beings, stealing, lying, taking of intoxicants that cloud the mind, and sexual misconduct. Lay Theravada Buddhists especially emphasize these precepts during the Rain Retreat and Buddhist holidays.

Another way of making merit is through the performance of pilgrimages. Pilgrimage sites vary, with a few internationally recognized places that pertain to the Buddha’s life, such as the site of Siddhartha Gautama’s awakening in Bodh Gaya, India, and the site of the Buddha’s birth in Lumbini, Nepal. Monasteries are popular destinations for Theravada pilgrimages, especially during festivals or celebrations such as the Magha Puja, which honors the Buddha’s teachings, or Visakha Puja, which celebrates the Buddha’s birth, awakening, and death.

Regional or country-specific pilgrimages often involve visiting relics (*dhatu*), which embody the first of the three refuges: the Buddha. Often, relics are enshrined in mounds that, depending on the region, are called stupa, pagoda, or *cetiya*. In Theravada, relics are divided into three categories of importance: relics of the body (*saririka-cetiyam*), relics of use (*paribhogika-cetiyam*), and relics of memory (*uddesika-cetiyam*). It is believed that Emperor Asoka dispersed 84,000 pieces of the Buddha’s body throughout Asia in his mission to spread Buddhist teachings. One of the most well-known of these relics of the body is the Tooth Relic in Kandy, Sri Lanka. Relics of the body are considered the most powerful of relics and do not have to come from the Buddha but may derive from locally venerated monks.

Relics of use are less common and pertain to important items the Buddha or a locally venerated monk used, such as a begging bowl or robe. Buddhist images are relics of memory and, although they are the least powerful of relics, are greatly respected in the Theravada tradition. For a Buddha image’s power to become reified, a consecration ceremony should take place to open the image’s eyes and actualize its sacrality.

Modernity

Theravada has undergone significant changes due in part to European colonization and its aftermath. With European colonialism, Theravada Buddhists encountered Western forms of modernity, particularly Protestant Christianity. These encounters elicited unique methods of identity affirmations that often took the form of nationalism.

In the late 19th century, the Theosophical Society’s cofounder, Col. Henry Olcott, visited Sri Lanka and strove to counteract the growing Christian missionary work. Founding the Buddhist Theosophical Society, he worked with Anagarika Dharmapala to transform the traditional Sri Lankan method of religious dissemination. Olcott and Dharmapala developed a system that involved Buddhist catechisms, Buddhist carols, a Young Men’s and Young Women’s Buddhist Association, and other devices that proved successful and greatly changed the traditional methods of Buddhist learning. Their attempts to protect and promote Sri Lankan Buddhism succeeded.

In 1948, Sri Lanka emerged as a Buddhist nation-state with a unique set of practices, which Gananath Obeyesekere and Richard Gombrich have dubbed “Protestant Buddhism.” In addition to the new form of Sri Lankan Buddhist practices and in contrast to other Theravada societies, Sri Lankan monks engaged openly in politics, forming the *Janatha Vimukti Peramuna*. Part of this new political presence was the advocacy of a Buddhist state, which became more vocal during the Sri Lankan civil war with the LTTE (Liberation Tigers of Tamil Eelam).

Although Sri Lanka is unique in its politicized monasticism, it is not alone in its efforts to assert a Buddhist presence at the national level. In response to the encroaching European colonialism along its borders, the Thai monarchy instituted

ecclesiastical and bureaucratic reforms in the early 20th century, which some scholars have called “State Buddhism.” Since the mid-20th century, Southeast Asian nation-states either have had significant changes to their constitution that underscore their Buddhist identity or have made multiple concerted efforts to do so.

While Theravada has become more visible within the state apparatus, it is also more visible in nongovernmental agencies and engaged Buddhist groups. One of the more globally recognized movements is the Sarvodaya Shramadana movement in Sri Lanka. This movement draws on meditation methods, Gandhian notions of truth-force (*satyagraha*), and the Theravada principle of loving kindness (*metta-karuna*) for conflict resolution and comprehensive development projects. Among the many individually engaged Buddhists is Dhammananda Bhikkhuni, the first fully ordained nun in Thailand. Dhammananda works on improving conditions for Buddhist women throughout Asia and has been at the forefront of the Order of Nun revival in Thailand. She oversees the *Yasodhara: The Newsletter on International Buddhist Women’s Activities*, which is available in more than 40 countries. She is also an active participant in the global coalition of Buddhist Women, *Sakyadhita* (Daughters of the Buddha), which was formed in 1987.

Theravada is a vibrant part of more than 150 million people’s lives and has had an even wider impact through the globalization of culture. Over the past 2,300 years, it has been a part of the political, economic, and cultural dimensions of Asia. Myriad and fluid, Theravada will continue to make a significant influence on the world in the years to come.

THICH NHAT HANH (B. 1926)

Thich Nhat Hanh is one of the greatest contemporary Buddhist teachers and the most famous master of Vietnamese Buddhism. He developed his own brand of syncretic teaching and practice and has been most successful in popularizing Buddhism in the West. He is a noted poet, artist, writer, creator, and innovator. He has written more than 85 books, including *Peace Is Every Step*, *Being Peace*, *Touching Peace*, *Call Me by My True Names*, *Living Buddha, Living Christ*, and *Teaching on Love and Anger*.

Thich Nhat Hanh was born at Tha Tien, Quang Ngai. His teacher was the 41st-generation teacher of Lamte Zen. He was ordained in 1949. In 1950, he cofounded An Quang Buddhist Institute and Phuong Boi Monastery. In 1961, he went to Princeton University and Columbia University. In 1963, he cofounded Van Hanh University and La Boi Press in Vietnam. In 1964, he founded the School of Youth for Social Services.

At the end of the Vietnam War, he was barred from returning home. He lived near Paris and then continued his international fight for peace. In 1969, he established the Unified Buddhist Church in France, which brings together Theravada and Mahayana traditions.

In 1982, he founded Plum Village, a grouping of five hamlets around Duras, east of Bordeaux, France. It is his home base and a major monastery, hosting more than 100 nuns and monks, and novices from Vietnam and the West. He teaches there publicly on Sundays. In 1983, he founded the Community of Mindful Living in Berkeley; in 1997, the Green Mountain Monastery and Maple Forest, Vermont; and then in 2000, Deer Park Monastery in Escondido, California. He has spoken for peace in many world meetings. The Vietnamese government approached him in 2004 to return and play a role in Vietnamese society, so he went back home to work toward the reconciliation of the people and their leaders.

Not only is Vietnamese Buddhism syncretic, but Thich Nhat Hanh personalized it even further. He popularized the term *engaged Buddhism*, which can be credited to the 13th-century King Tran Nhan Tong. His teaching is close to that of the eighth-generation teacher of the Lieu Quan School (1670–1742), a reformed Zen school popular in central Vietnam.

He founded the Order of Inter Being in 1964 and drafted the “14 Mindfulness Trainings.” He holds that women are equal to men. He has made Meditation Walk a common daily practice even for lay people, whereby the disciples walk as slowly as possible to attune their body to the land, the universe, and the spirit. His communities are based on a democratic management style, respect for seniority, and automatic self-regulation.

3HO (SIKH DHARMA FELLOWSHIP)

In 1969, Harbhajan Singh Puri (1929–2004), a Sikh from the Punjab, India, arrived in Los Angeles and began to teach the art of kundalini yoga. He adopted the name Yogi Bhajan, built a small following of students, and legally incorporated the Happy Healthy Holy Organization (3HO) by the end of that year. The life of this small group was structured around kundalini yoga practice, strict vegetarianism, and communal living. Early students of Yogi Bhajan went on to establish yoga centers in several American cities, including San Francisco, Santa Fe, Washington, D.C., and New York City.

In late December 1970, Yogi Bhajan took a group of his students to the Darbar Sahib, the inner sanctum of the Golden Temple in Amritsar, India, the most sacred site in the Sikh tradition, where several of them underwent the initiation ceremony of the double-edged sword (*khande di pahul*). In the process, they made the transition from the practice of yoga to taking new names, wearing traditional Sikh/Punjabi dress (*bana*), and committing to follow the Sikh path with some modifications, such as strict vegetarianism and wearing only white clothes—a color associated with purity.

The Shiromani Gurdwara Prabhandak Committee, the central administrative body overseeing Sikh gurdwaras, warmly welcomed this development, honored Yogi Bhajan with the title of Sri Singh Sahib (“the Honorable Sikh”), and assigned him the responsibility of spreading the Sikh message in the West. Yogi Bhajan saw the acceptance of the Sikh path by his American followers as a step toward Sikhism turning into a world religion beyond the boundaries of Punjab and Punjabi ethnicity.

With Amritsar in the background, Yogi Bhajan established his community in Espanola, New Mexico. Organized around the importance of a holistic lifestyle, traditional Sikh practices such as study of the Guru Granth Sahib, Sikh scripture, and martial training (*gatka*) were encouraged. To facilitate the transmission of knowledge about the Sikh way of life, Yogi Bhajan arranged to send the younger members of the community to Punjab and later established the Miri Piri Academy in Amritsar,

where American Sikh children received traditional Sikh education. In the subsequent decades, the 3HO community also ventured out into businesses such as The Golden Temple Restaurant, Yogi teas, Akal Security, and so on.

With Yogi Bhaijan's death in 2004, the 3HO Sikh community is now in the postfounder phase of its growth. The community has successfully managed to address the absence of his leadership by creating an administrative structure that oversees the religious life of the community at Espanola and other centers and its multiple business concerns. Even though their numbers have declined over the years, and by the end of the first decade of the 21st century they probably numbered only a few thousand, the rise of the 3HO is an interesting development in Sikh history, and the group constitutes an intriguing component of the global Sikh community.

TIANANMEN SQUARE

Tiananmen Square occupies a central location in both the physical and the symbolic geographies of China's capital city, Beijing. The site takes its name from the Gate of Heavenly Peace (*Tiananmen*), which is situated at the northern end of the square. Further to the north of the Gate of Heavenly Peace sits the Meridian Gate (*Wumen*), the entrance to the Forbidden City. Although Tiananmen predates Tiananmen Square by some several hundred years, both sites have played and continue to play prominent roles in the political history of China.

The Gate of Heavenly Peace was originally built in 1420, during the Ming Dynasty. At this time, the gate was given the name *Chengtianmen* to suggest that the dynasty had received the Mandate of Heaven to rule. This ancient Chinese notion, central to both the political and the religious history of the country, held that a virtuous ruler both rose to and remained in power by heavenly decree and sanction. The gate was thus from

its earliest inception designed to represent the legitimacy of Ming rule, and the site has ever since been used to the same effect by political dynasties. During the reign of the Qing Dynasty Emperor Shunzi (1644–1662), the gate was given the name *Tiananmen*, and Mao Zedong officially proclaimed the establishment of the People's Republic of China from the site on October 1, 1949.

It was the Communist Party that erected Tiananmen Square in the 1950s, and the site was often used to hold mass political rallies. Today, the site also contains both the Mausoleum of Mao Zedong and the Monument to the People's Heroes. To the east of the square lies the National Museum of China, and to the west sits the Great Hall of the People. Closing off the square to the south is the Central Yang Gate (*Zhengyangmen*), which is popularly known as Front Gate (*Qianmen*).

Of all the historical events that have occurred at the site, the most notorious remains what is referred to in China as the June Fourth Incident. In April 1989, spurred by the desire for more democratic reforms in the government of China, university and college students in Beijing held a series of escalating protest marches and rallies in Tiananmen Square. By May, growing numbers of urban workers in Beijing had joined the protesting students. On May 13, students and other protesters occupied Tiananmen Square and began a hunger strike, and on May 20, the government declared martial law, determined to end the protests before any deaths resulted. The Chinese military entered the square in force on the night of June 3, and by the next morning, the area had been cleared of protesters. The amount of violence involved in putting down the protests, as well as the numbers of dead and injured that resulted, remains a subject of debate.

TIBET

Tibet is a region in the Himalaya Mountains north of India that is administered by China. In the modern West, Tibet is often associated with the Vajrayana branch of Buddhism, and the name conjures up images of red-robed monks meditating amid snow-covered mountains. It is also frequently used as an example of human rights violations and the struggle to practice religion under a totalitarian state. As one might expect, religion in Tibet is more diverse and complex than what these stereotypes reveal.

Introduction of Buddhism to Tibet

The Buddhism of Tibet is a conglomeration of Indian Tantric Buddhism and indigenous pre-Buddhist practices. Prior to the advent of Buddhism, Tibet was ruled by a lineage of divine kings. Religious rituals centered on funerary ceremonies to guide the spirit of the deceased on its afterlife journey, and offerings and sacrifices were performed to ensure that the dead would have everything that they needed in the afterlife. Worship of mountains and local land deities, the performance of exorcisms, purifications, healing rites, and ransom rituals can all be traced to Tibet's pre-Buddhist past. Belief in a soul, called *la*, that may leave the body if a person experiences great shock or fright was an indigenous idea that was incorporated into Tibet's Buddhist rituals. Sometimes this pre-Buddhist religion is referred to as Bön, but for reasons discussed later, this name is problematic.

The first official introduction of Buddhism into Tibet occurred in the seventh century, when King Songtsen Gampo converted to Buddhism and sent Tibetans to India to bring back Buddhist scriptures and translate them into Tibetan. The second of Tibet's great Dharma Kings, Trisong Detsen, made Buddhism the official state religion and instituted government support for Buddhist monasteries. He brought the Indian Tantric master Padmasambhava to Tibet to "tame" the local deities and invited the Indian monk Santaraksita to Tibet to ordain the first Tibetan monks.

In the mid-ninth century, however, King Lang Darma took the throne. He and many powerful noble families favored a return to pre-Buddhist

religious practices, which were being threatened by the new religion. Lang Darma is often accused of abolishing Buddhism, but scholars believe that he merely withdrew state support from the temples and monasteries. In any case, his reign marks a 200-year period of decline during which the practice of Buddhism in Tibet virtually disappeared.

The second dissemination of Buddhism to Tibet occurred in the 11th century. Tibetans again looked to India as the source of authentic Buddhist teachings, and the Indian abbot Atiśa is credited with reintroducing Buddhist philosophy and monasticism to the Land of Snows. Many new Buddhist schools formed during this time of Buddhist revival. These sects rejected the translations and practices that survived from the eighth and ninth centuries in favor of new translations of the Indian originals. As a result, these schools are referred to as *Sarma*, meaning "new." Those who continued to practice the rituals and rely on scriptures translated during the first dissemination of Buddhism in Tibet became known as *Nyingma*, meaning "old."

Buddhism in Tibet Today

There are currently four main sects of Tibetan Buddhism. The Nyingma school considers Padmasambhava its founder. It follows a canon of scriptures that is not accepted by the three Sarma schools and does not place as much importance on monasticism. The Nyingma sect is unique in its tradition of revealing spiritual treasures called *terma* and its practice of *Dzogchen* ("Great Perfection"). The three Sarma schools are the Gelug, Kargyu, and Sakya. The Gelug school was founded by the scholar monk Tsong Khapa. It rose to power in the 17th century, when the fifth Dalai Lama took control of a centralized government. It is known for its emphasis on monasticism, philosophical study, and debate. The three great monasteries in Lhasa—Drepung, Ganden, and Sera—are Gelug institutions. The Kargyu sect traces its lineage to the great yogis Naropa, Marpa, and Milarepa. There are many subsects within the Kargyu school; the incarnation lineage of Karmapas belongs to the Karma Kargyu subsect. Mahamudra or "Great Seal" and the Six Yogas of Naropa are important Kargyu practices. Finally, the Sakya sect is named after the gray color of the

earth where its first monastery was founded. It enjoyed a period of political supremacy in Tibet when it was the sect favored by the powerful Mongols in the 13th century and the first half of the 14th century. Its main teachings are known as *Lamdre*, meaning “the path and its fruit.”

While the various Buddhist sects adhere to different scriptures and ritual traditions, there are many common practices shared by all Tibetan Buddhists. Lay practices include making daily water bowl offerings, circumambulating temples and sacred mountains, reciting mantras, burning incense, hanging prayer flags, and spinning prayer wheels. Tibetans venerate a pantheon of Buddhas and bodhisattvas. They also believe in the existence of worldly gods, local spirits such as mountain and soil deities, and zombies. Tibetan religious festivals include Losar, the celebration of the lunar New Year; Saga Dawa, the anniversary of the Buddha’s birth; the Great Prayer Festival held each year in Lhasa; and Gesar pageants celebrating the great god-king of Ling.

Because of the importance it places on the teacher-disciple relationship, Tibetan Buddhism is sometimes referred to as “Lamaism.” The basis for this name is the great reverence that Tibetans show to their highest teachers, or lamas. Tibetan Buddhists respect these lamas as living Buddhas—human incarnations of enlightened beings. The Dalai Lama, for example, is believed to be an incarnation of the bodhisattva Avalokiteśvara; the Panchen Lama is the embodiment of the Buddha Amitabha. Other important religious figures in Tibet include lay Tantric priests and astrologers, highly realized women known as *khandromas*, and oracles. Nechung, the state oracle of the Tibetan government, is consulted by the Dalai Lama regarding both religious and political decisions.

While most Tibetans are Buddhists, there are also communities of Muslims and even a few Christians in Tibet. There are also followers of Bön. The Bön tradition traces its origins to a figure named Tönpa Shenrab and a region known as Zhangzhung in what is now western Tibet. The Bön tradition has evolved over the centuries, and today bears a striking resemblance to the Buddhist schools. Nevertheless, followers of Bön consider themselves members of a distinct tradition having roots in but not identical with Tibet’s pre-Buddhist past.

Tibet and the People’s Republic of China

During the Cultural Revolution and incorporation of Tibet into the People’s Republic of China, Chinese troops destroyed an uncountable number of temples and monasteries and forced many monks and nuns to disrobe. Since 1959 when the Dalai Lama fled to India, tens of thousands of Tibetans have joined him in exile. Whereas in the past different Buddhist sects and lineages were often at odds or even at war with one another, this is no longer the case. The religious oppression and discrimination that Tibetans in Tibet continue to face and the experiences of those living in exile have resulted in the formation of a pan-Tibetan identity uniting Tibetans in central Tibet, Amdo, Khams, India, and various other countries of the world where Tibetans have sought refuge. This newfound sense of kinship has taken shape around religion and Tibet’s bodhisattva of compassion, the Dalai Lama.

TILlich, PAUL (1886–1965)

A German-born Protestant theologian whose most influential work was produced in the United

States, Paul Johannes Tillich is one of the most important Christian thinkers of the 20th century. The son of a Lutheran pastor, he was born in Starzeddel, Prussia, and studied at the universities of Berlin, Tübingen, Halle, and Breslau. Also ordained a Lutheran pastor, he served as an army chaplain during World War I, and his experiences in the army reshaped his culturally and politically conservative mind into that of a religious socialist. From 1919, he taught at the universities of Berlin, Marburg, Dresden, Leipzig, and Frankfurt. In 1933, his employment was terminated because of his attack on Nazi ideology in his book *The Socialist Decision*. He fled to the United States, where he taught at Union Theological Seminary until his retirement in 1955. He then accepted a post at Harvard University and, in 1962, moved to the University of Chicago.

Primarily as a result of the publication of a short collection of sermons in 1948, *The Shaking of the Foundations*, which became an international bestseller, he became America's most widely known theologian and something of a global celebrity. His most important work was his three-volume *Systematic Theology*, still one of Protestantism's most influential theological texts.

A mixture of existentialism, neo-scholastic ontology, and depth psychology, his work is a vigorous critique of traditional orthodoxy, which he accused of confusing theological truths with a particular temporary expression of them. Instead of taking theological ideas from the past and simply applying them to situations today, which fails to take the contemporary situation seriously, theology needs to incorporate dialogue into a formal theological structure by seeking to "correlate" fundamental questions about the human condition raised in modern culture with answers provided by "the symbols" used in Christian teaching.

A theological system is supposed to satisfy two basic needs: (1) the statement of the truth of the Christian message and (2) the interpretation of this truth for every new generation. Theology moves back and forth between two poles, the eternal truth of its foundation and the temporal situation in which the eternal truth must be received (Tillich, 1951, p. 3). This "method of correlation" takes seriously the questions posed by the modern situation, as raised in philosophy, politics, and the arts, and provides answers rooted in Christian thought.

While inspiring for many, his contemporary recasting of Christian theology was criticized by conservatives for being shaped less by the Bible, which is rarely quoted in his *Systematic Theology*, and more by modern culture and philosophy, particularly existentialism. For example, God is not an independently existing being but being in itself, "the ground of being," "that which concerns us ultimately." Indeed, any human activity that demonstrates "ultimate concern," such as works of art, can be considered "religious." This dissolving of the boundary between the sacred and the secular has been enormously influential.

Near the end of his life, inspired by a visit to Japan and discussions with Buddhist and Shinto priests, he focused on interfaith dialogue. While his death prevented any significant personal involvement, he did initiate a discussion on the relationship between Buddhism and Christianity. His 1961 Bampton Lectures, *Christianity and the Encounter of the World Religions*, which include a Buddhist-Christian dialogue, provide an introduction to his thought in this area.

TIMUR (1336–1405)

Timur, also commonly known as Tamerlane, was a Muslim warrior who conquered Central Asia in the 14th century and was the founder of the Timurid Empire and Dynasty. Born in the City of Kesh in Transoxiana, in what is now Uzbekistan,

Timur was a member of the Barlas tribe, Turkic Tatars who were descendants of Genghis Khan's Mongol hordes. Though Timur was considered a Muslim, and his conquests and rule took place under the banner of Islam, his relationship with the religion was mixed. Timur believed himself to be a *ghazi*, or Warrior of the Faith, and felt that Islam justified the use of violence against anyone regardless of their religion. Despite his Muslim faith, many of Timur's conquests were against fellow Muslims, and his treatment of them was savage. Timur also used Islam strategically, alternately relying on both the laws of Islam and Ghengis Khan, whichever was most advantageous for his purposes. Born into the Sunnī tradition, Timur also showed sympathy toward Sufi and Shi'a beliefs and was adept at using his affiliation with all three branches of Islam alternately to further his political and military goals.

Timur first gained power as a military leader during campaigns in Transoxiana by Chagatai Khan. In 1360, when Tughlugh Timur, Khan of Moghulistan, invaded Transoxiana, Timur was appointed leader of the Barlas tribe. Following Tughlugh's death, Timur reconquered Transoxiana and added significant territorial gains by 1370, reducing the Chagatai Khans, to whom he paid nominal deference, to mere figureheads in the process. Timur continued to make impressive territorial gains, winning campaigns in Khorezm, the Caspian Territories, Persia, the Caucasus, Moghulistan, and Georgia, among others, over the next 25 years. In 1398, Timur invaded India, ostensibly because of the idolatry and infidelity of the Muslim Delhi Sultanate but drawn largely by the Sultanate's great wealth. Timur sacked Delhi so thoroughly that it took more than a century to recover, before turning his attention back westward to sack Damascus and Baghdad and make war on the Ottoman Empire. In 1402, Timur defeated and captured the Ottoman Emperor Bayazid I at the Battle of Ankara, initiating the Ottoman Interregnum and throwing the empire into chaos. Following his success against the Ottomans, Timur rode eastward to challenge the Ming Dynasty in China but died of a fever en route. Timur's legacy is mixed, hailed as a champion of Central Asia and a military genius, his conquests of and viciousness

toward fellow Muslims had devastating consequences for many of the largest cities in the Islamic world.

TOGO

The West African nation of Togo achieved sovereignty in 1960, when 14 French-African colonies ceded from France and became independent nations. Present-day Togo is bordered by Benin to the east, Ghana to the west, Burkina Faso to the north, and the Atlantic Ocean, the Bight of Benin, and the Gulf of Guinea to the south. With a population of 6.6 million people, the country's size is smaller than West Virginia and its long, narrow shape enables its residents to experience six different ecological systems within the nation's borders. Ewe and Mina are spoken in the south, Dagomba and Kabiye are spoken in the north, and French is the official language spoken in schools, trade, and government. The nation consists mostly of Ewe, Fon, Mina, and Kabre peoples, with small pockets of Syrian-Lebanese and Europeans. French influences are seen in fashion, marketing ads, and in the readily available baguettes.

Togo is composed religiously of 20% Muslims, 29% Christians, and 51% indigenous practitioners. The capital, Lomé, is a cosmopolitan city bordering Ghana and is well-known for its Muslim

traders, Christian vendors, and smugglers from countries all across West Africa. Many Togolese Christians and Muslims simultaneously practice or combine their religious beliefs with local cultural practices, though publicly their religious leaders will often extol the exclusive adoption of one tradition. African Initiated Churches (AICs) are common, as they use charismatic religious leaders, who often combine Christian rites and biblical passages with locally embraced music, styles of service, and ceremony. Mosques are in every major city, and the call to prayer is heard over amplified intercoms.

Togolese Vodou (alternatively called Vodun, Vodun, Voodoo), has a structured pantheon that consists of numerous spirits and divinities that interrelate with human beings in daily practices, community ceremonies, rites of passage, vocational selection, marital relationships, and most other scenarios. Spirits (*vodu*) can forge relationships with humans based on a person's star, or destiny, which is brought with an infant at birth. Each *vodu* generally has associative colors, fabrics, and beads that identify a practitioner of the spirit to the community, as well as proverbs, oral histories, prohibitions, and special days devoted to the particular *vodu*. *Vodu* can be found residing in natural sources, such as water, mountains, and lightning, or at a crossroads or can be connected with man-made substances such as forged iron. Ancestors, who are seen as an extension of the living world, are also used to work on behest of religious practitioners seeking guidance, protection, or aid from one of the many spirits who work on a human's behalf.

Politically, the nation has struggled under General Eyadéma's presidency and military dictatorship, which lasted from 1967 to 2005, shortly followed by his son Faure Gnassingbé's succession. Collectively, this has led to political instability, social turmoil, acts of violence, international financial sanctions, refugee displacement, and suppression of the press. Since 2007, Togo has held what are internationally deemed as (mostly) fair and free elections, making Togo safer and more accessible as a democratic nation.

TOKYO

Global religions in the Japanese city of Tokyo can mostly be seen in the religion of immigrants. This entry will first look at the official data of Tokyo related to immigrants' religions and proceed to review some statistical profiles about Catholics and Muslims in Tokyo. Tokyo is not a typical city of Japan, though it is its capital, and the situation of Japan in general will be reviewed in the entry "Japan" in this encyclopedia.

Religious Corporations

Shintarō Ishihara, the governor of the Tokyo Metropolitan Government since 1999, proposed in 2000 a vision of Tokyo as a "world city." One of the aims of this vision is to have 5 million foreign tourists in 2015 (compared with 2.5 million in 1998) and 50,000 foreign students in 2015 (compared with nearly 20,000 in 1999). The present numbers reveal a relatively low level of internationalization or globalization for this city when compared with its size of 12 million residents. Official statistics of the Tokyo Metropolitan Government, however, show the steady growth of the foreign population in Tokyo and that whereas the percentage of foreigners among the total residents in Tokyo was only 1% in 1980, it was 2.9% on January 1, 2007.

In 2007, of the approximately 371,000 foreigners (among the 12,692,000 total residents), 126,000 Chinese, 110,000 Koreans, 31,000 Filipinos, and 18,000 U.S. Americans live in Tokyo. As current migration studies reveal, these people of foreign origin have carried with them, at least to some extent, their own religious traditions. If they stay in Japan long enough to have a family and to experience the birth and/or death of some of their family members, then they may follow

some form of religious rituals or ceremonies deriving from their own tradition or another form that they have found and accepted on the new soil of Japan, whether it is Buddhism, Shinto, or any of the new religious movements.

Official data about the status quo of religions in Tokyo can be available in the list of religious juridical corporations compiled and published annually by the Tokyo Metropolitan Government. According to the list dated on January 1, 2007, we can get a basic picture of religious corporations in Tokyo: The total number of religious corporations is 5,916, which consists of 2,873 Buddhist corporations, 1,604 Shinto, 454 Christian, and 985 other. The great majority (959) of the last category of "other" corporations belong to Tenrikyō, a new type of Shinto-based group.

The notable exceptions in the other corporations are the following: one Islamic corporation located in Setagaya, one Jewish corporation and three Islamic corporations in Shibuya, and one Confucian corporation in Musashino City.

If we take a closer look at Christian corporations, another feature will become visible. Among 454 Christian corporations, the great majority have derived from major Protestant missions from abroad, although their level of independence from foreign missions must be different from one group to another. There are a few exceptions to these Western mission churches. One category of the exceptions is seen in the indigenous Christian groups started by Japanese leaders outside of Western mission churches, and we will mention these indigenous groups below. Another category is seen among the immigrants' ethnic Christian churches. Three corporations belong to an ecumenical ethnic church, the Korean Christian Church in Japan (in Shinjuku, Shinagawa, and Adachi). Some of the other Korean Christians gather at another independent evangelical church in Arakawa and another corporation, Full Gospel Tokyo Church, in Shinjuku. Full Gospel Tokyo Church is a Japanese branch of the Yoido Full Gospel Church of Korea, the biggest Pentecostal church in the world. In addition to Korean churches, there is one Chinese Christian church in Suginami. Also under the category of Christianity in the list for Tokyo, we see Jehovah's Witnesses holding their congregations at Setagaya, Katsushika, Akishima City, Koganei City, and Kunitachi City.

The indigenous Christian groups started by Japanese leaders can also be regarded as a sign of the globalization of religion or of its aftereffects. Mark R. Mullins, a sociologist, studied 13 major indigenous groups, all originating in 20th-century Japan, and the following five among them are headquartered in Tokyo: Mu-Kyokai Group (established in 1901), The Church of the Eternal Way (1907); Christ Heart Union (1927); Spirit of Jesus Church (1941); and Life-Giving Christ (1966). Although these groups have been almost unnoticed by both scholars and the Japanese general public and criticized as deviations by Protestant mission churches, they deserve special attention if we consider the problems of the indigenization of Christianity under the context of globalization. Thus, Mullins argues that the indigenization of Christianity in Japan has been dealt with more directly and freely by these groups than by many of the mainline and transplanted Christian denominations.

Catholics From Abroad

Among the total Japanese population of 128 million in 2005, there are approximately 1 million Christians, namely, 450,000 Catholics, 540,000 Protestants, and 16,000 Orthodox. The biggest diocese of the Catholic Church in Japan is the Archdiocese of Tokyo, with 95,000 Catholics. In the central area of Tokyo comprising 23 wards, they have 45 churches; Mass in English is celebrated in 10 of these churches and Mass in French, Indonesian, and Tagalog, in 2 churches each. One of the most active Catholic churches in Tokyo is St. Ignatius Church, where Mass is celebrated in Japanese, English, Indonesian, Polish, Portuguese, Spanish, and Vietnamese.

The Catholic Commission of Japan for Migrants, Refugees, and People on the Move (J-CARM) presents interesting statistics about Catholics from abroad. Since the Catholic Church does not conduct a survey of the status quo of the foreign Catholics in Japan, the commission can only estimate the number by multiplying the legally registered number of foreign residents that is issued by the Japan Immigration Association by the percentage of Catholics in their native country that is issued by the Vatican. For example, they estimate that there are 11,000 Korean Catholics and 37,000 Filipino Catholics in Tokyo Archdiocese, and apart

from the 95,000 Japanese Catholics mentioned above, they estimate foreign Catholics in Tokyo at 75,000. This way of calculation shows more interesting numbers outside Tokyo. In some dioceses where there are a large number of immigrants from Catholic countries, foreign Catholics far outnumber Japanese Catholics: Thus, in the Saitama diocese, there are 20,000 Japanese and 85,000 foreign Catholics, and in the Nagoya diocese, there are 25,000 Japanese and 107,000 foreign Catholics (both 19% vs. 81%).

There are two intriguing facts here. First, despite the fact that in some dioceses foreign Catholics occupy a substantial part of the church life and immigration will tend to continue at one place or another, the Catholic Church in Japan does not have official statistics about them. Second, although J-CARM seems to attempt to grasp the reality of the existence of foreign Catholics, they apparently do not have a suitable method to reach a certain conclusion but can only make assumptions.

Muslims

As mentioned above, there are four Islamic juridical corporations in Tokyo, but the Muslims' presence and their activities seem to be developing not only in Tokyo but also in other areas in Japan. Hirofumi Okai, a scholar in migration studies, summarizes the chronological development of the establishment of mosques around Japan. He enumerates 38 mosques existent in Japan (the one in Nagoya established in 1931 was lost during World War II), the first one in Kobe in 1935 and three in Tokyo in 1938, 1962, and 1982. The other 34 are in various areas from 1991 to 2006, and among them 4 are in Tokyo. The Kobe Mosque was established mainly by Indian Muslims, while the earliest mosque in Tokyo was supported by major financial groups of Japan, with the interest in Central Asia during the imperialist regime. Two others in Tokyo established in 1962 and 1982 were supported by the Indonesian government and the Saudi Arabian government, respectively.

Japan experienced an economic boom in the 1980s and attracted labor from foreign countries. Bangladeshis, Iranians, and Pakistanis were the main immigrants during this period, until around 1990. At that time, the Japanese government

started to impose a visa requirement for Bangladeshis and Pakistanis in 1989 and for Iranians in 1992, which greatly restricted entry from these countries. According to official statistics from the Japan Immigration Association, as of the end of 2006, registered sojourners in Japan from these three countries are as follows: 11,329 nationwide and 3,235 in Tokyo from Bangladesh; 5,198 nationwide and 1,355 in Tokyo from Iran; and 9,086 nationwide and 1,457 in Tokyo from Pakistan. In addition to these sojourners from these three countries, 18,906 Indians live nationwide and 7,396 in Tokyo, and 24,858 Indonesians live nationwide and 2,474 in Tokyo, and some of the former and the majority of the latter can with good reason be considered to be Muslims. Tokyo has a high Muslim population, but Muslims have also spread out nationwide. This explains the spread of mosques nationwide that have been established since 1991.

TOLERANCE

Tolerance is in some quarters a virtue in disrepute. Its demand to abide, endure, permit, and even suffer the existence of what we find wrong and intolerable is fraught with contradictions. Tolerance involves accepting, abiding, or accommodating views that one rejects. In fact, its linguistic cognates in many languages include the verb *to suffer* (i.e., to suffer the existence of what one finds objectionable and wrong). It calls us to live in cognitive dissonance. We are obliged to *bear* what in fact we find unbearable: For, if we did not find

this, that, or the other word or deed objectionable, there would be no call to tolerate them. The whole issue of tolerance only arises when some act or speech is deemed objectionable.

Tolerance is, first and foremost, a method to live with what one finds objectionable, hence, by implication, with what is different from oneself and one's way of managing life. Tolerance as a virtue implies difference as an empirical fact. While not every difference is an objectionable difference, it is safe to assume that almost all of what we find objectionable we also define in opposition to what we are. It is in the face of what is both different and objectionable that tolerance is demanded.

To many, this demand, with the value judgment it entails (relegating certain acts to the realm of the wrong and unconscionable), is too insipid a virtue, falling far short of calls for the truly pluralistic or multicultural perspective that has become synonymous with what is right and fair and proper in the contemporary world. To these people, tolerance is not robust enough to support a shared life in a global world.

To others, however, tolerance is too broad a goal; it fails to delineate its own boundaries and cannot produce a definition of what would be intolerable. Fraught with internal contradiction, it would seem as well an unrestricted call to abide by all forms of objectionable behavior with no inherent limits on what is tolerable. After all, almost all would agree that there are actions that are beyond any moral compass and should not be tolerated. Many of the horrors of the 20th century, encompassing genocide and other crimes against humanity, would fall under this rubric. If certain sets of acts are clearly beyond what can be tolerated, we are left with the need to define the boundary of what can and cannot be tolerated. The real political and ethical debates, this group would argue, are over the definition of just this boundary, leaving the issue of tolerance as of only marginal significance.

Moreover, and to no small extent, tolerance as a virtue has in many countries been replaced with the idea of rights (individual rights, citizen rights, human rights) as the primary way of negotiating difference in the contemporary world. Rather than relying on a particular virtue—and an ill-defined and contradictory one at that—modern politics tend to organize collective life around a set of legally defined rights. Predicated most often on the

secularization of the public realm, the freedom and moral autonomy of the individual conscience, and the separation of the private from the public realm, modern liberal democratic societies have in some sense made tolerance an irrelevant attribute of social life.

Individual difference is guaranteed by rights, as are the workings of the private realm, and except in such cases where one's actions infringe on another's rights, these actions do not even enter the category of what is to be tolerated or not. The politics of rights over the politics of the good and of individual autonomy over shared public conceptions of the good inevitably leads to the diminishing of any engagement with the idea of tolerance as a virtue necessary for civic life. Modern societies have to a great extent elided the problem of tolerance—obviated the necessity to be tolerant rather than make people tolerant. They have replaced tolerance of difference with legal recognition and the entitlements of rights.

The irony of this situation is that the renewal of religious and ethnic identities in today's world, in both developing and developed countries, calls into question the efficacy of a language of rights as the sole means of negotiating difference. Resurgent religious and ethnoreligious commitments all register a need to go beyond the language of rights in order to secure our ability to abide with difference in a global world. It may therefore be wise to review the claims for tolerance, which are, interestingly enough, rooted in a religious consciousness. Indeed, with an attentive ear to the religious cadence, we can broaden the medieval idea of "bearing with" or "suffering" as defining the tolerant act beyond its initial, negative connotations of suffering evil or bearing with that which is distasteful. It can be understood rather as suffering one's own self-restraint, as bearing that which must be borne for our very life within society. What must be endured or suffered, tolerated, or permitted is our own bearing of the other.

The first move of tolerance is thus a move of restraint, of reining in. What is reined in first and foremost is judgment. To withhold judgment is to recognize the limits of knowledge and so to recognize the boundaries of self. Thus does tolerance raise the problem of restraint in the face of the other and of the other's truth claims, and so of the recognition of our own limits. This is where it

intersects with religious virtues such as humility; indeed, in the Arabic idiom, tolerance is best translated as *hilm*, that is humility, a trait associated with Abraham, Prophet Mohammad, and God himself. For indeed, without restraint there is no dialogue, without silence there is no language, and without tolerance there is no communal life.

The centrality of discussion and dialogue, and hence the self-restraint that makes dialogue possible, is evident in all traditions and emphasized in all works devoted to tolerance. Thus, the injunction of the apostle James to “let everyman be quick to hear but slow to speak” (p. 7) is quoted in the preface to Peter Abelard’s *A Dialogue of a Philosopher With a Jew and a Christian* (p. 1136). The point of Abelard’s *Dialogue* was itself less to uphold traditional Christian assumptions but rather to highlight the thread of common reason in all positions: the Law of the Jews, the natural law of the philosophers, and the supreme Good of the Christian God. Writing within a distinct genre of medieval dialogue, Abelard goes a step further in transforming the genre from a demonstration of Christian superiority to an exercise in mutual edification. More than 400 years after Abelard, Jean Bodin wrote his famous *Colloquium heptaplomeres de rerum sublimium aracnis abditis* (*Colloquium of the Seven About the Secrets of the Sublime*), which was a dialogue between a Catholic, a Lutheran, a Calvinist, a Jew, a Muslim, an advocate of natural religion, and a skeptic. Unintentionally resonant with certain Sufi views of religious truth, Bodin’s own argument posited a vision of the harmony of diverse perspectives through which tolerance is presented as an essential element of religious truth.

Bodin’s call to religious tolerance preceded many later arguments, including those of John Locke, as it ends with the argument that no one can be forced to believe against his will. (This was the central feature of John Locke’s argument for religious toleration in his 1689 *Letter Concerning Religious Toleration*.) It values discourse for its inherent differences, as all of Bodin’s fictional interlocutors keep their faith or their belief in both the existence of truth and in their own version thereof. Yet they *tolerate* difference and argument and even revel in it.

The writings of thinkers such as Jean Bodin (d. 1596) and, later, Pierre Bayle (d. 1706)

provided a critical bridge between the explicitly religious discourse of the 16th century and the increasingly natural law arguments of the late 17th and early 18th centuries. Pierre Bayle, in fact, extended toleration even to atheists, which neither Jean Bodin nor, later, John Locke was to do. (Locke also refused toleration to Catholics.) Bayle, indeed, anticipated a modern approach to toleration predicated on individual liberty and freedom of expression. Samuel Pufendorf’s (d. 1694) writings on toleration should also be noted.

With these writers, the problem of tolerance began to be understood in terms of individuals in their relations to one another. It ceased to be understood as a problem of the coexistence of different “truth communities” in a shared public space. Rather, the problem of tolerance became the logistical problem of directing the discreet acts of autonomous self-regulating agents in a market (of goods and later of ideas). The problem of tolerance became, as it is today, the problem of individuals and their acts.

TONGA

Tonga is an island nation in the South Pacific between Fiji and Tahiti, north of New Zealand.

The only island nation in the Pacific still maintaining a continuous indigenous monarchy, Tonga is a predominantly Christian nation with Methodism as its state religion. The inhabitants of the archipelago reported as more than 90% Christian, with 37% belonging to the Free Wesleyan Church, a Methodist organization. The denomination has fallen in popularity in recent years and endured a schism that created the Free Church of Tonga, garnering 11% of the population, and the Church of Tonga (technically an offshoot of the Free Church of Tonga), which claims 8% of the population. Other faiths include Roman Catholic (16%), Church of the Latter-Day Saints (17%), Seventh-Day Adventist (2%), and Anglican (1%). The ethnicity of the country is almost entirely Polynesian, and Tonga remained fairly unaffected by immigration as of the beginning of the 21st century.

While the Tongan founding myth has the islands being fished from the sea by Maui, one of the three major gods, people first arrived on Tonga from Fiji around 1500 BCE. The island had a sacred monarchy seeing the Tu'i Tonga (king) as an embodiment of the islands' people, and it still remains a powerful symbol for the nation. By the time Europeans first had contact with the nation in the 17th century, the authority of the Tu'i Tonga had been greatly reduced to a mainly religious role. The infamous Captain Cook visited the island in 1773 to a welcome reception, earning the archipelago the nickname of "the Friendly Islands." The first modern king, King George Tupou I, introduced a constitution in 1875; he was a convert to Christianity, and Wesleyan missionaries played a notable role in helping construct the governing document. Tonga never suffered official colonization, though in 1900 the British granted the nation's request for protectorate status in response to attempts by other colonial powers to overthrow the Tongan monarchy. The ties thereby created were peacefully dissolved in 1970, the same year Tonga joined the Commonwealth of Nations. It would become part of the United Nations in 1999.

Though abundantly Methodist today, the first Dutch missionaries made few inroads in Christianizing Tonga in the 18th century, but missionaries of other faiths had more success in the next hundred years. The nation's Christian character is evident in

its constitution, which demands all businesses to be closed on Sunday and holds that day holy by law, forever. At the end of the 20th century, the sacred monarchical institution continued to face growing challenges to its legitimacy, mostly from Tongan students supporting a full democracy. Tonga still allows the Christianizing of its people, and many missionaries of different denominations are still active on the island.

TORAH

The Hebrew term *Torah*, according to the general consensus of modern scholars, is connected with the *hiphil* conjugation of the root *yrh*, "to point out, direct, teach," and thus literally means "teaching" or "instruction." The Torah functions in Jewish traditions as a category invested with transcendent authority that has both textual and supra-textual dimensions. As the quintessential scripture and encompassing symbol of rabbinic Judaism, the Torah continues to be revered by contemporary

Jewish communities in Israel, the United States, and throughout the transnational diaspora.

The term *Torah* is used in rabbinic literature to designate a corpus of texts or teachings in at least four different senses: (1) in its narrow sense, the term is used to refer to the *Pentateuch* (the Five Books of Moses) or *Sefer Torah* (Book of the Torah); (2) the term is subsequently extended to refer to the entire Hebrew Bible, the *Tanakh*, comprising the Pentateuch together with the *Nevi'im* (Prophets) and *Ketuvim* (Writings); (3) the term is expanded further to include not only the Hebrew Bible, which is designated as the Written Torah (*tôrāh še bi-ktāb*), but also the Mishnah, Talmud, and Midrash, which contain the authoritative rabbinic teachings that constitute the Oral Torah (*tôrāh še b'e-al peh*); and (4) Torah functions as an encompassing category that includes potentially all of the texts, teachings, and practices of the normative rabbinic tradition.

This entry discusses the distinction between the Written Torah and Oral Torah, the Torah as a supratextual category, and the methods of engaging the Torah.

Written Torah and Oral Torah

This progressive expansion of the term *Torah* is reflected in the ways in which the categories of Written Torah and Oral Torah are defined and distinguished. The Written Torah is a fixed, bounded corpus of texts, whether understood in its narrow sense as the Pentateuch or in its broader sense as the entire Hebrew Bible. The Oral Torah, on the other hand, is a fluid, open-ended category, which in its broadest sense includes not only the halakic (legal) and haggadic (nonlegal) teachings contained in the Mishnah, Talmud, and Midrash but also potentially all of the teachings and practices that are authorized by the rabbinic sages in each generation as part of the oral tradition. The distinction between the Written Torah and Oral Torah is traditionally held to derive from the original revelation at Mount Sinai, in which God gave to the prophet Moses two Torahs: (1) a written text, consisting of the Pentateuch, *Nevi'im*, and *Ketuvim*, and (2) an oral tradition of interpretation that was destined to be preserved in the Mishnah, Talmud, and Midrash as well as in the teachings of subsequent generations of rabbis.

The canonical authority of the Torah is linked in particular to the Pentateuch, which is ascribed a special status as divine revelation in that its every word is traditionally believed to have been directly dictated by God to Moses, who acted as a scribe and recorded the words of God verbatim in the *Sefer Torah*. The authority of all subsequent texts and teachings is legitimated by establishing a connection between those texts or teachings and the *Sefer Torah*, by granting them a subsidiary status as part of the Written Torah, in the case of the books of the *Nevi'im* and *Ketuvim*; allotting them a designated place as part of the Oral Torah, in the case of the teachings of the Mishnah, Talmud, and Midrash; linking them to the revelation at Mount Sinai as part of the open-ended category of Oral Torah; or otherwise aligning them with the model of the *Sefer Torah*. Through such strategies, the Torah was transformed from a limited, bounded text—the *Sefer Torah*—into a limitless, encompassing symbol that represents the entire system of rabbinic Judaism.

The Mishnah, the foundational text of the Oral Torah, is a collection of originally oral laws (*halakhot*) that is divided into six orders (*sederim*) according to subject matter, without direct reference to the *Sefer Torah*. The Mishnah was compiled and redacted by R. Judah ha-Nasi in the beginning of the third century CE and contains the halakic teachings of the Tannaim, the earliest rabbinic authorities, who lived in Palestine during the first two centuries of the Common Era.

The Amoraim, the rabbinic authorities who were active in Palestine and Babylonia between the third and sixth centuries CE, worked through the Mishnah word by word, interpreting, elaborating, systematizing, and harmonizing its legal teachings and compiled two commentaries on the Mishnah in the form of the two Talmuds: the Jerusalem Talmud, or *Yerushalmi* (ca. 400 CE), and the Babylonian Talmud, or *Bavli* (ca. 500–600 CE). The Babylonian Talmud, an encyclopedic work comprising exegeses of the Hebrew Bible along with exegeses of the Mishnah and haggadic reflections along with halakic expositions, is considered the authoritative basis of Jewish thought and practice and is the principal focus of study in rabbinic academies throughout the world.

In addition to Mishnah and Talmud, the teachings of the Oral Torah are contained in a third

category of rabbinic literature, Midrash, which is concerned with interpreting, extending, and applying the teachings found in the books of the Written Torah, the Hebrew Bible. This category includes the various Midrashic collections (ca. 4th to 12th centuries CE), which contain exegetical expositions and homiletical discourses pertaining to specific books of the Hebrew Bible. It also includes the Midrashic interpretations of biblical passages embedded in the Jerusalem Talmud and Babylonian Talmud. We can further distinguish between three types of Midrashic collections. Exegetical Midrashim provide a running commentary on one of the books of the Hebrew Bible, expounding the book consecutively, chapter by chapter and verse by verse, and at times even commenting on the individual words in a verse (e.g., Genesis Rabbāh). Homiletical Midrashim do not provide a commentary on every chapter and verse in a biblical book but instead provide homilies related to the first verse(s) of the biblical passages that are read as part of the synagogue service either on regular Sabbaths (e.g., Leviticus Rabbāh and Tanhūmā' Y'lammdēnū Midrashim) or on special Sabbaths and festivals (e.g., P'siqṭā' d'ḥ-R. Kahana and P'siqṭā' Rabbāṭī). Narrative Midrashim do not contain exegetical or homiletical expositions of biblical books but rather present a unified haggadic narrative that constitutes a kind of "rewritten Bible," retelling and expanding on the teachings and events of the biblical narrative (e.g., Pirqē d'ḥ-R. Eliezer and Seder 'ēliyyāhū).

Torah Beyond Texts

The Sefer Torah (Pentateuch) was granted sacrosanct and authoritative status in the rabbinic tradition as divine revelation, and therefore any text, teaching, or practice that wished to invest itself with divinely sanctioned authority could only do so through becoming incorporated within the ever-expanding domain of Torah. While the Torah as a circumscribed written text is a bounded category, in its status as revealed truth it functions as an open-ended symbol that extends beyond the boundaries of the text and is capable of absorbing a host of candidates whose linkage to the revelation, however tenuous, has been established.

The encompassing nature of the Torah as a symbol is linked in particular to its identification

with the Word of God, for while the Sefer Torah might be held to be the most perfect, concentrated expression of the Word of God on earth, the Word itself is not limited to that expression. The divine Word through which God manifested Himself at the time of revelation is also represented as the creative power through which He brought forth creation. In certain representations of the Torah found in seminal form in rabbinic texts and subsequently elaborated in medieval kabbalistic texts, the Torah is personified as the primordial Word or wisdom that had existed in heaven from "the beginning," prior to the revelation, as a living aspect of God and the immediate source of creation. At the time of the revelation at Mount Sinai, the primordial Torah is represented as descending from its supernal abode and becoming embodied on earth in the concrete form of the Sefer Torah. It assumed the finite form of the Book of the Torah, but the book itself is understood in this context as simply the outer body in which the primordial reality of Torah resides as its innermost soul. In this perspective, the Sefer Torah itself becomes a symbol with transcendent significations in that it points beyond its own textuality to the divine reality enshrined within.

The authoritative status of the Torah as a limitlessly encompassing symbol is thus linked in rabbinic and kabbalistic traditions not only to its historical manifestation as a divinely revealed corpus of texts and teachings but also to its cosmological status as a transhistorical, primordial reality. Among the various representations of the Torah in rabbinic and kabbalistic texts, four main complexes can be distinguished: (1) the Torah is identified with the Word (*dābār*) of God or Name (*šēm*) of God, which participates in the reality and essence of God himself; (2) the Torah is personified as primordial wisdom (*ḥokmāh*), which serves as the architect of creation; (3) the Torah is depicted as the subtle plan or blueprint of creation, which contains the primordial elements of the divine language through which God brings forth the universe; and (4) the Torah in its mundane, historical form is a concrete written text composed of words and sentences inscribed on parchment, together with an oral tradition of interpretation that seeks to clarify and elaborate the implications of its laws and teachings for subsequent generations.

Engaging the Torah

Rabbinic portrayals of the revelation of the Torah at Mount Sinai emphasize that all of the people of Israel—male and female, young and old—received the revelation of the Torah and agreed to accept and observe its commandments. The covenant was established with the entire Israelite community, which is represented as a “kingdom of priests” and a “holy nation” that was selected from among all the nations of the world as the chosen people of God. Thus, all Jews are enjoined, as part of a national eschatology, to uphold the covenant by fulfilling the commandments of the Torah. In principle, the obligation to fulfill the commandments includes Torah study, although in the classical rabbinic period the domain of those who were allowed to engage in formal study of the Torah in rabbinic academies was carefully circumscribed by the rabbinic authorities, as indicated by the existence of categories of the “other” such as the *‘am hā-’āreṣ* (lit. “people of the land”) and women. Certain practices—in particular, preservation of the Written Torah through elaborate scribal traditions and codification of the authoritative interpretations of its teachings that constitute the Oral Torah—remained the exclusive province of the rabbinic elite, who as the designated heirs of Mosaic authority claimed a special status within the larger Jewish community. Even though the *‘am hā-’āreṣ* and women could engage the Torah aurally in the synagogue liturgy, through listening to the public reading of the Sefer Torah and to its exposition in the sermon, they were not allowed to recite, study, or interpret the Torah themselves.

In the contemporary period, the Orthodox movement continues to uphold the classical rabbinic perspective, although a number of Orthodox communities have experimented with establishing venues for women to engage in Torah study. In recent decades, the Reform, Reconstructionist, and Conservative movements have introduced important reforms to open the way of Torah to women, including counting women in a minyan, the quorum of 10 required for the Torah reading; allowing them to be called to the pulpit to read the Torah; and, most significantly, ordaining women as rabbis.

TORTURE

In the post-9/11 context, the images of the hooded Iraqi man at the Abu Ghraib prison standing on a box with his outstretched arms tied to electric wires, the goggled and muffled prisoners at Guantánamo, and the former U.S. Army reservist Lyndie England smilingly pointing to the naked Iraqi detainees have shocked the world. The shock caused by these images needs to be contextualized by recalling that torture has been a prominent part of Western and non-Western history, as both punishment and judicial torture, existing both legally and extra legally. These incidents have created challenges for the moral judgments of religious ethics. It is striking, however, that the recent debates have come up in the context of accommodating torture and cruel, inhuman, and degrading treatment (CIDT) within the legal and political institutions of democratic systems, making it imperative for people to evaluate the legal history

of torture. This entry discusses the legal history of torture, international prohibitions against torture, and torture in democracies.

Legal History of Torture

The term *torture* has been variously called *quaestio*, *tortura*, and *tormentum* in Latin and the vernacular. It historically refers to an act of questioning by the infliction of suffering to get the truth. The Greeks, according to Page Dubois, used the term *basanos* for torture, which meant testing the purity of gold. The meaning of the term was later extended to test whether a person was telling the truth in a trial.

In Western history, torture was used by the Greeks and later adopted by the Romans. From the 13th to the 18th century, torture was not just being extensively used, but actually became an integral part of the judicial system in western Europe. The law of proofs in 13th-century Europe depended either on the evidence by two eye witnesses or on confessions, and since the former was difficult to ensure, the emphasis shifted to confessions. Torture was used to gain confessions and was conducted with an elaborate set of protocols that were monitored by physicians and supervised by the judges, making it a process of judicial torture. The duration, mode, and severity of torture were predetermined to ensure the reliability of the confessions. The confession even had to be repeated in the court room for it to be accepted. Thus, as Edward Peters pointed out, torture became a part of the criminal procedure system. It is widely believed that interventions by 18th- and 19th-century Enlightenment philosophers such as Beccaria and Voltaire, with their focus on respect for the human body and human dignity, led to the abolition of torture. In contrast, historians such as John Langbein point out that the abolition of torture was not entirely due to the moral criticisms by these philosophers but rather due to the developments in the laws of proof. Unlike previous times, the judges could now use a variety of punishments for severe crimes and could mete out punishments based on guilt demonstrated through persuasion rather than ascertaining truth or certainty.

The significance of this legal history of torture is twofold: First, even in the most elaborate attempts to regulate the use of torture, it was not

possible to do so, and its reliability as a form of gaining information or truth was always in doubt. Thus, when Alan Dershowitz suggests the use of torture warrants to regulate the use of torture in extraordinary circumstances in the United States, the legal history of torture reminds one of the unreliability of the act and the difficulty in actually regulating torture. Second, the legal history of torture is also a reminder that moral criticisms were not the sole reason for the abolition of torture, such that the absence of torture cannot be seen as synonymous with modern, civilized, democratic societies. In modern times, often the problem of torture has been seen as an issue in nondemocratic, authoritarian, or totalitarian societies. Thus, Nazi Germany and Stalinist Russia in the past and Egypt and Jordan in the present are often represented as countries associated with torture. That in turn distracts attention from the presence of torture in democratic countries historically and in contemporary times. For example, the use of torture as a colonial practice by the French in Algeria and the British in India is still not a prominent part of the Western narrative on torture.

International Prohibitions Against Torture

Since the very inception of the United Nations, extremely strong initiatives against torture have been developed in international law. While prohibitions against torture are a part of the Universal Declaration of Human Rights, the International Covenant on Civil and Political Rights, and the Declaration Against Torture, the most comprehensive prohibition and monitoring of the protections against torture exists in the UN Convention Against Torture and Other Cruel, Inhuman or Degrading Treatment or Punishment. The definition of torture is a widely debated issue in international and national contexts, but a broadly accepted definition is the one adopted by the UN Convention:

Any act by which severe pain or suffering, whether physical or mental, is intentionally inflicted on a person for such purposes as obtaining from him or a third person information or a confession, punishing him for an act he or a third person has committed or is suspected of having committed, or intimidating or coercing him or a third person, or for any reason based on

discrimination of any kind, when such pain or suffering is inflicted by or at the instigation of or with the consent or acquiescence of a public official or other person acting in an official capacity. It does not include pain or suffering arising only from, inherent in or incidental to lawful sanctions. (*Convention Against Torture and Other Cruel, Inhuman or Degrading Treatment or Punishment*, 1985)

Despite the ratification of the UN Convention by more than 142 countries, there continue to be two main issues regarding the applicability of laws against torture apart from the limitations of enforcing international law. First, the applicability of laws to particular combatants and, second, whether the protections pertain only to torture and not equally to cruel, inhuman, and degrading treatment. The United States, for instance, argued that international laws, especially the Third Geneva Convention, which provides additional protections against torture and CIDT during times of conflict, were not applicable to the unlawful combatants in the war on terror. In addition, only torture was seen as criminalized by the U.S. Federal Torture Statute (based on the UN Convention) and not CIDT. Furthermore, the definition of torture employed by the United States indicated in the Jay S. Bybee memo was so narrow that only the most extreme forms of physical torture that caused pain equivalent to “organ damage or death” were disallowed. As a result, despite the presence of high-level memos showing that the United States did authorize harsh interrogation methods for both Abu Ghraib and Guantánamo, the excessively narrow interpretations of the protections against torture and CIDT allowed for limited action to be taken against the perpetrators. In addition, as argued elsewhere, the popular imagery of torture with its emphasis on physical brutality in popular TV shows such as *24* also reinforces the narrow legal definition of torture adopted by the United States.

Torture in Democracies

The issue of torture has also arisen in other democratic contexts in the past, notably in England and Israel. For instance, the English used methods such as hooding, sleep deprivation, loud noise, and food

and drink deprivation on Irish prisoners. In *Ireland v. England* (1976), the European Commission on Human Rights characterized the techniques used by the English against the Irish prisoners as torture, while the European Court characterized the same techniques as inhuman and degrading treatment. The reason why it is important to distinguish between torture or inhuman and degrading treatment is because under international law, the standards for torture are higher than for CIDT. As John Parry points out, there are no conditions under which torture can ever be justified. Countries are required to come up with certain domestic protections against torture, including prosecution of offenders and providing compensation, while CIDT primarily has to be prevented.

In Israel, shaking; the *shabach* position, where the hands are tied and the person is made to sit on a small chair that is slightly tilted; the frog crouch position; excessive tightening of handcuffs; and sleep deprivation were used on Palestinians. While the Supreme Court of Israel did disallow these methods—termed as *moderate physical pressure*—in 1999, the court did not characterize them as torture. Two things have to be noted about the Israeli context. First, the Justice Landau commission set up to enquire into the use of these methods did allow for the “necessity defense” to be available for those using these methods. Second, even though the Supreme Court did disallow these methods, it also stated that while these methods were not allowed by the present Constitution they could be authorized in the future. That left open the possibility of using “moderate physical pressure,” because the methods were not considered as severe as torture.

Thus, it is not surprising that the most controversial methods in the current war on terror have been the “no-touch” torture techniques, such as sleep deprivation, standing, use of phobias such as fear of dogs, loud music, stress positions, and sexual humiliation, many of them in combination. Alfred McCoy points out that some of these no-touch torture techniques, such as isolation, hooding, and stress positions, were developed, propagated to Latin America, and used by the U.S. Central Intelligence Agency (CIA) in previous decades. These methods have not just been a part of the CIA’s history, but according to Darius Rejali, these “clean” (nonscarring) methods are unique

because they were primarily developed by the main Western democracies—England, France, and the United States. These “stealth techniques,” Rejali states, are primarily found in democracies because of their history of monitoring human rights, thus requiring these democracies to use torture techniques that leave fewer marks and allow them to evade detection.

Finally, the debate on torture has also been an issue of philosophical concern. Michael Walzer, for instance, has suggested that torture can be used in extraordinary circumstances. At the same time, he also suggests that the politician who orders the torture should be willing to own responsibility for it and pay for it rather than be excused under the utilitarian logic of having ordered torture for the good of society. Walzer’s argument has been echoed in recent years by Jean Elshtain, who argues in favor of using coercive interrogation or torture lite in extraordinary circumstances as being preferable to an absolute prohibition of torture. Even those who acknowledge the necessity of using torture in the hypothetical “ticking bomb scenario” (extraordinary situations) point out that there is a danger of a “slippery slope,” such that even carefully regulated torture can get extended to ordinary situations. Furthermore, compounded by the history of unreliability of torture in gaining truthful information, the hypothetical assumes perfect knowledge about the disaster to be averted, which is almost impossible to ensure.

TRANSCENDENTAL MEDITATION

Transcendental Meditation, or TM, refers to techniques of meditation developed by Maharishi Mahesh Yogi, who founded the Spiritual Regeneration movement in Madras (now Chennai), India, in 1957, following the death of Swami Brahmananda Saraswati in 1953, for whom he served as secretary for many years. The technique involves a series of instructional steps taken under the guidance of a teacher, after which the student is assigned a mantra and then works on perfecting the meditation technique through regular daily practice. Some well-known people have been associated with TM over the years. Members of the Beatles were involved for many years and were perhaps the best known practitioners of the techniques and the TM movement in general. David Lynch, the well-known film director, has been a lifelong practitioner, as well.

The meditation techniques have been the focus of much research and some controversy. Articles claiming to prove the effectiveness of the techniques have appeared in journals such as *Science*, *Scientific American*, and many other professional journals. Claims of positive effects from practicing

TM techniques include lower blood pressure, decreased anxiety and stress, reduction of cholesterol, and other health benefits. Some debate has been generated over the issue of whether it is the specific TM techniques that lead to positive health-related results or if any kind of systematically applied meditation techniques would yield similar outcomes.

TM has been involved in other controversies as well, given that it has been grouped with other new religious movements (NRMs) that garnered public attention in the 1960s and 1970s. The Anti-Cult movement (ACM) organizations targeted TM, along with other NRMs, and some ACM spokespersons specifically claimed that TM was a “cult” that was teaching techniques akin to “brainwashing.” This type of claim has been involved in one precedent-setting legal action, *Kropinski v. World Plan Executive Council* (1988). This case involved a former member suing TM in 1985 for alleged fraud and emotional and physical harm brought on by practicing TM techniques. Kropinski won a judgment at the trial court level for \$138,000, but the case was reversed as to psychological harm on appeal, and other claims were settled. This case is important because it was the first time that Margaret Singer’s testimony was found lacking scientific credibility in a federal court. Singer was perhaps the best known of the anticult psychologists who had served as expert witnesses in a similar case brought against TM and other NRMs.

TM also has been controversial with its official claim that it is not a religion but a meditation technique; thus, allowing the technique to be used in schools and other governmental agencies would not be violative of the Establishment Clause of the U.S. constitution. The techniques have been integrated into many different settings, including in churches, school, and businesses. However, there was one federal court case, *Malnak v. Yogi* (1979) that found that certain TM practices did constitute a religion. Controversy has also developed over the high cost of getting initiated into TM techniques, with some scholars and others suggesting that TM is more a business than a technique or a religion.

TRANSLOCALIZATION

Translocalization is a term used for the process by which cultural forms, symbols, and practices are drawn into circulation through networks that detach them away from their original national and local contexts and may amplify or diversify their meanings. The concept is used within cultural globalization theory and is closely related to the now problematic term of locality and thus to delocalization and relocalization; it is mainly a space metaphor. For some scholars, economic and technological globalization is a homogenization process that produces cultural unified symbols (the McDonaldization of society) at the same time that it delocalizes others from their original contexts, only to be transformed in merchandise. Other positions show how economic globalization translates its course of action in local conditions, grounding symbols and practices in local terms while transforming traditions by circulating them in global flows such as tourism, spectacle, migration, and media exposure. This process is what is generally called translocalization.

Other applications to the term have regarded it as the main process of locating the global (Benedict) or as the product of the forces of globalization and localization (Czarniawska). It has also been applied to the new identity formations and connections shaped by the cultural background of migrants in host societies (Kupainien).

In religious studies, Argyriadis and De la Torre consider it as a movement metaphor, in close relation to delocalization—which is the actual movement of cultural forms. Translocalization processes point to the multilocations that religious identities can reach, as they are no longer necessarily anchored to a single territory, culture, nation, or ethnicity. These identities are practiced in multiple locations such as adhesions to ritual imaginary lineages, in movements with multinational or cosmological levels, and in virtual presences.

TRANSNATIONAL

The world is increasingly interconnected; an event in a distant place affects those in another. The term *transnational* refers to both the morphology and optic of these cross-border flows of people, capital, information, and commodities. Though the term *transnational* seems to presume the nation-state as a coherent entity, a transnational perspective does not naturalize the nation as a primary social and political unit in the modern world. Instead, a transnational optic considers the historical contingency of borders and social fields.

Religious institutions are some of the earliest transnational formations, thriving across a great expanse before there were nation-states to traverse. Among religious scholars, the term *transnational religion* most often refers to the beliefs, practices, and organizations of transmigrant communities, but it also characterizes religious activist and militant networks in global civil society. The first section will consider the theoretical emergence of transnational theory within the framework of transnational civil society, and the second section will consider its placement in the study of immigrant religious communities.

Transnational Civil Society

As globalization theory took shape in the 1990s, anthropologists and cultural studies theorists began to refer to the global culture. These cross-border flows of capital, information, and people have been characterized as varyingly nonisomorphic “scapes,” network societies, and emerging hybrid cultures that have weakened the centrality of the nation-state in the social imagination. Methodologically, the transnational is often distinguished from the global by the former’s attention to the everyday and the particular or, as one anthropologist put it, the more “humble” aspects of globalization. Given this attention to the translocality of global flows, transnational ethnographies are often multisited, tracking daily life across various borders, in several time zones, and via many networks.

The study of transnational cultural forms and communities (and later the religious reverberations of the September 11 attack on the World Trade

Center) sparked a cross-disciplinary interest in religion that has produced a burgeoning body of work. One of the most prescient of these collaborations was the project of Susanne Rudolph, a political scientist, and James Piscatori, an Islamicist, to rethink Cold War conceptions of national security by exploring various expressions of a religiously informed transnational civil society. They argued that religious memberships in social movements and nongovernmental organizations challenged both the presumed secular dominance of the public sphere and the state-centric presumptions of fields from international relations to security studies.

Since then, transnational civil society has become a rich and contested concept and the religious actors in this transnational public sphere, far more visible. Given the cross-border reach of many religious institutions, religious political action has challenged a state-centric model for centuries. In the 18th century, Quakers on both sides of the Atlantic were key figures in the transnational campaign against the slave trade. They came to this shared decision through prayer, moral reasoning, and prophetic dreams. Transnational religious activism, then, presumes a multidimensional scope of action involving a wide range of actors. These have been characterized by Keck and Sikkink as transnational activist networks that have multiplied in the latter part of the 20th century as advocates for global issues such as the environment and women's rights. As scholars indicate, transnational feminist networks and environmental movements have strong religious advocates and detractors at the global, regional, and national levels. One particular forum for transnational advocacy is the American evangelical community. Their intervention in U.S. domestic and foreign policy is expressed as an "evangelical transnationalism" that has become more nuanced as they interact with Christians in the Global South, who too are projecting a new global "progressive Pentecostalism," balancing evangelism and social concern.

Finally, diaspora communities also create transnational religio-political networks that collaborate to change their home country's regime, to create their own state, or to lobby for home state trade privileges. These cybernationalists often fund insurgents from afar, maintaining a transhistorical identity (stuck in the past and planning a liberated

future). Not all these groups are nation bound. Theological treatises of multinational militant groups of political Islam such as al Qaeda reject the legitimacy of the modern nation-state in fidelity to a global *umma*, though transnational religious terrorists have exploited new technologies to support an organizational mode that is decentered, multiple, and fluid.

Transnational Migrant Communities

The second, more visible scholarship in transnational religion attends to contemporary processes of travel, diaspora, and migration. A renewed interest in religious travel includes studies of missionaries and their transnational histories, such as the dissemination of *The Pilgrim's Progress* in Africa. They consider new forms of pilgrimage, such as the virtual hajj, and the vibrant niche of religious tourism that grosses \$18 billion a year. These globalized versions of old practices re-inform and commodify ritual paraphernalia and locate sacred space in the real and virtual worlds.

Migration scholars argued that though new diasporas have joined the "old" diasporas of Armenians, Jews, and Greeks, the theory of diaspora is still confined to national territory and imagination. They argue instead for a more fluid optic, less embedded in national space. Thus, those who maintain strong, regular ties to their homelands and organize their lives across national borders are called transnational migrants. Migrant theorists have argued that migrants were polycentric, living in their host country while participating socially, economically, and politically in their country of origin. Scholars of religion and migrant studies took to this framework quite easily as a way to characterize increasingly diverse communities whose "lived religion" was influenced by multiple sites of affiliation. Transnational religion explores the belief, practices, and organizational behavior of transnational migrants as they shift across time and space.

Scholars of transmigrant communities investigate how individuals live a daily religious life that is influenced by both sending and receiving communities. One example of this is the transit of social remittances. A Cambodian Buddhist family in France may support their local *wat* and then, with relations scattered through North America,

share in the financial and ceremonial support of a *wat* in their ancestral village as a way to ensure their karma and status in both places. Religious communities may thus participate in a transnational circuit of social remittance without actually moving.

Transnational religious communities are circuits of religious connections. Such connections may be based on an imagined tradition that inspires the construction of an Oyotunji village in South Carolina modeled after its origins in West Africa. Through these circuits, communities negotiate a narrative of racial and religious belonging that links their model village to Yorubaland in Nigeria, to the Caribbean, or to the Bronx, New York. Thus, religious circulation produces hybrid practices, language, ideas, and institutions that can revise religious orthodoxy while affirming primordial identities that are either universalized or exclusionary.

The organizational contexts of these different religious networks differ in many ways. Roman Catholic hierarchy offers a habitus that, with minimal modification, is recognizable in its parishes throughout the world. Baptist migrants from Governador Valadares in Brazil to Massachusetts negotiate their denominational identity within these separate communities. The transnationally devout express multilayered subjectivities. The ethnically informed religious identity in one context shifts as migrants take on new ethnic attributions in the host country, which then informs the latter. This fluid and fragmented identity is most apparent among marginal communities such as Mexican transgender sex workers in San Francisco, who are devotees of Santísima Muerte, the saint of death. As those who trespass many territories, devotional practice to Santísima Muerte inspires spiritual agency inside the structures that ostracize them. In this way, transnational communities create a counterhegemonic space, reframing the Other as other than themselves and sacralizing their social death.

Transnational religion thus spans both the public sphere of political action and the mobile spheres of migrant communities. It attends to the constraints of the state while ultimately disregarding it as the dominant unit of analysis.

TRANSVESTITES AND TRANSSEXUALS

Transsexuals feel an incongruity between the body they were born with and their identification as a man or a woman. Many transsexuals alter their anatomical sex, through sex reassignment surgeries or hormones, to align with their psychological gender. Transvestites, or cross-dressers, adopt the clothing and mannerisms associated in their culture with the opposite sex but may not identify *as* the opposite sex or seek permanent transformations. *Transgender* is commonly used as an umbrella term for gender-variant experiences, including transsexualism and transvestism. Although these terms are associated with specific Western contexts, they are broadly applied here to discuss a range of culture-specific phenomena related to religious traditions.

Interactions between religion and transgenderism are shaped by multiple, intersecting influences. The ways in which transgender individuals experience religion can be influenced by geographic and social locations; economic access to sex reassignment surgeries, hormones, or gendered clothing; availability of personal and institutional support systems; aesthetic norms; familial religious affiliations; and levels of social oppression, including physical dangers. Consequently, some individuals whose gender performances do not predictably match their bodies have rejected religion, while others maintain significant and complex relationships to one or more religious traditions.

Most religions have yet to state official positions on transgenderism. The lack of authoritative

pronouncements has resulted in diverse responses both within and among religious traditions around the world. Common themes among these responses include consideration of mythical or historical transgender religious figures, the sacred creation and preservation of sexed bodies, and gender-specific religious laws and practices.

Religious stances on sexuality affect how religious leaders and transgender individuals view transgenderism. Despite the fact that transgender individuals may identify with a range of sexual orientations throughout their life, some religious leaders associate all transgenderism with homosexuality. Evangelical Christians and Mormons—who believe that homosexual behaviors are sinful and homosexual desires are symptoms of psychological disorders—prescribe reparative therapy to “cure” the homosexuality that they think causes transgenderism. Some transgender individuals agree with religious proscriptions against homosexuality but do not identify themselves as homosexual. For example, some male-to-female transgender individuals see themselves as women who have sex with men rather than someone engaging in homosexuality. Other transgender religious participants associate with the asexuality of ascetics or eunuchs or choose to de-emphasize sexuality in their understandings of themselves as transgender.

Religious Roles

Some cultures have religious roles for transgender individuals. The hijras of India are a well-documented example. According to Gayatri Reddy’s study, hijras are usually individuals born male who choose to dress as women and act in an exaggeratedly feminine manner. Many excise their male genitalia through a ritual operation and are thereafter associated with the ability to bless fertility. Their spiritual power and social position are legitimized (to the degree that they are tolerated, despite ridicule) through their worship of the Hindu Goddess Bahucharamata or Ardhanarisvara, a half-man/half-woman version of Shiva. Hijras were traditionally known as celibate ascetics who tended the temples of the goddess. One contemporary group, the *badhai hijras*, still renounce sexual behaviors and earn their living singing, dancing, and playing instruments at religious ceremonies. Another group, the *kandra hijras*, engage in prostitution. In popular

opinion, both groups carry the power to curse or bless. In addition to their Hindu affiliations, many hijras identify as Muslim and follow gender-specific Islamic laws and rituals. This combination of Muslim and Hindu practices represents the hijras' ability—through their condoned social transgression—to cross multiple social boundaries.

Malaysian *mak nyahs*, male-to-female transsexuals, interact in various ways with the religions of their country, as shown in Teh Yik Koon's study. Many *mak nyahs* come from Buddhist, Muslim, Christian, or Hindu backgrounds. Buddhist religious teachers recognize the existence of transsexuals in their culture, and most have not explicitly rejected transgender behavior because it does not harm others. Muslim *mak nyahs* face the most religious and cultural resistance, due to Islamic fatwas that forbid cross-dressing and sex reassignment surgeries. Muslims who find ways of having sex reassignment surgeries illegally are not recognized by Muslim leaders or legal officials as having changed their sex. Muslim *mak nyahs* also express confusion about which gender they should take during prayer and whether they are allowed to participate in rituals. Non-Muslim *mak nyahs* do not face legal castigation in Malaysia for being transsexual. However, all *mak nyahs* face social ostracism and are required to keep their birth names in addition to their chosen *mak nyah* names.

In various Native American and First Nations tribes, transgender individuals constituted a special class of medicine men and women. They attributed their creative healing and artistic powers to dreams, selection at birth, or association with transgender myths or spirits. Traditional two-spirits, as they are now called, were usually men who dressed and behaved as women, and sometimes hermaphrodites or women who acted as men. The Lakota *winkte*, the Navaho *nadle*, and the Omaha *minquga* were examples of traditional two-spirits, whose gendered and religious roles varied by tribe. Some contemporary transgender Native Americans identify as two-spirits and have formed two-spirit organizations in North America.

New religious movements have attracted some transgender adherents. Witchcraft traditions, such as Wicca, appeal to some transgender individuals because of the emphasis on embodiment, creativity, transformation, and psychic wholeness. However, the relation of some witchcraft traditions to

women's spirituality movements and feminisms can limit openness toward transgenderism, which is sometimes viewed as challenging the sacrality of the female body.

Religious Rejections

Within Jewish and Christian traditions, there is strong evidence of resistance to transgender behaviors, which are viewed as challenging the God-given categories of gender and sex. Biblical scriptures are often applied to reject transgender behaviors. Transvestites have been commanded not to wear the clothing of the opposite sex by Deuteronomy 22:5. Sex reassignment surgeries have been condemned on the basis of passages such as Leviticus 21:20, which state that certain damaged or defective body parts render an individual unsuitable to sacrifice to the Lord. In Judaism, practical arguments against transformations are emphasized because the resulting identity creates confusion for gender-specific prayers, rituals, and divorce laws.

Christian responses to transgenderism have been mainly negative. Roman Catholicism has officially denounced transgender behaviors, especially transsexual surgeries that result in infertility. Catholics, evangelical Protestants, and Mormons, due to their emphasis on reproduction and belief that transgender individuals engage in sinful, homosexual activities, have excommunicated or chastised members who have permanently altered their sex. The psychological gender identification of transgender individuals is often dismissed among these groups as neurosis, sin, or demonic possession.

Many contemporary responses occur within the framework of improved, yet still highly oppressive, conditions for transgender individuals. In the United States and Europe, activists have celebrated legal and cultural successes that have increased mainstream transgender visibility. Modern sex reassignment surgeries have become more sophisticated since they were made available to the public in the 1950s. Academic interest in transgenderism has created the interdisciplinary field of transgender studies. However, within the growing public discourse on transgenderism, the profound influences of religion are often downplayed, ignored, or misunderstood.

Changing Relationships

Some religions associated with rejecting transgenderism have shown recent signs of increased acceptance. Some predominantly Muslim countries, including Iran and Turkey, now tend to legally tolerate transsexuality, despite condemnation of homosexuality and pathologization of transgenderism. This change is due to the distinction between homosexuality and gender variance, and the view that sex reassignment surgeries are acceptable treatments for what are diagnosed as gender identity disorders. Some Protestant denominations in the United States have displayed growing understanding and acceptance of transgenderism. The United Church of Christ, among others, began producing transgender educational literature around the turn of the millennium, and in 1995, the Presbyterian Church in the United States was the first mainline Protestant denomination to ordain a transsexual minister. Transgender support groups have also been created in numerous denominations. The first annual Interfaith Transgender Conference, held in Oregon in 2006, indicates the desire of some religious leaders in the United States to extend transgender acceptance across religious affiliations.

Despite much resistance, individuals have found ways of negotiating religious and transgender identities. Some bypass leaders and institutions and rely on personal religious authority. Sacred texts have been interpreted as favoring transgenderism, transgender identities have been claimed as divine gifts, and gender transformations have been likened to religious conversions. In Yoruba-diasporic religious traditions, possessions by male, female, or transgender spirits have been used to claim spiritual legitimacy for gender transformations. In other traditions, name-changing rituals and prayers have been used to sanctify transgender identities. While religion is more commonly associated with the oppression of transgender people, these examples show that for many transgender people around the world religion has been an important source of empowerment, legitimacy, community, and hope.

TRINIDAD AND TOBAGO

Surrounded by the Caribbean Sea and North Atlantic Ocean, the island republic of Trinidad and Tobago is located northeast of Venezuela on the eastern Caribbean chain. The two islands are located 21 miles (1 mile = 1.609 kilometers) apart, and together constitute a nation of nearly 1.3 million people almost evenly divided between Afro-Caribbean Christians and immigrant Indian Hindus and Muslims.

Trinidad was established by Spain in 1754 and Tobago, by Dutch, English, and later Latvians in the 18th century, as part of the New World colonies. As plantation and sharecropping economies, the two islands collectively switched colonial hands more than 30 times in two centuries. Populations soon practiced African-influenced religious traditions interspersed with European Christian practices. Following slavery's outlaw and the British Caribbean's full emancipation of Africans in 1838, large numbers of contracted immigrants from India and China were brought over to continue the harsh labor of sugarcane production. Fueled by capital colonial demand, the nation's fusion of African, Indian, Chinese, European, and Syrian-Lebanese cultures has promoted numerous locally created musical genres that have spread regionally and globally, including chutney soca, calypso, rapso, ragga soca, and other hybrid steel band genres.

Trinidad and Tobago gained independence from Britain in 1962. Eric Williams aided the nation's success in its infancy, though the ethnic politics of the country has created some tensions since. In the first decade of the 21st century, the president and titular head of the country was a Christian, George

Maxwell Richards, while the prime minister, Kamla Persad-Bissessar, was a Hindu. Though increasing crime has been an issue, the nation's wealth, strong education, and quality-of-life index make it one of the most prosperous countries in the Caribbean today.

English is the national language, though Spanish, Chinese, French, and Caribbean Hindustani are also spoken by the nation's multicultural inhabitants, who hark from four different continents and mostly reside on the island of Trinidad. Tobago mostly consists of descendants of African slaves. According to the 2000 census, the two-island nation is religiously 31.6% Protestant (Anglican, Baptist, Pentecostal, Seventh-Day Adventist, and other), 26% Catholic, 22.5% Hindu, 5.8% Muslim, and 14.1% unspecified, none, or other. Hybrid forms of African religion are still noticeably present. In diaspora, the nation's residents collectively practice many of the world's religions along with syncretistic mixes of those religions, such as the many forms of Orishas.

Recognized for innovations in the music, food, and tourist industries and having one of the highest literacy rates in the world, the nation has entered the global stage through its discovery of oil and gas reserves, which have aided the country's development for the past 30 years. The nation is most famous for its annual Carnival festivities held the day before the beginning of the Christian pre-Easter season of Lent, which bring in tens of thousands of foreign visitors to street celebrations, music venues, costume parties, and art performances, virtually doubling Trinidad's population overnight. While Port of Spain, Trinidad, is a bustling fast-paced city, Tobago's relaxed style and azure waters draw in thousands of European and South American tourists on vacation each year.

TUNISIA

The Tunisian Republic lies on northern Africa's Mediterranean coast, adjacent to Algeria and Libya, midway between the Atlantic Ocean and the Nile Valley. Despite its relatively small size, its location at the meeting point of three distinct cultures (Arabo-Islamic, sub-Saharan, and European) and its history of openness to a wide variety of contrasting influences, including that of the Berbers, the Phoenicians, the Romans, the Vandals, and the Arab Muslims, made it a center for major world religions, mainly Judaism, Christianity, and Islam early in the religions' histories. This religious diversity has been critical in shaping contemporary Tunisian society on paths that were markedly different from those of other countries in the Muslim world. It helped nurture a culture of religious pluralism while at the same time maintaining Islam as the official religion of the country.

In 1956, after 75 years of French colonization, Tunisia had a total population of 3,527,000, including 57,800 Jews, one third of whom had acquired French citizenship and joined the rank of the majority of Jewish foreign nationals, and 250,000 settlers, 180,000 of whom were French (mainly Catholic). This suggests that more than 97% of Tunisian citizens were Muslims. Despite this religious homogeneity, the Tunisian constitution, which declared Islam the official religion of the state, guaranteed universal religious freedom and established total equality between its citizens regardless of their religion, building on the progressive reforms of the Fundamental Pact of September 10, 1857, and the constitution of 1861.

Since independence, a series of measures were taken to bring the Tunisian Jewish and Christian communities into the national fold. In 1964, the Tunisian state signed a *modus vivendi* with the Roman Catholic Church. Unique to a Muslim country, it guaranteed religious freedom to the Catholic Church in Tunisia. Today, Tunisia has

22,000 Catholics (out of 10 million inhabitants), of which around 3,400 are Italian and many are French. Overall, they hold 44 nationalities. The diocese of Tunis has an indigenous bishop, around 30 priests, and 165 nuns. The Catholics have 10 schools with around 6,000 Muslim students.

Even though Jewish presence in the Muslim world has been subject to shifts in regional and international politics since the mid-20th century, Tunisia was the only Muslim country to appoint Jewish ministers in the government (1957). Today, 1,300 Tunisian Jews, the country's largest indigenous religious minority, practice their religion in public and with devotion. They have a Grand Rabbi and five officiating rabbis and a board of directors. Annually in April, the Jewish community holds an international pilgrimage on the holiday of Lag B'Omer to Djerba. It represents the centerpiece of Jewish life in the country. Jews from all over the world come in droves to celebrate the pilgrimage festival that takes place at El Ghriba, the oldest and most famous synagogue in North Africa.

Tunisia played a critical role in helping spark the political unrest across the Middle East that has been termed the "Arab Spring" of 2011 and that has led to the ouster of Egypt's President Hosni Mubarak and major internal violence within Libya and Syria. The beginning of this wave of protest was in Tunisia, when a young street vendor in Tunis, Mohamed Bouazizi, immolated himself on December 17, 2010, in protest against government actions that prohibited him from plying his trade. His act of defiance became the symbol of brazen resistance to government authoritarianism in Tunisia and throughout the Arab world. After a month of mounting public protest involving hundreds of thousands of Tunisian demonstrators, the 23-year rule of the Tunisian strongman President Zine El Abidine Ben Ali came to an end on January 14, 2011, and the dictator fled to Saudi Arabia. New political parties have been formed, and Islamic religious interests play a role in some of them. Democratic elections were held later in 2011.

TURBAN

The wrapped cloth head covering known as a turban has been a marker of eminent religious and political status in the cultures of the Middle East and the Indian subcontinent for centuries, and the importance of the turban in the religious identity of the Sikh community can be traced back to the beginnings of the tradition. In all likelihood, the early Gurus wore turbans to denote their status within the community; with the ascension of Guru Hargobind (1595–1644), however, we have specific references to the majesty of his turban representing a higher order of eminence than that of Jehangir, the Mughal emperor of the time.

The turban as a distinct marker of Sikh religious identity took a new turn during the period of Guru Gobind Singh (1661–1708), the last living Guru. As a result of the execution of his father, Guru Tegh Bahadur (1621–1675), at the hands of the Mughal authorities and the subsequent confrontation with the administration, Guru Gobind Singh commanded his Sikhs to distinguish themselves by their uncut hair covered with turbans. Manuals of conduct written around 1700 that focus on detailing the personal and collective behavior expected of Sikhs highlight the importance of unshorn hair (*kes*) and how a male Sikh should tie his turban daily and keep it tidy to the utmost extent.

Over time, the turban has become the most overt symbol of male Sikh identity, and its color and shape can provide interesting sociological information. For example, the shape of a turban will distinguish urban Sikhs from rural Sikhs; the round and large turban with displays of weaponry reflect the practices of sectarian groups such as the Namdharis and the Nihangs; and the colors blue and white indicate political affiliation with religious and secular parties, the Akali Dal and Congress, respectively. Although women do not

wear turbans in the mainstream Sikh community, in sectarian groups such as the Akhand Kirtani Jatha and the largely American Sikh movement, 3HO, it is obligatory for women to wear a turban. These two groups have emerged during the 20th century, and this practice indicates their emphasis on both religious orthodoxy and gender equality.

Increasingly, debates regarding the place of the turban have become quite polemical. For instance, in the Punjab there is profound concern that young Sikhs under the influence of modernity and globalization are cutting their hair and are no longer interested in wearing turbans. Given these changing trends, efforts have been made to educate young Sikhs about their heritage and the importance of the turban. In some places, competitions are held in turban tying, with prizes given to the individual who ties the best-shaped turban.

The large migration of Sikhs overseas has created additional areas of concern regarding the preservation versus assimilation of Sikh heritage in new cultural contexts. For example, where local driving and safety laws require the use of helmets, as a result, problems have emerged given the logistical difficulty of wearing a turban and a helmet at the same time. Many Sikhs have demanded to be relieved of some of these obligations given the importance of the turban as a Sikh religious symbol. The turban has also been in the spotlight in the wake of the events surrounding September 11, 2001. Despite these pressures, the turban remains the preeminent symbol of the Sikh tradition.

TURKEY

The Republic of Turkey is the Turkish nation-state located on the shores of the Mediterranean and Black seas at the crossroads between Europe and the Middle East; it was established in 1923 after the collapse of the Ottoman Empire in 1918. The 1982 constitution defines modern Turkey as a secular democratic republic and a social welfare state, respecting human rights and the rule of law. Its capital is Ankara, its flag is red with a white

crescent and a star, and the official language is Turkish. Turkey is situated in Asia Minor (Anatolia) and in a small portion in eastern Thrace, stretching from east to west between Asia and Europe. The total area of Turkey is 780,580 square kilometers (301,384 square miles), 97% of which lies in Asia and 3% in Europe. The population of the country was 74.8 million in 2009. Approximately 80% of the population is Turkish, and 15%–20% is of Kurdish origin. Turkmens, Arabs, Circassians, Anatolian Greeks, Jews, Armenians, and Assyrians make up a small portion of the population. The Kurdish population is mostly concentrated in southeastern Anatolia and in big urban centers, the Arab-origin people in the south along the Syrian border, and the non-Muslim communities in Istanbul, the largest city, and in Izmir, the port city in western Anatolia.

About 99% of the population is Muslim, the majority of which is Sunnī. There are also Shi'ite communities, mostly the Alevi population, which makes up about 20% of the Muslims. The Sunnī population belongs to the Hanefi School. The Greeks are affiliated with the Great Orthodox Patriarchate, and the Armenian Gregorian population with the Armenian Patriarchate, both located in the old imperial capital, Istanbul. There are also Armenian Catholic, Protestant, and Assyrian Orthodox churches. The majority of the Jewish community, about 20,000, lives in Istanbul, and the rest is dispersed in western Anatolian cities.

Turkish, the official language, is a branch of the Ural-Altai language family and is predominantly spoken in the country, together with some Kurdish dialects of Indo-European origin among some communities in eastern Anatolia. Turkish, written in the Latin alphabet since 1928, is a phonetic language using *o*, *u*, *c*, *g*, and *s* with diacritical marks as well. Kurdish and Armenian are also printed in Latin in dailies and periodicals.

The Republic of Turkey was established after the National Liberation War, which lasted 3 more years following the Great War. World War I ended for the Ottoman Empire on October 18, 1918, with the Mudros Agreement, and the Allied forces started to occupy strategic locations in Anatolia, depending on the interallied agreements during the war. Following the occupation of Izmir on May 15, 1919, by the Greek forces, and the partition of the country by the British, French, and Italian forces, the nationalist resistance was started in

Anatolia by Mustafa Kemal, the military hero of the Gallipoli campaign. Since the Ottoman government in Istanbul and Sultan Mehmet Vahdettin cooperated with the British with the idea of saving the remnants of the empire, the nationalist resistance was carried out both against the Allied imperialist occupation and against the Ottoman ancien régime. The Liberation War ended in 1922 with the Turkish victory, and the 1923 Lausanne Treaty became the cornerstone of the establishment of the modern Turkish nation-state.

The Turkish Revolution aimed at the secularization of the state with the abolishment of the sultanate in 1922, the establishment of the republic in 1923, and the removal of the caliphate, Shari'a courts, and religious schooling in 1924. As public education became nationalized and secularized, religious matters started to be organized by a state institution, the Directorate of Religious Affairs, which began to deal with the appointment of religious officials to mosques and religious offices and the maintenance of religious institutions. Teaching of religion was included in the curriculum of public schools, while religious sects and orders were prohibited and the social appearance of religions disappeared. The modern Turkish state separated politics and religion in accordance with the principles of laicism and applied a reform program for the secularization of society, politics, and culture. The legal order was secularized with the adoption of Western codes in civic, commercial, and penal affairs; the Latin alphabet was adopted for the integration of Turkish education with scientific developments; and reform attempts were made for the purification of language and understanding of history to enable the development of national citizens in the new nation-state. Turkish women gained equal citizenship in politics in 1934, and the first women representatives were elected to the parliament in the 1935 elections. The ideological principles of the Republican People's Party (RPP), established by Mustafa Kemal Atatürk, which ruled the country as the sole party for a quarter of a century, were integrated into the constitution in 1937. Republicanism, nationalism, secularism, populism, *étatisme* (statism, state control), and reformism were thus made the standards of the state.

In the foundation philosophy, Turkish secularism required the state to maintain public affairs in equal distance to all religions while securing the religious freedom of citizens as provided by law.

Faith was considered as a conscious issue in the minds of individuals, and the intervention of any other institution in the religious faith was prohibited. The use of religion for political purposes, the establishment of a political organization based on religious premises, and forcing any faith on individuals were also ruled out, as proselytizing of any believer was strictly banned.

Turkey followed a policy of balance between the Allied and the Axis forces and remained neutral for most of World War II, but it declared war against the Axis in 1945. Mainly due to the Soviet threat following the war, Turkey took its place in the Western world and became a founding member of the United Nations. The single-party regime ended in 1946 with the establishment of the Democrat Party (DP) by the developing industrial and agricultural interests. The DP came to power in the 1950 elections, defeating the RPP, the alliance of the military and civilian bureaucrats, the intelligentsia, and the urban middle classes. The DP preferred liberal economic development and an agriculture-oriented program, depending on the conservatives and providing concessions to Islamic circles. The DP's authoritarian rule and abuses of its majority power brought about the military intervention in 1960. With a new and more liberal constitution in 1961 and the establishment of new parties, the political system became very competitive in the 1960s. Together with the RPP, the Justice Party (JP), the Turkish Right, the Left, and the Islamists entered the scene toward the end of the decade. Defeated in the 1969 elections, the Left remained out of parliament and started to be represented in street demonstrations. The Right was organized in the National Action Party, depending on extreme nationalist politics, and the Islamic-oriented political party, the National Order, then the National Salvation Party (NSP), was established with a national outlook, seeking votes from the lower-middle classes. Though the state banned religious sects and dervish orders in the early reform era, the Islamic sects continued within society and reappeared in politics in the 1960s, giving their support to conservative and Islamist political parties.

Following the military memorandum against the JP government in 1971, the RPP established a coalition government with the NSP in 1973, a new experiment for an Islamic-oriented party to share political power in Turkey. After this short-lived coalition, Turkish politics was dominated by

center-right, right, and Islamist coalitions between 1975 and 1980, at a time when political chaos was prevailing on the streets and the society was suffering from economic crises.

The 1980 coup d'état annulled the parliament, closed down parties, banned political leaders, established a military government, and made a new constitution. Having prepared the ground for two-party politics for the sake of stability, the coup leaders ended up with the creation of a conservative, liberal democrat, and Islamist coalition, unified in the Motherland Party, which came to political power in 1983. In the 1990s, however, the multiparty system and unstable coalitions returned, with the reorganization of the Islamists in the Welfare Party, the nationalist Right in the National Action, and the liberal democrats in the True Path Party, pursuing the line of the DP and the JP.

The Islamist-oriented Welfare Party established the government in 1996, but the Constitutional Court closed it down for its threat to the state. As the mainstream Islamists were united around a new party, a splinter group of leaders founded the Justice and Development Party (known in Turkey as the *Adalet ve Kalkınma Partisi*, or AKP) with a new Islamist orientation, benefiting from the global rise of religiosity and religious politics. After a landslide victory in the 2002 elections, the pro-Western AKP, led by the former Istanbul mayor Recep Tayyip Erdoğan, tried to expand religious influence in the public sphere and protected its power in the 2007 elections with conservative, liberal, and Islamist electoral support. In the 2011 elections, the AKP increased its share of the popular vote.

TURKMENISTAN

Turkmenistan is a Turkic state in Central Asia. Formerly the Turkmen Soviet Socialist Republic, a republic in the Soviet Union, Turkmenistan declared independence on October 27, 1991. The population of Turkmenistan is largely Sunnī Muslim, with Muslims representing between 87% and 93% of the population. A small population of Eastern Orthodox Christians, the state religion of the pre-Soviet Russian Empire, also exists. Islam spread to Turkmenistan during the Islamic conquests of the seventh century, with most Turkmen practicing a form of popular folk Islam that is integrated with the tribal social organization of Turkmen society.

Islam became prominent in Turkmenistan due, in large part, to the missionary activities of Sufi dervishes and shaykhs in the 11th through 14th centuries. The adulation of these holy men combined with pre-Islamic religious traditions of shamanism and ancestor worship to form a distinctly Turkmen form of Islam. Central to the Turkmen form of Islam is the concept of the *öwlat*, translated alternately as “honor group” or “holy lineage.” Traditionally, there are six *öwlat*s in Turkmen society: Khoja, Seyit, Shikh, Magtım, Ata, and Müjewür, and each traces its lineage back, through the Sufi missionaries who helped convert the Turkmen to Islam, to one of the first four caliphs of Islam. Members of an *öwlat* are revered by the Turkmen, and they give spiritual guidance, blessings, and healing, as well as serving as mediators in both intertribal and intratribal disputes.

Under the Soviet Union, Islamic institutions such as mosques and religious schools were closed or destroyed, and Islam was discouraged as part of the general antireligious policies of the Soviet state. These policies had a profound effect on Islam in Turkmenistan as they isolated Turkmen Muslims from the greater Islamic world and destroyed many of the more institutionalized elements of the religion, further increasing the unofficial and localized character of Turkmen Islamic practices. In response to economic distress and religious persecution, Turkmen Muslims took part in the Basmachi Rebellion, an ultimately unsuccessful Central Asian Islamic uprising against the Soviet Union during the 1920s. After the fall of the Soviet Union, Islam experienced a revival, influenced and supported by the state. Islamic belief has become

an important aspect of Turkmen nationalism and national pride, and being Muslim is a crucial element of modern Turkmen identity.

TUTU, BISHOP DESMOND (B. 1931)

Bishop Desmond Tutu garnered world renown during the 1980s for his work as a South African Anglican priest actively opposing apartheid, South Africa's national system of racism and racial separation instituted in 1948. For his work, Tutu was awarded the Nobel Peace Prize in 1984. He gained further international recognition as chair of South Africa's postapartheid Truth and Reconciliation Commission. As a priest, Tutu has focused on advocating against racism, sexism, poverty, violence, and, recently, homophobia.

Tutu was born Desmond Mpilo Tutu in Klerksdorp, a city in the northern South African province of Transvaal. His parents were Zachariah Zelilo Tutu, a Xhosa who worked as a primary school teacher, and Aletta Dorothea Mavoertsek Mathlare, a Motswana. Desmond began his career as a teacher, following his father's footsteps; he was trained first at Pretoria Bantu Normal College and subsequently graduated from the University of South Africa in 1954. He married Nomalizo Leah

Shenxane, another teacher, in July 1955. They had four children.

After teaching high school for 3 years, Tutu began theological training to enter the priesthood at the College of the Resurrection and St. Peter in Rosettenville, an institution run by the Community of the Resurrection (an Anglican religious community that had influenced Tutu's early life). Tutu was ordained in 1960 and then spent 1962 to 1966 in London to receive a master's degree in theology from King's College. In 1975, Tutu became the first Black to be appointed dean of St. Mary's Cathedral in Johannesburg. Shortly thereafter, from 1976 to 1978, he was ordained bishop of Lesotho. He also served as the first Black general secretary to the South African Council of Churches, beginning in 1978.

Tutu was elected Anglican Archbishop of Cape Town from 1986 to 1996, during that time continuing his opposition to apartheid by urging non-violent resistance and finally witnessing the end of that system, signified by elections with universal suffrage in 1994. After retiring as archbishop, from 1996 to 1998, he chaired South Africa's Truth and Reconciliation Commission, a government commission that met to hear testimony concerning human rights violations from both victims and perpetrators of violence and oppression during apartheid. In 2007, Tutu founded The Elders, a group of international leaders working to solve pressing world issues.

Theologically, Tutu's influences include both forms of liberation and political theology as well as a variety of African theologies and spiritualities. The African concept of *ubuntu*, for example, that a person is a person through others, or that people always exist in a relationship, often features in his writings about forgiveness and reconciliation. Finally, a recurring theme for Tutu is an expressed hope for human beings to be understood in ways deeper than simply by racial definitions or divisions.

TYLOR, EDWARD BURNETT (1832–1917)

Edward Burnett Tylor was a 19th-century English anthropologist whose evolutionary theories of religion and culture greatly influenced subsequent generations of anthropologists and scholars of religion. He held the first chair of anthropology at Oxford University and published a number of widely praised works, including *Primitive Culture* (in two volumes, 1871) and *Anthropology* (1881), the first major textbook in the field.

E. B. Tylor was born to Quaker parents in Camberwell, London, on October 2, 1832. At the time, Quakers were barred from entering university. Thus, on completion of his secondary studies at Grove House School in Tottenham, it was expected that Tylor would help manage the family-owned brass works factory. In 1855, ill health forced Tylor to seek the warmer climates of Mexico and Central America, where his association with the archaeologist Henry Christy sparked his interest in ethnology and the emerging science of anthropology. On his return to England, Tylor published his travel notes as *Anahuac, or Mexico and the Mexicans, Ancient and Modern* (1861). This work was followed several years later by his *Researches Into the Early History of Mankind and the Development of Civilization* (1865), in which Tylor combined ethnographic research with the latest archaeological data. Tylor sought to compare the beliefs and customs of prehistoric peoples with those of contemporary tribal groups to show the progressive, though unequal, evolution of culture and religion as against the reigning theory of cultural and religious degeneration from a supposed golden age or Edenic paradise.

In 1871, Tylor published his two-volume magnum opus, *Primitive Culture*, subtitled *Researches in the Development of Mythology, Philosophy, Religion, Language, Art, and Custom*. Though Tylor sought to lay out a comprehensive science of culture and civilization, in actuality, he was much more interested in the evolution of the human mind, believing that “savage” religion could be understood by examining the thought-world from which it emerged—thus according to “savages” the same rational capacity as moderns. Thus, for Tylor, religion arose from the belief in spirits, the result of reflection on the experience of death coupled with prehistoric persons’ encounters of dead ancestors in their dreams. “Animism,” as Tylor called it, rested on two cardinal dogmas: (1) the souls of individuals and creatures continue after death and (2) the world of souls is ordered in the same fashion as the world of the living. In addition, to account for the persistence of ancient beliefs and customs into the present day, Tylor developed the notion of “survivals,” time-honored traditions that hold their place by force of people’s reverence for the past. Tylor’s brilliance was shown in his ability to sort through piles of ethnographic and archaeological reports and organize those materials into a convincing argument for the progressive development of human culture that was consistent with, though not dependent on, Darwin’s theory of evolution.

UGANDA

The Central African country of Uganda is known for a conservative Protestant Christianity that has a significant political influence. Indeed, there is hardly any separation between the sacred and the secular in its everyday life. Religion's intimate social role is not new; it is part of the society's tradition. Because life in premodern Uganda was often short and precarious, invocation of the supernatural played an important role in helping people cope with life's daily challenges. Since then, numerous natural and man-made disasters (e.g., disease epidemics, Arab slavery, political dictatorships, and civil war), poverty, the challenges of modern life, and the evangelizing activities of world religions have all played a part in sustaining the central place of religion in modern Ugandan society.

Uganda's religious landscape consists of three main groups: (1) the various world religions (mainly Christianity and Islam), (2) traditional/indigenous African religions, and (3) a plethora of syncretist religious groups (i.e., those that mix elements of various religions), including the Holy Spirit movement, the Movement for the Restoration of the Ten Commandments of God, and the Lord's Resistance Army.

Specifically, the distribution of Uganda's religious groups is as follows: Christians (85.2%, i.e., Catholics 41.2%, Anglicans 35.9%, Pentecostals 4.6%, Seventh-Day Adventists 1.5%, Orthodox Christians 0.1%, other Christians 1.9%), Muslims (12.1%), Baha'i (0.1%), traditional (1%), and the

nonreligious (0.9%). Although many Ugandans follow one main religion, it is fair to note that syncretism is widespread.

The country's dominant religions, Christianity and Islam, arrived in the country between 1840 and 1880. Islam came first in 1840, when the Buganda kingdom (the root of the country's name) started trading with the Indian Ocean Sultanate of Zanzibar, which is now part of Tanzania. Conversely, Christianity came to Uganda with the coming of British Protestant (mainly Anglican) and French Roman Catholic missionaries in 1877 and 1879, respectively. Besides being the fastest growing form of Christianity in Uganda, the Pentecostal/Evangelical movement that formally entered the country in the late 1950s is arguably the most socially, economically, and politically influential Christian group in the country.

Another thriving aspect of Ugandan Christianity consists of the African Independent Churches, whose syncretic theologies (i.e., the liberal mixing of Christian and traditional African religious elements) allegedly addresses the needs of their followers more effectively. Overall, there is greater religious diversity in Uganda's cities, being a reflection of the growing diversity of the country's urban population in this global era. With increased globalization in this century, Uganda's religious diversity is bound to increase.

UGARITIC RELIGION

Among the remains of the ancient city of Ugarit, situated just north of the modern city of Latakia on the Syrian coast of the Mediterranean Sea, are hundreds of texts that reveal an intricate and diverse religious picture of the city's inhabitants. Excavations began in 1929, and to date, around 1,500 different texts, from 17 archives, have been published, many of which were produced during the "golden age" of Ugarit in the 15th and 14th centuries BCE. Ugarit's position as a major port city made it a major center of international trade and exchange of religious ideas between the western Mediterranean, Egypt, and the ancient Near East during the Bronze Age. The likely existence of thriving scribal schools at Ugarit makes the Ugaritic texts an important source for understanding textual transmission in the Mediterranean, and the Ugaritic materials are often thought to provide the intellectual and religious milieu from which several important motifs in the Hebrew Bible were adopted.

Among the textual materials we find at Ugarit—most of which are written in the (northwest Semitic) Ugaritic language in an alphabetic cuneiform script—are various ritual texts, god/goddess lists, divination texts, economic documents, and mythological materials. Myths from Ugarit reveal a pantheon arranged in the form of a divine family, and various lines of archaeological data give us a glimpse into worship at Ugarit: Two large temples dedicated to the deities Baal and Dagan were uncovered at the site; iconographic images reveal the physical form of certain deities, such as El, Baal, and Athirat (biblical Asherah); and excavated tombs display Ugaritian beliefs about the placation of the deceased with food and drink offerings.

The fragmentary texts of the so-called Baal Epic are often adduced as a fascinating insight into Ugaritic religion and are cited for their connection to various biblical motifs, though there is no direct evidence that Ugaritians considered these stories about Baal as anymore "normative" or important than other kinds of texts. In particular, certain biblical epithets of divinity, such as "cloud-rider" (Psalm 68:4, 104:3), are also used to describe one major Ugaritic deity, Baal, the account of Baal's status as a mountain-dwelling divine warrior, his battle with the Sea (*Yamm*) and Death (*Mot*), followed by formulaic declarations of victory, and the erection of a temple/house for the victor have striking parallels in the biblical corpus (see, e.g., Exodus 15:1–19, 19; Isaiah: 27:1, 51:9–11; Nahum 1:3–4; Habakkuk 3:3–15; Psalm 29:10, 48:1–2, 68:4,16, 74:12–7; Daniel 7:1–14; in the Christian New Testament, Revelation 12). Some scholars have even speculated that certain biblical passages, such as Psalm 29, were copied directly from Ugaritic texts and adapted for Israelite worship. The motif of a new, young deity defeating powers of chaos (personified as the sea) also found its way eastward into the heart of Mesopotamia, where the Babylonian *Enuma Elish* presents its principal deity, Marduk, in a general role similar to that of Baal in the Ugaritic texts.

UKRAINE

For over a millennium, Ukraine, Europe's second largest country, has seen a variety of religious and political entities representing various cultures and social systems. It has been a crossroads of religious traditions and denominations.

Out of a shrinking population of some 46 million, Ukraine's religious believers constitute about 32 million. Around 25–30 million of these are Christians. Over half of the Christians are Orthodox, divided among the Ukrainian Orthodox Church under the Moscow Patriarchate, the Ukrainian Orthodox Church of the Kyiv Patriarchate, and the smaller Ukrainian Autocephalous Orthodox Church. The rest include 4–5 million Greek Catholics, 1 or 2 million Protestants, less than a million Roman Catholics, and several million unchurched Christian believers. Jews, Muslims, and others number less than a million each. Religious belief and practice are strongest in western Ukraine and weakest in the east and south. Several million Ukrainian Orthodox and Catholics reside in other parts of the former Soviet Union as well as in western Europe, the Americas, and Australia.

Around 988 CE, Grand Prince Vladimir of Kyiv (Kiev) adopted Byzantine Christianity as the religion of his realm, known as Kievan Rus'. It received and developed a Byzantine Slavonic religious culture developed in Bulgaria on Greek models. In 1596, part of Ukraine's Orthodox Christians under Polish Lithuanian rule reestablished communion with the Roman Church. These were known as Uniates (later Greek Catholics). Some of the nobility embraced the Reformation. In the 17th century, there arose an influential Ukrainian Orthodox culture distinguished by its theological literature, church architecture, icon painting, and choral music. After the union of Cossack Ukraine with Muscovy in 1654, Orthodox Ukrainians came under Russian Orthodox Church jurisdiction. Most of western Ukraine, which passed to Austria in 1772 and to Poland after 1918, remained Greek Catholic.

During the national revival of the 19th and 20th centuries, Christian motifs remained important in Ukrainian art and literature, also appearing in film. As in previous eras, the folk culture produced wooden churches, icons, and ritual objects.

In the wake of the 1917 Bolshevik Revolution, an independent Ukrainian Autocephalous Orthodox Church thrived briefly, only to be destroyed along with the dominant Russian church in the 1930s. During World War II, Stalin restored the Russian Orthodox Church and, in 1946, suppressed the Greek Catholics. With the disintegration of the

USSR, an independent Ukrainian Orthodox church sprang up along with a revived Greek Catholic Church. Evangelical Baptist, Adventist, Pentecostal, and other Christian congregations, persecuted under Soviet rule, expanded their activity in one of the most tolerant of the post-Soviet states.

Since the Middle Ages Jews have lived in Ukraine, the birthplace of Hasidism. The Jewish community survived repeated pogroms, only to be annihilated in the Holocaust. Most of Ukraine's Muslims are Crimean Tatars. Deported to Central Asia during World War II, they have been gradually returning to their homeland.

UMAYYAD DYNASTY

The Umayyad Dynasty presided over the Arab empire during a formative period in the development and expansion of Islamic religion and civilization (661–750). Later, Umayyad rule in Islamic Iberia (al-Andalus, 756–1031) fostered a flowering of Islamic and Jewish culture.

Civil war broke out within the Arab empire when the third caliph, 'Uthmān, was assassinated in 656. His successor, 'Alī, faced several challengers, including Mu'āwiyah, the governor of Syria and a senior member of 'Uthmān's family, the Umayyads. When 'Alī was assassinated by the *Kharijis* in 661, Mu'āwiyah was acknowledged as caliph, with Damascus as his capital.

Under the Umayyads, Arab expansion continued westward through North Africa and, with the Berber troops, Iberia (it was checked near Poitiers in 732), as well as eastward to Central Asia and the Indus River. 'Abd al-Malik (685–705) made Arabic the language of administration and coinage, while

his Dome of the Rock, with its anti-Trinitarian inscriptions, on the site of Abraham's sacrifice, the Jewish Temple, and Muhammad's ascension, demonstrated Islam's triumph over Judaism and Christianity. Though converts had to become clients (*mawālī*) of the Arabs, the latter began to lose their privileged position as conquerors as a more integrated Islamic society evolved. Muslims, however, remained a small minority ruling over "protected" non-Muslims (*dhimmis*), while Umayyad authorities were reluctant to recognize converts because Muslims were taxed more lightly.

Although most Umayyads were therefore assessed harshly in Islamic scholarship, the pious 'Umar II (717–720), who encouraged conversion while preventing the loss of the land tax, has been seen as the fifth "rightly guided" caliph after 'Ali. Designating themselves as God's deputies (singular, *khalīfat Allah*, hence caliph), the Umayyads derogated from the authority of the Qur'an and the Prophet—according to the emerging class of scholars (ulema), who sought to make themselves the exclusive interpreters of divine revelation. The Umayyads' introduction of hereditary rule (to promote political stability) reduced the elective caliphate to mere kingship, and gave charge to the Arab tribesmen, who had won the empire for God—and themselves. The Shi'i could not forgive the slaying of 'Ali's son Husayn at Karbala (680) while making a stand for the authority of the Prophet's family.

Intra-Umayyad conflicts (744–750) enabled the 'Abbāsids to seize the caliphate, but an Umayyad fugitive, 'Abd al-Rahmān, established an emirate in Córdoba (756–788). His successors, faced with numerous revolts, ruled all or part of al-Andalus until 1031, calling themselves caliphs from 929. The formation of a new, Arabic-speaking, Islamic society in Spain was accelerated by the prosperity of the 9th and 10th centuries (resulting from improved agricultural techniques, new crops, and international commerce). Architecture, poetry, and scholarship—secular and religious—flourished. Christians adopted the language and customs of the Arabs, and, while a few sought martyrdom, most apparently embraced Islam. For Jews, Umayyad Andalus was a golden age of Hebrew poetry and religious scholarship.

UNIFICATION CHURCH

The Unification Church is a new religious movement founded in Seoul in 1954 as the "Holy Spirit Association for the Unification of World Christianity" by Sun Myung Moon (b. 1920), a Korean who claims to have been asked by God to assume the role of the Messiah and restore the Kingdom of Heaven on earth. This, often contentious, movement (officially known as the Family Federation for World Peace and Unification since 1994) spread throughout the world, attracting the cooperation, admiration, and antagonism of notables in the worlds of religion, politics, academia, the media, business, the arts, entertainment, and sport. Among the more publicized features of the movement have been Moon's support for President Richard Nixon and the mass weddings where thousands of couples are "blessed" by Moon and his wife, known to their followers as "True Parents."

The Unification Church has an elaborate theology based on Moon's interpretation of the Bible and his own role as Messiah. The basic beliefs are outlined in the *Divine Principle*, which explains that humankind's fallen nature is due to Eve, who after being spiritually seduced by Lucifer, had a physical relationship with Adam before they had matured sufficiently to be blessed by God in marriage. Various key figures throughout history have been meant to contribute to the restoration. Jesus was unable to complete his mission because he was murdered before he could marry and set up the ideal, God-centered family, but this, it is claimed, was accomplished in 1960 when Moon married his present wife. A vast collection of talks by Moon contain further revelations of how he and his family have established numerous "foundations" from which

the futures of the physical and spiritual worlds have been developing according to God's plan.

Moon has always been a controversial figure, evoking extremes of adulation from his followers and intense detestation from his opponents. He has been imprisoned in Korea and, later, in America for tax evasion. He and his church first received international publicity through a series of revivalist rallies after he moved to the United States of America in the early 1970s, when the appeal was disproportionately made to well-educated, middle-class adults in their early 20s. Popularly known as "Moonies" (a term Unificationists now consider offensive), the converts became a familiar sight, selling flowers, candy, and literature in public places and inviting students and backpackers to meet friendly groups of idealistic young people eager to share their vision of how to serve God and/or make the world a better place. This could involve abandoning promising careers to work up to 18 hours a day, living in relatively primitive conditions, severing ties with relatives and friends, and letting Moon choose their marriage partner, who might not even speak their language. Concerned parents frequently became convinced that the only plausible explanation was that their offspring had been "brainwashed" and, in some cases, resorted to kidnapping in order to "deprogram" them.

Although details of the movement's finances are shrouded in mystery, it is clear that billions of dollars have been involved in the purchase of real estate (including land for a new "Garden of Eden" in Brazil), the running of businesses (including the loss-making *Washington Times*), and the promotion of Moon's many political ventures, supported by prominent figures such as George H. W. Bush and Louis Farrakhan, who, with other celebrities, are not infrequent guests at Unification conferences and dinners. In 2004, several congressmen found themselves witnessing Moon's "coronation" as "King of Peace" in a Senate Office Building. There are more than 1,000 organizations, institutions, and businesses associated in some way with Unificationism. These include Ambassadors for Peace: Bridgeport University; CARP; Il Hwa; International Cultural Foundation; Inter-Religious Federation for World Peace; Professors World Peace Academy; Tong Il; and Women's Federation for World Peace. Unification

businesses range from manufacturing armaments to fish restaurants; one lucrative Japanese enterprise is the "spiritual sales" of objects such as marble urns or statues for millions of yen on the understanding that they bring benefit to and from deceased relatives in the spirit world.

Although Moon remains the undoubted leader of the movement, considerable power now lies in the hands of certain members of his family and a select group of (mainly Korean) followers. Significance is also given to messages purporting to be from the spirit world, such as the pronouncements of a medium operating mainly from Chungpyung in Korea, who is believed to channel messages from Mrs. Moon's deceased mother, Dae Mo Nim. In the early 1980s, a revival was led by a Zimbabwean whom Moon endorsed as embodying the spirit of one of his sons who had died in a car crash. However, after "Black Heung Jin Nim" had beaten numerous members, and one of Moon's top aides had to be hospitalized, he was sent back to Africa, where he founded his own schismatic group. Other offshoots of the Unification movement include "Setsuri" (Jesus Morning Star), which has flourished in Korea and elsewhere in Asia.

By the start of the 21st century, the movement was far less visible than it had been in the 1970s and 1980s. Members are more likely to live with their spouse and children and to have work unrelated to the church. Although there are still converts, most of the new membership comes from those born into the movement. In the West, the majority of the first cohort of the second generation left the movement in early adulthood, but those in the second cohort are more likely to in the relatively more relaxed environment.

UNITARIANS

Unitarians are adherents to a noncreedal religious movement, derivative from Christianity yet in disjunction with it, denying the trinitarian character of God and open to insights from various faith traditions and intellectual positions. Although globally present, it is a minority group. It originates from 16th-century reactions to the Calvinist Reformation, stressing human free will, the goodness of humanity, and the use of individual reason. After Michael Servetus (1511–1553) attacked orthodox trinitarianism and was condemned for heresy, Faustus Socinus (1539–1604) augmented this teaching by denying Christ's divinity and pre-existence. Unitarianism further developed as a modern liberal religious phenomenon with humanist sympathies, especially in continental Europe, England, and North America.

The first Unitarian church was founded in Poland in the 16th century, shortly followed by an officially recognized congregation in Transylvania at the Diet of Torda in 1568. The movement survives today among ethnic Hungarians in Romania as a theistic, rationalist, and humanist church devoid of the worshiping of Jesus Christ. In England, Unitarianism started to develop in the 1600s but gained legal standing only in the 18th century. It was greatly influenced by James Martineau (1805–1900), whose theology centered on freedom and the intuitions within the individual human consciousness rather than external miraculous revelation or doctrine. The General Assembly of today's British Unitarianism was established in 1928, and it includes both liberal Christians and humanistic-oriented congregations.

In America, Unitarians trace their roots to an opposition to the Great Awakening of the 1740s in New England and to Jonathan Edwards's teachings, an opposition inspired by the ideas of James Arminius, who held to the principle of "free will" as opposed to predestination. An early Unitarian identity was forged as the liberal Henry Ware was appointed Professor of Divinity at Harvard in 1805, giving rise to a strong Unitarian tradition at this university. Subsequently, the preaching and writing of William Ellery Channing (1780–1842) defended Unitarianism as Arian Christianity (which asserted that Christ was not truly divine). The movement was, however, challenged from within by transcendentalists such as Ralph Waldo Emerson (1803–1882). A division became evident between the Christian liberals in the Northeast and the proponents of a freer religious inquiry, especially as the latter spread through the Midwest. However, a broadly understood religious humanism brought American Unitarians under the same organizational canopy, the American Unitarian Association (AUA), in 1925, preparing the ground for a merger with Universalists (creating the Unitarian Universalist Association [UUA]) in 1961. The International Council of Unitarians and Universalists (ICUU) followed suit in 1995, currently encompassing about 500,000 members on all continents.

As a global phenomenon, Unitarianism today is a creedless collection of diverse self-governing congregations and religious movements with locally rooted commitments to religious freedom. Unitarians are nonetheless linked together by common themes, which include tolerance for diverse views, liberty of individual conscience with respect to such views, the inherent value of each person, human relations driven by justice and compassion, responsible stewardship of the environment, and the practice of democratic principles.

UNITED ARAB EMIRATES

The United Arab Emirates (UAE) consists of the seven small emirates—Abu Dhabi, Dubai, Sharjah, Ras al-Khaimah, Ajman, Fujairah, and Umm al-Qaiwain—that were united as a federal state in 1971. Before the establishment of the oil economy in the early 1960s, two main orientations shaped traditional Emirati culture: (1) the nomadic, desert-oriented Bedouins with small oasis farming and (2) the ocean-oriented culture that revolved around pearling and sea trading. These subcultures were economically, politically, and socially interdependent, creating a common culture and social identity. The UAE shares significant aspects of its culture with neighboring Arab countries and the larger Arab culture.

The commercial production of oil triggered rapid population growth as a result of an increase in the national population from improvements in health care and living standards and the importation on a large scale of mostly male foreign laborers. The latter factor has generated a dependence on expatriate labor; the UAE has become a multi-ethnic society, and Emirati nationals account for only about 20% of the population.

Urbanization in UAE has been characterized by incomparable growth. Abu Dhabi is one of the most modern cities in the world. UAE cities have been heavily influenced by the global city type. Despite its Western-style skylines, the Emirati culture is strongly influenced by Islam and the traditional Arab social structures. This country's political system remains obscure as it is based on a patriarchal kingdom that allows for little political participation of its citizens. Its socioeconomic development is based on a phenomenally unbalanced native-foreign population ratio, which makes this country extraordinary.

UAE is unique for its net immigration rate, ranking first in the world according to the CIA (U.S. Central Intelligence Agency) world fact book. About two thirds of the immigrants are Asians, mainly from India, Pakistan, Iran, Sri Lanka, Bangladesh, and the Philippines. The remainder are Arabs, Europeans, and Americans. The official language is Arabic. Among the immigrant population, English, Hindi, Urdu, Farsi, and Filipino are spoken. English is the language of commerce.

The constitution of the UAE declares that the official religion of the UAE is Islam. The Muslim population of the country constitutes 96% of the total population. Islam dominates most aspects of life. Most Emiratis are members of the Sunnī sect. Matters relating to marriage, divorce, inheritance, economics, politics, and personal conduct are affected by Islamic law. There is a dual system of Islamic courts for criminal and family law matters and secular courts for civil law matters. Shi'a Muslims in Dubai may pursue Shi'a family law cases through a special Shi'a council rather than the Islamic courts. Emaritis are tolerant toward other religions, and immigrants of other faiths are allowed to have their own places of worship.

UNITED KINGDOM

The four nations that constitute the sovereign nation-state “The United Kingdom of Great Britain and Northern Ireland”—England, Northern Ireland, Scotland, and Wales—are all distinct, shaped by specific circumstances. Scotland, for example, has its own legal and education system and established church. The 1998 Scotland Act led to the formation of a Scottish parliament, though the U.K. parliament at Westminster (London) retains control over some areas such as defense. Wales's governing council was abolished in 1689 (leading to direct rule from Westminster), and it was only in 1999 that the Welsh National Assembly with various decision-making powers was created. The Anglican Church in Wales was disestablished in 1920. Northern Ireland has a

very particular religious and political history. It is now a distinct jurisdiction governed by a power-sharing government. The Anglican Church of Ireland was disestablished in 1871.

This entry focuses on England and Northern Ireland—the latter could be argued to be the most divergent of the United Kingdom's components, and the former has been instrumental in the formation of not only contemporary Northern Ireland, Scotland, and Wales but also many elements of the modern world. Reference is made to Scotland and Wales when there are details or differences of particular note. Initially a brief history of the United Kingdom and religion within it is provided, with an emphasis on colonialism. Intensified immigration post-World War II and secularization in the 20th century are then considered. This leads on to a discussion of religion in the United Kingdom in the 21st century, focused on diversity and integration.

Religion and the United Kingdom: A Brief History

The United Kingdom is historically a place of immigration and emigration, with its tapestry of invasions, wars, and conquests. Roman, Saxon, Viking, and Norman influences interacted with indigenous cultures such as the Celtic. Prior to the Roman conquest, pagan practices were prevalent within what came to be known as the United Kingdom. Christianity began to develop in the region from the third century CE. Christian communities were established in Ireland from which members travelled to evangelize the mainland. In the sixth century, Augustine was sent out by Pope Gregory to evangelize what came to be known as Britain (England, Scotland, and Wales). The process of embedding was varied and uneven but so successful ultimately that the United Kingdom came to be identified with Christianity, and within it numerous denominations arose that have since spread internationally.

Britain remained loyal to the pope in Rome until the 16th century, when, following the Protestant Reformation in Europe and Pope Clement VII's refusal to grant King Henry VIII a divorce, the Church of England was established. At the same time, the Anglican Churches of Wales and Ireland were established. John Knox, influenced by John Calvin, preached equality of all

church members and was instrumental in the establishment of Presbyterianism in Scotland. The Church of Scotland also became linked to the state. Thus, the enduring relationship between church and state in the United Kingdom was cemented, though the monarch is not head of the Church of Scotland, as is the case with the Churches of England, Ireland, and Wales.

To this day, 26 bishops from the Church of England sit in the Upper Chamber of Parliament as Lords Spiritual. Henry VIII's daughter Queen Mary temporarily reinstated Roman Catholicism as the official religion, a prospect that reemerged and concerned Parliament periodically. However, from 1534, the Church of England was essentially the state religion, and Roman Catholics endured various restrictions and persecution, fueled by fear of the European Catholic powers, especially France. Pope John Paul II's visit to Britain in 1982 was historic as it was the first by a pope since the 1500s.

The 16th, 17th, and 18th centuries with their political and religious upheavals were pivotal to the formation of the United Kingdom. During this period, nonconformist Christian sects proliferated, including the Puritans, Quakers, and Levellers. Their degree of religious freedom varied over time, and some left the country to escape persecution. The Puritans took their ideals to Virginia and New England. Out of Puritanical reform grew the Baptist movement, which split in the early 1600s over the question of Jesus' atonement. The radical role that Dissenters, such as the Baptists, had played in the English Civil War (1642–1651) led to fearful reactions and the passing of anti-Dissenter laws. Jews are documented as living in England as far back as 1215 in the Magna Carta. The community, however, was expelled in 1290, returning only at the time of Oliver Cromwell. Their presence remains small.

Presbyterians clashed with Parliament in England, especially over the issue of episcopacy in the established church. Ulster Presbyterians of Scottish extraction in Northern Ireland remained in tension with the state. Scotland and England were already deeply connected politically and economically, but this was cemented in 1707 with the Act of Union, which enshrined Scotland's acceptance of the English monarch as its own in law. The act protected the royal succession and trade, though Scotland retained its own laws.

In 1660, Charles II of England was declared king in Ireland. During the reign of James I (1680s), Ireland became “re-Catholicized,” fueling fears of Catholic rebellion and papish plots and anti-Irish sentiment in mainland Britain. Catholic bishops and schools became outlawed, as they were in Scotland. Catholics were double taxed, though the late 1700s did see the loosening of restrictions on Catholics and Dissenters in the United Kingdom.

In Ireland, there were tensions between Catholics and Protestants and within Protestantism between unionists and nationalists. The 1798 Irish rebellion led to the death of 30,000 people and damage to the Ulster Presbyterians particularly. In 1801, following fears of Irish nationalism and French influence, the United Kingdom of Great Britain and Ireland was instituted, though this was never a stable union.

From the early 1700s, an evangelical revival began in England resulting in the rise of Methodism and voluntary mission societies. John Wesley, an Anglican clergyman, became highly critical of the established church. Wesley emphasized the power of the Holy Spirit and de-emphasized doctrinal conformity. His group formally separated from the Church of England in 1795. Methodism had a considerable impact in England, Ireland, Scotland, and Wales, leading to a “Great Awakening” in the latter. It also spread worldwide through the British Empire, particularly to America.

British colonization continued through the 18th century, with English, Irish, Scottish, and Welsh people involved in the process, including the military defense of British territory and interests. It is through the project of empire building that British identity really became formed. In 1792, Baptist William Carey founded the Baptist Mission Society, which became the blueprint throughout western Europe for the Protestant voluntary missionary society exporting Christianity.

The Century of Expansion

At its peak, the British Empire covered a huge swathe of the world’s surface with dominions, Crown colonies, and protectorates in Africa, Asia, the Caribbean, and Oceania. Currently, the United Kingdom retains 14 overseas territories, and there are still 53 countries in the Commonwealth,

established in the late 19th century, 16 of which accept Queen Elisabeth II as their monarch. Industrialization, trade and commerce, scientific discovery, and competition with other European powers fed British overseas expansion. The churches participated in this process, engaging in international missions. The first Lambeth Conference, the decennial meeting of leaders from the Worldwide Anglican Communion, held in 1867 demonstrates the burgeoning consciousness of a global Anglican church.

Britons saw it as their Christian duty to bring the Gospel to and civilize the colonized peoples: the White man’s burden. Evangelicalism, with its emphasis on individual conversion and religious experience, facilitated the development of lay, voluntary missions. The churches, the Church of England in particular, became associated with the abolition of slavery, though it was the Evangelicals who finally pushed for it; their mission was thus associated with colonial imperialism.

The religious landscape changed at home as it did abroad. With rapid industrialization and consequent urbanization, the churches had to adapt to the presence of large, often impoverished populations in cities and towns. This fostered a large-scale and at times competitive church-building program and the further growth of Nonconformism, especially in Wales. In 1831, John Nelson Darby founded the Plymouth Brethren, with a strong emphasis on mission, baptism, and equality. William Booth founded the Salvation Army along military lines in 1878. These are two examples of British sects that developed in the 19th century and have survived into the 21st century. Interest in Eastern religions and spiritualism also grew.

In 1843, the “Disruption” occurred in the Church of Scotland, when many ministers and members left to found the Free Church of Scotland in protest over the political patronage of the clergy. The church’s authority to elect its own ministers was eventually reinstated in 1874.

Irish Catholic disaffection grew, especially with the British government’s deplorable handling of the Great Famine (1845–1852), during which the Irish population decreased by 25%. Numerous Irish people migrated to mainland Britain and beyond, leading to the establishment of an Irish diaspora, notably in the New World. The Irish Catholic nationalist movement grew, and the

Irish War of Independence (1919–1921) led to the partitioning of Ireland. Twenty-six southern counties became the Irish Free State, while six northern counties remained under British rule. Northern Irish Protestants wished to establish Northern Ireland as a Protestant state despite the residence of Catholics in the newly created nation.

Hence, the 19th century closed and the 20th opened with the British government controlling a vast empire but losing control of much of Ireland. England was the seat of power, and there was prejudice against Irish, Scottish, and Welsh people as well as racism against people in the colonies.

Migration and Secularization

Migration and secularization are key processes affecting religion in the United Kingdom in the 20th century. It is clear that a variety of Christian groups have existed within the United Kingdom for centuries. Other religious groups such as the Jewish community have also been present historically. However, the range and size of non-Christian groups increased with post-World War II immigration, mainly from the (former) British colonies. Following the Great Depression, two world wars, and resistance movements in colonies, extensive decolonization began. At the same time, the depleted labor force was insufficient for post-war reconstruction. Hence, labor was imported. People from within the Commonwealth were free to migrate to the United Kingdom, and many came from Africa and the Indian subcontinent, including Hindus, Muslims, and Sikhs. With the 1962 Immigration Act, such immigration was severely restricted and a process of consolidation began as families settled in the United Kingdom began to seek more permanent religious provision, leading to the construction of more temples and mosques. Difficulties separating ethnicity and religion arose in legislation, and new arrivals encountered discrimination.

Simultaneously, Christian participation began to decline. Callum Brown states that at least 44% of the Scottish population had a formal church connection in 1939, which had shrunk to 27% in 1994. Though in the 19th and 20th centuries Wales was known for its religious enthusiasm, since then organized religion has declined faster in Wales than anywhere else. It is only in Northern

Ireland that church membership figures have remained relatively high.

The British picture of decreasing Christian participation is attributed to various factors, including modernization, increase in leisure time, consumerism, and the sexual revolution of the 1960s. The church population in Britain is shrinking, ageing, and overwhelmingly female (though the number of women belonging to churches is also decreasing). Yet Grace Davie has nuanced this picture, highlighting the variations between different indicators of religiosity: Church attendance and membership are declining at a far faster rate than belief. Also, as will be seen, some churches are growing in the 21st century.

Northern Ireland

Strongly felt sectarian divisions between Catholics and Protestants in Northern Ireland have contributed to its enduringly high rates of church membership. They led to violence in the 1960s and the institution of British Direct Rule in 1972. The 1998 Good Friday Agreement laid the foundations for the present power-sharing government and peace in the country.

The 21st Century

Questions about religion were administered in the national censuses of England, Wales, Scotland, and Northern Ireland in 2001 after lobbying, particularly by religious groups, to reintroduce them. The aggregated results for Great Britain give 71.8% of the population as Christian, 15.1% as having no religion, 2.8% as Muslim, 1.0% as Hindu, 0.6% as Sikh, 0.5% as Jewish, 0.3% as Buddhist, and 0.3% as following other religions (7.4% did not state a religion). The fact that other national surveys have found a much lower proportion of Christians led to a critique of the census. It is generally thought that the timing of the census and placing of the question on religion in the English and Welsh census caused people to coalesce their religious, national, and ethnic identities, identifying themselves as British and Christian as opposed to Muslim. It is true that a dramatically smaller percentage of the British population go to church on a Sunday: 6.7% in 2005, according to Peter Brierley.

Black Christians who migrated to the United Kingdom post–World War II from the Caribbean and Africa found themselves rejected by the mainline denominations. Hence, they established their own, often Pentecostal-Charismatic, churches. In the 21st century, Black-majority churches are growing, along with White-majority evangelical and Pentecostal-Charismatic churches and Orthodox churches. The United Kingdom joined the European Union (EU) in 1973, and the 21st century expansion of the EU has led to an influx of migrants from new eastern European accession states, especially Poland, prompting the Catholic Church in the United Kingdom to increase provision for them. However, there are already indications that this form of migration is likely to be temporary.

The Church of England has suffered a marked decline in numbers. In 1998, there was controversy over the decision to admit female priests, and the Lambeth Conferences of 1998 and 2008 were dominated by a divide in the Worldwide Anglican Communion over the issue of homosexual clergy.

The number of active Christians in the United Kingdom may be declining, but mainline denominations continue to predominate in the state-funded armed forces, hospital, prison chaplaincies, and faith school system, though other faiths are increasingly represented.

Faith Schools

In England, there are 6,867 faith schools maintained by the state. The Church of England controls most of these, Roman Catholics have charge of about half as many, and far fewer are in the hands of Jewish, Muslim, Sikh, and Hindu groups (in descending order). In Scotland, there are 395 state-maintained faith schools, most of which are Roman Catholic. There are 263 in Wales, mostly run by the Church of Wales, followed by Roman Catholics. Finally, Northern Ireland has a total of 988 state-maintained faith schools, of which most are Roman Catholic and almost as many are “controlled schools,” the latter being Presbyterian, Church of Ireland, and Methodist. (These data were reported on March 10, 2009, in the document “Faith Schools: Admissions and Performance.”)

These numbers give a good indication of the persistence of Anglican and Catholic influence in

education, and the variation between nations within the United Kingdom. The establishment of more state-funded Muslim schools has been the catalyst for renewed debate about the validity of faith schools. Some believe that Roman Catholic and Protestant schools in Scotland and Northern Ireland have contributed to the perpetuation of sectarian divisions in these countries. This debate relates to the perceived “failure of multiculturalism” in contemporary British society and points up the particular focus on Islam within the discussion of this failure.

Islam

The British Muslim population is mainly concentrated in English cities. Incidents such as the “Paki bashing” in the 1980s, the 1989 Rushdie Affair (during which the British government refused to protect Muslims by extending an archaic law, ultimately repealed in 2008, that protected Christians from charges of blasphemy), and riots in northeast England involving young Muslim men indicated the fact that the relationship between Muslims and the wider British society could be contentious.

The bombings in London on July 7, 2005, and subsequent terrorist attempts raised both fears and questions, especially because the perpetrators were Muslims born and raised in the United Kingdom. Muslims are consistently negatively portrayed in the media, and many report feeling excluded, discriminated against, and non-British. Following international terrorist attacks by members of Muslim extremist groups, new immigration laws and policies have been introduced, making it more difficult to enter the United Kingdom. There has also been discussion of British values in the public sphere and controversies over religious dress. As a result, debate about religious freedom, freedom of expression, and pluralism has been reignited in the United Kingdom.

Religious Freedom

The 1998 Human Rights Act incorporated the European Convention on Human Rights into (English) law, protecting both individual and group rights to practice or change a religion. The Employment Equality (Religion or Belief) Regulations of 2003 and the 2006 Equality Act prohibit discrimination on the grounds of religion or belief in

employment and the provision of goods and services. However, Baha'is, Jehovah's Witnesses, Muslims, and Quakers all report experiencing social stigma, because the requirements of their faiths prevent participation in common social practices. There are complaints of ignorance and hostility as well as physical and verbal abuse from some members of minority religious groups.

Some groups, such as Scientology, are refused recognition by the Charities Commission (the government body that grants religious groups official status). The controversial Race and Religious Hatred Act of 2006, the introduction of protest exclusion zones, and the invocation of antiterror legislation to restrict peaceful demonstration, particularly against the Iraq War, have been seen as suppressing dissent and activism in the United Kingdom. The London riots in August 2011 were regarded by some observers as a protest against the marginalization of lower-class and immigrant communities.

Christianity is of enduring significance in the United Kingdom. It remains the foundation of British legal systems, and the Churches of England and Scotland remain established. There has been discussion of removing the Lords Spiritual from the House of Lords, but thus far, there has been no action. The Archbishop of Canterbury (the highest authority in the Anglican Church) has argued that these bishops serve as representatives of all faiths within the United Kingdom. He and other Anglican prelates speak publicly on a range of issues. The political and the religious spheres are not entirely separate in the United Kingdom, and accommodating the diverse religious groups now present within it is challenging. The religious landscape of this composite nation-state, the United Kingdom of Great Britain and Ireland, continues to mutate. Some religious groups, such as Methodists, shrink, while others, such as Pentecostals, grow. Non-Christian religious groups remain relatively small. Against a backdrop of increased and sometimes hysterical media coverage, continued migration, and shifting regulation, the future of religion in the United Kingdom remains both interesting and difficult to predict.

UNITED NATIONS

The world's preeminent international organization, the United Nations (UN), has played a role in almost every major international controversy since World War II. Its primary forums are the Security Council, with its five permanent members, and the General Assembly, which includes all the nations of the world. The UN's primary functions include the pursuit of collective security, peacekeeping, weapons inspections, the promotion of economic development, global health initiatives, and humanitarian assistance such as famine relief and responding to natural disasters. Its many agencies are also involved in protecting religious, cultural, and historical sites of interest, and the UN has provided a forum for negotiation of disputes between nations as well as for interstate and ethnoreligious conflicts.

Because of the imperial and colonial nature of the world prior to the advent of the UN in 1945, its predecessor organization, the League of Nations (1919–1945) with its original 29 members, was largely made up of European and Latin American nations. The membership of the UN (1945–), however, includes nations from all over the world representing all the major religions. At its inception in 1945, the 51 founding states of the UN consisted of 42 predominantly Christian states of various denominations; seven predominantly Muslim nations; a nation with a substantial Buddhist population, China, which also joined as a permanent member of the Security Council; and the predominantly Hindu state of India, which was allowed to join in 1945 despite not obtaining complete independence from Britain until 1947. The Jewish state of Israel joined in 1949. Today, the UN's 192 member nations represent an estimated 6 billion people worldwide. Of these, approximately 2 billion (33%) are Christians of various denominations; an estimated 1.2 billion (20%) are Muslims; Hindus constitute 800 million (14%); Buddhists, 300 million (5%); and Jews, approximately 14 million (0.2%).

U.S. President Franklin D. Roosevelt's proclamation of the Four Freedoms in January 1941 defined "freedom of religion" as one of the chief principles the Allies were fighting for during World War II. This also became one of the foundational ideals of the future UN. One year later, the Declaration of the United Nations of January 1942 defined "religious freedom" as one of the primary war aims of the "United Nations" alliance. These principles related to religious freedom shaped the UN Charter drafted in 1945. The charter (Article 1, Paragraph 3; Chapter IX, Article 55[c]) called for fundamental freedoms for all without distinction as to race, sex, language, or religion and explicitly rejected all forms of discrimination based on religion. Freedom of religion was also defined as one of the principles underlying the creation and composition of the General Assembly (Chapter IV, Article 13). The 1948 Universal Declaration of Human Rights further enshrined freedom of religion. And, in 1981, the General Assembly passed the Declaration on the Elimination of Religious Intolerance. More recently, in the wake of the widespread destruction of mosques and churches during the Balkan wars

of the 1990s and the Afghan government's toppling of the giant Buddha statues at Bamiyan (a UNESCO World Heritage Site) in 2001, the UN General Assembly passed the Protection of Religious Sites (May 2001), calling on governments and international organizations to take responsibility for the protection of religious and cultural treasures. Moreover, combating religious discrimination has remained a top priority on the agenda of UN Human Rights Commission and its successor the Human Rights Council.

UNITED STATES OF AMERICA

Religion in the United States historically was, and continues to be, shaped by the continuous inflow of new immigrants, their cultures, and their religious traditions. Moreover, a voluntary religious order and a rapidly changing sociocultural environment combine to make religion here dynamic and fluid; sensitive to individual needs and preferences as a means of recruiting followers; responsive to shifts in public opinion; this-worldly oriented and socially activist; diverse in styles, beliefs, and practices, especially within major traditions; yet also creative not just in its capacity to adapt to varying social environments but also in mobilizing people and resources in support of benevolent causes. All this means that American religion ("American" as short for the United States) is a work in progress, always evolving. For this reason, visitors to this country since the time of de Tocqueville have come away with so many differing, and at times conflicting, impressions of its religion, deeply enmeshed within the culture and of the culture enmeshed within it. "Observers of American religion regularly need to map the terrain," according to the historian Martin Marty (1976, p. 18). "Its bewildering pluralism, they soon learn resists a single or permanent outline." In the following section, this entry discusses the major religious traditions in the United States, regional patterns, polarized religion, and civil religion.

Major Religious Traditions

No map is more important than that of the major religious traditions and how they are changing over time. Protestant Christians were, and still are, the largest of the religious constituencies; the most influential historically of all the faith traditions culturally and politically, their numbers are now declining. Today, they represent just slightly more than 50% of the total population. Denominationally, the largest Protestant constituencies are the Southern Baptists and United Methodists. Overall, the more significant division among Protestants at present is “evangelical” versus “mainline,” a distinction important theologically, socially, and politically. Old Protestant traditions such as Presbyterians, Lutherans, Methodists, the United Church of Christ, American Baptists, and others shaped by historic theology, liturgy, and practice and culturally established in the past make up the mainline; Evangelicals, both as distinct religious bodies and as self-identified individuals, some of whom happen to be in mainline denominations, emphasize to a greater degree experiential faith, personal morality, and the individual’s relationship with God. Drawing on the Pew Religious Landscape Survey, a huge national survey of self-reported religious affiliations in 2007, evangelical Protestants (mainly White, variously described as Born-Again, Pentecostal, Charismatic, Holiness, Fundamentalist) accounted for 26.3% of the American population, whereas mainline Protestants represented 18.1%. Evangelicals are on average younger, better at keeping their children and youth within the faith, more diverse racially and ethnically, less educated, and less privileged financially; however, over the past 50 years, they have experienced considerable upward mobility.

The same survey indicated that Roman Catholics make up an additional 23.9% of the population. They are a growing constituency, largely because of the influx of Hispanics from Mexico, Cuba, and many other Central and South American countries. Twenty-nine percent of American Catholics today are Latin American, significant not just demographically but because of the transformations they are bringing about within an older, largely Irish and German style of Catholicism. Other Christian groups include the historically Black churches (6.9%), Church of Jesus Christ of Latter-Day Saints (Mormons) (1.7%), Jehovah’s

Witness (0.7%), Orthodox Christians (0.6%), and Other Christians (0.3%). All combined, the self-reported Christian population in the United States is roughly 79%, or somewhat more than three fourths of the American population.

The Jewish population is small, perhaps even smaller now than it was three or four decades ago (1.7%), and is mostly of the Reform tradition. Despite the huge influx of immigrants from around the globe since the immigration policy was liberalized in 1965, the relative sizes of the new immigrant faith communities remain quite small: Buddhist 0.7%, Muslim 0.6% (mostly Sunnī), Hindu 0.4%, and other world religions 0.3%. There is some dispute over exact numbers for Muslims, Sikhs, and some others, but probability sample surveys are generally more reliable for profiling faith communities than the membership statistics reported by the religious organizations themselves. The impact of these diverse populations religiously and culturally on the United States is far more important than their actual numbers. Growing Asian, Middle Eastern, and Latin American populations are diversifying the country, especially considering that within each of these are various ethnic, language, regional, and nationality subgroups. As many religion scholars have noted, Latin American immigrants are “Latinizing” the country, particularly the Catholic population; Muslims, Buddhists, Sikhs, Hindus, and others are “de-Christianizing” it; and Christian immigrants, who are the majority actually of all recent immigrants, are “de-Europeanizing” the many Protestant and Catholic communities.

Small religious groups of all kinds, especially in the theosophical, New Thought, and mystical traditions, continue to flourish. “Other faiths,” according to the Pew Survey, account for only 1.2%, the largest identified being Unitarian Universalists and self-declared New Agers. The influence of these traditions, too, is greater than their numbers would suggest, since Americans rather freely mix and match beliefs and spiritual themes across historic traditions. Belief in reincarnation, yoga and other meditation practices, astrology, and self-help means of tapping spiritual energy easily blend with more commonly held Judeo-Christian beliefs and practices.

The nonaffiliated sector has grown considerably in the past several decades—estimated at 16.1%.

This is a diverse grouping of several, somewhat distinct subgroups: atheists, agnostics, seekers, secularists, “believers but not belongers,” those claiming to be “spiritual but not religious,” and still others who while not affiliated with, or only peripherally involved with, any religious group say that they are religious in some personal way. There is no singular, widely encompassing rhetoric by which those within this heterogeneous sector define themselves or talk about such matters. An open, fluid constituency at any moment in time, many are recruited into religious faiths and spiritual practices, while just as many, if not more, drop out and/or pursue other possibilities. Curious Americans move in and out of active religious life and from one group to another as their personal circumstances change; short-term involvement and commitments are not uncommon. Perhaps fair to say, many within this constituency have a better sense of who they are not than who they are insofar as ultimate matters are concerned. A highly pluralist society such as the United States offers people the opportunity for thinking through their choices and to some degree fashioning their own personal meaning system as they journey and at times temporarily dwell “in, with, through, and against the religious idioms including (often enough) those not explicitly their own,” as the religious scholar Robert Orsi (1997, p. 7) puts it.

Regional Patterns

Generalizing to the country blurs some important religious differences across regions. And because religion in a fluid, voluntary order is closely associated with, and often legitimates, social mores, values, and political cultures, this entire cultural complex easily varies from one local setting to another. A 2008 book with the provocative title *One Nation, Divisible: How Religious Differences Shape American Politics*, summarizing the results of a large study conducted by Mark Silk and Andrew Walsh, identifies seven important regional cultures.

Beginning with the South, known for its low-church evangelical Protestantism, the major groupings are Southern Baptists, Pentecostals, Charismatic and Holiness people, and those within the historic African American denominations. Many mainliners in the region as well—Methodists in particular—are evangelical in outlook and practice. But not

counting these latter, the above combination accounts for 63% of all religious adherents within the region. White southern Evangelicals tend to be strong supporters of conservative politicians, for whom “family values” rhetoric is common.

Going westward across the country along the Mexican border is the Southern Crossroads region, with Texas at its center, which is populated largely by White Baptists and Catholics, half of whom are Hispanic, and less by Pentecostals, Charismatic and Holiness people, many of whom are Hispanic Protestants. Religiously, it is the most homogeneous region in the country, with relatively small numbers of non-Christians, though these latter populations are growing in urban areas. It is the most “churched” region, in the sense of having religious affiliations, and one of the most politically conservative.

Still further west, and extending upward to the Canadian border, is the vast mountain region. In the southern states of Arizona and New Mexico are concentrations of Catholics, both of Spanish descent and Hispanic, and White Protestants who migrated to the Sunbelt. Utah is two-thirds Mormon; Idaho’s largest group is Mormon, followed by Catholics. Wyoming, Montana, and Colorado have more Catholics than any other single religious constituency, but relatively there are large constituencies of the unaffiliated in these states as well. Politically, the region for the most part is conservative.

The Pacific region of California, Nevada, and Hawai‘i is diverse religiously but is dominated by Catholics, constituting 29% of the population. Nevada and California have absorbed masses of immigrants from Latin countries—accounting now for about 60% of the Catholic population—and from around the world. Jews, Mormons, Muslims, and Buddhists are overrepresented relative to their representation in the United States as a whole. More people identify with Eastern religions here than with any single mainline Protestant denomination, unlike in any other part of the country. The unaffiliated sector in Nevada is 61%; in Hawai‘i, 55%; and in California, 46%. The region is characterized by cultural and lifestyle pluralism, fluid identities, and progressive politics relative to other areas in the western region.

The Pacific Northwest stands out for having the lowest religious adherence in the country—Oregon

at 35%, Washington at 38%, and Alaska at 40%. Catholics dominate but with only slightly more than 11% of the entire population, followed by Pentecostals, Holiness, and other conservative religious groups at 9%. Eastern religions have more followers than any one mainline Protestant denomination except for Lutherans. The two most populous states—Washington and Oregon—are known for environmentalism, nature-based spirituality, and moderate to liberal politics, while Alaska in contrast is more conservative ideologically.

Moving back eastward on the upper border, there is the Midwest, described by these authors as “the most balanced region in the country,” in the sense that its religious and non-affiliated profile is more similar to the overall national average than that of any other region. The greatest exception are the mainline Protestants, who have a stronger presence here than within the country as a whole, especially Lutherans, who are widely present throughout Minnesota, Wisconsin, Iowa, and the Dakotas. Religious adherence is quite high, even higher in some places than in the South. Reflecting its “mainstream ethos,” the region is mixed ideologically but leans in the moderate direction.

The Middle Atlantic is also highly churchied relative to the rest of the country. About half of its religious adherents are Catholic, having more European than Latin cultural backgrounds. Proportionately, there are more Jews and also more Muslims, including high numbers of African American Muslims, in the region, and mainline Protestants outnumber Evangelicals by more than two to one—both features reflecting an older and persisting ethnoreligious context. Middle Atlantic political styles are very much colored by local environments and on the whole are ideologically moderate.

Finally, there is New England. Once the land of Puritans, today it is the most Catholic of all the regions. Here, mainline Protestants outnumber evangelical Protestants, and it is the only region where African American Protestants outnumber White Evangelicals. Still, it is the least Protestant of all the regions. Asian religions have grown significantly since the 1960s: Buddhists especially in Vermont and Hindus and Muslims in the southern states of Connecticut and Massachusetts. Some of the rural areas in the northern states have huge proportions unaffiliated—more than 50% in parts of New Hampshire and Maine; overall the region’s

unaffiliated rate is 38.5%. Politically, it is moderate to liberal.

Polarized Religion

Another religious mapping not to be overlooked today is that of conservative versus progressive faith and ideology. Not just Protestants, but all the major religious constituencies and many smaller ones are internally divided over moral and family-based issues. Since the days of Ronald Reagan, when evangelical Protestants and traditionalist Catholics became more aligned with the Republican Party, this alignment has continued and was particularly evident during the presidency of George W. Bush. Various developments coalesced here, creating a highly polarized religious context. One is that political conservatives co-opted religious language and advanced “value voters” rhetoric at a time when progressives had difficulty doing so for fear of losing nonreligious and more liberal religious voters. A second is that controversial issues such as abortion and gay rights were, and remain, highly divisive and thus pose a challenge for politicians in how best to address them. A third is that religious beliefs, values, and symbols are carefully framed by political candidates, especially in presidential politics, in a more deliberate and calculated manner now than ever before. “God-talk” has come to play a considerable role in politics, particularly by skilled conservative organizers who are very effective in developing social networks and special-purpose organizations for advancing partisan politics, often in ways blurring the lines between the religious and the political. These developments must be understood in the larger context of the so-called culture wars, which have received considerable attention. Emerging as a backlash to the moral and political freedom of the 1960s and early 1970s, the conservative movement in the years since has viewed itself as involved in a battle for the soul of the nation. The “culture wars” paradigm posits a deep cleavage between fundamentalists, Evangelicals, and religious conservatives generally, who constitute one camp, and religious liberals, humanists, and secularists, who constitute the other. Because the two are deeply divided in their views on moral authority and fundamental sources of truth, communication between the two is at best strained and at worst incommensurate,

with middle positions on policy difficult if not impossible to achieve. Conservatives locate authority in transcendent sources and privilege biblical text and divine revelation as opposed to scientific and evolutionary explanations; progressives see authority arising out of social arrangements and as a result of the coercive power of dominant groups especially and, thus, tend to see texts, teachings, and moral codes as humanly constructed and often at stake. The former often worry about greater moral relativism and institutional collapse in a secular world, whereas the latter stress individual rights and opportunities to become fully self-actualized. While this paradigm of a polarized nation is easily overdrawn and often exaggerated by social activists and the media, still it points to some highly contested social issues for the nation, around which religious and political energies come together in support of one or other ideological position. The family as a social institution particularly is a lightning rod in this clash of views. A host of seemingly irresolvable issues continue to attract public debate, such as male authority, gender roles, abortion, women's reproductive rights, gay marriage, stem cell research, parent-child relations, and, even more fundamentally, the definition of family itself. Increased numbers of single mothers and gay partners raising children help bring these issues into greater public focus.

Civil Religion

The nation's civil religion—that set of myths, beliefs, texts, and rituals used for interpreting national identity and purpose in relation to the transcendent—is itself deeply conflicted. While this has always been the case to some extent, in recent times, tensions have reached a high level. More than simply occasions for a few references to God and somber reflection, presidential inaugurations seem to have emerged as staging grounds for elaborating a particular civil religious perspective. George W. Bush's inaugurations conveyed a distinct Christian tone and drew on old myths of an innocent and millennial nation, one chosen by God to be a shining light and to carry freedom to the world; in the 2005 Inaugural Address alone, he invoked the words *freedom*, *free*, and *liberty* 49 times. In contrast, Barack Obama in the 2009 inauguration spoke of “a nation of Christians and

Muslims, Jews and Hindus, and non-believers.” The juxtaposition of “Christians” with “Muslims” projected the vision of a much more diverse nation and undercut the notion of the country as having a singular normative faith; and including “non-believers” in the inaugural address points to his effort at building a genuinely pluralist society, the religious and nonreligious united through bonds of civility, each recognizing and respecting the other.

American civil religion faces all the challenges that arise in the “culture wars” debate described above. But apart from these moral and ethical controversies, greater religious diversity poses its own challenges: how to expand the civil religious canopy and legitimating myths beyond their historic Judeo-Christian formulation and to include a more global religious symbolism. Religious versus secular interpretations of the nation will continue as well to provoke heated debate. Civil religious symbols and interpretations push in an inclusive direction, but here the challenge is especially difficult: how to envision and then forge a rhetoric of a common humanity appealing to universal values, many people saying this goes too far and abandons too much of historic religious content and others applauding these efforts as a means of unifying the country. Then there is the question of whether the country will have a civil religion with any prophetic force, that is, capable of calling on the nation to live up to its best ideals, to do more than simply justify its own political and economic interests. Related as well is America's role in global capitalism and the possibility that the country will be known mainly in other countries for its exports, all too easily wrapped in the rhetoric of salvation—“its goods, gadgets, and God-talk, all seemingly bound up together under the label of ‘Made in the United States’” (Roof & Caron, 2006, p. 131).

UNITY MOVEMENT

Founded in the late 1880s in Kansas City, Missouri, by Charles and Myrtle Fillmore, the Unity movement grew into perhaps the most influential New Thought group in the United States in the 20th century. It is best known for its teachings on positive thinking, mental healing, and financial prosperity.

Charles and Myrtle Fillmore began their advocacy of mental healing soon after Myrtle reported successfully healing herself of tuberculosis by repeatedly affirming that as “a child of God” she did not “inherit sickness.” The Fillmores began publishing a series of magazines devoted to mental healing and metaphysical religion that, by the mid-1890s, were consolidated into *Unity Magazine*. In 1890, at Myrtle’s suggestion, they began an organization to provide prayer support to those who wrote in for help, which later became known as “Silent Unity.” In 1891, the Fillmores were ordained as ministers by Emma Curtis Hopkins, a former student of Christian Science founder Mary Baker Eddy and the teacher of many of the first generation of New Thought teachers.

The Fillmores focused on using publications to spread their vision to all who would listen, regardless of their church affiliation. Throughout the late 19th and 20th centuries, Unity publications advocated the use of the latent powers of the mind to achieve spiritual well-being, physical health, and financial prosperity while maintaining a

generally Christian-centered vocabulary and altruistic emphasis. Bible passages tended to be interpreted allegorically, while Jesus was conceived of as a human who had found the inner spark of divinity in himself and taught others to do the same. Numerous other early New Thought writers contributed to the Fillmores’ efforts. The most influential of these was the New York homeopathic physician H. Emilie Cady, who in 1895 wrote a series of lessons that soon were collected into book form as *Lessons in Truth*, which became Unity’s introductory textbook and has sold more than 1.5 million copies.

Today, the Unity movement has two major organizational entities: the Unity School of Christianity and the Association of Unity Churches. The Unity School of Christianity, based in Lee’s Summit, Missouri, oversees publication activities, numerous educational retreats and seminars, and the prayer services of Silent Unity. In addition to *Unity Magazine*, the Unity School publishes the *Daily Word*, a magazine that focuses on daily inspirational interpretations of Scripture. It is published in eight languages and has a worldwide circulation of 91,000. Silent Unity provides prayer support to more than 1.5 million telephone callers annually, with 13 affiliates worldwide operating in English, Spanish, and French. The other major entity is the Association of Unity Churches, which organizes the activities of 875 Unity churches, 211 of them outside the United States.

Although Unity has been attacked as heretical by conservative Christian groups, its publications have been read by many who never formally identified with the New Thought movement. It has thus been one source of the spread of “health and wealth” ideas among Christians worldwide, even as many of Unity’s congregants and writers gravitate toward metaphysical and “New Age” religious orientations.

UNIVERSALISM

See Unitarians

URUGUAY

Uruguay is located in South America between Argentina and Brazil. Its official name is Oriental Republic of Uruguay, and its inhabitants are also referred to as “Orientals.” Uruguayan society resulted from the confluence of several cultures and ethnicities. The presence of pirates, corsairs, and illegal traders from Holland, France, and England was related to their interest in cattle for the production of leather. Along with some Iberians, they joined the native peoples and thus originated a unique culturally and racially *metizo* population, the Gauchos. Their religiosity was tenuous, although some sectors were influenced by the Jesuit and Franciscan missions of the 18th century. A slave market operated in Montevideo, and a fraction of the national population was brought from Africa during the initial years of the colonization.

Not only was Uruguay Spain’s last colonization effort in the continent, but the singularity of the nation was also propitiated by migratory waves from different parts of Europe, which intensified immediately after the establishment of an independent republic in 1830. A strong presence of the British in the regional politics and economy was associated with a settlement of British people in Uruguay and the foundation of the first English church in South America. Since the second half of the 19th century, Protestants were recognized, with Waldensians migrated from northern Italy, Reformed Swiss, and German Lutherans. Although the Uruguayan Catholic Church shares some of the features of Latin American Catholicism, it has been

neither as powerful nor as strongly connected with the state. The first system of public schools was established in 1870. It was well spread, nonconfessional, free, and compulsory. During the same period, the university diffused the doctrines of positivism. The 1919 constitution strengthened cultural secularization and the lay or nonconfessional state.

Today, the percentages of religious affiliation are 47%–51% Catholics, 17.2% nonbelievers, 11% Protestants and Pentecostals, 23.2% believers affiliated to no church, and 1.3% other traditions (African descendants, Jews, and Muslims). These figures show not only the diversity of religious affiliations but also the increasing secularization of Uruguay.

Uruguay is located east of the Uruguay River, which, along with River Plate in the south, divides it from Argentina. It also borders with Brazil on the northeastern corner. Geography has affected Uruguayan history since the beginning of its European colonization, as a territory that has been claimed first by the Spanish and the Portuguese and later by the Argentineans and the Brazilians. Attempting to secure an entrance to the continent via the rivers Plate, Uruguay, and Paraná, the Portuguese founded Colonia del Sacramento in 1680 and therein erected the country’s first Christian church. Around 1730, the Portuguese were replaced by the Spanish, who founded Montevideo. The national territory measures 176,200 square kilometers and consists of fertile plains with low hills, used as pasture lands for European livestock. The development of this economic sector began in the 16th century, before the intensive colonization of the country during the 18th century.

UZBEKISTAN

With a population of 27 million, Uzbekistan is Central Asia’s most populous country. Bordered by

Turkmenistan, Kazakhstan, Kyrgyzstan, Tajikistan, and Afghanistan, Uzbekistan is a doubly landlocked, arid country, rich in natural gas but lacking the water supply needed to sustainably support the extensive cotton farming. Ethnically homogeneous, 80% of the population is Uzbek, and almost 90% self-identify as Sunnī (Hanafi) Muslims. Russians who did not emigrate postindependence in 1991 live primarily in the capital, Tashkent, and religiously identify with Russian Orthodox Christianity. The once sizable Jewish population, concentrated in Bukhara, has dwindled, with most Jews having emigrated to Israel or the United States.

The territory of contemporary Uzbekistan consisted of a number of khanates that were centers of trade and periodic conflict. The Bukharan Khanate was a center of Islamic learning since the ninth century and home to Muhammad ibn Ismail al-Bukhari, compiler of the most authoritative Hadith collection. Other important Muslim figures from Bukhara include Baha-ud-Din Naqshband Bukhari, namesake of the Naqshabandi Sufi order, and Ibn Sina (Avicenna). During this period, the khan was the supreme leader, whose rule was seen as Islamic because he afforded the ulema an elite status. The khanates, however, were not considered Islamic states in the contemporary sense of the term; Islam was an unquestioned part of life, and disputes were often resolved within a milieu characterized as custom and tradition.

As the various khanates came under Russian control in the mid- to late 19th century, Uzbek autonomy gave way to colonial rule, and the Uzbek Soviet Socialist Republic was established in 1924. In the late 19th and early 20th centuries, the Jadids sought to reform Islam through encouraging modernist approaches to education and religion,

which resulted in clashes with traditionalist Muslim leaders. Both groups, however, resisted colonial rule and had conflicts first with the Russian and later with the Soviet authorities. In 1943, the Muslim Spiritual Directorates were established both to integrate socialist teachings and to control the propagation of Islamic learning. In the final assessment, the Soviet apparatus was successful in disrupting formal religious educational training.

In 1991, Uzbekistan gained independence and began promoting Islam as part of developing a national identity. This included the rehabilitation of shrines as historic sites associated with Uzbek heritage and the encouragement of a secular Islam perceived as unthreatening to the government. Under President Islam Karimov, however, there has been a general sense of religious restriction and persecution of orthodox and orthopraxic Muslims. Thus, the vast percentage of the population that embraces Islam faces the challenge of balancing its religious interests with the threat of persecution and dissatisfaction with the state.

VAISHNAVISM

As commonly understood, Vaishnavism is a prototypical form of Hinduism focusing on Vishnu (or His many manifestations and incarnations) as the Supreme Being. It is a form of monotheism that perceives other deities as subordinate, viewing them as demigods, angels, or empowered beings. Vaishnavism claims many millions of adherents, for it is the most widely practiced form of Hinduism in the Indian subcontinent.

While Vaishnavas acknowledge the Vedic idea that the many gods are just various faces of the Brahman (“Ultimate Reality”), they also assert that Brahman has an “original” face—the one belonging to Vishnu. A clarifying metaphor might run as follows: Just as one candle can be used to light others, and just as all candles thus lit would hold the same potency, so, too, is Vishnu the source of all divine emanations, even if these emanations are also various forms of the Supreme.

To avoid misconceptions about the esoteric truths concerning Vishnu, the texts advise affiliation and study with established lineages of knowledge, of which four stand out as representative of the rest: The Rudra, Sri, Kumara, and Brahma Sampradayas. These lineages have numerous offshoots and branches.

Once knowledge is received through any of these established lineages, several articles of faith unfold as a matter of course. Though these articles have been expressed in numerous ways, they are perhaps

best summed up by the 19th-century Vaishnava theologian Bhaktivinoda Thakur (1838–1914), as follows:

1. Vaishnavism sees itself not as a sectarian religion but as *Sanatana Dharma*, or the eternal righteous order. In other words, all religions are but various expressions of Vaishnavism, to greater or lesser degrees. The soul is by nature an eternal servant of Vishnu (or Krishna, Rama, Allah, Jehovah, and/or other manifestations of God, depending on the lineage, tradition, or religion with which one identifies).

2. God manifests variously—(a) as an impersonal abstraction, (b) as the soul of the universe, and (c) as the Supreme Person in His spiritual kingdom. He also appears in deity form—that is, as the image worshipped in the temple—and He often interacts with humankind in the form of his many incarnations (*avatars*), as already mentioned.

3. Krishna, or Vishnu (or one of His direct incarnations), is the Supreme form of the Godhead.

4. Vishnu possesses infinite and multifarious energies, which are briefly mentioned in the world’s sacred literature but are more fully described in the Vedic and Puranic texts of ancient India.

5. The souls of this world are part of Vishnu’s energies—they are technically called His “separated parts”—and their proper function is to serve Him and to develop love for Him.

6. Certain souls are engrossed in Vishnu's illusory energy, which is considered His "material energy" (*maya*). By the practice of Vaishnavism, they can free themselves from the grip of such an all-encompassing illusion.

7. All spiritual and material phenomena are simultaneously one with and yet different from the Lord.

8. Krishna, among all manifestations of Vishnu, is an ocean of intimacy, and one can derive the highest bliss by becoming reestablished in one's eternal relationship with Him, which is now dormant.

9. "Devotional service" (*Bhakti yoga*) is the mystical path by which one can enter into a relationship with God—it supersedes all pious action, the cultivation of knowledge, and various mystical endeavors, such as yoga and meditation (though in its practice it subsumes various forms of yogic mysticism). The science of this holy devotion is detailed in scriptures such as the *Bhagavad Gita* and the *Bhagavata Purana*, but it is chiefly understood by associating with devotees who carry it in their hearts. The central practices of this path include singing the praises of God, chanting His names in a regulated fashion, offering food to Him as a sacrament of devotion, and worshipping His image in the temple or in one's home.

10. Pure love of God alone is the ultimate fruit of the spiritual journey, and it is the essence of Vaishnava thought.

that is found in Tibet, Mongolia, Bhutan, parts of Nepal, and the Indian state of Sikkim. The analogy to a diamond reflects the indestructibility of its methods. Its practitioners believe it to be the most powerful, most effective, most advanced, and most dangerous Buddhist path. According to its adherents, Vajrayana is superior to its precedents, Hinayana ("Lesser Vehicle," also known as Theravada) and Mahayana ("Greater Vehicle"). This entry discusses the history and philosophy of Vajrayana Buddhism, as well as the tantras, mantras, deities, ritual practice, and distinctive features of Tibetan Vajrayana.

History

Vajrayana Buddhism was being practiced in India in the sixth century CE. Its distinct sets of practices and scriptures developed outside the monastic context and early Vajrayana may have been at least partially motivated as a form of protest against the elitism and exclusivity of monastic Buddhism. In contrast to lineages that emphasize asceticism or withdrawal from worldly life, Vajrayana practices engage the social and physical realities of our existence and use them on the path to Buddhahood.

In Indian Vajrayana, the figure to be emulated was not a mild-mannered, scholarly monk but a fierce, wandering yogi. Accomplished yogis, called *mahasiddhas*, had magical powers, such as the ability to fly, to read people's minds, and to project their consciousness into another body. Instead of observing a list of moral precepts, *mahasiddhas* deliberately transgressed and openly flaunted social norms. Virupa, for example, reputedly spent 3 days in a tavern drinking beer nonstop, and Kukkuripa cared more about the company of his dog than he did about the pleasures of heaven.

Vajrayana Buddhism was first successfully transmitted to Tibet in the seventh century CE. While it gained state support for a short time, it was not until its revival in the 11th century and the formation of the Sarma ("new") schools that Buddhism came to enjoy a secure status as the official religion of Tibet. At present, there are four main sects of Vajrayana Buddhism in Tibet. These schools are the Gelug, Kargyu, Nyingma, and Sakya. Recently, the Bön tradition has also been added as a fifth sect, but it is not entirely accepted as a Buddhist school, either by the other four sects or by its own adherents.

VAJRAYANA, TIBETAN

"Vajrayana Buddhism" designates the Diamond Vehicle (or Adamantine Vehicle) of Buddhism

Although it has largely disappeared from all but the most remote Himalayan regions of India, the practice of Vajrayana Buddhism continues to flourish in Tibet, Bhutan, Nepal, and Mongolia. Recently, Tibetan refugees have brought their Vajrayana traditions to many countries in the Americas, Asia, and Europe. Japan's Shingon Buddhism is also a form of Vajrayana.

Philosophy

Vajrayana Buddhism is rooted in Mahayana Buddhism. In fact, Tibetan Vajrayana Buddhists consider themselves to be practicing a form of Mahayana Buddhism. The Vajrayana vehicle accepts the Mahayana doctrines of emptiness and impermanence and, like the Mahayana, espouses belief in the intercession of bodhisattva figures. While the Mahayana provides important doctrinal and practical foundations, Vajrayana Buddhists consider the Mahayana view and methods to be limiting and time-consuming. Unlike the Theravada (Hinayana) and Mahayana approaches, which require many lifetimes of commitment, one who follows the Vajrayana route can achieve enlightenment in a single lifetime.

To advance this quickly along the Buddhist path, the Vajrayana practitioner cannot dispense with "negative" emotions such as anger and lust. Instead, *all* aspects of one's life experience and *all* of one's energies must be used as a part of one's spiritual practice. Vajrayana teachings emphasize the nonduality and the inherent pureness of all phenomena. According to the Vajrayana view, the sufferings of samsara are not distinct from the peace of nirvana. When one's mind and view are pure, one lives in a blissful Pure Land. When one's view is clouded and one's mind impure, one sees all appearances as samsara. Vajrayana images and rituals seek to demonstrate this doctrine and often depict male and female deities in sexual embrace. These types of representations aim to illustrate the union of opposites: male and female, compassion and wisdom, bliss and emptiness.

Another feature of Vajrayana is its use of the result, or "fruit," as the practice, or "path." This means that enlightenment is not a distant goal to be achieved only after much effort but is already present in the here and now. We simply need to recognize our already enlightened nature. The practices of Vajrayana are aimed at helping us

identify our Buddha nature by recognizing the emptiness of all phenomena, thus transforming our ordinary perceptions and experiences into enlightened awareness. The sun is a commonly used metaphor. When its rays are blocked by clouds or smog, the sun's light seems dull, but when the sky is clear, the sun shines brightly. Just as clouds in the sky do not change the nature of the sun, our ignorance does not affect our Buddha nature. It is only when we purify our karmic obscurations, such as delusion and attachment, however, that our inner purity is able to manifest and we realize perfect Buddhahood. This method is called "taking the result as the path" because the practitioner draws on his or her already enlightened nature at the same time as he or she moves toward fully realizing it.

Tantra

Vajrayana Buddhism is also known as Tantric Buddhism (or Tantrayana). In this case, the label "Tantric" reflects Vajrayana's reliance on scriptures called tantras.

Hinayana and Mahayana Buddhism, in contrast, rely only on the sutras, scriptures they believe to be the actual words of the historical Buddha Śakyamuni. Some non-Vajrayana Buddhists argue that the tantras are spurious later additions to the Buddhist canon and not actually the teachings of the historical Buddha (as the sutras are). Vajrayana followers respond to this criticism by claiming that the tantras are more advanced, more profound teachings than the sutras and represent the Buddha's final teachings, which he bestowed only on the most advanced bodhisattvas and disciples and which were only later committed to writing (or were taught by Buddhas other than Śakyamuni). According to the Tibetan tradition, the historical Buddha Śakyamuni "turned the wheel of the Dharma" three times. In the first turning, he gave the Hinayana teachings about karma and the necessity of avoiding negative actions. In the second turning, he gave the Mahayana teachings, explaining the emptiness of all phenomena and praising the bodhisattvas who commit themselves to helping others achieve enlightenment. In the third turning, the Buddha taught the profound Vajrayana, demonstrating the union of all phenomena.

In general, the tantras can be characterized as more centered on ritual and less concerned with

ethics and philosophy than the sutras. Different schools of Vajrayana have different classification techniques for the tantras. The Tibetan Sarma schools organize the Tantric teachings into four groups: (1) Action Tantras, (2) Performance Tantras, (3) Yoga Tantras, and (4) Highest Yoga Tantras. The contents of Action Tantras focus on bodily practices. They include physical and verbal activities aimed at purifying the practitioner and readying him or her for more advanced practices. The Performance Tantras deal with more pointed rituals that prepare the practitioner for meditative practice by allowing the practitioner to develop a relationship with a meditational deity (or deities). In the Performance Tantras, the meditational deity is conceived of as separate from oneself. The Yoga Tantras instruct the practitioner in envisioning himself or herself as a particular Buddhist deity. In fact, the Sanskrit term *yoga* means union and in this case refers to the union of the practitioner and the deity. Philosophically, this is possible because all phenomena are empty of inherent existence; from the ultimate point of view, an ordinary human being is no different from an enlightened Buddha. When a Tantric practitioner learns to experience himself or herself as a deity, the practitioner's surroundings become the perfected mandala of a Buddha's Pure Land. The Highest Yoga Tantras are also meditation practices. They are characterized by their use of sexual imagery and of emotions such as desire and anger. Tantras of the Highest Yoga category can be further divided into Father Tantras and Mother Tantras.

Mantra

In Tibetan, Vajrayana Buddhism is called "*sang ngak*," meaning "secret mantra" (or Mantrayana). As a label for a type of Buddhist practice, *secret mantra* refers to the guardedness of the teachings and the use of formulaic incantations in its rituals.

A mantra is like a spell; its correct recitation, the utterance of its syllables, is said to bring about a corresponding effect. Mantras are thought of as the verbal forms of certain energies, and reciting mantras activates these energies. Mantras are also important because as long as people are engaging their mind and speech in reciting mantras, they are unable to engage in harmful language or negative thoughts. The most popular Tibetan mantra is the

six-syllable mantra of the bodhisattva of compassion, Avalokiteśvara: *Om mani padme hum*.

Secrecy is an important element of Vajrayana Buddhism, and due to the secret nature of its practices, Vajrayana Buddhism is also known as esoteric Buddhism. The reason for guarding Tantric instructions is to protect oneself and others from harm. Because the Vajrayana affirms all facets of experience, its methods can be dangerous. If one engages in Tantric practices without correct understanding, great harm can result. Tibetans also believe that if a person disparages the teachings, that person will suffer the negative consequences. For this reason, the teachings should not be shared with those who are unlikely to have faith in them.

Deities

The Vajrayana pantheon is populated by numerous divine and semidivine figures. In addition to the historical Buddha Śākyamuni, there are the cosmic or primordial Buddhas, Samantabhadra, Vajradhara, and Vairocana. There are also five *dhyani* (meditational) Buddhas, each of which symbolizes a particular quality of enlightened activity and is associated with a particular Buddha family. These five Buddhas are depicted occupying the five cardinal directions (the fifth direction being the center), and each Buddha has his own consort, mantra, mudra, color, and element. Vairocana, for example, is the Buddha who occupies the center. He is white, associated with the ether element, and a member of the Tathagata Family. Amitabha is in the west. He is red, associated with the fire element, and a member of the Lotus Family. These five Buddhas are often depicted in mandalas and on the five faces of ritual crowns.

In addition to the five *dhyani* Buddhas, other popular Buddha figures include the Medicine Buddha; the female bodhisattva Tara; the bodhisattva of compassion, Avalokiteśvara; the future Buddha, Maitreya; and the bodhisattva of wisdom, Manjusri. In Vajrayana Buddhism, these deities appear in numerous forms, some peaceful and some wrathful, some with 1 head and 2 arms and some with 11 heads and 1,000 arms. The fearsome images of fanged beasts brandishing multiple weapons and wearing garlands of human skulls and fresh entrails are intended both to frighten away evil spirits and to represent the transmutation of negative

qualities, such as pride or bigotry, into purity and wisdom. According to Vajrayana, a Buddha or bodhisattva will take on a wrathful form when doing so will allow him or her to aid sentient beings more effectively. There are also lesser deities—wrathful protector gods—who when properly propitiated protect their devotees from harm and failure.

Other members of the Vajrayana pantheon include tutelary deities, called “*yidam*” in Tibetan. One’s *yidam* is one’s own personal deity with whom one establishes a special meditational relationship. Tibetans also revere female celestial beings called *dakinis*. Enigmatic *dakinis* are crucial to many aspects of Tantric Buddhist practice, including the revelation of spiritual treasures, called *terma*. In addition to these figures, since Vajrayana posits the possibility of becoming a Buddha in this very lifetime, Tibetan Buddhists believe that our ordinary world is populated with numerous *nirmanakaya* emanations of enlightened beings, even if we do not recognize them as such. These Buddha figures can manifest in any form, animate or inanimate.

A Vajrayana practitioner considers his or her teacher, or lama, to be the union of all the Buddhas and learns to cultivate an image of his or her lama as a foundation for his or her meditation practice, just as she also use Buddhas and bodhisattvas. The lama is crucial for spiritual progress, because it is the lama who transmits the essence of enlightenment to the disciple. As a result, forming a relationship with a spiritual teacher is a necessary requirement for Vajrayana practice.

Ritual Practice

Vajrayana rituals include initiation ceremonies, prayers, sacred dances, fire offerings, prostrations, chanting, and meditation. All these practices are aimed at aiding the practitioner in recognizing his or her inherent Buddha nature. Before beginning Vajrayana practice, a student must receive initiation and instruction from a qualified master. Tantric instructions are traditionally passed down in person from the teacher to the student, thus maintaining distinct lineage traditions over successive generations.

First, the student and the teacher must examine each other and establish mutual trust. Then, after

the student has completed any prerequisites and taken on any commitments or *samaya* vows (such as a promise to maintain a daily practice), the teacher begins instruction by bestowing initiation on the student. Initiation serves to purify the student’s mind stream, causing his or her potential to ripen and thus making him or her a fit vessel to receive the teachings. After the student has been properly “empowered,” the teacher may begin with an oral transmission. The oral transmission may take the form of the teacher’s own instruction, or it may consist of the teacher reading aloud from a text that the student will then study. In the case of a reading transmission, the ritual of hearing the text from the teacher’s mouth authorizes the student to begin study of the text on his or her own.

Tantric meditation techniques include breath manipulation and eventually control over the body’s physiological processes, its “winds and channels.” Advanced techniques include sexual practices, performed either as visualizations (especially in the case of monks and nuns who have taken vows of celibacy) or with an actual consort. There are many risks involved in sexual yoga—for example, becoming overcome by the physical sensations and losing sight of one’s purpose in the practice. For this reason, these rituals are undertaken only by the most expert practitioners.

Vajrayana rituals employ a variety of supports. The *vajra* is an important ritual implement in Tantric Buddhist practice. It is most often found in the shape of a five-pronged thunderbolt (the five prongs representing the five wisdoms) and is paired with its counterpart the bell. Held in the right and left hands, respectively, the *vajra* and bell symbolize the male and female principles—method and wisdom. Vajrayana practitioners also use handheld two-sided drums, rosaries for counting mantras, offering bowls made from or in the shape of the top of a human skull, and daggers. Ritual experts also employ *mudras*, symbolic hand gestures that evoke certain qualities and states of mind. Other ritual aids include *mandalas*, geometric diagrams that represent the cosmos or the abode of a particular Buddha. A *mandala* is a sacred space, a place of consecration that the practitioner enters through his or her meditation. It may take the form of a physical prop or an inner visualization.

Distinctive Features of Tibetan Vajrayana

Tibetan Vajrayana includes the unique systems of Dzogchen or “Great Perfection” practiced mainly in the Nyingma school and Mahamudra or “Great Seal,” a teaching lineage of the Kargyu sect. Practitioners of the Tibetan schools of Dzogchen and Mahamudra claim that the efficacy and profundity of their teachings exceed even that of the Highest Yoga Tantras. The manners in which these teachings are bestowed may seem incredible to the uninitiated. In a mind-to-mind transmission, for example, a master transmits realization directly from his or her mind to the mind of the student without the use of any words or gestures.

Terma, or spiritual treasures, of the Nyingma sect are teachings that the great Indian *mahasiddha* Padmasambhava hid when he visited Tibet in the eighth century. At that time, Tibetans were not ready to receive these teachings, so he concealed them to be unearthed, revealed, or remembered by a particular person at a particular time in the future. Some he hid in the earth in the form of ritual implements; some he hid as texts in temple pillars; others he hid in people’s mind streams. Because they are traced to Padmasambhava, *terma* are not considered the original ideas or compositions of their revealers but of a Buddha deposited for future generations by Padmasambhava.

Hinayana, Mahayana, and Vajrayana Buddhisms all incorporate an awareness of death into their teachings. In Tibetan Buddhism, this awareness is cultivated via meditations that allow the meditator to rehearse his or her time of death. Highly realized masters may even attain the ability to experience the *bardo*, the intermediate state between this life and the next. The *Tibetan Book of the Dead* describes the *bardo* experience and can be used as a map of our death journey. Great Dzogchen masters are said to achieve the rainbow body when they die; instead of leaving behind a corpse, their bodies shrink until they disappear. The passing of these masters is marked by extraordinary events, such as the appearance of rainbow-colored lights in the sky.

Dream yoga is a means of incorporating the dream and sleep states into Tantric practice. From a Vajrayana perspective, whatever appears to the senses is the creative play of a deity. Whatever one sees, for example, is an emanation of the deity’s body, and whatever we hear is a deity’s mantra. Because of the imaginal nature of the universe, our

dreams do not have to be unconscious, unaware displays of our imagination. Through dream yoga, one can learn to control one’s dreams and use the period of each day spent sleeping as a fruitful time of spiritual progress.

VALE DO AMANHECER

The Vale do Amanhecer (Valley of the Dawn) is a millenarian religious community situated in the Federal District of Brazil, 50 kilometers from its capital Brasília. It is a new religious movement with a complex syncretism, including elements of Christianity, Spiritism, Afro-Brazilian, and Oriental

religions, and beliefs in unidentified flying objects. The movement has spread all over Brazil (around 600 temples) and to seven other countries (the United States, Germany, Bolivia, Uruguay, Japan, Portugal, Trinidad-Tobago), garnering more than 100,000 adherents. The community was founded in 1959 by Neiva Chaves Zelaya (*Tia Neiva*), widowed at the age of 24 years and a mother of four children, who worked as a truck driver in central Brazil. Clairvoyant and guided by her visions, mainly by an Amerindian spirit named Father White Arrow (*Pai Seta Branca*), Neiva decided to consecrate her life to a special mission: to create a doctrine to heal people and to prepare humanity for the arrival of the third millennium.

Based on the so-called teachings of the spirits and combining elements of Allan Kardec's Spiritism, the doctrine of the Amanhecer considers its active members as mediums and the others as patients. Classified into two categories—jaguar and nymph—the mediums (a pair, a man and a woman) invoke the spirits during the rituals. The mediums are also characterized by their spiritual orientation: The one who “incorporates” (falls into a trance) is called *apará*, and the one who “indoctrinates” (teaches) the spirit is known as *doutrinador*.

Rituals are well-known for their impressive visual characteristics, with their use of different symbols from Aztec, Egyptian, and Afro-Brazilian religions: the colorful, shining costumes worn by the followers at the ceremonies; and the monumental displays, with huge statues, pyramids, lakes, waterfalls, stairways, and colored walls.

The ritual practices are very complex and require a great number of participants. Words, prayers, and gestures are previously determined and strictly controlled by the leaders of the ceremonies. They create a real epic scene where the verbal, sound, visual, and kinetic elements of the *mise-en-scène* are related.

Since Tia Neiva passed away in 1985, the Vale do Amanhecer has been ruled by the Trinos Presidente Triada, a triad that includes Tia Neiva's son, Raul Oscar Zelaya Chaves, who is also the official president of the community.

VANUATU

The Pacific island Republic of Vanuatu, formerly known by the colonial name of New Hebrides until it was changed by the government in 1980, is an archipelago of 80 islands with a majority Christian population. Nearly all Vanuatuans are Melanesian, with small communities of Europeans, Asians, and Pacific Islanders. While nearly all residents of the archipelago hold onto strong beliefs regarding ancestral spirits, and syncretic practices are widely evident in the country, more than 80% of the populace report adherence to one form of Christianity or another: 31% Presbyterian, 13% Roman Catholic, 13% Anglican, 11% Seventh-Day Adventist, and an additional 14% claimed by the Church of Christ, the Apostolic Church, the Assemblies of God, and other Protestant denominations. Members of the Baha'i Faith, along with Jehovah's Witnesses, members of the Church of the Latter-Day Saints, and some Buddhists, account for 10% of the population. Another 6% of Vanuatuans belong to the indigenous John Frum movement, a cargo cult begun in the late 1930s.

John Frum, thought by some to be based on a World War II American serviceman, is a messianic figure who is believed to have spread the doctrines of the movement. Those doctrines revolve around wealth; believers hold that for native Melanesians to gain wealth, they must reject all European symbols and customs and return to the traditional way

of life of the indigenous people. The followers, who now have their own political party, opposed the creation of independent Vanuatu, which would favor Western modernity and Christianity.

Though the Spanish were the first to come across the archipelago during the early-17th-century explorations, in the 1880s both Great Britain and France claimed parts of the country as their own. The result was the creation, in 1906, of a unique, “condominium” colony, where the two European powers shared political control. Catholic and Protestant missionaries arrived in the area in the 19th century, and religion would reaffirm the divisions already entrenched by the colonial powers; the Catholic communities were aligned with the French government, while the Anglophones, governed by Great Britain, were nearly uniformly Protestant. The division played out when the issue of independence was raised in 1980, when the two groups backed different political parties, and those pushing for independence were largely from the British camp. Politics and religion have been, and continue to be, largely bound together, and the first political party of the island was founded by Father Walter Lini, an Anglican priest who would serve as the first prime minister of independent Vanuatu.

At the beginning of the 21st century, much of the government is still made up of young pastors and leaders of Christian communities, but much of the daily lives of communities are still administered by local chiefs and elders. During independence, the government overtly looked to Christianity, along with the shared cultural experience of the islanders, to forge a national identity. The preamble of the Vanuatu constitution claims commitment to “traditional Melanesian values, faith in God, and Christian principles.” The Ministry of Internal Affairs, along with the Vanuatu Christian Council, provides the means for the government to interact with the religious communities and provide funding for Christian schools (though not for non-Christian religious instruction). Government schools also set aside time for religious education, which is implemented by local churches.

VATICAN CITY STATE AND THE HOLY SEE

With a territory of 0.44 square kilometers and a permanent population of only 900, Vatican City is the smallest independent state in the world. Yet it is known all over the globe as the seat of power of the 1.3-billion-member Roman Catholic Church, the headquarters known as the Holy See. Indeed, although Vatican City is recognized as an independent state in international law, its main function is to guarantee the independence of the Holy See and to grant it *de facto* recognition as an international power.

Vatican City is located on the west bank of the Tiber River in Rome and encompasses St. Peter's Church and Square, the pontifical palaces, several administrative buildings, the Vatican library, museums, and gardens. The Basilicas of St. John Lateran, Santa Maria Maggiore, and St. Paul in Rome together with the papal summer residence at Castel Gandolfo are also under the sovereignty of the Vatican City and as such enjoy extraterritoriality. It came into existence in February 1929, following the signing of the Lateran Pacts between the pope and Mussolini, which put an end to the “Roman question” created by the annexation of the Papal States by the Unitary Italian Kingdom in 1870. The pacts recognized the full sovereignty of the Holy See in international matters and its full ownership of and exclusive jurisdiction over the Vatican.

Although as temporal and spiritual entities the Vatican City and the Holy See are formally distinct, their governing structures are closely intertwined. The pope is both the absolute monarch of the city-state and the spiritual leader of the Church. The Pontifical Commission manages the administrative

affairs of the state, but the Code of Canon Law applies to both Vatican City and the Church. The Roman Curia is in charge of the central administration of the Church as well as the foreign affairs of the city-state.

Through the Vatican, the Holy See entertains diplomatic relations with 177 countries and international institutions (expanded from 91 before the election of Pope John Paul II). It is the only neutral permanent observer at the United Nations and, as such, can take part in all the debates of the General Assembly, although it cannot vote. Some observers claim that the Church takes advantage of this ambivalent status to exercise its religious authority in the secular arena, as exemplified by the promotion of its positions on reproductive health and gender relations at the International Conference on Population and Development in Cairo in 1994 and the Fourth International Conference on Women in Beijing in 1995. Others claim that given the tiny size of Vatican City, the Holy See intervenes in international debates not to defend narrow state interests but to advocate policies affecting the welfare of the world's peoples, such as environmental protection, social and economic justice, peace, and human rights.

VATICAN COUNCIL, SECOND

The Second Vatican Council (1962–1965) was a general assembly of the bishops and other ecclesiastical representatives of the Roman Catholic Church,

the second held since the 16th century. Pope John XXIII, attentive to the changing global context, called the Council as a means of renewing the Church and updating its pastoral practices in light of the needs of the modern era. The bishops present at the Council represented the increasingly global membership of the Church, and the Council's pronouncements shaped not only the internal life of the Church but its relationship with the cultures, states, civil societies, other Christian bodies, and other religions with which it interacts around the world.

The dramatic growth of Christianity in the non-European world in the 20th century was reflected in the attendance at the Council, which was larger and more diverse than any previous council. Of the approximately 3,000 bishops who attended, about one third (36%) were from Europe, another third (35%) from the Americas, and the remainder from Asia (14%), Africa (12%), and Oceania (3%). John XXIII, who died at the end of the first session, also invited non-Catholic religious leaders to attend as observers. His successor, Paul VI, took the unprecedented step of inviting Catholic women, including prominent leaders of women's religious orders, to observe what had previously been all-male assemblies.

In its Constitution on the Sacred Liturgy (*Sacrosantum Concilium*) and its Decree on Missionary Activity of the Church (*Ad Gentes*), the Council moved away from its ultramontane stress on the uniformity of Catholic practice and encouraged a deeper engagement with the cultures of the world, most notably by approving the translation of the Latin Mass into vernacular languages and by encouraging missionaries to explore the ways in which Catholic thought and practice could be accommodated to different cultures.

The Decree on Ecumenism (*Unitatis redintegratio*) and the Declaration on the Church's Attitude Toward Non-Christian Religions (*Nostra aetate*) fostered a new openness to dialogue and engagement with other traditions both Christian and non-Christian. *Nostra aetate* acknowledged that other religions, though different, may contain much that is true and holy and encouraged Catholics not only to greater dialogue and collaboration but also to promote that which is good in other traditions.

The Declaration on Religious Freedom (*Dignitatis humanae*) and the Pastoral Constitution on the

Church in the World of Today (*Gaudium et spes*) reshaped the relationship between the Church, states, and civil societies. Recognizing and affirming the principle of religious freedom, *Dignitatus humanae* recognized the right of individuals to be free of coercion in matters of religion as a civil right grounded in the nature of the human person. *Gaudium et spes* also stressed the fundamental dignity of the human person and the importance of constructive engagement with the deep questions raised by “the profound and rapid changes . . . spreading by degrees around the world.” Although the extent to which the Council broke with the past is still hotly debated, it clearly reoriented the way the Church engaged with the modern world.

VEDA

The term *Veda*, derived from the root *vid*, “to know,” means “knowledge.” The Veda functions in Hindu traditions as an authoritative category that is ascribed the status of transcendent knowledge and has both textual and supratextual dimensions. As a textual phenomenon, the Veda is revered in many Hindu traditions as the paradigmatic scripture that has historically provided a

legitimizing source of authority for later sacred texts and teachings up to the contemporary period. With approximately 1 billion Hindus in India and the diaspora, the Veda is thus a phenomenon with global reach whose authority continues to reverberate throughout the transnational network of Hindu communities and beyond.

The term *Veda* is used to designate a corpus of sacred texts in at least four different senses. (1) The term is used in its narrow sense to designate the four *Samhitās* (ca. 1500–800 BCE)—Ṛg-Veda, Yajur-Veda, Sāma-Veda, and Atharva-Veda—which are collections of verses (*ṛcs*), sacrificial formulae (*yajuses*), chants (*sāmans*), and incantations and imprecations (*atharvāṅgirases* or *atharvans*), respectively. The versified portions of the four *Samhitās* are termed *mantras*. (2) The term is subsequently extended to include not only the *Samhitās* but also three other categories of texts: (a) the *Brāhmaṇas* (ca. 900–650 BCE), sacrificial manuals attached to the *Samhitās* that are concerned with correct performance of the Vedic fire sacrifices (*yajñas*); (b) the *āraṇyakas*, “forest books” that reflect on the inner meaning of the sacrificial rituals; (c) and the *Upanishads* (ca. 800–200 BCE), the latest portions of the Vedas, which contain metaphysical speculations concerned with the attainment of knowledge (*jñāna*) of ultimate reality. (3) In post-Vedic speculations the term is at times extended even further to include two additional categories of texts that are designated as the “fifth Veda”: (a) the *Itihāsas*, or epics—the *Mahabharata* (ca. 200 BCE–100 CE) and the *Ramayana* of Vālmīki (ca. 200 BCE–200 CE) and (b) the *Puranas* (ca. 300–1000 CE and after), encyclopedic texts comprising cosmogonic myths, genealogies, and narratives about gods, kings, and sages. (4) Finally, Veda functions as an encompassing category within which can be subsumed potentially all sacred texts.

This entry discusses the distinction between the *śruti* and *smṛti* texts, the Veda as a supratextual category, and methods of engaging the Veda.

Śruti and Smṛti

To understand the mechanisms through which this expansion of the purview of the term *Veda* occurred, we need to examine more closely the distinction that is made in the Brahmanical Hindu

tradition between the two categories of sacred texts: (1) *śruti*, “that which was heard,” and (2) *smṛti*, “that which was remembered.” The core *śruti* texts are the mantras—*ṛcs*, *yajuses*, *sāmans*, and *atharvāṅgirases* or *atharvans*—collected in the Vedic Saṃhitās. The domain of *śruti* was subsequently extended to include not only the Saṃhitās but also the Brāhmaṇas, Āraṇyakas, and Upanishads. While the domain of *śruti* is in principle circumscribed, *smṛti* is a dynamic, open-ended category that includes the epics, Puranas, and *Dharmashastras* (ca. first to eighth centuries CE), and the Brahmanical legal codes, along with a variety of other texts that have been incorporated within this ever-expanding category in accordance with the needs of different periods and groups.

The primary criterion for distinguishing between the *śruti* and *smṛti* texts is generally characterized by both Indian and Western scholars as an ontological distinction between “revelation” and “tradition.” *śruti* texts—Saṃhitās, Brāhmaṇas, Āraṇyakas, and Upanishads—are traditionally understood to have been directly cognized—“seen” and “heard”—by inspired “seers” (*ṛṣis*) at the beginning of each cycle of creation. Among the orthodox schools of Hindu philosophy, the formal schools of Vedic exegesis, Pūrva-Mīmāṃsā and Vedānta, maintain that the *śruti*, or Vedic, texts are eternal (*nitya*), infinite (*ananta*), and uncreated (*apauruṣeya*)—not derived from any personal agent, whether human or divine—whereas the Nyāya, Vaiśeṣika, and Yoga schools view the Vedic texts as the work of God. All other sacred texts are relegated to a secondary status as *smṛti*, for they are held to have been composed by authors and are therefore designated as “that which was remembered” rather than “that which was heard.” On the basis of this criterion, the epics and Puranas are classified in the Brahmanical canon as *smṛti* texts, even though they may seek to identify themselves with *śruti* by claiming the status of the “fifth Veda.”

In attempting to assimilate themselves to the Veda, the epics and Puranas exemplify a well-documented phenomenon in Indian history whereby any Hindu text or teaching seeking to legitimate its authority had to do so with reference to the Veda. The legitimating function of the Veda within Hindu traditions derives from its role as a

transcendent source of authority. The core *śruti* texts, the Vedic mantras, are represented in the cosmogonic and cosmological speculations of Vedic and post-Vedic texts as eternal, transcendent knowledge that exists perpetually as the source and plan of the cosmos. The Vedic seers are portrayed as having stationed their awareness on the transcendent level where they “saw” and “heard” the primordial vibrations of pure knowledge manifesting as the fundamental rhythms of creation. They subsequently expressed on the gross level of speech that which they cognized on the transcendent level, and in this way the mantras assumed a concrete form on earth as recited texts. The Vedic mantras are thus granted the status of transcendent knowledge. Any subsequent sacred text can participate in that status only by assimilating itself to the Vedic mantras through a variety of strategies, including claiming to form part of *śruti*, the original cognitions of the seers, in the case of the Brāhmaṇas, Āraṇyakas, and Upanishads; claiming the status of the “fifth Veda,” in the case of the epics and Puranas; establishing a genealogy that directly links the text’s teachings to the Veda or to some form of divine revelation, in the case of *Dharmashastras* such as the Manu-Smṛti; claiming that the text’s teachings derive from lost Vedic texts, a claim that could potentially apply to all *smṛti* texts; or otherwise conforming to the model of the Veda. Through such strategies, the term *Veda* is extended beyond the circumscribed boundaries of the Vedic mantras and, through a process of “vedacization,” comes to include within its purview not only an expanded array of *śruti* texts but also potentially all *smṛti* texts and teachings that are promulgated by Brahmanical authorities.

Such strategies, including a variety of other modes of assimilation, have been used not only by exponents of the Brahmanical hierarchy but also by non-Brahmanical Hindu groups to invest their sacred texts with the transcendent authority of the Veda. The domain of Veda is thereby expanded beyond the Brahmanical Sanskritic canon of *śruti* and *smṛti* texts to include texts derived from non-Brahmanical origins, including a variety of vernacular texts that are authoritative for particular bhakti (devotional) communities. For example, the *Tiruvāymoli* of the poet Nammālvār (ca. ninth century CE)—the collection of Tamil hymns composed by one of the most acclaimed of the South

Indian Tamil Vaishnavas known as the Āḷvārs—is said to represent the four Vedic Saṃhitās and is designated as the “Dravidian Veda” or “Tamil Veda.” The *Rāmcaritmānas* of the poet Tulsīdās (ca. 16th century CE), a Hindi version of the *Ramayana* popular throughout North India, has been ascribed a similar status as the “fifth Veda” or “Hindi Veda.” Even scriptures derived from non-Hindu traditions have at times been identified with the Veda. For example, in South India, certain Tamil Christians deem the Bible to be the “true Veda,” whereas Tamil Muslims invest the Qur’an with an equivalent status. While some groups have thus sought to legitimate their texts through assimilating them to the Veda, certain bhakti and tantric movements have responded to the Veda by rejecting or subverting its authority. Whether the Veda is revered or rejected, appropriated or subverted, it remains a symbol invested with authoritative power that must be contended with by all those who wish to legitimate their teachings in the Hindu religious landscape.

Veda Beyond Texts

The Veda serves as a powerful and enduring symbol because it transcends the confines of textuality that limit the term to a circumscribed body of texts and comes to represent the totality of knowledge—not the ordinary knowledge derived through the powers of human observation and reasoning but the transcendent, infinite knowledge that is held to be the essence of ultimate reality and the source and foundation of creation. This knowledge is said to have been cognized by the Vedic seers and preserved by them and their Brahmanical descendants in the form of orally transmitted texts; but in the cosmogonic and cosmological speculations of Vedic and post-Vedic texts, the corpus of Vedic mantras preserved by the Brahmanical lineages is represented as only a limited manifestation of the unlimited, eternal reality of Veda. Among the network of representations associated with Veda, four complexes persist through the various strata of literature.

1. The Veda is described as the essence of Brahman, the ultimate reality, and is at times designated more specifically as śabdabrahman—Brahman embodied in the Word.
2. The Veda as the totality of knowledge is also at times identified with the creator principle as the immediate source of creation.
3. The Vedas (plural) are depicted as the archetypal plan of creation containing the primordial expressions of speech that the Creator utters to manifest the material realm of forms.
4. The Vedas in their mundane transmitted form are the mantra collections, or Saṃhitās, of the Ṛg-Veda, Yajur-Veda, Sāma-Veda, and Atharva-Veda that are recited by human beings on earth as part of the Vedic sacrificial rites.

Engaging the Veda

The Vedic Saṃhitās, the core *śruti* texts, have been preserved in an unbroken chain of oral transmission (*sampradāya*) for more than 3,000 years. The preservation of the Vedic recitative tradition, along with the performance of the Vedic sacrificial rituals, in which recitation of the Vedic mantras assumes a central role, has remained the exclusive prerogative of male Brahman priests from the Vedic period to the present time. While the tradition of recitative transmission is restricted to the Brahman class, the male members of the other two “twice-born” social classes (*varnas*), *Kshatriyas* (rulers and warriors) and *vaiśyas* (merchants, agriculturalists, and artisans), have traditionally been expected to undertake a limited period of Vedic study. However, Brahmanical ideology provides no paradigm of Vedic study and practice for the larger community who are excluded from the ranks of the twice-born—in particular, women, *śūdras* (servants), and “outcastes,” who are beyond the pale of the *varna* system. Indeed, women and *śūdras* are forbidden in the *Dharmashastras* from even hearing the Vedic mantras recited, let alone reciting them. Although these marginalized groups have thus been excluded from direct access to the core *śruti* texts, they seek to participate in the eternal reality of Veda through engaging certain *smṛti* texts that are ascribed the status of the “fifth Veda,” such as the epics and Puranas. In contrast to the highly circumscribed Vedic Saṃhitās, these popular devotional texts—both in their original Sanskrit versions and in their multiple vernacular retellings—are intended to inspire and edify the general populace and thus provide an alternative

means for women, *sūdras*, and others at the bottom of the social hierarchy to encounter the transcendent power of Veda.

Badarayana's Vedanta Sutra or Brahma Sutra led to the three major forms of Vedanta as expounded by Shankara (about eighth century CE), Ramanuja (about 11th century CE), and Madhva (about 1197 to 1276 CE). More recent movements that have advanced interest in Vedanta are the Arya Samaj and the Brahmo Samaj.

Shankara's nondualism or Advaita Vedanta has perhaps attracted more attention from Western observers in comparison with Ramanuja's qualified nondualism or Madhva's dualism. In North America, the Ramakrishna movement, advocated by Ramakrishna's disciple Swami Vivekananda, has led to the formation of the better known societies seeking to practice in the tradition of Advaita Vedanta. This is not the only Vedanta Society or Vedanta Centre, as may be seen in another group known as the International Vedanta Society, founded on a central figure known as Bhagavan.

In the 2 years following Swami Vivekananda's attendance at the Parliament of the World's Religions in 1893 in Chicago, he spoke to groups around the United States, which led to the establishment of a Vedanta Society in New York in 1894 and eventually a network at other locations in the United States and Canada and headquartered in India in 1897. Usually structured as twin legal entities, the Ramakrishna Math is the monastic organization, and the Ramakrishna Mission is for devotees who provide social and community services, including a free soup kitchen. Sunday school moral and spiritual education is also provided to youth through initiatives such as the Vedanta Vidya Mandir in Toronto, Ontario, Canada. The Vedanta Press in southern California has been an active publisher of printed materials on relevant topics.

The purpose of life in the context of Vedanta is to find God. There are many paths to finding Truth, and there is no intent to proselytize. From the perspective of Vedanta, one's affiliation with other religions or organizations is not material to the spiritual journey. The discipline requires unselfishness, service, and self-sacrifice rather than self-assertion. Actively accepting divinity in all forms, one is required to discipline one's mind and actions with an attitude of humility and reverence.

The International Vedanta Society, of which Bhagavan (meaning "God") is the central figure, is of more recent vintage. Its international headquarters is at Amingaon, Guwahati, Assam, India, and

VEDANTA SOCIETY

Vedanta Society is the name for organizations that have been established around the world to promote Vedantic ideas. Vedanta or the "end of the Vedas" refers to the time in India between 500 and 200 BCE during which several schools of thought developed, often by way of commentary on earlier sutras. For example, commentaries on

can also be found on Facebook (see “Bhagavan,” accessed May 3, 2010) and YouTube (see <http://in.youtube.com/ivstube>, accessed May 3, 2010). In his teachings, Bhagavan advocates realization of Truth through Love. The slogan adopted by this organization “Man Is God” is a restatement of the awareness that the individual and God are in reality indistinguishable. By analogy, and consistent with Advaita Vedanta, although one can differentiate between the individual waves and the ocean, they are in fact, one.

Bhagavan is one who has realized ultimate Truth and returned to share that Truth and lead others to this awareness of the oneness of all. Guru Swami Pavitrnanandaji Maharaj’s letters written from West Bengal, India, to Bhagavan in Assam, India, provided the instructions that enabled him to achieve supreme realization on December 15, 1984. Love for people prompted his return to contemporary life. His existence since then is as Truth and Love incarnate for the benefit of humanity, creating a new civilization. The society has developed groups around the world that continue to practice his teachings. To facilitate the realization of Truth, he identifies 12 commands.

In both forms, Vedanta Society and Vedanta Centre, it follows then that the objective is universal oneness as distinct from a universal fellowship. When awareness and realization of Truth is achieved, all matters in life are resolved and concluded. Awareness of oneness with God or *Samadhi* is the nondualist reality sought by the adherents of Vedanta Societies.

VENERABLE MASTER CHENG-YEN (B. 1937)

Venerable Master Cheng-yen is the founder of the Tzu Chi Foundation, one of the largest Buddhist philanthropic organizations in the world. She was born in 1937 into a middle-class family in the central city of Taizhong, Taiwan. At the age of 16 years, she took an oath to the Compassionate Bodhisattva Guanyin, whereby she vowed to become a lay Buddhist for 12 years if her mother recovered from a serious illness. Her mother did recover, which inspired her desire to become a Buddhist nun and dedicate her life to the Buddhist dharma. Her father died from brain hemorrhage caused by a stroke when she was 24 years. Cheng-yen’s compassion and empathy resulted in her feeling some sense of responsibility for his death. As a result, and against her mother’s wishes, she left home to become a Buddhist nun. However, she could not secure a Buddhist teacher to accept her vows without her family’s permission, and she reluctantly returned to her mother’s home. After a few years, she left her home again, but this time, she headed for the quiet rural county of Hualian, on Taiwan’s poor east coast. After wandering around various temples for several years, she finally took her vows in 1963, under a well-known secularizing and reformist monk named Yinshun (b. 1906). This inspired the fastest growing humanistic Buddhist movement in cultural China.

Cheng-yen established Tzu Chi in 1966 to perform a mission of helping the poor and educating the rich. She, along with five disciples and about 30 others, mostly homemakers, vowed to set aside half a New Taiwan dollar each day for a fund to aid poor families (equal to US1.3 cents). During their first year, they distributed about 435 U.S. dollars; today, Tzu Chi Foundation claims to have dispersed more than 100 million dollars. Cheng-yen’s Tzu Chi Foundation is one of the first Buddhist organizations in the history of Buddhism in any Chinese society to carry out large-scale

humanitarian missions around the globe. In recognition of these accomplishments, Cheng-yen was awarded the Philippine Magsaysay Award in 1991 and was nominated for the Nobel Peace Prize in 1993.

Cheng-yen emphasizes the importance of the laity and charitable activities in the propagation of the Buddhist dharma. Although the members of Tzu Chi follow the precepts of Chinese Mahayana Buddhism, there is a distinctly Taiwanese dimension to the teachings of Cheng-yen, which are often transmitted in Minnanhua, the local language, intermixed with Mandarin. Cheng-yen's theology does not rely on original scriptures and can be summed up as a series of aphorisms that emphasize the performance of good deeds.

One distinguishing feature of Tzu Chi is the seemingly matriarchal nature of the organization. Because of a Buddhist practice that allows nuns to initiate only women, Cheng-yen's following within the small monastic community she leads is exclusively female and ethnic Chinese. Indeed, the prevalence of women in Tzu Chi is not limited to the monastic community but extends to the whole of the lay organization, whereby 80% of the members are women. Despite this reliance on lay women, the functioning of Tzu Chi rests entirely on the authority of Cheng-yen. Her awe-inspiring authority is sustained by devotion to her within the organization and admiration from members of the Taiwanese media, who dub her the "Mother Teresa of Taiwan." Despite this reverence, however, the lifestyle of Cheng-yen is modest. The prestige of Cheng-yen and the success of her organization dramatically illustrate the ascendancy of engaged humanistic Buddhism, first in Taiwan and then around the globe.

VENEZUELA

The religious landscape of the country of Venezuela, on the northern coast of South America, has undergone multiple readjustments over the past four decades. While the 2001 census figures point to the clear predominance of Catholicism (96%), the contemporary religious scene is characterized by a growing pluralism, with some apparent tensions. The sustained growth of Protestantism (2%), particularly since the 1970s, has been one of the principal factors in the redefinition of religion in Venezuela. Pentecostal and neo-Pentecostal evangelical movements have found a fertile niche among the popular classes, where they operate in capillary fashion. The success of the Universal Church of the Kingdom of God exemplifies the surge of Protestantism. The Brazilian-based movement appeared on the scene in Venezuela in the 1990s, and its adherents have subsequently established a wide network of congregations, thanks to a sophisticated marketing strategy that includes radio and television programming, a newspaper, and a website.

The flourishing of Protestantism has not, however, slowed down the rise of its principal historical rivals—an array of practices frequently grouped under the generic term *brujería*, or "witchcraft." An example of such a group is the cult of María Lionza, which spread throughout Venezuela during the 20th century, in spite of tenacious government repression and persecution lasting until the 1960s. The highest expression of Spiritism in Venezuela, this possession cult is widely practiced in urban areas, where the pantheon of spirits has continued to grow and give rise to new modalities of trance. The Cuban religious forms known as *Santería* and *Palería*, introduced in Venezuela at the end of the 1960s and 1980s, respectively, are also in full expansion mode, and their influence on the malleable María Lionza cult seems increasingly apparent.

Another notable development has been the growing vitality of the esoteric and New Age movements, particularly since the 1990s. The wide range of practices and beliefs identified with these expressions (metaphysics, self-help, yoga, feng shui, cartomancy, astrology, crystal therapy, rebirth, angelology, etc.) enjoys tremendous popularity, especially in urban

centers. The growing number of talks, workshops, and seminars, as well as the growing body of specialized literature on these topics, indicates that the fascination with this new spirituality is still on the rise.

Religion in Venezuela has also undergone a series of transformations since the advent of the Bolivarian Revolution in 1998. One of these has been an interesting political mobilization on the part of certain religious movements, chiefly Pentecostals, and to a lesser extent *santeros* and spiritists, in support of the process of change introduced by the administration of Hugo Chávez. Another has been the loss of privilege suffered by the Catholic Church, whose ongoing confrontations with the government have made it one of the country's most emblematic opposition sectors.

short list of official religions signifies. Currently, the Vietnamese government officially recognizes Buddhism, Roman Catholicism, Protestantism, Islam, Baha'i, Hoa Hao, and Cao Dai, as well as Pure Land Buddhist Home Practice, the Threefold Southern Tradition, and the Threefold Enlightened Truth Path. Care should be exercised in taking any of those traditions as monolithic, as many have a syncretic character when practiced in Vietnam.

While the government of Vietnam does not give precise figures on religious adherence, approximate figures show that 80% or so follow the Vietnamese blend of Mahayana Buddhism and Confucianism (Tam Giáo) and 8% of the country are Christian, with the Catholic Church being the dominant denomination. About 3% of the total population are reported to be Cao Dai followers, and another 2% practice Hoa Hao. The minority Cham ethnic group are largely Muslim, mostly practicing a form of Islam unique to the group, known as Bani, with a strong subgroup of Sunnī Muslims. There are also small communities of Baha'i and Jews, and Theravada Buddhism is preferred by the Khmer people, who populate areas near the Cambodian border. Although not recognized as an "official" religion by the government, there are reports of Hindu communities within Vietnam as well, but figures are not available. While it is not possible to go into detail on all the religious aspects of Vietnam, this entry will give an overview of the development of the religions in Vietnam and offer a few insights into the traditions.

VIETNAM

The Southeast Asian country of Vietnam blends socialism and a distinct religious character. Its religious history has been shaped by indigenous beliefs interacting with the importation of a variety of religious traditions and the emergence of new religious movements. The Vietnamese government officially recognizes a small set of the world religions; according to the government's Decree 22 in 2005, for a religious organization to be recognized, it must have 20 years of "stable" operation. With sharp rebukes for faiths that speak out against the state's doctrines and practices, recognition is by no means a foregone conclusion, as the

The Tam Giáo

While the majority of Vietnamese report themselves as not subscribing to a religion, no doubt in part a consequence of the socialist nature of the nation, some estimate at least 80% of the populace to be nominally Buddhist. However, the Buddhist variation most practiced in Vietnam is known as Tam Giáo (Tam Đạo, "Triple Religion"), which blends Mahayana Buddhism with Confucianism and Daoism, and is synthesized with indigenous ancestor and hero worship.

The religious situation at the beginning of the 21st century has developed through a strong sense of Vietnamese distinctiveness coming into contact with foreign cultures, as well as internal strife

within the country. China largely controlled Vietnam until 938 CE, when Vietnam reasserted its independence. Vietnamese imperial dynasties then endured until the French colonized the country in the 1850s, ostensibly in response to the real or imagined harassment of its missionaries, and by the 1880s the whole of Vietnam was under French control. Vietnamese nationalist forces gained momentum during World War II, and after overthrowing the Japanese administration in 1945, the French attempted to reassert control. The Democratic Republic of Vietnam, established by the national hero par excellence Ho Chi Minh, finally expelled the French after an 8-year war. The country was divided into North and South Vietnam following the advent of a communist government, which drove Vietnamese Catholics into the southern regions of the country. The North attempted to forcibly reunify the nation, leading to the American war in Vietnam in the 1960s, which was driven in part by the pleas of Cardinal Francis Spellman, a strong proponent of American support for the South Vietnamese Catholic population. That war would come to an end with the expulsion of American forces from Saigon in 1975 and reunification under communist rule.

The blend of Tam Giáo philosophies shapes everyday behaviors and attitudes in Vietnam, even though the distinct religions of which it is composed may not be practiced formally. The worship of spirits, especially spirits of ancestors, forms a core part of Vietnamese religion, and most homes have altars on which ceremonies are performed on death anniversaries and the Lunar New Year. Funerals are likewise important to ensure the proper transfer of the departed soul and guard against the creation of malevolent ancestors. Ancestor worship and life cycle rituals are essential for the national identity of Vietnam, but through history, a divide has developed between the northern and southern parts of the country, which can be seen in their construction of national identity. The north, more favorable to the communist power structure, has elevated national symbols to replace religious ones, which has resulted in the near apotheosis of figures like Ho Chi Minh, the leader of the revolution. He remains a symbol of national pride, and a mythic model for political conduct. Southern Vietnam looks to figures from the Vietnamese dynasty for emulation, but northern

dominance has led to the suppression of those symbols.

Indigenous Vietnamese Religion

One religion that showcases Vietnam's distinctiveness is the new indigenous religion Cao Dai, short for *Đại Đạo Tam Kỳ Phổ Độ* (Great Religion [of the] Third Period [of] Revelation [and] Salvation), established in 1926. It is a syncretic, monotheistic religion that boasts 2–3 million adherents and whose dogma is based on the direct reception of religious messages from God to the founders. Followers look to join with God or escape from the cycle of birth and death, illustrating at a minimum the synthesis of Christian and Buddhist belief systems. Śakyamuni Buddha represents the high point of revelation, with Lao Ze of Daoism, Confucius, and Jesus all contributing important teachings to the religion. Blending religion with the social, recognized Cao Dai saints include Sun Yat-Sen, a Chinese revolutionary and political leader in the early 20th century; Nguyễn Bình Khiêm, a Vietnamese administrator and poet; and Victor Hugo, the 19th-century French writer and human rights activist.

The other indigenous Vietnamese “official” religion Hoa Hao was founded in 1939 by Huỳnh Phú Sổ, during the French occupation of Vietnam. Its teachings blend a form of lay Buddhism with a strong sense of Vietnamese nationalism, which has resulted in nearly all the professed 2 million followers living in Vietnam or diasporic communities. Hoa Hao has played a role in Vietnamese politics since its inception, supporting Japanese occupation during World War II, in the hope that Cường Để, the Absent Marquis and a descendant of a Vietnamese emperor, would once again rule Vietnam as emperor. Becoming an armed revolutionary group in the 1950s, the group became heavily anticommunist due to conflicts with provincial leaders in the An Giang province and provided one of the few places of reprieve for American and South Vietnamese troops during the 1960s war. In an attempt to rein in what officials consider a dissident group, the Hoa Hao Administrative Council was formed and recognized by the Vietnamese government in 1999. This council was created amid protests by several leaders of Hoa Hao, who condemned the council as an extension

of the government, which culminated in a division in the faith into the Traditional Hoa Hao Church and the Pure Hoa Hao Church. Followers have frequently complained of religious persecution, and two adherents self-immolated in 2005 to protest against the maltreatment. In 2007, the Vietnamese government outlawed Hoa Hao celebrations, an act that created a hard-line group based mainly in the United States standing against a more reformed group under the control of Vietnamese authorities.

Buddhism in Vietnam

Buddhism's history in Vietnam has some parallels to Hoa Hao's trials in the 21st century. First introduced by way of Central Asia (Mahayana) in the first century CE, then from India (Theravada) toward the seventh century CE, Buddhism grew throughout the first millennium of the Common Era. During the Chinese occupation in the early 15th century, Confucianism was given a renewed impetus, and traditional forms of Buddhism began to decline, compounded by the destruction of Buddhist temples by the Chinese. This is also likely the time when Tam Giáo was being formulated, the syncretism taking over customary Buddhist observance. The advent of Roman Catholicism with the French colonial force further repressed Buddhism and furthered the syncretism already highly evident. Vietnamese Buddhism became scattered, and 14 different sects are reported to have been in operation during the 1960s. The United Buddhist Church of Vietnam (UBCV) was founded in 1964 to unify the different sects in the face of a government that was increasingly considered hostile to the faith. In 1981, the Vietnamese government officially sanctioned the Vietnam Buddhist Sangha (VBS), which sought to incorporate Mahayana, Theravada, and Bhiksu Buddhism under a common flag controlled by the government, much to the chagrin of the UBCV. The administration required all Buddhist monks to be approved by and work for the VBS, a measure that has been criticized as an infringement on religious freedom. Tension between the UBCV and the VBS continued into the 21st century, and the UBCV was not permitted to celebrate Vesak Day in 2010—the celebration of the Buddha's birthday and a major festival for Vietnamese Buddhists.

Vietnamese Christianity

Christianity was first introduced to Vietnam in the 16th century, and the country still is home to the fourth largest Roman Catholic population in Asia. The French colonists actively promoted Catholicism as a method of controlling the indigenous people, and Jesuit missionaries were the most active group in the countryside. One particular remnant from the missionary activities of the Jesuits comes from Alexandre de Rhodes, who in the 17th century created a written system of the Vietnamese language using the Roman alphabet. The language, now called Quốc Ngữ, is still in use today and is the national language of Vietnam; it was also used in the first Vietnamese Bible, printed in 1651. After the country split into North and South Vietnam in the 1950s, Catholicism was again encouraged in the South, this time as a bulwark against the communist North. The Roman Catholic Church continued to work with its Vietnamese communities, and in 1988, all Vietnamese Catholics who died for their faith since Christianity's introduction were canonized as Vietnamese martyrs by Pope John Paul II. In 2010, President Nguyễn Minh Triết met with Pope Benedict XVI in the hope of furthering the relationship between the country and the Holy See.

Vietnam at the Beginning of the 21st Century

Freedom of religious practice in Vietnam at the beginning of the 21st century was guaranteed by the Vietnamese government in the Ordinance on Religion and Belief of 2004. However, the government requires the registration of religious organizations, and the ordinance states that any activities performed under the banner of religious freedom that seek “to undermine the country's peace, independence, and unity” are illegal. Missionary activities are also banned in Vietnam. Religious affiliation is marked on identification cards, and the reluctance of Vietnamese citizens to put such information on a communist identification card may in part be responsible for the difficulties in estimating the religious demographics. Churches are not permitted to purchase land directly, though many arrange for parishioners to purchase the land and pass the deed to the church to circumvent the restriction. Along with the complaints of Hoa Hao practitioners noted above,

Protestant communities in the country often report of restrictive treatment and harassment by the state, and there are accounts of discrimination against Christians applying for governmental posts. The Vietnamese government continues in its attempts to improve its international image regarding religious freedom, but instances of repression continued during the 2000s. Religious and ritual organizations, especially Buddhist and Spirit Medium coalitions, play a large role in the burgeoning civil society in Vietnam.

VIOLENCE

Religious traditions are largely nonviolent; yet every religious history leaves a trail of blood and a legacy of swords. Images of violence are a part of sacred iconography, symbolism, and mythology; and in every religious tradition, real acts of social violence are conducted in ways that are thought to be legitimized by divine will. These various images and acts of destruction can be collectively described as “religious violence,” though in many cases the religious ideas and practices that are associated with them are not narrowly theological. Apart from ritual sacrifice, real acts of violence are seldom intrinsic to any specific religious experience—wars are often justified in the name of religion, for instance, when the primary purpose is to extend political power. In this entry, *religious violence* refers to any symbolic or real act of violence that is associated with religion, even tangentially.

Because violence in both real and symbolic forms is found in all religious traditions, it can be regarded as a common feature of the religious imagination. Almost every tradition, for example, has some practice of sacrifice and some notion of cosmic war, a grand moral struggle that underlies all reality and can be used to justify acts of real warfare.

This suggests that religious violence is global, and global in several ways. First, the instances of both symbolic and real expressions of religious violence are universal; every religious tradition manifests it. Second, religious violence is transnational, in that religious movements that are involved in violent encounters are active transnationally, from the Christian crusades to the 20th-century Muslim movements of global jihad. And third, religious violence in the late 20th and early 21st centuries is often a response to globalization; it is related to the movements of social protest against the cultural homogenization of global society. This entry will explore the tradition of religious violence in each religious tradition, relating it to current movements of social change in the global era, and then briefly review the ways in which religious violence has been a subject of scholarly analysis.

Christianity

Perhaps the most central symbol of Christianity recalls an act of violence: the cross, which is the

symbolic representation of the crucifixion of Jesus. To most Christian believers, the symbol represents the sacrifice and redemption of Jesus, but the fact remains that the cross is an execution device. In the iconography of Roman Catholic churches, the body of the dying Jesus is portrayed on the cross in its bruised and bleeding condition; and in many Roman Catholic churches in Latin America, a statue of the broken body of Jesus lying in a casket is prominently on display. Similarly, the central ritual of Christianity, the Eucharist (called “Communion” or “the Lord’s Supper” by Protestants), is a symbolic ingestion of the body and blood of the dying Jesus. According to the Roman Catholic doctrine of transubstantiation, the bread and wine that are consumed during the ritual actually turn into the body and blood of Jesus. Few Christians would think that their participation in this familiar and comforting ritual was an act of symbolic cannibalism, but it is meant to recall the violent death (and miraculous resurrection) of the founder of the faith.

Some theorists—including Sigmund Freud and René Girard—have pointed to the Christian ritual of the Eucharist and regarded it as a symbolic displacement of real violence. That is, the symbolic acting out of violence provides an emotional outlet that reduces the possibility of real violence, especially within the religious community. And it is true that regardless of the blood symbolism of the faith, the teachings of Christianity are primarily pacifist. Only a few passages in the New Testament refer to acts of violence in a positive manner. “I come not to bring peace but bring a sword,” Jesus is said to have proclaimed in Matthew 10:34 (see also Luke 12:51–52). The context, however, indicates that Jesus is talking about the committed discipleship that his teachings demand and how they will create dissention and conflict within families. Similarly, when Jesus is reported to have driven the moneychangers out of the temple, this is taken as an example of his commitment to an unblemished form of religion rather than as advocating attacks on persons one deems immoral. The dominant theme of Jesus’ message is summed up in the admonition of Jesus to respond to violence with nonviolence: “I tell you, do not resist an evil person; if someone strikes you on the right cheek, turn to him the other also” (Matthew 5:38–39). Early leaders of the church, including Tertullian

and Origen, argued that this position meant that Christians were forbidden from taking human life, and hence they discouraged Christians from serving in the Roman army.

The pacifist attitude of Christian leaders ended when Christianity became the commanding religious tradition of the Roman Empire after the conversion of Emperor Constantine to Christianity in the fourth century CE. Rather than being a minority religious movement, Christianity was now expected to provide the moral foundation for the power of the state; this meant the necessity of justifying the use of military force. Church leaders began to develop the doctrine of just war, which was an idea first used by Cicero and later developed by Church Fathers such as Ambrose and Augustine, who made a distinction between the pure ethics of the “city of God” and the realistic ethics of the “city of man.” Yet the moral license to use force could be abused, which led a later Christian theologian, Thomas Aquinas, to reaffirm in the 13th century that war is always sinful, though it may occasionally be waged for a just cause. The “just war” position continues to be the major Christian statement on warfare: Though killing is immoral, it may be excused in the time of battle for a just cause if its effect is to reduce the climate of violence and injustice. An American Protestant theologian, Reinhold Niebuhr, applied the ideas of Augustine and the “just war” theory to the Allied position in World War II against Hitler. Niebuhr explained, however, that when it was necessary to use military power to stop a situation of violence and injustice, the violence should be applied as swiftly and skillfully “as a surgeon’s knife” (Niebuhr, 1940, p. 132).

Despite the attempts of “just war” theory to contain violence and limit its use, there have been instances in the history of Christianity in which violence was more intemperately associated with religion. From the 11th to the 13th century, for instance, a series of crusades were conducted by European Christians in an unsuccessful attempt to reclaim the holy land of Jerusalem and its environs for Christianity. Though the crusades were aimed at Muslim rule in Palestine, they also attempted to stop the expansion of the Muslim Seljuk Turks into Anatolia and were engaged on attacks on a wide variety of enemies of the pope and established Roman Catholic Christendom, including

Jews, Orthodox Christians, pagans, Mongols, and renegade Christian sects. Another period of excessive violence is related to the Spanish Inquisition in the 16th and 17th centuries. It was originally established to ensure the purity of the faith of those Muslims and Jews who converted to Christianity after Spain reverted to Christian rule after centuries of being under Muslim political authority. But it degenerated into trials, torture, and persecution—including executions—of all religious and social groups suspected to be deviant. The “wars of religion” in France in the 16th century and the Thirty Years War in the 17th century in Germany and elsewhere in Europe were battles between Roman Catholic and Protestant military forces waged more for the purpose of extending political control than to propagate the faith of one side or another. The end of the Thirty Years War resulted in the signing of the Peace of Westphalia; its recognition of political control over communities of constituents is often regarded as the beginning of the modern nation-state.

In the 20th century, one of the bloodiest confrontations involving Christian religious identities occurred in Northern Ireland. Though the confrontation was largely a dispute over two ethnic communities that claimed dominance over the same region, one side was Catholic and the other Protestant, and this gave the encounter a religious character. Some religious leaders, such as the fire-brand Protestant minister, Reverend Ian Paisley, played active roles in fomenting the antagonisms that led to the violence. Elsewhere in Europe, movements opposed to new immigrant communities often had a stridently anti-Muslim and pro-Christian message. In the United States, the rise of right-wing social movements related to the Christian militia were in the background of a series of terrorist incidents in the late 20th century; these included the shoot-out at Ruby Ridge in Idaho in 1992, a bombing at the site of the Olympics in Atlanta in 1996, and an attack on a Jewish day care center in Los Angeles in 1999. The most devastating moment of Christian violence in America was the bombing of the Oklahoma City Federal Building in 1995, which killed several hundred people and was the largest act of terrorism on American soil before the September 11, 2001, terrorist attack. The perpetrator, Timothy McVeigh, was a follower of Cosmotheism, advocated by

William Luther Pierce, who authored McVeigh’s favorite book, *The Turner Diaries*, under the pseudonym “Andrew Macdonald.” The religious ideology of the book is similar to extreme forms of the Christian Identity ideology, which regards Jews and non-White persons as racially inferior and imagines its own ideology and group to be the protectors of true Christendom.

The images of Protestant Christianity are sometimes exploited by political leaders in support of military efforts. Though historically the reformed tradition is strongly pacifist, martial images abound in the rhetoric and symbolism of the contemporary Protestant faith. Protestant preachers everywhere have encouraged their flocks to wage war against the forces of evil, and their homilies are followed with hymns about “Christian soldiers,” fighting “the good fight,” and struggling “manfully onward.” During the “war on terror” following the 9/11 attacks on the World Trade Center and Pentagon, and the subsequent U.S. military invasion and occupation of Afghanistan and Iraq, Christian religious images were appropriated by some political leaders to advance the notion that the American military position was justified in Christian terms.

Judaism

Unlike Christianity, few of the symbols and rituals of Judaism are linked with violence, though they often recall an ancient history that involved war and bloodshed. The Jewish tradition extends back to the biblical era of the Hebrew Bible (known by Christians as the Old Testament), when warfare was conducted with the explicit support of the Divine Being. “The Lord is a warrior,” states Exodus 15:3. Later in Exodus, God states a willingness to send “terror before you” (Exodus 23:27). In Deuteronomy, enemies in distant lands who surrender are allowed to live—though as forced laborers—and the scenes of battle are vivid and bloody.

The Book of Deuteronomy, however, makes a distinction between required wars and wars of expansion. Wars of expansion were justified not for material gain but for defensive purposes—to preempt the possibility of attack by distant enemies—and required wars were necessary to prevent foreign religious influence on the “chosen

people” within the Holy Land. Defense of the community was the only circumstance in which warfare was required and the only situation of military encounter in which Israelites could be certain that God was on their side. Later in the history of ancient Israel, the people were subjected to imperial control, and Israel was not in a position to support warfare. There were, however, militant protests and clashes with the Romans—including the Maccabean Revolt (166–164 BCE) and the revolt at Masada (73 CE).

After the creation of the modern state of Israel in 1948, religious writings emerged that support warfare in the cause of Israeli irredentism. Some of the most extreme positions justified the use of force against the Palestinian Arabs. A fringe movement mobilized around the notions of Messianic Zionism as described in the writings of Rabbi Abraham Isaac Kuk (also spelled “Kook”) and his son. The hope was that Israel would become not just a state that protected Jews but a fulfillment of biblical Israel and the coming of the Messiah to lead it. The militant activist Rabbi Meir Kahane developed his own distinctive “catastrophic Messianism,” as Ehud Sprinzak has called it, reasoning that the Messiah would come only after a great conflict in which Jews were able to prove their loyalty to and respect for God through military might. Critical to the theory was the Jewish claim on Jerusalem and the West Bank, the biblical lands of ancient Israel. This provided a religious basis for the resistance of Israeli settlers that has confounded Israeli-Palestinian negotiations for a peace settlement, and it delayed the establishment of a Palestinian state on the West Bank. Kahane’s own strident anti-Arab position left a legacy of violence, including his own assassination in 1990 by members of the Muslim group in New York City, some of whom were later implicated in the 1993 bombing of the World Trade Center. One of Kahane’s followers, Dr. Baruch Goldstein, attacked and killed Muslim worshippers in the 1994 massacre at the Cave of the Patriarchs in Hebron, precipitating a round of attacks on Israeli citizens by the militant Muslim Hamas movement in response.

Islam

Symbolic violence is manifest in the Shi’a branch of the Muslim community during the ritual day of

Ahura on the 10th day of the month of Muharram. It commemorates the martyrdom of the third Imam in the Shi’a tradition, Husayn ibn Ali, the grandson of Prophet Muhammad, at the Battle of Karbala. During this ritual, some of the faithful parade through the streets of Iran, Iraq, and other predominantly Shi’a regions, flagellating themselves with sticks and sharp instruments until they are bloody with usually superficial wounds. This ritual occasion is a call for self-sacrifice from the faithful and a recollection of the bloody struggles in early Shi’a history.

Warfare is a frequent feature of Muslim history, and like the Hebrew Bible of Jews and Christians, the sacred scriptures of Islam provide instances of divine sanction for battle. The Qur’an (also transliterated as “Koran”) is revered as having been transmitted in a series of revelations to Prophet Muhammad by the Angel Gabriel in the Arabian cities of Mecca (or Makkah) and Medina in the first decades of the seventh century CE. After the Prophet was driven from his home in Mecca, he organized a military force that was able to retake his native city and much more: By the end of the Prophet’s life in 632 CE, Islam dominated most of the Arabian world. In such a conflict of armed strife, it is not surprising that the Qur’anic revelations mention military struggle. This sentence from Sura 2 verse 190 of the Qur’an has been much quoted: “Fight in the cause of Allah those who fight you, but do not transgress limits; for Allah loves not transgressors.” But even this sentence preaches moderation in the time of battle, and most of the Qur’an is about nonviolent topics. What is remarkable, in fact, is how seldom the Qur’an speaks about fighting. The entire corpus of the Qur’anic revelations consists of more than 6,000 verses, and only a few—100 or so, less than 2%—refer to warfare.

These few references to fighting, however, have been employed by many Muslim political activists over the years to justify their own military expansion as a defense of the faith. Muslim theology makes a distinction between the world of peace within Islam (whose very name means “peace”) and the “world of conflict” (*dar al harb*) outside the Muslim world, where force is a means of cultural survival. In such contexts, another Muslim theological concept is often employed, the idea of *jihad*, a word that literally means “striving,” often

translated as “holy war.” Islamic law does not allow jihad to be used arbitrarily, for personal gain, or to justify forcible conversion to the faith: The only conversions regarded as valid are those that come about nonviolently, through rational persuasion and a change of heart. Most Muslims regard the true jihad as the internal struggle between belief and unbelief within each Muslim’s soul; but this has not stopped activists from employing the term for political gain.

In the late 20th century, a small number of strident Muslim political activists used the idea of jihad to justify their militant position against the secular states of the Middle East and their alleged sponsor, the United States. According to an Egyptian activist, Abd al-Salam Faraj, who was accused of being implicated in the assassination of Egypt’s prime minister Anwar Sadat, jihad is a “neglected duty” of Muslims. By that, Faraj meant the call to take up arms against secular political authorities. Though mainstream Muslims have had nothing to do with what they regarded as his extremist rambling, some political activists eagerly accepted it, since it provided the theological justification they needed for their violent acts. Among those who implemented the idea of antiseccular jihad were terrorist organizations in Egypt such as the al-Gama’*a* al Islamiyah and the anti-Israeli Muslim movements of Hamas in Palestine and Hezbollah in Lebanon. These movements have been directed toward nationalist goals, and a much broader sphere of warfare is imagined by the global jihadi movement represented by al Qaeda and the rogue activists associated with Osama bin Laden (d. 2011).

On September 11, 2001, 19 Muslim hijackers took control of four commercial airplanes shortly after they departed from Boston, Newark, and Washington, D.C., airports. Two were aimed at the twin towers of the World Trade Center in New York City, and approximately an hour after they crashed into the buildings, both towers collapsed, killing thousands. Another plane targeted the Pentagon, the headquarters of the U.S. Defense Department near Washington, D.C., and destroyed one section of the building. Though most Muslims around the world were horrified over the events of 9/11 and regarded the perpetrators as illegitimate Muslims, their own writings indicate that their terrorist actions were undertaken in a religious

manner. Though no specific moral or religious justifications are given for the acts of 9/11, the reference to great wars in Muslim history implies that the perpetrators regarded themselves as soldiers in a great spiritual battle against the enemies of Islam. At the same time, the rituals of purification that were specified in the written instructions given to them imply that the hijackers were preparing to undertake a religious rite. Some of the references in the instructions indicate that they should kill their victims in the manner of a religious sacrifice. Mention is made of the rewards that the hijackers would receive in heaven for their suicide missions, but heavenly rewards were clearly not the main point. Rather, the participants were made to feel honored that they were chosen to be on a great spiritual mission.

Hinduism and Sikhism

Justifications for warfare are found in the ancient Indian text dating from the fourth century BCE, the *Arthashastra*. The very name of the volume indicates its religious purpose: It is knowledge (*shastra*) about political and economic issues—*artha*—which are one of the four essential aspects of the Hindu way of life. Responsibility for political life is ultimately in the hands of the rulers, and thus the *Arthashastra* is largely aimed at showing how a king should rule, especially when confronted with enemies of the state.

One of the Hindu tradition’s most beloved texts, the Bhagavad Gita, is a sermon delivered in the context of war. It is part of the great epic, *The Mahabharata*, which comprises a shelf of books that were written down several centuries before the time of Christ. At the heart of the epic is a great battle on the field of Kurukshetra in North India between two sets of cousins, the Kauravas and the Pandavas. As one of the princes, Arjuna, prepares to command his chariot into battle, he reflects aloud about the meaninglessness of warfare. He will either kill or be killed, he despairs, and either way it will involve taking a life or being destroyed by one of his own cousins. The Bhagavad Gita then sets out several reasons why killing in warfare is permissible. It includes the argument that the soul cannot actually be killed: “He who slays, slays not; he who is slain, is not slain” (Bhagavad Gita 2:19). It also states that the ethical duties of someone in

the Kshatriya (warrior) caste is to fight, so violence is justified in the maintenance of social order.

The great Indian leader, Mohandas Gandhi, is remembered as an apostle of nonviolence, and indeed he has interpreted the Bhagavad Gita as being an allegorical reference to the cosmic conflict between good and evil. Yet Gandhi also allowed for an exception to his position of absolute pacifism when a limited act of violence would prevent a greater amount of violence. The examples he gave were the justification of halting a sniper in the midst of an act of killing or the defense of a people against an invading army.

In the 20th century, some of the movements supporting Hindu nationalism have involved violence. In the independence movement against British colonialism, some militant Bengalis were inspired by Kali, the goddess of destruction. The use of violence in India's independence movement was justified by the Hindu nationalist leader V. D. Savarkar and other leaders of the militant *Rashtriya Swyamsevak Sangh* (RSS; National Service Organization). The RSS was a precursor to a revived Hindu nationalist movement at the end of the 20th century, which brought the Bharatiya Janata Party (BJP) to power from 1998 to 2004. Though the leaders of the BJP denounced violence, a mob of its supporters attacked and destroyed a Muslim mosque in the town of Ayodhya, which stood on the spot that was said to be the birthplace of the god Rama. The BJP is also accused of fostering an attitude of intolerance that encouraged violent anti-Muslim attacks in various parts of the country.

The Sikh religious community in the North Indian state of Punjab is largely peaceful and shares many of the nonviolent precepts of the Hindu tradition to which it is historically related. The history of the Sikh tradition, however, is punctuated with military encounters between Sikh leaders and Muslim leaders of the Moghul Empire. The most faithful members of the Sikh community are known as the "the army of the faithful" (*Dal Khalsa*), and the Sikh symbol is a double-edged sword. The two sides of the sword are to indicate both spiritual and worldly power.

The idea of worldly power was taken literally by the Khalistan movement of Sikh separatism, which erupted in the 1980s in the Punjab. Thousands of Sikhs and Hindus were killed in a decade-long struggle that involved acts of terrorism and brutal

police responses. In 1984, Prime Minister Indira Gandhi authorized Indian troops to invade the holiest Sikh shrine, the Golden Temple, in the city of Amritsar. Thousands of pilgrims at the spot were killed, along with the radical Sikh leader Sant Jarnail Singh Bhindranwale, a rural preacher who had become the symbol of the movement's leadership. Later that year, Mrs. Gandhi's own Sikh bodyguards turned on her with automatic weapons, and her assassination was the cause of even more Sikh and Hindu violence. In 1985, an Air India airplane exploded en route from Canada to India killing all 329 passengers. This was the largest act of air terrorism involving a single plane, and Sikh activists were suspected in the incident.

Buddhism

Even before Buddhism became a part of China's religious heritage, ancient texts provided spiritual insights for social order. These included sanctions for war. Said to be the oldest military treatise in the world, the Chinese text *The Art of War* provides a spiritually balanced way of approaching warfare. It was written in the fifth century BCE in ancient China by Sun Tzu, "Master Sun"—which is most likely an honorific name given to a general, Sun Wu. *The Art of War* is a practical manual for fighting that has been applied to martial arts as well as to warfare between states. Like the ancient Indian text the *Arthashastra*, *The Art of War* implies that kings in ancient China conduct warfare only if they have a justifiable reason for doing so. Moreover, the manual insists that the conduct of war be consistent with the balanced state of harmony that is advocated in Chinese religious texts.

A similar stance was taken in Buddhist texts related to the martial arts. In Japan, in the early 17th century, for instance, Zen master Soho Takuan provided the philosophical underpinnings of the Japanese martial arts and the samurai warrior art of swordsmanship. In *The Unfettered Mind*, Takuan describes the correct attitude that is required to engage in battle and undertake the martial arts. He does not ask whether the conflict is worthy; he assumes that the fight is to uphold social order and is not for personal gain and that nonviolent options are not available to resolve the conflict. The question for Takuan is how to conduct an unavoidable conflict in a way that is consistent with Buddhist

principles. Takuan argues that Zen Buddhist practices are able to transform these actions through discipline, concentration, and abandoning extraneous thoughts.

The Buddhist doctrine of nonviolence, therefore, is not absolute. According to some Buddhist writers, traditional Buddhist teachings allow for some exceptions to the rule of nonviolence. They state that five conditions must be satisfied to prove that an act of violence has taken place: (1) something living must have been killed, (2) the killer must have known that it was alive, (3) the killer must have intended to kill it, (4) an actual act of killing must have taken place, and (5) the person or animal attacked must, in fact, have died. The third condition—the intention to kill—is often the most difficult to prove and allows for a relaxation of the absolute rule of nonviolence. One might kill in the process of defending one's home or country without having intended to kill those who were threatening. On a more mundane level, many Buddhists will eat meat as long as they have not killed the animal themselves or intended that the animal be killed. Though this understanding of Buddhist ethics can justify an armed defense of a nation, to use military force in a nondefensive way—to expand political control, for instance—would be prohibited under Buddhist ethics just as it is under Jewish, Christian, and Islamic ethical standards.

In Theravada Buddhist societies such as Thailand and Sri Lanka, where Buddhism is virtually the state religion, Buddhist precepts provide for the defensive use of the state's military force. The protection of Buddhist culture has also been a principle that has justified protests against the government—as in Myanmar (Burma), Tibet, Thailand, and Sri Lanka. In Sri Lanka, one of the leaders of the movement of independence against the British was a Buddhist monk. Members of Buddhist monastic orders have also been involved in opposition to the government after independence. A monk assassinated Prime Minister S. W. R. D. Bandaranaike in 1959, and monks were supporters of the Janatha Vimukthi Peramuna and other government opposition movements in the last decades of the 20th century. When a Buddhist monk was asked how, in light of Buddhist teachings on nonviolence, he could justify his support for violent antigovernment activities, he

explained that we live in an immoral world, implying that survival in a sinful world required strong measures, including militant means of defense (Juergensmeyer, 2008, p. 125).

In Japan, an eclectic Buddhist movement carried out one of the most dramatic acts of terrorism related to religion. Members of the Aum Shinrikyô movement in Japan released sarin gas, a poisonous nerve gas, in the Tokyo subway system in 1995; it killed a dozen people and injured thousands. This was the only act of religious terrorism that involved a weapon of mass destruction—poisonous gas. Many Japanese denied that the Aum Shinrikyô movement was actually Buddhist, but the teachings were taken from both Japanese and Tibetan Buddhism, along with iconography from Shaivite Hinduism and apocalyptic imagery from Christianity. It advanced prophecies about a future catastrophic war, an "Armageddon" that would culminate in World War III. Like many other violent religious movements, it claimed that its own actions were justified as defensive measures in response to larger violent confrontation.

Studies of Religious Violence

The earliest scholarly theories that have dealt with religious violence begin with the symbolic aspects, especially the ritual of sacrifice. The great 19th-century sociologist, Émile Durkheim, regarded the practice of sacrifice as central to the notion of religion. Within the Durkheimian school, Henri Hubert and Marcel Mauss developed the notion of sacrifice as the seminal religious act, a mediation between the sacred and the profane realms of reality. A more recent anthropological theory in the Durkheimian tradition comes from Maurice Bloch, who shows how sacrificial ritual in many societies can be an empowering act, a way of identifying with a victim to overcome the fear of victimization and become a conquering warrior and hunter.

Sigmund Freud provided a psychological dimension to the study of religious violence. Freud speculated that many of the myths and legends of religion provided a way of symbolic enacting violence and thereby displacing the drive to real acts of violence. Freud regarded the myth about Oedipus's desire to kill his father and seduce his mother as the prototype of all myth. Although many aspects of Freud's theories are discredited, the idea that

symbolic violence can displace the threat of real acts of violence has endured. Ernst Becker, for instance, has said that the violent images in religion can help deny the reality of death. Weston LaBarre, examining the Ghost Dance religion of the Plains Indians, argued that religion is an attempt to deny the destructive forces in life and seek strength in the transcendent. The French literary theorist, Georges Bataille, combined ideas about religion, sex, violence, and capitalism in a theory that borrows from Freud in trying to explain acts of control as attempts to restore the shattered self. Perhaps the most discussed theory in the Freudian tradition is the position of René Girard. In *Violence and the Sacred*, Girard restates Freud's point that the violent symbols and rituals of religion evoke, and thereby vent, destructive impulses. Where Girard differs from Freud, however, is in his thinking about what motivates the violent urges in the first place. Girard rejects the idea of aggressive instincts and instead identifies the basic impulse as "mimetic desire," which is the longing to imitate one's rival and to desire what one's rival desires.

Other social scientists have approached the matter of religious violence differently. Instead of looking at religious phenomena isolated from society, they place the study of religious violence within their social and political contexts. Karl Marx, for instance, thought of the violence of class conflict as helping explain how religion could be used as an instrument of exploitation.

At the end of the 20th century, the rise of new religious politics and the dramatic acts of terrorism associated with it brought new analyses of the phenomenon of religious violence. Martha Crenshaw distinguished between "instrumental" and "organizational" approaches to terrorism. David C. Rapoport traced the historical cycles of religious terrorism, and Ehud Sprinzak described the radical religious politics that could emerge in times when authority structures were weak and open democracy was not balanced by discipline and control. Martin Riesebrodt developed a theory of religion based on the development of new religious practices in response to catastrophic social situations, and Mark Juergensmeyer explained why the cosmic war images of religious traditions appealed to radical activists who lost faith in secular nationalism. Robert Pape argued that suicide terrorism was

undertaken largely for political reasons and religious ideology was simply an enhanced motivation for those who were looking for moral legitimacy for their violent acts. These analytic insights have been attempts to make sense of symbolic and real instances of religious violence, not only in the history of religious traditions but also in their contemporary manifestations.

VIRGIN ISLANDS (BRITISH)

The British Virgin Islands, a British territory in the Leeward Islands chain of the Caribbean Sea, consists of four major islands—Tortola, Virgin Gorda, Anegada, and Jost Van Dyke—plus many smaller ones; its religious character derives from British colonialism and 20th-century American missionary activity. Tortola is the largest island, and about 82% of the population lives there. According to the 1991 census, most of the inhabitants are Christian: 33% Methodist, 17% Anglican, 10% Roman Catholic, 9% Church of God, 6% Seventh-Day Adventist, 4% Baptist, 2% Jehovah's Witnesses, and 15% other Protestant.

While the islands were initially inhabited by Arawaks and Caribs, European colonizers killed most of the native peoples even as they brought in African slaves to work on sugar plantations. After

the Dutch initially settled Tortola in 1648, the English wrested control of it in 1672, along with the rest of the islands that would make up the British West Indies—until their designation as a British colony called Leeward Islands (1872–1960) and their subsequent status as an autonomous British Overseas Territory since 1967. Until the 18th century, Anglicanism was the official religion, although Anglican ministers preached to White audiences only, fearing that Christianity would make the slaves rebellious.

Moravian and Methodist missionaries began converting slaves in the 18th century. Apart from learning Christianity, the slaves gained literacy, permissible assembly, and social status among other slaves. A policy of noninterference with the political and social institutions surrounding slavery required missionaries to teach the slaves obedience to the White plantation owners and submission to secular authorities. Since Methodists like John Wesley generally opposed slavery, however, plantation owners suspected Methodists of aiding slave revolts on the islands in 1799. The enthusiastic style of worship, combined with literacy and status, helped turn most of the islands' Black population to Methodism by the mid-19th century.

In the early 20th century, indentured workers from India immigrated to the islands, practicing Hinduism and Islam from their homes. Minority communities of Hindus and Muslims continue to live on the islands today. Laborers from Lebanon, incorrectly called Syrians, were already Christian, and most of them joined the Catholic Church.

After World War II, American fundamentalist and evangelical churches began proselytizing in the Caribbean, fueling the swift growth of these churches on the British Virgin Islands. Since the 1970s, the numbers of Jehovah's Witnesses and Seventh-Day Adventists have increased steadily. Alongside growing urbanization, the Pentecostal and Holiness traditions also expanded rapidly, incorporating African-derived shouting and ecstatic worship practices alongside Christian theology. Charismatic worship is a hallmark of many modern Caribbean churches, whether Catholic or Protestant.

VIRGIN ISLANDS (U.S.)

The U.S. Virgin Islands, a territory of the United States in the Leeward Islands chain of the Caribbean Sea, consists of three major islands—St. Croix, St. John, and St. Thomas—plus smaller ones; its religious diversity stems from European and American missions mixed with African forms of ecstatic worship. A majority of the population lives on St. Croix and St. Thomas. According to the 2001 census, most inhabitants are Christian: 42% Baptist, 34% Roman Catholic, 17% Episcopalian, and 7% other.

Although Spain never established permanent settlements in the 16th century, explorers and planters warred with the native Caribs, who usually refused to convert to Catholicism, killing most of them over the next two centuries. Danish colonizers arrived in the late 17th and early 18th centuries, bringing slaves from West Africa to work on sugar plantations in what was then called the Danish West Indies. During this time, the Danish National Church, a form of Lutheranism, was the official religion in the colonies, although Denmark also recognized Roman Catholicism, the Dutch Reformed Church, and Judaism. Religious toleration reigned during the colonial period.

Moravian missionaries traveled from Germany to St. Thomas in 1732 to minister to slaves. Like the Methodists who followed them, Moravians taught slaves literacy as they converted them. Anglican missions to the islands increased in the late 18th century, as did the Jewish population. Although Catholic missionaries were already allowed to preach to slaves since the 1760s, in the

early 19th century, U.S. Archbishop John Carroll oversaw the expansion of Catholicism in the Leeward Islands, though mostly ministering to the Irish on St. Croix. By 1819, the Catholic Church began an independent diocese for the Caribbean Islands. Spiritual Baptists, a syncretistic religious movement combining Catholic, Baptist, and Orisha (from the Yoruba people of West Africa) beliefs and practices, emigrated from Trinidad to St. Croix in the late 19th or early 20th century. Their worship includes shouting, spirit possession, and mourning rituals.

The United States bought the islands in 1917, and under U.S. control, with no official state support, the Danish National Church on the islands collapsed.

In the 1960s, conservative evangelical church missions from the mainland United States converted thousands of islanders, outgrowing the mainline Protestant churches. Pentecostal and other charismatic faiths gained a popular following as well. However, the Baptist faith practiced by many Virgin Islanders is distinctively Caribbean, incorporating elements of African and Holiness worship such as ecstatic movement and experiencing the Holy Spirit during services. The post-World War II period also saw the growth of Hinduism, Islam, Vodou, and Rastafarianism, as emigrants arrived from India and the Middle East as well as neighboring islands such as Puerto Rico and Haiti.

The Catholic Church, witnessing the rise of revivalist worship within its own ranks, is turning to young priests and charismatic African missionaries to enliven services and add parishioners, bridging the gap between secular tastes and sacred beliefs and practices. The use of Caribbean gospel music in churches, for example, is creating a new cultural identity and communal ethos among the faithful in the Virgin Islands.

VIRGIN MARY

The plurality of representations of the Virgin Mary is rivaled only by the multifaceted meanings attributed to these representations across religions and continents. Revered as the virgin mother of Jesus, Mary of Nazareth is described in the New Testament as having conceived a child through the action of the Holy Spirit, thereby fulfilling the prophesy of Isaiah 7:14.

In Roman Catholic theology, “Mariology” is a specific field of thought. Mary is considered the human vessel through which Christ became human. However, she is set aside from other humans by four dogmas. Her divine motherhood, declared in 431 CE, recognizes that she was predestined to be the Mother of God. The second dogma is her perpetual virginity, even after giving birth to Jesus. Third, the doctrine of the immaculate conception was declared a dogma in 1854. It states that she bore no trace of original sin. The most recently established dogma (1950) is her bodily assumption into heaven at her death.

The Qur’an recognizes the virgin birth of Jesus. According to Islam, Mary (Maryam) is a particularly pious woman blessed by God, and in contrast with Christianity, her son (Issa) is not considered the son of God but rather the messenger of God.

The Protestant tradition criticizes the Catholic emphasis on Mary and her role as intercessor with Christ and God. Catholic Mariology is interpreted as a form of idolatry. Protestants reject the Marian dogmas and do not refer to Mary as the Mother of God, although they accept that Mary gave birth to Jesus who is fully God.

Within the Catholic world, the significance attributed to Mary is multifaceted. Our Lady of Guadalupe, for instance, is the name given to the dark-complected Virgin Mary who appeared to an Indian on the hill of Tepeyac in 1531 and who now

encapsulates Mexican national consciousness. Although the Virgin Mary was a patroness for Spanish conquerors, she embodied the revolutionary promise of liberation for Indians worshippers. William Taylor notes that her purity carried the promise of redemption and that her child was the source of a new beginning. Another layer of meaning is attributed to her role as an intercessor and how as such she legitimized acceptance of colonial authority by inspiring people to seek her mediation rather than address injustices directly. These contrasting interpretations coexisted through time with different emphases.

The plurality of interpretations has taken on a new dimension with the contemporary feminist critique of Mary’s virginity and her identification as the new Eve (her absolute obedience to God’s command contrasting with Eve’s disobedience). Her unyielding virginity is interpreted by some as a sign of female power and autonomy and by others as a reification of male power implying that the only path to spirituality for women is chastity.

VIVEKANANDA (1863–1902)

Swami (“master”) Vivekananda is one of the best known Hindu teachers in the Western world. A disciple of the Bengali saint Ramakrishna (1836–1886), he came to attend the World’s Parliament of Religions held in Chicago in 1893. A powerful orator, his inspiring speech at this meeting led to the first formal introduction of Hinduism to the

Americans. Vivekananda was also a social reformer and the founder of the Ramakrishna Mission; the Vedanta Societies he inspired have branches in many parts of the world.

Born Narendra Dutta in the city of Kolkata (formerly Calcutta), Vivekananda had a traditional upbringing at home and a secular education. In 1881, he met the spiritual teacher Ramakrishna and became his disciple, giving up his educational career and eventually becoming a monk. After his father's death in 1884, Narendra had to take care of his family, but following Ramakrishna's death in 1886, he also became the leader of a small spiritual family, a monastic brotherhood comprising 15 fellow disciples. Very soon they all became renunciants. Traveling all through India, he learned about its people and also began to see how the teachings of Ramakrishna, Hindu texts, and Vedanta could be made relevant not just to his individual spiritual well-being but to all Hindus and, in fact, the whole world.

In 1893, Vivekananda sailed to America to attend the Parliament of Religions in Chicago. Due to a miscommunication, he arrived several months before the conference and had no funds for subsistence. Helped by strangers in America, he eventually attended the Parliament. He began his speech addressing the delegates as "brothers and sisters" and received a standing ovation from the delegates. Most people trace the history of Hinduism in America to this famous address. Sister Gargi (born Marie Louise Burke, 1911–2004), one of the best known biographers of Swami Vivekananda, writes that on that day, the Vedanta movement started in the West.

An eloquent speaker, Vivekananda was invited to speak at several forums in the United States. Vivekananda's primary teaching was a form of Hindu philosophy called Vedanta, based on Hindu sacred texts such as the Bhagavad Gita and the Upanishads and as interpreted by his teacher Ramakrishna. The Vedanta Society of New York was founded in 1894. He preached in America and Europe for the next several years and returned to India in early 1897. That year, in India, Vivekananda started both the Ramakrishna Mission, an organization in which monastic personnel and laypeople could come together to disseminate a practical, engaged Vedanta, and the Belur Math, a monastic order, in West Bengal.

When Vivekananda returned to America in 1899, he lectured in several organizations on topics such as "Christ, the Messenger" and "The Way to the Realization of a Universal Religion." With his disciples, he started a number of Vedanta Societies around the country. In April 1900, Vivekananda founded the Vedanta Society of Northern California, known earlier as The Vedanta Class, and The Vedanta Society of San Francisco. The purpose of the organization was to help him in his work in India and for Americans to study Vedanta philosophy. After touring Europe, Constantinople, and Cairo later that year, Vivekananda returned to India and died when he was only 39 years old, in 1902.

Vivekananda opened up Vedanta and parts of Hindu thought to people of all faiths by interpreting religious texts as having "universal" messages and by understanding all human beings to have a divine potential in them. He was also practical; just as he wanted the Western world to understand India's spiritual contribution, he wanted Indians to have access to Western education while at the same time being conversant with and proud of their own heritage. Vedanta Societies are now found in many parts of the world.

Vivekananda is known as one who spoke of a common identity at a time when the word *Hindu* was not in common use and sectarianism was the rule; thus he not only brought Hindu ideas to the West, he can also be seen as one who brought the idea of a common Hinduism to Hindus in India.

VODOU

Vodou is Haiti's national religion and incorporates elements from traditional African religion with Christian images and practices. The term *voodoo* is a creation of the European American imaginary and should be rejected as it has been misconstrued to designate irrational, baseless, and unfounded myths about Vodou practices. Other spellings used over the years included the French traditional spelling *Vaudou*, and also *Vodun* or *Vodoun*, and even the Spanish *Vodu*.

In 2010, about 70% of Haitians are still officially Roman Catholics, whereas another 30% (some would say more) are Protestants, belonging to Baptist, Adventist, or (increasingly) Pentecostal denominations or other less mainstream churches. Despite these formal religious affiliations, the commonly held view is that most Haitians are *Vodouizan* (Vodouists) to one degree or another; some even go as far as to say that Haitians may be 100% Vodouists in terms of worldview. Even if all Haitians are not active participants in the faith, without doubt, Vodou beliefs represent key components of the Haitian national consciousness and serve as repositories of knowledge and aesthetics. The reality is that for most Haitians, whether they live in rural or urban settings, Vodou is above all a way of life and mode of being involving the continuation as well as transfiguration of ancestral traditions. Simply put, for the *sèvitè*, those who serve the spirits, it is a way of seeing the world, a particular mode of interaction with others, and ultimately a ritualized system of healing and of relating to larger cosmic forces within the universe. As a sophisticated philosophy and complex religious system, Vodou regulates this worldly existence while harmonizing humans' rapport with the divine.

Origins

Vodou developed in the crucible of colonial life. Haitian Vodou is a neo-African spiritual system, philosophical construct, and religion whose core resides largely in Dahomey (presently Benin) and in Yorubaland, in western Nigeria. The term *Vodou* derives from the Fon word for "god" or "spirit." It also signifies in a larger sense "in the

company of the spirits" or "belonging to the family of the spirits." Another common interpretation is "introspection into the unknown." There are other meanings. In Ghana, for example, spirits are called Vodous. Haitians call the deities *Lwa*, *anj*, and *mystè*. What is distinctive about Haitian Vodou additionally is that it incorporated the powerful systems of the Bakongo peoples in Central Africa, creating a synthesis that did not occur elsewhere in the Caribbean or in Latin America. Also, earlier influences were found extant from Islamicized, enslaved Africans. Vodou had been a powerful ideological force in waging the wars of liberation in Haiti, in forging the revolutionary movements that led to *the dismantling of slavery and independence*. It is certain that Haitian leaders and the mass of insurgents were well versed in these African and neo-African traditions, especially since as many as two thirds of the population had been born in West and Central Africa and not in the colony of Saint-Domingue. Vodou in Haiti seems to have been a deliberate amalgam of various African traditions, cobbled together from similar systems in an effort to unify Africans from various parts of the continent and speaking different African languages well into the first two decades of the 19th century, after independence was proclaimed. Vodou also incorporated some aspects of the religion of the Arawaks, Freemasonry, and, of course, Catholicism. From the latter, it integrated more than juxtaposed the dates of celebrations for the saints now associated with the Vodou *Lwa*, the Catholic iconography, and the prayers that many still use to open Vodou ceremonies (*sèvis Lwa*). Vodou—together with the Creole language, which evolved from a similar base—served as a unifier, particularly in the provinces, when the populations retreated from national public life in the form of a quasi-permanent *maronage*, in protest against having been marginalized by the Haitian power structure that emerged after independence in 1804. Haiti then found itself isolated and ostracized, but this also gave Vodou time to develop further until the Concordat signed between the Haitian state and the Holy See in 1860. In those six decades, it acquired some of its final forms, unimpeded, alive in both rural and urban settings, not having to share the national space with other religious traditions. After that, things changed. Vodou had to contend with persecutions

from both the state and the Catholic Church during various times in its history, notably in 1896, between 1913 and 1941, during the aftermath of the Duvalier regime, and currently, as Vodou is under constant attack from various Protestant sects.

Philosophical Tenets

Haitian Vodou's theological structure is similar to other religious forms found in Africa and elsewhere on the American continents, North and South. It shares similarities with Cuba's *la Regla de Ocha* (Santería) and with Brazilian Candomblé in all its variants. Haitian Vodou, as other African or African-derived religions, lends itself to monotheistic faiths in the establishment of one supreme, omnipotent God. This supreme entity, Gran Mèt or Bondye, however, is immaterial in every sense of the word, as prayers are not addressed to "it." Below the Gran Mèt are literally hundreds of deities, Lwa, that are emanations of natural forces, energetic and electromagnetic entities even, that are rendered into ethical principles or societal values and, then, anthropomorphized. As illustrations, Danbala Wedo is *knowledge*, while the Ezili spirits represent *love* in its many guises. *Justice* becomes Ogou, and its many manifestations. Gede is *life* itself, sexuality, and death—all poles of the same continuum. Human beings and all of nature are associated with one or the other deities, with whom they share their vital energies. Each person has a guardian angel so to speak, the Mèt Tèt, who leads and guides the person. This would provide the basis for African/Haitian psychology, pedagogy, and other disciplines that place the person at the center of creation. In Haiti, Vodou is the superstructure. It transcends religion, and beyond spiritual discipline, it infuses all other societal systems. Vodou is never far removed from all fields, be they economics, politics, family structure, healing, or the arts, providing an integrated and integrative world sense that goes a long way in explicating the country's history and cultural life.

Rituals

The Lwa are grouped primarily in two major pantheons, the Rada (Fon), the sweeter spirits with cooler energy, and the hotter deities from the

Petwo-Kongo traditions; some see the latter more as Creole spirits from this continent who respond to particular needs of the Haitian population at given times. For instance, Ogou, the warrior who gives strength and courage, seems to be a favorite in ceremonies in rural settings or overseas, where Haitians struggle to create a safe space. Depending on the call placed by the drums or songs—drumming and songs are central elements of the ceremony and are carefully orchestrated—Ezili may come, for example, as a Freda (Rada) or as Jewouj or Dantò (Petwo). During ceremonies, Lwa mount their *chwal*, their horses, joining in the life of the living to deal with health and family crises and spiritual imbalance, to allow energy to flow better, and to advise, chastise, guide, and restore balance and harmony, continuously opening channels of communication between spirits and humans; the Lwa also visit in dreams. Each Lwa has its color(s), tree, scents, *vèvè* (a ritual drawing traced at the beginning of ceremonies), songs, day of the week, and favorite food carefully prepared and placed on beautifully crafted altars during *sèvis*. Sophisticated rituals and initiatory rites are part of the process leading to the priesthood. The male (*houngan*) and female (*manbo*) priests are ultimately responsible for the needs of their Vodou families; the *hounsi* are initiates who have undergone the first level of initiation (*kanzo*) and assist in the rituals at the house or the temple (*hounfò*). In the peristil (temple), one finds the *djèvo*, the initiation room and the center post, the *potomitan* through which the Lwa travel from under the water, from *anba dlò*, where they reside.

Future

Haitians typically never discuss Vodou; they live it. This is understandable in light of the circumstances under which it emerged and evolved and due to the pervasive misrepresentations of the West. Vodou was not recognized as a national religion until the constitution of 1987 and the presidential decree of April 4, 2003, which officially made it a religion *à part entière*, deserving equal rights along with other faiths. As more and more practitioners in Haiti acknowledge their involvement in Vodou and as the religion becomes less stigmatized overseas, it is now more accepted for Haitians and others hailing from the African

diaspora as well as *Blan* (non-Blacks), to practice it openly and with pride in Haiti and in other parts of the world, including the United States, Cuba, the Dominican Republic, Canada, and France. Estimates of Vodou practitioners overseas range above 1 million. Contemporary research and advocacy work has started to change the image of Vodou in Haiti and abroad. Pioneer scholars include Milo Rigaud, Harold Courlander, Katherine Dunham, Maya Deren, and, more recently, Karen McCarthy Brown, among many other active researchers. We also note the efforts of groups such as KOSANBA, the Scholarly Association for the Study of Haitian Vodou, and associations such as Zentrail, Bodè National, and the *Konfèderasyon Vodouizan Ayisyen*, or the 2008 election of a national representative for the religion: Max G. Beauvoir. All in all, the presence,

role, and importance of Haitian Vodou in Haitian history, society, and culture are unarguable. Vodou is recognizably a part of the national ethos and should be embraced as such.

WAHHABIS

The Wahhabis today represent an ultraconservative, orthodox interpretation of Islam that is characterized by belief in and adherence to absolute monotheism (*tawhid*), giving particular attention to ritual correctness and the centrality of Shari'a (Islamic law). Although the heartland of Wahhabism remains Saudi Arabia, the use of the kingdom's tremendous financial resources for missionary activity (*da'wah*) has resulted in global influence.

Wahhabism was originally founded in central contemporary Saudi Arabia by the 18th-century religious and legal scholar Muhammad Ibn 'Abd al-Wahhab as an Islamic revival (*tajdid*) and reform (*islah*) movement. The original movement called for a return to the Qur'an and Hadith (records of the sayings and deeds of Prophet Muhammad) for the purpose of historical and thematically contextualized reinterpretation (*ijtihad*) and rediscovery of their either specific or universal meaning, as opposed to the then current practice of imitation of past scholarship (*taqlid*). Ibn 'Abd al-Wahhab preached a program of invitation (*da'wah*), in which preaching and a gradual educational process were intended to lead to social transformation and consideration of public welfare (*maslahah*). Jihad was therefore limited in both scope and importance in Ibn 'Abd al-Wahhab's writings and was to be used only in the defense of a Muslim community under military attack or the threat of imminent military attack.

Wahhabism entered its political phase through the formation of an alliance between Ibn 'Abd al-Wahhab and Muhammad Ibn Saud in 1744, a relationship that remains at the core of the contemporary Saudi state. The original alliance demarcated the boundaries between religion and politics, as the imam was responsible for the religious leadership, instruction, and guidance of the state, while the emir was responsible for political and military leadership. Following the death of Ibn Saud in 1767, the state usurped a portion of the imam's prerogative, embarking on a program that used religion, specifically the command to promote virtue and prevent vice, to justify state consolidation and the establishment of national unity. The addition of the teachings of the medieval scholar and jurist Ibn Taymiyya to the Wahhabi tradition by the early 19th century further placed religion at the service of the state through its justification of jihad as holy war against those deemed to be state opponents or those failing to live according to the Wahhabi interpretation of Islam.

Defined by its emphasis on *tawhid*, which does not permit association of anyone or anything with God (*shirk*), Wahhabis across history have confronted and sometimes engaged in conflict with other sects or trends in Islamic thought considered to be engaged in associationism, most notably Shi'is and Sufis, through accusations of their being unbelievers (*takfir*). This *takfiri* ideology was developed into a jihadist trend by certain extremists in the 20th century, purportedly justifying jihad as holy war against any individual or state accused of failure to abide by their interpretation of Islam.

Particularly since 9/11, the Saudi religious establishment and independent shaykhs have emphasized the differences between jihadist trends and the Wahhabi tradition, sometimes referred to as Salafi. Alongside those who seek to maintain the religious status quo, there are a plurality of voices calling for greater empowerment for religious scholars outside the religious establishment (notably the *Sahwis*) and for reinterpretation and reform of Islamic thought and practice within the kingdom, including by encouraging interfaith dialogue, cooperation, and coexistence.

WALES

The story of religion in the United Kingdom region of Wales is closely bound to her struggle for identity and autonomy to preserve and protect her culture and her language against the encroachments of England, her mighty neighbor to the east. Druidism is the earliest recorded religion in Wales, but the arrival of the Romans and then the spread of Christianity overwhelmed this and other native British cultures. In the 500 years before the invasion of the Normans in 1066, Welsh Christianity flourished, but the new French rulers imposed religious unity by demanding recognition of and obedience to the church headed by the Archbishop in Canterbury. This was reinforced during the Protestant Reformation, when King Henry VIII broke with the pope and the Church in

Rome to assert his political supremacy in his kingdom as well as his religious authority in 1534.

To carry the new doctrines to the people, the Bible was translated into vernacular languages, and in Wales, both the faith and the language were boosted by this move. Protestantism thus became well anchored, and during the religious and political upheavals in England, the Welsh people moved closer to Puritanism. Many members of Puritan sects such as Quakers and Baptists fled to America to escape persecution. The tradition of religious dissent continued in Wales and was marked by a series of religious revivals, the first of which was the Methodist movement in the 18th century, and John Wesley himself journeyed around southern Wales preaching.

The new conditions of the Industrial Revolution changed Britain economically, politically, and socially, and Nonconformist groups, which also included the Congregationalists, moved away from the Church of England, beginning a great movement of chapel building so that the congregations might have their own places of worship. However, even as Wales underwent a last great revival around 1904 to 1905, religion and the strict moral code of the Nonconformists were being superseded by socialist movements, especially in the industrial heartlands of the southern Welsh valleys. The temporary prosperity brought by the two world wars gave way to economic depression and religious decline.

The Church in Wales was disestablished in 1920, becoming a member church of the Anglican Communion, but today technological change and increasing secularism mean that Christianity is losing its impact. Today, all the main world religions have communities in Wales. The oldest Muslim community in Britain was established by Yemeni migrants in the 1850s in Cardiff, the home of the first British mosque, of which there are now 40 in Wales. It is estimated that there are about 5,000 Hindus in the country (total population 2.9 million) and a similar number of Buddhists, most of whom live in communities in central and western Wales. The Jewish community in Wales numbers around 2,000, which is also approximately the number of Sikhs living there. In recent years, Druidism has been revived in parts of Wales where people have reverted to pre-Christian traditions and beliefs.

WAR ON TERRORISM

The phrase *War on Terrorism* (also known as “the War on Terror” or “the Global War on Terror/Terrorism”) refers to the broad military, political, and legal initiatives launched by the United States and its allies following the terrorist attacks of September 11, 2001. Although the phrase had been used as early as the 19th century, it came into widespread usage by the Bush administration following the 9/11 attacks to refer to a global campaign against terrorist organizations, individuals, and state sponsors of terrorism that included, but far exceeded, the al Qaeda network. In his 2002 State of the Union address, for example, President Bush defined the War on Terror very broadly as a campaign not just against al Qaeda but also against the “axis of evil,” consisting of Iraq, Iran, North Korea, and their “terrorist allies.” From its inception, the War on Terror had complex religious implications, some explicit and others less so.

While President Bush used the term *crusade* only once to describe the War on Terror, he did make consistent and repeated use of the language of “good versus evil” and numerous invocations of God, the Almighty, and Providence. Perhaps the clearest example of this use of religious rhetoric appeared in President Bush’s 2003 State of the Union address, in which he made the strongest case for the invasion of Iraq. Here, the president first identified the “evil of international terror” with the “evil” of Saddam Hussein’s regime; and he then identified the United States as the nation that has received the “call of history” to aid in the spread of freedom as God’s gift to humanity:

Americans are a free people, who know that freedom is the right of every person and the future of every nation. The liberty we prize is not America’s gift to the world; it is God’s gift to humanity. We Americans have faith in ourselves, but not in ourselves alone. We do not claim to know all the ways of Providence, yet we can trust in them, placing our confidence in the loving God behind all of life and all of history.

Many critics of the War on Terror argued that its sweeping rhetoric has been used to justify a wide range of problematic and at times illegal agendas.

These include the preemptive invasion of Iraq; a vast program of warrantless wiretapping; the use of harsh interrogation techniques such as waterboarding (which the United States itself considered torture after World War II), indefinite detentions, a network of secret CIA prisons, and other alleged human rights abuses. Moreover, many critics questioned the fundamental logic of declaring war on a tactic such as terrorism rather than on a specific nation or group, which would seem to imply a state of perpetual and unwinnable war.

In March 2009, the Pentagon under the new Obama administration ceased to use the phrase *War on Terror* and began to adopt the alternate phrase *Overseas Contingency Operation* to describe its efforts to combat global terrorist organizations. After the killing of Osama bin Laden by a U.S. military raid on his hideout in Abbottabad, Pakistan, on May 2, 2011, many observers declared that the “War on Terror” was finally over.

WEBER, MAX (1864–1920)

Max Weber, an original mind and one of the most influential thinkers of the 20th century, laid the ground for the theoretical and empirical foundations of the sociology of religion and the comparative analysis of civilizations. His classical essay *The Protestant Ethic and the Spirit of*

Capitalism is a refutation of a vulgar historical materialism that dismisses the role of religious values and beliefs in social action. In this early essay, published between 1904 and 1905 in the journal *Archive for Social Science and Social Policy*, Weber addresses the problem of the relationship between religion and modernity and the impact of religious values and beliefs on the modifications of human behavior and its subsequent effects on the rise of modern capitalism. His analysis focuses on one form of inner-worldly asceticism: Calvinist Puritanism.

Weber's thesis argues that the rise of modern capitalism was the unintended consequence of the actions of the Puritans, who were seeking a "right religious form of life" to reach salvation. The Puritans, following Calvin's theology, thought that the only way to attain salvation was to dedicate themselves to the construction of the Kingdom of God on earth. The Puritans redefined their relationship with nature and with themselves through hard work and religious discipline. This "redirectionality" of people toward nature was possible only by the radicalization of the Christian doctrines of salvation and the theological conceptions of the inscrutability of God and predestination of souls—the idea that God's intentions are beyond human comprehension and that salvation does not depend on one's own effort. No individual, according to Calvin, has the power to decide his or her salvation; only God has this power. Our works do not contribute anything to this purpose. In Calvin's writings, the desperate Puritan found a "path" that clearly set the steps to true religious piety and salvation. In their search for certainty, the Puritans found a form of corroboration of being chosen by God in the realization of their callings and in their everyday jobs and activities. As a consequence, every detail of life changed, including habits of work, social relationships, and even sexual behavior. In this process, asceticism and hard work, the main expressions of Calvinist conversion, permitted the creation, accumulation, and reproduction of capital. The irony of this phenomenon is that Puritanism undermined its own purposes. Capitalism grew, and Puritanism eventually faded away; the world became the scene of a ceaseless market and not the domain of Puritan morality.

However, the thesis that predestination had a fundamental role in the rise of capitalism is only a surface-level view of Weber's work. Weber

considered that "rational capitalism" and "Protestant ethic" are ideal types used to emphasize one of the multiple factors that determined the emergence of modern capitalism. Weber undertook a comparative analysis of other civilizations to determine the specific social conditions that were fundamental in the rise of Western capitalism.

For Weber, capitalism is a new form of restructuring social space according to a specific form of rationality that was possible only in Western societies. In looking for answers to this singularity, he undertook a work of comparative scholarship. Between 1916 and 1917, Weber published his essays on the religions of India, China, and Ancient Judaism. In 1920, these essays were published in a single book titled *Collected Essays on the Sociology of Religion*.

In searching for this uniqueness, Weber emphasized that Western capitalism is the final culmination of a complex mix of social factors that involved calculability, formal and fixed rules, written notations, and social coordination based on a single moral standard, among other factors. Weber identified three problems that he did not fully develop in *The Protestant Ethic*: (1) the rise of modern science and its struggle against magic, (2) the role of brotherhood and equality in the destruction of a society based on kin relationships (family relationships) and their replacement with individually based relationships, and (3) the role of social carriers who diffuse and incorporate in their activities and actions the theories and doctrines of charismatic leaders.

After analyzing Confucianism, Daoism, Hinduism, and Buddhism, and contrasting their ethics and ideas with the theology of the Puritans, Weber argues that these religions impeded the suppression and abolition of magic and rested on family ties, which hindered the development of a universal morality and its corresponding legal institutions. Weber concludes his comparative analysis by highlighting the revolutionary force of the notions of brotherhood and equality of prophetic Judaism and their importance for the rationalization of the world in Western societies. Messianic prophecy in ancient Judaism provided a morality in which rewards and punishment were distributed according to a universal and single moral standard, replacing traditional morality based on the distinction between the in-group and the out-group. Moreover, the defeat of magic by Judaism

represented an essential precondition for the rise of Western rationality. The liberation of religion from magic is one of the fundamental criteria for rationalization and for a modern economic mind-set.

Despite the importance of these “utilitarian” dimensions of religion, Weber considers that they are not the only fundamental aspects of the multi-form and complex nature of religion. He views religion as a form of “existential justification” against the chaos, fragility, and senselessness of human life.

In the history of religions, there have been “specialists” in the administration and innovation of the goods of salvation: priests and prophets. Weber relates specific social activities such as the intellectualization of the world with specific social groups. Weber views at least two forces that operate in the transformation of religion: differentiation and rationalization. Weber sees the first distinction of religion from magical coercion in the differentiation of the magician from the priest. The process of differentiation is simultaneously the expression of an increasing rationalization. The recognition of the power of a god and of his character as a personal lord is the fundamental prerequisite for the distinction between religion and magic. The god is no longer an object of coercion. The god becomes an autonomous entity with his own plans and desires. The only way to obtain his favor is through entreaties and gifts. The priest becomes the new mediator between the overlord and its human supplicants. In this way, the differentiation of gods from demons entails the rise of the priesthood as a distinctive social group, and this social distinction is an essential *precondition* for further rationalization.

Like the opposition between the priest and the magician, Weber defines the prophet in contrast to the priest. The latter defines his authority based on his official position, his office. The prophet receives, in contrast, his legitimation and authority from his personal calling: revelation and charisma. In this sense, the prophet is similar to the magician insofar as the prophet exerts his power by virtue of his personal gifts. However, the prophet is not a mere entrepreneur of the goods of salvation; he is a carrier of a doctrine or commandment. The prophet is someone who establishes a new moral order, such as Solon or Moses. The establishment of a new system of law has historically required the need for legitimation, and a firm and common

foundation for legitimacy has always been religion, which secures “divine approbation.”

In his unfinished opus magnum *Economy and Society*, Weber undertook a synthesis of his ideas. In this work, Weber insists that religion is a social matrix of meaning that provides significance and guidance to social actors who, in contexts of uncertainty, need to answer basic questions about their existence. Among those questions, the most important is concerned with the destiny of the self and the precariousness of human existence: death and suffering. For Weber, the constitution of the social group is not the mere result of material interests but the historical confluence of ideal needs, for instance, the need for a logical explanation of the existence of evil in the world. The rise of a particular group is the outcome of the multiple social forces that underlie diverse human needs. For Weber, events, works, and human accomplishments are the expression of particular historical crystallizations.

The impact and influence of Weber’s theories are enormous. Since the translation of the German edition of *The Protestant Ethic* into English by Talcott Parsons and the subsequent efforts of structural functionalism to integrate Weber’s sociology into its own categories, the work of Weber has stimulated original research on the relationship between politics and religion in Robert Bellah’s notion of civil religion, and on the interrelationship between Axial religions and multiple modernities in the work of S. N. Eisenstadt.

WOMEN'S ROLES

The role of women refers to characteristics and behaviors of females within a religious tradition, as well as the influence that particular women have had on the development of the tradition. Long ignored, women's role is a topic that has attracted a great deal of interest and controversy since the advent of the feminist movement in the past century. While early feminists criticized religions for legitimating patriarchy, later research has shown that women's role in religion varies considerably. It varies not only across different religions but within any one religious tradition and can change significantly over time. To assess women's role, one must consider not only their place in the church or temple but also in the domestic realm. One must distinguish between official teachings of religion and popular movements and between what is taught and what is actually practiced. This entry will discuss patriarchy, changes in women's role in religion over time, and variations in women's role within particular traditions.

Patriarchy in Religion

Patriarchy (male dominance) has been the norm both in universal world religions and in indigenous religious tradition for most of recorded history. Almost all religions articulated the primary role of women as wives and mothers, limiting their participation and leadership in religious institutions and subordinating them to male authority in both the private and the public domain. By designating women's roles as divinely ordained, religion provided powerful justification for gendered norms.

The three great monotheistic religions have historically been patriarchal in structure. Jewish women were not counted in the minyan (the quorum of 10 men that is necessary to have public worship) and were excluded from the rabbinate. While observant male Jews are bound by 613

mitzvot (commandments), the Talmud exempts women from all positive time-bound commandments, including synagogue attendance on holy days. The only exception, three women's mitzvot (weekly preparation of bread and lighting of Sabbath candles and the observance of purity laws during menstruation), do not challenge the assumption that women's primary role is to take care of the home and children.

Christian women were similarly excluded from the priesthood in the Catholic Church and from ministry among Protestants. While women were included in public worship, the Bible admonishes women to be silent in church and to submit to their husband's authority. The ideal role for women was modeled on Mary, either a virgin or a mother. Proper motherhood required marriage, which meant that the only role available to most Christian women was to be somebody's wife. Monastic life offered alternative religious roles for women as a scholar or teacher or even as leaders in religious ritual. But such roles were limited to the confines of the monastery and the company of other women.

The separation of female space was also important in Islam, even without a monastic tradition. In some Islamic cultures, women went to separate prayer services. More commonly, the mosque was considered male space (like the synagogue), while women prayed at home. As does the Bible, the Qur'an stipulates male authority in both the home and religious institutions. The imam has always been male, even when he is leading a female prayer service. A wife should be obedient and can be punished if she is not; and the custom in many cultures of women's seclusion to the private quarters of the home along with wearing a covering (hijab) in public spaces further reaffirmed her primarily domestic role.

The role of women in the major Asian religions was similarly circumscribed. In Confucian philosophy, which provided the basis for gender roles in the religions of China, Japan, and other East Asian cultures, women's yielding to male authority is articulated as reflecting the natural order of the universe. In India, Hindu religious law, as articulated in the *Dharmashastras*, such as Manu's, describes a woman's primary role as serving her husband as a living god. Her religious duties were to bear him sons, keep the house, and, following the mythical

model of Sita, selflessly devote her life to his welfare. A pious woman must pay respect to various deities, but the priests conducting services in Hindu temples to both gods and goddesses were always male. While Buddhism has no priesthood, its institutional leadership has been predominantly male. The sangha was theoretically open to women, and female monasteries were established in some cultures, but the vast majority of Buddhist orders were male. The guidelines for monastic rule articulated different behavioral precepts for men and for women and subjected female monasteries to the administrative oversight of male colleagues. In short, it is not difficult to find support for feminist claims that religion has served to legitimate patriarchy.

There are exceptions to the patriarchal pattern. Remarkably, the sacred texts of all these religions include descriptions of women as public leaders or even goddesses: Deborah (a prophet and judge) in Judaism, Aisha (an author of the Hadith) in Islam, Mary Magdalen (receiving instructions from the resurrected Jesus to tell the others of his return), Durga (a warrior goddess) in Hinduism, and Prajapadi (founder of the first women's sangha) in Buddhism. But these legendary ideals did not generally translate into the institutional roles available to ordinary women.

Institutional leadership was possible for women in religions with a significant monastic tradition, such as Buddhism and Christianity, which offered a religious alternative—the role of nun—to women who did not wish to marry and have children. While female monasteries often had fewer resources and were administratively subject to male authority, they provided education and leadership opportunities often unavailable in the surrounding culture. But these exceptions do not challenge the underlying assumption that women's primary religious role is within the home.

There were also exceptional individuals—women, who despite institutions that subordinated them, had an important and lasting impact on their tradition: Jewish women such as Beruriah, a second-century Talmudic scholar; Catholic writers such as Christine de Pizan, who spoke out against the misogynist writing of her time, or nuns such as Hildegard of Bingen, who produced beautiful music that is still played today; among Protestants, Mother Ann Lee, founder of the Shakers, whose followers believed her to be the second coming of

Christ, and Frances Willard and Elizabeth Cady Stanton, who advocated not only for women's suffrage but also for women's right to follow God's call to the ministry; in the Islamic tradition, Aisha, the youngest wife of the prophet Muhammad, the presumed author of numerous Hadith and said to have ridden into battle with the Sunnīs; and in the Vajrayana Buddhist tradition of Tibet, biographical accounts of women who became siddhas (enlightened ones), such as Mandarava, a Tantric teacher. It is possible that there were more such women whose lives were not recorded. The official history of most religions is largely "his story," with the contribution of women rarely noted. Feminist scholarship has begun to fill in the gaps, recovering writings by and about women as well as sociological data about the lives of women in the past. But much work remains to be done.

Indigenous religions are also sometimes viewed as an exception to the patriarchal pattern. In fact, most indigenous cultures do assign specific roles to men and women, with female religious activities typically focused on family and children, while males preside over public religion. Thus, women played a leadership role in the celebration of a girl's coming of age ceremony among the Apache. But in the Lakota Sun Dance, an annual celebration that draws Native Americans from many different tribes, women were historically excluded from participation. One area in which women have long had public religious authority is as a healer or a medium. In many indigenous cultures, the collection of healing herbs was a female role, passed on from mother to daughter. The role of shaman or diviner, who acts as a medium between humans and the spirit world, is also often open to women. Examples of female religious healers include *curanderas* in Mexico, diviners in East Africa, or shamans in Korea. But how typical these roles are remains a matter of debate. Indigenous religions are small and have not been as extensively studied as the world religions. They often rely on oral transmission, so we lack reliable data about their past. Finally, they often coexist in a culture dominated by one of the patriarchal world religions, so it can be difficult to sort out what is indigenous and what reflects outside influence. Given the currently available information about indigenous religions, it appears that they are no more gender neutral than world religions. In short,

while there are variations in the details, all religions seem to be characterized by some degree of biological determinism.

Changes in Women's Role

History suggests that restriction or subordination of women's role may not be inherent in a particular religion. Rather, it develops and evolves as various generations interpret and apply a tradition. Religious traditions dynamically interact with the culture around them: They both shape it and are shaped by it.

Goddess Religion

We do not know whether women's role in religion was always subordinate. Some scholars hypothesize that patriarchal world religions were preceded by a matriarchal, goddess-worshipping culture, in which women were free and had equal if not more power than men. This peace-loving, unarmed culture was wiped out by the invasion of warlike nomadic hordes that imposed patriarchal religions. While there is little doubt that many ancient cultures did worship both male and female deities, what impact this had on the role of human women remains unclear. The theory that religion once empowered women has considerable popular appeal, but the evidence for it comes mostly from archaeological remnants of preliterate cultures, the interpretation of which is disputed.

Liberating Founders and Patriarchal Institutions

In religions for which we do have written records, women's role changes over time. All the major world religions emerged many centuries ago in cultures that were deeply patriarchal, where women were widely viewed as not only physically but intellectually inferior and were, like children or slaves, considered the property of men. We should not be surprised, therefore, that sacred texts are rife with sexism. But at least some of the founders of the great religions also challenged the values of their time. In Hindu culture of the fifth century BCE, the religious life was open only to men, but Gautama Buddha allowed women into the sangha. In the context of the Jewish culture of his time, it was quite radical for Jesus, a rabbi, to have female disciples. Muhammad

established laws that protected women's right to education, income, and inheritance. Reportedly, the prophet's wives were actively engaged in the early Muslim community, and although some elders opposed it, Muhammad resisted their efforts to exclude women from Friday prayer.

Unfortunately, the founders' efforts to improve women's role were almost always eroded over time. There is ample evidence of women teachers in early Christianity, but this gives way to an all-male priesthood by the second century. Female Buddhist monastic orders were established during Gautama's lifetime but soon declined and had all but vanished by the sixth century. After Prophet Muhammad's death, women were gradually pushed out of public religious participation. As contemporary sociological research has shown, new religions often challenge the values of their culture, and later when the movement becomes institutionalized, moves from sect status to that of church, it adapts to mainstream cultural values. In most parts of the world, patriarchy was mainstream. So patriarchy in religion went unchallenged until the modern age.

The Feminist Movement

Women's roles in many religions began to change with the coming of modernity in the late 18th and the 19th centuries. The rise of individualism, which gave birth to democratic movements, combined with the increasing power of science to undermine the authority of religious institutions, preparing the ground for feminists to question patriarchal understandings of women's role. Feminism is often perceived as a secular movement that undermines the traditional values of religious institutions from the outside. But the efforts to reform religion are almost always driven by some of the most faithful followers of a religion, those willing to risk disapprobation or even punishment by religious authorities. And sometimes, the impetus to expand women's roles in secular society originates in religion. Thus, many of the activists for women's suffrage in mid-19th-century America were evangelical Christians. Religious feminists sought to change women's role so as to empower and include them fully in the practice and leadership of their traditions. They questioned laws and traditions that restricted women's role to the home and promoted

women's leadership in church and synagogue. As a result of these efforts, women are now ordained as ministers in many Protestant churches, as rabbis in Reform and Conservative Jewish communities, and as abbots of Buddhist monasteries.

Variations in Women's Role Within Traditions

The understanding of women's role in a given religion is based on traditions, many of them centuries old. But tradition must be interpreted, and not everyone interprets it the same way. The secularization of many societies, particularly in wealthier, industrialized nations, has led to a split in many religious traditions between more liberal, modernist branches, which are open to feminist interpretations, and fundamentalist ones, which are not. While Anglicans and Reform Jews, for example, began ordaining female ministers and rabbis in the 1970s, Catholics, fundamentalist and evangelical Protestants, and Orthodox Jews still do not permit the ordination of women, and they affirm woman's commitment to the domestic sphere as primary. Even within conservative religious communities, however, there are debates over gender, with women's role often serving as a symbol of denominational boundaries, distinguishing between religions that adapt to changing cultural mores and those that do not.

Variations in women's roles are also found in mystical movements that stress direct religious experience. Here, written doctrines or institutional rules that may exclude women are trumped by the Spirit of God. In Hassidic Judaism, Chana Rochel could become a female rebbe in 19th-century Russia. In Pentecostal Christianity, there were women such as Aimee Sample McPherson who, filled with the gift of the Holy Spirit, became charismatic leaders of major churches. And there are numerous female gurus, such as Ma Jnanananda, who are revered as divine incarnations by thousands of followers in devotional Hinduism.

There have always been differences between how the leadership of religious institutions understand women's role and how ordinary people practice it. The sacred texts and laws of any tradition are produced by a literary elite, usually male, whose teachings tend to exclude women from formal religious practice. In many cultures, however,

women do play important roles in domestic rituals and may even lead public rituals when the need arises. In rural India, Hindu women preside over rites celebrating the birth of a child, and they conduct puja to the goddess Devi or to Lord Krishna to protect their husbands or family. In the United States, we find women preaching in fundamentalist Christian churches whose formal teachings would seem to exclude women from such roles. In states that have a shortage of Catholic priests, there are nuns leading all aspects of parish life, including religious services (a traveling priest is brought in to celebrate the Eucharist).

Differences in the role of women in various religions can also be caused by factors external to religion, such as the level of education or the degree of church-state separation where the religion is practiced. It is a common prejudice among Westerners to think of Christianity as less patriarchal than other religions because women in predominantly Christian nations such as England or the United States have more choices and rights than those in other parts of the world. Such a judgment overlooks the fact that there is a vibrant fundamentalist Christian movement that defends traditional women's roles and thousands of Western Christian women who believe that God created them to serve a husband in the home. The freedoms enjoyed by Western women may derive less from Christianity than from a secular legal system that prevents state enforcement of religious laws and allows individuals to choose whether or not they want to follow traditional gender roles. Role choices are also expanded by education, which allows women to question patriarchal customs and offers alternative interpretations of their tradition. In India, for example, Hindu women living in rural areas are still largely confined to the role of wife and mother, and their religious behavior is oriented to preserve the welfare of their husbands. Among educated women, however, we find numerous doctors and engineers and a nascent feminist movement that is beginning to articulate Indian goddesses as a source of women's empowerment.

Women's role in religion continues to be the source of much debate. Traditionalist explanations assert that gender roles are ordained by God (or a wise leader) and should not be changed. In this view, placing women under male authority and assigning them primarily domestic roles reflects the natural differences between the sexes. The role of

women is different, but it is no less valuable than that of men. Modernist interpreters suggest that women's roles in religion reflect the patriarchal values of ancient cultures—cultures in which slavery was morally acceptable and women had the legal status of children—that are no longer appropriate today. Feminists point out that it was men who wrote the sacred texts and established the institutional rules of organized religion. These men's articulation of women's role reflected their own experience of women in their lives as mothers, wives, daughters, or lovers—women whom they depended on and loved but who may also distract them from their religious pursuits. In this view, assigning women a different role from men only perpetuates women's subordination.

charity based in the United Kingdom. According to its website, the WCF “works to develop better understanding, cooperation, and respect between people of different faiths.” The WCF accomplishes this work by sponsoring lectures, conferences, and travel opportunities and by publishing newsletters and books that address interfaith issues.

The WCF was founded by Francis Younghusband and several of his associates in 1936. The son of John Younghusband and Clara Jane Shaw, Francis Younghusband was born in India in 1863. After spending parts of his childhood in both India and England, where he was raised a Christian, Francis Younghusband later joined the military and traveled extensively throughout India, China, and Tibet. In a 1936 BBC broadcast published in *The Listener* magazine, Francis Younghusband traced his inspiration for the WCF to the years he spent abroad, during which he encountered and befriended numerous individuals of the Confucian, Buddhist, Hindu, and Muslim faiths.

The creation of the WCF was also influenced by Younghusband's participation in the second World Parliament of Religions, held in Chicago in 1933. In his scholarship on the WCF, Rev. Dr. Marcus Braybrooke notes that Younghusband's involvement with the World Parliament of Religions encouraged him to organize his own international gathering committed to building fellowship among people of different faiths. While several titles were considered, such as “The All-Faiths Fellowship,” ultimately the meeting was dubbed the “World Congress of Faiths.” Held at University College, London, in 1936, the first WCF brought together prominent scholars of world religions, including Yusuf Ali, D. T. Suzuki, and Sarvepalli Radhakrishnan, as well as various clergy and religious leaders. According to Braybrooke, it was agreed that the aim of the WCF was not to create a new synthetic religion but rather to generate understanding and a sense of unity between the world's religions. After this conference, the WCF became an interfaith organization with an executive body and president, and since its founding, the WCF has sponsored numerous interfaith gatherings and initiatives.

The initial vision for the WCF was international in scope, which to this day is reflected in the organization's popular journal *Interreligious Insight*

WORLD CONGRESS OF FAITHS

The World Congress of Faiths (WCF) is an interfaith membership organization and registered

(formerly *World Faiths Encounter*). In recent years, the work of the WCF has been concentrated primarily in the United Kingdom, where it is a member of the Inter Faith Network, an association of British interfaith organizations. From its inception to the present, the WCF has been a leading voice in the interfaith movement, helping forge respect and understanding among people of different faiths at the international and domestic levels.

WORLD COUNCIL OF CHURCHES

The World Council of Churches [WCC] is a fellowship of 349 Christian denominations representing all inhabited geographical regions of the earth. The council began to be organized in the late 1930s, but World War II (1939–1945) delayed its formal inauguration until 1948. Its principal purpose is as a forum for dialogue and cooperation among member churches and their partners in other churches, faiths, and agencies. Primary programmatic emphases include theological discussions, mission and evangelism, peace and justice, ecological integrity, the role of churches in international affairs, and interreligious relationships.

The preponderance of WCC member churches are Protestant, Orthodox, Anglican, or Old

Catholic. Several Pentecostal bodies have joined the WCC in recent decades. The Roman Catholic Church is not a member of the WCC, but relations between the two bodies have been positive since the Second Vatican Council of the early 1960s. There is a Joint Working Group between the Roman Catholic Church and the World Council of Churches, and there are joint commissions made up of delegates from both fellowships.

Historical Background

The modern ecumenical movement, dedicated to the search for church unity, began in the late 19th century, when Christians regularly began to pray and work across ecclesiastical boundaries in search of greater oneness in Christ. Discussions arising from the World Missionary Conference held at Edinburgh, Scotland, in 1910 led to the creation of the International Missionary Council and several other movements for closer interchurch relations. Among these movements were “Faith and Order,” concerned with matters of doctrine and church government; “Life and Work,” focusing on cooperation in social, medical, and service ministries; and an alliance of churches acting to promote world peace.

Following World War I (1914–1918), the Eastern Orthodox synod of Constantinople addressed a letter “to all the churches” proposing the establishment of a fellowship of Christian churches similar in form to the League of Nations. In 1937 to 1938, church leaders agreed to establish the WCC. In August 1948, representatives of 147 churches were able to assemble in Amsterdam and constitute the WCC. Most of the founders were from Protestant and Anglican churches in western Europe and North America.

In 2010, WCC membership stood at 349 churches and reflected the dramatic growth of Christianity in Africa, in Asia, and throughout the Global South.

The chief executive officer of the WCC is the general secretary. This office has been filled by Willem A. Visser 't Hooft, a Reformed minister from The Netherlands (while the WCC was in the process of formation, 1938–1948, and following the WCC's inauguration, 1948–1966); Eugene Carson Blake, a Presbyterian minister from the United States (1966–1972); Philip Potter, a

Methodist minister from the West Indies (1972–1984); Emilio Castro, a Methodist minister from Uruguay (1985–1992); Konrad Raiser, a minister of the Evangelical or Protestant church in Germany (1993–2003); Samuel Kobia, a Methodist minister from Kenya (2004–2009); and Olav Fykse Tveit, a Lutheran minister from the Church of Norway (2010–present).

The WCC holds its assemblies every 6–8 years. The First Assembly at Amsterdam was convened in 1948, and in 2006 the Ninth Assembly was held in Porto Alegre, Brazil. The next assembly is due to be held in 2013 in Busan, South Korea. The WCC central committee and executive committee meet regularly to guide the work of the council between assemblies.

Achievements Since 1948

In the decades since the founding of the WCC, new councils of churches and other ecumenical bodies in different countries and regions have created a genuinely worldwide network of which the WCC is an integral part. This network inspires its members to share resources of all kinds—theological, liturgical, spiritual, material, and human.

Since the papacy of John XXIII and the Second Vatican Council, the Roman Catholic Church has become a full member of many national and regional ecumenical organizations, international commissions, and the Joint Working Group that coordinates activities with the WCC.

Shared convictions on faith, life, and witness have enriched theological reflection. For example, theologians from different church traditions working together in the Faith and Order joint commission produced a 1982 statement on “baptism, eucharist, and ministry” that has led to greater understanding and changed relationships between churches of different confessional traditions.

During the Week of Prayer for Christian Unity in mid-January each year, Christians are drawn together in common worship and meditation. The annual theme is developed by the WCC-administered Faith and Order commission with the Pontifical Council for Promoting Christian Unity.

The WCC has also helped coordinate educational ministries among its member churches and, since the aftermath of World War II, has provided

a laboratory for graduate theological education at the Ecumenical Institute in Bossey, Switzerland.

Since its creation, the WCC has supported and inspired church participation in struggles for justice, peace, and the integrity of all creation. One example is the support given by churches, through the WCC’s Program to Combat Racism, to the struggle against apartheid in South Africa. Other examples include support for efforts to defend human rights in Latin America during the decades of military dictatorships, to advance the reunification of Korea, and to end internal conflicts in Sudan. One aspect of the WCC lies in its function as an NGO advocating for its members’ concerns in arenas related to the United Nations and particular governments.

Recognition of the importance of interreligious dialogue and relations with other faiths, as well as of the integrity of all creation, has been a particular hallmark of the WCC. From the end of the 20th century to the beginning of the 21st century, the WCC has focused on the churches’ solidarity with women and the overcoming of violence throughout the world.

Criticisms of the Council

The WCC has a diverse constituency and an even wider diversity of people outside its membership. Critics abound.

Some voices from the churches have accused the WCC of succumbing in its policies and activities to secular and political values. Orthodox critics have asked whether the council’s worldview owes too much to Enlightenment philosophy, while Western conservatives have found the Marxist underpinning of liberation thought exerting undue influence on WCC statements concerning international and economic policies.

In the 1970s and 1980s, the WCC came under intense criticism for its role in the antiapartheid struggle throughout southern Africa. In the United States, there were notably negative critiques of the council in the media, for example, in *The Reader’s Digest* and the CBS News magazine program *60 Minutes*.

After the International Missionary Council was merged into the WCC in 1961, many conservative Evangelicals argued that the interdenominational missionary task had sunk to second-place status at

best, playing a supporting role to the WCC's interest in causes of social justice and world peace. One response to the merger was the creation in 1974 of a new force for evangelical mission outside the WCC, the Lausanne Committee for World Evangelism.

A similar complaint has been made by some proponents of the Faith and Order agenda, claiming that the social and international interests of WCC leaders have reduced the resources available for doctrinal and ecclesial discussions.

Others have complained that the institutional nature of the WCC encourages a "cheap unity" that seeks easy accommodations and avoids hard choices. In such circumstances, old patterns of domination remain unopposed, and prophetic voices are muffled by means of bureaucratic devices.

Throughout its history, the WCC has sought to foster dialogue with its critics, to listen for and learn from uncomfortable truths, and to build new forums where more constructive cooperation among Christians is possible.

Initiatives With the Future in View

New forms of commitment are emerging in the life of the WCC. Young people are finding their own expressions (and thus assuming ownership) of the Christian movement. As the most comprehensive body among the modern expressions of inter-church dialogue and cooperation, the WCC has committed itself to building new relationships with nonmember churches and agencies through autonomous platforms such as the Global Christian Forum, the centennial celebrations of Edinburgh (1910 to 2010), and the ACT Alliance for inter-church diaconal service and relief.

WORLD ECONOMIC FORUM

Based in Davos, Switzerland, and incorporated as a nonprofit foundation in 1971, the motto of the World Economic Forum is "entrepreneurship in the global public interest." Seeking to develop a next-generation regime in which values are as important a basis as rules, it links social development and economic progress as essential to sustainability. In the process, since the beginning of this millennium, the forum has found it necessary to integrate religious perspectives into governance agendas.

Faith communities are now integrated into the structures through the Global Agenda Council on Faith as well as through the Community of Global Religious Leaders and the Benchmarking Series. In doing so, the forum provides a basis to consider religion in association with conventional economic matters such as industry and politics. Discussions at the Summit on the Global Agenda, in Dubai, United Arab Emirates (November 2008) highlighted the status of religion on the global agenda. The council proposed that religion can contribute to business, society, and conflict prevention and peace building.

In December 2009, in collaboration with the Nielsen Company and Georgetown University, the forum conducted an opinion poll in 10 countries over Facebook. The respondents were from France, Germany, India, Indonesia, Israel, Mexico, Saudi Arabia, South Africa, Turkey, and the United States. Of the more than 130,000 respondents over

the age of 18 years, almost 80% were under 30. The questions were intended to determine personal values, the sources of the values, and the role of the same values in global economic and governance systems.

More than two thirds of the people who responded to the poll believe that the current economic crisis is also a crisis of ethics and values. Only 54% of the respondents believe that universal values exist; religion and faith are most likely to affect values in the United States, Saudi Arabia, and South Africa. Only 18% of the participants aged 18–23 selected this as the primary source of their values. A detailed discussion of the poll on values and ethics appears in Part 1 of the May 2010 report, titled “Faith and the Global Agenda: Values for the Post-Crisis Economy.” Part 2 of the same report provides “Perspectives From Global Religious Leaders.” The council encourages a fundamental rethinking of moral and regulatory frameworks and promotes global interconnectedness and a more communitarian spirit.

The statements from several religious leaders provide comments from their traditions. The information they provide is intended to contribute to the values of interconnectedness and community. The plurality of religious resources also reflects the commitment to a multistakeholder process in tackling global challenges.

With the capacity for and interest in multiple discourses, an initial dialogue and cooperation between Islam and the West has commenced through the Community of West and Islam Dialogue (C-100). The first of a series of benchmarking reports commenced in 2008 and focused on the state of dialogue between Islam and the West.

Community partners and supporters include His Royal Highness Prince Hussam bin Saud bin Abdulaziz al Saud, Saudi Arabia; The Ronald S. Lauder Foundation, the United States; and Xenel Group, Saudi Arabia. Participants include 1,000 member companies that typically are enterprises each with more than \$5 billion in turnover, strategic partner companies, industry partner companies, and event partner companies.

WORLD RELIGIONS

The idea of world religions became a popular way of thinking about the diversity of the world’s religious traditions in the latter half of the 20th century. Religious communities were thought of as “world religions” if they were historic religious traditions with a worldwide or nearly worldwide presence/distribution, regardless of their numbers. World religions were regarded as possessing a standardized scripture or set of scriptures (i.e., a sacred canon), a universal message, shared rituals, and a religious clergy. Though most religious traditions are, in fact, far too diverse internally to conform to any simple description, thinking about “world religions” using this template often forced them into a uniform mold.

Moreover, assumptions were made about the difference—an implied cultural superiority—that the major world religions possessed in contrast to nontextual, nonhistorical “traditional religions.” Some scholars have suggested that the following features distinguish world religions from traditional religions.

1. World religions deal with larger, more abstract theological concerns about crucial topics such as salvation, the human problem and its remedy, and the nature of the Divine or governing grand principles, whereas traditional religions focus primarily on more immediate concerns, such as how to treat a snake bite, to find a marriage partner, to obtain success in a business venture, or to divine the whereabouts of a wrongdoer.
2. World religions have formalized, standardized scriptures, whereas traditional religions are chiefly carried through oral tradition.

3. World religions are more expansive, appealing to a wider range of people than traditional religions, which are usually confined to a particular locale, ethnicity, or small-scale people group.

None of these categories apply to all forms of the “major world religions” or to all aspects of the “traditional religions,” and it is important not to overplay the distinction between world and traditional religions. On the ground, where people live, work, are born, and die, religions are not experienced by the believer as neatly separated types, “world” and “traditional.” As such, these distinctions are, at best, heuristic categories (in the language of sociology, “ideal types”) and at worst, misleading stereotypes, since they do not capture all the nuances of lived religious experience.

The typical list of world religions includes Hinduism, Buddhism, Jainism, Sikhism, Daoism (Taoism), Confucianism, Judaism, Christianity, and Islam, with Daoism and Confucianism not only considered Chinese religions but philosophies as well. There are several ways in which these world religions have been compared and contrasted. One is by region, highlighting a religion’s place of origin and its expansion globally. Thus, there are the Middle Eastern (or Abrahamic) traditions (i.e., Judaism, Christianity, and Islam), the South Asian (Indic) traditions (i.e., Hinduism, Buddhism, Sikhism, and Jainism), and the East Asian traditions (i.e., Daoism, Confucianism, and some forms of Buddhism). No world religion has emerged evenly around the world, but all have appeared in a specific time and place. Distinctions are also made between those religions that have a particular founder (e.g., Islam, Christianity) and those that do not (e.g., Hinduism).

The great sociologist of religion, Max Weber, referred to religions of universal salvation, such as Christianity, Islam, and Buddhism. Historically, the religions of universal salvation have expanded through the following means:

1. *Migration*, where the numbers of adherents increase simply by the influx of religionists and births
2. *Trade contacts*, whereby economic power, political force, and personal presence can merge to create a compelling arena for religious change

3. *Conversion*, by which the message of the religion itself, always embedded in social, cultural, and psychological contexts, can attract new adherents, making such religious change a multifaceted process
4. *The use of violence*, whereby the power of the state, empire, or other social congeries is employed to force the acceptance or repudiation of particular religions

Partly due to the universal vision of the world religions, these religions have helped stimulate and even guide processes of globalization and, thus, have transformed the world.

Another way of categorizing world religions is to identify them either as reform movements within earlier religious traditions or as a movement *sui generis* (alone in its own class) in nature. Some of the major world religions appeared as a result of reinterpreting major theological or doctrinal elements of earlier traditions. For instance, Siddhartha Gautama, who became the Buddha, and thus the founder of Buddhism, and Mahavira, the founder of Jainism, were both members of the Kshatriya caste in India, but both led movements that became separate from Hinduism by redefining fundamental concepts that are common to all Indic traditions, such as karma, dharma, and moksha. Both Buddhism and Jainism were anti-Brahmanical movements in the Indian subcontinent and appealed to a wide number of people. Daoism and Confucianism, on the other hand, emerged as two of the most popular schools of Chinese philosophy during a time when China was experiencing significant social and economic change, a context in which six major schools of thought surfaced in an attempt to retrieve a sense of harmony that had been severely threatened during the Chinese Axial Age.

While the relationship between Daoism and Confucianism has been said to be complementary, with the Dao representing yang forces and Confucianism the yin side of the Dao, the relationship between Judaism, Christianity, and Islam is more complex. Some argue that Christianity is continuous with Judaism, by affirming that Jesus was the Jewish Messiah (the Anointed One) promised and foretold in the Old Testament, while others see Jesus as the universal Christ, the beginning of a “new creation,” as the Apostle Paul suggested.

Islam accepts the prior revelations of both Judaism and Christianity, with Muhammad being considered the final and seal of the prophets. While scholars of religions recognize the influence of Hinduism and Islam on Sikhism, most Sikhs today regard their tradition as being neither Hindu nor Muslim but rather a distinct religious tradition.

Yet another way to understand the world religions is to highlight the form and role of the deity they affirm, whether that ultimate being is a personal God, a distant God, or a formal Principle, Power, or Cosmic Law that is indescribable yet inequitably pervasive. This distinction gives rise to the popular demarcation between monotheistic and polytheistic religious traditions, which is another category that is much too simplistic to be analytically useful. The monotheistic traditions are said to be Judaism, Christianity, and Islam, which affirm the existence of one God, who created, sustains, and will ultimately judge humanity. The knowledge of that God varies according to tradition, but sacraments, rituals, prayers, and revealed sacred texts (e.g., the Torah, New Testament, and Qur'an) are believed to be carriers of God's message. Even monotheistic traditions differ in terms of how they identify the distance between God and human beings. For instance, Christianity affirms that God became incarnate in Jesus Christ, upholding the belief that in Christ the physical presence of God was present on earth. The Christian theological formulation is that God is at once *transcendent*, entirely distinct from all creation, and *immanent*, being with us in Jesus Christ. In comparison, Islam's repudiation of anything that can be compared with or associated with God (i.e., Allah) serves as a crucial constraint and guide to the daily life of Muslims. The Arabic term *shirk* (i.e., "associationism") refers to wrongful attempts by human beings to associate someone or something, even a person, ambition, or material item, with God, since God is so great that He cannot be compared, as expressed in the common Arabic Muslim slogan *Allahu Akbar* ("God is greater"). No image can represent God, and nothing can displace God. Yet Islam displays great variety on this topic, since Muslim mystics (i.e., Sufis) experience God as quite close, even as close as one's jugular vein (Qur'an 50:16). Thus, even within the monotheistic traditions, there are multiple understandings of God and the location of God vis-à-vis creation.

The Hindu tradition is regarded as polytheistic, though beyond the multiplicity of images of gods, there is the Hindu notion that there is one single ground of being, and ultimate unity. Other non-monotheistic traditions do not recognize a God, personal or otherwise, but instead acknowledge a Power or Cosmic Law within which individuals and communities need to live in order to have fruitful, healthy lives while maintaining social harmony and cosmic stability. In Daoism, Confucianism, and Theravada Buddhism, affirmation of creation by a personal being is less important than living according to the immensely powerful cosmic laws that determine one's life in the present and future. Daoism and Confucianism are based on the Dao, a preexistent "way" or force that permeates all things and out of which all things are, in the language of *Dao-te-Ching*, "named." That declaration means that the Dao is preexistent yet gave rise to all that is: "The unnamable is the eternal real [Dao]. Naming is the origin of all particular things" (*Dao-te-Ching*, 1). The extent to which one lives according to cosmic forces, such as the Dao of Chinese religious traditions or the Four Noble Truths of Buddhism, is the degree to which one lives well. Failure to live according to cosmic principles or truths can lead to all kinds of misery, including physical disease, social disharmonies, and even death. Some world religions are not organized exclusively around monotheistic notions of God or cosmic laws. For instance, while Hinduism recognizes a universal, indefinable divine essence (i.e., Brahman) that pervades all things and can only be known in the particular, it also affirms the existence of dharma (duty) law, which should guide a devotee's life.

In the late-modern world it has become common to speak of "global religion" rather than "world religions," indicating a crucial relationship between the world religious traditions and globalizing forces. The study of global religion attempts to answer such questions as these: How have the world religions made their way across the globe? Who or what are the carriers of the world religions? How have they changed by their engagement with local cultures? And how have cultures been changed by the world religions? For instance, how was early South Asian Buddhism reinterpreted when it was adopted by the peoples of East Asia (e.g., Korean, Chinese, and Japanese Buddhism)?

How has Christianity been translated into forms meaningful to Nigerians or Mexicans? How have Chinese religious traditions been adapted in the North Atlantic region, where, for instance, there is a robust attraction to practicing tai chi chuan, employing feng shui, and decorating homes with Zen styles? Of course the North Atlantic connection to Chinese religions goes deeper than mere stylistic or culinary tastes, for there are burgeoning numbers of non-Asians who have adopted either in part or wholly Chinese religious perspectives, as exemplified by a contemporary discussion called “Boston Confucianism,” which argues that it is indeed possible to be Confucian without being Asian, just as it has been possible to be Muslim without being Arab, Buddhist without being Indian, Christian without being Western, or Jewish without being ethnically Jewish. Nevertheless in the global arena, the world religions have been employed to shore up ethnic identities, legitimating horrible atrocities against other religionists or enabling surprisingly great acts of benevolent humanitarianism and sacrificial compassion.

WORLD SOCIAL FORUM

The World Social Forum (WSF) began in 2001 as a civil society counterpoint to the corporate-organized World Economic Forum. The global gathering is now held semiannually in a location in the Global South. Activists from diverse movements, cultures, and faith traditions come together in the WSFs to share analyses of the social effects of economic globalization, to strengthen alliances, and to exchange experiences and organizing strategies. It is seen as a *process* because it explicitly links discussions and organizing experiences across time and place. The WSF aims to build a transnational movement and encourage what analysts have called “experiments in global democracy.” The longevity of the effort and the large numbers of people it has mobilized demonstrate its political significance.

Organized around the idea that “another world is possible,” the World Social Forum process has provided a focal point and organizing infrastructure for social movements and facilitated coordination and cooperation across movement sectors as well as across national borders and over time. It emerged following a series of large and confrontational demonstrations against the World Trade Organization, the World Bank and International Monetary Fund, the Group of Eight, and regional trade blocs. At the time, many activists in an emergent “global justice movement” sought new strategies for advancing critical analyses of economic globalization and alternative visions of globalization. The turnout at early meetings consistently overwhelmed organizers and demonstrated the resonance of the WSF’s message. From the very beginning, activists began organizing local, national, and regional social forums, explicitly linking conversations and themes across time and place. Global gatherings now attract up to 150,000 participants, and tens of thousands more participate through local, national, and regional forums.

An international council facilitates international coordination and leadership of the WSF process.

Organizers have made conscious use of technology to advance efforts to expand dialogue among diverse civil society members, reflecting a commitment to expanding participation from those most marginalized by dominant social institutions. The WSF has shifted its location and organizing format to promote greater inclusion and participatory democracy. There is constant internal debate about the limitations in fully achieving these ideals, and these debates fuel innovations that have expanded the forum's accessibility to poor and oppressed groups.

The WSF is an important and evolving response to the failures of representative democracy that supports cross-national and cross-sectoral dialogue on some of the most pressing conflicts of our day. Its process orientation allows for learning and relationship building to help unite a very diverse collection of individuals and groups.

WORLD THEOLOGY

World theology can refer either to the convergence of theological ideas from different religious traditions around the world or to the way theological speculation within a single tradition has changed to respond to the globalization of culture and the global diasporas of religious communities. Wilfred Cantell Smith, in *Towards a World Theology*, has

explored the former kind of thinking, the way theological ideas in different religious traditions have much in common and interact in pluralistic settings. This entry will focus on the latter—the way in which theology in one tradition, Christianity, has adapted to its global context.

The contours of a Christian world theology can be identified by the common concerns shared by theologians working in different regions of the world. Globalization, international migration, capitalism, and war are all issues that have influenced Christian theology since the emergence of the modern world. One of the key elements of a Christian world theology is the recognition of the unique contributions made by scholars from theologies outside Europe and North America, in regions such as Africa, South America, Asia, and the Pacific. Christian theology by scholars from several denominations continues to undergo significant development around the world.

Catholic Theology

At the beginning of the 20th century, Catholic theology was influenced by renewal movements that sought to move beyond the neoscholastic theology that had dominated Catholic thinking since the late 19th century. Pope Leo XIII (r. 1878–1903), in his encyclical *Aeterni Patris* (1879), had given primacy to neoscholastic theology, emphasizing that theology should look back to the work of St. Thomas Aquinas. For some Catholic theologians, this situation narrowed the focus of Catholic thought. It can be argued that Leo XIII's championing of Aquinas set the foundations for the Modernist movement (1890–1910). A group of scholars, including George Tyrrell (1861–1909) and Alfred Loisy (1857–1940), attempted to bring critical historical perspectives borrowed from Protestant theology into Catholic thought. The Modernists were suppressed by the Vatican because their findings on the life of Christ and the nature of the Church were interpreted as being unorthodox.

By the end of World War II, the New Theology (*théologie nouvelle*) movement had become influential. Scholars who belonged to this movement included Yves Congar (1904–1995) and Henri de Lubac (1896–1991), both of whom sought to recognize the influence of the early Church Fathers on Catholic theology. Karl Rahner's (1904–1984)

writings on grace and the sacraments were also important in the years prior to the 1960s. The writings of these scholars were questioned by some Vatican officials but were taken up by the Catholic Church at the Second Vatican Council (Vatican II).

Vatican II (1962–1965) constitutes a point of renewal for Catholic culture and theology, and Catholic theology expanded greatly after the council. Karl Rahner, whose thinking underpinned much of the discussion at Vatican II, interpreted the Church as being a diaspora of the faithful, living in disparate parts of the world but sharing witness to Jesus Christ. For Rahner, Vatican II constituted a leap forward for the Church, from being an institution focused on Europe to becoming a world Church that speaks to global communities.

After the council, Catholic theology became much more concerned with issues such as the role of women and the role of the laity in the Catholic Church. Furthermore, the council's concern with ecumenism has encouraged Catholic theologians to work more closely with theologians from other Christian denominations and faiths.

In the late 1960s, Liberation Theology emerged as a powerful force in defending the rights of the poor. Authors such as Gustavo Gutierrez (b. 1928) and Leonardo Boff (b. 1938) wrote persuasive theological texts that took up the concerns of the poor, revealing a debt to the work of Marx. This welding of Marxism and Christianity became a source of concern for the Vatican, and although no one was officially excommunicated, many were asked to explain how their writings were compatible with Catholic thought.

Anglican and Protestant Theology

In the early 20th century, the existential movement influenced theologians such as Paul Tillich (1886–1965) and prompted examinations regarding God's presence in the world of modernity. For Tillich, the modern world challenged believers by emphasizing the struggle for meaning that modern people grapple with.

In Protestant theology, the work of Rudolf Bultmann (1884–1976) and Karl Jaspers (1883–1969) on myth in the New Testament influenced a number of thinkers seeking to address questions about the relevance of Christianity in modernity. Bultmann argued that the symbolism of the New

Testament was intended to capture the imagination of those living in the ancient world. In his popular writings, Anglican Bishop John Robinson (1919–1983) proposed a theological outlook that engaged with the secularization of European society. Robinson took Bultmann's work on myth as his point of departure and called for the gospel message to be presented in modern language and symbols. Other theologians were also concerned with the role of faith in modern society. Harvey Cox (b. 1929) addressed North Americans, arguing that revolutionary activity was central in Christian history, such as the resistance to Roman pagan religion by the early Christians.

Reflecting on the importance of the Holocaust in the 20th century, authors such as Jurgen Moltmann (b. 1926) have composed theologies that address questions on how theological speculation could best be carried out after such an event. Such work was inspired by the writings of Dietrich Bonhoeffer (1906–1945), who was imprisoned and executed by the Nazis for his resistance to them. Bonhoeffer had grappled with the issue of how religion can survive in an increasingly secularized world.

After the social changes that took place in the 1960s, a shift occurred whereby theology began to borrow more heavily from social theory. Theologians began to be concerned with social issues of injustice and poverty, and this was reflected in theological work that emphasized social justice, equality, and suffering as shared social concerns. Recent work by John Milbank has been critical of the influence that social theory has had on theology. For Milbank, social theory's atheistic undertones are problematic if such perspectives are used by theologians.

In recent years, debates about evangelical forms of Protestantism have raised questions about the relevance of secularization theories, which claim that modern society is growing less religious. The presence of fundamentalist and evangelical groups in the United States provides evidence that religion and modern society are not incompatible, as some secularization theorists have argued.

Postmodernity has provided theology with both challenges and opportunities. How unified systems of theological knowledge and notions of transcendence may be sustained under postmodern conditions is debated, and the connection

between religious belief and language is also of concern for postmodern scholars of theology.

Theology in Global Settings

African Christian theologies have focused on a range of issues important to the experience of African believers from many countries that share a similar culture and history. The dialogue between indigenous African religions and Christianity is one such area, as is the interpretation of the gospels in light of the colonial history of the continent. With regard to the relationship between African religions and Christianity, some African theologies see a great deal of compatibility between the two, while for others, such a relationship gives rise to syncretism. Islam has a long history in the African continent, particularly in the north, and the tensions since 9/11 have become an area of concern for religious scholars of all faiths in the region. Liberation Theology has been a powerful influence in African religious thought, becoming very prominent in South Africa because of the former apartheid system. Other social concerns such as poverty, access to health care and education, and concerns about AIDS and the rights of women have also been the focus of African Christian theologians.

Like African theology, Asian Christian theologies are also concerned with the relationship between faiths such as Christianity and Islam and existing Asian religions. Asia shares with Africa a colonial history. Initial contact between Christian theology and existing religions in Asia was one of condescension on the part of missionaries, but over time, theologians in Asia have reconsidered the relationship between Christianity and traditional Asian religions. Asia's colonial history has been interpreted as containing contradictory elements for belief and theology. On the one hand, exploitation at the hands of the colonizers has led to critical interpretations of Christianity, while on the other, the political liberalism and advances in technology brought by the colonial nations has had an impact on people's standard of living in Asia and has, in turn, helped maintain a dialogue between Christian theology and traditional Asian religions.

In South America, Liberation Theology has been a major influence, particularly due to its ecumenical basis. The struggle against corrupt governments in some states in South America has

also enhanced its prestige there. In the Pacific, theologians have sought to stress the connection between religious and cultural life and the importance of missionary activity in countries such as New Zealand and in many Pacific islands.

Theologians of all faiths around the world are today engaged with topics such as religion under global conditions and the impact of environmental concerns and sustainability. Migration and inequality in wealth and access to resources are also concerns that will engage theologians around the world in the years ahead.

WORLD'S PARLIAMENT OF RELIGIONS

The World's Parliament of Religions was a convention of religious leaders from around the world held in September 1893 in Chicago. The parliament was part of the larger celebrations surrounding the Columbian Exposition, a fair commemorating the 400th anniversary of Columbus arriving in the Americas. The parliament's organizers hoped that the event would bring together religious leaders from around the world in a spirit of mutual learning and brotherhood, to show how the wisdom of the world's faiths could be mustered for the betterment

of society and, ultimately, to affirm the theistic core underlying all the world's religions. While the extent of toleration and pluralism demonstrated at the 1893 parliament is debated by scholars, the event was undoubtedly a watershed moment in the history of global encounter between religious traditions from the "West" and the "East." In a century dominated by imperialism and missionizing, the parliament showcased an alternative attitude toward non-Western religions, one that had been growing in popularity through the second half of the 1800s. Instead of bringing Christianity to the rest of the world, private organizations such as the Theosophical Society and academic bodies such as the American Society of Comparative Religion were now working to introduce global religious traditions to the Western world. The success of this project reached a palpable crescendo with the rousing applause received by the Bengali Hindu theologian Swami Vivekananda during three packed-house lectures that he gave during the parliament.

In many ways, it was Vivekananda who set the stage for the world's parliament legacy to endure in the 20th and 21st centuries. In 1988, two members of the Vivekananda Vedanta Society, which the Swami founded in Chicago following the 1893 parliament, proposed organizing an event to celebrate its 100-year anniversary. The suggestion was taken up by a new organization called the Council for a Parliament of the World's Religions, and in 1993, a renamed "Parliament of the World's Religions" was held in Chicago. The event attracted 8,000 participants from around the world, including religious leaders, ecumenical groups, philanthropic organizations, and scholars. A week-long conference culminated in the participants' formal endorsement of a document titled *Towards a Global Ethic*, drafted by Hans Küng, which declared their commitments to four global ethical

principles. Since 1993, the council has organized two other parliaments. In 1999, a Cape Town, South Africa, parliament attracted 7,000 participants, including Nelson Mandela and the Dalai Lama; and concluded with the presentation of another document, *A Call to Our Guiding Institutions*, encouraging the world's leaders in religion, business, education, politics, and media to reevaluate and re-form their roles in the world. In 2004, the council held a parliament in Barcelona, Spain, in association with the city's Universal Form of Cultures. The council hosted a parliament in 2009 in Melbourne, Australia.

YAGÉ

Yagé is a hallucinogenic drink consumed in indigenous religious rituals in South America. *Ayahuasca*, as it is known in the native Quechua language, is an Amazonian plant combination that is made by cooking the stem of *Banisteriopsis caapi*, a vine of the family Malpighiaceae, with the leaves of *Psychotria viridis*, of the Rubiaceae. In areas of Colombia and Ecuador, the admixture plant is *Diplopterys cabrerana*, also of the Malpighiaceae, where it is known under the name *yagé* (also written *yajé*). *B. caapi* contains the alkaloids harmine and tetrahydroharmine, with traces of harmaline, while both *P. viridis* and *D. cabrerana* contain the powerful visionary alkaloid dimethyltryptamine (DMT). DMT is not orally active, being readily inactivated in the gut and liver by the enzyme monoamine oxidase (MAO). Harmine is an MAO inhibitor, protecting DMT from deactivation, which is then able to cross the blood-brain barrier and bind on serotonin receptors sites in the central nervous system.

Travelers and anthropologists have reported the use of ayahuasca/yagé by numerous indigenous groups of the Upper Amazon, where it is mainly used to get in touch with spiritual realms, for healing and divination. In some instances, especially in the past, it is also used in great collective ceremonies of a religious character. Ayahuasca permeates the cultural lives of many indigenous groups, including their art, narratives, and general cosmological ideas. Its use was adopted by the riverain

mestizo population of Peru, Ecuador, and to a certain extent also Colombia, Brazil, and Bolivia, probably in the beginning of the 20th century, where practitioners use it in ceremonies of a shamanic nature, for healing, for divination, and for “learning from the plants.” A rigorous training involving a special diet and sexual segregation is a requirement to become an *ayahuasquero*. However, it is sometimes also taken simply to see the visions that it often elicits, ayahuasca being often referred to as the jungle cinema or TV.

In contemporary Brazil, ayahuasca is considered as a sacrament by the three main Christian syncretic religious organizations, which emerged in the Amazonian states of Acre and Rondônia, its use then being extended in the past decades to all states in Brazil, as well as to other countries. These religious organizations are the creation of three religious figures, all coming from the Brazilian Northeast, Raimundo Irineu Serra (1892–1971) and Daniel Pereira de Matos (1904–1958), who established their religious organizations in Rio Branco, Acre, and José Gabriel da Costa (1922–1971), who in 1961 created in Porto Velho, Rondônia, the *União do Vegetal* (UDV). A fourth religious leader, Sebastião Mota (1920–1990), a follower of Irineu Serra, created after his death, a new religious branch, which separated from the matrix. The *Centro Eclético de Fluente Luz Universal Raimundo Irineu Serra* (CEFLURIS, Eclectic Center of Fluid Universal Light Raimundo Irineu Serra), created in 1972, first expanded to urban areas of many Brazilian states and later into other countries in Europe, the Americas, and Japan. The

original nucleus created by Irineu Serra, known as *Alto Santo*, divided into several small nuclei, all located in Rio Branco, plus an offshoot in Porto Velho. The religious organization created by Daniel Pereira de Matos, known as *Barquinha*, has also divided into various churches in Rio Branco, with smaller units in Brasilia and Salvador. The UDV is experiencing the greatest growth. It is found in almost every major Brazilian city, has members in all levels of society, and is spreading to other countries. Followers of Irineu Serra, Pereira de Matos, and Sebastião Mota call the sacred brew *Santo Daime*, while those of José Gabriel da Costa call it *Vegetal*. All of these religious organizations have been influenced by *kardecism* and by European esoteric traditions. They all believe in reincarnation. There is a strong popular Catholic ethos in Barquinha and Santo Daime (Alto Santo and CEFLURIS), while stronger Afro-Brazilian elements are found in Barquinha, as manifested in Umbanda or Candomblé. There is a frequent movement of persons between different ayahuasca doctrinal lines, and schisms occurred within these religious organizations with the emergence of new charismatic religious leaders and the gradual incorporation of the use of ayahuasca by other religious organizations. This has contributed to the appearance of more and more groups led by new *ayahuasqueros* in religious, therapeutic, musical, or artistic settings in Brazil, Peru, Colombia, and Ecuador, while indigenous shamans travel the world or Western *ayahuasqueros* conduct sessions in their own countries. There has been a revival of ayahuasca-mediated shamanism among some indigenous communities, to a great extent set in motion by Western interest in the brew and its economic value. Caution is thus in place when people present themselves as ayahuasca experts, as not all of them have undergone proper training or adhere to high ethical standards. On the other hand, there is a growing scientific and popular interest in ayahuasca for the possibilities it offers in the study of consciousness and also as a tool for personal growth, creativity, and healing in general.

YARMULKE/KIPPAH

The Hebrew word *kippah*, *yarmulke* in Yiddish, refers to a head covering that functions as an outward sign of Jewish identity. The exact derivation of these terms is uncertain, but Rabbi Joseph Telushkin postulates that *yarmulke* is a combination of the two Aramaic words *yarei* and *me'elokha* ("one who fears God"). Over time and throughout Jewish diasporic life, *kippah* has taken on a multiplicity of meanings, oftentimes representing conflicting views of Jewish Halakha ("law") and attesting to developed minhag ("custom"). There is no halakhic mandate on the fabric, size, shape, and color of a kippah. There even is no halakhic injunction that one needs to wear it constantly or whether it is solely for men. Even within each movement, traditions are not static. What is consistent in variations on the tradition of wearing a kippah is that its use represents attempts at humility and respect.

An early allusion to a head covering, not necessarily the kippah, is found in the biblical description of priestly garments worn in the Temple. One Midrash speaks of Moses showing proper reverence, according to the rabbis, when pronouncing the name of God by hiding his face, in contrast to others who demonstrated insolence by looking on with uncovered heads. Yet covering here refers to wrapping one's body, not just the head, in a tallith (prayer shawl).

Notions of cultivating piety and reflecting one's devotion are emphasized in later rabbinic writings. Several Babylonian Talmud tractates mention covering one's head in the hope of inducing piety, a belief echoed in the Zohar, a medieval kabbalistic text, which states that a rabbi walked no more than 4 cubits without a covered head out of consciousness of the Divine Presence above. Other Talmudic tractates indicate that wearing a hat is optional, a matter of custom. The major emphasis

in these texts contrasts impudence (i.e., bareheadedness and haughtiness) with proper forms of reverence (i.e., humility within the community and in God's presence).

Developing out of the ambiguous Talmudic and post-Talmudic statements is the notion that wearing a *kippah* has taken on the force of law. A differentiation is made between interpretations of devotional head covering and historical instances of female bareheadedness, which varied across cultures and through time. Beginning in the 17th century, and breaking with the previous custom of dressing like others, developments in some European Jewish communities included prohibition on praying as the Christians did (i.e., bareheaded), although these customs varied regionally.

Cases continue to arise that put in question the status of the kippah and the identification of its wearer. For example, as of 2004, the French government banned the wearing of a kippah in public schools, and the specific kippah that passes as a symbol of a particular religious and political movement within Israel, the nationalistic segment of Orthodox Jews, takes on new, less religious and political, overtones in the United States. Today, Orthodox males cover their heads at almost all times, and Conservative males and some females use the wearing of a *kippah* in the synagogue. Within Reform Judaism, decisions on head covering are left to the individual.

YEMEN

Yemen (*al-yaman*), officially known as the Republic of Yemen, is located on the Arabian Peninsula south of Saudi Arabia and west of Oman, and its coastline borders the Arabian Sea and the Red Sea. It has a population of 22,858,238 (estimate as of July 2010), almost entirely Muslim. The capital of Yemen is Sana'a. Arabic is the primary language spoken in this country. Prior to Yemen's unification in 1990, it was divided into two states. In 1918, Northern Yemen became independent from the Ottoman Empire and was eventually known as the Yemen Arab Republic (YAR). Southern Yemen was colonized by the British from 1839 to 1967. After the British withdrew, southern Yemen declared its capital to be Aden, and this state became known as the Socialist People's Democratic Republic of Yemen. Currently, Yemen's political system is republican; both men and women are in theory allowed to vote and run for office. Yemen is known for its tribal society. While almost all citizens of Yemen are Muslim, religious diversity is present within that category.

Religious statistics for Yemen are not generally reliable; however, according to one report, approximately 30%–35% of the population are Zaydi Shi'i (traditionally from the north of Yemen) and 60%–65%, Shafi'i Sunnī. Sufism also has a long history in this country, especially in the governorates of Ta'izz and the Hadramawt, where many shrines of Sufi saints can be found. The city of Tarim in the Hadramawt region houses a prominent institute for the study of Sufism, known as Dar al-Mustafa. Other religious minorities include Ismailis and a dwindling number of Jews.

Tensions among religious groups include Shafi'i-Zaydi strife. Perhaps of greater concern is the friction between the Salafis, on the one hand, influenced by extremist revival movements stemming from nearby Saudi Arabia, and the Sufis, moderates, and secularists, on the other. The government suffers from instability and is battling secession movements in the south and the Zaydi Huthis in the north. The European Union and the United States offer aid to Yemen in the attempt to curb the influence of Islamic extremism and the al Qaeda, which is active in Yemen.

Yemen is the poorest Arab country and one of the poorest countries in the world. The literacy rates for men and women are approximately 70% and 30%, respectively, and are even lower in rural areas. The reasons behind Yemen's poverty are many and include inadequate natural resource management and a dwindling groundwater supply. Additional factors involve agricultural policy, political instability, widespread corruption, and the legacy of the previous ruler Imam Yahya (1904–1948), who kept much of Yemen in relative isolation for decades. Yemen's poverty and low rate of literacy shape the ways in which Islam is practiced by many in Yemen who have little access to textual sources of religious orthodoxy and who thus practice "popular" forms of Islam.

YIDDISH

Yiddish is a language spoken primarily by Jews of eastern European descent. Unlike other West-Germanic languages, Yiddish is a fusion language comprising mainly Germanic, Hebrew/Aramaic, and Slavic components, featuring a Hebrew-derived orthography. There are an estimated

500,000 native speakers of Yiddish, with the largest communities in Israel, the United States, and Russia, although reliable statistics are difficult to ascertain due to the reluctance of certain orthodox groups to participate in censuses. The figure represents a significant decline from its peak of 11 million speakers at the outbreak of World War II, 7–8 million of whom lived in eastern Europe.

Philologists trace the origins of Yiddish to the 11th century. Max Weinreich argued that Yiddish emerged when Judeo-Romance-speaking Jews encountered Germanic tribes in the Upper Rhine Valley. Others have argued for a Bavarian context, while, radically, Paul Wexler has posited Slavic origins, claiming that Yiddish is a relexified form of Upper Sorbian. Most scholars continue to accept Weinreich's thesis, particularly its sociolinguistic base. Weinreich considered Yiddish a constituting element of Ashkenazic Jewish life, reflecting and determining its unique configuration. Yiddish helped retain traditional folkways as the community migrated eastward, while the language itself became heavily Slavicized after the population shifted in the 17th century. In 1908, the Czernowitz Language Conference proclaimed Yiddish a Jewish National Language, while the YIVO Institute for Jewish Research developed a standardized orthography and phonology in the 1930s. This is the version taught today.

Early Yiddish texts range from memoirs and ethical wills to translations of Arthurian legends. Among the largest bodies of premodern Yiddish texts are prayers written for women. Women were largely uneducated in Hebrew, the traditional language of Jewish learning, and they turned to Yiddish as a religious outlet. Many Yiddish books claimed to be written for the benefit of women, and this became a means of justifying Yiddish-language publication. The development of a literature in the women-oriented vernacular parallels the situation in other European literatures.

Modern Yiddish literature emerged in the mid-19th century. Its three classic authors were Sholem Yankev Abramovitch, Sholom Aleichem, and I. L. Peretz, who together developed many of its generic features. The literature grew exponentially before World War II, becoming truly cosmopolitan with major centers in the Soviet Union, United States, and Poland. Ironically, Yiddish literature enjoyed some of its greatest successes after the war, culminating in

I. B. Singer's receipt of the Nobel Prize in 1978. Today, secular Yiddish literature is written by a small number of writers; however, recent years have seen the emergence of younger authors, many of whom learned the language in universities. There is also a growing corpus of texts written by and for Hassidic Jews, who continue to use Yiddish as a daily spoken language.

YING YANG AND THE FIVE PHASES

See Chinese Popular Religion; Daoism

YMCA, YWCA

The Young Men's Christian Association (YMCA) and the Young Women's Christian Association (YWCA) began separately in mid-19th-century England as Protestant voluntary associations. Their early, middle-class members sought to provide moral guidance, Christian community, and charity in the context of industrialization; the movement was also a response to the evangelical revivalism ignited by the visiting American Protestant Revivalist preacher Charles Grandison Finney. National YMCAs and YWCAs have since formed around the world, and many of them have abandoned missionary fervor in favor of more secularized agendas promoting the intellectual, physical, and spiritual well-being of Christians and non-Christians alike. While perhaps best known for sports facilities and travel hostels, the

YMCA and the YWCA have rich histories of societal engagement in many countries.

The national YMCAs came together to form the World Alliance of YMCAs in 1855, while the national YWCAs came together to form the World YWCA in 1894. Although the YMCAs and YWCAs developed as separate organizations, they remain closely affiliated at the international level. According to the official websites, the World Alliance of YMCAs claims the status of the oldest voluntary international organization, and the World YWCA prides itself as one of the first international women's organization to exist independently of male organizations. Currently, both international organizations have national branches in more than 120 countries.

Their missions remain rooted in nondenominational Christianity yet are open to global concerns and the needs of individual countries. The first world conference of YMCAs in 1855 in Paris adopted what became known as the Paris Basis, which stated that the mission of the YMCA was to bring together young Christian men despite their differences. Bringing men together often took the form of team sports, which led to the promotion of "muscular Christianity" in the late 19th century and the invention of various sports, including basketball. In 1973, the mission was reaffirmed and updated with the concern for fostering love, honesty, and creativity within the international organization; working toward equality and justice in the world; and promoting the holistic development of its members. In 1998, the World Alliance of YMCAs expressed a desire to address the concerns of the 21st century in what they called "Challenge 21." These concerns included attention to the rights of women, children, the poor, and those oppressed due to their religious or racial affiliations.

Both the YMCA and the YWCA are dedicated to contemporary social change. The World YWCA considers its mission to be the improvement of the lives of women and children around the world. It has supported job training programs for women and encouraged the development of female leadership. It also holds a wider agenda of spreading awareness of environmental sustainability, human rights protection, HIV/AIDs prevention, and international peace and justice.

YOGA

Yoga has become more than just a Sanskrit term referring to union or a system of philosophy. Its current reach extends far beyond the pages of Patanjali's Yoga Sutra and beyond the borders of India. Yoga studios have emerged all over the Americas, Europe, Africa, and Asia. Yoga has been translated into these many different global contexts, but what remains constant in these many translations is a bodily practice that revolves around the asanas or poses.

Yoga was introduced to the global stage via the intertwined forces of colonialism and capitalism. During the colonial reign under the British Raj, yoga experienced a renaissance of sorts and became more popular in India as a Hindu practice. Yoga was rediscovered as an example of rational and enlightened Hinduism (in contrast to other practices that focused on the iconic and ritualized).

At the same time, there were religious leaders in India geared up for exporting yoga outside India. One of the first ambassadors for yoga outside India was Swami Vivekananda, who came to the United States in 1893 as a delegate for the World Parliament of Religions. Vivekananda's yoga, *Raja Yoga*, focused more on *pranayama* or controlled breathing and was marketed as universal practice that could supplement and complement Christianity.

While yoga remained popular in certain circles throughout the first half of the 20th century, it was not until the 1960s that it really began to take off. The growing openness to Eastern religions and the heightened profile of the yoga teacher B. K. S. Iyengar helped increase its popularity. Iyengar's focus on correct postures using props,

such as blocks and straps, helped many people of all ages and ability levels to participate in the practice of modern yoga.

Because of the popularity of yoga around the world, controversies surrounding the religious or secular location of yoga have emerged. While Vivekananda and Iyengar may have constructed the practice of yoga as universal, there are other teachers of yoga, such as Ram Dev, who situate the practice within the Hindu tradition. Yoga is taught not only in Hindu ashrams but also in gyms, public schools, and prisons. To add more complexity to this controversy, Christian and Jewish yoga have also gained various followers, which has led followers of the three faiths and scholars to debate the locations of religious boundaries.

While various factions continue to debate the religious, universal, or secular place of yoga, it continues to become more popular across the globe and is creating a network across national, social, religious, and economic boundaries.

YOUTH WITH A MISSION

Youth With a Mission (YWAM) is an evangelical, nondenominational Christian organization officially based in more than 175 countries. It was founded in 1960 by Loren Cunningham, who was then in charge of the youth activities in Los Angeles of the Assemblies of God. After he left this Pentecostal denomination in 1964, YWAM adopted a charismatic stance by promoting an individualized religious

experience beyond denominational labels, refusing any sacred/secular distinction and spreading, since the 1980s to 1990s, the Spiritual Warfare theology.

Its development relies primarily on the Discipleship Training Schools, which attract several thousands of young Christians each year, mainly from evangelical, charismatic, and Pentecostal backgrounds but also from mainline Protestant churches and Catholicism. This program, launched in 1969 under the name of “Schools of Evangelism,” took its current name in 1978 as it became the first degree of YWAM’s newly established university, called the University of the Nations, located in Kona, Hawai‘i. It includes 3 months of teaching followed by 3 months of missionary work that often gives students the opportunity to discover new countries. This international mobility, of particular appeal to youth, also generates tensions between YWAM and many local churches, which fear that their young leaders are irrevocably moving away from them.

Students and permanent staff members (YWAMers) have to raise funds by themselves to meet their financial needs. They are invited to support the leaders of the various programs established since the 1960s, specifically in the seven priority domains that Cunningham pointed out in 1989 to “shape the society for Christ”: (1) the family; (2) churches; (3) education; (4) the media; (5) politics; (6) arts, entertainment, and sports; and (7) business, science, and technology. They are also encouraged to launch new projects through mobilization of their personal relationship and financial support networks. This twofold dynamic has led to a remarkable diversification of YWAM activities, officially endorsed by the leadership team during the 1990s through the concept of “families of ministries,” putting emphasis on a network of networks rather than vertical hierarchical structures. Early religious socialization, centered on the King’s Kids program, constitutes one of the most important of these “families.” Another international ministry, Mercy Ships—medical missionary ships—founded in 1978 by Don Stephen, became an officially distinct body in 2003. These ships have greatly contributed to the development of YWAM in Third World countries, especially Africa.

Historically, YWAM’s growth began in America, then expanded to the Asia-Pacific area through its campaigns in New Zealand at the end of the 1960s—a country that soon afterward provided several of the early YWAM leaders. In Asia, it has

benefited during the past decades from the rise of Pentecostalism in South Korea. YWAM is now present in all the continents except Antarctica and has established itself as a multicultural organization. The growing proportion of non-Western YWAMers (43% in 1997, more than 50% in 2010) enables YWAM to take an effective part in the efforts of evangelical missionary networks focused on the 10/40 Window (countries located between the 10th and the 40th north parallels), especially in continental China.

YUGOSLAVIA

Yugoslavia refers to the former Pan-Slavic state that dominated the Slavic Balkans for most of the 20th century and was finally totally dissolved in 2002, when the only regions left in the Yugoslav federation, Montenegro and Serbia, renamed their federation as “Serbia and Montenegro.” Yugoslavia was conceived in 1918, after the end of World War I, as a proposed united kingdom of Serbs, Croats, and Slovenes (all unified under Slavic identity and culture). Slavic nationalism was strong in the late 19th century and enjoyed considerable Russian support for the ideal of a Pan-Slavic state. Yugoslavia was the closest manifestation of the Pan-Slavic ideal, but it always strained under the diversity of religion, ethnicity, and national identity within its borders. Croatia and Slovenia joined the union more to stave off Austrian and Italian expansion than to identify with Slavic ethnicity.

Religion was one of the key distinguishing factors that led to early disillusionment with the project of the Slavic state. Croats, Bosnians, Albanians,

Roma, Slovenes, and Montenegrins, all resented the increasing dominance of Eastern Orthodox Serbs in the government. Prior to World War II, the Ustaše, an extreme Catholic fascist group, and other terrorist groups tugged at the already tenuous hold of the Serbian-led government in Belgrade. Yugoslavia attempted to remain neutral during the war but wavered under economic pressure from Nazi Germany and the Serbian monarchy's affinity toward Britain. The tensions were resolved when the Nazis invaded Yugoslavia in 1941. After the war, the country was once again unified as Yugoslavia under a nonaligned communist regime led by Marshal Tito, who played off of Western and Soviet concerns masterfully. The disintegration of the communist state in 1990 sparked off what is now known as the Wars of Yugoslavian Secession, with the first armed conflict in Slovenia in 1991 and the last in Kosovo in 1998.

Prior to the communist regime, religion was only suppressed insofar as it was connected to sedition and internal conflict. Tito's partisans generally did not claim an overt religious affiliation, unlike the Catholic Ustaše. Tito maintained internal order through typical iron-fisted communist tactics early during his regime and was particularly suspicious of religious institutions that promoted ethnic identity or were viewed as foreign (e.g., Mormon or Protestant evangelical groups). However, after the

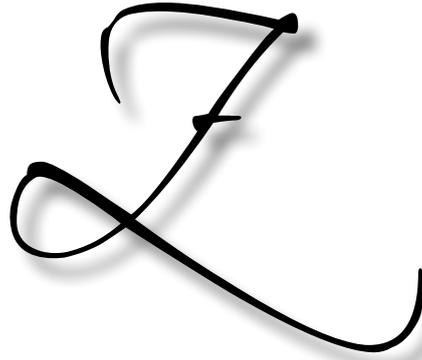

formal break with the Soviets in 1948, Tito began a process of increased autonomy for the various provinces, which included more latitude for the respective religious groups. The ever-simmering nationalism took on more pronounced religious meaning over the 20th century, which led to a deadly combination of religious and ethnic warfare from 1992 to 1998 between the Croats (Catholic), Bosnians (Muslim), Albanians (Muslim), and Serbs (Orthodox), most notably in Bosnia and Kosovo. Warfare strengthened the bonds between ethnicity and religion in such a powerful way that religious diversity is, at the very least, seen as unpatriotic in the former Yugoslav republics as they seek to heal from a century of resentment and a decade of war.

ZAMBIA

The Republic of Zambia in southern Africa is surrounded by the Democratic Republic of the Congo, Tanzania, Malawi, Mozambique, Zimbabwe, Botswana, Namibia, and Angola. One of the earliest Europeans to enter the country was the Protestant missionary and African explorer David Livingstone. His extensive explorations in the mid-19th century brought Zambia to the attention of the Western world and inspired countless other missionaries.

Roman Catholic, Methodist, Anglican, and Baptist missions in neighboring countries such as South Africa, Tanzania, and Malawi expanded into Zambia in the late 1800s. They worked not only to convert the native population to Christianity but also to enculturate them to Western morals and values. The influence of the mission churches is still felt in modern-day Zambia: English is the official language, and Christianity is the official religion. In addition to the traditional mission churches, African-initiated churches (AICs), those that originated independently, are also an important part of the religious landscape. These churches emerged in the colonial era as indigenous interpretations of Christianity within the Zambian sociopolitical context and served as havens from European domination, in some cases supporting nationalist organizations in the struggle for independence.

Zambia gained independence from Britain in 1964, and since the 1970s, many Pentecostal and Charismatic churches in the United States have

sent missionaries to the country; these missionaries found audiences responsive to the preaching of the prosperity gospel, which promotes the idea that God wants to bless his followers with material wealth. As the hardships associated with structural adjustment took hold of the country in the 1980s and 1990s, the popularity of spiritual remedies for the suffering of the masses increased. In 1991, a Pentecostal, Fredrick J. T. Chiluba, was elected president, and the influx of Pentecostal and Charismatic missionaries and the founding of churches in the country surged to even greater levels.

A 1996 amendment to the Zambian constitution made Christianity the official religion of the country. However, other religions are freely practiced in Zambia. The country's current religious makeup is estimated to be anywhere from 50% to 87% Christian, with Roman Catholics being the largest group. According to various estimates, 1%–5% of the population is Hindu, mainly residents of South Asian and Middle Eastern descent. The Baha'i community in Zambia is the 10th largest in the world and constitutes 1%–2% of the population. Zambia has the largest number of Jehovah's Witnesses in Africa, with a quarter million members (1% of the population). Adherents to indigenous beliefs are estimated at 1% of the population, while 5% are estimated to be atheist or to have no religious beliefs. Islam has a long history in Zambia, starting with Arab slave traders in the mid-18th century. Other Muslims came to Zambia from India during the colonial period and settled along the railway from Lusaka to

Livingstone. Today, Muslims are estimated to make up 1%–5% of the population.

ZEN BUDDHISM

Zen is the Japanese form of the Chinese Ch’an, in turn deriving from the Sanskrit *dhyana*, or meditation. Centered in East Asia, it is a form of Buddhism that emphasizes attaining enlightenment through the quiet sitting known as *zazen* and through interaction with a *roshi*, or Zen teacher. Zen is known for its substantial influence on the traditional arts of Japan. More than most other forms of Buddhism, Zen has spread worldwide and has had a significant cultural impact in the West.

History

Zen or Ch’an emerged in China shortly after the introduction of Buddhism in the early centuries of the common era. Clearly an adaptation of the imported religion to Chinese cultural values, it combines the basic Buddhist emphasis on monastic discipline and enlightenment with Daoist naturalism. The key figure is the half-legendary Bodhidharma (ca. 470–532), who is said to have brought the tradition from India to China. His teaching

stressed that Zen is not something realized through the study of texts but by direct experience transmitted from teacher to student. That training may entail the harsh discipline of abuse and even blows, as well as long hours of *zazen*, but it can produce a personality as free as Bodhidharma himself, who was allegedly able to speak impertinently even to an emperor.

Ch’an was developed in China by celebrated teachers such as Hongren (601–674) and Shenziu (ca. 606–706), who emphasized sudden enlightenment and the use of enigmatic stories and questions, known in Japanese as *koans*, to bring it about. A significant event was the persecution of Buddhism by the Tang Dynasty in 845, after Confucian allegations that the foreign faith was parasitic. Many great monasteries were destroyed, and their monks returned to lay life, but Ch’an was largely spared because its centers were comparatively modest and out of the way and its monks supported themselves by the work of their own hands. The upshot was that monastic Buddhism in China, and the priesthood, became largely Ch’an, though popular religion favored Pure Land Buddhism.

In the 12th and 13th centuries, Ch’an was introduced as Zen Buddhism in Japan. This was during Japan’s Kamakura era (1185–1333), a time of much spiritual ferment. Eisai (1141–1215) went to China to bring back the *Rinzai* school of Zen, while Dogen (1200–1253) did the same for the *Soto* school. Rinzai, with a more dynamic view of Zen, emphasizes intense interaction between *roshi* and disciple, with much use of koans. Soto, conversely, presents a more quietist Zen, in which realization is attained moment by moment while doing *zazen* and daily work. Both schools attracted the support of the samurai or warrior class, dominant in the Kamakura period. Like the contemporary knights of Europe, they greatly valued self-discipline while aspiring to a higher culture. In Zen’s monastic discipline and its spare but elegant art, many men preparing to face death on the field of battle found a spirituality that seemed right for them.

The subsequent Ashikaga or Muromachi period (1392–1568) was the golden age of Zen in Japan. Under lavish patronage by the shoguns of the Ashikaga house, Zen architecture, gardens, flower arrangement, the “tea ceremony,” and Noh plays,

with their decided Zen influence, all took form and flourished. So also, as one would expect in samurai culture, did martial arts such as *kendo*, the “way of the sword,” with their appropriation of Zen’s indifference to life or death and its focus on the present moment, in which one must act spontaneously, without conscious deliberation. All these arts inculcated naturalness of medium and movement, harmony with nature, and apparent simplicity. At the same time, they actually came out of long and rigorous discipline, intended to prune away all that is not truly natural in self and expression.

A little later, in the Tokugawa period (1600–1868) the concise 17-syllable (in Japanese) haiku poem, so epitomizing the Zen way of seeing, reached its peak under the great Basho (1644–1694). His haiku,

*An old pond
A frog jumps in
The sound of water*

is said to express the whole of Buddhism for those who understand it. Hakuin (1685–1768) organized the traditional koans, and the corresponding stages of Zen practice, systematically.

Practice

The foundational Zen practice is *zazen*, sitting meditation. Traditionally, it is done in the “lotus posture,” with the legs crossed, each foot on the opposite thigh. The back and head are erect, eyes focused ahead. Breathing is slow and deep; teachers will often ask students to begin by counting breaths from 1 to 10 to help keep the mind steady.

Later, especially in the Rinzai tradition, a student may hold a koan in the mind during *zazen*. These will be given in an interview with the *roshi*. Some familiar koans are “What is the sound of one hand?” or “What was your face before you were born?” Both of these refer to the oneness of the universe. The point is not to think about them intellectually but just to hold them in the mind during *zazen* and in daily life, until they work a deep influence on the mind. Then, when the student is asked by the *roshi* to demonstrate the meaning of the koan, the response would not be an explanation so much as a gesture or a cry showing

that the student is himself or herself a part of the oneness. The student should carry that awareness into the routine work, in the kitchen or garden or grounds, which is no less a part of Zen.

Zazen sessions are generally held in the morning and evening for 2 hours or so, often in 30-minute segments broken by brief walking. They are preceded and ended with more formal Buddhist worship—bows, sutra chanting, perhaps a *teisho* or brief sermon. Zen combines inner freedom with firm ritual and discipline, and they are seen to go together. In this respect, the “tea ceremony” is almost like a Zen sacrament, for it does something very ordinary and natural, making and serving tea, in a way that appears naturally graceful and polished. Yet that is the result of much practice, just as playing the piano so well that it seems “easy” is the product of years of work. So also the other natural-seeming Zen arts: the gardens of raked sand, the ink paintings of a few strokes, the “tossed” yet graceful *ikebana* or flower arrangements, even the martial arts.

Zen in the West

This kind of awareness, and for many the world behind Zen arts as well, seemed a different perspective from the Western and is one that has appealed to Westerners. That attraction led to the sprouting of Zen centers in most major countries outside Asia and to a “Zen” cultural influence that has gone far beyond its formal practice, affecting art, architecture, music, poetry, novels, and even brand names. Together with Vedanta Hinduism, Zen is an early and continuing example of the globalization of religion from the East on several levels.

The story of formal Zen in the West begins with the Japanese monk Soen Shaku (1859–1919), who represented the tradition at the World’s Parliament of Religions in Chicago in 1893. He was also the teacher of D. T. Suzuki (1870–1966), whose books and lectures did so much to popularize Zen; of Nyogen Senzaki (1876–1958), the first Zen monk to reside permanently in America; and, through another student of his, of Shigemitsu Sasaki (1882–1945; also called Sokei-an), founder of the First Zen Institute of New York in 1930, the premier lasting Zen establishment for Westerners.

It was after World War II that the Western vogue for Zen crescendoed. The 1950s were allegedly a

decade of conformity, but they had a rebellious undertow, epitomized by the “Beat Generation.” Sparked by the writings of Suzuki and reports from occupied Japan by Europeans and Americans who had sampled the culture of the erstwhile enemy, Zen came to represent what many were seeking. Zen meant different things, of course. Alan Watts, in *Beat Zen, Square Zen, and Zen*, contrasted the Zen of the “Beats,” a wandering, aesthetic, “bohemian” kind of life supposedly modeled on the “Zen Lunatics” of old, with the “square Zen” of formal discipline and practice. Three books can be taken to represent the three Western Zens: (1) Alan Watts’s *The Way of Zen*, the Daoistic, artistic, philosophical kind of Zen; (2) Philip Kapleau’s *The Three Pillars of Zen*, the Zen of rigorous practice, enlivened by vivid accounts of modern enlightenment; and (3) Jack Kerouac’s *The Dharma Bums*, a semiautobiographical presentation of “Beat Zen.” In all these ways, through a kind of ripple effect, Zen has gone global.

ZIMBABWE

The Republic of Zimbabwe is a landlocked country in the southern part of Africa, bordered by South Africa, Botswana, Zambia, and Mozambique. The country consists of several ethnicities, the largest of which is Shona. Three languages hold official status: English, Shona, and Ndebele.

The traditional religion indigenous to Zimbabwe is a monotheistic faith that believes in one supreme creator, called Mwari by the Shona and Mulimu by the Ndebele. Prayers are channeled to the creator through family ancestors, sometimes with the help of a spirit medium. Early contact with European religion came when the Jesuit priest Goncalo de Silveria reached the Munhumutapa capital in 1560. However, the first permanent missions were not established until 1859 by the London Missionary Society. Some of the early Christian missionaries who encountered the indigenous religion recognized its monotheistic nature and incorporated local concepts into their evangelism of the locals. For some contemporary Zimbabweans, the Christian faith is practiced in conjunction with indigenous religious practices. Thus, in addition to attending Christian churches regularly, they might also visit traditional healers, consult a spirit medium for advice, or visit a Mwari shrine. Some local religious groups, such as the Seven Apostles, formally combine Christian beliefs with traditional African beliefs.

Today, the country is approximately 70% Christian. The largest denomination is Roman Catholic, and there are significant numbers of Anglicans, Methodists, and Presbyterians. These mainline denominations were imported into Zimbabwe during the colonial era and are financially maintained by a foreign missionary infrastructure. Pentecostalism is the fastest growing sector of Christianity and was originally brought to South Africa and the then southern Rhodesia by foreign missionaries in the 1950s. It is highly transnational due to the international ties created through the Zimbabwe diaspora (such as business contacts and remittances) and through the vast range of ideologies incorporated into the teachings at different times (such as the Christian prosperity gospel, neoliberal capitalism, Marxism, and pan-Africanism). The indigenous Zimbabwe Assemblies of God, Africa (ZAOGA), founded by Ezekiel Guti in 1960, claims to have over 1 million members in Zimbabwe, South Africa, and across the world in places such as Sidney, Sao Paulo, Toronto, Shanghai, Paris, New Delhi, Rome, and London. ZAOGA is an example of what has been called the “reverse flow” of missionaries from the Global South to the former missionary-sending countries of the North.

Various non-Christian religions have been introduced as a result of immigration. Islam is practiced in Zimbabwe primarily by South Asian immigrants from India and Pakistan as well as some North Africans and Middle Easterners. Muslims make up approximately 1% of the population. These are also small Jewish, Hindu, and Buddhist populations, which like the Muslims, are primarily composed of immigrants located in the capital city, Harare. Like Christianity, the Baha'i faith was established in Zimbabwe through efforts at evangelism. The first Baha'i missionary arrived in 1953 from Iran, followed by missionaries from the United Kingdom and the United States. In 2003, the Baha'is in Zimbabwe celebrated their 50th anniversary in the country with an international conference.

of the Jews since their exile from their homeland in the year 73 CE and their perennial political feebleness made them an obvious and accessible target of the xenophobia and economic frustration felt by host nations in the tumultuous and uncertain years that marked the rise of modernity. This entry describes the circumstances in which Zionism was born, the leaders who inspired and initiated the movement, the challenges and obstacles it faced, and the various interpretations and factions it spawned.

The Forerunners of Zionism

Prior to the formal establishment of the Zionist organization and the convening of the first Zionist Congress in Basel, Switzerland, in August 1897, there were several educators and spiritual leaders who wrote about the necessity and inevitability of a Jewish national awakening as a precondition for redemption and salvation. The common theme with all these thinkers was that saving the Jews from persecution is possible only through the return to their ancient homeland and resettling the land of Israel. These early advocates of national deliverance and emancipation came to be known as the precursors of Zionism. Three persons, in particular, with differing personalities and disparate backgrounds and beliefs emerged as passionate advocates of Zionism. They were Rabbi Zvi Kalischer (1795–1874), an Ashkenazi Orthodox Rabbi from northern Poland; Rabbi Yehuda Alkalai (1798–1878), a Sephardi Orthodox Rabbi from Serbia; and Moses Hess (1812–1875), a secular communist philosopher and a colleague of Marx and Engels. The two rabbis, unlike their peers, believed that self-help and activism are not heretical but a part of the divine intervention of saving the Jews and restoring their status as the chosen people. However, it must happen in two stages, the first being the actual return to Zion, which would then enable the coming of the Messiah and the full redemption of Israel. Hess, on the other hand, wholeheartedly believed in the ingathering of Jews from all their exile communities because assimilation among the Gentiles could never work. In a striking departure from his earlier conviction, that universal education and emancipation would promote and facilitate the assimilation of Jews in their host societies, violent anti-Semitic

ZIONISM

Zionism is the national movement of the Jewish people. It was formed as part of the advent of nationalism in the mid-19th century and was precipitated by the growing anti-Semitism accompanied by waves of violence against Jews around the world but mainly in Eastern Europe. The dispersion

outbursts all over Europe convinced Hess that only immigration to Zion and the establishment of a socialist society there is the viable solution for the survival of Judaism. Thus, from ostensibly opposing points of departure, the three prominent harbingers of Zionism reached similar conclusions. In their major literary works *Seeking Zion* (1862), *A Lot for the Lord* (1957), and *Rome and Jerusalem* (1862), respectively, they exerted a significant influence on Zionist leaders, even on the founder of the movement, Theodore Herzl, who as a secular man admitted that he never would have written his seminal *The Jewish State* if he had not read Hess's *Rome and Jerusalem* first.

Herzl, Founder of the Zionist Movement

The trigger event for Herzl's activism and his dedication to establish an infrastructure for a concentrated effort to solve the Jewish predicament was the Dreyfus affair in France. In this notorious case of false accusation, a Jewish military officer was charged with treason, brought to trial, and convicted. Before he was sent to prison, he was stripped of his ranks and humiliated in a public military degradation ceremony. Herzl covered the trial as a correspondent for the Viennese newspaper *Neue Freie Presse* in the winter of 1894 and was deeply affected by the anti-Semitic atmosphere that had engulfed the judicial processions and the public debate in France at the time. Some historians claim that the ascendancy of the anti-Semitic Austrian politician Karl Lueger to the position of mayor of Vienna in 1895 bore even more influence on Herzl's decision to relinquish his hopes for emancipation and assimilation and become a Zionist. He immediately immersed himself in feverishly writing his seminal book *Der Judenstaat* (*The Jewish State*), which came out in February 1896 and laid the ground for the official establishment of the Zionist movement and the first Zionist Congress in Basel, Switzerland, in August 1897.

Challenges to the Zionist Idea

The first major challenge for Herzl and his colleagues in the Zionist leadership was to reach out and consolidate their initiative into a cohesive national movement by enticing and mobilizing Jews from different countries and different continents,

with dissimilar cultures and languages and disparate degrees of urgency to invoke and redeem their Jewish identity. Jews from Western and Central Europe experienced an entirely different rapport with their host environment than their brethren from Eastern Europe, and both of these concentrations of Jewish communities encountered a vastly different reality from Jewish existence in the Middle East, North Africa, or Asia. The globalization and dispersion of Judaism made the national awakening and reunification of Jews a much more difficult task. The Zionist leadership's first priority was to align all Jews from the prosperous North American communities with the ravaged and pogrom-stricken Russian communities, and the German and French secularly educated and self-emancipated Jews with the traditionalist and conservatively religious Yemenite or Tunisian Jews. The forefathers of Zionism were mostly secular, some even socialist, Jews who promoted their agenda on rationalist, socioeconomic grounds. Their most pressing quest was to save the Jews from perishing under the onslaught of anti-Semitism. The sentimental and spiritual value of returning to the promised land of their birthright was less evident to them. However, the majority of Zionism's prospective adherents were devout Jews who for generations had cultivated their affinity to Zion on the merit of their religious beliefs and cultural kinship.

This apparent incompatibility between the leaders and the putative followers needed to be attenuated by adjustment of the Zionist elite to the circumstances in which most of their potential recruits lived. The unfamiliarity of most Zionist intelligentsia with the aspirations and hopes of their people induced them to make extended trips among Jewish diasporas in order to acquaint themselves with the woes and difficulties that kindled the age-old desire to return to Zion. Herzl and his associates at the helm of the Zionist establishment realized that to put their vision into action, they would have to canvass the postexilic Jewish world and persuade community leaders to join the movement. The annual congresses and the periodic conferences and summits held in different cities in Europe were attended only by the elected delegates and professional, dedicated Zionists. The critical masses remained in their local communities, and their level of involvement was very low to nonexistent. In their proselytizing efforts to sway the Jews from

passivity to activism and from waiting for divine salvation to man-made self-redemption, Zionist leaders travelled across the seas and oceans and traversed the continents.

Contending Interpretations and Factions

However, the absence of a single political jurisdiction and the abiding authority of an independent state has hampered a unified and coherent endeavor to promulgate the idea of Zionism. Instead, a multipronged effort was launched, generated, and maintained by several divergent beliefs or understandings of what Zionism meant. The major variants of the Zionist idea were political Zionism, practical Zionism, and cultural Zionism. Alongside these initial disparities, other disagreements developed between national and religious Zionism and, a little later, between labor and revisionist Zionism as well. This variegation of Zionist thought reflected the contending denominations within the Jewish nationalist revival. Secular, religious, socialistic, and nationalistic rifts already existed in the dispersed Jewish communities, and the various attitudes toward the idea of Zionism augmented these rivalries and reinforced the existing faultlines between the factions.

Political or diplomatic Zionism meant the effort to obtain a charter or a legal permit to allow a Jewish state in Eretz Israel (the Land of Israel), or Palestine. Such a charter could have been granted only from one of the political powers of the time, especially those powers that had a direct influence on or a vested interest in the international situation in the Middle East, such as Great Britain, Germany, or Turkey. This stately path was preferred by Theodore Herzl and some of his deputies such as David Wolffsohn and Max Nordau. They firmly believed that political endorsement and international recognition must precede any action on the ground and that diplomatic achievements would facilitate and guarantee the build-up effort in Palestine. The exponents of practical Zionism contended the opposite: The work on the ground—cultivating the land, building settlements, expanding the Jewish population in Eretz Israel by encouraging immigration—is the most essential task, and it must continue unabated regardless of diplomatic negotiations. The leaders of this orientation were Zionist activists who immigrated to Zion in the early waves

of immigration at the end of the 19th century and Eastern European Jews, who unlike Western and Central European Jews, were artisans, workers, and farmers and hence more comfortable with a hands-on, matter-of-fact lifestyle. In contrast to the first two versions of Zionism, the cultural or spiritual orientation did not consider the return to Zion as a first, all-encompassing priority. The focus of cultural Zionism was the rejuvenation of the Jewish culture and reconnection to their heritage—the language and the values of their past. Their incentive for national revivalism was not “the problem of the Jews,” as Herzl wrote, but “the problem of Judaism,” in the words of a prominent figure in this camp, the revered journalist and essayist Asher Ginzberg, better known by his pen name Ahad Ha’am (One of the People). He maintained that Eretz Israel should be considered a spiritual center for world Jewry, but massive immigration there was not necessary. It was more important to nurture and bolster the unique Jewish identity in the various diasporas, and the Land of Israel would play a pivotal role as a source of inspiration. These three approaches vied for the attention and support of the Jewish communities, and though they were all part of the surge of national revitalization, their priorities and missions were in collision.

Other sources of friction within Zionism were tensions between the religious and the secular as well as between labor and revisionism. The former emphasized the deep-rooted disagreement regarding the nature of salvation, whether divine or human. The Zionist movement, initially a secular endeavor, could not give up on the masses of potential recruits who were religious. To enable their incorporation and active participation in the movement, the secular leaders of the movement underlined the spiritual and sacred nexus between the Jews and the Promised Land, while the religious constituencies on their part joined the Zionist initiative despite the absence of a redeeming Messiah. Their leaders, especially Rabbi Abraham Kook, reinterpreted Zionism as preparing the soil for the advent of the divine redeemer and, thus, managed to reconcile the religious and secular agendas within Zionism. The rift between labor Zionism and revisionist Zionism is akin to the polarity between the ideological Left and Right, respectively. In 1925, Vladimir (Zeev) Jabotinsky,

a journalist and a charismatic Zionist leader from the Ukraine, formed the Zionist Revisionist Organization as a renegade faction within the Zionist organization. His dissent focused on the attitude of the Zionists toward Britain and the general direction of the Zionist policy in Eretz Israel. He vehemently believed that Britain was becoming increasingly anti-Jewish in its Palestine policy and that the conciliatory manner that the Zionist leadership demonstrated toward the British was defeatist and uncalled for. His main rivals were Chaim Weitzmann, the president of the Zionist movement at the time and later the first president of the state of Israel, a British citizen and supporter of the London policy in the Middle East, and David Ben Gurion, the dominant leader of the Zionist workers' union in Palestine and later the first prime minister of Israel. Their dispute extended further to the general character of Zionism, with Jabotinsky harshly criticizing what he perceived to be their inaction and their placatory stance and Weitzmann and Ben Gurion warning against Jabotinsky's militancy and aggression as jeopardizing their efforts at securing the Zionist goal.

ZOROASTRIANISM (AND PARSIS)

One of the oldest revealed religions (if not the oldest), Zoroastrianism developed in ancient Persia and played a role in the evolution of the Judaic, Christian, and Islamic belief systems. Heavily dualistic in its beliefs, the community that was for so long based in the lands of modern-day Iran has been greatly diminished and dislocated; at the beginning of the 21st century, the largest group of believers, known as Parsis (Parsees), reside in India. This entry will outline the basic tenets of the Zoroastrian faith, give a short history of the tradition, and attempt to show some ways in which scholars have envisioned Zoroastrian influence on many major world religions.

Theology

Zoroaster is the Greek name for the prophet known as Zarathustra, the eponymous founder of the religion, who likely lived in Persia around 1500 BCE. Zoroastrianism is regarded as the first monotheistic faith and revolved around the worship of the deity Ahura Mazda (Ormazd in the Pahlavi language), the supreme God, who is the source of good and the world. His counterpart is the spirit Angra Mainyu (Pahlavi: Ahriman), who represents violence and death and engages in battle with Ahura Mazda until the end of time. Their conflict involves the entire universe, and each person must decide which side to join (this has sometimes been interpreted as an internal battle within each believer). The victory of Ahura Mazda is assured, and neither dualism nor evil will exist when time ends; even hell, where the evil dead reside, will be destroyed in the end.

The Avesta, the holy book of Zoroastrianism, preserves 17 hymns (*gāthās*) believed to have been written by Zoroaster. These *gāthās* are not directives but rather passionate poems about the worship of one God, the choice between good and evil, the idea of righteousness, and the cosmic order. The Avesta also contains the laws of the tradition, written after Zoroaster's death and leading to questions about their inspiration and the divisions in Zoroastrian communities that had followed.

Asha, the all-encompassing natural law, is another important belief of Zoroastrians. No direct translation for the idea exists, much like the Dao of

Daoism, but Zoroaster makes much use of it in the *gāthās*, and it is often symbolized by fire. It is the basis for the structure of Zoroaster's moral philosophy, the embodiment of the order that rules the world, and Zoroaster declares it to mean Ahura Mazda's righteousness. It likely is contiguous to or shares aspects with the Hindu *ṛta*, as both contain the idea of a path to be followed by the righteous.

Other beliefs of Zoroastrians will be familiar as they are shared by other global faiths. Death, for example, results in the deceased's soul being determined as worthy of heaven or hell by the deities Mithra, Sraosha, and Rashnu. There is also a savior figure, the *Saoshyant*, who would be born of a virgin in the line of Zoroaster and bring about the end of time and with it the gathering of all souls to heaven. Angels form another part of Zoroastrian doctrine, and they are divided into three categories: (1) *Amesha Spentas*, the archangels; (2) *Yazaatas*, the angels, and (3) *Fravashis*, the guardian angels. The first two are embodiments of abstract ideas and virtues or concrete objects of nature, while the third are "assigned" to individuals, watching over them and providing a moral model for the individual.

Zoroastrianism requires confession for penance, as well as several rituals of purification; some of these are done daily and some only at certain times and in certain places. Dogs play a role in the ritual practices of Zoroastrians, as their gaze is thought to ward off evil spirits. The chief ceremony of the religion is the *Yasna*, a sacrifice of the sacred liquor known as *haoma* in front of the sacred fire, which all temples must keep constantly burning. There is also a requirement to pray five times a day.

History

Religious estimates for the time of Zoroaster range from 6000 to 600 BCE, but most scholars agree that he lived sometime between 1500 and 1000 BCE. Herodotus claims that the Magi, practitioners of Zoroastrianism, were influential during the reign of the Median emperors but were defamed following their dissidence during the merging of the Median and Persian empires under Cyrus the Great. The loss of power of the priests did not mean a denigration of the religion, however; in fact, Cyrus the Great ostensibly made Zoroastrianism the official religion of his Achaemenid Empire. Cyrus's successor, Darius I,

likewise adopted Ahura Mazda as the chief god of his empire, continuing the faith's eminent position in the political realm. This would hold until the emergence of the Islamic dynasties in the seventh century CE. Zoroastrianism did play a role in marginalizing the polytheistic peoples of the time, and it was under Darius that the boundaries between Mithra and Ahura Mazda began to shift, both becoming understood to be gods of sovereignty and sealers of oaths.

The Sassanid Dynasty, coming to power in the third century CE, retained Zoroastrianism as the state religion and undertook a program to persecute Christians, which was surprising considering the similarities between the two faiths. However, the program was not targeted at all Christians equally; the relationship of the Sassanids to the Christian Roman Empire seemed more of a political consequence than a matter of belief, as the Patriarchate of the Church of the East was better treated by the Sassanids. With the defeat of the Sassanid Dynasty by the Umayyads, Zoroastrianism began to lose its direct influence in the world, but its indirect influence would continue through the impact the religion had on Islam, Christianity, and Judaism.

The Parsis of India are the last major Zoroastrian community in the world. It is estimated that the ranks of believers has fallen to less than 200,000 worldwide, the great majority residing in India. Having left the lands of Iran due to the persecution suffered under the Muslims in the 10th century CE, the name *Parsi* (Persian) was first seen in 12th-century travel logs of European travelers to India. Following the Parsis settling in the Greater Mumbai (former Bombay) area, they integrated into Indian society while maintaining their distinct culture and traditions. The members of the community instituted the first cotton mills and newspapers of India as well as the first Indian-owned bank. Their ranks include several preeminent Indians, such as Sir Jamsetji Tata, the "father of Indian industry," and Dadabhai Naoroji, the first Asian member of the British parliament and a mentor to the human rights champion Mohandas Karamchand Gandhi.

The numbers of the Parsi community, and thereby of the practitioners of Zoroastrianism, have been steadily declining. Parsis do not proselytize, and owing to the religion's basis in Persian tribal culture, members must be born and initiated into the faith. Inter-marriage with those outside the

religion is frowned on, and some have argued that the favorable status Zoroastrianism accords women has led to many of them choosing not to have children, which has played a role in decreasing the numbers of Parsis. In 1970, there began a slow exodus of Parsis from India to Western countries, resulting in a growing number of small communities in the United States, Canada, and Australia, to name a few.

Influence on Other Religions

The idea of monotheism itself has been attributed to Zoroaster. It has been surmised that the Jewish model (on which the Christian and Islamic belief systems are based) took this central notion from the Zoroastrian religion. At the time of the writing of the Jewish postexilic scriptures, Zoroastrianism was the religion of the empire, and its influence could have affected the beliefs of the authors. As with any attempts to prove one belief system informing the beliefs of another, precise linkages are not easy to establish, but the similitude of the beliefs compounded by the prevalence of Zoroastrianism during its formative years makes this plausible. In the Jewish scriptures, beliefs that align with Zoroastrian concepts appear only after those beliefs were available in the cultural milieu. Added to this was the likely interaction of Zoroastrianism with Greek and Roman cults, especially the Mithras Cult, which has been recognized as being influential on burgeoning Christianity.

Beliefs concerning heaven and hell, the cosmic battle of evil against good, and a Satan that opposes (but is not quite equal to) God all likely have their roots in Zoroastrian thought, as well as the important doctrine of a savior born of a virgin and the final judgment. Adding to this is the fact that certain Islamic traditions revere Zoroaster as a prophet of their own religion. Zoroastrianism and Hinduism also share many similarities, sometimes attributed to both traditions springing from an older Indo-European religion, evidence of which has been lost to time. The sacrificial rituals are similar in practice and close in title, *Yasna* in Zoroastrianism and *Yajna* in Hinduism. There is also the close association mentioned above between *Asha* and *rta*, the moral orders promoted by the two religions.

The impact of the Zoroastrian faith extends far beyond the Parsis who still practice it to those who

are followers of the religions that have taken aspects of Zoroastrianism and made them their own. While it was the official religion of an empire for over a millennium, its influence continues among the faithful in religions that boast much larger levels of adherence.
