Automotive air-conditioning repairers install and repair air-conditioners and service their components, such as compressors, con-

densers, and controls. These workers require special training in federal and state regulations governing the handling and disposal of refrigerants. *Front-end mechanics* align and balance wheels and repair steering mechanisms and suspension systems. They frequently use special alignment equipment and wheel-balancing machines. *Brake repairers* adjust brakes, replace brake linings and pads, and make other repairs on brake systems. Some technicians specialize in both brake and front-end work.

Work environment. While most automotive service technicians worked a standard 40 hour week in 2006, 30 percent worked longer hours. Some may work evenings and weekends to satisfy customer service needs. Generally, service technicians work indoors in well-ventilated and -lighted repair shops. However, some shops are drafty and noisy. Although many problems can be fixed with simple computerized adjustments, technicians frequently work with dirty and greasy parts, and in awkward positions. They often lift heavy parts and tools. Minor cuts, burns, and bruises are common, but technicians can usually avoid serious accidents if safe practices are observed.

Training, Other Qualifications, and Advancement

Automotive technology is rapidly increasing in sophistication, and most training authorities strongly recommend that people seeking work in automotive service complete a formal training program in high school or in a postsecondary vocational school or community college. However, some service technicians still learn the trade solely by assisting and learning from experienced workers. Acquiring National Institute for Automotive Service Excellence (ASE) certification is important for those seeking work in large, urban areas.

Education and training. Most employers regard the successful completion of a vocational training program in automotive service technology as the best preparation for trainee positions. High school programs, while an asset, vary greatly in scope. Graduates of these programs may need further training to become qualified. Some of the more extensive high school programs participate in Automotive Youth Education Service (AYES), a partnership between high school automotive repair programs, automotive manufacturers, and franchised automotive dealers. All AYES high school programs are certified by the National Institute for Automotive Service Excellence. Students who complete these programs are well prepared to enter entry-level technician positions or to advance their technical education. Courses in automotive repair, electronics, physics, chemistry, English, computers, and mathematics provide a good educational background for a career as a service technician.

Postsecondary automotive technician training programs usually provide intensive career preparation through a combination of classroom instruction and hands-on practice. Schools update their curriculums frequently to reflect changing technology and equipment. Some trade and technical school programs provide concentrated training for 6 months to a year, depending on how many hours the student attends each week, and award a certificate. Community college programs usually award a certificate or an associate degree. Some students earn repair certificates in a particular skill and leave to begin their careers. Associate degree programs, however, usually take 2 years to complete and include classes in English, basic mathematics, computers, and other subjects, as well as automotive repair. Recently, some programs have added classes on customer service, stress management, and other employability skills. Some formal training programs have alliances with tool manufacturers that help entry-level technicians accumulate tools during their training period.

Various automobile manufacturers and participating franchised dealers also sponsor two-year associate degree programs at postsecondary schools across the nation. Students in these programs typically spend alternate 6- to 12-week periods attending classes full time and working full time in the service departments of sponsoring dealers. At these dealerships, students work with an experienced worker who provides hands-on instruction and timesaving tips.

Those new to automotive service usually start as trainee technicians, technicians' helpers, or lubrication workers, and gradually acquire and practice their skills by working with experienced mechanics and technicians. In many cases, on-the-job training may be a part of a formal education program. With a few months' experience, beginners perform many routine service tasks and make simple repairs. While some graduates of postsecondary automotive training programs are often able to earn promotion to the journey level after only a few months on the job, it typically takes 2 to 5 years of experience to become a fully qualified service technician, who is expected to quickly perform the more difficult types of routine service and repairs. An additional 1 to 2 years of experience familiarizes technicians with all types of repairs. Complex specialties, such as transmission repair, require another year or two of training and experience. In contrast, brake specialists may learn their jobs in considerably less time because they do not need complete knowledge of automotive repair.

Employers increasingly send experienced automotive service technicians to manufacturer training centers to learn to repair new models or to receive special training in the repair of components, such as electronic fuel injection or air-conditioners. Motor vehicle dealers and other automotive service providers may send promising beginners or experienced technicians to manufacturer-sponsored technician training programs to upgrade or maintain employees' skills. Factory representatives also visit many shops to conduct short training sessions.

Other qualifications. The ability to diagnose the source of a problem quickly and accurately requires good reasoning ability and a thorough knowledge of automobiles. Many technicians consider diagnosing hard-to-find troubles one of their most challenging and satisfying duties. For trainee automotive service technician jobs, employers look for people with strong communication and analytical skills. Technicians need good reading, mathematics, and computer skills to study technical manuals. They must also read to keep up with new technology and learn new service and repair procedures and specifications.

Training in electronics is vital because electrical components, or a series of related components, account for nearly all malfunctions in modern vehicles. Trainees must possess mechanical aptitude and knowledge of how automobiles work. Experience working on motor vehicles in the Armed Forces or as a hobby can be very valuable.

Certification and advancement. ASE certification has become a standard credential for automotive service technicians. While not mandatory for work in automotive service, certification is common for all non entry-level technicians in large, urban areas. Certification is available in 1 or more of 8 different areas of automotive service, such as electrical systems, engine repair, brake systems, suspension and steering, and heating and air-conditioning. For certification in each area, technicians must have at least 2 years of experience and pass the examination. Completion of an automotive training program in high school, vocational or trade school, or community or junior college may be substituted for 1 year of experience. For ASE certification as a Master Automobile Technician, technicians must be certified in all eight areas.

By becoming skilled in multiple auto repair services, technicians can increase their value to their employer and their pay. Experienced technicians who have administrative ability sometimes advance to shop supervisor or service manager. Those with sufficient funds

many times open independent automotive repair shops. Technicians who work well with customers may become automotive repair service estimators.

Employment

Automotive service technicians and mechanics held about 773,000 jobs in 2006. Automotive repair and maintenance shops and automotive dealers employed the majority of these workers—29 percent each. In addition, automotive parts, accessories, and tire stores employed 7 percent of automotive service technicians. Others worked in gasoline stations; general merchandise stores; automotive equipment rental and leasing companies; federal, state, and local governments; and other organizations. Almost 17 percent of service technicians were self-employed, more than twice the proportion for all installation, maintenance, and repair occupations.

Job Outlook

The number of jobs for automotive service technicians and mechanics is projected to grow faster than average for all occupations over the next decade. Employment growth will create many new jobs, but total job openings will be significantly larger because many skilled technicians are expected to retire and will need to be replaced.

Employment change. Employment of automotive service technicians and mechanics is expected to increase 14 percent between 2006 and 2016, compared to 10 percent for all occupations. It will add a large number of new jobs, about 110,000, over the decade. Demand for technicians will grow as the number of vehicles in operation increases, reflecting continued growth in the driving age population and in the number of multi-car families. Growth in demand will be offset somewhat by continuing improvements in the quality and durability of automobiles, which will require less frequent service.

Employment growth will continue to be concentrated in automobile dealerships and independent automotive repair shops. Many new jobs also will be created in small retail operations that offer after-warranty repairs, such as oil changes, brake repair, air-conditioner service, and other minor repairs generally taking less than 4 hours to complete. Employment of automotive service technicians and mechanics in gasoline service stations will continue to decline, as fewer stations offer repair services.

Job prospects. In addition to openings from growth, many job openings will be created by the need to replace a growing number of retiring technicians. Job opportunities in this occupation are expected to be very good for those who complete high school or postsecondary automotive training programs and who earn ASE certification. Some employers report difficulty in finding workers with the right skills. People with good diagnostic and problem-solving abilities, and training in basic electronics and computer courses are expected to have the best opportunities. Those without formal automotive training are likely to face competition for entry-level jobs.

Most people who enter the occupation can expect steady work, even during downturns in the economy. Although car owners tend to postpone maintenance and repair on their vehicles when their budgets are strained, employers usually cut back on hiring new workers during economic downturns instead of letting experienced workers go.

Earnings

Median hourly wage-and-salary earnings of automotive service technicians and mechanics, including commission, were $16.24 in May 2006. The middle 50 percent earned between $11.96 and $21.56 per hour. The lowest 10 percent earned less than $9.17, and the highest 10 percent earned more than $27.22 per hour. Median annual earnings in the industries employing the largest numbers of service technicians were as follows:

Local government, excluding schools	$19.07
Automobile dealers	18.85
Automotive repair and maintenance	14.55
Gasoline stations	14.51
Automotive parts, accessories, and tire stores	14.38

Many experienced technicians employed by automobile dealers and independent repair shops receive a commission related to the labor cost charged to the customer. Under this system, weekly earnings depend on the amount of work completed. Employers frequently guarantee commissioned technicians a minimum weekly salary.

Automotive service technicians who are members of labor unions, such as the International Association of Machinists and Aerospace Workers; the International Union, United Automobile, Aerospace, and Agricultural Implement Workers of America; the Sheet Metal Workers' International Association; and the International Brotherhood of Teamsters, may enjoy more benefits than nonunion workers do.

Related Occupations

Other workers who repair and service motor vehicles include automotive body and related repairers, diesel service technicians and mechanics, and small engine mechanics.

Diesel Service Technicians and Mechanics

(O*NET 49-3031.00)

Significant Points

- A career in diesel engine repair can offer relatively high wages and the challenge of skilled repair work.
- Opportunities are expected to be very good for people who complete formal training programs.
- National certification is the recognized standard of achievement for diesel service technicians and mechanics.

Nature of the Work

Diesel-powered engines are more efficient and durable than their gasoline-burning counterparts. These powerful engines are standard in our nation's trucks, locomotives, and buses and are becoming more prevalent in light vehicles, including passenger vehicles, pickups, and other work trucks.

Diesel service technicians and mechanics, including *bus and truck mechanics and diesel engine specialists*, repair and maintain the diesel engines that power transportation equipment. Some diesel technicians and mechanics also work on other heavy vehicles and mobile equipment, including bulldozers, cranes, road graders, farm tractors, and combines. Other technicians repair diesel-powered passenger automobiles, light trucks, or boats. (For information on technicians and mechanics working primarily on gasoline-powered automobiles, heavy vehicles and mobile equipment, or boat engines, see the *Handbook* sections on automotive service technicians, heavy vehicle and mobile equipment service technicians, and small engine mechanics.)

Increasingly, diesel technicians must be versatile to adapt to customers' needs and new technologies. It is common for technicians to handle all kinds of repairs, working on a vehicle's electrical system one day and doing major engine repairs the next. Diesel maintenance is becoming increasingly complex, as more electronic components are used to control the operation of an engine. For example, microprocessors now regulate and manage fuel timing, increasing the engine's efficiency. Also, new emissions standards require mechanics to retrofit engines with emissions control systems, such as emission filters and catalysts, to comply with pollution regulations. In modern shops, diesel service technicians use hand-held or laptop computers to diagnose problems and adjust engine functions.

Technicians who work for organizations that maintain their own vehicles spend most of their time doing preventive maintenance. During a routine maintenance check, technicians follow a checklist that includes inspecting brake systems, steering mechanisms, wheel bearings, and other important parts. Following inspection, technicians repair or adjust parts that do not work properly or remove and replace parts that cannot be fixed.

Diesel service technicians repair and maintain diesel engines in tractor trailers, locomotives, and construction equipment.

Diesel service technicians use a variety of tools in their work, including power tools, such as pneumatic wrenches that remove bolts quickly; machine tools, such as lathes and grinding machines to rebuild brakes; welding and flame-cutting equipment to remove and repair exhaust systems; and jacks and hoists to lift and move large parts. Common hand tools—screwdrivers, pliers, and wrenches—are used to work on small parts and get at hard-to-reach places. Diesel service technicians and mechanics also use a variety of computerized testing equipment to pinpoint and analyze malfunctions in electrical systems and engines. Employers typically furnish expensive power tools, computerized engine analyzers, and other diagnostic equipment, but workers usually accumulate their own hand tools over time.

Work environment. Technicians normally work in well-lighted and ventilated areas. However, some shops are drafty and noisy. Many employers provide lockers and shower facilities. Diesel technicians usually work indoors, although they occasionally repair vehicles on the road. Diesel technicians may lift heavy parts and tools, handle greasy and dirty parts, and stand or lie in awkward positions while making repairs. Minor cuts, burns, and bruises are common, although serious accidents can usually be avoided when safety procedures are followed. Technicians may work as a team or be assisted by an apprentice or helper when doing heavy work, such as removing engines and transmissions.

Most service technicians work a standard 40-hour week, although some work longer hours, particularly if they are self-employed. A growing number of shops have expanded their hours to speed repairs and offer more convenience to customers. Technicians employed by truck and bus firms providing service around the clock may work evenings, nights, and weekends.

Training, Other Qualifications, and Advancement

Employers prefer to hire graduates of formal training programs because those workers are able to advance quickly to the journey level of diesel service. Other workers who learn diesel engine repair through on-the-job training need 3 to 4 years of experience before becoming journey-level technicians.

Education and training. High school courses in automotive repair, electronics, English, mathematics, and physics provide a strong educational background for a career as a diesel service technician or mechanic. Many mechanics also have additional training after high school.

A large number of community colleges and trade and vocational schools offer programs in diesel engine repair. These programs usually last from 6 months to 2 years and may lead to a certificate of completion or an associate degree. Some offer about 30 hours per week of hands-on training with equipment; others offer more lab or classroom instruction. Formal training provides a foundation in the latest diesel technology and instruction in the service and repair of the equipment that technicians will encounter on the job. Training programs also teach technicians to interpret technical manuals and to communicate well with coworkers and customers. Increasingly, employers work closely with representatives of educational programs, providing instructors with the latest equipment, techniques, and tools and offering jobs to graduates.

Although formal training programs lead to the best prospects, some technicians and mechanics learn through on-the-job training. Unskilled beginners generally are assigned tasks such as cleaning parts, fueling and lubricating vehicles, and driving vehicles into and out of the shop. Beginners are usually promoted to trainee positions as they gain experience and as vacancies become available.

After a few months' experience, most trainees can perform routine service tasks and make minor repairs. These workers advance to increasingly difficult jobs as they prove their ability and competence. After technicians master the repair and service of diesel engines, they learn to work on related components, such as brakes, transmissions, and electrical systems. Generally, technicians with at least 3 to 4 years of on-the-job experience will qualify as journey-level diesel technicians.

Employers often send experienced technicians and mechanics to special training classes conducted by manufacturers and vendors, in which workers learn about the latest technology and repair techniques.

Other qualifications. Employers usually look for applicants who have mechanical aptitude and strong problem-solving skills and who are at least 18 years old and in good physical condition. Technicians need a state commercial driver's license to test-drive trucks or buses on public roads. Many companies also require applicants to pass a drug test. Practical experience in automobile repair at an automotive service station, in the Armed Forces, or as a hobby is valuable as well.

Certification and advancement. Experienced diesel service technicians and mechanics with leadership ability may advance to shop supervisor or service manager, and some open their own repair shops. Technicians and mechanics with sales ability sometimes become sales representatives.

Although national certification is not required for employment, many diesel engine technicians and mechanics find that it increases their ability to advance. Certification by the National Institute for Automotive Service Excellence (ASE) is the recognized industry credential for diesel and other automotive service technicians and mechanics. Diesel service technicians may be certified as master medium/heavy truck technicians, master school bus technicians, or master truck equipment technicians. They may also be certified in specific areas of truck repair, such as drivetrains, brakes, suspension and steering, electrical and electronic systems, or preventive maintenance and inspection. For certification in each area, a technician must pass one or more of the ASE-administered exams and present proof of 2 years of relevant work experience. To remain certified, technicians must be retested every 5 years.

Employment

Diesel service technicians and mechanics held about 275,000 jobs in 2006. These workers were employed in almost every industry, particularly those that use trucks, buses, and equipment to haul, deliver, and transport materials, goods, and people. The largest employer, the truck transportation industry, employed 1 out of 6 diesel service technicians and mechanics. Less than 1 out of 10 were employed by local governments, mainly to repair school buses, waste removal trucks, and road equipment. A similar number were employed by automotive repair and maintenance facilities. The rest were employed throughout the economy, including construction, manufacturing, retail and wholesale trade, and automotive leasing. About 16,000, a relatively small number, were self-employed. Nearly every area of the country employs diesel service technicians and mechanics, although most work is found in towns and cities where trucking companies, bus lines, and other fleet owners have large operations.

Job Outlook

The number of jobs for diesel service technicians and mechanics is projected to grow about as fast as average. Opportunities should be very good for people who complete formal training in diesel mechanics.

Employment change. Employment of diesel service technicians and mechanics is expected to grow 11 percent from 2006 to 2016, about as fast as the average for all occupations. Additional trucks—and truck repairers—will be needed to keep pace with the increasing volume of freight shipped nationwide. Moreover, the greater durability and economy of the diesel engine relative to the gasoline engine is expected to increase the number of buses, trucks, and other vehicles powered by diesel engines.

And because diesel engines are now cleaner burning and more efficient—to comply with emissions and environmental standards—they are expected to be used in more passenger vehicles, which will create jobs for diesel service technicians and mechanics over the long run. In fact, auto industry executives are projecting more sales of diesel passenger vehicles as gasoline prices increase. In the short-run, many older diesel engines in trucks must be retrofitted to comply with the new emissions regulations, creating more jobs for diesel engine mechanics.

Job prospects. People who enter diesel engine repair will find favorable opportunities, especially as the need to replace workers who retire increases over the next decade. Opportunities should be very good for people who complete formal training in diesel mechanics at community colleges or vocational and technical schools. Applicants without formal training will face stiffer competition for jobs.

Most people entering this occupation can expect relatively steady work because changes in economic conditions have less of an effect on the diesel repair business than on other sectors of the economy. During a downturn in the economy, however, employers may be reluctant to hire new workers.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Bus and truck mechanics and diesel engine specialists	49-3031	275,000	306,000	32,000	11

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Earnings

Median hourly earnings of bus and truck mechanics and diesel engine specialists, including incentive pay, were $18.11 in May 2006, more than the $17.65 median hourly earnings for all installation, maintenance, and repair occupations. The middle 50 percent earned between $14.48 and $22.07 an hour. The lowest 10 percent earned less than $11.71, and the highest 10 percent earned more than $26.50 an hour. Median hourly earnings in the industries employing the largest numbers of bus and truck mechanics and diesel engine specialists in May 2006 were as follows:

Local government	$21.22
Motor vehicle and motor vehicle parts and supplies merchant wholesalers	18.27
Automotive repair and maintenance	17.53
General freight trucking	17.14
Specialized freight trucking	16.15

Because many experienced technicians employed by truck fleet dealers and independent repair shops receive a commission related to the labor cost charged to the customer, weekly earnings depend on the amount of work completed. Beginners usually earn from 50 to 75 percent of the rate of skilled workers and receive increases as they become more skilled.

About 23 percent of diesel service technicians and mechanics are members of labor unions, including the International Association of Machinists and Aerospace Workers; the Amalgamated Transit Union; the International Union, United Automobile, Aerospace and Agricultural Implement Workers of America; the Transport Workers Union of America; the Sheet Metal Workers' International Association; and the International Brotherhood of Teamsters. Labor unions may provide additional benefits for their members.

Related Occupations

Diesel service technicians and mechanics repair trucks, buses, and other diesel-powered equipment. Related technician and mechanic occupations include aircraft and avionics equipment mechanics and service technicians, automotive service technicians and mechanics, heavy vehicle and mobile equipment service technicians and mechanics, and small engine mechanics.

Sources of Additional Information

More details about work opportunities for diesel service technicians and mechanics may be obtained from local employers such as trucking companies, truck dealers, or bus lines; locals of the unions previously mentioned; and local offices of your state employment service. Local state employment service offices also may have information about training programs. State boards of postsecondary career schools have information on licensed schools with training programs for diesel service technicians and mechanics.

Heavy Vehicle and Mobile Equipment Service Technicians and Mechanics

(O*NET 49-3041.00, 49-3042.00, and 49-3043.00)

Significant Points

- Opportunities should be excellent for people with formal postsecondary training in diesel or heavy equipment mechanics; those without formal training will face keen competition.
- This occupation offers relatively high wages and the challenge of skilled repair work.
- Skill in using computerized diagnostic equipment is important in this occupation.

Nature of the Work

Heavy vehicles and mobile equipment are indispensable to many industrial activities from construction to railroads. Various types of equipment move materials, till land, lift beams, and dig earth to pave the way for development and production. Heavy vehicle and mobile equipment service technicians and mechanics repair and maintain engines and hydraulic, transmission, and electrical systems for this equipment. Farm machinery, cranes, bulldozers, and railcars are all examples of heavy vehicles that require such service. (For information on service technicians specializing in diesel engines, see the section on diesel service technicians and mechanics elsewhere in the *Handbook*.)

Service technicians perform routine maintenance checks on agricultural, industrial, construction, and rail equipment. They service fuel, brake, and transmission systems to ensure peak performance, safety, and longevity of the equipment. Maintenance checks and comments from equipment operators usually alert technicians to problems. After locating the problem, these technicians rely on their training and experience to use the best possible technique to solve the problem.

With many types of modern heavy and mobile equipment, technicians can plug diagnostic computers into onboard computers to diagnose a component needing adjustment or repair. If necessary, they may partially dismantle affected components to examine parts for damage or excessive wear. Then, using hand-held tools, they repair, replace, clean, and lubricate parts as necessary. In some cases, technicians re-calibrate systems by typing codes into the onboard computer. After reassembling the component and testing it for safety, they put it back into the equipment and return the equipment to the field.

Many types of heavy and mobile equipment use hydraulics to raise and lower movable parts. When hydraulic components malfunction, technicians examine them for fluid leaks, ruptured hoses, or worn gaskets on fluid reservoirs. Occasionally, the equipment requires extensive repairs, as when a defective hydraulic pump needs replacing.

Service technicians diagnose electrical problems and adjust or replace defective components. They also disassemble and repair undercarriages and track assemblies. Occasionally, technicians weld broken equipment frames and structural parts, using electric or gas welders.

Heavy vehicle service technicians often make repairs at work sites rather than in repair shops.

Technicians use a variety of tools in their work: power tools, such as pneumatic wrenches to remove bolts quickly; machine tools, like lathes and grinding machines, to rebuild brakes; welding and flame-cutting equipment to remove and repair exhaust systems; and jacks and hoists to lift and move large parts. Service technicians also use common hand tools—screwdrivers, pliers, and wrenches—to work on small parts and to get at hard-to-reach places. They may use a variety of computerized testing equipment to pinpoint and analyze malfunctions in electrical systems and other essential systems. Tachometers and dynamometers, for example, serve to locate engine malfunctions. Service technicians also use ohmmeters, ammeters, and voltmeters when working on electrical systems. Employers typically furnish expensive power tools, computerized engine analyzers, and other diagnostic equipment, but hand tools are normally accumulated with experience, and many experienced technicians have thousands of dollars invested in them.

It is common for technicians in large shops to specialize in one or two types of repair. For example, a shop may have individual specialists in major engine repair, transmission work, electrical systems, and suspension or brake systems. Technicians in smaller shops, on the other hand, generally perform multiple functions.

Technicians also specialize in types of equipment. *Mobile heavy equipment mechanics and service technicians*, for example, keep construction and surface mining equipment, such as bulldozers, cranes, graders, and excavators in working order. Typically, these workers are employed by equipment wholesale distribution and leasing firms, large construction and mining companies, local and federal governments, and other organizations operating and maintaining heavy machinery and equipment fleets. Service technicians employed by the federal government may work on tanks and other armored equipment.

Farm equipment mechanics service, maintain, and repair farm equipment, as well as smaller lawn and garden tractors sold to suburban homeowners. What once was a general repairer's job around the farm has evolved into a specialized technical career. Farmers have increasingly turned to farm equipment dealers to service and repair their equipment because the machinery has grown in complexity. Modern equipment uses more computers, electronics, and hydraulics, making it difficult to perform repairs without specialized training and tools.

Railcar repairers specialize in servicing railroad locomotives and other rolling stock, streetcars and subway cars, or mine cars. Most railcar repairers work for railroads, public and private transit companies, and railcar manufacturers.

Work environment. Heavy vehicle and mobile equipment service technicians usually work indoors. To repair vehicles and equipment, technicians often lift heavy parts and tools, handle greasy and dirty parts, and stand or lie in awkward positions. Minor cuts, burns, and bruises are common, but serious accidents normally are avoided when safety practices are observed. Although some shops are drafty and noisy, technicians usually work in well-lighted and ventilated areas. Many employers provide uniforms, locker rooms, and shower facilities. Mobile heavy equipment mechanics and railcar repairers generally work a standard 40 hour week.

When heavy or mobile equipment breaks down at a construction site, it may be too difficult or expensive to bring into a repair shop, so the shop will send a field service technician to the site to make repairs. Field service technicians work outdoors and spend much of their time away from the shop. Generally, the more experienced service technicians specialize in field service. They drive trucks specially equipped with replacement parts and tools. On occasion, they must travel many miles to reach disabled machinery.

The hours of work for farm equipment mechanics vary according to the season of the year. During the busy planting and harvesting seasons, farm equipment mechanics often work 6 or 7 days a week, 10 to 12 hours daily. In slow winter months, however, mechanics may work fewer than 40 hours a week.

Training, Other Qualifications, and Advancement

Although industry experts recommend that applicants complete a formal diesel or heavy equipment mechanic training program after graduating from high school, many people qualify for service technician jobs by training on the job. Employers seek people with mechanical aptitude who are knowledgeable about diesel engines, transmissions, electrical systems, computers, and hydraulics.

Education and training. High school courses in automobile repair, physics, chemistry, and mathematics provide a strong foundation for a career as a service technician or mechanic. After high school, those interested in heavy vehicle repair can choose to attend many community colleges and vocational schools that offer programs in diesel technology. Some of these schools tailor programs to heavy equipment mechanics. These programs teach the basics of analytical and diagnostic techniques, electronics, and hydraulics. The increased use of electronics and computers makes training in electronics essential for new heavy and mobile equipment mechanics. Some one- to two-year programs lead to a certificate of completion, whereas others lead to an associate degree in diesel or heavy equipment mechanics. Formal training programs enable trainee technicians to advance to the journey, or experienced worker, level sooner than with informal ones.

Entry-level workers with no formal background in heavy vehicle repair begin to perform routine service tasks and make minor repairs after a few months of on-the-job training. As they prove their ability and competence, workers advance to harder jobs. After trainees master the repair and service of diesel engines, they learn to work on related components, such as brakes, transmissions, and electrical systems. Generally, a service technician with at least 3 to 4 years of on-the-job experience is accepted as fully qualified.

Many employers send trainee technicians to training sessions conducted by heavy equipment manufacturers. The sessions, which typically last up to 1 week, provide intensive instruction in the repair of the manufacturer's equipment. Some sessions focus on particular components found in the equipment, such as diesel engines, transmissions, axles, or electrical systems. Other sessions focus on particular types of equipment, such as crawler-loaders and crawler-dozers. When appropriate, experienced technicians attend training sessions to gain familiarity with new technology or equipment.

Other qualifications. Technicians must read and interpret service manuals, so reading ability and communication skills are both important skills to have. The technology used in heavy equipment is becoming more sophisticated, and technicians should feel comfortable with computers and electronics because hand-held diagnostic computers are often used to make engine adjustments and diagnose problems. Experience in the Armed Forces working on diesel engines and heavy equipment provides valuable background for these positions.

Certification and advancement. Industry certification often allows workers to advance faster. Voluntary certification by the National Institute for Automotive Service Excellence is the recognized industry credential for heavy vehicle and mobile equipment service technicians, who may be certified as master medium/heavy truck technicians or in a specific area of heavy-duty equipment repair, such as brakes, electrical systems, or suspension and steering. For certification in each area, technicians must pass a written examination and have at least 2 years of experience. High school, vocational or trade school, or community or junior college training in gasoline or diesel engine repair may substitute for up to 1 year of experience. To remain certified, technicians must be retested every 5 years.

Experienced technicians may advance to field service jobs, where they have a greater opportunity to tackle problems independently and earn additional pay. Field positions may require a commercial driver's license and a clean driving record. Technicians with administrative ability may become shop supervisors or service managers. Some technicians open their own repair shops or invest in a franchise.

Employment

Heavy vehicle and mobile equipment service technicians and mechanics held about 188,000 jobs in 2006. Approximately 131,000 were mobile heavy equipment mechanics, 31,000 were farm equipment mechanics, and 27,000 were railcar repairers.

About 29 percent were employed by machinery, equipment, and supplies merchant wholesalers. About 14 percent worked in construction, primarily for specialty trade contractors and highway, street, and bridge construction companies; another 13 percent were employed by federal, state, and local governments. Other service technicians worked in agriculture; mining; rail transportation and support activities; and commercial and industrial machinery and equipment rental, leasing, and repair. A small number repaired equipment for machinery and railroad rolling stock manufacturers or lawn and garden equipment and supplies stores. About 5 percent of service technicians were self-employed.

Nearly every area of the country employs heavy and mobile equipment service technicians and mechanics, although most work in towns and cities where equipment dealers, equipment rental and leasing companies, and construction companies have repair facilities.

Job Outlook

The number of heavy vehicle and mobile equipment service technicians and mechanics is expected to grow about as fast as average. Those who have completed postsecondary training programs should find excellent opportunities, but those without a formal background in diesel engine or heavy vehicle repair will face keen competition.

Employment change. Employment of heavy vehicle and mobile equipment service technicians and mechanics is expected to grow by 10 percent through the year 2016, about as fast as the average for all occupations. Increasing numbers of heavy duty and mobile equipment service technicians will be required to support growth in the construction and mining industries. Additionally, the agriculture and railroad industries are projected to see more demand over the decade, potentially generating new jobs for farm equipment and railcar repairers, although job opportunities for these repairers will not be as numerous. Finally, as this equipment becomes more complex, repairs increasingly must be made by specially trained technicians. In large part, these service jobs will be with wholesale equipment dealers and rental and leasing companies who do much of the repair work associated with heavy vehicles and mobile equipment.

Job prospects. Opportunities for heavy vehicle and mobile equipment service technicians and mechanics should be excellent for those who have completed formal training programs in diesel or heavy equipment mechanics. People without formal training are expected to encounter growing difficulty entering these jobs.

Most job openings for mobile, rail, and farm equipment technicians will arise from the need to replace experienced repairers who retire. Employers report difficulty finding candidates with formal postsecondary training to fill available service technician positions. This is often because young people with mechanic training and experience opt to take jobs as automotive service technicians or diesel service technicians—jobs that offer more openings and a wider variety of locations in which to work.

Construction and mining operations, which use large numbers of heavy vehicles and mobile equipment, are particularly sensitive to changes in the level of economic activity. While the increased use of such equipment increases the need for periodic service and repair, heavy and mobile equipment may be idle during downturns. Thus, opportunities for service technicians that work on construction and mining equipment may fluctuate with the nation's economic cycle. In addition, opportunities for farm equipment mechanics are seasonal and are best in warmer months.

Earnings

Median hourly earnings of mobile heavy equipment mechanics were $19.44 in May 2006, as compared to $17.65 per hour for all installation, maintenance, and repair occupations. The middle 50 percent earned between $15.65 and $23.45. The lowest 10 percent

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Heavy vehicle and mobile equipment service technicians and mechanics	49-3040	188,000	206,000	18,000	10
Farm equipment mechanics	49-3041	31,000	31,000	400	1
Mobile heavy equipment mechanics, except engines	49-3042	131,000	147,000	16,000	12
Rail car repairers	49-3043	27,000	28,000	1,300	5

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

earned less than $12.64, and the highest 10 percent earned more than $28.18. Median hourly earnings in the industries employing the largest numbers of mobile heavy equipment mechanics were as follows:

Federal government	$21.96
Local government	20.33
Machinery, equipment, and supplies merchant wholesalers	19.15
Commercial and industrial machinery and equipment rental and leasing	18.73
Other specialty trade contractors	18.63

Median hourly earnings of farm equipment mechanics were $14.16 in May 2006. The middle 50 percent earned between $11.34 and $17.35. The lowest 10 percent earned less than $9.30, and the highest 10 percent earned more than $20.77. In machinery, equipment, and supplies merchant wholesalers, the industry employing the largest number of farm equipment mechanics, median earnings were $14.37.

Median hourly earnings of railcar repairers were $20.82 in May 2006. The middle 50 percent earned between $16.75 and $24.71. The lowest 10 percent earned less than $12.48, and the highest 10 percent earned more than $28.02. Median hourly earnings were $21.63 in rail transportation, the industry employing the largest number of railcar repairers.

Field technicians normally earn a higher wage than their counterparts because they are required to make on-the-spot decisions to serve their customers.

About 23 percent of heavy vehicle and mobile equipment service technicians and mechanics are members of unions, including the International Association of Machinists and Aerospace Workers, the International Union of Operating Engineers, and the International Brotherhood of Teamsters. Members may enjoy job benefits in addition to what employers provide.

Related Occupations

Workers in related repair occupations include aircraft and avionics equipment mechanics and service technicians; automotive service technicians and mechanics; diesel service technicians and mechanics; industrial machinery mechanics and maintenance workers; and small engine mechanics.

Sources of Additional Information

More details about job openings for heavy vehicle and mobile equipment service technicians and mechanics may be obtained from local heavy and mobile equipment dealers and distributors, construction contractors, and government agencies. Local offices of the state employment service also may have information on job openings and training programs.

Small Engine Mechanics

(O*NET 49-3051.00, 49-3052.00, and 49-3053.00)

Significant Points

- Job prospects should be excellent for people who complete formal training programs.
- Most mechanics learn their skills on the job or while working in related occupations.
- Use of motorcycles, motorboats, and outdoor power equipment is seasonal in many areas, so mechanics may service other types of equipment or work reduced hours in the winter.

Nature of the Work

Small engine mechanics repair and service power equipment ranging from jet skis to chainsaws. Mechanics usually specialize in the service and repair of one type of equipment, although they may work on closely-related products.

When a piece of equipment breaks down, mechanics use various techniques to diagnose the source and extent of the problem. The mark of a skilled mechanic is the ability to diagnose mechanical, fuel, and electrical problems and to make repairs quickly. Quick and accurate diagnosis requires problem-solving ability and a thorough knowledge of the equipment's operation.

Some jobs require minor adjustments or the replacement of a single item, whereas a complete engine overhaul requires hours to disassemble the engine and replace worn valves, pistons, bearings, and other internal parts. Some highly skilled mechanics use specialized components and the latest computerized equipment to customize and tune motorcycles and motorboats for racing.

Hand tools are the most important work possessions of mechanics. Small engine mechanics use wrenches, pliers, and screwdrivers on a regular basis. Mechanics usually provide their own tools, although employers will furnish expensive power tools, computerized engine analyzers, and other diagnostic equipment. Computerized engine analyzers, compression gauges, ammeters and voltmeters, and other testing devices help mechanics locate faulty parts and tune engines. This equipment provides a systematic performance report of various components to compare against normal ratings. After pinpointing the problem, the mechanic makes the needed adjustments, repairs, or replacements.

Small engine mechanics may work on motorcycles, motorboats, lawnmowers, or other outdoor power equipment.

Small engines also require periodic service to minimize the chance of breakdowns and to keep them operating at peak performance. During routine maintenance, mechanics follow a checklist that includes the inspection and cleaning of brakes, electrical systems, fuel injection systems, plugs, carburetors, and other parts. Following inspection, mechanics usually repair or adjust parts that do not work properly or replace unfixable parts.

Motorcycle mechanics specialize in the repair and overhaul of motorcycles, motor scooters, mopeds, dirt bikes, and all-terrain vehicles. Besides repairing engines, they may work on transmissions, brakes, and ignition systems and make minor body repairs. Mechanics often service just a few makes and models of motorcycles because most work for dealers that service only the products they sell.

Motorboat mechanics, or *marine equipment mechanics*, repair and adjust the electrical and mechanical equipment of inboard and outboard boat engines. Most small boats have portable outboard engines that are removed and brought into the repair shop. Larger craft, such as cabin cruisers and commercial fishing boats, are powered by diesel or gasoline inboard or inboard-outboard engines, which are removed only for major overhauls. Most of these repairs, therefore, are performed at docks or marinas. Motorboat mechanics also may work on propellers, steering mechanisms, marine plumbing, and other boat equipment.

Outdoor power equipment and other small engine mechanics service and repair outdoor power equipment such as lawnmowers, garden tractors, edge trimmers, and chain saws. They also may occasionally work on portable generators and go-carts. In addition, small engine mechanics in certain parts of the country may work on snowblowers and snowmobiles, but demand for this type of repair is both seasonal and regional.

Work environment. Small engine mechanics usually work in repair shops that are well lighted and ventilated but are sometimes noisy when engines are tested. Motorboat mechanics may work outdoors in poor weather conditions when making repairs aboard boats. They may also work in cramped or awkward positions to reach a boat's engine. Outdoor power equipment mechanics face similar conditions when they need to make on-site repairs.

During the winter months in the northern United States, mechanics may work fewer than 40 hours a week because the amount of repair and service work declines when lawnmowers, motorboats, and motorcycles are not in use. Many mechanics work full-time only during the busy spring and summer seasons. However, they often schedule time-consuming engine overhauls or work on snowmobiles and snowblowers during winter downtime. Mechanics may work considerably more than 40 hours a week when demand is strong.

Training, Other Qualifications, and Advancement

Due to the increasing complexity of motorcycles and motorboats, employers prefer to hire mechanics who have graduated from formal training programs. However, because the number of these specialized postsecondary programs is limited, most mechanics still learn their skills on the job or while working in related occupations.

Education and training. Employers prefer to hire high school graduates for trainee mechanic positions, but many will accept applicants with less education if they possess adequate reading, writing, and math skills. Helpful high school courses include small engine repair, automobile mechanics, science, and business math. Many equipment dealers employ high school students part time and during the summer to help assemble new equipment and perform minor repairs.

Once employed, trainees learn routine service tasks under the guidance of experienced mechanics by replacing ignition points and spark plugs or by taking apart, assembling, and testing new equipment. As they gain experience and proficiency, trainees progress to more difficult tasks, such as advanced computerized diagnosis and engine overhauls. Anywhere from 3 to 5 years of on-the-job training may be necessary before a novice worker becomes competent in all aspects of the repair of motorcycle and motorboat engines. Repair of outdoor equipment, because of fewer moving parts, requires less on-the-job training.

A growing number of motorcycle and marine equipment mechanics graduate from formal motorcycle and motorboat postsecondary programs. Employers prefer to hire these workers for their advanced knowledge of small engine repair. These workers also tend to advance quickly to more demanding small engine repair jobs.

Employers often send mechanics and trainees to courses conducted by motorcycle, motorboat, and outdoor power equipment manufacturers or distributors. These courses, which can last up to 2 weeks, upgrade workers' skills and provide information on repairing new models. Manufacturer classes are usually a prerequisite for any mechanic who performs warranty work for manufacturers or insurance companies.

Other qualifications. For trainee jobs, employers hire people with mechanical aptitude who are knowledgeable about the fundamentals of small 2- and 4-stroke engines. Many trainees get their start by working on automobiles, motorcycles, motorboats, or outdoor power equipment as a hobby. Knowledge of basic electronics is essential because many parts of small vehicles and engines are electric.

Advancement. The skills needed for small engine repair can transfer to other occupations, such as automobile, diesel, or heavy vehicle and mobile equipment mechanics. Experienced mechanics with leadership ability may advance to shop supervisor or service manager jobs. Mechanics with sales ability sometimes become sales representatives or open their own repair shops.

Employment

Small engine mechanics held about 78,000 jobs in 2006. Motorcycle mechanics held around 21,000 jobs. Motorboat mechanics held approximately 24,000 and outdoor power equipment and other small engine mechanics about 33,000. Almost half, 47 percent, of small engine mechanics worked for either other motor vehicle deal-

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Small engine mechanics	49-3050	78,000	87,000	9,100	12
Motorboat mechanics	49-3051	24,000	29,000	4,600	19
Motorcycle mechanics	49-3052	21,000	24,000	2,600	12
Outdoor power equipment and other small engine mechanics	49-3053	33,000	35,000	1,800	6

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

ers—an industry that includes retail dealers of motorcycles, boats, and miscellaneous vehicles—or for retail hardware, lawn, and garden stores. Most of the remainder were employed by independent repair shops, marinas and boatyards, equipment rental companies, wholesale distributors, and landscaping services. About 23 percent were self-employed, compared to about 7 percent of workers in all installation, maintenance, and repair occupations.

Job Outlook

Average employment growth is projected for of small engine mechanics. Job prospects should be excellent for people who complete formal training programs.

Employment change. Employment of small engine mechanics is expected to grow 12 percent between 2006 and 2016, about as fast as the average for all occupations. An increase in the population of retired people is expected to increase the number of people who have leisure time and income to spend on recreational equipment such as motorcycles and motorboats. Moreover, the increase in the population of coastal and lake regions should add to the popularity of motorboats, and continued motorcycle use among 18- to 24-year-olds will contribute to rising motorcycle sales. The need for mechanics to maintain and repair motorcycles and motorboats is expected to increase with sales.

Outdoor equipment mechanics will not experience the same level of growth. Although the construction of new single-family houses will result in an increase in the sale of lawn and garden machinery and the need for mechanics to repair it, growth will be strongly tempered by a trend toward smaller lawns and the contracting out of maintenance to landscaping firms that often repair their own equipment. Small engine mechanics' growth also will be tempered by the tendency of many consumers to replace relatively inexpensive items rather than have them repaired.

Job prospects. Job prospects should be excellent for people who complete formal training programs. Employers prefer mechanics who have knowledge of both 2- and 4-stroke engines and other emissions-reducing technology as the government increases regulation of the emissions produced by small engines. Many of the job openings for small engine mechanics will result from the need to replace the many experienced small engine mechanics who are expected to transfer to other occupations, retire, or stop working for other reasons.

Work tends to be more available in summer months.

Earnings

Median wage-and-salary earnings of motorcycle mechanics were $14.45 an hour in May 2006, as compared to $17.65 for all installation, maintenance, and repair occupations. The middle 50 percent earned between $11.31 and $18.41. The lowest 10 percent earned less than $8.96, and the highest 10 percent earned more than $23.31. Median hourly earnings in other motor vehicle dealers, the industry employing the largest number of motorcycle mechanics, were $14.42.

Median wage-and-salary earnings of motorboat mechanics were $15.96 an hour in May 2006. The middle 50 percent earned between $12.66 and $20.01. The lowest 10 percent earned less than $9.94, and the highest 10 percent earned more than $24.40. Median hourly earnings in other motor vehicle dealers, the industry employing the largest number of motorboat mechanics, were $15.68.

Median wage-and-salary earnings of outdoor power equipment and other small engine mechanics were $12.94 an hour in May 2006. The middle 50 percent earned between $10.36 and $16.05. The lowest 10 percent earned less than $8.31, and the highest 10 percent earned more than $19.31. Median hourly earnings in lawn and garden equipment and supplies stores, the industry employing the largest number of outdoor power equipment and other small engine mechanics, were $12.74.

Small engine mechanics in small shops usually receive few benefits, but those employed in larger shops often receive paid vacations, sick leave, and health insurance. Some employers also pay for work-related training, provide uniforms, and help mechanics purchase new tools.

Related Occupations

Mechanics and repairers who work on durable equipment other than small engines include automotive service technicians and mechanics, diesel service technicians and mechanics, heavy vehicle and mobile equipment service technicians and mechanics, and home appliance repairers.

Sources of Additional Information

To learn about work opportunities, contact local motorcycle, motorboat, and lawn and garden equipment dealers, boatyards, and marinas. Local offices of the state employment service also may have information about employment and training opportunities.

Other Installation, Maintenance, and Repair Occupations

Coin, Vending, and Amusement Machine Servicers and Repairers

(O*NET 49-9091.00)

Significant Points

- Most workers in this occupation learn their skills on the job.
- Opportunities should be especially good for people with some knowledge of electronics.

Nature of the Work

Coin, vending, and amusement machines give out change, test our gaming skills, and dispense refreshments nearly everywhere we turn. Coin, vending, and amusement machine servicers and repairers install, service, and stock such machines and keep them in good working order.

Occupations in this industry are classified by the type of machine they work on and whether they specialize in servicing or repairing the machines. *Vending machine servicers*, often called *route drivers,* visit machines that dispense soft drinks, candy and snacks, and other items. They collect money from the coin and cash-operated machines, restock merchandise, and change labels to indicate new selections. They also keep the machines clean and appealing.

Vending machine repairers, often called *mechanics* or *technicians,* make sure that the machines operate correctly. On the rela-

Coin, vending, and amusement machine repairers may make repairs onsite or at their workshop.

tively simple gravity-operated machines, repairers check the keypads, motors, and merchandise chutes. When checking complicated electrical and electronic machines, such as beverage dispensers, they check to see that the machines mix drinks properly and that the refrigeration and heating units work correctly. If the machines are not in good working order, the mechanics repair them. When installing machines, vending machine repairers make the necessary water and electrical connections and check them for proper operation.

Amusement machine servicers and repairers work on jukeboxes, video games, pinball machines, and slot machines. They update selections, repair or replace malfunctioning parts, and rebuild existing equipment.

Vending machine servicers and repairers employed by small companies may both fill and fix machines on a regular basis. These combination servicers-repairers stock machines, collect money, fill coin and currency changers, and repair machines when necessary.

If a machine breaks down, vending and amusement machine repairers inspect it for obvious problems, such as loose electrical wires, malfunctions of the coin mechanism or bill validator, and leaks. When servicing electronic machines, repairers test them with hand-held diagnostic computers that determine the extent and location of any problem. Repairers may only have to replace a circuit board or other component to fix the problem. However, if the problem cannot be readily located, these workers refer to technical manuals and wiring diagrams and use testing devices, such as electrical circuit testers, to find defective parts. Repairers decide whether they must replace a part and whether they can fix the malfunction on-site or whether they have to send the machine to the repair shop.

In the repair shop, vending and amusement machine repairers use power tools, such as grinding wheels, saws, and drills, as well as voltmeters, ohmmeters, oscilloscopes, and other testing equipment. They also use ordinary repair tools, such as screwdrivers, pliers, and wrenches.

Preventive maintenance—avoiding trouble before it starts—is a major job of repairers. For example, they periodically clean refrigeration condensers, lubricate mechanical parts, and adjust machines so that they perform properly. Servicers and repairers also do some paperwork, such as filing reports, preparing repair cost estimates, ordering parts, and keeping daily records of merchandise distributed and money collected. However, new machines with computerized inventory controls reduce the paperwork that a servicer must complete.

Work environment. Repairers generally work a total of 40 hours a week. However, vending and amusement machines operate around the clock, so repairers may be on call to work at night and on weekends and holidays.

Some vending and amusement machine repairers work primarily in company repair shops that generally are quiet, well lighted, and have adequate workspace. Others many spend substantial time on the road, visiting machines wherever they have been placed. Repair work is relatively safe, although servicers and repairers must take care to avoid hazards such as electrical shocks and cuts from sharp tools and other metal objects.

Training, Other Qualifications, and Advancement

Most workers learn their skills on the job. Employers normally hire high school graduates, and give preference to those with high school or vocational school courses in electronics, refrigeration, and machine repair.

Education and training. Electronics have become more prevalent in vending and amusement machines. While employers only require workers to have graduated high school, they give preference to those who have completed programs in basic electronics at vocational high schools and junior colleges. Postsecondary programs in electronics can last 1 to 2 years.

Once hired, new workers are trained informally on the job to fill and fix machines by observing, working with, and receiving instruction from experienced repairers. Beginners start training with simple jobs, such as cleaning or stocking machines. They then learn to rebuild machines by removing defective parts and repairing, adjusting, and testing the machines. Next, they accompany an experienced repairer on service calls and, finally, make visits on their own. This learning process takes from 6 months to 2 years, depending on the individual's abilities, previous education, types of machines serviced, and quality of instruction.

To learn about new machines, repairers and servicers sometimes attend training sessions sponsored by manufacturers and distributors. Both trainees and experienced workers sometimes take evening courses in basic electricity, electronics, microwave ovens, refrigeration, and other related subjects to learn about new techniques and equipment.

Other qualifications. Employers usually require applicants to demonstrate mechanical ability, either through related work experience or by scoring well on mechanical-aptitude tests. Because coin, vending, and amusement machine servicers and repairers sometimes handle thousands of dollars in merchandise and cash, employers try to hire persons who are trustworthy and have no criminal record.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Coin, vending, and amusement machine servicers and repairers	49-9091	48,000	46,000	-1,400	-3

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Also, the ability to deal tactfully with people is important because servicers and repairers play a significant role in relaying customers' requests and concerns. A driver's license and a good driving record are essential for most vending and amusement machine servicer and repairer jobs, and some employers require their servicers to be bonded.

Certification and advancement. The National Automatic Merchandising Association has two self-study technician training programs, one for vending machine repairers and another for machine servicers. Self-study manuals give instruction in subjects such as customer relations, safety, electronics, and reading schematics. Upon completion of the program, repairers must pass a written test to become certified as a technician or journeyman. Certified and other skilled servicers and repairers may be promoted to supervisory jobs or go into business for themselves.

Employment

Coin, vending, and amusement machine servicers and repairers held about 48,000 jobs in 2006. Of these workers, 18 percent were self-employed. Twenty-four percent of these workers were employed by vending machine operators that sell food and other items through machines. Others worked for beverage manufacturing or wholesale companies that have their own machines and for amusement, gambling, and recreation establishments that own video games, jukeboxes, slot machines, and similar types of amusement equipment.

Job Outlook

Employment of coin, vending, and amusement machine servicers and repairers is expected to decline moderately through the year 2016. Opportunities for these workers, however, should be good for those with the proper training or related experience.

Employment change. Employment of coin, vending, and amusement machine services and repairers is expected to decrease by 3 percent between 2006. However, the number of vending machines available to the public is expected to increase. Establishments that are likely to install additional vending machines include industrial plants, hospitals, stores, schools and prisons in order to meet the public demand for inexpensive snacks and other food items. Growth of casino slot machines and coin-operated lottery ticket machines will increase the total number of amusement machines as well.

Despite the expected increase in the number of vending and amusement machines in use, improved technology in newer machines will cause a moderate decline in employment because these machines require less maintenance and need restocking less often. Many will contain computers that record sales and inventory data, reducing the amount of time-consuming paperwork that otherwise would have to be filled out. In addition, some new machines use wireless data transmitters to signal the vending machine company when the machine needs restocking or repairing. This allows servicers and repairers to be dispatched only when needed, instead of having to check each machine on a regular schedule.

Job prospects. Job opportunities should be good for those with training in a related electronic repair field, and who are willing to travel and work at times other than regular business hours. Opportunities will be limited for those with just a high school degree and no training in electronics repair. Job openings will also arise from the need to replace experienced repairers who transfer to other occupations or leave the labor force.

Earnings

Median hourly earnings of coin, vending, and amusement machine servicers and repairers were $13.80 in May 2006. The middle 50 percent earned between $10.84 and $17.23 an hour. The lowest 10 percent earned less than $8.77 an hour, and the highest 10 percent earned more than $21.35 an hour. Median hourly earnings were $12.94 in vending machine operators, the industry employing the largest number of coin, vending, and amusement machine servicers and repairers in May 2006.

Typically, workers who service and repair slot machines in states with some form of legalized gaming have the highest wages. Overtime work usually commands a premium on wages, and some union contracts stipulate higher pay for night work and for emergency repair jobs on weekends and holidays than for regular hours. Some of these workers are members of the International Brotherhood of Teamsters: 17 percent of vending machine repairers and servicers belonged to a union in 2006, as compared with 12 percent for all occupations.

Related Occupations

Other workers who repair equipment with electrical and electronic components include electrical and electronics installers and repairers; electronic home entertainment equipment installers and repairers; heating, air-conditioning, and refrigeration mechanics and installers; and home appliance repairers.

Sources of Additional Information

Information on job opportunities in this field can be obtained from local vending machine firms and local offices of your state employment service.

For general information on vending machine servicing and repair, contact

➤ National Automatic Merchandising Association, 20 N. Wacker Dr., Suite 3500, Chicago, IL 60606. Internet: http://www.vending.org

Heating, Air-Conditioning, and Refrigeration Mechanics and Installers

(O*NET 49-9021.00, 49-9021.01, and 49-9021.02)

Significant Points

- Employment is projected to grow as fast as the average.
- Job prospects are expected to be excellent.
- Employers prefer to hire those who have completed technical school training or a formal apprenticeship.

Nature of the Work

Heating and air-conditioning systems control the temperature, humidity, and the total air quality in residential, commercial, industrial, and other buildings. Refrigeration systems make it possible to store and transport food, medicine, and other perishable items. Heating, air-conditioning, and refrigeration mechanics and installers—also called *technicians*—install, maintain, and repair such systems. Because heating, ventilation, air-conditioning, and refrigeration systems often are referred to as HVACR systems, these workers also may be called *HVACR technicians.*

Heating, air-conditioning, and refrigeration systems consist of many mechanical, electrical, and electronic components, such as motors, compressors, pumps, fans, ducts, pipes, thermostats, and switches. In central forced air heating systems, for example, a furnace heats air, which is then distributed via a system of metal or fiberglass ducts. Technicians must be able to maintain, diagnose, and correct problems throughout the entire system. To do this, they adjust system controls to recommended settings and test the performance of the system using special tools and test equipment.

Technicians often specialize in either installation or maintenance and repair, although they are trained to do both. They also may specialize in doing heating work or air-conditioning or refrigeration work. Some specialize in one type of equipment—for example, hydronics (water-based heating systems), solar panels, or commercial refrigeration. Some technicians also sell service contracts to their clients. Service contracts provide for regular maintenance of the heating and cooling systems and they help to reduce the seasonal fluctuations of this type of work.

Excellent job prospects are expected for heating, air-conditioning, and refrigeration mechanics and installers.

Technicians follow blueprints or other specifications to install oil, gas, electric, solid-fuel, and multiple-fuel heating systems and air-conditioning systems. After putting the equipment in place, they install fuel and water supply lines, air ducts and vents, pumps, and other components. They may connect electrical wiring and controls and check the unit for proper operation. To ensure the proper functioning of the system, furnace installers often use combustion test equipment, such as carbon dioxide testers, carbon monoxide testers, combustion analyzers, and oxygen testers. These tests ensure that the system will operate safely and at peak efficiency.

After a furnace or air-conditioning unit has been installed, technicians often perform routine maintenance and repair work to keep the systems operating efficiently. They may adjust burners and blowers and check for leaks. If the system is not operating properly, they check the thermostat, burner nozzles, controls or other parts to diagnose and correct the problem.

Technicians also install and maintain heat pumps, which are similar to air conditioners but can be reversed so that they both heat and cool a home. Because of the added complexity and the fact that they run both in summer and winter, these systems often require more maintenance and need to be replaced more frequently than traditional furnaces and air conditioners.

During the summer, when heating systems are not being used, heating equipment technicians do maintenance work, such as replacing filters, ducts, and other parts of the system that may accumulate dust and impurities during the operating season. During the winter, air-conditioning mechanics inspect the systems and do required maintenance, such as overhauling compressors.

Refrigeration mechanics install, service, and repair industrial and commercial refrigerating systems and a variety of refrigeration equipment. They follow blueprints, design specifications, and manufacturers' instructions to install motors, compressors, condensing units, evaporators, piping, and other components. They connect this equipment to the ductwork, refrigerant lines, and electrical power source. After making the connections, they charge the system with refrigerant, check it for proper operation and leaks, and program control systems.

When air-conditioning and refrigeration technicians service equipment, they must use care to conserve, recover, and recycle the refrigerants used in air-conditioning and refrigeration systems. The release of these refrigerants can be harmful to the environment. Technicians conserve the refrigerant by making sure that there are no leaks in the system; they recover it by venting the refrigerant into proper cylinders; they recycle it for reuse with special filter-dryers; or they ensure that the refrigerant is properly disposed of.

Heating, air-conditioning, and refrigeration mechanics and installers are adept at using a variety of tools, including hammers, wrenches, metal snips, electric drills, pipe cutters and benders, measurement gauges, and acetylene torches, to work with refrigerant lines and air ducts. They use voltmeters, thermometers, pressure gauges, manometers, and other testing devices to check airflow, refrigerant pressure, electrical circuits, burners, and other components.

Other craft workers sometimes install or repair cooling and heating systems. For example, on a large air-conditioning installation job, especially where workers are covered by union contracts, ductwork might be done by sheet metal workers and duct installers; electrical work by electricians; and installation of piping, condensers, and other components by pipelayers, plumbers, pipefitters, and steamfitters. Home appliance repairers usually service room air-conditioners and household refrigerators. (Additional information

about each of these occupations appears elsewhere in the *Handbook*.)

Work environment. Heating, air-conditioning, and refrigeration mechanics and installers work in homes, retail establishments, hospitals, office buildings, and factories—anywhere there is climate-control equipment that needs to be installed, repaired, or serviced. They may be assigned to specific job sites at the beginning of each day or may be dispatched to a variety of locations if they are making service calls.

Technicians may work outside in cold or hot weather or in buildings that are uncomfortable because the air-conditioning or heating equipment is broken. In addition, technicians might work in awkward or cramped positions and sometimes are required to work in high places. Hazards include electrical shock, burns, muscle strains, and other injuries from handling heavy equipment. Appropriate safety equipment is necessary when handling refrigerants because contact can cause skin damage, frostbite, or blindness. Inhalation of refrigerants when working in confined spaces also is a possible hazard.

The majority of mechanics and installers work at least a 40-hour week. During peak seasons, they often work overtime or irregular hours. Maintenance workers, including those who provide maintenance services under contract, often work evening or weekend shifts and are on call. Most employers try to provide a full workweek year-round by scheduling both installation and maintenance work, and many manufacturers and contractors now provide or even require year-round service contracts. In most shops that service both heating and air-conditioning equipment, employment is stable throughout the year.

Training, Other Qualifications, and Advancement

Because of the increasing sophistication of heating, air-conditioning, and refrigeration systems, employers prefer to hire those who have completed technical school training or a formal apprenticeship. Some mechanics and installers, however, still learn the trade informally on the job.

Education and training. Many secondary and postsecondary technical and trade schools, junior and community colleges, and the U.S. Armed Forces offer six-month to two-year programs in heating, air-conditioning, and refrigeration. Students study theory of temperature control, equipment design and construction, and electronics. They also learn the basics of installation, maintenance, and repair. Three accrediting agencies have set academic standards for HVACR programs. These accrediting bodies are HVAC Excellence, the National Center for Construction Education and Research, and the Partnership for Air-Conditioning, Heating, and Refrigeration Accreditation. After completing these programs, new technicians generally need between an additional 6 months and 2 years of field experience before they are considered proficient.

Many technicians train through apprenticeships. Apprenticeship programs frequently are run by joint committees representing local chapters of the Air-Conditioning Contractors of America, the Mechanical Contractors Association of America, Plumbing-Heating-Cooling Contractors—National Association, and locals of the sheet metal workers' International Association or the United Association of Journeymen and Apprentices of the Plumbing and Pipefitting Industry of the United States and Canada. Local chapters of the Associated Builders and Contractors and the National Association of Home Builders sponsor other apprenticeship programs. Formal apprenticeship programs normally last 3 to 5 years and combine paid on-the-job training with classroom instruction. Classes include subjects such as the use and care of tools, safety practices, blueprint reading, and the theory and design of heating, ventilation, air-conditioning, and refrigeration systems. In addition to understanding how systems work, technicians must learn about refrigerant products and the legislation and regulations that govern their use.

Applicants for apprenticeships must have a high school diploma or equivalent. Math and reading skills are essential. After completing an apprenticeship program, technicians are considered skilled trades workers and capable of working alone. These programs are also a pathway to certification and, in some cases, college credits.

Those who acquire their skills on the job usually begin by assisting experienced technicians. They may begin by performing simple tasks such as carrying materials, insulating refrigerant lines, or cleaning furnaces. In time, they move on to more difficult tasks, such as cutting and soldering pipes and sheet metal and checking electrical and electronic circuits.

Several organizations have begun to offer basic self-study, classroom, and Internet courses for individuals with limited experience.

Licensure. Heating, air-conditioning, and refrigeration mechanics and installers are required to be licensed by some states and localities. Requirements for licensure vary greatly, but all states or localities that require a license have a test that must be passed. The contents of these tests vary by state or locality, with some requiring extensive knowledge of electrical codes and others focusing more on HVACR-specific knowledge. Completion of an apprenticeship program or 2 to 5 years of experience are also common requirements.

In addition, all technicians who purchase or work with refrigerants must be certified in their proper handling. To become certified to purchase and handle refrigerants, technicians must pass a written examination specific to the type of work in which they specialize. The three possible areas of certification are: Type I—servicing small appliances; Type II—high-pressure refrigerants; and Type III—low-pressure refrigerants. Exams are administered by organizations approved by the U.S. Environmental Protection Agency, such as trade schools, unions, contractor associations, or building groups.

Other qualifications. High school courses in shop math, mechanical drawing, applied physics and chemistry, electronics, blueprint reading, and computer applications provide a good background for those interested in entering this occupation. Some knowledge of plumbing or electrical work also is helpful. A basic understanding of electronics is becoming more important because of the increasing use of electronics in equipment controls. Because technicians frequently deal directly with the public, they should be courteous and tactful, especially when dealing with an aggravated customer. They also should be in good physical condition because they sometimes have to lift and move heavy equipment.

Certification and advancement. Throughout the learning process, technicians may have to take a number of tests that measure their skills. For those with relevant coursework and less than 1 year of experience, the industry has developed a series of exams to test basic competency in residential heating and cooling, light commercial heating and cooling, and commercial refrigeration. These are referred to as "Entry-level" certification exams and are commonly conducted at both secondary and postsecondary technical and trade schools. HVACR technicians who have at least 1 year of experience performing installations and 2 years of experience performing maintenance and repair can take a number of different tests to certify their competency in working with specific types of equipment, such as oil-burning furnaces. These tests are offered through the Refrigeration Service Engineers Society, HVAC Excellence, Carbon Monoxide Safety Association, Air-Conditioning and Refrigeration Safety Coalition, and North American Technician Excellence, Inc., among others. Employers increasingly recommend

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16 Number	Change, 2006-16 Percent
Heating, air conditioning, and refrigeration mechanics and installers	49-9021	292,000	317,000	25,000	9

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

taking and passing these tests and obtaining certification; doing so may increase advancement opportunities.

Advancement usually takes the form of higher wages. Some technicians, however, may advance to positions as supervisor or service manager. Others may move into sales and marketing. Still others may become building superintendents, cost estimators, system test and balance specialists, or, with the necessary certification, teachers. Those with sufficient money and managerial skill can open their own contracting business.

Employment

Heating, air-conditioning, and refrigeration mechanics and installers held about 292,000 jobs in 2006; about 55 percent worked for plumbing, heating, and air-conditioning contractors. The rest were employed in a variety of industries throughout the country, reflecting a widespread dependence on climate-control systems. Some worked for fuel oil dealers, refrigeration and air-conditioning service and repair shops, schools, and stores that sell heating and air-conditioning systems. Local governments, the federal government, hospitals, office buildings, and other organizations that operate large air-conditioning, refrigeration, or heating systems also employed these workers. About 13 percent of these workers were self-employed.

Job Outlook

With average job growth and numerous expected retirements, heating, air-conditioning, and refrigeration mechanics and installers should have excellent employment opportunities.

Employment change. Employment of heating, air-conditioning, and refrigeration mechanics and installers is projected to increase 9 percent during the 2006–2016 decade, as fast as the average for all occupations. As the population and stock of buildings grows, so does the demand for residential, commercial, and industrial climate-control systems. Residential HVACR systems generally need replacement after 10 to 15 years; the large number of homes built in recent years will enter this replacement timeframe by 2016. The increased complexity of HVACR systems, which increases the possibility that equipment may malfunction, also will create opportunities for service technicians. A growing focus on improving indoor air quality and the increasing use of refrigerated equipment by a growing number of stores and gasoline stations that sell food should also create more jobs for heating, air-conditioning, and refrigeration technicians.

Concern for the environment has prompted the development of new energy-saving heating and air-conditioning systems. An emphasis on better energy management should lead to the replacement of older systems and the installation of newer, more efficient systems in existing homes and buildings. Also, demand for maintenance and service work should increase as businesses and homeowners strive to keep increasingly complex systems operating at peak efficiency. Regulations prohibiting the discharge and production of older types of refrigerants that pollute the atmosphere should continue to result in the need to replace many existing air conditioning systems or to modify them to use new environmentally safe refrigerants. The pace of replacement in the commercial and industrial sectors will quicken if Congress or individual states change tax rules designed to encourage companies to buy new HVACR equipment.

Job prospects. Job prospects for heating, air-conditioning, and refrigeration mechanics and installers are expected to be excellent, particularly for those who have completed training from an accredited technical school or a formal apprenticeship. Job opportunities should be best in the fastest growing areas of the country. A growing number of retirements of highly skilled technicians are expected to generate many job openings. Many contractors have reported problems finding enough workers to meet the demand for service and installation of HVACR systems.

Technicians who specialize in installation work may experience periods of unemployment when the level of new construction activity declines, but maintenance and repair work usually remains relatively stable. People and businesses depend on their climate-control or refrigeration systems and must keep them in good working order, regardless of economic conditions.

Earnings

Median hourly wage-and-salary earnings of heating, air-conditioning, and refrigeration mechanics and installers were $18.11 in May 2006. The middle 50 percent earned between $14.12 and $23.32 an hour. The lowest 10 percent earned less than $11.38, and the top 10 percent earned more than $28.57. Median hourly earnings in the industries employing the largest numbers of heating, air-conditioning, and refrigeration mechanics and installers were:

Hardware, and plumbing and heating equipment and supplies merchant wholesalers	$20.53
Commercial and industrial machinery and equipment (except automotive and electronic) repair and maintenance	19.95
Direct selling establishments	19.12
Plumbing, heating, and air-conditioning contractors	17.46
Electrical contractors	16.74

Apprentices usually begin at about 50 percent of the wage rate paid to experienced workers. As they gain experience and improve their skills, they receive periodic increases until they reach the wage rate of experienced workers.

Heating, air-conditioning, and refrigeration mechanics and installers enjoy a variety of employer-sponsored benefits. In addition to typical benefits such as health insurance and pension plans, some employers pay for work-related training and provide uniforms, company vans, and tools.

About 14 percent of heating, air-conditioning, and refrigeration mechanics and installers are members of a union. The unions to which the greatest numbers of mechanics and installers belong are the sheet metal workers International Association and the United Association of Journeymen and Apprentices of the Plumbing and Pipefitting Industry of the United States and Canada.

Related Occupations

Heating, air-conditioning, and refrigeration mechanics and installers work with sheet metal and piping, and repair machinery, such as electrical motors, compressors, and burners. Other workers who have similar skills include boilermakers; home appliance repairers; electricians; sheet metal workers; and pipelayers, plumbers, pipefitters, and steamfitters.

Sources of Additional Information

For more information about opportunities for training, certification, and employment in this trade, contact local vocational and technical schools; local heating, air-conditioning, and refrigeration contractors; a local of the unions or organizations previously mentioned; a local joint union-management apprenticeship committee; or the nearest office of the state employment service or apprenticeship agency. You can also find information on the registered apprenticeship system with links to state apprenticeship programs on the U.S. Department of Labor's Web site: http://www.doleta.gov/atles_bat. Apprenticeship information is also available from the U.S. Department of Labor's toll-free helpline: (877) 872-5627.

Home Appliance Repairers

(O*NET 49-9031.00, 49-9031.01, and 49-9031.02)

Significant Points

- Little or no change in employment is projected; however, very good job opportunities are expected, particularly for those with formal training in appliance repair and electronics.
- Workers learn on the job; good customer service skills and a driver's license are essential.

Nature of the Work

Home appliance repairers, also known as *in-home service professionals,* install and repair home appliances. Some repairers work on small appliances such as microwave ovens and vacuum cleaners. Others specialize in major appliances such as refrigerators, dishwashers, washers and dryers, and window air conditioning units. (Workers whose primary responsibility is the installation and repair of heating and central air conditioning units are covered in a separate *Handbook* statement on heating, air conditioning and refrigeration mechanics and installers—although some worker responsibilities may overlap.) Home appliance repairers install household durable goods such as refrigerators, washing machines, and cooking products. They may have to install pipes in a customer's home to connect the appliances to a gas or water line. In these cases, once the lines are in place, they turn on the gas or water and check for leaks. Home appliance repairers also answer customers' questions about the care and use of appliances.

When problems with home appliances occur, home appliance repairers visually inspect the appliance and check for unusual noises, excessive vibration, leakage of fluid, or loose parts to determine the cause of the failure. Repairers disassemble the appliance to

Home appliance repairers often make house calls to diagnose and fix stoves, refrigerators, dishwashers, or other appliances.

examine its internal parts for signs of wear or corrosion. They follow service manuals and use testing devices such as ammeters, voltmeters, and wattmeters to check electrical systems for shorts and faulty connections.

After identifying problems, home appliance repairers replace or repair defective belts, motors, heating elements, switches, gears, or other items. They tighten, align, clean, and lubricate parts as necessary. Repairers use common hand tools, including screwdrivers, wrenches, files, and pliers, as well as soldering guns and tools designed for specific appliances. When repairing appliances with electronic parts, they may replace circuit boards or other electronic components.

When repairing refrigerators and window air-conditioners, repairers must take care to conserve, recover, and recycle chlorofluorocarbon (CFC) and hydrochlorofluorocarbon (HCFC) refrigerants used in the cooling systems, as is required by law. Federal regulations also require that home appliance repairers document the capture and disposal of refrigerants.

Repairers write up estimates of the cost of repairs for customers, keep records of parts used and hours worked, prepare bills, and collect payments. If an appliance is still under warranty, self-employed repairers will talk with the original appliance manufacturer to recoup monetary claims for work performed.

Work environment. Home appliance repairers who handle portable appliances usually work in quiet and adequately lighted and ventilated repair shops. Those who repair major appliances may spend several hours a day driving to and from appointments and emergency calls. Repairers sometimes work in cramped and uncomfortable positions when they are replacing parts in hard-to-reach areas of appliances. Repairer jobs generally are not hazardous, but workers must exercise care and follow safety precautions to avoid electrical shocks and gas leaks, and prevent injuries when lifting and moving large appliances.

Home appliance repairers usually work with little or no direct supervision. Many home appliance repairers work a standard 40-hour week, but may work overtime and weekend hours in the summer months, when they are in high demand to fix refrigerators and window mounted air-conditioners. Some repairers work early morning, evening, and weekend shifts and may remain on call in case of an emergency.

Training, Other Qualifications, and Advancement

Most entry-level workers in this profession enter without any specific training or experience and learn on the job, although employers prefer to hire those who have completed programs in electronics or appliance repair. A driver's license and good customer service skills are essential to work on appliances in customer's homes.

Education and training. Most home appliance repairers enter the occupation with a high school diploma or its equivalent and very little training in repairing appliances. Most learn their jobs while working with more experienced workers, which can last from several months to a few years. In businesses that fix portable appliances in a repair shop, trainees work on a single type of appliance, such as a vacuum cleaner, until they master its repair. Then they move on to others, until they can work on all appliances repaired by the shop. In companies that repair major appliances, beginners assist experienced repairers on service visits. Up to 3 years of on-the-job training may be needed for a technician to become skilled in all aspects of repair.

While on-the-job training is the most common method of training, employers prefer to hire students of appliance repair or electronics programs offered in high school vocational programs, postsecondary technical schools or community colleges. These programs can last 1 to 2 years and include courses in basic electricity and electronics as most home appliances contain electronic components. These programs can help reduce the amount of on-the-job training required for entry-level workers.

Whether their basic skills are developed through formal training or on the job, trainees usually receive additional training from their employer and from manufacturers. Some appliance manufacturers and department store chains have formal training programs that include home study and shop classes, in which trainees work with demonstration appliances and other training equipment. Many repairers receive supplemental instruction through two- or three-week seminars conducted by appliance manufacturers. Repairers authorized for warranty work by manufacturers are required to attend periodic training sessions.

Licensure. The U.S. Environmental Protection Agency (EPA) has mandated that all repairers who buy or work with refrigerants pass a written examination to become certified in their proper handling. Exams are administered by EPA-approved organizations, such as trade schools, unions, and employer associations. There also are EPA-approved take-home certification exams. Although no formal training is required for certification, many of these organizations offer training programs designed to prepare workers for the certification examination.

A driver's license is necessary in order to drive to customer's homes.

Certification and other qualifications. Mechanical and electrical aptitudes are desirable, and those who work in customers' homes must be courteous and tactful. Those who are self-employed need good business and financial skills to maintain a business.

Home appliance repairers may exhibit their competence by passing one of several certification examinations offered by various organizations. Although voluntary, such certifications can be helpful when seeking employment. The National Appliance Service Technician Certification (NASTeC), which is administered by the International Society of Certified Electronics Technicians (ISCET), requires repairers to pass a comprehensive examination that tests their competence in the diagnosis, repair, and maintenance of major home appliances. The Professional Service Association (PSA) administers a similar certification program. Those who pass the PSA examination earn the Certified Appliance Professional (CAP) designation.

Advancement. Repairers in large shops or service centers may be promoted to supervisor, assistant service manager, or service manager. Some repairers advance to managerial positions such as regional service manager or parts manager for appliance or tool manufacturers. Experienced repairers who have sufficient funds and knowledge of small-business management may open their own repair shops.

Employment

Many communities across the country employ home appliance repairers, but a high concentration of jobs can be found in more populated areas. Home appliance repairers held 57,000 jobs in 2006. About 36 percent of salaried repairers worked for retail trade establishments such as department stores and electronics and appliance stores. About 27 percent of repairers were self-employed. Another 21 percent work in household goods repair and maintenance.

Job Outlook

Little or no change in employment of home appliance repairers is projected. However, very good job opportunities are expected, particularly for individuals with formal training in appliance repair and electronics.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Home appliance repairers	49-9031	57,000	58,000	900	2

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Employment change. The number of home appliance repairers will grow 2 percent between 2006 and 2016, reflecting little or no change. The number of home appliances in use is expected to increase with growth in the numbers of households. The decision to repair an appliance, however, often depends on the price to replace the appliance versus the cost to make the repairs. So while higher priced major appliances designed to have a long life are more likely to be repaired, small appliances are apt to be discarded rather than be repaired. With sales of high-end appliances growing, demand for major appliance repairers should be strong into the future.

Job prospects. In addition to new jobs created over the 2006–2016 period, openings will arise as home appliance repairers retire or transfer to other occupations. Very good job opportunities are expected, with job openings continuing to outnumber jobseekers. Individuals with formal training in appliance repair and electronics should have the best opportunities.

Jobs are expected to be increasingly concentrated in larger companies as the number of smaller shops and family-owned businesses decline. Employment is relatively steady and workers are rarely laid off because demand for major appliance repair services is fairly constant.

Earnings

Median hourly earnings, including commissions, of home appliance repairers were $16.28 in May 2006. The middle 50 percent earned between $12.37 and $20.79 a year. The lowest 10 percent earned less than $9.37, and the highest 10 percent earned more than $25.84 a year. In May 2006, median hourly earnings of home appliance repairers in the largest employing industries were $15.18 in electronics and appliance stores and $17.02 in personal and household goods repair and maintenance.

Earnings of home appliance repairers vary with the skill level required to fix equipment, the geographic location, and the type of equipment repaired. Many repairers receive a commission along with their salary, therefore earnings increase with the number of jobs a repairer can complete in a day.

Many larger dealers, manufacturers, and service stores offer typical benefits such as health insurance coverage, sick leave, and retirement and pension programs. Some home appliance repairers belong to the International Brotherhood of Electrical Workers.

Related Occupations

Other workers who repair electrical and electronic equipment include electrical and electronics installers and repairers; electronic home entertainment equipment installers and repairers; small-engine mechanics; coin, vending, and amusement machine servicers and repairers; and heating, air-conditioning, and refrigeration mechanics and installers.

Industrial Machinery Mechanics and Maintenance Workers

(O*NET 49-9041.00 and 49-9043.00)

Significant Points

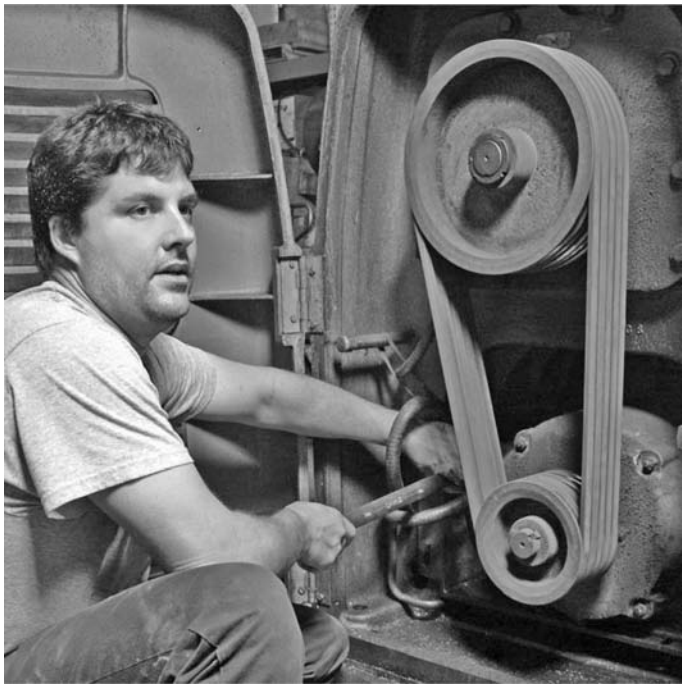
- Most of these workers are employed in manufacturing, but a growing number work for industrial equipment dealers and repair shops.
- Machinery maintenance workers learn on the job, while industrial machinery mechanics usually need some education after high school plus experience working on specific machines.
- Applicants with broad skills in machine repair and maintenance should have favorable job prospects.

Nature of the Work

Imagine an automobile assembly line: a large conveyor system moves unfinished automobiles down the line, giant robotic welding arms bond the different body panels together, hydraulic lifts move the motor into the body of the car, and giant presses stamp body parts from flat sheets of steel. All of these machines—the hydraulic lifts, the robotic welders, the conveyor system, and the giant presses—sometimes break down. When the assembly line stops because a machine breaks down, it costs the company money. Industrial machinery mechanics and machinery maintenance workers maintain and repair these very different, and often very expensive, machines.

The most basic tasks are performed by *machinery maintenance workers*. These employees are responsible for cleaning and lubricating machinery, performing basic diagnostic tests, checking performance, and testing damaged machine parts to determine whether major repairs are necessary. In carrying out these tasks, maintenance workers must follow machine specifications and adhere to maintenance schedules. Maintenance workers may perform minor repairs, but major repairs are generally left to machinery mechanics.

Industrial machinery mechanics, also called *industrial machinery repairers* or *maintenance machinists,* are highly skilled workers who maintain and repair machinery in a plant or factory. To do this effectively, they must be able to detect minor problems and correct them before they become major. Machinery mechanics use techni-



Industrial machinery mechanics and maintenance workers replace worn drive belts.

cal manuals, their understanding of the equipment, and careful observation to discover the cause of the problem. For example, after hearing a vibration from a machine, the mechanic must decide whether it is due to worn belts, weak motor bearings, or some other problem. Mechanics need years of training and experience to diagnose problems, but computerized diagnostic systems and vibration analysis techniques provide aid in determining the nature of the problem.

After diagnosing the problem, the industrial machinery mechanic disassembles the equipment to repair or replace the necessary parts. When repairing electronically controlled machinery, mechanics may work closely with electronic repairers or electricians who maintain the machine's electronic parts. (Electrical and electronics installers and repairers, as well as electricians, appear elsewhere in the *Handbook*.) Increasingly, mechanics are expected to have the electrical, electronics, and computer programming skills to repair sophisticated equipment on their own. Once a repair is made, mechanics perform tests to ensure that the machine is running smoothly.

Primary responsibilities of industrial machinery mechanics also often include preventive maintenance and the installation of new machinery. For example, they adjust and calibrate automated manufacturing equipment, such as industrial robots. Part of setting up equipment is programming the programmable logic control (PLC), a frequently used type of computer used as the control system for automated industrial machines. Situating and installing machinery has traditionally been the job of millwrights, but as plants retool and invest in new equipment, companies increasingly rely on mechanics to do this task for some machinery. (A section on millwrights appears elsewhere in the *Handbook*.)

Industrial machinery mechanics and machinery maintenance workers use a variety of tools to perform repairs and preventive maintenance. They may use hand tools to adjust a motor or a chain hoist to lift a heavy printing press off the ground. When replacements for broken or defective parts are not readily available, or when a machine must be quickly returned to production, mechanics may create a new part using lathes, grinders, or drill presses. Mechanics use catalogs to order replacement parts and often follow blueprints, technical manuals, and engineering specifications to maintain and fix equipment. By keeping complete and up-to-date records, mechanics try to anticipate trouble and service equipment before factory production is interrupted.

Work environment. In production facilities, these workers are subject to common shop injuries such as cuts, bruises, and strains. They also may work in awkward positions, including on top of ladders or in cramped conditions under large machinery, which exposes them to additional hazards. They often use protective equipment such as hardhats, safety glasses, steel-tipped shoes, hearing protectors, and belts.

Because factories and other facilities cannot afford to have industrial machinery out of service for long periods, mechanics may be on call or assigned to work nights or on weekends. Overtime is common among full-time industrial machinery mechanics; about 30 percent work over 40 hours a week.

Training, Other Qualifications, and Advancement

Machinery maintenance workers can usually get a job with little more than a high school diploma or its equivalent—most learn on the job. Industrial machinery mechanics, on the other hand, usually need some education after high school plus experience working on specific machines before they can be considered a mechanic.

Education and training. Employers prefer to hire those who have taken courses in mechanical drawing, mathematics, blueprint reading, computer programming, or electronics. Entry-level machinery maintenance worker positions generally require a high school diploma, GED, or its equivalent. However, employers increasingly prefer to hire machinery maintenance workers with some training in industrial technology or an area of it, such as fluid power. Machinery maintenance workers typically receive on-the-job training lasting a few months to a year to perform routine tasks, such as setting up, cleaning, lubricating, and starting machinery. This training may be offered by experienced workers, professional trainers, or representatives of equipment manufacturers.

Industrial machinery mechanics usually need a year or more of formal education and training after high school to learn the growing range of mechanical and technical skills that they need. While mechanics used to specialize in one area, such as hydraulics or electronics, many factories now require every mechanic to have knowledge of electricity, electronics, hydraulics, and computer programming.

Workers can get this training in a number of different ways. Experience in the military repairing equipment, particularly ships, is highly valued by employers. Also, two-year associate degree programs in industrial maintenance are good preparation. Some employers offer four-year apprenticeship programs that combine classroom instruction with paid on-the-job-training. Apprenticeship programs usually are sponsored by a local trade union. Other mechanics may start as helpers or in other factory jobs and learn the skills of the trade informally and by taking courses offered through their employer. Classroom instruction focuses on subjects such as shop mathematics, blueprint reading, welding, electronics, and computer training. In addition to classroom training, it is important that mechanics train on the specific machines they will repair. They can get this training on the job, through dealer or manufacturer's representatives or in a classroom.

Other qualifications. Mechanical aptitude and manual dexterity are important for workers in this occupation. Good reading comprehension is also necessary to understand the technical manuals of a wide range of machines. And, good physical conditioning and agility are necessary because repairers sometimes have to lift heavy objects or climb to reach equipment.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Industrial machinery mechanics and maintenance workers	—	345,000	368,000	23,000	7
Industrial machinery mechanics	49-9041	261,000	284,000	24,000	9
Maintenance workers, machinery	49-9043	84,000	83,000	-900	-1

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Advancement. Opportunities for advancement vary by specialty. Machinery maintenance workers, if they take classes and gain additional skills, may advance to industrial machinery mechanic or supervisor. Industrial machinery mechanics also advance by working with more complicated equipment and gaining additional repair skills. The most highly skilled repairers can be promoted to supervisor, master mechanic, or millwright.

Employment

Industrial machinery mechanics and maintenance workers held about 345,000 jobs in 2006. Of these, 261,000 were held by the more highly skilled industrial machinery mechanics, while machinery maintenance workers accounted for 84,000 jobs. The majority of both types of workers were employed in the manufacturing sector in industries such as food processing and chemical, fabricated metal product, machinery, and motor vehicle and parts manufacturing. Additionally, about 9 percent work in wholesale trade, mostly for dealers of industrial equipment. Manufacturers often rely on these dealers to make complex repairs to specific machines. About 7 percent of mechanics work for the commercial and industrial machinery and equipment repair and maintenance industry, often making site visits to companies to repair equipment. Local governments employ a number of machinery maintenance workers, but few mechanics.

Job Outlook

Employment of industrial machinery mechanics and maintenance workers is projected to grow about as fast as average, and job prospects should be favorable for those with a variety of repair skills.

Employment change. Employment of industrial machinery mechanics and maintenance workers is expected to grow 7 percent from 2006 to 2016, about as fast as the average for all occupations. As factories become increasingly automated, these workers will be needed to maintain and repair the automated equipment. However, many new machines are more reliable and capable of self-diagnosis, making repairs easier and quicker and somewhat slowing the growth of repairer jobs.

Industrial machinery mechanics and maintenance workers are not as affected by changes in production levels as other manufacturing workers. During slack periods, when some plant workers are laid off, mechanics often are retained to do major overhaul jobs and to keep expensive machinery in working order. In addition, replacing highly skilled and experienced industrial maintenance workers is quite difficult, which discourages lay-offs.

Job prospects. Applicants with broad skills in machine repair and maintenance should have favorable job prospects. Many mechanics are expected to retire in coming years, and employers have reported difficulty in recruiting young workers with the necessary skills to be industrial machinery mechanics. In addition to openings from growth, most job openings will stem from the need to replace workers who transfer to other occupations or who retire or leave the labor force for other reasons.

Earnings

Median hourly wage-and-salary earnings of industrial machinery mechanics were $19.74 in May 2006. The middle 50 percent earned between $15.87 and $24.46. The lowest 10 percent earned less than $12.84, and the highest 10 percent earned more than $29.85.

Machinery maintenance workers earned somewhat less than the higher skilled industrial machinery mechanics. Median hourly wage-and-salary earnings of machinery maintenance workers were $16.61 in May 2006. The middle 50 percent earned between $12.91 and $21.53. The lowest 10 percent earned less than $10.29, and the highest 10 percent earned more than $26.46.

Earnings vary by industry and geographic region. Median hourly wage-and-salary earnings in the industries employing the largest numbers of industrial machinery mechanics are:

Electric power generation, transmission, and distribution	$26.02
Motor vehicle parts manufacturing	24.97
Machinery, equipment, and supplies merchant wholesalers	18.94
Plastics product manufacturing	18.79
Commercial and industrial machinery and equipment (except automotive and electronic) repair and maintenance	17.78

About 18 percent of industrial machinery mechanics and maintenance workers are union members. Labor unions that represent these workers include the United Steelworkers of America; the United Auto Workers; the International Association of Machinists and Aerospace Workers; the United Brotherhood of Carpenters and Joiners of America; and the International Union of Electronic, Electrical, Salaried, Machine, and Furniture Workers-Communications Workers of America.

Related Occupations

Other occupations that involve repairing and maintaining industrial machinery include machinists; maintenance and repair workers, general; millwrights; electrical and electronics installers and repairers; electricians; and pipelayers, plumbers, pipefitters, and steamfitters.

Sources of Additional Information

Information about employment and apprenticeship opportunities may be obtained from local employers and from local offices of the state employment service. For further information on apprenticeship programs, write to the Apprenticeship Council of your state's labor department or local firms that employ machinery mechanics and repairers. You can also find information on registered apprenticeships, together with links to state apprenticeship programs, on the U.S. Department of Labor's Web site: http://www.doleta.gov/atels_bat. Apprenticeship information is also available from the U.S. Department of Labor's toll-free helpline: (877) 872-5627.

Line Installers and Repairers

(O*NET 49-9051.00 and 49-9052.00)

Significant Points

- Earnings are higher than in most other occupations that do not require postsecondary education.
- A growing number of retirements should create very good job opportunities, especially for electrical power-line installers and repairers.
- Line installers and repairers often work outdoors, and conditions can be hazardous.
- Most line installers and repairers require several years of long-term on-the-job training.

Line installers and repairers wear safety gear to protect themselves from electrical current.

Nature of the Work

Line installers and repairers work on the vast networks of wires and cables that provide customers with electrical power and voice, video and data communications services. *Electrical power-line installers and repairers,* also called *line erectors,* install and maintain the networks of power lines that go from generating plants to the customer. *Telecommunications line installers and repairers* install and repair the lines and cable that provide such services as cable television, telephone service, and the Internet to residential and commercial customers.

All line installers construct new lines by erecting utility poles and towers, or digging underground trenches, to carry the wires and cables. They may use a variety of construction equipment, including digger derricks, trenchers, cable plows, and borers. Digger derricks are trucks equipped with augers and cranes. Workers use augers to dig holes in the ground and use cranes to set utility poles in place. Trenchers and cable plows are used to cut openings in the earth for the laying of underground cables. Borers, which tunnel under the earth, are used to install tubes for the wire without opening a trench in the soil.

When construction is complete, line installers string cable along poles and towers or through tunnels and trenches. While working on poles and towers, installers use truck-mounted buckets to elevate themselves to the top of the structure, but sometimes they have to physically climb the pole or tower. Next, they pull up cable from large reels mounted on trucks, set the line in place, and pull up the slack so that it has the correct amount of tension. Finally, line installers attach the cable securely to the structure using hand and hydraulic tools. When working with electrical power lines, installers bolt or clamp insulators onto the poles before attaching the cable. Underground cable is laid directly in a trench, pulled through a tunnel, or strung through a conduit running through a trench.

Other installation duties include setting up service for customers and installing network equipment. To set up service, line installers string cable between the customers' premises and the nearest lines running on poles or towers or in trenches. They connect wiring to houses and check the connection for proper voltage readings. Line installers also may install a variety of network equipment. When setting up telephone and cable television lines, they install amplifiers and repeaters that maintain the strength of communications transmissions. When running electrical power lines, they install and replace transformers, circuit breakers, switches, fuses, and other equipment to control and direct the electrical current.

In addition to installation, line installers and repairers are responsible for maintenance of electrical, telecommunications, and cable television lines. Workers periodically travel in trucks, helicopters, and airplanes to visually inspect the wires and cables. Sensitive monitoring equipment can automatically detect malfunctions on the network, such as loss of current flow. When line repairers identify a problem, they travel to the location of the malfunction and repair or replace defective cables or equipment.

Bad weather or natural disasters can cause extensive damage to networks of lines. Line installers and repairers must respond quickly to these emergencies to restore critical utility and communications services. This can often involve working outdoors in adverse weather conditions.

Installation and repair work may require splicing, or joining together, separate pieces of cable. Each cable contains numerous individual wires; splicing the cables together requires that each wire in one piece of cable be joined to another wire in the matching piece. Line installers join these wires and the surrounding cables using small hand tools, epoxy (an especially strong glue), or mechanical equipment. At each splice, they place insulation over the conductor and seal the splice with moistureproof covering. At some companies, specialized *cable splicing technicians* perform splices on larger lines.

Telecommunications networks are in the process of replacing older conventional wire or metal cables with new fiber optic cables. Fiber optic cables are made of hair-thin strands of glass, which convey pulses of light. These cables carry much more information at higher speeds than conventional cables. Splicing fiber optic cable requires specialized equipment that carefully slices, matches, and aligns individual glass fibers. The fibers are joined by either electrical fusion (welding) or a mechanical fixture and gel (glue).

The work performed by electrical power-line installers and telecommunications line installers and is quite similar, but there are some differences. Working with power lines requires specialized knowledge of transformers, electrical power distribution systems, and substations. In contrast, working with telecommunications lines requires specialized knowledge of fiber optics and telecommunications switches and routers.

Work environment. Line installers and repairers must climb and maintain their balance while working on poles and towers. They lift equipment and work in a variety of positions, such as stooping or kneeling. Their work often requires that they drive utility vehicles, travel long distances, and work outdoors under a variety of weather conditions.

Line installers and repairers encounter serious hazards on their jobs and must follow safety procedures to minimize potential dan-

ger. They wear safety equipment when entering utility holes and test for the presence of gas before going underground. Electric power line workers have the more hazardous jobs. High-voltage power lines can instantly electrocute a worker who comes in contact with a live cable, so line installers and repairers must use electrically insulated protective devices and tools when working with such cables. Power lines are typically higher than telephone and cable television lines, increasing the risk of severe injury due to falls. To prevent these injuries, line installers and repairers must use fall-protection equipment when working on poles or towers.

Since line installers and repairers fix damage from storms, they may be asked to work long and irregular hours. They can expect frequently to be on-call and work overtime. When performing normal maintenance and constructing new lines, line installers work more normal hours.

Training, Other Qualifications, and Advancement

Most line installers and repairers require several years of long-term on-the-job training and some classroom work to become proficient. Formal apprenticeships are common.

Education and training. Line installers and repairers usually need at least a high school diploma. Employers look for people with basic knowledge of algebra and trigonometry and good reading and writing skills. Some also prefer to hire people with technical knowledge of electricity or electronics obtained through vocational programs, community colleges, or the Armed Forces.

Programs in telecommunications, electronics, or electricity, many of which are operated with assistance from local employers and unions, are offered by many community or technical colleges. Some programs work with local companies to offer one-year certificates that emphasize hands-on field work. More-advanced two-year associate degree programs provide students with a broader knowledge of the technology used in telecommunications and electrical utilities. They offer courses in electricity, electronics, fiber optics, and microwave transmission. Employers often prefer to hire graduates of these programs for line installer and repairer jobs.

Line installers and repairers receive most of their training on the job. Electrical line installers and repairers often must complete formal apprenticeships or other employer training programs. These programs, which can last up to 5 years, combine on-the-job training with formal classroom courses and are sometimes administered jointly by the employer and the union representing the workers. Unions include the International Brotherhood of Electrical Workers, the Communications Workers of America, and the Utility Workers Union of America. Government safety regulations strictly define the training and education requirements for apprentice electrical line installers.

Line installers and repairers working for telephone and cable television companies receive several years of on-the-job training. They also may attend training or take online courses provided by equipment manufacturers, schools, unions, or industry training organizations.

Other qualifications. Line installers and repairers must be able to read instructions, write reports, and solve problems. If they deal directly with customers, they also must have good customer service skills. They should also be mechanically inclined and like working with computers and new technology.

Physical fitness is important because they must be able to climb, lift heavy objects (many employers require applicants to be able to lift at least 50 pounds), and do other physical activity that requires stamina, strength, and coordination. Line installers and repairers often must work at a considerable height above the ground so they cannot be afraid of heights. Normal ability to distinguish colors is necessary because wires and cables may be color-coded. In addition, they often need a commercial driver's licenses to operate company-owned vehicles, so a good driving record is important.

Certification and advancement. Entry-level line installers may be hired as ground workers, helpers, or tree trimmers, who clear branches from telephone and power lines. These workers may advance to positions stringing cable and performing service installations. With experience, they may advance to more sophisticated maintenance and repair positions responsible for increasingly larger portions of the network. Promotion to supervisory or training positions also is possible, but more advanced supervisory positions often require a college degree.

Advancement for telecommunications line installers is also made easier by earning certifications—formal recognition by a respected organization of one's knowledge of current technology. The Society of Cable Television Engineers (SCTE), for example, offers certification programs for line installers and repairers employed in the cable television industry. Candidates for certification can attend training sessions at local SCTE chapters.

Employment

Line installers and repairers held about 275,000 jobs in 2006. Approximately 162,000 were telecommunications line installers and repairers; the remainder were electrical power-line installers and repairers. Nearly all line installers and repairers worked for telecommunications companies, including both cable television distribution and telecommunications companies; construction contractors; or electric power generation, transmission, and distribution companies.

Approximately 6,100 line installers and repairers were self-employed. Many of these were contractors employed by the telecommunications companies to handle customer service problems and installations.

Job Outlook

Employment of line installers and repairers is projected to grow more slowly than average, but retirements are expected to create very good job opportunities for new workers, particularly for electrical power-line installers.

Employment change. Overall employment of line installers and repairers will grow 6 percent between 2006 and 2016, slower than the average for all occupations. Growth will reflect an increasing demand for electricity and telecommunications services as the population grows. However, productivity gains—particularly in maintaining these networks—will keep employment growth slow.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Line installers and repairers	49-9050	275,000	290,000	16,000	6
Electrical power-line installers and repairers	49-9051	112,000	120,000	8,100	7
Telecommunications line installers and repairers	49-9052	162,000	170,000	7,500	5

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Employment of telecommunications line installers and repairers will grow more slowly than the average for all occupations. As the population expands, installers will be needed to lay the wiring for new developments and provide new telecommunications and cable television services. Additionally, old copper wiring will need to be replaced with fiber optic cable, also requiring more installers. The fiber optic lines will allow companies to give customers high-speed access to data, video, and graphics. Fiber optic lines allow for greater amounts of data to be transmitted through the cables at a faster rate. Fiber optic lines are expected to be more reliable in the long run, however, so they will require fewer workers.

Growth of wireless communications will also slow job increases for line installers and repairers in the long run. More households are switching to wireless delivery of their communications, video, and data services. Although wireless networks use lines to connect cellular towers to central offices, they do not require as many line installers to maintain and expand their systems. Satellite television providers—another major portion of the wireless communications industry—will also reduce demand for wire-based phone, Internet, and cable TV.

Employment of electrical power-line installers and repairers is expected to grow about as fast as the average for all occupations. Despite consistently rising demand for electricity, power companies will cut costs by shifting more work to outside contractors and hire fewer installers and repairers. Most new jobs for electrical power-line installers and repairers are expected to arise among contracting firms in the construction industry.

Job prospects. Very good job opportunities are expected, especially for electrical power-line installers and repairers. A growing number of retirements will create many job openings.

Earnings

Earnings for line installers and repairers are higher than those in most other occupations that do not require postsecondary education. Median hourly earnings for electrical power-line installers and repairers were $24.41 in May 2006. The middle 50 percent earned between $18.73 and $28.90. The lowest 10 percent earned less than $13.96, and the highest 10 percent earned more than $34.20. Median hourly earnings in the industries employing the largest numbers of electrical power-line installers and repairers in May 2006 are shown below:

Electric power generation, transmission, and distribution	$25.90
Wired telecommunications carriers	24.82
Local government	23.06
Building equipment contractors	22.04
Utility system construction	19.29

Median hourly earnings for telecommunications line installers and repairers were $22.25 in May 2006. The middle 50 percent earned between $15.56 and $28.40. The lowest 10 percent earned less than $11.88, and the highest 10 percent earned more than $32.80. Median hourly earnings in the industries employing the largest numbers of telecommunications line installers and repairers in May 2006 are shown below:

Wired telecommunications carriers	$27.61
Building equipment contractors	17.89
Cable and other subscription programming	17.72
Cable and other program distribution	17.45
Utility system construction	15.41

Many line installers and repairers belong to unions, principally the Communications Workers of America, the International Brotherhood of Electrical Workers, and the Utility Workers Union of America. For these workers, union contracts set wage rates, wage increases, and the time needed to advance from one job level to the next.

Good health, education, and vacation benefits are common in the occupation.

Related Occupations

Other workers who install and repair electrical and electronic equipment include electricians; power plant operators, distributors, and dispatchers; and radio and telecommunications equipment installers and repairers.

Maintenance and Repair Workers, General

(O*NET 49-9042.00)

Significant Points

- General maintenance and repair workers are employed in almost every industry.
- Many workers learn their skills informally on the job.
- Job growth and turnover in this large occupation should result in excellent job opportunities, especially for people with experience in maintenance and related fields.

Nature of the Work

Most craft workers specialize in one kind of work, such as plumbing or carpentry. General maintenance and repair workers, however, have skills in many different crafts. They repair and maintain machines, mechanical equipment, and buildings and work on plumbing, electrical, and air-conditioning and heating systems. They build partitions, make plaster or drywall repairs, and fix or paint roofs, windows, doors, floors, woodwork, and other parts of building structures. They also maintain and repair specialized equipment and machinery found in cafeterias, laundries, hospitals, stores, offices, and factories.

Typical duties include troubleshooting and fixing faulty electrical switches, repairing air-conditioning motors, and unclogging drains. New buildings sometimes have computer-controlled systems that allow maintenance workers to make adjustments in building settings and monitor for problems from a central location. For example, they can remotely control light sensors that turn off lights automatically after a set amount of time or identify a broken ventilation fan that needs to be replaced.

General maintenance and repair workers inspect, diagnose problems, and determine the best way to correct them.

General maintenance and repair workers inspect and diagnose problems and determine the best way to correct them, frequently checking blueprints, repair manuals, and parts catalogs. They obtain supplies and repair parts from distributors or storerooms. Using common hand and power tools such as screwdrivers, saws, drills, wrenches, and hammers, as well as specialized equipment and electronic testing devices, these workers replace or fix worn or broken parts, where necessary, or make adjustments to correct malfunctioning equipment and machines.

General maintenance and repair workers also perform routine preventive maintenance and ensure that machines continue to run smoothly, building systems operate efficiently, and the physical condition of buildings does not deteriorate. Following a checklist, they may inspect drives, motors, and belts, check fluid levels, replace filters, and perform other maintenance actions. Maintenance and repair workers keep records of their work.

Employees in small establishments, where they are often the only maintenance worker, make all repairs, except for very large or difficult jobs. In larger establishments, duties may be limited to the maintenance of everything in a workshop or a particular area.

Work environment. General maintenance and repair workers often carry out several different tasks in a single day, at any number of locations. They may work inside a single building or in several different buildings. They may have to stand for long periods, lift heavy objects, and work in uncomfortably hot or cold environments, in awkward and cramped positions, or on ladders. Those employed in small establishments often work with only limited supervision. Those in larger establishments frequently work under the direct supervision of an experienced worker. Some tasks put workers at risk of electrical shock, burns, falls, cuts, and bruises.

Most general maintenance workers work a 40-hour week. Some work evening, night, or weekend shifts or are on call for emergency repairs.

Training, Other Qualifications, and Advancement

Many general maintenance and repair workers learn their skills informally on the job as helpers to other repairers or to carpenters, electricians, and other construction workers.

Education and training. General maintenance and repair workers often learn their skills informally on the job. They start as helpers, watching and learning from skilled maintenance workers. Helpers begin by doing simple jobs, such as fixing leaky faucets and replacing light bulbs, and progress to more difficult tasks, such as overhauling machinery or building walls. Some learn their skills by working as helpers to other types of repair or construction workers, including machinery repairers, carpenters, or electricians.

Several months of on-the-job training are required to become fully qualified, depending on the skill level required. Some jobs require a year or more to become fully qualified. Because a growing number of new buildings rely on computers to control their systems, general maintenance and repair workers may need basic computer skills, such as how to log onto a central computer system and navigate through a series of menus. Companies that install computer-controlled equipment usually provide on-site training for general maintenance and repair workers.

Many employers prefer to hire high school graduates. High school courses in mechanical drawing, electricity, woodworking, blueprint reading, science, mathematics, and computers are useful. Because of the wide variety of tasks performed by maintenance and repair workers, technical education is an important part of their training. Maintenance and repair workers often need to do work that involves electrical, plumbing, and heating and air- conditioning systems, or painting and roofing tasks. Although these basic tasks may not require a license to do the work, a good working knowledge of many repair and maintenance tasks is required. Many maintenance and repair workers learn some of these skills in high school shop classes and postsecondary trade or vocational schools or community colleges.

Licensure. Licensing requirements vary by state and locality. In some cases, workers may need to be licensed in a particular specialty such as electrical or plumbing work.

Other qualifications. Mechanical aptitude, the ability to use shop mathematics, and manual dexterity are important. Good health is necessary because the job involves much walking, standing, reaching, and heavy lifting. Difficult jobs require problem-solving ability, and many positions require the ability to work without direct supervision.

Advancement. Many general maintenance and repair workers in large organizations advance to maintenance supervisor or become craftworkers such as electricians, heating and air-conditioning mechanics, or plumbers. Within small organizations, promotion opportunities may be limited.

Employment

General maintenance and repair workers held 1.4 million jobs in 2006. They were employed in almost every industry. Around 19 percent worked in manufacturing industries, almost evenly distributed

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Maintenance and repair workers, general	49-9042	1,391,000	1,531,000	140,000	10

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

through all sectors, while about 10 percent worked for federal, state, and local governments. Others worked for wholesale and retail firms and for real estate firms that operate office and apartment buildings.

Job Outlook

Average employment growth is expected. Job growth and the need to replace those who leave this large occupation should result in excellent job opportunities, especially for those with experience in maintenance and related fields.

Employment change. Employment of general maintenance and repair workers is expected to grow 10 percent during the 2006–2016 decade, about as fast as the average for all occupations. Employment is related to the number of buildings—for example, office and apartment buildings, stores, schools, hospitals, hotels, and factories—and the amount of equipment needing maintenance and repair. One factor limiting job growth is that computers allow buildings to be monitored more efficiently, partially reducing the need for workers.

Job prospects. Job opportunities should be excellent, especially for those with experience in maintenance or related fields. General maintenance and repair is a large occupation, generating many job openings due to growth and the need to replace those who leave the occupation. Many job openings are expected to result from the retirement of experienced maintenance workers over the next decade.

Earnings

Median hourly earnings of general maintenance and repair workers were $15.34 in May 2006. The middle 50 percent earned between $11.66 and $19.90. The lowest 10 percent earned less than $9.20, and the highest 10 percent earned more than $24.44. Median hourly earnings in the industries employing the largest numbers of general maintenance and repair workers in May 2006 are shown in the following tabulation:

Local government	$15.85
Elementary and secondary schools	15.76
Activities related to real estate	13.44
Lessors of real estate	13.06
Traveler accommodation	11.76

Some general maintenance and repair workers are members of unions including the American Federation of State, County, and Municipal Employees and the United Auto Workers.

Related Occupations

Some duties of general maintenance and repair workers are similar to those of carpenters; pipelayers, plumbers, pipefitters, and steamfitters; electricians; and heating, air-conditioning, and refrigeration mechanics. Other duties are similar to those of coin, vending, and amusement machine servicers and repairers; electrical and electronics installers and repairers; electronic home entertainment equipment installers and repairers; and radio and telecommunications equipment installers and repairers.

Sources of Additional Information

Information about job opportunities may be obtained from local employers and local offices of the state.

For information related to maintenance managers, contact

➤ International Maintenance Institute, P.O. Box 751896, Houston, TX 77275-1896. Internet: http://www.imionline.org

Millwrights

(O*NET 49-9044.00)

Significant Points

- Millwrights usually train in four-year to five-year apprenticeships; some learn through community college programs coupled with informal paid on-the-job training.
- Despite projected slower-than-average employment growth, well-qualified applicants should have excellent job opportunities.
- About 50 percent of millwrights belong to labor unions, one of the highest rates of membership in the economy.

Nature of the Work

Millwrights install, replace, dismantle, and repair machinery and heavy equipment used in power generation, including wind power, hydroelectric damns, and natural gas turbines, and in manufacturing plants, construction sites, and mining operations. The development of new technologies requires millwrights to work with new industry-specific and highly complex precision machines. Some of these machines have tolerances smaller than the width of a human hair.

The millwright's responsibilities begin before a new piece of machinery arrives at the jobsite. Millwrights consult with production managers, industrial engineers, and others to determine the optimal placement of the machine in the plant. Some equipment, such as a metal forging press, is so heavy that it must be placed on a new foundation. Millwrights either prepare the foundation themselves or supervise its construction. As a result, they must know how to read blueprints and to work with a variety of building materials.

When the new machine arrives, millwrights unload, inspect, and move the equipment into position. To lift and move light machinery, millwrights use rigging and hoisting devices, such as pulleys and cables. With heavier equipment, they may use hydraulic-lift trucks or cranes. Lifting such heavy equipment requires millwrights to understand the load properties of cables, ropes, hoists, and cranes. Parts of power plant turbines and other machinery can weigh more than 100 tons and must be precisely positioned; even nuts and bolts can weigh a few hundred pounds each and require a crane to move.

Next, millwrights assemble the machinery. They fit bearings, align gears and wheels, attach motors, and connect belts, according to the manufacturer's blueprints and drawings. Precision leveling

Millwrights repair complex industrial machinery.

and alignment are important in the assembly process, so millwrights measure angles, material thickness, and small distances with calipers, squares, micrometers, and other tools. When a high level of precision is required, they use devices such as lasers and ultrasonic measuring and alignment tools. Millwrights also work with hand and power tools, such as cutting torches, welding machines, hydraulic torque wrenches, hydraulic stud tensioners, soldering guns, and with metalworking equipment, including lathes and grinding machines.

In addition to installing and dismantling machinery, many millwrights work with industrial mechanics and maintenance workers to repair and maintain equipment. This includes preventive maintenance, such as lubrication and fixing or replacing worn parts. If a spare part is unavailable, a millwright may use a lathe or other machine tool to cut a new part. (For further information on machinery maintenance, see the section on industrial machinery mechanics and maintenance workers elsewhere in the *Handbook*.)

Increasingly sophisticated automation means more complicated machines for millwrights to install and maintain, requiring millwrights to specialize in certain machines or machine brands. For example, some millwrights specialize in installing and maintaining turbines in power plants that can weigh hundreds of tons and contain thousands of parts. This machinery requires special care and knowledge, so millwrights receive additional training and are required to be certified by the turbine manufacturer.

Work environment. Millwrights in manufacturing often work in a machine shop and use protective equipment, such as safety belts, protective glasses, and hardhats, to avoid injuries from falling objects or machinery. Those employed in construction may work outdoors in difficult weather conditions.

Millwrights at construction sites may travel long distances to worksites. For example, millwrights who specialize in turbine installation travel to wherever new power plants are being built.

Advanced equipment, such as hydraulic wrenches and hydraulic stud tensioners, have made the work safer and eliminated the need for millwrights to use sledge hammers to pound bolts into position. Other equipment has reduced the strenuous tasks that caused injuries in the past.

Millwrights work independently or as part of a team. Because disabled machinery costs time and money, many millwrights work overtime and some work in shifts; about 39 percent of millwrights report working more than 40 hours during a typical week. During power outages or other emergencies, millwrights often work overtime.

Training, Other Qualifications, and Advancement

Millwrights usually train in four-year to five-year apprenticeships that combine paid on-the-job training with classroom instruction. Some learn through community college programs coupled with informal paid on-the-job training.

Education and training. Employers prefer applicants who have a high school diploma, GED, or the equivalent and some vocational training or experience. Courses in science, mathematics, mechanical drawing, computers, and machine shop practice are useful. Once hired, millwrights are trained through four-year to five-year apprenticeship programs that combine on-the-job training with classroom instruction, or through community college programs coupled with informal on-the-job training.

Apprenticeships include training in dismantling, moving, erecting, and repairing machinery. Trainees also might learn carpentry, welding, use of concrete, sheet-metal work, and other skills related to installation and repair. Millwright apprentices often attend about 1 week of classes every 3 months. Classroom instruction covers mathematics, blueprint reading, hydraulics, vibration analysis, conveyor systems, electricity, computers, electronics, machining, and instruction in specific machinery. Millwrights are expected to keep their skills up-to-date and may need additional training on technological advances, such as laser shaft alignment.

Other qualifications. Because millwrights assemble and disassemble complicated machinery, mechanical aptitude is very important. Strength and agility also are necessary for lifting and climbing. Millwrights need good interpersonal and communication skills to work as part of a team and to effectively give detailed instructions to others.

Advancement. Advancement for millwrights usually takes the form of higher wages. Some advance to the position of supervisor or superintendent; others may become self-employed contractors.

Employment

Millwrights held about 55,000 jobs in 2006. About half work in manufacturing, primarily in industries such as transportation equipment manufacturing and primary metals manufacturing. About 40 percent of millwrights are employed in construction, where most work for contracting firms that assemble and maintain machinery and equipment for the manufacturing and utility industries, among others. Although millwrights work in every state, employment is concentrated in heavily industrialized areas.

Job Outlook

Employment of millwrights is projected to grow more slowly than average. Opportunities for well-qualified applicants should be excellent, however, as many experienced millwrights retire.

Employment change. Employment of millwrights is projected to grow 6 percent during the 2006–2016 decade, slower than the average for all occupations. To remain competitive in coming years, firms will continue to need millwrights to dismantle old equipment and install new high-technology machinery. Highly automated systems that are installed and maintained by millwrights often allow manufacturing companies to remain competitive with producers in lower-wage countries. Warehouse and distribution companies also are deploying highly automated conveyor systems, which are assembled and maintained by millwrights. In addition, growth in both power generation, including wind power and turbines for natural gas and coal plants, and oil and gas extraction and refining will help drive employment growth.

Employment growth will be dampened somewhat by foreign competition in manufacturing. In addition, the demand for millwrights will be adversely affected as other workers, such as industrial machinery mechanics and maintenance workers, assume some installation and maintenance duties.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Millwrights	49-9044	55,000	58,000	3,200	6

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Job prospects. The large number of expected retirements and the difficulty of recruiting new workers will create excellent job opportunities for well-qualified applicants. Job prospects should be especially good for those who have experience in machining, welding, or doing mechanical work. Employment prospects for millwrights are better than for some other manufacturing workers because they work across a wide range of industries, including power generation, paper mills, mining, and motor vehicle parts manufacturing. When a downturn occurs in one industry, millwrights can more easily switch to another industry. There will always be a need to maintain and repair existing machinery, dismantle old machinery, and install new equipment.

Earnings

Median hourly wage-and-salary earnings of millwrights were $21.94 in May 2006. The middle 50 percent earned between $17.13 and $29.42. The lowest 10 percent earned less than $13.84, and the highest 10 percent earned more than $34.39. Earnings vary by industry and geographic location. Median hourly wage-and-salary earnings in the industries employing the largest numbers of millwrights were:

Pulp, paper, and paperboard mills	$25.43
Iron and steel mills and ferroalloy manufacturing	20.91
Nonresidential building construction	20.34
Building equipment contractors	19.67
Sawmills and wood preservation	17.55

About 50 percent of millwrights belong to labor unions, one of the highest rates of membership in the economy.

Related Occupations

Other workers who install and maintain manufacturing equipment include industrial machinery mechanics and maintenance workers; tool and die makers; aircraft and avionics equipment mechanics and service technicians; structural and reinforcing iron and metal workers; boilermakers; and assemblers and fabricators. Millwrights also machine parts and operate computer-controlled machine tools as do machinists and computer control programmers and operators. Millwrights often use welding and soldering to assemble and repair machines as do welding, soldering, and brazing workers.

Sources of Additional Information

For further information on apprenticeship programs, write to the Apprenticeship Council of your state's labor department, local offices of your state employment service, or local firms that employ millwrights. You can also find information on the registered apprenticeships, together with links to state apprenticeship programs, on the U.S. Department of Labor's Web site: http://www.doleta.gov/atels_bat. Apprenticeship information is also available from the U.S. Department of Labor's toll-free helpline: (877) 872-5627.

Precision Instrument and Equipment Repairers

(O*NET 49-9061.00, 49-9062.00, 49-9063.00, 49-9064.00, and 49-9069.99)

Significant Points

- Training requirements include a high school diploma and, in most cases, postsecondary education, coupled with significant on-the-job training.
- Overall employment is expected to grow about as fast as average, and good opportunities are expected for most types of jobs.
- About 1 out of 6 are self-employed.

Nature of the Work

Repairing and maintaining watches, cameras, musical instruments, medical equipment, and other precision instruments requires a high level of skill and attention to detail. Some devices contain tiny gears that must be manufactured to within one one-hundredth of a millimeter of design specifications, and other devices contain sophisticated electronic controls. Job descriptions vary greatly, depending on the type of instrument being repaired.

Camera and photographic equipment repairers fix broken cameras and other optical devices. The repairer must first determine whether a repair should be attempted, because many inexpensive cameras cost more to repair than to replace. The most complicated or expensive repairs are usually referred back to the manufacturer or to a large repair center. If the repairer decides to proceed with the job, the problem must be diagnosed, often by disassembling numerous small parts in order to reach the source. The defective parts are then replaced or repaired. Many problems are caused by the electronic circuits used in cameras, and fixing these circuits requires an understanding of electronics. Camera repairers also maintain cameras by removing and replacing broken or worn parts and cleaning and lubricating gears and springs. Because many of the components involved are extremely small, repairers must have a great deal of manual dexterity. Frequently, older camera parts are no longer available, requiring repairers to build replacement parts or to strip junked cameras. When machining new parts, workers often use a small lathe, a grinding wheel, and other metalworking tools.

Repairs on digital cameras are similar to those on conventional cameras, but because digital cameras have no film to wind, they have fewer moving parts. Digital cameras rely on software, so any repair to the lens requires that it be calibrated with the use of software and by connecting the camera to a personal computer. Because digital cameras are generally more expensive and more widely used than film cameras, they are quickly becoming the most important source of business for camera repairers.

Watch and clock repairers work almost exclusively on expensive and antique timepieces, because moderately priced timepieces are cheaper to replace than to repair. Electrically powered clocks and quartz watches and clocks function with almost no moving parts, limiting necessary maintenance to replacing the battery. Many expensive timepieces still employ old-style mechanical movements and a manual or automatic winding mechanism. This type of timepiece must be regularly adjusted and maintained. Repair and maintenance work on a mechanical timepiece requires using hand tools to disassemble many fine gears and components. Each part is inspected for signs of wear. Some gears or springs may need to be replaced or machined. Exterior portions of the watch may require

Watch repairers must work with very small, sensitive parts.

polishing and buffing. Specialized machines are used to clean all of the parts with ultrasonic waves and a series of baths in cleaning agents. Reassembling a watch often requires lubricating key parts.

As with older cameras, replacement parts are frequently unavailable for antique watches or clocks. In such cases, watch repairers must machine their own parts. They employ small lathes and other machines in creating tiny parts.

Musical instrument repairers and tuners combine their love of music with a highly skilled craft. These artisans, often referred to as technicians, work in four specialties: Band instruments, pianos and organs, orchestral string instruments, and guitars. (Repairers and tuners who work on electronic organs are discussed in the *Handbook* statement on electronic home entertainment equipment installers and repairers.)

Band instrument repairers, *brass and wind instrument repairers*, and *percussion instrument repairers* focus on woodwind, brass, reed, and percussion instruments damaged through deterioration or by accident. In most cases, the problem with the instrument will be clear, but in some cases the repairers must diagnose the issue. They may unscrew and remove rod pins, keys, worn cork pads, and pistons and remove soldered parts by means of gas torches. Using filling techniques or a mallet, they repair dents in metal and wood. They also use gas torches, grinding wheels, lathes, shears, mallets, and small hand tools and, are skilled in metalworking and woodworking.

Violin and guitar repairers adjust and repair stringed instruments. Some repairers work on both stringed and band instruments. Initially, repairers play and inspect the instrument to find any defects. They replace or repair cracked or broken sections and damaged parts. They also restring the instruments and repair damage to their finish. Because the specifications of all types of instruments vary greatly, custom parts machining is considered an essential skill.

Piano tuners and repairers use different techniques, skills, and tools. Most workers in this group are tuners; only a few workers in this occupation specialize in refurbishing older pianos. Tuning involves tightening and loosening different strings to achieve the proper tone or pitch. Pitch matching is usually done by ear—an experienced tuner can compare the sound of a pitch with a tuning fork, and then with other pitches on the piano to make sure it is tuned properly. Tuners must make house calls, as piano tuning is sensitive to movement and most pianos cannot be transported easily. Some repairers specialize in restoring older pianos. Restoration is complicated work, often involving replacing many of the parts, which number more than 12,000 in some pianos. With proper maintenance and restoration, pianos often survive more than 100 years.

Pipe organ repairers do work similar to that of piano repairers, but with organ pipes rather than piano strings. Tuning pipe organs is very complicated, as most organs have thousands of pipes, and different pipes are tuned in different ways. Additionally, many repairers assemble new organs or expand organs with new ranks of pipes. Even with repairers working in teams or with assistants, organ maintenance can take several weeks or even months, depending upon the size of the organ.

Medical equipment repairers, also known as *biomedical equipment technicians*, maintain, adjust, calibrate, and repair electronic, electromechanical, and hydraulic equipment used in hospitals and other medical environments. They use various tools, including multimeters, specialized software, and computers designed to communicate with specific pieces of hardware. These repairers use hand tools, soldering irons, and other electronic tools to repair and adjust equipment. Among the tools they use is equipment designed to simulate water or air pressure. Faulty circuit boards and other parts are normally removed and replaced. Medical equipment repairers must maintain careful, detailed logs of all maintenance and repair that they perform on each piece of equipment.

Medical equipment repairers work on medical equipment such as defibrillators, heart monitors, medical imaging equipment (X rays, CAT scanners, and ultrasound equipment), voice-controlled operating tables, and electric wheelchairs. Because most equipment repairs take place within a hospital, medical equipment repairers must be comfortable working around patients. In some cases, repairs may take place while equipment is being used. When this is the case, the repairer must take great care to make sure that repairs do not disturb the patient.

Other precision instrument and equipment repairers service, repair, and replace a wide range of equipment associated with automated or instrument-controlled manufacturing processes. For most of these repairers, the emphasis is on determining the problem and how to best approach the solution. In many cases, replacement is preferable to repair, since precision parts are often very sensitive and may cost more to repair than replace. Replacement parts are not always available, so repairers sometimes machine or fabricate new parts. Repairers may also be responsible for preventive maintenance and calibration, which involves regular lubrication, cleaning, and adjustment of many measuring devices. Increasingly, it also involves solving computer software problems as more control devices, such as valves, are controlled by software. To adjust a control device, a technician may need to connect a laptop computer to the control device's computer and make adjustments through changes to the software commands.

Work environment. Camera, watch, and musical instrument repairers work under fairly similar solitary, low-stress conditions with minimal supervision. A quiet, well-lit workshop or repair shop is typical. Piano and organ tuners must travel to the instruments being repaired. Often, these workers can adjust their schedules, allowing for second jobs as needed. Musical instrument repairer jobs are attractive to many professional musicians and retirees because the flexible hours common to repair work allow these individuals time for other pursuits.

Medical equipment and other precision instrument and equipment repairers normally work daytime hours, but are often expected to be on call. Still, like other hospital and factory employees, some repairers work irregular hours. Medical equipment repairers must work in a patient environment, which has the potential to expose them to diseases and other health risks, but occupational injuries are relatively uncommon.

Precision instrument repairers work under a wide array of conditions, from hot, dirty, noisy factories, to air-conditioned workshops, to the outdoors on fieldwork. Attention to safety is essential, as the work sometimes involves dangerous machinery, toxic chemicals, or radiation. Due to the individualized nature of the work, supervision is fairly minimal.

Training, Other Qualifications, and Advancement

For most precision equipment repairers, the most significant source of postsecondary education is on-the-job training. Even in positions where an associate or bachelor's degree is required, an internship or apprenticeship is generally required before a technician is fully qualified. In some cases, learning these trades can take as many as seven years.

Education and training. Most employers require at least a high school diploma for beginning precision instrument and equipment repairers. Many employers prefer applicants with some postsecondary education.

The educational background required for camera and photographic equipment repairers varies, but some knowledge of electronics is necessary. Some workers complete postsecondary training, such as an associate degree, in electronics. The job requires the ability to read electronic schematic diagrams and comprehend other technical information, in addition to manual dexterity. New employees are trained on the job in two stages over about a year. First, they learn to repair a single product over a couple of weeks. Then, they learn to repair other products and refine their skills for 6 to 12 months while working under the close supervision of an experienced repairer. Finally, repairers continually teach themselves through studying manuals and attending manufacturer-sponsored seminars on the specifics of new models.

Training also varies for watch and clock repairers. Several associations, including the American Watchmakers-Clockmakers Institute and the National Association of Watch and Clock Collectors, offer certifications. Some certifications can be completed in a few months; others require simply passing an examination; the most demanding certifications require 3,000 hours, taken over 2 years, of classroom time in technical institutes or colleges. Those who have earned the most demanding certifications are usually the most sought-after by employers. Clock repairers generally require less training than do watch repairers, because watches have smaller components and require greater precision. Some repairers opt to learn through assisting a master watch repairer. Nevertheless, developing proficiency in watch or clock repair requires several years of education and experience.

For musical instrument repairers and tuners, employers prefer individuals with post-high school training in music repair technology. According to a Piano Technicians Guild membership survey, the overwhelming majority of respondents had at least some college education; most had a bachelor's or higher degree, although not always in music repair technology. Almost all repairers have a strong musical background; many are musicians themselves. Also, a basic ability to play the instruments being repaired is normally required. Courses in instrument repair are offered only at a few technical schools and colleges. Correspondence courses are common for piano tuners. Graduates of these programs normally receive additional training on the job, working with an experienced repairer. Many musical instrument repairers and tuners begin learning their trade on the job as assistants or apprentices. Trainees perform a variety of tasks around the shop. Full qualification usually requires 2 to 5 years of training and practice. Musical instrument repair and tuning requires good manual dexterity, a strong sense of pitch, and good hand-eye coordination.

Medical equipment repairers' training includes on-the-job training, manufacturer training classes, and associate degree programs. While an associate degree in electronics or medical technology is normally required, training varies by specialty. For those with a background in electronics, on-the-job training is more common for workers repairing less electronically sophisticated equipment, such as hospital beds or electric wheelchairs. An associate or even a bachelor's degree, often in medical technology or engineering, and a passing grade on a certification exam is likely to be required of persons repairing more complicated equipment, such as CAT scanners and defibrillators. Many repairers are trained in the military. New repairers begin by observing and assisting an experienced worker over a period of 3 to 6 months, learning a single piece of equipment at a time. Gradually, they begin working independently, while still under close supervision. Biomedical equipment repairers are constantly learning new technologies and equipment through seminars, self-study, and certification exams.

Educational requirements for other precision instrument and equipment repair jobs also vary, but include a high school diploma, with a focus on mathematics and science courses. Because repairers need to understand blueprints, electrical schematic diagrams, and electrical, hydraulic, and electromechanical systems, most employers require an associate or sometimes a bachelor's degree in instrumentation and control, electronics, or a related engineering field. In addition to formal education, a year or two of on-the-job training is required before a repairer is considered fully qualified. Many instrument and equipment repairers begin by working in a factory in another capacity, such as repairing electrical equipment. As companies seek to improve efficiency, other types of repair workers are trained to repair precision measuring equipment.

Certification and other qualifications. Much training takes place on the job. The ability to read and understand technical manuals is important. Necessary physical qualities include good fine-motor skills and acute vision. Those working with musical instruments must also have good hearing. Also, precision equipment repairers must be able to pay close attention to details, enjoy problem solving, and have the desire to disassemble machines to see how they work. Most precision equipment repairers must be able to work alone with minimal supervision.

Because many precision instrument and equipment repairers are self-employed, they must also have business skills. Although business most often comes from word-of-mouth advertising, repairers must nevertheless work to establish themselves in the industry. Further, they must manage their business operations, which may mean purchasing insurance and managing their own accounting.

Although most of the positions in this field do not require certification, it may be helpful in finding a job or demonstrating competency to prospective clients. There are several certifications possible in this diverse group of repairers. Information on various certifications is available from the sources of additional information at the end of the statement.

Advancement. Advancement opportunities vary greatly among precision instrument and equipment repairers. For self-employed repairers, advancement may mean the ability to charge more for their services. For workers who are employed by firms, supervisory

opportunities are available. In both cases, an experienced worker may become a mentor to someone who is new to the field.

Employment

Precision instrument and equipment repairers held 68,000 jobs in 2006. Employment was distributed among the detailed occupations as follows:

Medical equipment repairers	38,000
Musical instrument repairers and tuners	6,000
Camera and photographic equipment repairers	4,400
Watch repairers	3,800
Precision instrument and equipment repairers, all other	16,000

Medical equipment repairers often work for hospitals or wholesale equipment suppliers, while those in the occupation titled "all other precision instrument repairers" frequently work for manufacturing companies and wholesalers of durable goods. About 1 out of 6 precision instrument and equipment repairers was self-employed—most are proprietors of jewelry, camera, medical equipment, or music repair services.

Job Outlook

Good opportunities are expected for most types of precision instrument and equipment repairer jobs. Overall employment growth is projected to be about as fast as the average for all occupations over the 2006–2016 period; however, projected growth varies by detailed occupation.

Employment change. Projected employment growth for precision instrument and equipment repairers varies greatly by specialty.

Employment of camera and photographic equipment repairers is projected to decline by about 2 percent between 2006 and 2016, and employment of watch repairers is projected to decline 5 percent over the same period. These occupations are in decline primarily because the products they service are often less expensive to replace than to repair. Most of the workers who remain in this industry will specialize in repair of expensive watches and cameras, as well as antiques.

Over the same time period, the employment of musical instrument repairers and tuners is projected to increase 3 percent, which is slower than average. Band and orchestra programs in high schools continue to provide most of the business for these workers, and they have been declining for several years. With fewer new musicians, there will be a slump in instrument rentals, purchases, and repairs. In the meantime, however, there continues to be a demand for these services, and new opportunities should continue to arise as the population grows.

The medical equipment repairer occupation is projected to increase 22 percent between 2006 and 2016, which is much faster than the average for all occupations, as a result of increased demand for medical services and increasing complexity of the equipment used in hospitals and clinics. Opportunities should be increasingly good for those who have a strong understanding of software and electronics, as many new medical devices are increasingly reliant on computers.

Over the same time period, employment of other precision instrument and equipment repairers is projected to increase 4 percent, more slowly than average, as most of them work in declining manufacturing industries. Nevertheless, these workers can expect to play an increasingly large role in those industries, as automation continues to dominate modern manufacturing.

Job prospects. Despite varying levels of growth in the various occupations, almost all workers in these fields can expect good job prospects over the next decade. As the baby boomer generation nears retirement, many skilled workers in these occupations are expected to leave the workforce. Additionally, many technical schools and other programs offering courses in these occupations have closed, leading to a shortage of qualified workers. Individuals with strong apprenticeships or internships should have the best prospects as instrumentation continues to become more complex and requires ever greater skill to repair.

Earnings

The following tabulation shows median annual earnings for various precision instrument and equipment repairers in May 2006:

Medical equipment repairers	$40,580
Camera and photographic equipment repairers	34,850
Watch repairers	30,900
Musical instrument repairers and tuners	29,200
Precision instrument and equipment repairers, all other	46,250

Earnings ranged from less than $16,230 for the lowest 10 percent of musical instrument repairers and tuners to more than $69,280 for the highest 10 percent in the occupation all other precision instrument and equipment repairers in May 2006.

Earnings within the different occupations vary significantly, depending upon skill levels. For example, a lesser skilled watch and clock repairer may simply change batteries and replace worn wrist straps, while a highly skilled watch and clock repairer with years of training and experience may rebuild and replace worn parts.

Related Occupations

Many precision instrument and equipment repairers work with precision mechanical and electronic equipment. Other workers who repair precision mechanical and electronic equipment include computer, automated teller, and office machine repairers and coin, vending, and amusement machine servicers and repairers. Other workers who make precision items include medical, dental, and ophthalmic laboratory technicians. Some precision instrument and equipment repairers work with a wide array of industrial equipment. Their work environment and responsibilities are similar to those of industrial machinery mechanics and maintenance workers. Much of the

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Precision instrument and equipment repairers	49-9060	68,000	77,000	8,700	13
Camera and photographic equipment repairers	49-9061	4,400	4,300	-100	-2
Medical equipment repairers	49-9062	38,000	46,000	8,200	22
Musical instrument repairers and tuners	49-9063	6,000	6,200	200	3
Watch repairers	49-9064	3,800	3,600	-200	-5
Precision instrument and equipment repairers, all other	49-9069	16,000	17,000	700	4

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

work of watch repairers is similar to that of jewelers and precious stone and metal workers. Camera repairers' work is similar to that of electronic home entertainment equipment installers and repairers; both occupations work with consumer electronics that are based around a circuit board, but that also involve numerous moving mechanical parts.

Assemblers and Fabricators

(O*NET 51-2011.00, 51-2021.00, 51-2022.00, 51-2023.00, 51-2031.00, 51-2041.00, 51-2091.00, 51-2092.00, 51-2093.00, and 51-2099.99)

Significant Points

- Most assemblers work on teams, making good communication skills and the ability to get along with others important.
- A high school diploma is sufficient for most jobs, but experience and extra training are needed for more advanced assembly work.
- Employment is projected to decline slowly.
- Job opportunities are expected to be good for qualified applicants in the manufacturing sector, particularly in jobs needing more training.

Nature of the Work

Assemblers and fabricators play an important role in the manufacturing process. They assemble both finished products and the pieces that go into them. The products they assemble using tools, machines, and their hands range from entire airplanes to intricate timing devices. They fabricate and assemble household appliances, automobiles and automobile engines and parts, computers, electronic devices, and more.

Changes in technology have transformed the manufacturing and assembly process. Automated manufacturing systems now use robots, computers, programmable motion control devices, and various sensing technologies. These systems change the way in which goods are made and affect the jobs of those who make them. The more advanced assemblers must be able to work with these new technologies and use them to produce goods.

The job of an assembler or fabricator ranges from very easy to very complicated, requiring a range of knowledge and skills. Skilled assemblers putting together complex machines, for example, begin by reading detailed schematics or blueprints that show how to assemble the machine. After determining how parts should connect, they use hand or power tools to trim, shim, cut, and make other adjustments to fit components together and align properly. Once the parts are properly aligned, they connect them with bolts and screws or by welding or soldering pieces together.

Careful quality control is important throughout the assembly process, so assemblers look for faulty components and mistakes in the assembly process. They help to fix problems before more defective products are produced.

Manufacturing techniques are evolving away from traditional assembly line systems toward "lean" manufacturing systems, which are causing the nature of assemblers' work to change. Lean manufacturing uses teams of workers to produce entire products or components. *Team assemblers* may still work on an assembly line, but they rotate through different tasks, rather than specializing in a single task. The team also may decide how the work is assigned and how different tasks are performed. This worker flexibility helps companies cover for absent workers, improves productivity, and increases companies' ability to respond to changes in demand by shifting labor from one product line to another. For example, if demand for a product drops, companies may reduce the total number of workers producing it, asking the remaining workers to perform more stages of the assembly process. Some aspects of lean production, such as rotating tasks and seeking worker input on improving the assembly process, are common to all assembly and fabrication occupations.

Although more than half of all assemblers and fabricators are classified as "team assemblers," others specialize in producing one type of product or perform the same or similar functions throughout the assembly process. These workers are classified according to the products they assemble or produce. *Electrical and electronic equipment assemblers*, for example, build products such as electric motors, computers, electronic control devices, and sensing equipment. Automated systems have eliminated much of the mass production work in electronic assembly, so a growing amount of the work of electrical and electronic assemblers is manual assembly during the small-scale production of electronic devices used in avionic systems, military systems, and medical equipment.

Electromechanical equipment assemblers assemble and modify electromechanical devices such as household appliances, dynamometers, actuators, or vending machines. *Coil winders,*

Electrical and electronics assemblers solder electronic parts together.

tapers, and finishers wind wire coil used in resistors, transformers, generators, and electric motors. *Engine and other machine assemblers* construct, assemble, or rebuild engines and turbines, and machines used in agriculture, construction, mining, and almost all manufacturing industries, including rolling mills, textiles, paper, and food processing. *Aircraft structure, surfaces, rigging, and systems assemblers* assemble, fit, fasten, and install parts of airplanes, space vehicles, or missiles, including tails and wings, landing gear, and heating and ventilation systems. *Structural metal fabricators and fitters* cut, align, and fit together structural metal parts prior to welding or riveting. *Fiberglass laminators and fabricators* create products made of fiberglass, mainly boat decks and hulls and automobile body parts. *Timing device assemblers, adjusters, and calibrators* perform precision assembling or adjusting of timing devices within very narrow tolerances.

It has become more common to involve assemblers and fabricators in product development. Designers and engineers consult manufacturing workers during the design stage to improve product reliability and manufacturing efficiency. For example, an assembler may tell a designer that the dash of a new car design will be too difficult to install quickly and consistently. The designer could then redesign the dash to make it easier to install.

Some experienced assemblers work with designers and engineers to build prototypes or test products. These assemblers must be able to read and interpret complex engineering specifications from text, drawings, and computer-aided drafting systems. They also may need to use a variety of tools and precision measuring instruments.

Work environment. The working environment for assemblers and fabricators is improving, but varies by plant and by industry. Many physically difficult tasks have been made much easier through the use of hydraulic and electromechanical equipment, such as manually tightening massive bolts or moving heavy parts into position. Assembly work, however, may still involve long periods of standing or sitting.

Most factories today are generally clean, well-lit, and well-ventilated, and depending on what type of work is being performed, they may also need to be dirt and dust-free. Electronic and electromechanical assemblers particularly must work in environments free of dust that could affect the operation of the products they build. Some assemblers may also come into contact with potentially harmful chemicals or fumes, but ventilation systems and other safety precautions normally minimize any harmful effects. Other assemblers may come in contact with oil and grease, and their working areas may be quite noisy.

Most full-time assemblers work a 40-hour week, although overtime and shift work is common in some industries. Work schedules of assemblers may vary at plants with more than one shift.

Training, Other Qualifications, and Advancement

The education level and qualifications needed to enter these jobs vary depending on the industry and employer. While a high school diploma or GED is sufficient for most jobs, experience and extra training is needed for more advanced assembly work.

Education and training. Most applicants for assembler positions need only a high school diploma or GED. However, some employers may require specialized training or an associate degree for the most skilled assembly jobs. For example, jobs with electrical, electronic, and aircraft and motor vehicle products manufacturers typically require more education and experience. Other positions may require only brief on-the-job training, sometimes including employer-sponsored classroom instruction.

Other qualifications. Assembly workers must be able to follow instructions carefully, which may require some basic reading skills and the ability to follow diagrams and pictures. Manual dexterity and the ability to carry out complex, repetitive tasks quickly and methodically also are important. For some positions, the ability to lift heavy objects may be needed. Team assemblers also need good interpersonal and communication skills to be able to work well with their teammates. Good eyesight is necessary for assemblers and fabricators who work with small parts. Plants that make electrical and electronic products may test applicants for color vision because their products often contain many differently colored wires.

Advancement. As assemblers and fabricators become more experienced, they may progress to jobs that require greater skill and may be given more responsibility. Experienced assemblers may become product repairers if they have learned the many assembly operations and understand the construction of a product. These workers fix assembled pieces that operators or inspectors have identified as defective. Assemblers also can advance to quality control jobs or be promoted to supervisor. Experienced assemblers and fabricators also may become members of research and development teams, working with engineers and other project designers to design, develop, and build prototypes, and test new product models. In some companies, assemblers can become trainees for one of the skilled trades, such as machinist. Those with a background in math, science, and computers may advance to become programmers or operators of more highly automated production equipment.

Employment

Assemblers and fabricators held nearly 2.1 million jobs in 2006. They worked in almost every industry, but 3 out of 4 worked in manufacturing. Within the manufacturing sector, assembly of transportation equipment, such as aircraft, autos, trucks, and buses, accounted for 19 percent of all jobs. Assembly of computers and electronic products accounted for another 11 percent of all jobs. Other industries that employ many assemblers and fabricators are machinery manufacturing: heating and air-conditioning equipment; agriculture, construction, and mining machinery; and engine, turbine, and power transmission equipment; electrical equipment, appliance, and component manufacturing: lighting, household appliances, and electrical equipment; and fabricated metal products.

The following tabulation shows the employment of assemblers and fabricators in the manufacturing industries that employed the most workers in 2006:

Motor vehicle parts manufacturing	145,000
Motor vehicle manufacturing	106,000
Semiconductor and other electronic component manufacturing	88,000
Navigational, measuring, electromedical, and control instruments manufacturing	76,000
Architectural and structural metals manufacturing	74,000

Assemblers and fabricators also work in many other nonmanufacturing industries. Twelve percent were employed by employment services firms, mostly as temporary workers; most of these temporary workers were likely assigned to manufacturing plants. Wholesale and retail trade firms employed the next highest number of assemblers and fabricators. Many of these assemblers perform the final assembly of goods before the item is delivered to the customer. For example, most imported furniture is shipped in pieces and assemblers for furniture wholesalers and retailers put together the furniture prior to delivery.

Team assemblers, the largest specialty, accounted for 61 percent of assembler and fabricator jobs. The distribution of employment among the various types of assemblers was as follows in 2006:

Team assemblers	1,274,000
Electrical and electronic equipment assemblers	213,000
Structural metal fabricators and fitters	103,000
Electromechanical equipment assemblers	60,000
Engine and other machine assemblers	45,000
Fiberglass laminators and fabricators	33,000
Aircraft structure, surfaces, rigging, and systems assemblers	28,000
Coil winders, tapers, and finishers	23,000
Timing device assemblers, adjusters, and calibrators	2,500
Assemblers and fabricators, all other	292,000

Job Outlook

Employment of assemblers and fabricators is projected to decline slowly, primarily reflecting productivity growth and strong foreign competition in manufacturing. Job opportunities are expected to be good for qualified applicants in the manufacturing sector, particularly in jobs needing more training.

Employment change. Employment of assemblers and fabricators is expected to decline slowly by 4 percent between 2006 and 2016. Within the manufacturing sector, employment of assemblers and fabricators will be determined largely by the growth or decline in the production of certain manufactured goods. In general, despite projected growth in the output of manufactured goods, employment overall is expected to decline as the whole sector becomes more automated and is able to produce more with fewer workers. However, some individual industries are projected to have more jobs than others. The aircraft products and parts industry is projected to gain jobs over the decade as demand for new commercial and military planes grows significantly. Thus, the need for aircraft structure, surfaces, rigging, and systems assemblers is expected to grow. In addition, because much of the assembly in the aerospace industry is done in hard-to-reach locations—inside airplane fuselages or gear boxes, for example—which are unsuited to robots, aircraft assemblers will not be as easily replaced by automated processes.

In most other manufacturing industries, employment of assemblers and fabricators will be negatively affected by increasing automation, improving productivity, and the shift of assembly to countries with lower labor costs. The effects of automation, though, will be felt more among some types of assemblers and fabricators than among others. Automation will replace workers in operations with a large volume of repetitive work. Automation will have less effect on the assembly of parts that are irregular in size or location.

The use of team production techniques has been one factor in the continuing success of the manufacturing sector, boosting productivity and improving the quality of goods. Thus, while the number of assemblers overall is expected to decline in manufacturing, the number of team assemblers will grow or remain stable as more manufacturing plants convert to using team production techniques.

Other manufacturers have sent their assembly functions to countries where labor costs are lower. Decisions by U.S. corporations to move assembly to other nations should limit employment growth for assemblers in some industries, but a free trade environment also may lead to growth in the export of goods assembled in the United States.

The largest increase in the number of assemblers and fabricators is projected to be in the employment services industry, which supplies temporary workers to various industries. Temporary workers are gaining in importance in the manufacturing sector and elsewhere as companies strive for a more flexible workforce to meet the fluctuations in the market. There will also be more jobs for assemblers and fabricators in the wholesale and retail sectors of the economy. As more goods come unassembled from foreign countries to save on shipping costs, wholesalers and retailers are increasingly assembling products before selling them to their customers.

Job prospects. Job opportunities for assemblers are expected to be good for qualified applicants in the manufacturing sector, particularly in jobs needing more training. Some employers report difficulty finding qualified applicants looking for manufacturing employment. The best opportunities should be with smaller manufacturers as large, high-profile companies tend to attract more applicants. In addition to new jobs stemming from growth in this occupation, many job openings will result from the need to replace workers leaving or retiring from this large occupational group. For example, foreign automobile manufacturers who built plants in the 1980s are expecting a large number of retirements in the next decade and a surge in demand for team assemblers.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16 Number	Change, 2006-16 Percent
Assemblers and fabricators	51-2000	2,075,000	1,982,000	-93,000	-4
Aircraft structure, surfaces, rigging, and systems assemblers	51-2011	28,000	32,000	3,600	13
Electrical, electronics, and electromechanical assemblers	51-2020	297,000	227,000	-70,000	-23
Coil winders, tapers, and finishers	51-2021	23,000	16,000	-7,000	-30
Electrical and electronic equipment assemblers	51-2022	213,000	156,000	-57,000	-27
Electromechanical equipment assemblers	51-2023	60,000	55,000	-5,500	-9
Engine and other machine assemblers	51-2031	45,000	41,000	-3,900	-9
Structural metal fabricators and fitters	51-2041	103,000	103,000	-200	0
Miscellaneous assemblers and fabricators	51-2090	1,602,000	1,579,000	-23,000	-1
Fiberglass laminators and fabricators	51-2091	33,000	35,000	2,100	6
Team assemblers	51-2092	1,274,000	1,275,000	700	0
Timing device assemblers, adjusters, and calibrators	51-2093	2,500	2,300	-200	-8
Assemblers and fabricators, all other	51-2099	292,000	266,000	-25,000	-9

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Earnings

Earnings vary by industry, geographic region, skill, educational level, and complexity of the machinery operated. Median hourly wage-and-salary earnings of team assemblers were $11.63 in May 2006. The middle 50 percent earned between $9.22 and $14.93. The lowest 10 percent earned less than $7.69, and the highest 10 percent earned more than $19.14. Median hourly wage-and-salary earnings in the manufacturing industries employing the largest numbers of team assemblers were as follows:

Motor vehicle manufacturing	$21.60
Motor vehicle parts manufacturing	13.06
Other wood products manufacturing	11.11
Plastics products manufacturing	10.64
Employment services	9.20

Median hourly wage-and-salary earnings of electrical and electronic equipment assemblers were $12.29 in May 2006. The middle 50 percent earned between $9.84 and $15.80. The lowest 10 percent earned less than $8.25, and the highest 10 percent earned more than $19.81. Median hourly wage-and-salary earnings in the manufacturing industries employing the largest numbers of electrical and electronic equipment assemblers were as follows:

Navigational, measuring, electromedical, and control instruments manufacturing	$13.42
Electrical equipment manufacturing	13.05
Computer and peripheral equipment manufacturing	12.80
Communications equipment manufacturing	11.96
Semiconductor and other electronic component manufacturing	11.45

In May 2006, other assemblers and fabricators had the following median hourly wage-and-salary earnings:

Aircraft structure, surfaces, rigging, and systems assemblers	$21.83
Engine and other machine assemblers	15.99
Structural metal fabricators and fitters	14.56
Timing device assemblers, adjusters, and calibrators	13.86
Electromechanical equipment assemblers	13.25
Coil winders, tapers, and finishers	12.64
Fiberglass laminators and fabricators	12.49
Assemblers and fabricators, all other	12.85

Many assemblers and fabricators are members of labor unions. These unions include the International Association of Machinists and Aerospace Workers; the United Automobile, Aerospace and Agricultural Implement Workers of America; the International Brotherhood of Electrical Workers; and the United Steelworkers of America.

Related Occupations

Other occupations that involve operating machines and tools and assembling products include welding, soldering, and brazing workers and machine setters, operators, and tenders—metal and plastic. Also, both millwrights and tool and die makers assemble complex manufacturing equipment. Assemblers and fabricators also are responsible for some quality control and product testing, as are inspectors, testers, sorters, samplers, and weighers.

Sources of Additional Information

Information about employment opportunities for assemblers is available from local offices of the state employment service and from locals of the unions mentioned earlier.

Food Processing Occupations

(O*NET 51-3011.00, 51-3021.00, 51-3022.00, 51-3023.00, 51-3091.00, 51-3092.00, and 51-3093.00)

Significant Points

- Most workers in manual food processing jobs require little or no training prior to being hired.
- As more jobs involving cutting and processing meat shift from retail stores to food processing plants, job growth will be concentrated among lesser-skilled workers, who are employed primarily in manufacturing.
- Highly skilled bakers should be in demand.

Nature of the Work

Food processing occupations include many different types of workers who process raw food products into the finished goods sold by grocers, wholesalers, restaurants, or institutional food services. These workers perform a variety of tasks and are responsible for producing many of the food products found in every household. Some of these workers are bakers, others process meat, and still others operate food processing equipment.

Bakers mix and bake ingredients according to recipes to produce varying quantities of breads, pastries, and other baked goods. Bakers commonly are employed in grocery stores and specialty shops and produce small quantities of breads, pastries, and other baked goods for consumption on premises or for sale as specialty baked goods. While the quantities are often small, the varieties of bread usually are not. Specialty handcrafted—or artisan—bread, comes with seeds, nuts, fruits, olives, and cheese, which can be included in a crusty loaf, round loaf, flat or even focaccia bread. Bakers can also add a variety of flavors, too, such as rosemary, pecan, fig, garlic, red pepper, sesame, and anise.

In manufacturing, bakers produce goods in large quantities, using high-volume mixing machines, ovens, and other equipment. Goods produced in large quantities usually are available for sale through distributors, grocery stores, supermarkets, or manufacturers' outlets.

Other food processing workers convert animal carcasses into manageable pieces of meat, known as boxed meat or case-ready meat, suitable for sale to wholesalers and retailers. The nature of their jobs varies significantly depending on the stage of the process in which they are involved. Butchers and meat cutters, for example, work primarily in groceries and wholesale establishments that provide meat to restaurants and other retailers; whereas, meat, poultry, and fish cutters and trimmers commonly work in animal slaughtering and processing plants.

In animal slaughtering and processing plants, *slaughterers and meat packers* slaughter cattle, hogs, goats, and sheep, and cut the carcasses into large wholesale cuts, such as rounds, loins, ribs, tenders, and chucks, to facilitate the handling, distribution, marketing, and sale of meat. In most plants, some slaughterers and meat packers further process the large parts into cuts that are ready for retail stores. Retailers and grocers increasingly prefer such prepackaged meat products because a butcher isn't needed to display and sell them. Slaughterers and meat packers also produce hamburger meat and meat trimmings, preparing sausages, luncheon meats, and other fabricated meat products. They usually work on assembly lines, with each individual responsible for only a few of the many cuts needed to process a carcass. Depending on the type of cut, these

In large grocery stores, butchers and meat cutters separate wholesale cuts of meat into retail cuts or individually sized servings.

workers use knives; cleavers; meat saws; band saws; or other potentially dangerous equipment.

Poultry cutters and trimmers slaughter and cut up chickens, turkeys, and other types of poultry. Although the poultry processing industry is becoming increasingly automated, many jobs, such as trimming, packing, and deboning, are still done manually. Most poultry cutters and trimmers perform routine cuts on poultry as it moves along production lines.

Meat, poultry, and fish cutters and trimmers also prepare ready-to-heat foods, usually at processing plants. This preparation often entails filleting meat, poultry, or fish; cutting it into bite-sized pieces or tenders; preparing and adding vegetables; and applying sauces and flavorings, marinades, or breading. These case-ready products are gaining in popularity as they offer quick and easy preparation for consumers while, in many cases, also offering a healthier option.

Manufacturing and retail establishments are likely to employ fish cutters and trimmers, also called *fish cleaners*. These workers primarily scale, cut, and dress fish by removing the head, scales, and other inedible portions and cutting the fish into steaks or fillets. In retail markets, these workers may also wait on customers and clean fish to order.

Butchers and meat cutters process meat at later stages of production. Those who work for large grocery stores, wholesale establishments that supply meat to restaurants, or institutional food service facilities separate wholesale cuts of meat into retail cuts or smaller pieces, known as primals. These butchers cut meat into steaks and chops, shape and tie roasts, and grind beef for sale as chopped meat. Boneless cuts are prepared using knives, slicers, or power cutters, while band saws and cleavers are required to cut bone-in pieces of meat. Butchers and meat cutters in retail food stores also may weigh, wrap, and label the cuts of meat; arrange them in refrigerated cases for display; and prepare special cuts to fill unique orders by customers.

Others in food processing occupations include *food batchmakers*, who set up and operate equipment that mixes, blends, or cooks ingredients used in the manufacture of food products according to formulas or recipes; *food cooking machine operators and tenders*, who operate or tend cooking equipment, such as steam-cooking vats, deep-fry cookers, pressure cookers, kettles, and boilers to prepare food products, such as meat, sugar, cheese, and grain; and *food and tobacco roasting, baking, and drying machine operators and tenders*, who use equipment to reduce the moisture content of food or tobacco products or to prepare food for canning. The machines they use include hearth ovens, kiln driers, roasters, char kilns, steam ovens, and vacuum drying equipment.

Work environment. Working conditions vary by type and size of establishment. Most traditional bakers work in bakeries, cake shops, hot-bread shops, hotels, restaurants, cafeterias, and in the bakery departments of supermarkets. Bakers may work under hot and noisy conditions. They typically work under strict order deadlines and critical time-sensitive baking requirements, both of which can induce stress.

Although many bakers often work as part of a team, they also may work alone when baking particular items. These workers may supervise assistants and teach apprentices and trainees. Bakers in retail establishments may be required to serve customers. Bakers usually work odd hours in shifts and may work early mornings, evenings, weekends, and holidays.

In animal slaughtering and processing plants and in large retail food establishments, butchers and meat cutters work in large meat cutting rooms equipped with power machines and conveyors. In small retail markets, the butcher or fish cleaner may work in a cramped space behind the meat or fish counter. To prevent viral and bacterial infections, work areas are kept clean and sanitary.

Butchers and meat cutters, poultry and fish cutters and trimmers, and slaughterers and meatpackers often work in cold, damp rooms. Refrigerated work areas prevent meat from spoiling; they are damp because meat cutting generates large amounts of blood, condensation, and fat. Cool, damp floors increase the likelihood of slips and falls. In addition, cool temperatures, long periods of standing, and repetitious physical tasks make the work tiring. As a result, butchers as well as meat, poultry, and fish cutters and trimmers are more susceptible to injury than are most other workers.

Injuries include cuts and occasional amputations, which occur when knives, cleavers, or power tools are used improperly. Also, repetitive slicing and lifting often lead to cumulative trauma injuries, such as carpal tunnel syndrome. To reduce the incidence of cumulative trauma injuries, some employers have reduced employee workloads, added prescribed rest periods, redesigned jobs and tools, and promoted increased awareness of early warning signs as steps to prevent further injury. Nevertheless, workers in the occupation still face the serious threat of disabling injuries.

Workers who operate food processing machinery typically work in production areas that are specially designed for food preservation or processing. Food batchmakers, in particular, work in kitchen-type, assembly-line production facilities. Because this work involves food, work areas must meet governmental sanitary regulations. The ovens, as well as the motors of blenders, mixers, and other equipment, often make work areas very warm and noisy. There are some hazards, such as burns, created by the equipment that these workers use.

Food batchmakers; food and tobacco roasting, baking, and drying machine operators; and food cooking machine operators and tenders spend a great deal of time on their feet and generally work a regular 40-hour week that may include evening and night shifts.

Training, Other Qualifications, and Advancement

Training varies widely among food processing occupations. However, most manual food processing workers require little or no training before being hired.

Education and training. Bakers often start as apprentices or trainees. Apprentice bakers usually start in craft bakeries, while trainees usually begin in store bakeries, such as those in supermarkets. Bakers need to become skilled in baking, icing, and decorating. Knowledge of bakery products and ingredients, as well as mechanical mixing and baking equipment, is also important. Many

apprentice bakers participate in correspondence study and may work towards a certificate in baking. Working as a baker's assistant or at other activities that involve handling food is also a useful way to train.

The skills needed to be a baker are often underestimated. Bakers need to know about ingredients and nutrition, government health and sanitation regulations, business concepts, applied chemistry—including how ingredients combine and how they are affected by heat, and production processes, including how to operate and maintain machinery. Computers often operate high-speed automated equipment typically found in modern food plants.

Most butchers as well as poultry and fish cutters and trimmers acquire their skills through on-the-job training programs. The length of training varies significantly. Simple cutting operations require a few days to learn, while more complicated tasks, such as eviscerating slaughtered animals, generally require several months of training. The training period for highly skilled butchers at the retail level may be 1 or 2 years.

Generally, trainees begin by doing less difficult jobs, such as making simple cuts or removing bones. Under the guidance of experienced workers, trainees learn the proper use and care of tools and equipment, while also learning how to prepare various cuts of meat. After demonstrating skill with various meat cutting tools, trainees learn to divide carcasses into wholesale cuts and wholesale cuts into retail and individual portions. Trainees also may learn to roll and tie roasts, prepare sausage, and cure meat. Those employed in retail food establishments often are taught operations, such as inventory control, meat buying, and recordkeeping. In addition, growing concern about food-borne pathogens in meats has led employers to offer numerous safety seminars and extensive training in food safety to employees.

On-the-job training is common among food machine operators and tenders. They learn to run the different types of equipment by watching and helping other workers. Training can last anywhere from a month to a year, depending on the complexity of the tasks and the number of products involved. A degree in an appropriate area—dairy processing for those working in dairy product operations, for example—is helpful for advancement to a lead worker or a supervisory role. Most food batchmakers participate in on-the-job training, usually from about a month to a year. Some food batchmakers learn their trade through an approved apprenticeship program.

Other qualifications. Bakers need to be able to follow instructions, have an eye for detail, and communicate well with others.

Meat, poultry, and fish cutters and trimmers need manual dexterity, good depth perception, color discrimination, and good hand-eye coordination. They also need physical strength to lift and move heavy pieces of meat. Butchers and fish cleaners who wait on customers should have a pleasant personality, a neat appearance, and the ability to communicate clearly. In some states, a health certificate is required for employment.

Certification and advancement. Bakers have the option of obtaining certification through the Retails Bakers of America. While not mandatory, obtaining certification assures the public and prospective employers that the baker has sufficient skills and knowledge to work at a retail baking establishment.

The Retail Bakers of America offer certification for four levels of competence with a focus on several broad areas, including baking sanitation, management, retail sales, and staff training. Those who wish to become certified must satisfy a combination of education and experience requirements prior to taking an examination. The education and experience requirements vary by the level of certification desired. For example, a certified journey baker requires no formal education but a minimum of 1 year of work experience. On the other hand, a certified master baker must have earned the certified baker designation, and must have completed 30 hours of sanitation coursework approved by a culinary school or government agency, 30 hours of professional development courses or workshops, and a minimum of 8 years of commercial or retail baking experience.

Food processing workers in retail or wholesale establishments may progress to supervisory jobs, such as department managers or team leaders in supermarkets. A few of these workers may become buyers for wholesalers or supermarket chains. Some food processing workers go on to open their own markets or bakeries. In processing plants, workers may advance to supervisory positions or become team leaders.

Employment

Food processing workers held 705,000 jobs in 2006. Employment among the various types of food processing occupations was distributed as follows:

Bakers	149,000
Meat, poultry, and fish cutters and trimmers	144,000
Butchers and meat cutters	131,000
Slaughterers and meat packers	122,000
Food batchmakers	95,000
Food cooking machine operators and tenders	44,000
Food and tobacco roasting, baking, and drying machine operators and tenders	19,000

Thirty-four percent of all food processing workers were employed in animal slaughtering and processing plants. Grocery stores employed another 24 percent. Most of the remainder worked in other food manufacturing industries. Butchers, meat cutters, and bakers are employed in almost every city and town in the nation, while most other food processing jobs are concentrated in communities with food processing plants.

Job Outlook

Job opportunities should be available in all food processing specialties due to the need to replace experienced workers who transfer to other occupations or leave the labor force. Overall employment is expected to increase about as fast as average.

Employment change. Overall employment in the food processing occupations is projected to increase 8 percent during the 2006–2016 decade, about as fast as the average for all occupations. Increasingly, cheaper meat imports from abroad will have a negative effect on domestic employment in many food processing occupations. As more jobs involving cutting and processing meat shift from retail stores to food processing plants, job growth will be concentrated among lesser-skilled workers, who are employed primarily in manufacturing.

As the nation's population grows, the demand for meat, poultry, and seafood should continue to increase. Successful marketing by the poultry industry is likely to increase demand for chicken and ready-to-heat products. Similarly, the development of prepared food products that are lower in fat and more nutritious promises to stimulate the consumption of red meat. The trend toward preparing case-ready meat at the processing level also should contribute to demand for animal slaughterers and meat packers, especially as those products become available at lower prices.

Lesser skilled meat, poultry, and fish cutters and trimmers—who work primarily in animal slaughtering and processing plants—should experience 11 percent growth, about as fast as the average for all occupations, and employment of slaughters and meat packers

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16 Number	Change, 2006-16 Percent
Food processing occupations	51-3000	705,000	764,000	59,000	8
Bakers	51-3011	149,000	164,000	15,000	10
Butchers and other meat, poultry, and fish processing workers	51-3020	398,000	431,000	34,000	8
Butchers and meat cutters	51-3021	131,000	134,000	2,500	2
Meat, poultry, and fish cutters and trimmers	51-3022	144,000	160,000	16,000	11
Slaughterers and meat packers	51-3023	122,000	138,000	16,000	13
Miscellaneous food processing workers	51-3090	158,000	169,000	10,000	7
Food and tobacco roasting, baking, and drying machine operators and tenders	51-3091	19,000	21,000	2,000	11
Food batchmakers	51-3092	95,000	105,000	10,000	11
Food cooking machine operators and tenders	51-3093	44,000	42,000	-2,100	-5

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

is expected to increase 13 percent, also about as fast as the average. With the growing popularity of labor-intensive, ready-to-heat poultry products, demand for poultry workers should rise steadily. Potentially offsetting growth will be increased automation and plant efficiency, although some technological breakthroughs may be years away. Fish cutters also will be in demand, as the task of preparing ready-to-heat fish goods gradually shifts from retail stores to processing plants. Advances in fish farming, or "aquaculture," should also help meet the growing demand for fish and produce job growth for fish cutters.

Employment of more highly skilled butchers and meat cutters, who work primarily in large supermarkets, is expected to grow 2 percent, which is considered little or no change in employment. The proliferation of case-ready meat products and automation in the animal slaughtering and processing industries are enabling employers to transfer employment from higher paid butchers to lower wage slaughterers and meat packers in meat packing plants. At present, most red meat arrives at grocery stores partially cut up, but a growing share of meat is being delivered prepackaged with additional fat removed to wholesalers and retailers. This trend is resulting in less work and, thus, fewer jobs for retail butchers.

While high-volume production equipment limits the demand for lesser skilled bakers in manufacturing, overall employment of bakers, particularly highly skilled bakers, should increase 10 percent, about as fast as the average for all occupations, due to growing numbers of bakers in stores, specialty shops, and traditional bakeries. In addition to the growing numbers of cookie, muffin, and cinnamon roll bakeries, the numbers of specialty bread and bagel shops have been growing, spurring demand for artisan bread and pastry bakers.

Employment of food batchmakers and food and tobacco cooking and roasting machine operators and tenders, are expected to grow 11 percent each, about as fast as the average for all occupations. However, as more of this work is being done at the manufacturing level rather than at the retail level, potential employment gains may be offset by productivity gains from automated blending and roasting equipment.

Employment of food cooking machine operators and tenders is expected to decline moderately, about 5 percent, as cooking equipment such as steam vats, deep fryers, kettles, and broilers is increasingly automated.

Job prospects. Jobs should be available in all food processing specialties because of the need to replace experienced workers who transfer to other occupations or leave the labor force. Highly skilled bakers should be especially in demand because of growing demand for specialty products and because of the time it takes to learn to make them.

Earnings

Earnings vary by industry, skill, geographic region, and educational level. Median annual earnings of bakers were $22,030 in May 2006. The middle 50 percent earned between $17,720 and $28,190. The highest 10 percent earned more than $35,380, and the lowest 10 percent earned less than $15,180. Median annual earnings in the industries employing the largest numbers of bakers in May 2006 are given in the following tabulation:

Bakeries and tortilla manufacturing	$22,580
Grocery stores	22,170
Specialty food stores	21,900
Full-service restaurants	20,770
Limited-service eating places	19,990

Median annual earnings of butchers and meat cutters were $26,930 in May 2006. The middle 50 percent earned between $20,630 and $35,240. The highest 10 percent earned more than $43,260 annually, while the lowest 10 percent earned less than $16,520. Butchers and meat cutters employed at the retail level typically earn more than those in manufacturing. Median annual earnings in the industries employing the largest numbers of butchers and meat cutters in May 2006 were:

Other general merchandise stores	$34,190
Grocery stores	27,830
Grocery and related product wholesalers	25,690
Specialty food stores	23,180
Animal slaughtering and processing	23,080

Meat, poultry, and fish cutters and trimmers typically earn less than butchers and meat cutters. In May 2006, median annual earnings for these lower skilled workers were $20,370. The middle 50 percent earned between $17,100 and $24,120. The highest 10 percent earned more than $29,070, while the lowest 10 percent earned less than $14,960. The following tabulation shows median annual earnings in the industries employing the largest numbers of meat, poultry, and fish cutters and trimmers in May 2006:

Other general merchandise stores	$25,150
Grocery stores	20,680
Animal slaughtering and processing	20,530
Specialty food stores	19,990
Seafood product preparation and packaging	18,180

Median annual earnings of food batchmakers were $23,100 in May 2006. The middle 50 percent earned between $17,730 and $30,120. The highest 10 percent earned more than $37,930, and the lowest 10 percent earned less than $15,060. The following tabulation presents median annual earnings in the industries employing the largest numbers of food batchmakers in May 2006:

Dairy product manufacturing	$28,570
Fruit and vegetable preserving and specialty food manufacturing	25,100
Other food manufacturing	23,550
Sugar and confectionery product manufacturing	22,370
Bakeries and tortilla manufacturing	21,720

In May 2006, median annual earnings for slaughterers and meat packers were $21,690. The middle 50 percent earned between $18,290 and $25,440. The highest 10 percent earned more than $28,570, and the lowest 10 percent earned less than $15,950. Median annual earnings in animal slaughtering and processing, the industry employing the largest number of slaughterers and meat packers, were $21,730 in May 2006.

Median annual earnings for food cooking machine operators and tenders were $21,280 in May 2006. The middle 50 percent earned between $17,160 and $27,140. The highest 10 percent earned more than $34,350, and the lowest 10 percent earned less than $14,600. Median annual earnings in grocery stores, the industry employing the largest number of food cooking machine operators and tenders, were $19,400 in May 2006.

In May 2006, median annual earnings for food and tobacco roasting, baking, and drying machine operators and tenders were $23,510. The middle 50 percent earned between $18,820 and $31,540. The highest 10 percent earned more than $38,740, and the lowest 10 percent earned less than $15,910.

Food processing workers generally received typical benefits, including pension plans for union members or those employed by grocery stores. However, poultry workers rarely earned substantial benefits. In 2006, 21 percent of all food processing workers were union members or were covered by a union contract. Many food processing workers are members of the United Food and Commercial Workers International Union.

Related Occupations

Food processing workers must be skilled at both hand and machine work and must have some knowledge of processes and techniques that are involved in handling and preparing food. Other occupations that require similar skills and knowledge include chefs, cooks, and food preparation workers.

State employment service offices can provide information about job openings for food processing occupations.

Metal Workers and Plastic Workers

Computer Control Programmers and Operators

(O*NET 51-4011.00 and 51-4012.00)

Significant Points

- Manufacturing industries employ almost all of these workers.
- Workers learn in apprenticeship programs; informally on the job; and in secondary, vocational, or postsecondary schools. Many entrants have previously worked as machinists or machine setters, operators, and tenders.
- Despite the projected slow decline in employment, job opportunities should be excellent, as employers are expected to continue to have difficulty finding qualified workers.

Nature of the Work

Computer control programmers and operators use computer numerically controlled (CNC) machines to cut and shape precision products, such as automobile, aviation, and machine parts. CNC machines operate by reading the code included in a computer-controlled module, which drives the machine tool and performs the functions of forming and shaping a part formerly done by machine operators. CNC machines include machining tools such as lathes, multi-axis spindles, milling machines, laser cutting machines, and wire electrical discharge machines. CNC machines cut away material from a solid block of metal or plastic—known as a workpiece—to form a finished part. Computer control programmers and operators normally produce large quantities of one part, although they may produce small batches or one-of-a-kind items. They use their knowledge of the working properties of metals and their skill with CNC programming to design and carry out the operations needed to make machined products that meet precise specifications.

CNC programmers—also referred to as *numerical tool and process control programmers*—develop the programs that run the machine tools. They review three-dimensional computer aided/automated design (CAD) blueprints of the part and determine the sequence of events that will be needed to make the part. This may involve calculating where to cut or bore into the workpiece, how fast to feed the metal into the machine, and how much metal to remove.

Next, CNC programmers turn the planned machining operations into a set of instructions. These instructions are translated into a computer aided/automated manufacturing (CAM) program containing a set of commands for the machine to follow. These commands normally are a series of numbers (hence, numerical control) that describes where cuts should occur, what type of cut should be used, and the speed of the cut. After the program is developed, CNC programmers and operators check the programs to ensure that the machinery will function properly and that the output will meet specifications. Because a problem with the program could damage costly machinery and cutting tools or simply waste valuable time and materials, computer simulations may be used to check the program before a trial run. If errors are found, the program must be changed and retested until the problem is resolved. In addition, growing connectivity between CAD/CAM software and CNC machine tools is

Computer control operators reprogram computer numerically controlled machines.

raising productivity by automatically translating designs into instructions for the computer controller on the machine tool. These new CAM technologies enable programs to be easily modified for use on other jobs with similar specifications.

After the programming work is completed, *CNC setup operators*—also referred to as *computer-controlled machine tool operators, metal and plastic*—set up the machine for the job. They download the program into the machine, load the proper cutting tools into the tool holder, position the workpiece (piece of metal or plastic that is being shaped) on the CNC machine tool—spindle, lathe, milling machine, or other machine—and then start the machine. During the test run of a new program, the setup operator, who may also have some programming skills, or the CNC programmer closely monitors the machine for signs of problems, such as a vibrating work piece, the breakage of cutting tools, or an out-of-specification final product. If a problem is detected, a setup operator or CNC programmer will modify the program using the control module to eliminate the problems or to improve the speed and accuracy of the program.

Once a program is completed, the operation of the CNC machine may move from the more-experienced setup operator to a less-skilled *machine operator*. Operators load workpieces and cutting tools into a machine, press the start button, monitor the machine for problems, and measure the parts produced to check that they match specifications. If they encounter a problem that requires modification to the cutting program, they shut down the machine and wait for a more experienced CNC setup operator to fix the problem. Many CNC operators start at this basic level and gradually perform more setup tasks as they gain experience.

Regardless of skill level, all CNC operators detect some problems by listening for specific sounds—for example, a dull cutting tool that needs changing or excessive vibration. Machine tools rotate at high speeds, which can create problems with harmonic vibrations in the workpiece. Vibrations cause the machine tools to make minor cutting errors, hurting the quality of the product. Operators listen for vibrations and then adjust the cutting speed to compensate. CNC operators also ensure that the workpiece is being properly lubricated and cooled, because the machining of metal products generates a significant amount of heat.

Since CNC machines can operate with limited input from the operator, a single operator may monitor several machines simultaneously. Typically, an operator might monitor two machines cutting relatively simple parts from softer materials, while devoting most of his or her attention to a third machine cutting a much more difficult part from hard metal, such as stainless steel. Operators are often expected to carefully schedule their work so that all of the machines are always operating.

Work environment. Most machine shops are clean, well lit, and ventilated. Most modern CNC machines are partially or totally enclosed, minimizing the exposure of workers to noise, debris, and the lubricants used to cool workpieces during machining. Nevertheless, working around machine tools can be noisy and presents certain dangers, and workers must follow safety precautions. Computer-controlled machine tool operators, metal and plastic, wear protective equipment, such as safety glasses to shield against bits of flying metal and earplugs to dampen machinery noise. They also must exercise caution when handling hazardous coolants and lubricants. The job requires stamina because operators stand most of the day and, at times, may need to lift moderately heavy workpieces.

Numerical tool and process control programmers work on desktop computers in offices that typically are near, but separate from, the shop floor. These work areas usually are clean, well lit, and free of machine noise. Numerical tool and process control programmers occasionally need to enter the shop floor to monitor CNC machining operations. On the shop floor, CNC programmers encounter the same hazards and exercise the same safety precautions as do CNC operators.

Many computer control programmers and operators work a 40-hour week. CNC operators increasingly work evening and weekend shifts as companies justify investments in more expensive machinery by extending hours of operation. Overtime is common during peak production periods.

Training, Other Qualifications, and Advancement

Computer control programmers and operators train in various ways—in apprenticeship programs, informally on the job, and in secondary, vocational, or postsecondary schools. In general, the more skills needed for the job, the more education and training are needed to qualify. Many entrants have previously worked as machinists or machine setters, operators, and tenders.

Education and training. The amount and type of education and training needed depends on the type of job. Entry-level CNC machine operators may need only a couple of weeks of on-the-job training to reach proficiency. Setup operators and programmers, however, may need years of experience or formal training to write or modify programs. Programmers and operators can receive their training in various ways—in apprenticeship programs, informally on the job, and in secondary, vocational, or postsecondary schools. A growing number of computer control programmers and more skilled operators receive their formal training from community or technical colleges. For some specialized types of programming, such as that needed to produce complex parts for the aerospace or shipbuilding industries, employers may prefer individuals with a degree in engineering.

For those interested in becoming computer control programmers or operators, high school or vocational school courses in mathematics (trigonometry and algebra), blueprint reading, computer programming, metalworking, and drafting are recommended. Apprenticeship programs consist of shop training and related classroom instruction. In shop training, apprentices learn filing, handtapping, and dowel fitting, as well as the operation of various machine tools. Classroom instruction includes math, physics, programming, blueprint reading, CAD software, safety, and shop practices. Skilled computer control programmers and operators need an understanding of the machining process, including the complex physics that occur at the cutting point. Thus, most training programs teach CNC oper-

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16 Number	Change, 2006-16 Percent
Computer control programmers and operators	51-4010	158,000	153,000	-5,700	-4
Computer-controlled machine tool operators, metal and plastic	51-4011	141,000	136,000	-4,200	-3
Numerical tool and process control programmers	51-4012	18,000	16,000	-1,500	-8

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

ators and programmers to perform operations on manual machines prior to operating CNC machines.

As new automation is introduced, computer control programmers and operators normally receive additional training to update their skills. This training usually is provided by a representative of the equipment manufacturer or a local technical school. Many employers offer tuition reimbursement for job-related courses.

Certification and other qualifications. Employers prefer to hire workers who have a basic knowledge of computers and electronics and experience with machine tools. In fact, many entrants to these occupations have previously worked as machinists or machine setters, operators, and tenders. Persons interested in becoming computer control programmers or operators should be mechanically inclined and able to work independently and do highly accurate work.

To boost the skill level of all metalworkers and to create a more uniform standard of competency, a number of training facilities and colleges have recently begun implementing curriculums by incorporating national skills standards developed by the National Institute of Metalworking Skills (NIMS). After completing such a curriculum and passing a performance requirement and written exam, trainees are granted an NIMS credential that provides formal recognition of competency in a metalworking field. Completion of a formal certification program provides expanded career opportunities.

Advancement. Computer control programmers and operators can advance in several ways. Experienced CNC operators may become CNC programmers, and some are promoted to supervisory or administrative positions in their firms. A few open their own shops.

Employment

Computer control programmers and operators held about 158,000 jobs in 2006. About 89 percent were computer-controlled machine tool operators, metal and plastic, and about 11 percent were numerical tool and process control programmers. Manufacturing employs almost all of these workers. Employment was concentrated in fabricated metal products manufacturing, machinery manufacturing, plastics products manufacturing, and transportation equipment manufacturing making mostly aerospace and automobile parts. Although computer control programmers and operators work in all parts of the country, jobs are most plentiful in the areas where manufacturing is concentrated.

Job Outlook

Despite the projected slow decline in employment of computer control programmers and operators, job opportunities should be excellent, as employers are expected to continue to have difficulty finding qualified workers.

Employment change. Employment of computer control programmers and operators is expected to decline slowly by 4 percent through 2016. While CNC machine tools will be increasingly used, advances in CNC machine tools and manufacturing technology will further automate the production process, boosting CNC operator productivity and limiting employment. The demand for computer control programmers also will be negatively affected by the increasing use of software (CAD/CAM) that automatically translates part and product designs into CNC machine tool instructions.

Job prospects. Computer control programmers and operators should have excellent job opportunities despite the projected slow decline in employment. Due to the limited number of people entering training programs, employers are expected to continue to have difficulty finding workers with the necessary skills and knowledge.

Earnings

Median hourly earnings of computer-controlled machine tool operators, metal and plastic, were $15.23 in May 2006. The middle 50 percent earned between $12.10 and $18.84. The lowest 10 percent earned less than $9.91, whereas the top 10 percent earned more than $22.45. Median hourly earnings in the manufacturing industries employing the largest numbers of computer-controlled machine tool operators, metal and plastic, in May 2006 were:

Metalworking machinery manufacturing	$17.45
Other fabricated metal product manufacturing	15.34
Machine shops; turned product; and screw, nut, and bolt manufacturing	14.85
Motor vehicle parts manufacturing	14.12
Plastics product manufacturing	12.32

Median hourly earnings of numerical tool and process control programmers were $20.42 in May 2006. The middle 50 percent earned between $16.14 and $25.61. The lowest 10 percent earned less than $13.11, while the top 10 percent earned more than $31.85.

Many employers, especially those with formal apprenticeship programs, offer tuition assistance for training classes.

Related Occupations

Occupations most closely related to computer control programmers and operators are other metal and plastic working occupations, which include machinists; tool and die makers; machine setters, operators, and tenders—metal and plastic; and welding, soldering, and brazing workers. Numerical tool and process control programmers apply their knowledge of machining operations, metals, blueprints, and machine programming to write programs that run machine tools. Computer programmers also write detailed programs to meet precise specifications.

Machine Setters, Operators, and Tenders—Metal and Plastic

(O*NET 51-4021.00, 51-4022.00, 51-4023.00, 51-4031.00, 51-4032.00, 51-4033.00, 51-4034.00, 51-4035.00, 51-4051.00, 51-4052.00, 51-4061.00, 51-4062.00, 51-4071.00, 51-4072.00, 51-4081.00, 51-4191.00, 51-4192.00, 51-4193.00, 51-4194.00, and 51-4199.99)

Significant Points

- Manufacturing industries employ more than 90 percent of workers.
- A few weeks of on-the-job training is sufficient for most workers to learn basic machine operations, but a year or more is required to become a highly skilled operator or setter.
- Overall employment of machine setters, operators, and tenders is projected to decline rapidly over the 2006–2016 period as a result of productivity improvements and competition for jobs from abroad.
- Those who can operate multiple machines will have the best opportunities for advancement and for gaining jobs with more long-term potential.

Nature of the Work

Consider the parts of a toaster, such as the metal or plastic housing or the lever that lowers the toast. These parts, and many other metal and plastic products, are produced by machine setters, operators, and tenders—metal and plastic. In fact, machine operators in the metalworking and plastics industries play a major role in producing most of the consumer products on which we rely daily.

In general, these workers can be separated into two groups—those who set up machines for operation and those who operate the machines during production. Setup workers prepare the machines *prior* to production, perform initial test runs producing a part, and may adjust and make minor repairs to the machinery during its operation. Operators and tenders primarily monitor the machinery *during* its operation; sometimes they load or unload the machine or make minor adjustments to the controls. Many workers both set up and operate equipment. Because the setup process requires an understanding of the entire production process, setters usually have more training and are more highly skilled than those who simply operate or tend machinery. As new automation simplifies the setup process, however, less skilled workers also are increasingly able to set up machines for operation.

Setters, operators, and tenders usually are identified by the type of machine with which they work. Some examples of specific titles are drilling- and boring-machine toolsetters, milling- and planing-machine tenders, and lathe- and turning-machine tool operators. Job duties usually vary with the size of the firm and the type of machine being operated. Although some workers specialize in one or two types of machinery, many are trained to set up or operate a variety of machines. Increasing automation allows machine setters to operate multiple machines simultaneously. In addition, newer production techniques, such as team-oriented "lean" manufacturing, require machine operators to rotate between different machines. Rotating assignments results in more varied work, but also requires workers to have a wider range of skills.

Machine setters, operators, and tenders operate a wide range of machine tools.

Machine setters, operators, and tenders—metal set up and tend machines that cut and form all types of metal parts. Setup workers plan and set up the sequence of operations according to blueprints, layouts, or other instructions. Often this involves loading a computer program with instructions into the machine's computer controls. On all machines, including those with computer controls, setup workers respond to problems during operation by adjusting the speed, feed and other variables. They also choose the proper coolants and lubricants and select the instruments or tools for each operation. Using micrometers, gauges, and other precision measuring instruments, setup workers compare the completed work within the required tolerances.

Although there are many different types of metalworking machine tools that require specific knowledge and skills, most operators perform similar tasks. Whether tending grinding machines that remove excess material from the surface of solid piece of metal or presses that extrude molten metal through a die to form wire, operators usually perform simple, repetitive operations that can be learned quickly. Typically, these workers place metal stock in a machine on which the operating specifications have already been set. They watch one or more machines and make adjustments to the machines based on either reading from computers and gauges or measuring the resulting product. Regardless of the type of machine they operate, machine operators usually depend on more skilled and experienced setup workers for major adjustments when the machines are not functioning properly.

Machine setters, operators, and tenders—plastic set up and tend machines that transform plastic compounds—chemical-based products that can be produced in powder, pellet, or syrup form—into a wide variety of consumer goods such as toys, tubing, and auto parts. These products are manufactured by various methods, of which injection molding is the most common. The injection-molding machine heats and liquefies a plastic compound and forces it into a mold. After the part has cooled and hardened, the mold opens and the part is released. Many common kitchen products are produced with this method. To produce long parts, such as pipes or window frames, an extruding machine usually is used. These machines force a plastic compound through a die that contains an opening with the desired shape of the final product. Blow molding is another common plasticsworking technique. Blow-molding machines force hot air into a mold that contains a plastic tube. As the air moves into the

mold, the tube is inflated to the shape of the mold, and a plastic container is formed. The familiar two-liter soft-drink bottles are produced by this method.

Work environment. Most machine setters, operators, and tenders—metal and plastic work in areas that are clean, well lit, and well ventilated. Nevertheless, many operators require stamina, because they are on their feet much of the day and may do moderately heavy lifting. Also, these workers operate powerful, high-speed machines that can be dangerous if strict safety rules are not observed. Most operators wear protective equipment, such as safety glasses and earplugs, to protect against flying particles of metal or plastic and against noise from the machines. However, many modern machines are enclosed, minimizing the exposure of workers to noise, dust, and lubricants used during machining. Other required safety equipment varies by work setting and machine. For example, those in the plastics industry who work near materials that emit dangerous fumes or dust must wear face masks or self-contained breathing apparatus.

Overtime is common during periods of increased production for most machine setters, operators, and tenders—metal and plastic, but they usually work a 40-hour week. Because many metalworking and plastics working shops operate more than one shift daily, some operators work nights and weekends.

Training, Other Qualifications, and Advancement

A few weeks of on-the-job training is sufficient for most workers to learn basic machine operations, but a year or more is required to become a highly skilled operator or setter.

Education and training. Employers generally prefer workers who have a high school diploma or equivalent for jobs as machine setters, operators, and tenders. Being able to read, write, and speak English is important. Those interested in this occupation can improve their employment opportunities by completing high school courses in shop and blueprint reading and by gaining a working knowledge of the properties of metals and plastics. A solid math background, including courses in algebra, geometry, trigonometry, and basic statistics, also is useful, along with experience working with computers.

Trainees begin by observing and assisting experienced workers, sometimes in formal training programs or apprenticeships. Under supervision, they may start as tenders, supplying materials, starting and stopping the machine, or removing finished products from it. Then they advance to the more difficult tasks performed by operators, such as adjusting feed speeds, changing cutting tools, or inspecting a finished product for defects. Eventually, they develop the skills and experience to setup machines and assist newer operators.

The complexity of the equipment largely determines the time required to become an operator. Most operators learn the basic machine operations and functions in a few weeks, but a year or more may be needed to become skilled operators or to advance to the more highly skilled job of setter. Although many operators learn on the job, some community colleges and other educational institutions offer courses and certifications in operating metal and plastics machines. In addition to providing on-the-job training, some employers send promising machine tenders to classes. Other employers prefer to hire workers who have completed, or currently are enrolled in, a training program.

Setters or technicians often plan the sequence of work, make the first production run, and determine which adjustments need to be made. As a result, these workers need a thorough knowledge of the machinery and of the products being manufactured. Strong analytical abilities are particularly important for this job. Some companies have formal training programs for operators and setters, which often combine classroom instruction with on-the-job training. For some positions, such as grinders and rolling or pressing setup workers, formal apprenticeships are available. These programs require 300–600 hours of classroom training and 2000–4000 hours of on-the-job experience. Workers complete these programs in about two to four years, depending upon the program.

Other qualifications. As the machinery in manufacturing plants becomes more complex and with changes to shop-floor organization that require more teamwork among employees, employers increasingly look for persons with good communication and interpersonal skills. Mechanical aptitude, manual dexterity, and experience working with machinery also are helpful.

Certification and advancement. Job opportunities and advancement can be enhanced by becoming certified in a particular machining skill. The National Institute for Metalworking Skills has developed standards for machine setters, operators, and tenders—metal. After taking an approved course and passing a written exam and performance requirement, the worker is issued a credential that signifies competence in a specific machining operation. The Society of Plastics Industry, the national trade association representing plastics manufacturers, also certifies workers in that industry. Certifications vary greatly depending upon the skill level involved. Both organizations offer multiple levels of operator and setter certifications. Certifications allow operators and setters to switch jobs more easily because they can prove their skills to a potential employer.

Advancement for operators usually takes the form of higher pay and a wider range of responsibilities, eventually than can advance to be setup workers. With experience and training they can become multiple-machine operators, or trainees for more highly skilled positions, such as, machinists, tool and die makers, or computer-control programmers. (See the statements on machinists, computer control programmers and operators, and tool and die makers elsewhere in the *Handbook*.) Some setup workers may advance to supervisory positions.

Employment

Machine setters, operators, and tenders—metal and plastic held about 1.1 million jobs in 2006. More than 90 percent of jobs were found in manufacturing, primarily in fabricated metal product manufacturing, plastics and rubber products manufacturing, primary metal manufacturing, machinery manufacturing, and motor vehicle parts manufacturing.

Job Outlook

Overall employment in the various machine setter, operator, and tender occupations is expected to decline rapidly during the projection period. Those who can operate multiple machines will have the best opportunities for advancement and for gaining jobs with more long-term potential.

Employment change. Overall employment in the various machine setter, operator, and tender occupations is expected to decline rapidly by 15 percent from 2006 to 2016. In general, employment growth of these workers will be affected by technological advances, changing demand for the goods they produce, foreign competition, and the reorganization of production processes.

One of the most important factors influencing employment change in this occupation is the implementation of labor-saving machinery. Many firms are adopting new technologies, such as computer-controlled machine tools and robots in order to improve quality, lower production costs, and remain competitive. Computer-controlled equipment allows operators to tend a greater number of machines simultaneously and often makes setup easier, thereby reducing the amount of time setup workers spend on each machine.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Machine setters, operators, and tenders—metal and plastic	—	1,141,000	975,000	-166,000	-15
Forming machine setters, operators, and tenders, metal and plastic	51-4020	161,000	140,000	-20,000	-13
Extruding and drawing machine setters, operators, and tenders, metal and plastic	51-4021	94,000	87,000	-6,700	-7

Lay-out workers, metal and plastic	51-4192	10,000	8,100	-2,000	-20
Plating and coating machine setters, operators, and tenders, metal and plastic	51-4193	42,000	37,000	-5,100	-12
Tool grinders, filers, and sharpeners	51-4194	22,000	18,000	-4,200	-19
Metal workers and plastic workers, all other	51-4199	49,000	36,000	-12,000	-25

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Robots are being used to load and unload parts from machines. The lower-skilled manual machine tool operators and tenders jobs are more likely to be eliminated by these new technologies, because the functions they perform are more easily automated.

The demand for machine setters, operators, and tenders—metal and plastic largely mirrors the demand for the parts they produce. The consumption of plastic products has grown as they have been substituted for metal goods in many products in recent years. The process is likely to continue and should result in stronger demand for machine operators in plastics than in metal.

Both the plastics and metal industries, however, face stiff foreign competition that is limiting the demand for domestically produced parts. One way in which larger U.S. producers have responded to this competition is by moving production operations to other countries where labor costs are lower. These moves are likely to continue and will further reduce employment growth for machine operators, setters, and tenders—metal and plastic in the United States. Another way domestic manufacturers compete with low-wage foreign competition is by increasing their use of automated systems, which can make manufacturing establishments more competitive by improving their productivity. However, increased automation also limits employment growth.

Job prospects. Despite the overall rapid employment decline, a large number of machine setter, operator, and tender jobs will become available because of an expected surge in retirements, primarily baby boomers, by the end of the decade. Workers with a thorough background in machine operations, certifications from industry associations, exposure to a variety of machines, and a good

working knowledge of the properties of metals and plastics will be better able to adjust to the changing environment. In addition, new shop-floor arrangements will reward workers with good basic mathematics and reading skills, good communication skills, and the ability and willingness to learn new tasks. As workers adapt to team-oriented production methods, those who can operate multiple machines will have the best opportunities for advancement and for gaining jobs with more long-term potential.

Earnings

Earnings for machine operators can vary by size of the company, union status, industry, and skill level and experience of the operator. Also, temporary employees, who are being hired in greater numbers, usually get paid less than permanently employed workers. The median hourly earnings in May 2006 for a variety of machine setters, operators, and tenders—metal and plastic were:

Model makers, metal and plastic	$20.22
Patternmakers, metal and plastic	17.01
Lay-out workers, metal and plastic	16.15
Metal-refining furnace operators and tenders	15.69
Lathe and turning machine tool setters, operators, and tenders, metal and plastic	15.46
Milling and planing machine setters, operators, and tenders, metal and plastic	15.18
Rolling machine setters, operators, and tenders, metal and plastic	14.93
Heat treating equipment setters, operators, and tenders, metal and plastic	14.83
Tool grinders, filers, and sharpeners	14.73
Multiple machine tool setters, operators, and tenders, metal and plastic	14.68
Drilling and boring machine tool setters, operators, and tenders, metal and plastic	14.36
Pourers and casters, metal	14.22
Forging machine setters, operators, and tenders, metal and plastic	13.94
Foundry mold and coremakers	13.82
Extruding and drawing machine setters, operators, and tenders, metal and plastic	13.58
Grinding, lapping, polishing, and buffing machine tool setters, operators, and tenders, metal and plastic	13.50
Plating and coating machine setters, operators, and tenders, metal and plastic	13.21
Cutting, punching, and press machine setters, operators, and tenders, metal and plastic	12.66
Molding, coremaking, and casting machine setters, operators, and tenders, metal and plastic	12.29
Metal workers and plastic workers, all other	16.69

Related Occupations

Workers in occupations closely related to machine setters, operators, and tenders—metal and plastic include machinists; tool and die makers; assemblers and fabricators; computer control programmers and operators; painting and coating workers, except construction and maintenance; and welding, soldering, and brazing workers. Often, machine operators are responsible for checking the quality of parts being produced, work similar to that of inspectors, testers, sorters, samplers, and weighers.

Machinists

(O*NET 51-4041.00)

Significant Points

- Machinists learn in apprenticeship programs, informally on the job, in vocational high schools, and in community or technical colleges.
- Many entrants previously have worked as machine setters, operators, or tenders.
- Although employment is projected to decline, job opportunities are expected to be good.

Nature of the Work

Machinists use machine tools, such as lathes, milling machines, and machining centers, to produce precision metal parts. Although they may produce large quantities of one part, precision machinists often produce small batches or one-of-a-kind items. They use their knowledge of the working properties of metals and their skill with machine tools to plan and carry out the operations needed to make machined products that meet precise specifications.

Machinists first review electronic or written blueprints or specifications for a job before they machine a part. Next, they calculate where to cut or bore into the workpiece—the piece of steel, aluminum, titanium, plastic, silicon or any other material that is being shaped. They determine how fast to feed the workpiece into the machine and how much material to remove. They then select tools and materials for the job, plan the sequence of cutting and finishing operations, and mark the workpiece to show where cuts should be made.

After this layout work is completed, machinists perform the necessary machining operations. They position the workpiece on the machine tool—drill press, lathe, milling machine, or other type of machine—set the controls, and make the cuts. During the machining process, they must constantly monitor the feed rate and speed of the machine. Machinists also ensure that the workpiece is properly lubricated and cooled because the machining of metal products generates a significant amount of heat. The temperature of the workpiece is a key concern because most metals expand when heated; machinists must adjust the size of their cuts relative to the temperature.

During the cutting process, machinists detect problems by listening for specific sounds—for example, that of a dull cutting tool or excessive vibration. Dull cutting tools are removed and replaced. Cutting speeds are adjusted to compensate for harmonic vibrations, which can decrease the accuracy of cuts, particularly on newer high-speed spindles and lathes. After the work is completed, machinists use both simple and highly sophisticated measuring tools to check the accuracy of their work against blueprints.

Some machinists, often called *production machinists,* may produce large quantities of one part, especially parts requiring the use

Machinists change worn cutting tools on computer-controlled machines.

of complex operations and great precision. Many modern machine tools are computer numerically controlled (CNC). CNC machines, following a computer program, control the cutting tool speed, change dull tools, and perform all of the necessary cuts to create a part. Frequently, machinists work with computer control programmers to determine how the automated equipment will cut a part. (See the section on computer control programmers and operators elsewhere in the *Handbook*.) The machinist determines the cutting path, speed of the cut and the feed rate, and the programmer converts path, speed, and feed information into a set of instructions for the CNC machine tool.

Because most machinists train in CNC programming, they may write basic programs themselves and often modify programs in response to problems encountered during test runs. Modifications, called offsets, not only fix problems, but they also improve efficiency by reducing manufacturing time and tool wear. After the production process is designed, computer control operators implement it by performing relatively simple and repetitive operations.

Some manufacturing techniques employ automated parts loaders, automatic tool changers, and computer controls, allowing machines to operate without anyone present. One production machinist, working 8 hours a day, might monitor equipment, replace worn cutting tools, check the accuracy of parts being produced, adjust offsets, and perform other tasks on several CNC machines that operate 24 hours a day. In the off-hours, during what is known as "lights-out manufacturing," a factory may need only a few machinists to monitor the entire factory.

Maintenance machinists repair or make new parts for existing machinery. After an industrial machinery mechanic or maintenance worker discovers the broken part of a machine, they give the broken part to the machinist. (See the section on industrial machinery mechanics and maintenance workers elsewhere in the *Handbook*.) To replace broken parts, maintenance machinists refer to blueprints and perform the same machining operations that were needed to create the original part. While production machinists are concentrated in a few industries, maintenance machinists work in many manufacturing industries.

Because the technology of machining is changing rapidly, machinists must learn to operate a wide range of machines. Some newer machines use lasers, water jets, or electrified wires to cut the workpiece. While some of the computer controls are similar to other machine tools, machinists must understand the unique cutting properties of these different machines. As engineers create new types of machine tools and new materials to machine, machinists must constantly learn new machining properties and techniques.

Work environment. Today, most machine shops are relatively clean, well lit, and ventilated. Many computer-controlled machines are partially or totally enclosed, minimizing the exposure of workers to noise, debris, and the lubricants used to cool workpieces during machining. Nevertheless, working around machine tools presents certain dangers, and workers must follow safety precautions. Machinists wear protective equipment, such as safety glasses to shield against bits of flying metal and earplugs to dampen machinery noise. They also must exercise caution when handling hazardous coolants and lubricants, although many common water-based lubricants present little hazard. The job requires stamina because machinists stand most of the day and, at times, may need to lift moderately heavy workpieces. Modern factories use autoloaders and overhead cranes to reduce heavy lifting.

Many machinists work a 40-hour week. Evening and weekend shifts are becoming more common as companies extend hours of operation to make better use of expensive machines. However, this trend is somewhat offset by lights-out manufacturing that uses fewer machinists and the use of machine operators for less desirable shifts. Overtime is common during peak production periods.

Training, Other Qualifications, and Advancement

Machinists train in apprenticeship programs, vocational schools, or community or technical colleges, or informally on the job. Many entrants previously have worked as machine setters, operators, or tenders.

Education and training. There are many different ways to become a skilled machinist. Many entrants previously have worked as machine setters, operators, or tenders. In high school, students should take math courses, especially trigonometry, and, if available, courses in blueprint reading, metalworking, and drafting. After high school, some machinists learn entirely on the job, but most acquire their skills in a mix of classroom and on-the-job training. Formal apprenticeship programs, typically sponsored by a union or manufacturer, are an excellent way to learn the job of machinist, but are often hard to get into. Apprentices usually must have a high school diploma, GED, or the equivalent, and most have taken algebra and trigonometry classes.

Apprenticeship programs consist of paid shop training and related classroom instruction lasting up to 4 years. In shop training, apprentices work almost full time and are supervised by an experienced machinist while learning to operate various machine tools. Classroom instruction includes math, physics, materials science, blueprint reading, mechanical drawing, and quality and safety practices. In addition, as machine shops have increased their use of computer-controlled equipment, training in the operation and programming of CNC machine tools has become essential. Apprenticeship classes are often taught in cooperation with local community colleges or vocational-technical schools. A growing number of machinists are learning the trade through two-year associate degree programs at community or technical colleges. Graduates of these programs still need significant on-the-job experience before they are fully qualified.

Certification and other qualifications. People interested in becoming machinists should be mechanically inclined, have good problem-solving abilities, be able to work independently, and be able to do highly accurate work (tolerances may reach 50/1,000,000ths of an inch) that requires concentration and physical effort. Experience working with machine tools is helpful. In fact, many entrants have worked as machine setters, operators, or tenders.

To boost the skill level of machinists and to create a more uniform standard of competency, a number of training facilities, state apprenticeship boards, and colleges are implementing curriculums that incorporate national skills standards developed by the National Institute of Metalworking Skills (NIMS). After completing such a curriculum and passing practical and written exams, trainees are granted a NIMS credential. Completing a recognized certification program provides a machinist with better career opportunities and helps employers better judge the abilities of new hires. Journeyworker certification can be obtained from state apprenticeship boards after completing an apprenticeship.

As new automation is introduced, machinists normally receive additional training to update their skills. This training usually is provided by a representative of the equipment manufacturer or a local technical school. Some employers offer tuition reimbursement for job-related courses.

Advancement. Machinists can advance in several ways. Experienced machinists may become CNC programmers, tool and die makers, or mold makers, or be promoted to supervisory or administrative positions in their firms. A few open their own machine shops.

Employment

Machinists held about 397,000 jobs in 2006. About 78 percent of machinists work in manufacturing industries, such as machine shops and machinery, motor vehicle and parts, aerospace products and parts, and other transportation equipment manufacturing. Maintenance machinists work in most industries that use production machinery.

Job Outlook

Although employment of machinists is projected to decline slowly, job prospects are expected to be good.

Employment change. Employment of machinists is projected to decline slowly by 3 percent over the 2006–2016 decade because of rising productivity among these workers and strong foreign competition in the manufacture of goods. Machinists will become more efficient as a result of the expanded use of and improvements in technologies such as CNC machine tools, autoloaders, and high-speed machining. This allows fewer machinists to accomplish the same amount of work. Technology is not expected to affect the employment of machinists as significantly as that of some other production workers, however, because machinists monitor and maintain many automated systems. Due to modern production techniques, employers prefer workers, such as machinists, who have a wide range of skills and are capable of performing almost any task in a machine shop.

Job prospects. Despite the projected decline in employment, job opportunities for machinists should continue to be good as employers value the wide-ranging skills of these workers. Also, many young people with the necessary educational and personal qualifications needed to become machinists prefer to attend college or may not wish to enter production occupations. Therefore, the number of workers learning to be machinists is expected to be less than the number of job openings arising each year from the need to replace experienced machinists who retire or transfer to other occupations.

Employment levels in this occupation are influenced by economic cycles—as the demand for machined goods falls, machinists involved in production may be laid off or forced to work fewer hours. Employment of machinists involved in plant maintenance, however, often is more stable because proper maintenance and repair of costly equipment remains critical to manufacturing operations, even when production levels fall.

Earnings

Median hourly wage-and-salary earnings of machinists were $16.71 in May 2006. The middle 50 percent earned between $13.14 and $20.82. The lowest 10 percent earned less than $10.29, while the top 10 percent earned more than $25.31. Median hourly wage-and-salary earnings in the manufacturing industries employing the largest number of machinists were:

Aerospace product and parts manufacturing	$18.46
Motor vehicle parts manufacturing	18.27
Metalworking machinery manufacturing	17.36
Machine shops; turned product; and screw, nut, and bolt manufacturing	16.24
Employment services	11.98

Apprentices earn much less than experienced machinists, but earnings increase quickly as they improve their skills. Also most employers pay for apprentices' training classes.

Related Occupations

Occupations most closely related to that of machinist are other machining occupations, which include tool and die makers; machine setters, operators, and tenders—metal and plastic; and computer control programmers and operators. Maintenance machinists work closely with industrial machinery mechanics and maintenance workers.

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Tool and Die Makers

(O*NET 51-4111.00)

Significant Points

- Most tool and die makers need 4 or 5 years of classroom instruction and on-the-job training to become fully qualified.
- Employment is projected to decline because of strong foreign competition and advancements in automation.
- Despite the decline in employment, excellent job opportunities are expected.

Nature of the Work

Tool and die makers are among the most highly skilled workers in manufacturing. These workers produce and repair tools, dies, and special guiding and holding devices that enable machines to manufacture a variety of products we use daily—from clothing and furniture to heavy equipment and parts for aircraft.

Toolmakers craft precision tools and machines that are used to cut, shape, and form metal and other materials. They also produce jigs and fixtures—devices that hold metal while it is bored, stamped, or drilled—and gauges and other measuring devices. Die makers construct metal forms, called dies, that are used to shape metal in stamping and forging operations. They also make metal molds for diecasting and for molding plastics, ceramics, and composite materials. Some tool and die makers craft prototypes of parts, and then, working with engineers and designers, determine how best to manufacture the part. In addition to developing, designing, and producing new tools and dies, these workers also may repair worn or damaged tools, dies, gauges, jigs, and fixtures.

To perform these functions, tool and die makers employ many types of machine tools and precision measuring instruments. They also must be familiar with the machining properties, such as hardness and heat tolerance, of a wide variety of common metals, alloys, plastics, ceramics, and other composite materials. Tool and die makers are knowledgeable in machining operations, mathematics, and blueprint reading. In fact, tool and die makers often are considered highly specialized machinists. The main difference between tool and die makers and machinists is that machinists normally make a single part during the production process, while tool and die makers make many parts and assemble and adjust machines used in the production process. (See the section on machinists elsewhere in the *Handbook*.)

While many tools and dies are designed by engineers or tool designers, tool and die makers are also trained to design tools and often do. They may travel to a customer's plant to observe the operation and suggest ways in which a new tool could improve the manufacturing process.

Once a tool or die is designed, tool and die makers, working from blueprints, plan the sequence of operations necessary to manufacture the tool or die. They measure and mark the pieces of metal that will be cut to form parts of the final product. At this point, tool and die makers cut, drill, or bore the part as required, checking to ensure that the final product meets specifications. Finally, these workers assemble the parts and perform finishing jobs such as filing, grinding, and polishing surfaces. While manual machining has declined, it is still used for unique or low-quantity parts that are often required in building tools and dies.

Tool and die makers use manual lathes to make custom parts or small batches of parts.

Tool and die makers use computer-aided design (CAD) to develop products and parts. Specifications entered into computer programs can be used to electronically develop blueprints for the required tools and dies. Numerical tool and process control programmers use computer-aided design or computer-aided manufacturing (CAD/CAM) programs to convert electronic drawings into CAM-based computer programs that contain instructions for a sequence of cutting tool operations. (See the section on computer control programmers and operators elsewhere in the *Handbook*.) Once these programs are developed, computer numerically controlled (CNC) machines follow the set of instructions contained in the program to produce the part. Computer-controlled machine tool operators or machinists normally operate CNC machines, but tool and die makers are trained in both operating CNC machines and writing CNC programs, and they may perform either task. CNC programs are stored electronically for future use, saving time and increasing worker productivity.

After machining the parts, tool and die makers carefully check the accuracy of the parts using many tools, including coordinate measuring machines, which use sensor arms and software to compare the dimensions of the part to electronic blueprints. Next, they assemble the different parts into a functioning machine. They file, grind, shim, and adjust the different parts to properly fit them together. Finally, tool and die makers set up a test run using the tools or dies they have made to make sure that the manufactured parts meet specifications. If problems occur, they compensate by adjusting the tools or dies.

Work environment. Tool and die makers usually work in toolrooms that are normally quieter than typical manufacturing production floors because there are fewer machines running at once. Toolrooms also are generally kept clean and cool to minimize heat-related expansion of metal workpieces. To minimize the exposure of workers to moving parts, machines have guards and shields. Most computer-controlled machines are totally enclosed, minimizing workers' exposure to noise, dust, and the lubricants used to cool workpieces during machining. Tool and die makers also must follow safety rules and wear protective equipment, such as safety glasses to shield against bits of flying metal, earplugs to protect against noise, and gloves and masks to reduce exposure to hazardous lubricants and cleaners. These workers also need stamina because they often spend much of the day on their feet and may do moderately heavy lifting. Companies employing tool and die makers have traditionally operated only one shift per day. Overtime and weekend work are common, especially during peak production periods.

Training, Other Qualifications, and Advancement

It usually takes 4 or 5 years of classroom and paid on-the-job training to become a fully trained tool and die maker. Good math, problem-solving, and computer skills are important requirements for these workers.

Education and training. Most tool and die makers learn their trade through 4 or 5 years of education and training in formal apprenticeships or in other postsecondary programs offered at local community colleges or technical schools. These programs often include a mix of classroom instruction and paid hands-on experience. According to most employers, apprenticeship programs are the best way to learn all aspects of tool and die making. Most apprentices must have a high school diploma, GED, or equivalent, and high school mathematics and shop classes make it easier to get into an apprenticeship program.

Traditional apprenticeships usually require that the apprentice complete a specific number of work and classroom hours to complete the program, which typically takes 4 or 5 years. Some companies and state apprenticeship programs, however, are now shifting from time-based programs to competency-based programs. Under competency-based programs, apprentices can move ahead more quickly by passing a series of exams and demonstrating competency in a particular job skill.

While formal apprenticeship programs may be the best way to learn the job, many tool and die makers receive most of their formal classroom training from community and technical colleges while working for a company that often supports the employee's training goals and provides the needed on-the-job training less formally. These trainees often begin as machine operators and gradually take on more difficult assignments. Many machinists become tool and die makers.

During their training, tool and die maker trainees learn to operate milling machines, lathes, grinders, laser and water cutting machines, wire electrical discharge machines, and other machine tools. They also learn to use hand tools for fitting and assembling gauges and other mechanical and metal-forming equipment. In addition, they study metalworking processes, such as heat treating and plating. Classroom training usually consists of tool designing, tool programming, blueprint reading, and, if needed, mathematics courses, including algebra, geometry, trigonometry, and basic statistics. Tool and die makers must have good computer skills to work with CAD/CAM technology, CNC machine tools, and computerized measuring machines.

Even after completing a formal training program, tool and die makers still need years of experience to become highly skilled. Most specialize in making certain types of tools, molds, or dies.

Certification and other qualifications. State apprenticeship boards certify tool and die makers as journey workers after they have completed a licensed program. While a state certification is not necessary to work as a tool and die maker, it gives workers more flexibility in employment and is required by some employers. Apprentices usually must be at least 18 years old, in addition to having a high school education and high school mathematics classes.

Because tools and dies must meet strict specifications—precision to one ten-thousandth of an inch is common—the work of tool and die makers requires skill with precision measuring devices and a high degree of patience and attention to detail. Good eyesight is essential. People entering this occupation also should be mechanically inclined, able to work and solve problems independently, have strong mathematical skills, and be capable of doing work that requires concentration and physical effort. Tool and die makers who visit customers' plants need good interpersonal and sales skills.

Employers generally look for someone with a strong educational background as an indication that the person can more easily adapt to change, which is a constant in this occupation. As automation continues to change the way tools and dies are made, workers regularly need to update their skills to learn how to operate new equipment. Also, as materials such as alloys, ceramics, polymers, and plastics are increasingly used, tool and die makers need to learn new machining techniques to deal with the new materials.

Advancement. There are several ways for skilled workers to advance. Some move into supervisory and administrative positions in their firms or they may start their own shop. Others may take computer courses and become computer-controlled machine tool programmers. With a college degree, a tool and die maker can go into engineering or tool design.

Employment

Tool and die makers held about 101,000 jobs in 2006. Most worked in industries that manufacture metalworking machinery, transportation equipment such as motor vehicle parts, fabricated metal products, and plastics products. Although they are found throughout the country, jobs are most plentiful in the Midwest and the Northeast, where many of metalworking companies are located.

Job Outlook

Employment of tool and die makers is projected to decline rapidly. However, excellent job opportunities are expected as many employers report difficulty finding qualified applicants.

Employment change. Employment of tool and die makers is projected to decline rapidly by 10 percent over the 2006–2016 decade because of strong foreign competition in manufacturing and advances in automation, including CNC machine tools and computer-aided design, that should improve worker productivity. On the other hand, tool and die makers play a key role in building and maintaining advanced automated manufacturing equipment, which makes them less susceptible to lay-offs than other less-skilled production workers. As firms invest in new equipment, modify production techniques, and implement product design changes more rapidly, they will continue to rely heavily on skilled tool and die makers for retooling.

Job prospects. Despite declining employment, excellent job opportunities are expected. Employers in certain parts of the country report difficulty attracting skilled workers and apprenticeship candidates with the necessary abilities to replace retiring workers and fill other openings. The number of workers receiving training in this occupation is expected to continue to be fewer than the number of openings created each year by tool and die makers who retire or transfer to other occupations. A major factor limiting the number of people entering the occupation is that many young people who have

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Tool and die makers	51-4111	101,000	91,000	-9,700	-10

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

the educational and personal qualifications necessary to learn tool and die making usually prefer to attend college or do not wish to enter production occupations.

Earnings

Median hourly wage-and-salary earnings of tool and die makers were $21.29 in May 2006. The middle 50 percent earned between $17.29 and $26.77. The lowest 10 percent had earnings of less than $13.85, while the top 10 percent earned more than $32.41. Median hourly wage-and-salary earnings in the manufacturing industries employing the largest numbers of tool and die makers were as follows:

Motor vehicle parts manufacturing	$26.45
Plastics product manufacturing	20.79
Forging and stamping	20.24
Metalworking machinery manufacturing	20.08
Machine shops; turned product; and screw, nut, and bolt manufacturing	19.41

The pay of apprentices is tied to their skill level. As they gain more skills and reach specific levels of performance and experience, their pay increases.

Related Occupations

The occupations most closely related to the work of tool and die makers are other machining occupations. These include machinists; computer control programmers and operators; and machine setters, operators, and tenders—metal and plastic. Another occupation that requires precision and skill in working with metal is welding, soldering, and brazing workers.

Like tool and die makers, assemblers and fabricators assemble and repair complex machinery. Millwrights and industrial machinery mechanics also repair and assemble manufacturing equipment. When measuring parts, tool and die makers use some of the same tools and equipment that inspectors, testers, sorters, samplers, and weighers use in their jobs.

Welding, Soldering, and Brazing Workers

(O*NET 51-4121.00, 51-4121.01, 51-4121.02, 51-4121.03, 51-4121.04, 51-4121.05, 51-4121.06, 51-4121.07, and 51-4122.00)

Significant Points

- About 2 out of 3 jobs are in manufacturing industries.
- Training ranges from a few weeks of school or on-the-job training to several years of combined school and on-the-job training.
- Employment is projected to grow more slowly than average.
- Job prospects should be excellent as employers report difficulty finding enough qualified people.

Nature of the Work

Welding is the most common way of permanently joining metal parts. In this process, heat is applied to metal pieces, melting and fusing them to form a permanent bond. Because of its strength, welding is used in shipbuilding, automobile manufacturing and repair, aerospace applications, and thousands of other manufacturing activities. Welding also is used to join beams when constructing

Welders inspect their work to ensure a strong bond.

buildings, bridges, and other structures and to join pipes in pipelines, power plants, and refineries.

There are over 80 different welding processes that a welder can employ. Some are performed manually, and the work is entirely controlled by the welder. Others are semiautomatic, and the welder uses machinery, such as a wire feeder, to perform welding tasks.

One of the most common types of welding is arc welding. Standard arc welding involves two large metal alligator clips that carry a strong electrical current. One clip is attached to any part of the piece being welded. The second clip is connected to a thin welding rod. When the rod touches the piece, a powerful electrical circuit is created. The massive heat created by the electrical current causes both the piece and the steel core of the rod to melt together, cooling quickly to form a solid bond. The speed with which the welder works can affect the strength of the weld.

Two common and advanced types of arc welding are Tungsten Inert Gas (TIG) and Metal Inert Gas (MIG) welding. TIG welding often is used with stainless steel or aluminum. The welder holds the welding rod in one hand and an electric torch in the other hand. The torch is used to simultaneously melt the rod and the piece. MIG uses a spool of continuously fed wire instead of a rod, which allows the welder to join longer stretches of metal without stopping to replace a rod. The welder holds the wire feeder, which functions like the alligator clip in arc welding.

Like arc welders, soldering and brazing workers use molten metal to join two pieces of metal. However, the metal added during the soldering and brazing process has a melting point lower than that of the piece, so only the added metal is melted, not the piece. Soldering uses metals with a melting point below 800 degrees Fahrenheit; brazing uses metals with a higher melting point. Because soldering and brazing do not melt the piece, these processes normally do not create the distortions or weaknesses in the piece that can occur with welding. Soldering commonly is used to join electrical, electronic, and other small metal parts. Brazing produces a stronger joint than does soldering and often is used to join metals other than steel, such as brass. Brazing can also be used to apply coatings to parts to reduce wear and protect against corrosion.

Skilled welding, soldering, and brazing workers generally plan work from drawings or specifications and use their knowledge of welding processes and base metals to determine how best to join the parts. The difficulty of the weld is determined by its position—horizontal, vertical, overhead, or 6G (circular, such as in large pipes)—and by the type of metals to be fused. Highly skilled welders often are trained to work with a wide variety of materials, such as titanium, aluminum, or plastics, in addition to steel. Welders then select and set up welding equipment, execute the planned welds, and examine welds to ensure that they meet standards or specifications.

By observing problems during the welding process, welders can compensate by adjusting the speed, voltage, amperage, or feed of the rod. Some welders have more limited duties, however. They perform routine jobs that already have been planned and laid out and do not require extensive knowledge of welding techniques.

Automated welding is used in an increasing number of production processes. In these instances, a machine or robot performs the welding tasks while being monitored by a welding machine operator. Welding, soldering, and brazing machine setters, operators, and tenders follow specified layouts, work orders, or blueprints. Operators must load parts correctly and constantly monitor the machine to ensure that it produces the desired bond.

The work of arc, plasma, and oxy-gas cutters is closely related to that of welders. However, instead of joining metals, cutters use the heat from an electric arc, a stream of ionized gas called plasma, or burning gases to cut and trim metal objects to specific dimensions. Cutters also dismantle large objects, such as ships, railroad cars, automobiles, buildings, or aircraft. Some operate and monitor cutting machines similar to those used by welding machine operators. Plasma cutting has been increasing in popularity because, unlike other methods, it can cut a wide variety of metals, including stainless steel, aluminum, and titanium.

Work environment. Welding, soldering, and brazing workers often are exposed to a number of hazards, including very hot materials and the intense light created by the arc. They wear safety shoes, goggles, hoods with protective lenses, and other devices designed to prevent burns and eye injuries and to protect them from falling objects. They normally work in well-ventilated areas to limit their exposure to fumes. Automated welding, soldering, and brazing machine operators are not exposed to as many dangers, and a face shield or goggles usually provide adequate protection for these workers.

Welders and cutters may work outdoors, often in inclement weather, or indoors, sometimes in a confined area designed to contain sparks and glare. Outdoors, they may work on a scaffold or platform high off the ground. In addition, they may be required to lift heavy objects and work in a variety of awkward positions, while bending, stooping, or standing to perform work overhead.

Although about 50 percent of welders, solderers, and brazers work a 40-hour week, overtime is common, and nearly 1 out of 5 welders work 50 hours per week or more. Welders also may work in shifts as long as 12 hours. Some welders, solderers, brazers, and machine operators work in factories that operate around the clock, necessitating shift work.

Training, Other Qualifications, and Advancement

Training for welding, soldering, and brazing workers can range from a few weeks of school or on-the-job training for low-skilled positions to several years of combined school and on-the-job training for highly skilled jobs.

Education and training. Formal training is available in high schools and postsecondary institutions, such as vocational-technical institutes, community colleges, and private welding schools. The U.S. Armed Forces operate welding schools as well. Although some employers provide training, they prefer to hire workers who already have experience or formal training. Courses in blueprint reading, shop mathematics, mechanical drawing, physics, chemistry, and metallurgy are helpful. An understanding of electricity also is very helpful, and knowledge of computers is gaining importance, especially for welding, soldering, and brazing machine operators, who are becoming more responsible for the programming of robots and other computer-controlled machines. Since understanding the welding process and inspecting welds is important for both welders and welding machine operators, companies hiring machine operators prefer workers with a background in welding.

Certification and other qualifications. Some welding positions require general certifications in welding or certifications in specific skills such as inspection or robotic welding. The American Welding Society certification courses are offered at many welding schools. Some employers have developed their own internal certification tests.

Welding, soldering, and brazing workers need good eyesight, hand-eye coordination, and manual dexterity. They should be able to concentrate on detailed work for long periods and be able to bend, stoop, and work in awkward positions. In addition, welders increasingly must be willing to receive training and perform tasks in other production jobs.

Advancement. Welders can advance to more skilled welding jobs with additional training and experience. For example, they may

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16 Number	Change, 2006-16 Percent
Welding, soldering, and brazing workers	51-4120	462,000	484,000	22,000	5
Welders, cutters, solderers, and brazers	51-4121	409,000	430,000	21,000	5
Welding, soldering, and brazing machine setters, operators, and tenders	51-4122	53,000	54,000	1,600	3

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

become welding technicians, supervisors, inspectors, or instructors. Some experienced welders open their own repair shops. Other welders, especially those who obtain a bachelor's degree, become welding engineers.

Employment

Welding, soldering, and brazing workers held about 462,000 jobs in 2006. About 2 of every 3 welding jobs were found in manufacturing. Jobs were concentrated in fabricated metal product manufacturing, transportation equipment manufacturing, machinery manufacturing, architectural and structural metals manufacturing, and construction.

Job Outlook

Employment of welding, soldering, and brazing workers is expected to grow more slowly than average. They will have excellent job opportunities as some welding employers report difficulty finding trained welders.

Employment change. Employment of welding, soldering, and brazing workers is expected to grow about 5 percent over the 2006–2016 decade, slower than the average for all occupations. Welding has grown significantly over the long term because of advances that have allowed it to replace other joining technologies in many applications. Thus, demand for welders is increasing in the construction, manufacturing, and utilities industries. Despite overall employment declines in the manufacturing industry, the outlook for welders in manufacturing is far stronger than for other occupations. The basic skills of welding are the same across industries, so welders can easily shift from one industry to another depending on where they are needed most. For example, welders laid off in the auto industry have been able to find work in the booming oil and gas industry, although the shift may require relocating.

Automation is less of a threat to welders and welding machine operators than to other manufacturing occupations. Welding machines must still be operated by someone who is knowledgeable about welding and can inspect the weld and make adjustments. In custom applications, much of the work is difficult or impossible to automate. This includes manufacturing small batches of items, construction work, and making repairs in factories.

Job prospects. Retirements and job growth in the oil and gas and other industries are expected to create excellent opportunities for welders. Welding schools report that graduates have little difficulty finding work, and some welding employers report difficulty finding trained welders.

Earnings

Median wage-and-salary earnings of welders, cutters, solderers, and brazers were $15.10 an hour in May 2006. The middle 50 percent earned between $12.30 and $18.47. The lowest 10 percent had earnings of less than $10.08, and the top 10 percent earned over $22.50. The range of earnings of welders reflects the wide range of skill levels. Median hourly wage-and-salary earnings of welders, cutters, solderers, and brazers in the industries employing the largest numbers of them were:

Other general purpose machinery manufacturing	$15.43
Agriculture, construction, and mining machinery manufacturing	14.90
Commercial and industrial machinery and equipment (except automotive and electronic) repair and maintenance	14.59
Architectural and structural metals manufacturing	14.39
Motor vehicle body and trailer manufacturing	13.68

Median wage-and-salary earnings of welding, soldering, and brazing machine setters, operators, and tenders were $14.90 an hour in May 2006. The middle 50 percent earned between $12.02 and $18.90. The lowest 10 percent had earnings of less than $9.95, and the top 10 percent earned over $25.44. Their median wage-and-salary earnings in motor vehicle parts manufacturing, the industry employing them in the largest numbers, were $17.75 an hour in May 2006.

Many welders belong to unions. Among these are the International Association of Machinists and Aerospace Workers; the International Brotherhood of Boilermakers, Iron Ship Builders, Blacksmiths, Forgers and Helpers; the International Union, United Automobile, Aerospace and Agricultural Implement Workers of America; the United Association of Journeymen and Apprentices of the Plumbing, Pipefitting, Sprinkler Fitting Industry of the United States and Canada; and the United Electrical, Radio, and Machine Workers of America.

Related Occupations

Welding, soldering, and brazing workers are skilled metal workers. Other skilled metal workers include machinists; machine setters, operators, and tenders—metal and plastic; computer control programmers and operators; tool and die makers; sheet metal workers; and boilermakers. Assemblers and fabricators of electrical and electronic equipment often assemble parts using soldering. Pipelayers, plumbers, pipefitters, and steamfitters also need welding skills.

Sources of Additional Information

For information on training opportunities and jobs for welding, soldering, and brazing workers, contact local employers; the local office of the state employment service; or schools providing welding, soldering, or brazing training.

Printing Occupations

Bookbinders and Bindery Workers

(O*NET 51-5011.00 and 51-5012.00)

Significant Points

- Employment is expected to decline rapidly, reflecting the use of more productive machinery and the growth of imports of bound printed material.
- Opportunities for hand bookbinders are limited because only a small number of establishments do this highly specialized work.
- Most bookbinders and bindery workers train on the job.

Nature of the Work

The process of combining printed sheets into finished products such as books, magazines, catalogs, folders, and directories is known as "binding." When a publication or advertising supplement has been printed, it must then be folded, glued, stitched, stapled, or otherwise turned into the finished product that will be seen by the public. *Bindery workers* set up, operate, and maintain the machines that perform these various tasks, while *bookbinders* perform highly skilled hand finishing operations.

Job duties depend on the material being bound. Some types of binding and finishing jobs consist of only one step. Preparing leaflets or newspaper inserts, for example, requires only folding. Binding of books and magazines, on the other hand, requires a number of steps. Bindery workers first assemble the books and magazines from large, flat, printed sheets of paper. They then operate machines that first fold printed sheets into "signatures," which are groups of pages arranged sequentially. They then assemble the signatures in sequence and join them by means of a saddle-stitch process or perfect binding (where no stitches are used). In firms that do "edition binding," workers bind books produced in large numbers, or "runs."

In libraries where repair work on rare books is needed, bookbinders sew, stitch, or glue the assembled printed sheets, shape the book bodies with presses and trimming machines, and reinforce them with glued fabric strips. Covers are created separately and glued, pasted, or stitched onto the book bodies. The books then undergo a variety of finishing operations, often including wrapping in paper jackets. In establishments that print new books, this work is done mechanically.

Bookbinders pay careful attention to detail to avoid binding pages incorrectly.

A small number of bookbinders work in hand binderies. These highly skilled workers design original or special bindings for limited editions, or restore and rebind rare books. Some binders repair books and provide other specialized binding services to libraries.

Bookbinders and bindery workers in small shops may perform many binding tasks, while those in large shops tend to specialize. Tasks may include performing perfect binding or operating laminating machinery. Others specialize as folder operators or cutter operators, and may perform adjustments and minor repairs to equipment as needed.

Work environment. Binderies often are noisy and jobs can be strenuous, requiring considerable lifting, standing, and carrying. Binding often resembles an assembly line on which workers perform repetitive tasks. The jobs also may require stooping, kneeling, and crouching, but equipment that minimizes such activity is now widely available.

Bookbinders and bindery workers normally work 40 hours per week, although weekend and holiday hours may be necessary if production on a job is behind schedule. Many large printers operate around the clock, so some bindery workers may work on shifts. Part-time workers made up 11 percent of this occupation in 2006.

Training, Other Qualifications, and Advancement

On-the-job training remains the most common form of training for entry level bindery workers, but new technology will require workers to obtain more formal training. Attention to detail and mechanical aptitude are important for these jobs.

Education and training. High school students interested in bindery careers should take shop courses or attend a vocational-technical high school. Occupational skill centers also provide an introduction to bindery work and bookbinding. For entry-level positions, most employers look for high school graduates or those with associate degrees.

Training in graphic communications also can be an asset. Vocational-technical institutes offer postsecondary programs in the graphic arts, as do some skill-updating or retraining programs and community colleges. Other programs are made available by unions to their members. Four-year colleges also offer programs related to printing and publishing, but their emphasis is on preparing people for careers as graphic artists, educators, or managers in the graphic arts field.

While postsecondary education is available, most bookbinders and bindery workers learn the craft through on-the-job training. Inexperienced workers usually are assigned simple tasks such as moving paper from cutting machines to folding machines. They learn basic binding skills, including the characteristics of paper and how to cut large sheets of paper into different sizes with the least amount of waste. Usually, it takes one to three months to learn to operate the simpler machines but it can take up to one year to become completely familiar with more complex equipment, such as computerized binding machines. As workers gain experience, they learn to operate more types of equipment. To keep pace with changing technology, retraining is increasingly important for bindery workers.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Bookbinders and bindery workers	51-5010	72,000	57,000	-15,000	-21
Bindery workers	51-5011	65,000	51,000	-14,000	-22
Bookbinders	51-5012	7,200	6,000	-1,200	-17

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Formal apprenticeships are not as common as they used to be, but still are offered by some employers. Apprenticeships allow beginners to acquire skills by working alongside skilled workers while also taking classes. The more structured program provided by an apprenticeship enables workers to acquire the high levels of specialization and skill needed for some bindery and bookbinding jobs.

Other qualifications. Bindery work requires careful attention to detail. Accuracy, patience, neatness, and good eyesight are all important. Mechanical aptitude is necessary to operate the newer, more automated equipment, and workers with computer skills will increasingly be in demand. Manual dexterity is needed in order to count, insert, and fold. In addition, creativity and artistic ability are necessary for hand bookbinding.

Certification and advancement. With experience, binders can expect increased salaries and more responsibility. Completion of a formal certification program can further advancement opportunities. Without additional training, advancement opportunities outside of bindery work are limited. In large binderies, experienced bookbinders or bindery workers may advance to supervisory positions.

Employment

In 2006, bookbinders and bindery workers held about 72,000 jobs, including 7,200 as skilled bookbinders and 65,000 as bindery workers. More than 3 out of 4 bookbinding and bindery jobs are in printing and related support activities. Traditionally, the largest employers of bindery workers were bindery trade shops, which are companies that specialize in providing binding services for printers without binderies or whose printing production exceeds their binding capabilities. However, this type of binding is now being done increasingly in-house, and is now called "in-line finishing."

The publishing industry employed less than 1 in 10 bindery workers. Other bindery workers were found in the employment services industry, which supplies temporary workers to companies that require their services.

Job Outlook

Employment of bookbinders and bindery workers is projected to decline rapidly between 2006 and 2016, but opportunities should be good because many job openings are created by bindery workers who transfer to other occupations.

Employment change. Overall employment of bookbinders and bindery workers is expected to decline rapidly by 21 percent between 2006 and 2016. Over this period, demand for domestic bindery workers will slow as productivity in printing and bindery operations increases. Computers have caused binding to become increasingly automated, and coupled with other technological advances, have reduced labor requirements. Consequently, more printing companies are expected to perform bindery services in-house rather than send the work to specialized binding shops. Also, some bindery jobs will be lost because of outsourcing of work to firms in foreign countries where books and other materials that take a long time to make can be produced more cheaply.

More efficient binding machinery will slow growth in demand for specialized bindery workers who assist skilled bookbinders. The number of establishments that do hand bookbinding is small, also limiting growth.

Job prospects. Bindery workers generally face favorable job opportunities because many workers leave these jobs and there is a recurring need to replace them. However, improvements in binding machinery mean fewer will be replaced than leave. Additionally, many skilled bookbinders are older and will likely retire in the next decade. Experienced workers will continue to have the best opportunities for these skilled jobs. Prospects for all bindery jobs will be best for workers who have completed training or certification programs, internships, or who have experience in a related production occupation.

Earnings

Median hourly earnings of bookbinders were $14.55 in May 2006, compared to $13.16 per hour for all production occupations. The middle 50 percent earned between $10.48 and $19.34 an hour. The lowest 10 percent earned less than $8.30, and the highest 10 percent earned more than $22.69.

Median hourly earnings of bindery workers were $12.29 in May 2006. The middle 50 percent earned between $9.67 and $16.02 an hour. The lowest 10 percent earned less than $7.93, and the highest 10 percent earned more than $20.14.

Related Occupations

Other workers who set up and operate production machinery include prepress technicians and workers; printing machine operators; machine setters, operators, and tenders—metal and plastic; and various other precision machine operators.

Sources of Additional Information

Information about apprenticeships and other training opportunities may be obtained from local printing industry associations, local bookbinding shops, local offices of the Graphic Communications Conference or local offices of the state employment service. Apprenticeship information is also available from the U.S. Department of Labor's toll-free helpline: (877) 282-5627.

Prepress Technicians and Workers

(O*NET 51-5021.00 and 51-5022.00)

Significant Points

- Most prepress technician jobs now require formal postsecondary graphic communications training in the various types of computer software used in digital imaging.
- Employment is projected to decline rapidly as the increased use of computers in typesetting and page layout requires fewer prepress technicians.

Nature of the Work

The printing process has three stages: prepress, press, and binding or finishing. While workers in small print shops are usually responsible for all three stages, in most printing firms, formatting print jobs and correcting layout errors before the job goes to print is the responsibility of a specialized group of workers. Prepress technicians and workers are responsible for this prepress work. They perform a variety of tasks to help transform text and pictures into finished pages and prepare the pages for print.

Prepress technicians receive images from in-house graphic designers or directly from customers and see the job through the process of preparing print-ready pages to create a finished printing plate. Printing plates are thin sheets of metal that carry the final image to be printed. Printing presses use this plate to copy the image to the printed products we see every day. Once a printing plate has been created, prepress technicians collaborate with printing machine operators to check for any potential printing problems. Several plates may be needed if a job requires color, but advanced printing technology does not require plates.

For a long time, prepress workers used a photographic process to make printing plates. This is a complex process involving ultraviolet light and chemical exposure through which the text and images of a print job harden on a metal plate and become water repellent. These hard, water repellent portions of the metal plate are in the form of the text and images that will be printed on paper. More recently, the printing industry has largely moved to technology known as "direct-to-plate," by which the prepress technicians send the data directly to a plating system, by-passing the need for the photographic technique.

The direct-to-plate technique is just one example of digital imaging technology that has largely replaced cold type print technology. Prepress technicians known as *preflight technicians* or *production coordinators* are using digital imaging technology to complete more and more print jobs. Using this technology, technicians take electronic files received from customers and check them for completeness. They then format the jobs using electronic page layout software in order to fit the pages to dimensions of the paper stock to be used. When color printing is required, the technicians produce an electronic image of the printed pages and then print a copy, or "proof," of the pages as they will appear when printed. The technician then has the proofs delivered or mailed to the customer for a final check. Once the customer approves the proofs, technicians use laser "imagesetters" to expose digital images of the pages directly onto the thin metal printing plates.

Advances in computer software and printing technology continue to change prepress work. Today, customers of print shops often use their own computers to do much of the typesetting and page layout work formerly done by prepress technicians. This process, called "desktop publishing," provides printers with pages of material that look like the desired finished product. This work is usually done by desktop publishers or graphic designers with knowledge of publishing software. (Sections on desktop publishers and graphic designers appear elsewhere in the *Handbook*.) As a result, prepress workers often receive files from customers on a computer disk or via e-mail that contain typeset material already laid out in pages. Other more advanced technologies now allow prepress technicians to send printing files directly to the printer and skip the plate-making process altogether. Despite the shortcuts that technological advancements allow, workers still need to understand the basic processes behind prepress, press, and finishing operations. Some workers, known as *job printers,* perform prepress and print operations. Job printers often are found in small establishments where work combines several job skills.

Prepress technicians and workers increasingly use direct-to-plate technologies that eliminate direct contact with ink and chemicals.

Work environment. Prepress technicians and workers usually work in clean, air-conditioned areas with little noise. Some workers may develop eyestrain from working in front of a video display terminal or other minor problems, such as backaches. Those platemakers who still work with toxic chemicals face the hazard of skin irritations. Workers are often subject to stress and the pressures of deadlines and tight work schedules.

Prepress employees usually work an eight-hour day. Some workers—particularly those employed by newspapers—work night shifts. Weekend and holiday work may be required, particularly when a print job is behind schedule. Part-time prepress technicians made up 12 percent of this occupation in 2006.

Training, Other Qualifications, and Advancement

Employers prefer workers with formal training in printing or publishing. Familiarity with the printing process, including the technology used, and attention to detail are the qualities that employers will seek most in job applicants.

Education and training. Many employers consider the best candidates for prepress jobs to be individuals with a combination of work experience in the printing industry and formal training in the new digital technology. The experience of these applicants provides them with an understanding of how printing plants operate and demonstrates their interest in advancing within the industry.

Traditionally, prepress technicians and workers started as helpers and were trained on the job. Some of these jobs required years of experience performing detailed manual work to become skillful enough to perform the most difficult tasks. Today, however, employers expect workers to have some formal postsecondary graphic com-

munications training in the various types of computer software used in digital imaging and will train workers on the job as needed.

For beginners, two-year associate degree programs offered by community colleges, junior colleges, and technical schools teach the latest prepress skills and allow students to practice applying them. There are also four-year bachelor's degree programs in graphic design aimed primarily at students who plan to move into management positions in printing or design. For workers who do not wish to enroll in a degree program, prepress-related courses are offered at many community colleges, junior colleges, four-year colleges and universities, vocational-technical institutes, and private trade and technical schools. Workers with experience in other printing jobs can take a few college-level graphic communications courses to upgrade their skills and qualify for prepress jobs.

Other qualifications. Employers prefer workers with good communication skills, both oral and written. When prepress problems arise, prepress technicians and workers should be able to deal courteously with customers to resolve them. Also, in small shops, they may take customer orders. Persons interested in working for firms using advanced printing technology need to be comfortable with electronics and computers. At times, prepress personnel may have to perform computations in order to estimate job costs or operate many of the electronics used to run modern equipment.

Prepress technicians and workers need manual dexterity and accurate eyesight. Good color vision helps workers find mistakes and locate potential problems. It is essential for prepress workers to be able to pay attention to detail and work independently. Artistic ability is often a plus. Employers also seek persons who are comfortable with the pressures of meeting deadlines, using new software, and operating new equipment.

Advancement. Employers may send experienced technicians to industry-sponsored update and retraining programs to develop new skills or hone current ones. This kind of prepress training is sometimes offered in-house or through unions in the printing industry.

Employment

Prepress technicians and workers overall held about 119,000 jobs in 2006. Most prepress jobs are found in the printing industry, while newspaper publishing employs the second largest number of prepress technicians and workers.

The printing and publishing industries are two of the most geographically dispersed in the United States. While prepress jobs are found throughout the country, large numbers are concentrated in large printing centers such as Chicago, Los Angeles–Long Beach, New York City, Minneapolis–St. Paul, Philadelphia, Boston, and Washington, DC.

Job Outlook

Employment of prepress technicians and workers is projected to decline rapidly through 2016, because of improvements in printing technology that require fewer of these workers. Despite this, job prospects are good for prepress technicians with good computer and customer service skills.

Employment change. Overall employment of prepress technicians and workers is expected to decline by 16 percent over the 2006–2016 period. Demand for printed material should continue to grow, spurred by rising levels of personal income, increasing school enrollments, higher levels of educational attainment, and expanding markets. But the use of computers and publishing software—often by the clients of the printing company—will result in rising productivity of prepress technicians, and thus halting the creation of new jobs.

Computer software now allows office workers at a desktop computer terminal to specify text typeface and style and to format pages. This development shifts traditional prepress functions away from printing plants into advertising and public relations agencies, graphic design firms, and large corporations. As page layout and graphic design capabilities of computer software have become less expensive and more user-friendly, many companies are turning to in-house desktop publishing. Some firms also are finding it less costly to prepare their own newsletters and other reports. At newspapers, writers and editors also are doing more composition using publishing software. This rapid growth in the use of desktop publishing software has eliminated most prepress typesetting and composition technician jobs associated with the older printing technologies. In addition, new technology is increasing the amount of automation that printing companies can employ, which leaves less work for prepress workers. The duties of prepress workers will likely begin to merge with those of other printing industry workers—such as those of customer service representatives—which will also curb prepress job growth.

Job prospects. Despite a decline in the number of new prepress positions, opportunities will be favorable for workers with strong computer and customer service skills, such as preflight technicians who electronically check materials prepared by clients and adapt them for printing.

In order to compete in the desktop publishing environment, commercial printing companies are adding desktop publishing and electronic prepress work to the list of services they provide. Electronic prepress technicians, digital proofers, platemakers, and graphic designers are using new equipment and ever-improving software to design and lay out publications and complete their printing more quickly. The increasing range of services offered by printing companies using new digital technologies mean that opportunities in prepress work will be best for those with computer backgrounds who have completed postsecondary programs in printing technology or graphic communications. Workers with this background will be better able to adapt to the continuing evolution of publishing and printing technology.

Earnings

While wage rates for prepress technicians and workers depend on basic factors such as employer, education, and location, the median hourly earnings of prepress technicians and workers were $16.01 in May 2006, compared to $13.16 per hour for all production occupations. The middle 50 percent earned between $11.98 and $20.69 an

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Prepress technicians and workers	—	119,000	100,000	-19,000	-16
Job printers	51-5021	48,000	44,000	-4,500	-9
Prepress technicians and workers	51-5022	71,000	56,000	-15,000	-21

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

hour. The lowest 10 percent earned less than $9.37, and the highest 10 percent earned more than $25.71 an hour. Median hourly earnings in printing and related support activities, the industry employing the largest number of prepress technicians and workers, were $16.44 in May 2006, while workers in the newspaper, periodical, and book publishing industry earned $15.17 an hour.

For job printers, median hourly earnings were $15.58 in May 2006. The middle 50 percent earned between $12.15 and $19.83 an hour. The lowest 10 percent earned less than $9.56, and the highest 10 percent earned more than $24.70 an hour. Median hourly earnings in the industries employing the largest numbers of job printers May 2006 were $16.19 in the newspaper, periodical, and book publishing industry and $15.76 in printing and related support activities.

Related Occupations

Prepress technicians and workers use artistic skills in their work. These skills also are essential for artists and related workers, graphic designers, and desktop publishers. Moreover, many of the skills used in Web site design also are employed in prepress technology. Prepress technicians' work also is tied in closely with that of printing machine operators.

Sources of Additional Information

Details about training programs may be obtained from local employers such as newspapers and printing shops or from local offices of the state employment service.

Printing Machine Operators

(O*NET 51-5023.00, 51-5023.01, 51-5023.02, 51-5023.03, 51-5023.04, 51-5023.05, 51-5023.06, 51-5023.07, 51-5023.08, and 51-5023.09)

Significant Points

- Most printing machine operators are trained on the job.
- Retirements of older press operators are expected to create openings for skilled workers.
- Rising demand for customized print jobs will mean those skilled in digital printing operations will have the best job opportunities.

Nature of the Work

Printing machine operators, also known as *press operators,* prepare, operate, and maintain printing presses. Duties of printing machine operators vary according to the type of press they operate. Traditional printing methods, such as offset lithography, gravure, flexography, and letterpress, use a plate or roller that carries the final image that is to be printed and copies the image to paper. In addition to the traditional printing processes, plateless or nonimpact processes are coming into general use. Plateless processes—including digital, electrostatic, and ink-jet printing—are used for copying, duplicating, and document and specialty printing. Plateless processes usually are done by quick printing shops and smaller in-house printing shops, but increasingly are being used by commercial printers for short-run or customized printing jobs.

Printing machine operators execute production orders through an increasingly automated process.

Machine operators' jobs differ from one shop to another because of differences in the types and sizes of presses. Small commercial shops can be operated by one person and tend to have relatively small presses, which print only one or two colors at a time. Large newspaper, magazine, and book printers use giant "in-line web" presses that require a crew of several press operators and press assistants.

After working with prepress technicians (who are covered in the *Handbook* statement on prepress technicians and workers) to identify and resolve any potential problems with a job, printing machine operators prepare machines for printing. To prepare presses, operators install the printing plate with the images to be printed and adjust the pressure at which the machine prints. Then they ink the presses, load paper, and adjust the press to the paper size. Operators ensure that paper and ink meet specifications, and adjust the flow of ink to the inking rollers accordingly. They then feed paper through the press cylinders and adjust feed and tension controls. New digital technology, in contrast, is able to automate much of this work.

While printing presses are running, printing machine operators monitor their operation and keep the paper feeders well stocked. They make adjustments to manage ink distribution, speed, and temperature in the drying chamber, if the press has one. If paper tears or jams and the press stops, which can happen with some offset presses, operators quickly correct the problem to minimize downtime. Similarly, operators working with other high-speed presses constantly look for problems, and when necessary make quick corrections to avoid expensive losses of paper and ink. Throughout the run, operators must regularly pull sheets to check for any printing imperfections. Most printers have, or will soon have, presses with computers and sophisticated instruments to control press operations, making it possible to complete printing jobs in less time. With this equipment, printing machine operators set up, monitor, and adjust the printing process on a control panel or computer monitor, which allows them to control the press electronically.

In most shops, machine operators also perform preventive maintenance. They oil and clean the presses and make minor repairs.

Work environment. Operating a press can be physically and mentally demanding, and sometimes tedious. Printing machine operators are on their feet most of the time. Often, operators work under pressure to meet deadlines. Most printing presses are capable of high printing speeds, and adjustments must be made quickly to

avoid waste. Pressrooms are noisy, and workers in certain areas wear ear protection. Working with press machinery can be hazardous, but the threat of accidents has decreased with newer computerized presses that allow operators to make most adjustments from a control panel.

Many printing machine operators, particularly those who work for newspapers, work weekends, nights, and holidays as many presses operate continually. They also may work overtime to meet deadlines. The average operator worked 40 hours per week in 2006.

Training, Other Qualifications, and Advancement

Although employers prefer that beginners complete a formal apprenticeship or a postsecondary program in printing equipment operation, most printing machine operators are trained on the job. Attention to detail and familiarity with electronics and computers are essential for operators.

Education and training. Beginning printing machine operators load, unload, and clean presses. With time and training, they may become fully qualified to operate that type of press. Operators can gain experience on more than one kind of printing press during the course of their career.

Experienced operators will periodically receive retraining and skill updating. For example, printing plants that change from sheet-fed offset presses to digital presses have to retrain the entire press crew because skill requirements for the two types of presses are different.

Apprenticeships for printing machine operators, once the dominant method for preparing for this occupation, are becoming less prevalent. When they are offered by the employer, they include on-the-job instruction and some related classroom training or correspondence school courses.

Formal postsecondary programs in printing equipment operation offered by technical and trade schools, community colleges, and universities are growing in importance. Postsecondary courses in printing provide the theoretical and technical knowledge needed to operate advanced equipment that employers look for in an entry-level worker. Some postsecondary school programs require two years of study and award an associate degree.

Because of technical developments in the printing industry, courses in chemistry, electronics, color theory, and physics are helpful in secondary or postsecondary programs.

Other qualifications. Persons who wish to become printing machine operators need mechanical aptitude to make press adjustments and repairs. Workers need good vision and attention to detail to locate and fix problems with print jobs. Oral and written communication skills also are required. Operators should possess the mathematical skills necessary to compute percentages, weights, and measures, and to calculate the amount of ink and paper needed to do a job. Operators now also need basic computer skills to work with newer printing machines.

Certification and advancement. As printing machine operators gain experience, they may advance in pay and responsibility by working on a more complex printing press. For example, operators who have demonstrated their ability to work with a one-color sheet-fed press may be trained to operate a four-color sheet-fed press. Voluntarily earning a formal certification may also help advance a career in printing. An operator also may advance to pressroom supervisor and become responsible for an entire press crew. In addition, printing machine operators can draw on their knowledge of press operations to become cost estimators, providing estimates of printing jobs to potential customers.

Employment

Printing machine operators held about 198,000 jobs in 2006. Half of all operator jobs were in printing and related support activities. Paper manufacturers and newspaper publishers also were large employers. Additional jobs were in advertising agencies, employment services firms, and colleges and universities that do their own printing.

The printing and newspaper publishing industries are two of the most geographically dispersed in the United States. While printing machine operators can find jobs throughout the country, large numbers of jobs are concentrated in large printing centers such as Chicago, Los Angeles–Long Beach, New York, Minneapolis–St. Paul, Philadelphia, Boston, and Washington, DC.

Job Outlook

Employment of printing machine operators is projected to decline moderately through 2016, as newer printing presses require fewer operators. Despite this, job opportunities are expected to be favorable because a large number of these workers are expected to retire over the next decade. The best opportunities will be available to skilled operators.

Employment change. Employment of printing machine operators is expected to decline moderately by six percent over the 2006–2016 decade even as the output of printed materials is expected to increase. Employment will fall because of increasing automation in the printing industry and because of the outsourcing of some production to foreign countries.

Book and magazine circulation will increase as school enrollments rise and niche publications continue to enjoy success. Additional growth will also come from the increasing ability of the printing industry to profitably print smaller quantities, which should widen the market for printed materials as production costs decline.

Commercial printing will continue to be driven by increased expenditures for print advertising materials. New marketing techniques are leading advertisers to increase spending on messages targeted to specific audiences, and should continue to require the printing of a wide variety of catalogs, direct mail enclosures, newspaper inserts, and other kinds of print advertising.

However, employment will not grow at the same pace as output because increased use of new computerized printing equipment will require fewer operators. This will especially be true with the increasing automation of the large printing presses used in the newspaper industry. In addition, some companies are lowering their printing costs by having their work printed out of the country when it does not need to be completed quickly. New business practices within the publishing industry, such as printing-on-demand and electronic publishing, will reduce the size of print runs, further moderating output.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Printing machine operators	51-5023	198,000	186,000	-11,000	-6

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Job prospects. Opportunities for employment in printing machine operation should be favorable. Retirements of older printing machine operators and the need for workers trained on increasingly computerized printing equipment will create many job openings over the next decade. For example, small printing jobs will increasingly be run on sophisticated high-speed digital printing equipment that requires a complex set of operator skills, such as knowledge of database management software. Those who complete postsecondary training programs in printing and who are comfortable with computers will have the best employment opportunities.

Earnings

Median hourly earnings of printing machine operators were $14.90 in May 2006, as compared to $13.16 per hour for all production occupations. The middle 50 percent earned between $11.11 and $19.49 an hour. The lowest 10 percent earned less than $8.84, and the highest 10 percent earned more than $24.23 an hour. Median hourly earnings in the industries employing the largest numbers of printing machine operators in May 2006 were:

Newspaper, periodical, book, and directory publishers	$17.27
Converted paper product manufacturing	16.37
Printing and related support activities	15.55
Plastics product manufacturing	13.81
Advertising and related services	11.95

The basic wage rate for a printing machine operator depends on the geographic area in which the work is located and on the size and complexity of the printing press being operated.

Related Occupations

Other workers who set up and operate production machinery include machine setters, operators, and tenders—metal and plastic; bookbinders and bindery workers; and various precision machine operators.

Textile, Apparel, and Furnishings Occupations

(O*NET 51-6011.00, 51-6021.00, 51-6031.00, 51-6041.00, 51-6042.00, 51-6051.00, 51-6052.00, 51-6061.00, 51-6062.00, 51-6063.00, 51-6064.00, 51-6091.00, 51-6092.00, 51-6093.00, and 51-6099.99)

Significant Points

- Most workers learn through on-the-job training.
- This group ranks among the rapidly declining occupations because of increases in imports, offshore assembly, productivity gains from automation, and new fabrics that do not need as much processing.
- Earnings of most workers are low.

Nature of the Work

Textile, apparel, and furnishings workers produce fibers, cloth, and upholstery, and fashion them into a wide range of products that we use in our daily lives. Textiles are the basis of towels, bed linens, hosiery and socks, and nearly all clothing, but they also are a key ingredient in products ranging from roofing to tires. Jobs range from those that involve programming computers to those in which the worker operates large industrial machinery and to those that require substantial handwork.

Textile machine setters, operators, and tenders run machines that make textile products from fibers. The first step in manufacturing textiles is preparing the natural or synthetic fibers. *Extruding and forming machine operators, synthetic and glass fibers*, set up and operate machines that extrude or force liquid synthetic material such as rayon, fiberglass, or liquid polymers through small holes and draw out filaments. Other operators put natural fibers such as cotton, wool, flax, or hemp through carding and combing machines that clean and align them into short lengths collectively called "sliver." In making sliver, operators may combine different types of natural fibers and synthetics filaments to give the product a desired texture, durability, or other characteristic. *Textile winding, twisting, and drawing-out machine operators* take the sliver and draw out, twist, and wind it to produce yarn, taking care to repair any breaks.

Textile bleaching and dyeing machine operators control machines that wash, bleach, or dye either yarn or finished fabrics and other products. *Textile knitting and weaving machine operators* put the yarn on machines that weave, knit, loop, or tuft it into a product. Woven fabrics are used to make apparel and other goods, whereas some knitted products (such as hosiery) and tufted products (such as carpeting) emerge in near-finished form. Different types of machines are used for these processes, but operators perform similar tasks, repairing breaks in the yarn and monitoring the yarn supply while tending many machines at once. *Textile cutting machine operators* trim the fabric into various widths and lengths, depending on its intended use.

Apparel workers cut fabric and other materials and sew it into clothing and related products. Workers in a variety of occupations fall under the heading of apparel workers. *Tailors, dressmakers, and sewers* make custom clothing and alter and repair garments for individuals. However, workers in most apparel occupations are found in manufacturing, performing specialized tasks in the production of large numbers of garments that are shipped to retail establishments for sale.

Textile machine setters, operators, and tenders tend machines that weave yarn into apparel.

Fabric and apparel patternmakers convert a clothing designer's original model of a garment into a pattern of separate parts that can be laid out on a length of fabric. After discussing the item with the designer, these skilled workers usually use a computer to outline the parts and draw in details to indicate the positions of pleats, buttonholes, and other features. (In the past, patternmakers laid out the parts on paper, using pencils and drafting instruments such as rulers.) Patternmakers then alter the size of the pieces in the pattern to produce garments of various sizes, and they may mark the fabric to show the best layout of pattern pieces to minimize waste of material.

Once an item's pattern has been made and marked, mass production of the garment begins. *Cutters and trimmers* take the patterns and cut out material, paying close attention to their work because mistakes are costly. Following the outline of the pattern, they place multiple layers of material on the cutting table and use an electric knife or other tools to cut out the various pieces of the garment; delicate materials may be cut by hand. In some companies, computer-controlled machines do the cutting.

Sewing machine operators join the parts of a garment together, reinforce seams, and attach buttons, hooks, zippers, and accessories to produce clothing. After the product is sewn, other workers remove lint and loose threads and inspect and package the garments.

Shoe and leather workers are employed either in manufacturing or in personal services. In shoe manufacturing, *shoe machine operators and tenders* operate a variety of specialized machines that perform cutting, joining, and finishing functions. In personal services, *shoe and leather workers and repairers* perform a variety of repairs and custom leatherwork for the general public. They construct, decorate, or repair shoes, belts, purses, saddles, luggage, and other leather products. They also may repair some products made of canvas or plastic. When making custom shoes or modifying existing footwear for people with foot problems or special needs, shoe and leather workers and repairers cut pieces of leather, shape them over a form shaped like a foot, and sew them together. They then attach soles and heels, using sewing machines or cement and nails. They also dye and polish the items, using a buffing wheel to produce a smooth surface and lustrous shine. When making luggage, they fasten leather to a frame and attach handles and other hardware. They also cut and secure linings inside the frames and sew or stamp designs onto the exterior of the luggage. In addition to performing all of the preceding steps, saddle makers often apply leather dyes and liquid topcoats to produce a glossy finish on a saddle. They also may decorate the surface of the saddle by hand stitching or by stamping the leather with decorative patterns and designs. Shoe and leather workers and repairers who own their own shops keep records and supervise other workers.

Upholsterers make, fix, and restore furniture that is covered with fabric. Using hammers and tack pullers, upholsterers who restore furniture remove old fabric and stuffing to get down to the springs and wooden frame. Then they reglue loose sections of the frame and refinish exposed wood. The springs sit on a cloth mat, called webbing, that is attached to the frame. Upholsterers replace torn webbing, examine the springs, and replace broken or bent ones.

Upholsterers who make new furniture start with a bare wooden frame. First, they install webbing, tacking it to one side of the frame, stretching it tight, and tacking it to the other side. Then, they tie each spring to the webbing and to its neighboring springs. Next, they cover the springs with filler, such as foam, a polyester batt, or similar fibrous batting material, to form a smooth, rounded surface. Then they measure and cut fabric for the arms, backs, seats, sides, and other surfaces, leaving as little waste as possible. Finally, sewing the fabric pieces together and attaching them to the frame with tacks, staples, or glue, they affix any ornaments, such as fringes, buttons, or rivets. Sometimes, upholsterers provide pickup and delivery of the furniture they work on. They also help customers select new coverings by providing samples of fabrics and pictures of finished pieces.

Laundry and drycleaning workers clean cloth garments, linens, draperies, blankets, and other articles. They also may clean leather, suede, furs, and rugs. When necessary, they treat spots and stains on articles before laundering or drycleaning. They tend machines during cleaning and ensure that items are not lost or misplaced with those of another customer. *Pressers, textile, garment, and related materials*, shape and remove wrinkles from items after steam pressing them or ironing them by hand. Workers then assemble each customer's items, box or bag them, and prepare an itemized bill for the customer.

Work environment. Most people in textile, apparel, and furnishings occupations work a standard five-day, 35- to 40-hour week. Working on evenings and weekends is common for shoe and leather workers, laundry and drycleaning workers, and tailors, dressmakers, and sewers employed in retail stores. Many textile and fiber mills often use rotating schedules of shifts so that employees do not continuously work nights or days. But these rotating shifts sometimes cause workers to have sleep disorders and stress-related problems.

Although much of the work in apparel manufacturing still is based on a piecework system that allows for little interpersonal contact, some apparel firms are placing more emphasis on teamwork and cooperation. Under this new system, individuals work closely with one another, and each team or module often governs itself, increasing the overall responsibility of each operator.

Working conditions vary by establishment and by occupation. In manufacturing, machinery in textile mills is often noisy, as are areas in which sewing and pressing are performed in apparel factories; patternmaking and spreading areas tend to be much quieter. Many older factories are cluttered, hot, and poorly lit and ventilated, but more modern facilities usually have more workspace and are well lit and ventilated. Textile machinery operators use protective glasses and masks that cover their noses and mouths to protect against airborne particles. Many machines operate at high speeds, and textile machinery workers must be careful not to wear clothing or jewelry that could get caught in moving parts. In addition, extruding and forming machine operators wear protective shoes and clothing when working with certain chemical compounds.

Work in apparel production can be physically demanding. Some workers sit for long periods, and others spend many hours on their

feet, leaning over tables and operating machinery. Operators must be attentive while running sewing machines, pressers, automated cutters, and the like. A few workers wear protective devices such as gloves. In some instances, new machinery and production techniques have decreased the physical demands on workers. For example, newer pressing machines are controlled by foot pedals or by computer and do not require much strength to operate.

Laundries and drycleaning establishments are often hot and noisy. Employees also may be exposed to harsh solvents, but newer environmentally-friendly and less toxic cleaning solvents are improving the work environment in these establishments. Areas in which shoe and leather workers make or repair shoes and other leather items can be noisy, and odors from leather dyes and stains frequently are present. Workers need to pay close attention when working with machines, to avoid punctures, lacerations, and abrasions.

Upholstery work is not dangerous, but upholsterers usually wear protective gloves and clothing when using sharp tools and lifting and handling furniture or springs. During most of the workday, upholsterers stand and may do a lot of bending and heavy lifting. They also may work in awkward positions for short periods.

Training, Other Qualifications, and Advancement

A high school diploma is sufficient for most jobs in textile, apparel, and furnishings occupations. Most people learn their jobs by working alongside more experienced workers.

Education and training. Most workers in these jobs have a high school diploma or less education. However, applicants with postsecondary vocational training or previous work experience may have a better chance of getting a more skilled job and advancing to a supervisory position.

Machine operators usually are trained on the job by more experienced employees or by machinery manufacturers' representatives. Operators begin with simple tasks and are assigned more difficult operations as they gain experience.

Precision shoe and leather workers and repairers generally also learn their skills on the job. Manual dexterity and the mechanical aptitude to work with hand tools and machines are important in shoe repair and leatherworking. Shoe and leather workers who produce custom goods should have artistic ability as well. Beginners start as helpers for experienced workers, but, in manufacturing, they may attend more formal in-house training programs. Beginners gradually take on more tasks until they are fully qualified workers, a process that takes about 2 years in an apprenticeship program or as a helper in a shop. Other workers spend 6 months to a year in a vocational training program. Learning to make saddles takes longer. Shoe repairers need to keep their skills up to date to work with the rapidly changing footwear styles and materials. Some attend trade shows or specialized training seminars and workshops in custom shoemaking, shoe repair, and other leatherwork sponsored by associations.

Custom tailors, dressmakers, and sewers often have previous experience in apparel production, design, or alteration. Knowledge of fabrics, design, and construction is very important. Custom tailors sometimes learn these skills through courses in high school or a community college. Some experienced custom tailors open their own tailoring shop. Custom tailoring is a highly competitive field, however, and training in small-business operations can mean the difference between success and failure.

Laundry and dry cleaning workers usually learn on the job also. Although laundries and drycleaners prefer entrants with previous work experience, they routinely hire inexperienced workers.

Most upholsterers learn their skills on the job, but a few do so through apprenticeships. Inexperienced persons also may take training in basic upholstery in vocational schools and some community colleges. The length of training may vary from 6 weeks to 3 years. Upholsterers who work on custom-made pieces may train for 8 to 10 years.

Other qualifications. In manufacturing, textile and apparel workers need good hand-eye coordination, manual dexterity, physical stamina, and the ability to perform repetitive tasks for long periods. As machinery in the industry continues to become more complex, knowledge of the basics of computers and electronics will increasingly be an asset. In addition, the trends toward cross-training of operators and working in teams will increase the time needed to become fully trained on all machines and require interpersonal skills to work effectively with others.

Upholsterers should have manual dexterity, good coordination, and the strength needed to lift heavy furniture. An eye for detail, a flair for color, and the ability to use fabrics creatively also are helpful.

Advancement. Some production workers may become first-line supervisors, but most can advance only to more skilled operator jobs. Some in the shoemaking and leatherworking occupations begin as workers or repairers and advance to salaried supervisory and managerial positions. Some open their own shop. They are more likely to succeed if they understand business practices and management and offer good customer service in addition to their technical skills.

Upholsterers, too, can open their own shops. The upholstery business is highly competitive, however, so operating a shop successfully is difficult. Some experienced or highly skilled upholsterers may become supervisors or sample makers in large shops and factories.

Employment

Textile, apparel, and furnishings workers held 873,000 jobs in 2006. Employment in the detailed occupations that make up this group was distributed as follows:

Laundry and dry-cleaning workers	239,000
Sewing machine operators	233,000
Pressers, textile, garment, and related materials	77,000
Upholsterers	55,000
Tailors, dressmakers, and custom sewers	54,000
Textile winding, twisting, and drawing out machine setters, operators, and tenders	43,000
Textile knitting and weaving machine setters, operators, and tenders	40,000
Sewers, hand	23,000
Textile bleaching and dyeing machine operators and tenders	19,000
Textile cutting machine setters, operators, and tenders	19,000
Extruding and forming machine setters, operators, and tenders, synthetic and glass fibers	18,000
Shoe and leather workers and repairers	16,000
Fabric and apparel patternmakers	9,200
Shoe machine operators and tenders	4,100
All other textile, apparel, and furnishings workers	24,000

Manufacturing jobs are concentrated in California, North Carolina, Georgia, New York, Texas, and South Carolina. Jobs in reupholstery, shoe repair and custom leatherwork, and laundry and drycleaning establishments are found in cities and towns throughout the nation. Overall, about 12 percent of all workers in textile, apparel, and furnishings occupations were self-employed; however, about half of all tailors, dressmakers, and sewers and about a quarter of all upholsterers were self-employed.

Job Outlook

Overall employment of textile, apparel, and furnishings workers is expected to decline rapidly through 2016, but some openings will be created by the need to replace workers who leave the occupation.

Employment change. Employment in textile, apparel, and furnishing occupations is expected to decline by 11 percent between 2006 and 2016. Apparel workers have been among the most rapidly declining occupational groups in the economy. Increasing imports, the use of offshore assembly, and greater productivity through automation will contribute to additional job losses. Also, many new textiles require less production and processing.

Domestic production of apparel and textiles will continue to move abroad, and imports to the U.S. market are expected to increase. Fierce competition in the market for apparel will keep domestic apparel and textile firms under intense pressure to cut costs and produce more with fewer workers. Although the textile industry already is highly automated, it will continue to seek to increase worker productivity through the introduction of labor-saving machinery and the invention of new fibers and fabrics that reduce production costs. Technological developments, such as computer-aided marking and grading, computer-controlled cutters, semiautomatic sewing and pressing machines, and automated material-handling systems have increased output while reducing the need for some workers in larger firms.

Despite advances in technology, the apparel industry has had difficulty employing automated equipment for many assembly tasks because of the delicate properties of many textiles. Also, the industry produces a wide variety of apparel items that change frequently with changes in style and season. Even so, increasing numbers of sewing machine operator jobs are expected to be lost to low-wage workers abroad.

Outside of the manufacturing sector, tailors, dressmakers, and sewers—the most skilled apparel workers—are expected to experience little to no change in employment. Most of these workers are self-employed or work in clothing stores. The demand for custom home furnishings and tailored clothes is diminishing in general, but remains steady in upscale stores and by certain clients. Designer apparel and other handmade goods also appeal to people looking for one-of-a-kind items.

Employment of shoe and leather workers is expected to decline rapidly through 2016 as a result of growing imports of less expensive shoes and leather goods and of increasing productivity of U.S. manufacturers. Also, buying new shoes often is cheaper than repairing worn or damaged ones. However, declines might be offset somewhat as the population continues to age and more people need custom shoes for health reasons.

Employment of upholsterers is expected to decline moderately through 2016 as new furniture and automotive seats use more durable coverings and as manufacturing firms continue to become more automated and efficient. Demand for the reupholstery of furniture also is expected to decline as the increasing manufacture of new, relatively inexpensive upholstered furniture causes many consumers simply to replace old, worn furniture. However, demand will continue to be steady for upholsterers who restore very valuable furniture. Most reupholstery work is labor intensive and not easily automated.

Job prospects. Even though the overall number of jobs in this occupation is decreasing, job openings do arise each year from the need to replace some of the many workers who transfer to other occupations, retire, or leave the occupation for other reasons.

Earnings

Earnings of textile, apparel, and furnishings workers vary by occupation. Because many production workers in apparel manufacturing are paid according to the number of acceptable pieces they produce, their total earnings depend on skill, speed, and accuracy. Workers

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Textile, apparel, and furnishings occupations	51-6000	873,000	777,000	-97,000	-11
Laundry and dry-cleaning workers	51-6011	239,000	262,000	23,000	10
Pressers, textile, garment, and related materials	51-6021	77,000	74,000	-3,400	-4
Sewing machine operators	51-6031	233,000	170,000	-63,000	-27
Shoe and leather workers	51-6040	20,000	17,000	-3,100	-16
Shoe and leather workers and repairers	51-6041	16,000	14,000	-1,600	-10
Shoe machine operators and tenders	51-6042	4,100	2,600	-1,500	-36
Tailors, dressmakers, and sewers	51-6050	77,000	76,000	-1,800	-2
Sewers, hand	51-6051	23,000	21,000	-2,900	-12
Tailors, dressmakers, and custom sewers	51-6052	54,000	55,000	1,000	2
Textile machine setters, operators, and tenders	51-6060	122,000	88,000	-34,000	-28
Textile bleaching and dyeing machine operators and tenders	51-6061	19,000	14,000	-5,900	-30
Textile cutting machine setters, operators, and tenders	51-6062	19,000	14,000	-5,100	-27
Textile knitting and weaving machine setters, operators, and tenders	51-6063	40,000	28,000	-12,000	-31
Textile winding, twisting, and drawing out machine setters, operators, and tenders	51-6064	43,000	33,000	-11,000	-24
Miscellaneous textile, apparel, and furnishings workers	51-6090	106,000	92,000	-14,000	-13
Extruding and forming machine setters, operators, and tenders, synthetic and glass fibers	51-6091	18,000	15,000	-3,100	-18
Fabric and apparel patternmakers	51-6092	9,200	6,600	-2,600	-29
Upholsterers	51-6093	55,000	50,000	-4,900	-9
Textile, apparel, and furnishings workers, all other	51-6099	24,000	21,000	-3,600	-15

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

covered by union contracts tend to have higher earnings. Median hourly earnings by occupation in May 2006 were as follows:

Fabric and apparel patternmakers	$15.74
Extruding and forming machine setters, operators, and tenders, synthetic and glass fibers	13.78
Upholsterers	13.09
Textile knitting and weaving machine setters, operators, and tenders	11.68
Textile bleaching and dyeing machine operators and tenders	11.20
Textile winding, twisting, and drawing out machine setters, operators, and tenders	11.08
All other textile, apparel, and furnishings workers	11.03
Tailors, dressmakers, and custom sewers	11.01
Shoe machine operators and tenders	10.54
Textile cutting machine setters, operators, and tenders	10.39
Shoe and leather workers and repairers	9.83
Sewers, hand	9.79
Sewing machine operators	9.04
Laundry and dry-cleaning workers	8.58
Pressers, textile, garment, and related materials	8.56

Benefits vary by size of company and work that is done. Large employers typically offer all usual benefits. Apparel workers in retail trade also may receive a discount on their purchases from the company for which they work. In addition, some of the larger manufacturers operate company stores from which employees can purchase apparel products at significant discounts. Some small firms and drycleaning establishments, however, offer only limited benefits. Self-employed workers generally have to purchase their own insurance.

Related Occupations

Textile, apparel, and furnishings workers apply their knowledge of textiles and leathers to fashion products with the use of hand tools and machinery. Others who produce products using hand tools, machines, and their knowledge of the materials with which they work include assemblers and fabricators; food-processing workers; jewelers and precious stone and metal workers; and woodworkers.

Sources of Additional Information

Information about job opportunities in textile, apparel, and furnishings occupations is available from local employers and local offices of state employment services.

Woodworkers

(O*NET 51-7011.00, 51-7021.00, 51-7031.00, 51-7032.00, 51-7041.00, 51-7042.00, and 51-7099.99)

Significant Points

- Most woodworkers are trained on the job; basic machine operations may be learned in a few months, but becoming a skilled woodworker often requires several years of experience.
- Job prospects will be best for highly skilled woodworkers who produce customized work, which is less susceptible to automation and import competition, and for those who can operate computerized numerical control machines.
- Employment is highly sensitive to economic cycles; during economic downturns, workers are subject to layoffs or reductions in hours.

Nature of the Work

Despite the abundance of plastics and other materials, wood products continue to be useful and popular. Woodworkers help to meet the demand for wood products by creating finished products from lumber. Many of these products are mass produced, such as many types of furniture, kitchen cabinets, and musical instruments. Other products are crafted in small shops that make architectural woodwork, handmade furniture, and other specialty items.

Although the term woodworker often evokes images of a craftsman who builds ornate furniture using hand tools, the modern wood industry is highly technical. Some woodworkers still build by hand, but more often, hand tools have been replaced by power tools, and much of the work has been automated. Work is usually done on an assembly line, meaning that most individuals learn to perform a single part of a complex process. Different types of woodworkers are employed in every stage of the building process, from sawmill to finished product. Their activities vary greatly.

Many woodworkers use computerized numerical control (CNC) machines to operate factory tools. Using these machines, woodworkers can create complex designs with fewer human steps. This technology has raised worker productivity by allowing one operator to simultaneously tend a greater number of machines. The integration of computers with equipment has improved production speed and capability, simplified setup and maintenance requirements, and increased the demand for workers with computer skills.

Production woodworkers set up, operate, and tend all types of woodworking machines. In sawmills, *sawing machine operators and tenders* set up, operate, or tend wood-sawing machines that cut logs into planks, timbers, or boards. In manufacturing plants, woodworkers first determine the best method of shaping and assembling parts, working from blueprints, supervisors' instructions, or shop drawings that woodworkers themselves produce. Before cutting, they often must measure and mark the materials. They verify dimensions and may trim parts using hand tools such as planes, chisels, wood files, or sanders to ensure a tight fit.

Woodworking machine operators and tenders set up, operate, or tend specific woodworking machines, such as drill presses, lathes, shapers, routers, sanders, planers, and wood-nailing machines. New operators may simply press a switch on a woodworking machine and monitor the automatic operation, but more highly skilled operators set up the equipment, cut and shape wooden parts, and verify dimensions using a template, caliper, or rule.

After wood parts are made, woodworkers add fasteners and adhesives and connect the pieces to form a complete unit. The product is then finish-sanded; stained, and, if necessary, coated with a sealer, such as lacquer or varnish. Woodworkers may perform this work in teams or be assisted by helpers.

Precision or custom woodworkers, such as *cabinetmakers and bench carpenters, modelmakers and patternmakers*, and *furniture finishers*, often build one-of-a-kind items. These highly skilled precision woodworkers usually perform a complete cycle of tasks—cutting, shaping, and preparing surfaces and assembling complex

Woodworkers use sophisticated equipment to make wood into furniture.

wood components into a finished wood product. Precision workers normally need substantial training and an ability to work from detailed instructions and specifications. In addition, they often are required to exercise independent judgment when undertaking an assignment. They may still use heavy machinery and power tools in their everyday work. As CNC machines have become less expensive, many smaller firms have started using them.

Work environment. Working conditions vary by industry and specific job duties. In logging and sawmills, for example, workers handle heavy, bulky material and often encounter excessive noise, dust, and other air pollutants. However, the use of earplugs and respirators may alleviate these problems. Safety precautions and computer-controlled equipment minimize risk of injury from rough wood stock, sharp tools, and power equipment.

In furniture and kitchen cabinet manufacturing, employees who operate machinery also must wear ear and eye protection. They follow operating safety instructions and use safety shields or guards to prevent accidents. Those who work in areas where wood is cut or finishings applied often must wear an appropriate dust or vapor mask or a complete protective safety suit. Prolonged standing, lifting, and fitting of heavy objects are common characteristics of the job.

Training, Other Qualifications, and Advancement

Many woodworkers are highly skilled and require significant on-the-job training. Mathematics skills, especially geometry, are essential and computer skills are increasingly important.

Education and training. Employers seek applicants with a high school diploma or the equivalent because of the growing sophistication of machinery and the constant need for retraining. People seeking woodworking jobs can enhance their employment and advancement prospects by completing high school and receiving training in mathematics, science, and computer applications.

Woodworkers increasingly acquire skills through higher education. For many workers, this means earning a degree from a vocational or trade school. Others may attend colleges or universities that offer training in wood technology, furniture manufacturing, wood engineering, and production management. These programs prepare students for positions in production, supervision, engineering, and management and are increasingly important as woodworking technology advances.

Most woodworkers are trained on the job, however, picking up skills informally from experienced workers. They can learn basic machine operations and job tasks in a few months, but becoming a skilled woodworker often requires 2 or more years.

Beginners usually observe and help experienced machine operators. They may supply material to, or remove fabricated products from, machines. Trainees also do simple machine operating jobs while closely supervised by experienced workers. As beginners gain experience, they perform more complex jobs with less supervision. Some may learn to read blueprints, set up machines, and plan the sequence of the work.

Other qualifications. In addition to training, woodworkers need mechanical ability, manual dexterity, and the ability to pay attention to detail and safety. As the industry becomes more sophisticated, skill with computers and computer-controlled machinery is becoming more important.

Advancement. Advancement opportunities are often limited and depend on education and training, seniority, and a worker's skills and initiative. Sometimes experienced woodworkers become inspectors or supervisors responsible for the work of a group of woodworkers. Production workers can advance into these positions by assuming additional responsibilities and attending workshops, seminars, or college programs. Those who are highly skilled may set up their own woodworking shops.

Employment

Woodworkers held about 370,000 jobs in 2006. Self-employed woodworkers, mostly cabinetmakers and furniture finishers, accounted for 12 percent of these jobs.

Three out of 4 woodworkers were employed in manufacturing. About 2 out of 5 worked in establishments manufacturing household and office furniture and fixtures, and 1 in 3 worked in wood product manufacturing, producing a variety of raw, intermediate, and finished woodstock. Wholesale and retail lumber dealers, furniture stores, reupholstery and furniture repair shops, and construction firms also employ woodworkers.

Woodworking jobs are found throughout the country. However, lumber and wood products-related production jobs are concentrated in the Southeast, Midwest, and Northwest, close to the supply of wood. Furniture-making jobs are more prevalent in the Southeast. Custom shops can be found everywhere, but generally are concentrated in or near highly populated areas.

Job Outlook

Overall employment of woodworkers is expected to grow slower than average. Opportunities should be good for skilled applicants.

Employment change. Overall employment of woodworkers is expected to grow by 3 percent during the 2006–2016 decade, which is slower than the average of all occupations. This slow growth will be a result of increased automation in the wood products manufacturing industry. Technology is becoming increasingly important to this industry, and automation has greatly reduced the number of people required to produce a finished product. Furthermore, international competition—especially from China—has led to a significant decline in domestic employment of these workers.

Employment of sawing and woodworking machine setters, operators, and tenders is expected to grow more slowly than the average through 2016. Import growth will lead to job losses in the U.S. industry. To remain competitive, some domestic firms are expected to move their production processes to foreign countries, further reducing employment. Firms that stay are increasingly using advanced technology, such as robots and CNC machinery. These developments will prevent employment from rising with the demand for wood products, particularly in the mills and manufacturing plants where many processes can be automated.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Woodworkers	51-7000	370,000	380,000	11,000	3
Cabinetmakers and bench carpenters	51-7011	149,000	153,000	4,100	3
Furniture finishers	51-7021	31,000	30,000	-1,000	-3
Model makers and patternmakers, wood	51-7030	4,200	2,500	-1,700	-40
Model makers, wood	51-7031	1,900	1,100	-800	-41
Patternmakers, wood	51-7032	2,300	1,400	-900	-40
Woodworking machine setters, operators, and tenders	51-7040	165,000	173,000	8,800	5
Sawing machine setters, operators, and tenders, wood	51-7041	65,000	68,000	2,500	4
Woodworking machine setters, operators, and tenders, except sawing	51-7042	100,000	106,000	6,400	6
Woodworkers, all other	51-7099	20,000	21,000	300	2

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Employment of furniture finishers is expected to decline slowly. Since furniture is largely mass-produced, it is highly susceptible to import competition; the percentage of imported furniture sold in the United States has steadily increased over the years, a trend that is expected to continue. Labor is significantly less expensive in developing countries, so these forces will likely affect the industry for quite some time.

Employment of bench carpenters and cabinetmakers is expected to grow more slowly than average, while modelmakers and patternmakers are expected to decline rapidly. Other specialized woodworking occupations will experience little or now change in growth. Demand for these workers will stem from increases in population, personal income, and business expenditures and from the continuing need for repair and renovation of residential and commercial properties. Therefore, opportunities should be available for workers who specialize in items such as moldings, cabinets, stairs, and windows. Firms that focus on custom woodwork will be best able to compete against imports without transferring jobs offshore.

Job prospects. Despite slower than average employment growth, prospects should be good for qualified workers. Many experienced woodworkers will soon reach retirement age, and this will create a need for new workers. In general, opportunities for more highly skilled woodworkers will be better than for woodworkers in specialties susceptible to automation and competition from imported wood products. The need for woodworkers with technical skills to operate their increasingly advanced computerized machinery will be especially great. Custom workers and modelmakers and patternmakers who know how to create and execute designs on a computer may have the best opportunities. These jobs require an understanding of wood and a strong understanding of computers—a combination that can be somewhat difficult to find.

The number of new workers entering these occupations has declined greatly in recent years, as training programs become less available or popular. Competition for jobs is expected to be mild, and opportunities should be best for woodworkers who, through vocational education or experience, develop highly specialized woodworking skills or knowledge of CNC machine tool operation.

Employment in all woodworking specialties is highly sensitive to economic cycles. During economic downturns, workers are subject to layoffs or reductions in hours.

Earnings

Median annual wage-and-salary earnings of cabinetmakers and bench carpenters were $27,010 in May 2006. The middle 50 percent earned between $21,350 and $34,290. The lowest 10 percent earned less than $17,660, and the highest 10 percent earned more than $43,060.

Median annual wage-and-salary earnings of sawing machine setters, operators, and tenders, wood were $24,280. The middle 50 percent earned between $19,620 and $29,930. The lowest 10 percent earned less than $16,290, and the highest 10 percent earned more than $36,220.

Median annual wage-and-salary earnings of woodworking machine setters, operators, and tenders, except sawing were $23,940. The middle 50 percent earned between $19,460 and $29,480. The lowest 10 percent earned less than $16,410, and the highest 10 percent earned more than $35,950.

Median annual wage-and-salary earnings were $25,010 for furniture finishers and $22,580 for all other woodworkers.

Related Occupations

Like woodworkers, carpenters also work with wood. In addition, many woodworkers follow blueprints and drawings and use machines to shape and form raw wood into a final product. Workers who perform similar functions working with other materials include sheet metal workers; structural and reinforcing iron and metal workers; computer control programmers and operators; machinists; textile, apparel, and furnishings occupations; and tool and die makers.

Plant and System Operators

Power Plant Operators, Distributors, and Dispatchers

(O*NET 51-8011.00, 51-8012.00, and 51-8013.00)

Significant Points

- Job prospects are expected to be good as many workers retire and new plants are built.
- Most entry-level workers start as helpers or laborers, and several years of training and experience are required to become fully qualified.
- Familiarity with computers and a basic understanding of science and math are helpful for those entering the field.

Nature of the Work

Electricity is vital for most everyday activities. From the moment you flip the first switch each morning, you are connecting to a huge network of people, electric lines, and generating equipment. Power plant operators control the machinery that generates electricity. Power plant distributors and dispatchers control the flow of electricity from the power plant, over a network of transmission lines, to industrial plants and substations, and, finally, over distribution lines to residential users.

Power plant operators control and monitor boilers, turbines, generators, and auxiliary equipment in power-generating plants. Operators distribute power demands among generators, combine the current from several generators, and monitor instruments to maintain voltage and regulate electricity flows from the plant. When power requirements change, these workers start or stop generators and connect or disconnect them from circuits. They often use computers to keep records of switching operations and loads on generators, lines, and transformers. Operators also may use computers to prepare reports of unusual incidents, malfunctioning equipment, or maintenance performed during their shift.

Operators in plants with automated control systems work mainly in a central control room and usually are called *control room operators* or *control room operator trainees or assistants*. In older plants, the controls for the equipment are not centralized; *switchboard operators* control the flow of electricity from a central point, while *auxiliary equipment operators* work throughout the plant, operating and monitoring valves, switches, and gauges.

Power plant operators spent most of their time monitoring systems for problems.

In nuclear power plants, most operators start working as *equipment operators* or *auxiliary operators*. They help the more senior workers with equipment maintenance and operation while learning the basics of plant operation. With experience and training they may be licensed by the Nuclear Regulatory Commission as *reactor operators* and authorized to control equipment that affects the power of the reactor in a nuclear power plant. *Senior reactor operators* supervise the operation of all controls in the control room. At least one senior operator must be on duty during each shift to act as the plant supervisor.

Power distributors and dispatchers, also called *load dispatchers* or *systems operators*, control the flow of electricity through transmission lines to industrial plants and substations that supply residential needs for electricity. They monitor and operate current converters, voltage transformers, and circuit breakers. Dispatchers also monitor other distribution equipment and record readings at a pilot board—a map of the transmission grid system showing the status of transmission circuits and connections with substations and industrial plants.

Dispatchers also anticipate power needs, such as those caused by changes in the weather. They call control room operators to start or stop boilers and generators, in order to bring production into balance with needs. Dispatchers handle emergencies such as transformer or transmission line failures and route current around affected areas. In substations, they also operate and monitor equipment that increases or decreases voltage, and they operate switchboard levers to control the flow of electricity in and out of the substations.

Work environment. Operators, distributors, and dispatchers who work in control rooms generally sit or stand at a control station. This work is not physically strenuous, but it does require constant attention. Operators who work outside the control room may be exposed to danger from electric shock, falls, and burns.

Nuclear power plant operators are subject to random drug and alcohol tests, as are most workers at such plants. Additionally, they have to pass a medical examination every two years and may be exposed to small amounts of ionizing radiation as part of their jobs.

Because electricity is provided around the clock, operators, distributors, and dispatchers usually work one of three eight-hour shifts or one of two 12-hour shifts on a rotating basis. Shift assignments may change periodically so that all operators share less desirable shifts. Work on rotating shifts can be stressful and fatiguing because of the constant change in living and sleeping patterns.

Training, Other Qualifications, and Advancement

Power plant operators, dispatchers, and distributors generally need a combination of education, on-the-job training, and experience. Candidates with strong computer and technical skills are generally preferred.

Education and training. Employers often seek recent high school graduates for entry-level operator, distributor, and dispatcher positions. Workers with college or vocational school degrees will have more advancement opportunities, especially in nuclear power plants. Although it is not a prerequisite, many senior reactor operators have a bachelor's degree in engineering or the physical sciences.

Workers selected for training as power plant operators or distributors undergo extensive on-the-job and classroom instruction. Several years of training and experience are required for a worker to become a fully qualified control room operator or power plant distributor.

In addition to receiving initial training to become fully qualified as a power plant operator, distributor, or dispatcher, most workers are given periodic refresher training—especially the nuclear power plant operators. Refresher training usually is taken on plant simulators designed specifically to replicate procedures and situations that might be encountered at the trainee's plant.

Licensure. Power plant operators, distributors, and dispatchers may need licenses depending on jurisdiction and specific job function. Requirements vary greatly from place to place and may be administered by state, county, or local governments.

Extensive training and experience are necessary to pass the Nuclear Regulatory Commission (NRC) examinations required for nuclear reactor operators and senior nuclear reactor operators. Before beginning training, a nuclear power plant worker must have 3 years of power plant experience. At least 6 months of this must be on-site at the nuclear power plant where the operator is to be licensed. Training generally takes at least 1 year, after which the worker must take an NRC-administered examination. To maintain their licenses, reactor operators must pass an annual practical plant operation exam and a biennial written exam administered by their employers. Reactor operators can upgrade their licenses to the senior reactor operator level after a year of licensed experience at the plant by taking another examination given by the NRC. Training may include simulator and on-the-job training, classroom instruction, and individual study. Experience in other power plants or with Navy nuclear propulsion plants also is helpful.

Advancement. Most entry-level workers start as helpers or laborers and advance to more responsible positions as they become comfortable in the plant. In many cases, there are mandatory waiting times between starting a position and advancing to the next level due to licensing requirements. With sufficient training and experience, workers can become shift supervisors or, in nuclear power plants, senior reactor operators.

Because power plants have different systems and safety mechanisms, it is often very difficult to advance by changing companies or plants. Most utilities promote from within; most workers advance within a particular plant or by moving to another plant owned by the same utility.

Employment

Power plant operators, distributors, and dispatchers held about 47,000 jobs in 2006, of which 3,800 were nuclear power plant operators, 8,600 were power distributors and dispatchers, and 35,000 were other power plant operators. Jobs were located throughout the country. About 70 percent of jobs were in electric power generation, transmission, and distribution. About 16 percent worked in government, mainly in local government. Others worked for manufacturing establishments that produced electricity for their own use.

Job Outlook

Employment of power plant operators, distributors, and dispatchers is projected to experience little or no employment change, but job opportunities are expected to be very good due to the large number of retiring workers who must be replaced, increased demand for energy, and recent legislation which paves the way for a number of new plants.

Employment change. Between 2006 and 2016, employment of power plant operators, distributors, and dispatchers is projected to experience little or no employment change, growing by about 2 percent. Electric utilities are expected to build new power plants in response to the Energy Policy Act of 2005, which provides a number of subsidies. Growth will be tempered by a continued emphasis on cost reduction and automation. Although new power plants will require fewer workers than their older counterparts, the machinery in the new plants will be more technologically complex and environmental regulations will require much closer attention to emissions, so workers will be required to have higher skill levels.

Job prospects. Job opportunities are expected to be very good for people who are interested in becoming power plant operators, distributors, and dispatchers. During the 1990s, the emphasis on cost cutting among utilities led to hiring freezes and the laying off of younger workers. The result is an aging workforce, half of which is expected to retire within the next 10 years. Utilities have responded by setting up new education programs at community colleges and high schools throughout the country. Prospects should be especially good for people with computer skills and a basic understanding of science and mathematics.

Earnings

Median annual earnings of power plant operators were $55,000 in May 2006. The middle 50 percent earned between $45,110 and $65,460. The lowest 10 percent earned less than $35,590, and the highest 10 percent earned more than $75,240.

Median annual earnings of nuclear power reactor operators were $69,370 in May 2006. The middle 50 percent earned between $61,590 and $78,150. The lowest 10 percent earned less than $54,180, and the highest 10 percent earned more than $92,240.

Median annual earnings of power distributors and dispatchers were $62,590 in May 2006. The middle 50 percent earned between $52,510 and $73,920. The lowest 10 percent earned less than $42,370, and the highest 10 percent earned more than $85,740.

Stationary Engineers and Boiler Operators

(O*NET 51-8021.00, 51-8021.01, and 51-8021.02)

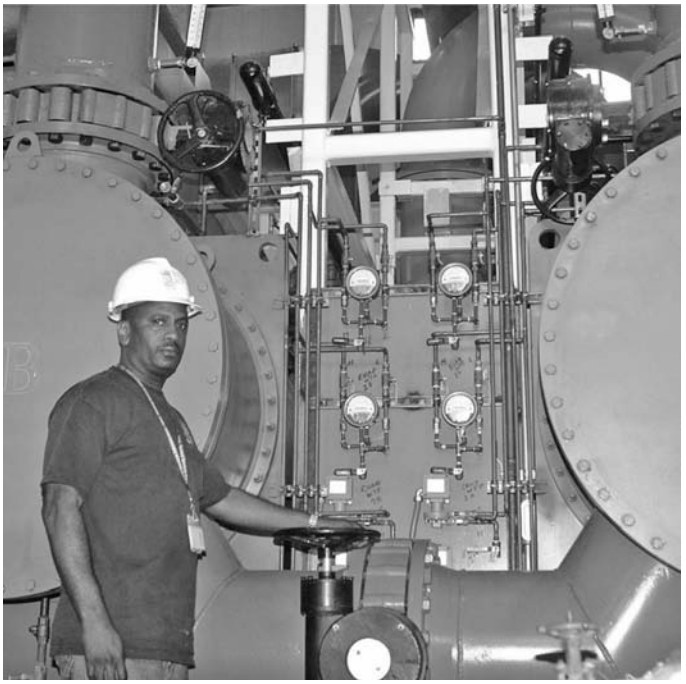
Significant Points

- Workers usually acquire their skills through a formal apprenticeship program or through on-the-job training supplemented by courses at a trade or technical school.
- Most workers need to be licensed, but licensing requirements vary across the nation.
- Employment is projected to grow slowly, and applicants may face competition for jobs.
- Opportunities will be best for workers with training in computerized controls and instrumentation.

Nature of the Work

Most large office buildings, malls, warehouses, and other commercial facilities have extensive heating, ventilation, and air-conditioning systems that keep them comfortable all year long. Industrial plants often have additional facilities to provide electrical power, steam, or other services. Stationary engineers and boiler operators control and maintain these systems, which include boilers, air-conditioning and refrigeration equipment, diesel engines, turbines, generators, pumps, condensers, and compressors. The equipment that stationary engineers and boiler operators control is similar to equipment operated by locomotive or marine engineers, except that it is used to generate heat or electricity, rather than to move a train or ship.

Stationary engineers and boiler operators start up, regulate, repair, and shut down equipment. They ensure that the equipment operates safely, economically, and within established limits by monitoring meters, gauges, and computerized controls. Stationary engineers and boiler operators control equipment manually in many older buildings and, if necessary, make adjustments. They watch and listen to machinery and routinely check safety devices, identifying and correcting any trouble that develops.



Stationary engineers monitor boilers and make necessary adjustments and repairs.

In newer buildings, stationary engineers typically use computers to operate the mechanical, electrical, and fire safety systems. They monitor, adjust, and diagnose these systems from a central location, using a computer linked into the buildings' communications network.

Routine maintenance is a regular part of the work of stationary engineers and boiler operators. Engineers use hand and power tools to perform maintenance and repairs ranging from a complete overhaul to replacing defective valves, gaskets, or bearings. They lubricate moving parts, replace filters, and remove soot and corrosion that can reduce the boiler's operating efficiency. They also test the water in the boiler and add chemicals to prevent corrosion and harmful deposits. In most facilities, stationary engineers are responsible for the maintenance and balancing of air systems, as well as hydronic systems that heat or cool buildings by circulating fluid (such as water or water vapor) in a closed system of pipes. They may check the air quality of the ventilation system and make adjustments to keep the operation of the boiler within mandated guidelines. Servicing, troubleshooting, repairing, and monitoring modern systems all require the use of sophisticated electrical and electronic test equipment. Additionally, many stationary engineers perform other maintenance duties, such as carpentry, plumbing, locksmithing, and electrical repairs.

Stationary engineers and boiler operators keep a record of relevant events and facts concerning the operation and maintenance of the equipment. When working with steam boilers, for example, stationary engineers and boiler operators observe, control, and record steam pressure, temperature, water level, chemistry, power output, fuel consumption, and emissions from the boiler. They also note the date and nature of all maintenance and repairs.

In a large building or industrial plant, a senior stationary engineer may be in charge of all mechanical systems in the building and may supervise a team of assistant stationary engineers, turbine operators, boiler tenders, and air-conditioning and refrigeration operators and mechanics. In a small building or industrial plant, there may be only one stationary engineer.

Work environment. Engine rooms, power plants, boiler rooms, mechanical rooms, and electrical rooms are usually clean and well lighted. Even under the most favorable conditions, however, some stationary engineers and boiler operators are exposed to high temperatures, dust, dirt, and high noise levels from the equipment. Maintenance duties also may require contact with oil, grease, or smoke. Workers spend much of the time on their feet. They also may have to crawl inside boilers and work in crouching or kneeling positions to inspect, clean, or repair equipment.

Stationary engineers and boiler operators work around hazardous machinery, such as low- and high-pressure boilers and electrical equipment. They must follow procedures to guard against burns, electric shock, and noise, danger from moving parts, and exposure to hazardous materials, such as asbestos or toxic chemicals.

Stationary engineers and boiler operators generally have steady, year-round employment. The average workweek is 40 hours. In facilities that operate around the clock, engineers and operators usually work one of three daily eight-hour shifts on a rotating basis. Weekend and holiday work often is required.

Training, Other Qualifications, and Advancement

Many stationary engineers and boiler operators begin their careers in mechanic or helper positions and are trained on-the-job by more experienced engineers. Others begin by entering formal apprenticeships or training programs. After completing the required training, workers can become licensed, which allows them to work on boilers of a certain size without supervision.

Education and training. Most employers prefer to hire persons with at least a high school diploma or the equivalent for stationary engineers and boiler operator jobs. Workers primarily acquire their skills on the job and usually start as boiler tenders or as helpers to more experienced workers. This practical experience may be supplemented by postsecondary vocational training in subjects such as computerized controls and instrumentation. Other workers complete formal apprenticeship programs. Becoming an engineer or operator without completing a formal apprenticeship program usually requires many years of work experience.

The International Union of Operating Engineers sponsors apprenticeship programs and is the principal union for stationary engineers and boiler operators. In selecting apprentices, most local labor-management apprenticeship committees prefer applicants with a basic understanding of mathematics, science, computers, mechanical drawing, machine shop practice, and chemistry. An apprenticeship usually lasts 4 years and includes 8,000 hours of on-the-job training. In addition, apprentices receive 600 hours of classroom instruction in subjects such as boiler design and operation, elementary physics, pneumatics, refrigeration, air-conditioning, electricity, and electronics.

Continuing education—such as vocational school or college courses—is becoming increasingly important for stationary engineers and boiler operators, in part because of the growing complexity of the equipment with which engineers and operators now work. In 2006, roughly half of all stationary engineers between the ages of 25 and 44 had at least some college coursework.

Most large and some small employers encourage and pay for skill-improvement training for their employees. These employers often realize major cost savings due to greater efficiency of their workers; improved maintenance, reliability, and effective lifespan of equipment; and a better safety record. Well-trained workers manage energy better, which can also greatly reduce an employer's energy costs. Training is almost always provided when new equipment is introduced or when regulations concerning some aspect of the workers' duties change.

Licensure. Most states and cities have licensing requirements for stationary engineers and boiler operators. Applicants for licensure usually must be at least 18 years of age, reside for a specified period in the state or locality in which they wish to work, meet experience requirements, and pass a written examination. A stationary engineer or boiler operator who moves from one state or city to another may have to pass an examination for a new license due to regional differences in licensing requirements.

There are several classes of stationary engineer licenses. Each class specifies the type and size of equipment the engineer is permitted to operate without supervision. A licensed first-class stationary engineer is qualified to run a large facility, supervise others, and operate equipment of all types and capacities. An applicant for this license may be required to have a high school education, have completed an apprenticeship or lengthy on-the-job training, and have several years of experience working with a lower class license. Licenses below first class limit the types or capacities of equipment the engineer may operate without supervision.

Other qualifications. In addition to training, stationary engineers and boiler operators need mechanical aptitude and manual dexterity. Being in good physical condition is also important.

Advancement. Stationary engineers and boiler operators advance by being placed in charge of larger, more powerful, or more varied equipment. Generally, engineers advance to these jobs as they obtain higher class licenses. Some stationary engineers and boiler operators advance to become boiler inspectors, chief plant engineers, building and plant superintendents, or building managers. A few obtain jobs as examining engineers or technical instructors.

Because most stationary engineering staffs are relatively small, workers may find it difficult to advance, especially within a company. Most high-level positions are held by experienced workers with seniority. Workers wishing to move up to these positions must often change employers or wait for older workers to retire before they can advance.

Employment

Stationary engineers and boiler operators held about 45,000 jobs in 2006. They worked throughout the country, generally in the more heavily populated areas in which large industrial and commercial establishments are located. Jobs were dispersed throughout a variety of industries. The majority of jobs were in state and local government, manufacturing, and hospitals.

Job Outlook

Employment in this occupation is expected to grow more slowly than the average through 2016. Applicants may face competition for

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Stationary engineers and boiler operators	51-8021	45,000	47,000	1,600	3

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

jobs. Employment opportunities will be best for those with apprenticeship training and experience using computerized systems.

Employment change. Employment of stationary engineers and boiler operators is expected to grow by 3 percent between 2006 and 2016, which is more slowly than the average for all occupations. Continuing commercial and industrial development will increase the amount of equipment to be operated and maintained. However, automated systems and computerized controls are making newly installed equipment more efficient, thus reducing the number of jobs needed for its operation.

Job prospects. People interested in working as stationary engineers and boiler operators should expect to face competition for these relatively high-paying positions. Slow job growth coupled with the tendency of experienced workers to stay in a job for decades should continue to make openings scarce. While many workers will reach retirement age within the next decade, the number of workers who need to be replaced will be small relative to other occupations.

Earnings

Median annual earnings of stationary engineers and boiler operators were $46,040 in May 2006. The middle 50 percent earned between $36,490 and $57,380. The lowest 10 percent earned less than $28,370, and the highest 10 percent earned more than $68,690.

Related Occupations

Workers who monitor and operate stationary machinery include chemical plant and system operators; gas plant operators; petroleum pump system operators, refinery operators, and gaugers; power plant operators, distributors, and dispatchers; and water and liquid waste treatment plant and system operators. Other workers who maintain the equipment and machinery in a building or plant are industrial machinery mechanics and maintenance workers, and millwrights.

Sources of Additional Information

Information about apprenticeships, vocational training, and work opportunities is available from state employment service offices, locals of the International Union of Operating Engineers, vocational schools, and state and local licensing agencies. Apprenticeship information is also available from the U.S. Department of Labor's toll-free helpline: (877) 282-5627.

Water and Liquid Waste Treatment Plant and System Operators

(O*NET 51-8031.00)

Significant Points

- Employment is concentrated in local government and private water, sewage, and other systems utilities.
- Because of a large number of upcoming retirements and the difficulty of filling these positions, job opportunities will be excellent.
- Completion of an associate degree or a one-year certificate program increases an applicant's chances for employment and promotion.

Nature of the Work

Clean water is essential for everyday life. *Water treatment plant and system operators* treat water so that it is safe to drink. *Liquid waste treatment plant and system operators*, also known as *wastewater treatment plant and system operators,* remove harmful pollutants from domestic and industrial liquid waste so that it is safe to return to the environment.

Water is pumped from wells, rivers, streams, and reservoirs to water treatment plants, where it is treated and distributed to customers. Wastewater travels through customers' sewer pipes to wastewater treatment plants, where it is treated and either returned to streams, rivers, and oceans or reused for irrigation and landscaping. Operators in both types of plants control equipment and processes that remove or destroy harmful materials, chemicals, and microorganisms from the water. Operators also control pumps, valves, and other equipment that moves the water or wastewater through the various treatment processes, after which they dispose of the removed waste materials.

Operators read, interpret, and adjust meters and gauges to make sure that plant equipment and processes are working properly. Operators control chemical-feeding devices, take samples of the water or wastewater, perform chemical and biological laboratory analyses, and adjust the amounts of chemicals, such as chlorine, in the water. They employ a variety of instruments to sample and measure water quality, and they use common hand and power tools to make repairs to valves, pumps, and other equipment.

Water and wastewater treatment plant and system operators increasingly rely on computers to help monitor equipment, store the results of sampling, make process-control decisions, schedule and record maintenance activities, and produce reports. In some modern plants, operators also use computers to monitor automated systems and determine how to address problems.

Occasionally, operators must work during emergencies. A heavy rainstorm, for example, may cause large amounts of wastewater to flow into sewers, exceeding a plant's treatment capacity. Emergencies also can be caused by conditions inside a plant, such as chlorine gas leaks or oxygen deficiencies. To handle these conditions, operators are trained to make an emergency management response and use special safety equipment and procedures to protect public health

Many water and liquid waste treatment plant and system operators work alone, managing small plants.

and the facility. During these periods, operators may work under extreme pressure to correct problems as quickly as possible. Because working conditions may be dangerous, operators must be extremely cautious.

The specific duties of plant operators depend on the type and size of the plant. In smaller plants, one operator may control all of the machinery, perform tests, keep records, handle complaints, and perform repairs and maintenance. Operators in this type of plant may have to be on-call 24 hours a day in case of an emergency. In medium-sized plants, operators monitor the plant throughout the night by working in shifts. In large plants, operators may be more specialized and monitor only one process. They might work with chemists, engineers, laboratory technicians, mechanics, helpers, supervisors, and a superintendent.

Water quality standards are largely set by two major federal environmental statutes: the Safe Drinking Water Act, which specifies standards for drinking water, and the Clean Water Act, which regulates the discharge of pollutants. Industrial facilities that send their wastes to municipal treatment plants must meet certain minimum standards to ensure that the wastes have been adequately pretreated and will not damage municipal treatment facilities. Municipal water treatment plants also must meet stringent standards for drinking water. The list of contaminants regulated by these statutes has grown over time. As a result, plant operators must be familiar with the guidelines established by federal regulations and how they affect their plant. In addition, operators must be aware of any guidelines imposed by the state or locality in which the plant operates.

Work environment. Water and wastewater treatment plant and system operators work both indoors and outdoors and may be exposed to noise from machinery and to unpleasant odors. Operators' work is physically demanding and often is performed in unclean locations; they must pay close attention to safety procedures because of the presence of hazardous conditions, such as slippery walkways, dangerous gases, and malfunctioning equipment.

Plants operate 24 hours a day, 7 days a week. In small plants, operators may work during the day and be on-call in the evening, nights and weekends. Medium and large plants that require constant monitoring may employ workers in three eight-hour shifts. Because larger plants require constant monitoring, weekend and holiday work is generally required. Operators may be required to work overtime.

Training, Other Qualifications, and Advancement

Employers usually hire high school graduates who are trained on-the-job, and later become licensed. Education after high school improves job prospects.

Education and training. A high school diploma usually is required for an individual to become a water or wastewater treatment plant operator. The completion of an associate degree or a one-year certificate program in water quality and wastewater treatment technology increases an applicant's chances for employment and promotion because plants are becoming more complex. The majority of such programs are offered by trade associations, and can be found throughout the country. These programs provide a good general knowledge of water and wastewater treatment processes, as well as basic preparation for becoming an operator. In some cases, a degree or certificate program can be substituted for experience, allowing a worker to become licensed at a higher level more quickly.

Trainees usually start as attendants or operators-in-training and learn their skills on the job under the direction of an experienced operator. They learn by observing and doing routine tasks such as recording meter readings, taking samples of wastewater and sludge, and performing simple maintenance and repair work on pumps, electric motors, valves, and other plant equipment. Larger treatment plants generally combine this on-the-job training with formal classroom or self-paced study programs.

Most state drinking water and water pollution control agencies offer courses to improve operators' skills and knowledge. The courses cover principles of treatment processes and process control, laboratory procedures, maintenance, management skills, collection systems, safety, chlorination, sedimentation, biological treatment, sludge treatment and disposal, and flow measurements. Some operators take correspondence courses on subjects related to water and wastewater treatment, and some employers pay part of the tuition for related college courses in science or engineering.

Licensure. The Safe Drinking Water Act Amendments of 1996, enforced by the U.S. Environmental Protection Agency, specify national minimum standards for certification of public water system operators. Operators must pass an examination certifying that they are capable of overseeing water treatment operations. Mandatory certification is implemented at the state level, and licensing requirements and standards vary widely depending on the state. There are generally three to four different levels of certification, depending on the operator's experience and training. Higher levels qualify the operator to oversee a wider variety of treatment processes. Although relocation may mean having to become certified in a new jurisdiction, many states accept other states' certifications.

Other qualifications. Water and wastewater treatment plant operators need mechanical aptitude and the ability to solve problems intuitively. They should also be competent in basic mathematics, chemistry, and biology. They must have the ability to apply data to formulas that determine treatment requirements, flow levels, and concentration levels. Some basic familiarity with computers also is necessary, as operators generally use them to record data. Some plants also use computer-controlled equipment and instrumentation.

Certification and advancement. In addition to mandatory certifications required by law, operators can earn voluntary certifications that demonstrate their skills and knowledge. The Association of Boards of Certification offers several levels and types of certification to people who pass exams and have sufficient education and experience.

As operators are promoted, they become responsible for more complex treatment processes. Some operators are promoted to plant supervisor or superintendent; others advance by transferring to a larger facility. Postsecondary training in water and wastewater treatment, coupled with increasingly responsible experience as an operator, may be sufficient to qualify a worker to become superintendent of a small plant, where a superintendent also serves as an operator. However, educational requirements are rising as larger, more complex treatment plants are built to meet new drinking water and water pollution control standards. With each promotion, the operator must have greater knowledge of federal, state, and local regulations. Superintendents of large plants generally need an engineering or science degree.

A few operators get jobs as technicians with state drinking water or water pollution control agencies. In that capacity, they monitor and provide technical assistance to plants throughout the state. Vocational-technical school or community college training generally is preferred for technician jobs. Experienced operators may transfer to related jobs with industrial liquid waste treatment plants,

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Water and liquid waste treatment plant and system operators	51-8031	111,000	126,000	15,000	14

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

water or liquid waste treatment equipment and chemical companies, engineering consulting firms, or vocational-technical schools.

Employment

Water and wastewater treatment plant and system operators held about 111,000 jobs in 2006. Almost 4 in 5 operators worked for local governments. Others worked primarily for private water, sewage, and other systems utilities and for private waste treatment and disposal and waste management services companies. Private firms are increasingly providing operation and management services to local governments on a contract basis.

Water and wastewater treatment plant and system operators were employed throughout the country, but most jobs were in larger towns and cities. Although nearly all operators worked full time, those in small towns may work only part time at the treatment plant, with the remainder of their time spent handling other municipal duties.

Job Outlook

Water and wastewater treatment plant and system operators jobs are expected to grow faster than the average for all occupations. Job opportunities should be excellent for qualified workers.

Employment change. Employment of water and wastewater treatment plant and system operators is expected to grow by 14 percent between 2006 and 2016, which is faster than the average for all occupations. An increasing population and the growth of the economy are expected to boost demand for water and wastewater treatment services. As new plants are constructed to meet this demand, new water and wastewater treatment plant and system operator new jobs will arise.

Local governments are the largest employers of water and wastewater treatment plant and system operators. Employment in privately owned facilities will grow faster, as federal certification requirements have increased utilities' reliance on private firms specializing in the operation and management of water and wastewater treatment facilities.

Job prospects. Job opportunities should be excellent because the retirement of the baby boomer generation will require that many operators with years of experience be replaced. Further, the number of applicants for these jobs is normally low, due primarily to the physically demanding and unappealing nature of some of the work. Opportunities should be best for persons with mechanical aptitude and problem solving skills.

Earnings

Median annual earnings of water and wastewater treatment plant and system operators were $36,070 in May 2006. The middle 50 percent earned between $28,120 and $45,190. The lowest 10 percent earned less than $21,860, and the highest 10 percent earned more than $55,120. Median annual earnings of water and liquid waste treatment plant and systems operators in May 2006 were $36,200 in local government and $34,180 in water, sewage, and other systems.

In addition to their annual salaries, water and wastewater treatment plant and system operators usually receive benefits that may include health and life insurance, a retirement plan, and educational reimbursement for job-related courses.

Related Occupations

Other workers whose main activity consists of operating a system of machinery to process or produce materials include chemical plant and system operators; gas plant operators; petroleum pump system operators, refinery operators, and gaugers; power plant operators, distributors, and dispatchers; and stationary engineers and boiler operators.

Other Production Occupations

Inspectors, Testers, Sorters, Samplers, and Weighers

(O*NET 51-9061.00, 51-9061.01, 51-9061.02, 51-9061.03, 51-9061.04, and 51-9061.05)

Significant Points

- Almost 7 in 10 are employed in manufacturing establishments.
- While a high school diploma is sufficient for basic testing of products, complex precision-inspecting positions are filled by experienced assemblers, machine operators, or mechanics who already have a thorough knowledge of the products and production processes.
- Employment is expected to decline slowly, reflecting the growth of automated inspection and the redistribution of quality-control responsibilities from inspectors to other production workers.

Nature of the Work

Inspectors, testers, sorters, samplers, and weighers ensure that your food will not make you sick, that your car will run properly, and that your pants will not split the first time you wear them. These workers monitor or audit quality standards for virtually all domestically manufactured products, including foods, textiles, clothing, glassware, motor vehicles, electronic components, computers, and structural steel. As product quality becomes increasingly important to the success of many manufacturing firms, daily duties of inspectors have changed. In some cases, the job titles of these workers also have been changed to *quality-control inspector* or a similar name, reflecting the growing importance of quality. (A separate statement on construction and building inspectors appears elsewhere in the *Handbook*.)

Regardless of title, all inspectors, testers, sorters, samplers, and weighers work to guarantee the quality of the goods their firms produce. Specific job duties also vary across the wide range of industries in which these workers are found. For example, materials inspectors may check products by sight, sound, feel, smell, or even taste to locate imperfections such as cuts, scratches, bubbles, missing pieces, misweaves, or crooked seams. These workers also may verify dimensions, color, weight, texture, strength, or other physical characteristics of objects. Mechanical inspectors generally verify that parts fit, move correctly, and are properly lubricated; check the pressure of gases and the level of liquids; test the flow of electricity; and do a test run to check for proper operation. Some jobs involve only a quick visual inspection; others require a longer, detailed one. Sorters may separate goods according to length, size, fabric type, or color, while samplers test or inspect a sample taken from a batch or production run for malfunctions or defects. Weighers weigh quantities of materials for use in production.

Inspectors, testers, sorters, samplers, and weighers are involved at every stage of the production process. Some inspectors examine materials received from a supplier before sending them to the production line. Others inspect components and assemblies or perform a final check on the finished product. Depending on their skill level, inspectors also may set up and test equipment, calibrate precision instruments, repair defective products, or record data.

Inspectors, testers, sorters, samplers, and weighers rely on a number of tools to perform their jobs. Although some still use hand held measurement devises such as micrometers, calipers, and alignment gauges, it is more common for them to operate electronic inspection equipment, such as coordinate measuring machines (CMMs). These machines use sensitive probes to measure a part's dimensional accuracy and allow the inspector to analyze the results using computer software. Inspectors testing electrical devices may use voltmeters, ammeters, and oscilloscopes to test insulation, current flow, and resistance. All the tools that inspectors use are maintained by calibration technicians, who ensure that they work properly and generate accurate readings.

Inspectors mark, tag, or note problems. They may reject defective items outright, send them for repair or correction, or fix minor problems themselves. If the product is acceptable, inspectors may screw a nameplate onto it, tag it, stamp it with a serial number, or certify it in some other way. Inspectors, testers, sorters, samplers, and weighers record the results of their inspections, compute the percentage of defects and other statistical measures, and prepare inspection and test reports. Some electronic inspection equipment automatically provides test reports containing these inspection results. When defects are found, inspectors notify supervisors and help to analyze and correct the production problems.

Inspectors, testers, sorters, samplers, and weighers often work in laboratories and may need a background in science.

The emphasis on finding the root cause of defects is a basic tenet of modern management and production philosophies. Industrial production managers (see the statement on this occupation elsewhere in the *Handbook*) work closely with the inspectors to reduce defects and improve quality. In the past, a certain level of defects was considered acceptable because variations would always occur. Current philosophies emphasize constant quality improvement through analysis and correction of the causes of defects. The nature of inspectors' work has changed from merely checking for defects to determining the cause of those defects.

Increased emphasis on quality control in manufacturing means that inspection is more fully integrated into the production process than in the past. Now, companies have integrated teams of inspection and production workers to jointly review and improve product quality. In addition, many companies now use self-monitoring production machines to ensure that the output is produced within quality standards. Self-monitoring machines can alert inspectors to production problems and automatically repair defects in some cases.

Some firms have completely automated inspection with the help of advanced vision inspection systems, using machinery installed at one or several points in the production process. Inspectors in these firms monitor the equipment, review output, and perform random product checks.

Testers repeatedly test existing products or prototypes under real-world conditions. For example, they may purposely abuse a machine by not changing its oil to see when failure occurs. They may devise automated machines to repeat a basic task thousands of times, such as opening and closing a car door. Through these tests, companies determine how long a product will last, what parts will break down first, and how to improve durability.

Work environment. Working conditions vary by industry and establishment size. As a result, some inspectors examine similar products for an entire shift, whereas others examine a variety of items.

In manufacturing, it is common for most inspectors to remain at one workstation. Inspectors in some industries may be on their feet all day and may have to lift heavy objects, whereas in other industries, they sit during most of their shift and read electronic printouts with massive quantities of data. Workers in heavy manufacturing plants may be exposed to the noise and grime of machinery; in other plants, inspectors work in clean, air-conditioned environments suitable for carrying out controlled tests. Other inspectors rarely see the products they are inspecting and instead do the majority of their work examining electronic readouts in front of a computer.

Some inspectors work evenings, nights, or weekends. Shift assignments generally are made on the basis of seniority. Overtime may be required to meet production goals.

Training, Other Qualifications, and Advancement

Most inspectors, testers, sorters, samplers, and weighers enter the occupation after spending years at a particular company or in an industry. They usually get their training on the job.

Education and training. Training requirements vary, based on the responsibilities of the inspector, tester, sorter, sampler, or weigher. For workers who perform simple "pass/fail" tests of products, a high school diploma generally is sufficient, together with basic in-house training. Training for new inspectors may cover the use of special meters, gauges, computers and other instruments; quality-control techniques; blueprint reading; safety; and reporting requirements. There are some postsecondary training programs in testing, but many employers prefer to train inspectors on the job.

Chances of finding work in this occupation can be improved by studying industrial trades, including computer-aided design, in high school or in a postsecondary vocational program. Laboratory work in the natural or biological sciences may also improve one's analytical skills and enhance the ability to find work in medical or pharmaceutical labs where many of these workers are employed.

As companies implement more automated inspection techniques that require less manual inspection, workers in this occupation have to learn to operate and program more sophisticated equipment and learn software applications. Since this requires additional skills, the need for higher education may be necessary. To address this need, some colleges are offering associate degrees in fields such as quality control management.

Other qualifications. In general, inspectors, testers, sorters, samplers, and weighers need mechanical aptitude, math and communication skills, and good hand-eye coordination and vision. Another important skill is the ability to analyze and interpret blueprints, data, manuals, and other material to determine specifications, inspection procedures, formulas, and methods for making adjustments.

Certification and advancement. Complex inspection positions are filled by experienced assemblers, machine operators, or mechanics who already have a thorough knowledge of the products and production processes. To advance to these positions, experienced workers may need training in statistical process control, new automation, or the company's quality assurance policies. As automated inspection equipment and electronic recording of results is common, computer skills are also important.

Training has become more formalized with the advent of standards from the International Organization for Standardization. As a result, certification as a quality inspector, offered by the American Society for Quality, is designed to certify that someone is trained in the field and may enable workers to advance within the occupation. To take the exam for certification, two years of on the job experience in mechanical inspection or a related field is required.

Advancement for workers with the necessary skills frequently takes the form of higher pay. They may also advance to inspector of more complex products, supervisor, or related positions such as purchaser of materials and equipment.

Employment

Inspectors, testers, sorters, samplers, and weighers held about 491,000 jobs in 2006. About 7 in 10 worked in manufacturing establishments that produced such products as motor vehicle parts, plastics products, semiconductor and other electronic components, and aerospace products and parts. Inspectors, testers, sorters, samplers, and weighers also were found in employment services, wholesale trade, architectural, engineering, and related services, and government agencies.

Job Outlook

Like that of many other occupations concentrated in manufacturing industries, employment of inspectors, testers, sorters, samplers, and weighers is expected to decline moderately through the year 2016. The decline stems primarily from the growing use of automated inspection and the redistribution of some quality-control responsibilities from inspectors to production workers. Additionally, as manufacturing companies continue to move some production offshore, the need for these workers will lessen.

Employment change. Employment of inspectors, testers, sorters, samplers, and weighers is expected to decline moderately by 7 percent between 2006 and 2016. Because the majority of inspectors, testers, sorters, samplers, and weighers work in the manufacturing sector, their outlook is greatly affected by what happens to manufacturing companies. As this sector becomes more automated and productive and as some production moves offshore, the number of

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16 Number	Change, 2006-16 Percent
Inspectors, testers, sorters, samplers, and weighers	51-9061	491,000	457,000	-35,000	-7

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

inspectors, testers, sorters, samplers, and weighers is expected to decline. However, the continuing emphasis on producing quality goods and the need for accuracy in the growing medical and biotechnology fields will positively affect this occupation and moderate the decline.

In some industries, however, automation is not a feasible alternative to manual inspection. Where key inspection elements are oriented toward size, such as length, width, or thickness, automation will become more important in the future. But where taste, smell, texture, appearance, fabric complexity, or product performance is important, inspection will continue to be done by workers. Employment of inspectors, testers, sorters, samplers, and weighers is expected to increase faster than average in the employment services industry, as manufacturers and industrial firms hire more temporary inspectors to increase the flexibility of their staffing.

The emphasis on improving quality and productivity has led manufacturers to invest in automated inspection equipment and to take a more systematic approach to quality inspection. Continued improvements in technologies, such as spectrophotometers and computer-assisted visual inspection systems, allow firms to effectively automate inspection tasks, increasing workers' productivity and reducing the demand for inspectors. Inspectors will continue to operate these automated machines and monitor the defects they detect. Thus, while the growing emphasis on quality has increased the importance of inspection, the increased automation of inspection has limited the demand for inspectors.

Apart from automation, firms are integrating quality control into the production process. Many inspection duties are being redistributed from specialized inspectors to fabrication and assembly workers who monitor quality at every stage of the production process. In addition, the growing implementation of statistical process control is resulting in "smarter" inspection. Using this system, firms survey the sources and incidence of defects so that they can better focus their efforts on reducing production of defective products.

Job prospects. Although numerous job openings will arise due to the need to replace workers who move out of this large occupation, many of these jobs will be open only to experienced workers with advanced skills.

Earnings

Median hourly earnings of inspectors, testers, sorters, samplers, and weighers were $14.14 in May 2006. The middle 50 percent earned between $10.84 and $18.79 an hour. The lowest 10 percent earned less than $8.65 an hour, and the highest 10 percent earned more than $24.85 an hour. Median hourly earnings in the industries employing the largest numbers of inspectors, testers, sorters, samplers, and weighers in May 2006 were:

Aerospace product and parts manufacturing	$20.62
Motor vehicle parts manufacturing	16.74
Semiconductor and other electronic component manufacturing	13.32
Plastics product manufacturing	12.85
Employment services	11.12

Related Occupations

Other workers who conduct inspections include agricultural inspectors, construction and building inspectors, fire inspectors and investigators, occupational health and safety specialists and technicians, and transportation inspectors.

Jewelers and Precious Stone and Metal Workers

(O*NET 51-9071.00, 51-9071.01, 51-9071.06, and 51-9071.07)

Significant Points

- About half of all jewelers are self-employed.
- Jewelers usually learn their trade in vocational or technical schools, through distance-learning centers, or on the job.
- Prospects for bench jewelers and other skilled jewelers should be favorable; keen competition is expected for lower-skilled manufacturing jobs, such as assemblers and polishers.

Nature of the Work

Jewelers and precious stone and metal workers use a variety of common and specialized hand tools and equipment to design and manufacture new pieces of jewelry; cut, set, and polish gem stones; repair or adjust rings, necklaces, bracelets, earrings, and other jewelry; and appraise jewelry, precious metals, and gems. Jewelers usually specialize in one or more of these areas and may work for large jewelry manufacturing firms, for small retail jewelry shops, or as owners of their own businesses. Regardless of the type of work done or the work setting, jewelers need a high degree of skill, precision, and attention to detail.

Some jewelers design or make their own jewelry. Following their own designs or those created by designers or customers, they begin by shaping the metal or by carving wax to make a model for casting the metal. The individual parts then are soldered together, and the jeweler may mount a diamond or other gem or may engrave a design into the metal. Other jewelers do finishing work, such as setting stones, polishing, or engraving, or make repairs. Typical repair work includes enlarging or reducing ring sizes, resetting stones, and replacing broken clasps and mountings.

Bench jewelers usually work in jewelry retailers. They perform a wide range of tasks, from simple jewelry cleaning and repair to moldmaking and fabricating pieces from scratch. In larger manufacturing businesses, jewelers usually specialize in a single operation. *Mold and model makers* create models or tools for the jewelry that

Jewelers usually learn their trade in vocational or technical schools, through distance-learning centers, or on the job.

is to be produced. *Assemblers* solder or fuse jewelry and their parts; they also may set stones. *Engravers* etch designs into the metal with specialized tools, and *polishers* bring a finished luster to the final product.

Jewelers typically do the handiwork required to produce a piece of jewelry, while *gemologists* and laboratory graders analyze, describe, and certify the quality and characteristics of gem stones. Gemologists may work in gemological laboratories or as quality control experts for retailers, importers, or manufacturers. After using microscopes, computerized tools, and other grading instruments to examine gem stones or finished pieces of jewelry, they write reports certifying that the items are of a particular quality. Many jewelers also study gemology to become familiar with the physical properties of the gem stones with which they work.

Jewelry appraisers carefully examine jewelry to determine its value, after which they write appraisal documents. They determine the value of a piece by researching the jewelry market, using reference books, auction catalogs, price lists, and the Internet. They may work for jewelry stores, appraisal firms, auction houses, pawnbrokers, or insurance companies. Many gemologists also become appraisers.

In small retail stores or repair shops, jewelers and appraisers may be involved in all aspects of the work. Those who own or manage stores or shops also hire and train employees; order, market, and sell merchandise; and perform managerial duties.

New technology is helping to produce jewelry of higher quality at a reduced cost and in a shorter amount of time. For example, lasers are often used for cutting and improving the quality of stones, for applying intricate engraving or design work, and for inscribing personal messages or identification on jewelry. Jewelers also use lasers to weld metals together in milliseconds with no seams or blemishes, improving the quality and appearance of jewelry.

Some manufacturing firms use computer-aided design and manufacturing (CAD/CAM) to facilitate product design and automate some steps in the moldmaking and modelmaking process. CAD allows jewelers to create a virtual-reality model of a piece of jewelry. Using CAD, jewelers can modify the design, change the stone, or try a different setting and see the changes on a computer screen before cutting a stone or performing other costly steps. Once they are satisfied with the model, CAM produces it in a waxlike or other material. After the mold of the model is made, it is easier for manufacturing firms to produce numerous copies of a given piece of jewelry, which are then distributed to retail establishments across the country. Similar techniques may be used in the retail setting, allowing customers to review their jewelry designs with the jeweler and make modifications before committing themselves to the expense of a customized piece of jewelry.

Work environment. A jeweler's work involves a great deal of concentration and attention to detail. Trying to satisfy customers' and employers' demands for speed and quality while working on precious stones and metal can cause fatigue or stress. However, the use of more ergonomically correct jewelers' benches has eliminated most of the strain and discomfort caused by spending long periods over a workbench.

Lasers require both careful handling to avoid injury and steady hands to direct precision tasks. In larger manufacturing plants and some smaller repair shops, chemicals, sharp or pointed tools, and jewelers' torches pose safety threats and may cause injury if proper care is not taken. Most dangerous chemicals, however, have been replaced with synthetic, less toxic products to meet safety requirements.

In repair shops, jewelers usually work alone with little supervision. In retail stores, they may talk with customers about repairs, perform custom design work, and even do some selling. Because many of their materials are valuable, jewelers must observe strict security procedures, including working behind locked doors that are opened only by a buzzer, working on the other side of barred windows, making use of burglar alarms, and, in larger jewelry establishments, working in the presence of armed guards.

Training, Other Qualifications, and Advancement

Jewelers usually learn their trade in vocational or technical schools, through distance-learning centers, or on the job. Formal training enhances employment and advancement opportunities.

Education and training. Jewelers usually learn their trade in vocational or technical schools, through distance-learning centers, or on the job. For those interested in working in a jewelry store or repair shop, vocational and technical training or courses offered by public and private colleges are the best sources of training. In these programs, which can vary in length from 6 months to 1 year, students learn the use and care of jewelers' tools and machines and basic jewelrymaking and jewelry-repairing skills, such as designing, casting, and setting and polishing stones.

Technical school courses also cover topics such as blueprint reading, math, and shop theory. To enter some technical school programs and most college programs, a high school diploma or its equivalent is required. However, some schools specializing in jewelry training do not require graduation from high school.

Colleges and art and design schools offer programs that can lead to the degree of bachelor of fine arts, or master of fine arts, in jewelry design. Various institutes offer courses and programs in gemology. Programs cover a wide range of topics, including the identification and grading of diamonds and gem stones.

Computer-aided design is becoming increasingly common, and students—especially those interested in design and manufacturing—may wish to obtain training in it; however, most employers will provide such training.

Most employers feel that vocational school and technical school graduates need up to a year of additional supervised on-the-job training or an apprenticeship to refine their repair skills and learn more about the operation of the store or shop. In addition, some employers encourage workers to improve their skills by enrolling in short-term technical school courses such as fabricating, jewelry design, jewelry manufacturing, wax carving, and gemology. Employers may pay all or part of the cost of this additional training.

In jewelry manufacturing plants, workers traditionally develop their skills through informal apprenticeships and on-the-job training. The apprenticeship or training period lasts up to 1 year, depending on the difficulty of the specialty. Training usually focuses on casting, setting stones, making models, or engraving. In recent years, a growing number of technical schools have begun to offer training designed for jewelers working in manufacturing. Employers in manufacturing may prefer graduates of these programs because they are familiar with the production process and require less on-the-job training.

Other qualifications. The precise and delicate nature of jewelry work requires finger and hand dexterity, good hand-eye coordination, patience, and concentration. Artistic ability and fashion consciousness are major assets, particularly in jewelry design and jewelry shops, because jewelry must be stylish and attractive. Those who work in jewelry stores have frequent contact with customers and should be neat, personable, and knowledgeable about the merchandise. In addition, employers require workers of good character because jewelers work with valuable materials.

Certification and advancement. Jewelers of America offers four credentials, ranging from Certified Bench Jeweler Technician to Certified Master Bench Jeweler, for bench jewelers who pass a written and practical exam. Certification is not required to work as a bench jeweler, but it may help jewelers to show expertise and to advance.

Advancement opportunities are limited and depend greatly on an individual's skill and initiative. In manufacturing, some jewelers advance to supervisory jobs, such as master jeweler or head jeweler, but for most, advancement means earning higher pay for the same job. Jewelers who work in jewelry stores or repair shops may become managers; some open their own businesses.

Those interested in starting their own business should first establish themselves and build a reputation for their work within the jewelry trade. Once they obtain sufficient credit from jewelry suppliers and wholesalers, they can acquire the necessary inventory. Also, because the jewelry business is highly competitive, jewelers who plan to open their own store should have sales experience and knowledge of marketing and business management. Courses in these subjects are often available from technical schools and community colleges.

Employment

Jewelers and precious stone and metal workers held about 52,000 jobs in 2006. About 51 percent of these workers were self-employed; many operated their own store or repair shop, and some specialized in designing and creating custom jewelry.

About 22 percent of wage-and-salary jobs for jewelers and precious stone and metal workers were in retail trade, primarily in jewelry, luggage, and leather goods stores. Another 17 percent of jobs were in jewelry and silverware manufacturing. A small number of jobs were with merchant wholesalers of miscellaneous durable goods and in repair shops providing repair and maintenance of personal and household goods. Although jewelry stores and repair shops were found in every city and in many small towns, most jobs were in larger metropolitan areas. Many jewelers employed in manufacturing worked in Rhode Island, New York, Chicago, Dallas, Florida, or California.

Job Outlook

Employment of jewelers and precious stone and metal workers is expected to experience little or no change. Prospects for bench jewelers and other skilled jewelers should be favorable; keen competition is expected for lower-skilled manufacturing jobs, such as assemblers and polishers.

Employment change. Employment of jewelers and precious stone and metal workers is expected to experience little or no change, declining 2 percent between 2006 and 2016.

The increasing numbers of affluent individuals, working women, double-income households, and fashion-conscious men are expected to keep jewelry sales strong. The population aged 45 and older, which accounts for a major portion of jewelry sales, also is on the rise. However, most jewelry manufacturing has already moved abroad, and this trend is expected to continue.

Nontraditional jewelry marketers, such as discount stores, mail-order and catalogue companies, television shopping networks, and Internet retailers, have expanded the number of buying options and increased their sales volume. However, these establishments require fewer sales staff, limiting employment opportunities for jewelers and precious stone and metal workers who work mainly in sales.

Traditional jewelers may continue to lose some of their market share to nontraditional outlets, but they will maintain a large customer base. Many buyers prefer to see and try on jewelry before purchasing it or enjoy the experience of shopping in a store. Jewelry stores also have the advantage of being able to offer personalized service and build client relationships. Additionally, new jewelry sold by nontraditional retailers will create demand for skilled jewelers for sizing, cleaning, and repair work. There may also be increased demand for bench jewelers as baby boomers seek customization and repair of heirloom jewelry.

Job prospects. Despite little or no change in employment, opportunities should be favorable for bench jewelers and other skilled jewelers. New jewelers will be needed to replace those who retire or who leave the occupation for other reasons. When master jewelers

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Jewelers and precious stone and metal workers	51-9071	52,000	51,000	-1,200	-2

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

retire, they take with them years of experience that require substantial time and financial resources to replace. Many employers have difficulty finding and retaining jewelers with the right skills and the necessary knowledge. Opportunities in jewelry stores and repair shops will be best for graduates from training programs for jewelers or gemologists.

Keen competition is expected for lower-skilled manufacturing jobs that are amenable to automation, such as assemblers and polishers. Jewelry designers who wish to create their own jewelry lines should expect intense competition. Although demand for customized and boutique jewelry is strong, it is difficult for independent designers to establish themselves.

The jewelry industry can be cyclical. During economic downturns, demand for jewelry products and for jewelers tends to decrease. However, demand for repair workers should remain strong even during economic slowdowns because maintaining and repairing jewelry is an ongoing process. In fact, demand for jewelry repair may increase during recessions, as people repair or restore existing pieces rather than purchase new ones.

Earnings

Median annual wage-and-salary earnings for jewelers and precious stone and metal workers were $29,750 in May 2006. The middle 50 percent earned between $22,390 and $40,160. The lowest 10 percent earned less than $17,760, and the highest 10 percent earned more than $54,940.

Most jewelers start out with a base salary, but once they become more proficient, they may begin charging by the number of pieces completed. Jewelers who work in retail stores may earn a commission for each piece of jewelry sold. Many jewelers also enjoy a variety of benefits, including reimbursement from their employers for work-related courses and discounts on jewelry purchases.

Related Occupations

Jewelers and precious stone and metal workers do precision handwork. Other skilled workers who do similar jobs include precision instrument and equipment repairers; welding, soldering, and brazing workers; and woodworkers. Some jewelers and precious stone and metal workers create their own jewelry designs. Other occupations that require visual arts abilities include artists and related workers, and various designers— commercial and industrial, fashion, floral, graphic, and interior. Finally, some jewelers and precious stone and metal workers are involved in the buying and selling of stones, metals, or finished pieces of jewelry. Similar occupations include retail salespersons and sales representatives in wholesale trade.

Medical, Dental, and Ophthalmic Laboratory Technicians

(O*NET 51-9081.00, 51-9082.00, and 51-9083.00)

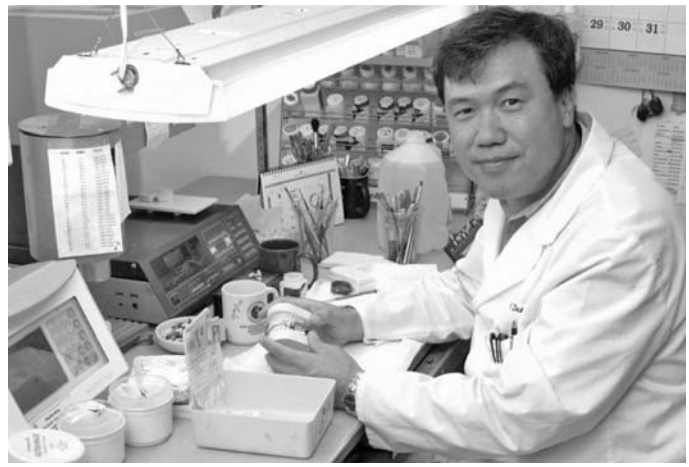
Significant Points

- Around 55 percent of salaried jobs are in medical equipment and supply manufacturing laboratories, which usually are small, privately owned businesses with fewer than 5 employees.
- Most technicians learn their craft on the job, but many employers prefer to hire those with formal training.
- Slower-than-average employment growth is expected for dental and ophthalmic laboratory technicians, while average employment growth is expected for medical appliance technicians.
- Job opportunities should be favorable because few people seek these positions.

Nature of the Work

When patients require a medical device to help them see clearly, chew and speak well, or walk, their health care providers send requests to medical, dental, and ophthalmic laboratory technicians. These technicians produce a variety of implements to help patients.

Medical appliance technicians construct, fit, maintain, and repair braces, artificial limbs, joints, arch supports, and other surgical and medical appliances. They follow prescriptions or detailed instructions from podiatrists or orthotists, who request braces, supports, corrective shoes, or other devises; prosthetists, who order prostheses—replacement limbs, such as an arm, leg, hand, or foot—for patients who need them due to a birth defect, accident, or amputation; or other health care professionals. Medical appliance technicians who work with these types of devices are called orthotic and prosthetic technicians. Other medical appliance technicians work with appliances that help correct other medical problems, such as hearing aids.



Dental laboratory technicians create models of a patient's mouth, and use those models to create dental prosthetics such as dentures.

Creating medical devices takes several steps. To make arch supports, for example, technicians first make a wax or plastic impression of the patient's foot. Then they bend and form a material so that it conforms to prescribed contours required to fabricate structural components. If a support is mainly required to correct the balance of a patient with legs of different lengths, a rigid material is used. If the support is primarily intended to protect those with arthritic or diabetic feet, a soft material is used. Supports and braces are polished with grinding and buffing wheels. Technicians may cover arch supports with felt to make them more comfortable.

For prostheses, technicians construct or receive a plaster cast of the patient's limb to use as a pattern. Then, they lay out parts and use precision measuring instruments to measure them. Technicians may use wood, plastic, metal, or other material for the parts of the artificial limb. Next, they carve, cut, or grind the material using hand or power tools. Then, they drill holes for rivets and glue, rivet, or weld the parts together. They are able to do very precise work using common tools. Next, technicians use grinding and buffing wheels to smooth and polish artificial limbs. Lastly, they may cover or pad the limbs with rubber, leather, felt, plastic, or another material. Also, technicians may mix pigments according to formulas to match the patient's skin color and apply the mixture to the artificial limb.

After fabrication, medical appliance technicians test devices for proper alignment, movement, and biomechanical stability using meters and alignment fixtures. They also may fit the appliance on the patient and adjust them as necessary. Over time the appliance will wear down, so technicians must repair and maintain the device. They also may service and repair the machinery used for the fabrication of orthotic and prosthetic devices.

Dental laboratory technicians fill prescriptions from dentists for crowns, bridges, dentures, and other dental prosthetics. First, dentists send a specification of the item to be manufactured, along with an impression or mold of the patient's mouth or teeth. With new technology, a technician may receive a digital impression rather than a physical mold. Then dental laboratory technicians, also called *dental technicians,* create a model of the patient's mouth by pouring plaster into the impression and allowing it to set. They place the model on an apparatus that mimics the bite and movement of the patient's jaw. The model serves as the basis of the prosthetic device. Technicians examine the model, noting the size and shape of the adjacent teeth, as well as gaps within the gumline. Based upon these observations and the dentist's specifications, technicians build and shape a wax tooth or teeth model, using small hand instruments called wax spatulas and wax carvers. The wax model is used to cast the metal framework for the prosthetic device.

After the wax tooth has been formed, dental technicians pour the cast and form the metal and, using small hand-held tools, prepare the surface to allow the metal and porcelain to bond. They then apply porcelain in layers, to arrive at the precise shape and color of a tooth. Technicians place the tooth in a porcelain furnace to bake the porcelain onto the metal framework, and then adjust the shape and color, with subsequent grinding and addition of porcelain to achieve a sealed finish. The final product is a nearly exact replica of the lost tooth or teeth.

In some laboratories, technicians perform all stages of the work, whereas in other labs, each technician does only a few. Dental laboratory technicians can specialize in 1 of 5 areas: orthodontic appliances, crowns and bridges, complete dentures, partial dentures, or ceramics. Job titles can reflect specialization in these areas. For example, technicians who make porcelain and acrylic restorations are called *dental ceramists.*

Ophthalmic laboratory technicians—also known as *manufacturing opticians, optical mechanics,* or *optical goods workers*—make prescription eyeglass or contact lenses. Prescription lenses are curved in such a way that light is correctly focused onto the retina of the patient's eye, improving his or her vision. Some ophthalmic laboratory technicians manufacture lenses for other optical instruments, such as telescopes and binoculars. Ophthalmic laboratory technicians cut, grind, edge, and finish lenses according to specifications provided by dispensing opticians, optometrists, or ophthalmologists and may insert lenses into frames to produce finished glasses. Although some lenses still are produced by hand, technicians are increasingly using automated equipment to make lenses.

Ophthalmic laboratory technicians should not be confused with workers in other vision care occupations. Ophthalmologists and optometrists are "eye doctors" who examine eyes, diagnose and treat vision problems, and prescribe corrective lenses. Ophthalmologists are physicians who also perform eye surgery. Dispensing opticians, who also may do the work of ophthalmic laboratory technicians, help patients select frames and lenses, and adjust finished eyeglasses. (See the statement on physicians and surgeons, which includes ophthalmologists, as well as the statement on optometrists and opticians, dispensing, elsewhere in the *Handbook*.)

Ophthalmic laboratory technicians read prescription specifications, select standard glass or plastic lens blanks, and then mark them to indicate where the curves specified on the prescription should be ground. They place the lens in the lens grinder, set the dials for the prescribed curvature, and start the machine. After a minute or so, the lens is ready to be "finished" by a machine that rotates it against a fine abrasive, to grind it and smooth out rough edges. The lens is then placed in a polishing machine with an even finer abrasive, to polish it to a smooth, bright finish.

Next, the technician examines the lens through a lensometer, an instrument similar in shape to a microscope, to make sure that the degree and placement of the curve are correct. The technician then cuts the lenses and bevels the edges to fit the frame, dips each lens into dye if the prescription calls for tinted or coated lenses, polishes the edges, and assembles the lenses and frame parts into a finished pair of glasses.

In small laboratories, technicians usually handle every phase of the operation. In large ones, in which virtually every phase of the operation is automated, technicians may be responsible for operating computerized equipment. Technicians also inspect the final product for quality and accuracy.

Work environment. Medical, dental, and ophthalmic laboratory technicians generally work in clean, well-lighted, and well-ventilated laboratories. They have limited contact with the public. Salaried laboratory technicians usually work 40 hours a week, but some work part time. At times, technicians wear goggles to protect their eyes, gloves to handle hot objects, or masks to avoid inhaling dust. They may spend a great deal of time standing.

Dental technicians usually have their own workbenches, which can be equipped with Bunsen burners, grinding and polishing equipment, and hand instruments, such as wax spatulas and wax carvers. Some dental technicians have computer-aided milling equipment to assist them with creating artificial teeth.

Training, Other Qualifications, and Advancement

Most medical, dental, and ophthalmic laboratory technicians learn their craft on the job; however, many employers prefer to hire those with formal training.

Education and training. High school students interested in becoming medical appliance technicians should take mathematics, metal and wood shop, and drafting. Medical appliance technicians usually begin as helpers and gradually learn new skills as they gain experience.

Formal training is also available. In 2006, there were four orthotic and prosthetic technician programs accredited by the National Commission on Orthotic and Prosthetic Education (NCOPE). These programs offer either an associate degree or a one-year certificate for orthotic or prosthetic technicians. The programs instruct students on human anatomy and physiology, orthotic and prosthetic equipment and materials, and applied biomechanical principles to customize orthotics or prostheses. The programs also include clinical rotations to provide hands-on experience.

Dental laboratory technicians begin by learning simple tasks, such as pouring plaster into an impression, and progress to more complex procedures, such as making porcelain crowns and bridges. Becoming a fully trained technician requires an average of 3 to 4 years, depending upon the individual's aptitude and ambition, but it may take a few years more to become an accomplished technician. High school students interested in becoming dental laboratory technicians should take courses in art, metal and wood shop, drafting, and sciences. Courses in management and business may help those wishing to operate their own laboratories.

Training in dental laboratory technology also is available through community and junior colleges, vocational-technical institutes, and the Armed Forces. Formal training programs vary greatly both in length and in the level of skill they impart. In 2006, 20 programs in dental laboratory technology were accredited by the Commission on Dental Accreditation in conjunction with the American Dental Association. These programs provide classroom instruction in dental materials science, oral anatomy, fabrication procedures, ethics, and related subjects. In addition, each student is given supervised practical experience in a school or an associated dental laboratory. Accredited programs normally take 2 years to complete and lead to an associate degree. A few programs take about 4 years to complete and offer a bachelor's degree in dental technology. Graduates of two-year training programs need additional hands-on experience to become fully qualified.

Each dental laboratory owner operates in a different way, and classroom instruction does not necessarily expose students to techniques and procedures favored by individual laboratory owners. Students who have taken enough courses to learn the basics of the craft usually are considered good candidates for training, regardless of whether they have completed a formal program. Many employers will train someone without any classroom experience.

Ophthalmic laboratory technicians start on simple tasks if they are training to produce lenses by hand. They may begin with marking or blocking lenses for grinding; then, they progress to grinding, cutting, edging, and beveling lenses; finally, they are trained in assembling the eyeglasses. Depending on individual aptitude, it may take up to 6 months to become proficient in all phases of the work.

Employers filling trainee jobs prefer applicants who are high school graduates. Courses in science, mathematics, and computers are valuable; manual dexterity and the ability to do precision work are essential. Technicians using automated systems will find computer skills valuable.

A few ophthalmic laboratory technicians learn their trade in the Armed Forces or in the few programs in optical technology offered by vocational-technical institutes or trade schools. These programs have classes in optical theory, surfacing and lens finishing, and the reading and applying of prescriptions. Programs vary in length from 6 months to 1 year and award certificates or diplomas.

Other qualifications. A high degree of manual dexterity, good vision, and the ability to recognize very fine color shadings and variations in shape also are necessary for dental technicians. An artistic aptitude for detailed and precise work also is important.

Certification and advancement. Voluntary certification for orthotic and prosthetic technicians is available through the American Board for Certification in Orthotics and Prosthetics (ABC). Applicants are eligible for an exam after completing a program accredited by NCOPE or obtaining 2 years of experience as a technician under the direct supervision of an ABC-certified practitioner. After successfully passing the appropriate exam, technicians receive the Registered Orthotic Technician, Registered Prosthetic Technician, or Registered Prosthetic-Orthotic Technician credential. Certification may help those orthotic and prosthetic technicians seeking to advance.

With additional formal education, medical appliance technicians who make orthotics and prostheses can advance to become orthotists or prosthetists, technicians who work with patients who need braces, artificial limbs, or related devices and help to determine the specifications for those devices.

In large dental laboratories, dental technicians may become supervisors or managers. Experienced technicians may teach or take jobs with dental suppliers in such areas as product development, marketing, and sales. Opening one's own laboratory is another, and more common, way to advance and earn more.

The National Board for Certification, an independent board established by the National Association of Dental Laboratories, offers certification in dental laboratory technology. Certification, which is voluntary except in three states, can be obtained in five specialty areas: crowns and bridges, ceramics, partial dentures, complete dentures, and orthodontic appliances. Certification may increase chances of advancement.

Ophthalmic laboratory technicians can become supervisors and managers. Some become dispensing opticians, although further education or training generally is required in that occupation.

Employment

Medical, dental, and ophthalmic laboratory technicians held about 95,000 jobs in 2006. About 55 percent of salaried jobs were in medical equipment and supply manufacturing laboratories, which usually are small, privately owned businesses with fewer than 5 employees. However, some laboratories are large; a few employ more than 1,000 workers. The following tabulation shows employment by detailed occupation:

Dental laboratory technicians	53,000
Ophthalmic laboratory technicians	29,000
Medical appliance technicians	12,000

In addition to manufacturing laboratories, many medical appliance technicians worked in health and personal care stores, while others worked in public and private hospitals, professional and commercial equipment and supplies merchant wholesalers, or consumer goods rental centers. Some were self-employed.

In addition to manufacturing laboratories, many dental laboratory technicians worked in offices of dentists. Some dental laboratory technicians open their own offices.

Most ophthalmic laboratory technician jobs were in medical equipment and supplies manufacturing laboratories, about 29 percent. Another 29 percent of jobs were in health and personal care stores, such as optical goods stores that manufacture and sell prescription glasses and contact lenses. Some jobs were in offices of optometrists or ophthalmologists, while others worked at professional and commercial equipment and supplies merchant wholesalers. A few worked in commercial and service industry machine manufacturing firms that produce lenses for other optical instruments, such as telescopes and binoculars.

Job Outlook

Overall, slower-than-average growth is expected for employment of medical, dental, and ophthalmic laboratory technicians. However, job opportunities should be favorable because few people seek these positions.

Employment change. Overall employment for these occupations is expected to grow five percent from 2006 to 2016, slower than the average for all occupations.

Medical appliance technicians will grow at nine percent, about as fast as the average for all occupations, because of the increasing prevalence of the two leading causes of limb loss—diabetes and cardiovascular disease. In addition, advances in technology may spur demand for prostheses that allow for greater movement.

Employment of dental laboratory technicians is expected to grow more slowly than average, at four percent. During the last few years, demand has arisen from an aging public that is growing increasingly interested in cosmetic prostheses. For example, many dental laboratories are filling orders for composite fillings that are the same shade of white as natural teeth to replace older, less attractive fillings. However, job growth for dental laboratory technicians will be limited. The overall dental health of the population has improved because of fluoridation of drinking water and greater emphasis on preventive dental care, which has reduced the incidence of dental cavities. As a result, full dentures will be less common, as most people will need only a bridge or crown.

Ophthalmic laboratory technicians are expected to experience employment growth of seven percent, about as fast as the average for all occupations. Demographic trends make it likely that many more Americans will need vision care in the years ahead. Not only will the population grow, but also the proportion of middle-aged and older adults is projected to increase rapidly. Middle age is a time when many people use corrective lenses for the first time, and elderly persons usually require more vision care than others. However, the increasing use of automated machinery will temper job growth for ophthalmic laboratory technicians.

Job prospects. Job opportunities for medical, dental, and ophthalmic laboratory technicians should be favorable, despite expected slower-than-average growth. Few people seek these jobs, reflecting the relatively limited public awareness and low starting wages. In addition to openings from job growth, many job openings also will arise from the need to replace technicians who transfer to other occupations or who leave the labor force.

Earnings

Median hourly earnings of wage-and-salary medical appliance technicians were $14.99 in May 2006. The middle 50 percent earned between $11.34 and $19.65 an hour. The lowest 10 percent earned less than $8.93, and the highest 10 percent earned more than $27.00 an hour.

Median hourly earnings of wage-and-salary dental laboratory technicians were $15.67 in May 2006. The middle 50 percent earned between $11.61 and $20.57 an hour. The lowest 10 percent earned less than $9.16, and the highest 10 percent earned more than $26.13 an hour. In the two industries that employed the most dental laboratory technicians, medical equipment and supplies manufacturing and offices of dentists, median hourly earnings were $15.09 and $17.74, respectively.

Median hourly earnings of wage-and-salary ophthalmic laboratory technicians were $12.24 in May 2006. The middle 50 percent earned between $9.86 and $15.82 an hour. The lowest 10 percent earned less than $8.38, and the highest 10 percent earned more than $19.98 an hour. Median hourly earnings were $11.63 in medical equipment and supplies manufacturing and $11.49 in health and personal care stores, the two industries that employ the most ophthalmic laboratory technicians.

Related Occupations

Medical, dental, and ophthalmic laboratory technicians manufacture and work with the same devices that are used by dispensing opticians and orthotists and prosthetists. Other occupations that work with or manufacture goods using similar tools and skills are precision instrument and equipment repairers and textile, apparel, and furnishings occupations.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Medical, dental, and ophthalmic laboratory technicians	51-9080	95,000	100,000	5,000	5
Dental laboratory technicians	51-9081	53,000	55,000	2,000	4
Medical appliance technicians	51-9082	12,000	13,000	1,200	9
Ophthalmic laboratory technicians	51-9083	29,000	31,000	1,900	7

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

General information on grants and scholarships is available from individual schools. State employment service offices can provide information about job openings for medical, dental, and ophthalmic laboratory technicians.

Painting and Coating Workers, Except Construction and Maintenance

(O*NET 51-9121.00, 51-9122.00, and 51-9123.00)

Significant Points

- About 7 out of 10 jobs are in manufacturing establishments.
- Most workers acquire their skills on the job; training usually lasts from a few days to several months, but becoming skilled in all aspects of painting can require 1 to 2 years of training.
- Overall employment is projected to decline, but employment change will vary by specialty.
- Good job prospects are expected for those with painting experience.

Nature of the Work

Millions of items ranging from cars to candy are covered by paint, plastic, varnish, chocolate, or some other type of coating solution. Painting or coating is used to make a product more attractive or protect it from the elements. The paint finish on an automobile, for example, makes the vehicle more attractive and provides protection from corrosion. Achieving this end result is the work of painting and coating workers.

Before painting and coating workers can begin to apply the paint or other coating, they often need to prepare the surface. A metal, wood, or plastic part may need to be sanded or ground to correct imperfections or rough up a surface so that paint will stick to it. After preparing the surface, the product is carefully cleaned to prevent any dust or dirt from becoming trapped under the paint. Metal parts are often washed or dipped in chemical baths to prepare the surface for painting and protect against corrosion. If the product has more than one color or has unpainted parts, masking is required. Masking normally involves carefully covering portions of the product with tape and paper.

After the product is prepared for painting, coating, or varnishing, a number of techniques may be used to apply the paint. Perhaps the most straightforward technique is simply dipping an item in a large vat of paint or other coating. This is the technique used by *dippers*, who immerse racks or baskets of articles in vats of paint, liquid plastic, or other solutions by means of a power hoist.

Spraying products with a solution of paint or some other coating is also quite common. *Spray machine operators* use spray guns to coat metal, wood, ceramic, fabric, paper, and food products with paint and other coating solutions. Following a formula, operators fill the machine's tanks with a mixture of paints or chemicals, adding prescribed amounts of solution. Then they adjust nozzles on the spray guns to obtain the proper dispersion of the spray, and they hold or position the guns so as to direct the spray onto the article. Operators also check the flow and viscosity of the paint or solution and visually inspect the quality of the coating. When products are drying, these workers often must regulate the temperature and air circulation in drying ovens.

Transportation equipment painters work in well-ventilated paint rooms.

Some factories use automated painting systems that are operated by *coating, painting, and spraying machine setters, operators, and tenders*. When setting up the systems, operators position the automatic spray guns, set the nozzles, and synchronize the action of the guns with the speed of the conveyor carrying articles through the machine and drying ovens. The operator also may add solvents or water to the paint vessel to prepare the paint for application. During the operation of the painting machines, these workers tend the equipment, observe gauges on the control panel, and check articles for evidence of any variation from specifications. The operator uses a manual spray gun to "touch up" flaws.

Powder coating is another common technique for painting manufactured goods. Powder coating machines achieve a smooth finish on metal objects. Workers oversee machines that electrically charge the metal object so that it acts like a magnet. The object enters a powder room filled with powdered paint that is attracted to the magnetic object. After being covered in the powder, the object is baked in an oven where the paint melts into a smooth paint finish.

Individuals who paint, coat, or decorate articles such as furniture, glass, pottery, toys, cakes, and books are known as *painting, coating, and decorating workers*. Some workers coat confectionery, bakery, and other food products with melted chocolate, cheese, oils, sugar, or other substances. Paper is often coated to give it its gloss or finish and silver, tin, and copper solutions are often sprayed on glass to make mirrors.

The best known group of painting and coating workers are those who refinish old or damaged cars, trucks, and buses in automotive body repair and paint shops. *Transportation equipment painters*, also called *automotive painters*, who work in repair shops are among the most highly skilled manual spray operators because they perform intricate, detailed work and mix paints to match the original color, a task that is especially difficult if the color has faded. The preparation work on an old car is similar to painting other metal objects. The paint is normally applied with a manually controlled spray gun.

Transportation equipment painters who work on new cars oversee several automated steps. A modern car is first dipped in an anti-corrosion bath, then painted with the color of the car, and then painted in several coats of clear paint. The clear paint prevents scratches from damaging the colored paint on the car.

Most other transportation equipment painters either paint equipment too large to paint automatically—such as ships or giant construction equipment—or perform touch-up work to repair flaws in the paint caused either by damage during assembly or flaws during the automated painting process.

Whatever object is being painted and in whatever method, the painting process is often repeated several times to achieve a thick, smooth, protective coverage.

Work environment. Painting and coating workers typically work indoors and may be exposed to dangerous fumes from paint and coating solutions, although in general, workers' exposure to hazardous chemicals has decreased because of regulations limiting emissions of volatile organic compounds and other hazardous air pollutants. Painting usually is done in special ventilated booths with workers typically wearing masks or respirators that cover their noses and mouths. More sophisticated paint booths and fresh-air systems are increasingly used to provide a safer work environment.

Operators have to stand for long periods, and when using a spray gun, they may have to bend, stoop, or crouch in uncomfortable positions to reach different parts of the article. Some painters work suspended from ropes to reach high places.

Most painting and coating workers work a normal 40-hour week, but automotive painters in repair shops can work more than 50 hours a week, depending on the number of vehicles that need repainting.

Training, Other Qualifications, and Advancement

Most workers acquire their skills on the job; training usually lasts from a few days to several months, but becoming skilled in all aspects of painting can require 1 to 2 years of training.

Education and training. Training for beginning painting and coating machine setters, operators, and tenders and for painting, coating, and decorating workers, may last from a few days to a couple of months. Coating, painting, and spraying machine setters, operators, and tenders who modify the operation of computer-controlled equipment may require additional training in computer operations and minor programming. Most transportation equipment painters start as helpers and also gain their skills informally on the job.

Becoming skilled in all aspects of painting usually requires 1 to 2 years of on-the-job training and sometimes requires some formal classroom instruction. Beginning helpers usually remove trim, clean, and sand surfaces to be painted; mask surfaces they do not want painted; and polish finished work. As helpers gain experience, they progress to more complicated tasks, such as mixing paint to achieve a good match and using spray guns to apply primer coats or final coats to small areas.

Additional instruction in safety, equipment, and techniques is offered at some community colleges and vocational or technical schools. Some automotive painters are sent to technical schools to learn the intricacies of mixing and applying different types of paint. Such programs can improve employment prospects and speed promotion. Employers also sponsor training programs to help their workers become more productive. Additional training is available from manufacturers of chemicals, paints, or equipment, explaining their products and giving tips about techniques.

Other qualifications. Painting and coating workers in factories need to be able to read and follow detailed plans or blueprints. Some workers also need artistic talent to paint furniture, decorate cakes, or make sure that the paint on a car or other object is the right color. Applicants should be able to breathe comfortably wearing a respirator.

Certification and advancement. Voluntary certification by the National Institute for Automotive Service Excellence (ASE) is recognized as the standard of achievement for automotive painters. For certification, painters must pass a written examination and have at least 2 years of experience in the field. High school, trade or vocational school, or community or junior college training in automotive refinishing that meets ASE standards may substitute for up to 1 year of experience. To retain the certification, painters must retake the examination at least every 5 years.

Experienced painting and coating workers with leadership ability may become team leaders or supervisors. Many become paint and coating inspectors. Those who get practical experience or formal training may become sales or technical representatives for chemical or paint companies. Some automotive painters eventually open their own shops.

Employment

Painting and coating workers held about 192,000 jobs in 2006. Coating, painting, and spraying machine setters, operators, and tenders accounted for about 106,000 jobs, while transportation equipment painters constituted about 54,000. Another 31,000 jobs were held by painting, coating, and decorating workers.

Approximately 7 out of 10 wage-and-salary workers were employed by manufacturing establishments, particularly those that manufacture fabricated metal products, transportation equipment, industrial machines, household and office furniture, and plastic, wood, and paper products. Outside of manufacturing, workers were employed by independent automotive repair shops and by motor vehicle dealers. Less than 4 percent were self-employed.

Job Outlook

Overall employment of painting and coating workers is expected to decline slowly, but employment change will vary by specialty. Good job prospects are expected for those with painting experience.

Employment change. Overall employment of painting and coating workers is expected to decline slowly by 4 percent from 2006 to 2016. Declining employment is expected because better spraying

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Painting workers	51-9120	192,000	184,000	-8,000	-4
Coating, painting, and spraying machine setters, operators, and tenders	51-9121	106,000	93,000	-14,000	-13
Painters, transportation equipment	51-9122	54,000	59,000	4,600	8
Painting, coating, and decorating workers	51-9123	31,000	32,000	1,100	4

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

and coating machines and techniques allow fewer workers to produce the same amount of work. But employment change will vary by specialty.

Employment of coating, painting, and spraying machine setters, operators, and tenders is expected to decline 13 percent as improvements in the automation of paint and coating applications raise worker productivity, allowing fewer workers to accomplish the same work. For example, operators will be able to coat goods more rapidly as sophisticated industrial machinery moves and aims spray guns more efficiently.

Employment of transportation equipment painters is projected to grow 8 percent. Many transportation equipment painters work in auto body repair and the need for these workers is expected to increase as the number of cars on the road goes up. Growth in the ship building industry is expected to create additional openings for those who paint ships.

Painting, coating, and decorating workers are projected to grow 4 percent. Growth will be driven by growing employment in retail operations. In manufacturing, competition from imports and automation should reduce employment. However, the specialized skills required by these workers should limit job losses from automation.

Job prospects. Like many manufacturing occupations, employers report difficulty finding qualified workers. Opportunities should be good for those with painting experience. Excellent opportunities will exist for experienced painters in the oil and gas industry and the ship building industry over the next decade.

Earnings

Median hourly earnings of wage-and-salary coating, painting, and spraying machine setters, operators, and tenders were $12.90 in May 2006. The middle 50 percent earned between $10.34 and $16.28 an hour. The lowest 10 percent earned less than $8.67, and the highest 10 percent earned more than $19.87 an hour.

Median hourly earnings of wage-and-salary transportation equipment painters were $17.15 in May 2006. The middle 50 percent earned between $13.29 and $23.08 an hour. The lowest 10 percent earned less than $10.82, and the highest 10 percent earned more than $28.10 an hour. Median hourly earnings of transportation equipment painters were $17.15 in automotive repair and maintenance shops and $23.98 in motor vehicle manufacturing.

Median hourly earnings of wage-and-salary painting, coating, and decorating workers were $11.04 in May 2006. The middle 50 percent earned between $9.00 and $14.09 an hour. The lowest 10 percent earned less than $7.55, and the highest 10 percent earned more than $18.23 an hour.

Many automotive painters employed by motor vehicle dealers and independent automotive repair shops receive a commission based on the labor cost charged to the customer. Under this method, earnings depend largely on the amount of work a painter does and how fast it is completed. Employers frequently guarantee commissioned painters a minimum weekly salary. Helpers and trainees usually receive an hourly rate until they become sufficiently skilled to work on commission. Trucking companies, bus lines, and other organizations that repair and refinish their own vehicles usually pay by the hour.

Many painting and coating machine operators belong to unions, including the International Union of Painters and Allied Trades, the Sheet Metal Workers International Association, the United Auto Workers, and the International Brotherhood of Teamsters. Most union operators work for manufacturers and large motor vehicle dealers.

Related Occupations

Other occupations similar to painting and coating workers include painters and paperhangers and machine setters, operators, and tenders—metal and plastic. Painters who work in auto body repair work closely with automotive body and related repairers.

Sources of Additional Information

For more details about work opportunities, contact local manufacturers, automotive body repair shops, motor vehicle dealers, vocational schools, locals of unions representing painting and coating workers, or the local offices of the state employment service. The state employment service also may be a source of information about training programs.

Photographic Process Workers and Processing Machine Operators

(O*NET 51-9131.00 and 51-9132.00)

Significant Points

- Most workers receive on-the-job training from their companies, manufacturers' representatives, and experienced workers.
- A rapid decline in employment is expected as digital photography becomes commonplace.
- Job opportunities will be best for individuals with experience using computers and digital technology.

Nature of the Work

Both amateur and professional photographers rely heavily on photographic process workers and processing machine operators to develop film, make prints or slides, and do related tasks, such as enlarging or retouching photographs. *Photographic processing machine operators* operate various machines, such as mounting presses and motion picture film printing, photographic printing, and film developing machines. *Photographic process workers* perform more delicate tasks, such as retouching photographic negatives, prints, and images to emphasize or correct specific features.

A rapid decline in employment of photographic process workers and processing machine operators is expected as digital photography becomes commonplace.

Processing machine operators who work with digital images first load the raw images onto a computer, either directly from the camera or, more commonly, from a storage device such as a flash card or CD. Most processing of the images is done automatically by software, but images may also be reviewed manually by the operator, who then selects the images the customer wants printed and the quantity. Some digital processors also upload images onto a Web site so that the customer can view them from a home computer and share them with others.

Photographic processing machine operators often have specialized jobs. *Film process technicians* operate machines that develop exposed photographic film or sensitized paper in a series of chemical and water baths to produce negative or positive images. First, technicians mix developing and fixing solutions, following a formula. They then load the film in the machine, which immerses the exposed film in the various solutions to bring out the image. Finally they rinse it in water to remove the chemicals. The technician then dries the film. In some cases, these steps are performed by hand.

Color printer operators control equipment that produces color prints from negatives. These workers read customer instructions to determine processing requirements. They load film into color printing equipment, examine negatives to determine equipment control settings, set controls, and produce a specified number of prints. Finally, they inspect the finished prints for defects, remove any that are found, and insert the processed negatives and prints into an envelope for return to the customer.

Photographic process workers, sometimes known as *digital imaging technicians*, use computer images of conventional negatives and specialized computer software to vary the contrast of images, remove unwanted background, or combine features from different photographs.

Although computers and digital technology are replacing much manual work, some photographic process workers, especially those who work in portrait studios, still perform many specialized tasks by hand directly on the photo or negative. *Airbrush artists* restore damaged and faded photographs, and may color or shade drawings to create photographic likenesses using an airbrush. *Photographic retouchers* alter photographic negatives, prints, or images to accentuate the subject. *Colorists* apply oil colors to portrait photographs to create natural, lifelike appearances. *Photographic spotters* remove imperfections on photographic prints and images.

Work environment. Photographic process workers and processing machine operators generally work in clean, appropriately lighted, well-ventilated, and air-conditioned offices, photofinishing laboratories, or one-hour minilabs. In recent years, more commercial photographic processing has been done on computers than in darkrooms, and this trend is expected to continue.

Some photographic process workers and processing machine operators are exposed to the chemicals and fumes associated with developing and printing. These workers must wear rubber gloves and aprons and take precautions against these hazards. Those who use computers for extended periods may experience back pain, eyestrain, or fatigue.

Photographic processing machine operators must do repetitive work accurately and at a rapid pace. Photographic process workers do detailed tasks, such as airbrushing and spotting, which can contribute to eye fatigue.

Training, Other Qualifications, and Advancement

Most photographic process workers and processing machine operators receive on-the-job training from their companies, manufacturers' representatives, and experienced workers. New employees gradually learn to use the machines and chemicals that develop and print film and the computer techniques to process and print digital images.

Education and training. Employers prefer applicants who are high school graduates or who have some experience in the field. Familiarity with computers is essential for photographic processing machine operators. The ability to perform simple mathematical calculations also is helpful.

Photography courses that include instruction in film processing are valuable preparation. Such courses are available through high schools, vocational-technical institutes, private trade schools, and colleges and universities; some colleges offer degrees in photographic technology.

On-the-job training in photographic processing occupations can range from just a few hours for print machine operators to several months for photographic processing workers such as airbrush artists and colorists. Some workers attend periodic training seminars to maintain a high level of skill. With much of the processing and editing work now being done on computers, employees must continually learn new programs as they become available.

Other qualifications. Manual dexterity, good hand-eye coordination, and good vision, including normal color perception, are important qualifications for photographic process workers.

Advancement. Photographic process machine workers can sometimes advance from jobs as machine operators to supervisory positions in laboratories or to management positions within retail stores.

Employment

Photographic process workers held about 24,000 jobs in 2006. Photographic processing machine operators held about 49,000 jobs in 2006.

About 20 percent of photographic process workers were employed in photographic services. An additional 13 percent were employed by electronic and appliance stores and drug stores, and 14 percent worked in the publishing, internet services, and motion picture industries.

About 70 percent of photographic processing machine operators worked in retail establishments, primarily in general merchandise stores and drug stores Small numbers were employed in the printing industry and in portrait studios and commercial laboratories that process the work of professional photographers.

Job Outlook

A rapid decline in employment is expected for photographic process workers and processing machine operators through the year 2016. Job opportunities will be best for individuals with experience using computers and digital technology.

Employment change. Employment of photographic process workers and processing machine operators is expected to decline rapidly by 45 percent over the 2006–2016 decade. Digital cameras, which use electronic memory rather than film to record images, have in recent years become standard among professional photographers. They are rapidly gaining in popularity among amateur photographers as well as the cost of these cameras continues to fall. This will continue to reduce the demand for traditional photographic processing machine operators. However, while many digital camera owners will choose to print their own pictures with their own equipment, a growing number of casual photographers are choosing not to acquire the needed equipment and skills to print the photos themselves. For them, self-service machines and online ordering services will be able to meet most of the demand, but there will still be some demand for professionals to print digital photos and operate the machines, as well as to develop and print photos from those who continue to use film cameras.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16 Number	Change, 2006-16 Percent
Photographic process workers and processing machine operators	51-9130	73,000	40,000	-33,000	-45
Photographic process workers	51-9131	24,000	15,000	-8,600	-36
Photographic processing machine operators	51-9132	49,000	25,000	-25,000	-50

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Digital photography also will reduce demand for photographic process workers. Using digital cameras and technology, consumers who have a personal computer and the proper software are able to download and view pictures on their computer, as well as to manipulate, correct, and retouch their own photographs. No matter what improvements occur in camera technology, though, some photographic processing tasks will still require skillful manual treatment.

Job prospects. Job opportunities will be best for individuals with experience using computers and digital technology. Employment fluctuates somewhat over the course of the year, typically peaking during school graduation and summer vacation periods.

Earnings

Earnings of photographic process workers vary greatly depending on skill level, experience, and geographic location. Median hourly earnings for photographic process workers were $11.19 in May 2006. The middle 50 percent earned between $8.61 and $15.12. The lowest 10 percent earned less than $7.32, and the highest 10 percent earned more than $21.43. Median hourly earnings were $11.65 in photographic services.

Median hourly earning for photographic processing machine operators were $9.38 in May 2006. The middle 50 percent earned between $8.01 and $11.44. The lowest 10 percent earned less than $7.16, and the highest 10 percent earned more than $14.92. Median hourly earnings in the two industries employing the largest numbers of photographic processing machine operators were $9.58 in photographic services and $8.50 in health and personal care stores.

Related Occupations

Photographic process workers and processing machine operators need specialized knowledge of the photo developing process. Other workers who apply specialized technical knowledge include clinical laboratory technologists and technicians, computer operators, jewelers and precious stone and metal workers, prepress technicians and workers, printing machine operators, and science technicians.

Semiconductor Processors

(O*NET 51-9141.00)

Significant Points

- Employment is expected to decline over the next 10 years because of increasing automation and the building of many new plants abroad.
- Opportunities will be best for applicants who have an associate degree in a relevant subject.

Nature of the Work

Semiconductors are unique substances, which, under different conditions, can act as either conductors or insulators of electricity. Semiconductor processors turn one of these substances—silicon—into microchips, also known as integrated circuits. These microchips contain millions of tiny electronic components and are used in a wide range of products, from personal computers and cellular telephones to airplanes and missile guidance systems.

To manufacture microchips, semiconductor processors start with cylinders of silicon called ingots. First, the ingots are sliced into thin wafers. Using automated equipment, workers or robots polish the wafers, imprint precise microscopic patterns of the circuitry onto them using photolithography, etch out patterns with acids, and replace the patterns with conductors, such as aluminum or copper. The wafers then receive a chemical bath to make them smooth, and the imprint process begins again on a new layer with the next pattern. A complex chip may contain more than 20 layers of circuitry. Once the process is complete, wafers are then cut into individual chips, which are enclosed in a casing and shipped to equipment manufacturers.

The manufacturing and slicing of wafers to create semiconductors takes place in cleanrooms—production areas that are kept free of all airborne matter because the circuitry on a chip is so small that even microscopic particles can make it unusable. All semiconductor processors working in cleanrooms must wear special lightweight outer garments known as “bunny suits.” These garments fit over clothing to prevent lint and other particles from contaminating the cleanroom.

Semiconductor processors wear protective garments called “bunny suits” to avoid contaminating the chips they produce.

There are two types of semiconductor processors: operators and technicians. *Operators* start and monitor the equipment that performs the various production tasks. They spend the majority of their time at computer terminals, monitoring the operation of equipment to ensure that each of the tasks in the production of the wafer is performed correctly. Operators may also transfer wafer carriers from one station to the next, though the lifting of heavy wafer carriers is done by robots in most new fabricating plants.

Technicians are generally more experienced workers who troubleshoot production problems and make equipment adjustments and repairs. They take the lead in assuring quality control and in maintaining equipment. They also test completed chips to make sure they work properly. To keep equipment repairs to a minimum, technicians perform diagnostic analyses and run computations. For example, technicians may determine if a flaw in a chip is due to contamination and peculiar to that wafer, or if the flaw is inherent in the manufacturing process.

Work environment. The work pace in cleanrooms is deliberately slow. Limited movement keeps the air in cleanrooms as free as possible of dust and other particles, which can destroy microchips during their production. Because the machinery sets the operators' rate of work, workers maintain a relaxed pace. Although workers spend some time alone monitoring equipment, operators and technicians spend much of their time working in teams.

Technicians are on their feet most of the day, walking through the cleanroom to oversee production activities. Operators spend a great deal of time sitting or standing at workstations, monitoring computer readouts and indicators.

The temperature in the cleanrooms must be kept within a narrow range and is generally comfortable for workers. Although bunny suits cover virtually the entire body, their lightweight fabric keeps the temperature inside fairly comfortable. Entry and exit of workers from the cleanroom are controlled to minimize contamination, and workers must be reclothed in a clean bunny suit and decontaminated each time they return to the cleanroom.

Several highly toxic chemicals are used at various points in the process of manufacturing microchips. Workers who are exposed to such chemicals can be seriously harmed. However, fabrication plants are designed with safeguards to ensure that these chemicals are handled, used, and disposed of without exposing workers or the surrounding environment. Toxic chemicals are applied to wafers by computer-controlled machine tools in sealed chambers, and there is normally little risk of workers coming into contact with them.

Semiconductor fabricating plants operate around the clock. Night and weekend work is common. In some plants, workers maintain standard eight-hour shifts, five days a week. In other plants, employees are on duty for 12-hour shifts to minimize the disruption of cleanroom operations brought about by changes. Managers may also allow workers to alternate schedules, thereby distributing the overnight shift equitably.

Training, Other Qualifications, and Advancement

People interested in becoming semiconductor processors—either operators or technicians—need strong technical skills, an ability to solve problems intuitively, and an ability to work in teams. Mathematics, including statistics, and physical science knowledge are also very useful. Communication skills and an understanding of manufacturing principles are also very important.

Education and training. For semiconductor processor jobs, employers prefer applicants who have completed an associate degree. However, experience plus completion of a one-year certificate program in semiconductor technology, offered by some community colleges, may also be sufficient. Some semiconductor technology programs at community colleges include internships at semiconductor fabricating plants. Other applicants may qualify by completing a degree in high-tech manufacturing. Hands-on training is an important part of degree and certificate programs.

To ensure that operators and technicians keep their skills current, employers provide regular on-the-job training. Some employers also provide financial assistance to employees who want to earn an associate or bachelor's degree, especially if the employee is working toward becoming a technician.

Advancement. Workers advance as they become more comfortable with the equipment and better understand the manufacturing process. Employees train workers for several months, after which they become entry-level operators or technicians. After a few years, as they become more knowledgeable about the operations of the plant, they generally advance to the intermediate level. This entails greater responsibilities. Over time, usually 7 to 10 years, workers may become senior technicians, who lead teams of technicians and work directly with engineers to develop processes in the plant.

Employment

Semiconductor processors held approximately 42,000 jobs in 2006. Nearly all of them were employed in the computer and electronic product manufacturing industry.

Job Outlook

Employment of semiconductor processors is projected to decline through 2016. Opportunities will be best for those with a two-year degree and experience working in high-tech manufacturing.

Employment change. Employment of semiconductor processors is projected to decline moderately, decreasing by 13 percent between 2006 and 2016. Although the demand for microchips is growing at a very rapid rate, employment levels in the industry will not increase over the next 10 years because of automation and the opening of fabricating plants in other countries. As the electrical components of chips become smaller, they become more sensitive. This means that chip manufacturers prefer precise robotics to human workers, who could potentially damage the chips. Additionally, there is a trend toward moving production to the areas where demand is most concentrated, thus, reducing the demand for U.S. exports of microchips. While this has not decreased U.S. production, fewer new plants are being constructed here.

Because of increased automation, most of the new positions created will be for technicians. While operator jobs will decline as older plants close and newer plants use more robotics, technician jobs will become more prevalent as the machinery becomes more

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Semiconductor processors	51-9141	42,000	37,000	-5,500	-13

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

complex and needs more monitoring. Technicians are responsible for understanding more of the fabrication process, so companies hiring new employees will expect a higher level of competency.

The demand for semiconductor chips remains very high, stemming from the many existing and future applications for semiconductors in computers, appliances, machinery, biotechnology, vehicles, cell phones, and other equipment.

Job prospects. Despite the decline in employment, some jobs will open up due to the need to replace workers who leave the occupation. Bcause specialized training is required to excel in this field, the number of openings is expected to remain in rough balance with the number of qualified job seekers. Prospects will be best for applicants with an associate degree and experience in high-tech manufacturing.

Earnings

Median annual earnings of wage-and-salary semiconductor processors were $32,860 in May 2006. The middle 50 percent earned between $26,680 and $40,620 an hour. The lowest 10 percent earned less than $21,700, and the top 10 percent earned more than $49,470 an hour.

Technicians with an associate degree in electronics or semiconductor technology generally start at higher salaries than those with less education.

Semiconductor processors generally received good benefits packages, including health care, disability plans and life insurance, stock options and retirement.

Related Occupations

Semiconductor processors do production work that resembles the work of precision assemblers and fabricators of other high-tech equipment. Also, many electronic semiconductor processors have academic training in semiconductor technology, which emphasizes scientific and engineering principles. Other occupations that require some college or postsecondary vocational training emphasizing such principles are engineering technicians, electrical engineers, and science technicians.

Transportation and Material Moving Occupations

Air Transportation Occupations

Air Traffic Controllers

(O*NET 53-2021.00)

Significant Points

- Nearly all air traffic controllers are employed by the Federal Aviation Administration (FAA), an agency of the federal government.
- Replacement needs will continue to account for most job openings, reflecting the large number of air traffic controllers who will be eligible to retire over the next decade.
- Competition to get into FAA training programs is expected to remain keen; however, graduates of these programs have good job prospects.
- Air traffic controllers earn relatively high pay and have good benefits.

Nature of the Work

The air traffic control system is a vast network of people and equipment that ensures the safe operation of commercial and private aircraft. Air traffic controllers coordinate the movement of air traffic to make certain that planes stay a safe distance apart. Their immediate concern is safety, but controllers also must direct planes efficiently to minimize delays. Some regulate airport traffic through designated airspaces; others regulate airport arrivals and departures.

Although *airport tower controllers* or *terminal controllers* watch over all planes traveling through the airport's airspace, their main responsibility is to organize the flow of aircraft into and out of the airport. Relying on radar and visual observation, they closely monitor each plane to ensure a safe distance between all aircraft and to guide pilots between the hangar or ramp and the end of the airport's airspace. In addition, controllers keep pilots informed about changes in weather conditions such as wind shear, a sudden change in the velocity or direction of the wind that can cause the pilot to lose control of the aircraft.

During arrival or departure, several controllers direct each plane. As a plane approaches an airport, the pilot radios ahead to inform the terminal of the plane's presence. The controller in the radar room, just beneath the control tower, has a copy of the plane's flight plan and already has observed the plane on radar. If the path is clear, the controller directs the pilot to a runway; if the airport is busy, the plane is fitted into a traffic pattern with other aircraft waiting to land. As the plane nears the runway, the pilot is asked to contact the tower. There, another controller, who also is watching the plane on radar, monitors the aircraft the last mile or so to the runway, delaying any departures that would interfere with the plane's landing. Once the plane has landed, a ground controller in the tower directs it along the taxiways to its assigned gate. The ground controller usually works entirely by sight, but may use radar if visibility is very poor.

The procedure is reversed for departures. The ground controller directs the plane to the proper runway. The local controller then informs the pilot about conditions at the airport, such as weather, speed and direction of wind, and visibility. The local controller also issues runway clearance for the pilot to take off. Once in the air, the plane is guided out of the airport's airspace by the departure controller.

After each plane departs, airport tower controllers notify *enroute controllers* who will next take charge. There are 21 air route traffic control centers located around the country, each employing 300 to 700 controllers, with more than 150 on duty during peak hours at the busiest facilities. Airplanes usually fly along designated routes; each center is assigned a certain airspace containing many different routes. Enroute controllers work in teams of up to three members, depending on how heavy traffic is; each team is responsible for a section of the center's airspace. A team, for example, might be responsible for all planes that are between 30 and 100 miles north of an airport and flying at an altitude between 6,000 and 18,000 feet.

To prepare for planes about to enter the team's airspace, the radar associate controller organizes flight plans coming off a printer. If two planes are scheduled to enter the team's airspace at nearly the same time, location, and altitude, this controller may arrange with the preceding control unit for one plane to change its flight path. The previous unit may have been another team at the same or an adjacent center, or a departure controller at a neighboring terminal. As a plane approaches a team's airspace, the radar controller accepts responsibility for the plane from the previous controlling unit. The controller also delegates responsibility for the plane to the next controlling unit when the plane leaves the team's airspace.

The radar controller, who is the senior team member, observes the planes in the team's airspace on radar and communicates with the pilots when necessary. Radar controllers warn pilots about nearby planes, bad weather conditions, and other potential hazards. Two planes on a collision course will be directed around each other. If a pilot wants to change altitude in search of better flying conditions,

Air traffic controllers are primarily concerned with safety, but they also must direct planes efficiently to minimize delays.

the controller will check to determine that no other planes will be along the proposed path. The team responsible for the aircraft notifies the next team in charge of the airspace ahead as the flight progresses. Through team coordination, the plane arrives safely at its destination.

Both airport tower and enroute controllers usually control several planes at a time; often, they have to make quick decisions about completely different activities. For example, a controller might direct a plane on its landing approach and at the same time provide pilots entering the airport's airspace with information about conditions at the airport. While instructing these pilots, the controller also might observe other planes in the vicinity, such as those in a holding pattern waiting for permission to land, to ensure that they remain well separated.

The FAA has implemented an automated air traffic control system, called the National Airspace System (NAS) Architecture. The NAS Architecture is a long-term strategic plan that will allow controllers to more efficiently deal with the demands of increased air traffic. It encompasses the replacement of aging equipment and the introduction of new systems, technologies, and procedures to enhance safety and security and support future aviation growth. The NAS Architecture facilitates continuing discussion of modernization between the FAA and the aviation community.

In addition to airport towers and enroute centers, air traffic controllers also work in flight service stations at more than 35 locations, including 17 locations in Alaska. These *flight service specialists* provide pilots with preflight and inflight weather information, suggested routes, and other aeronautical information important to the safety of a flight. Flight service specialists relay air traffic control clearances to pilots not in direct communications with a tower or center, assist pilots in emergency situations, and initiate and coordinate searches for missing or overdue aircraft. At certain locations where there is no airport tower or the tower has closed for the day, flight service specialists provide airport advisory services to landing and departing aircraft. However, they are not involved in actively managing and separating air traffic.

Some air traffic controllers work at the FAA's Air Traffic Control Systems Command Center in Herndon, VA, where they oversee the entire system. They look for situations that will create bottlenecks or other problems in the system and then respond with a management plan for traffic into and out of the troubled sector. The objective is to keep traffic levels in the trouble spots manageable for the controllers working at enroute centers.

Work environment. During busy times, controllers must work rapidly and efficiently. Total concentration is required to keep track of several planes at the same time and to make certain that all pilots receive correct instructions. The mental stress of being responsible for the safety of several aircraft and their passengers can be exhausting. Unlike tower controllers, radar controllers also have the extra stress of having to work in semi-darkness, never seeing the actual aircraft they control except as a small "bleep" on the radarscope. Controllers who work in flight service stations work in offices close to the communications and computer equipment.

Controllers work a basic 40-hour week; however, they may work additional hours, for which they receive overtime, or premium pay, or equal time off. Because most control towers and centers operate 24 hours a day, 7 days a week, controllers rotate night and weekend shifts. Contract flight service station working conditions may vary somewhat from the FAA.

Training, Other Qualifications, and Advancement

To become an air traffic controller, a person must complete an FAA-approved education program; pass a pre-employment test; receive a school recommendation; meet the basic qualification requirements in accordance with federal law; and achieve a qualifying score on the FAA-authorized pre-employment test. Candidates also must pass a medical exam, undergo drug screening, and obtain a security clearance before they can be hired.

Education and training. Individuals must enroll in an FAA-approved education program and pass a pre-employment test that measures the applicant's ability to learn the controller's duties. Exceptions are air traffic controllers with prior experience and military veterans. The pre-employment test is currently offered only to students in the FAA Air Traffic Collegiate Training Initiative Program or the Minneapolis Community and Technical College, Air Traffic Control Training Program. The test is administered by computer and takes about 8 hours to complete. To take the test, an applicant must apply under an open advertisement for air traffic control positions and be chosen to take the examination. When there are many more applicants than available positions, applicants are selected to take the test through random selection. In addition to the pre-employment test, applicants must have 3 years of full-time work experience, have completed a full 4 years of college, or a combination of both. In combining education and experience, 1 year of undergraduate study—30 semester or 45 quarter hours—is equivalent to 9 months of work experience. Certain kinds of aviation experience also may be substituted for these requirements.

Upon successful completion of an FAA-approved program, individuals who receive school recommendation, meet the basic qualification requirements (including being less than 31 years of age) in accordance with federal law, and achieve a qualifying score on the FAA-authorized pre-employment test become eligible for employment as an air traffic controller.

Upon selection, employees attend the FAA Academy in Oklahoma City, OK, for 12 weeks of training, during which they learn the fundamentals of the airway system, FAA regulations, controller equipment, and aircraft performance characteristics, as well as more specialized tasks.

After graduation from the FAA Academy in Oklahoma City, candidates are assigned to an air traffic control facility and are classified as "developmental controllers" until they complete all requirements to be certified for all of the air traffic control positions within a defined area of a given facility. Generally, it takes new controllers with only initial controller training between 2 and 4 years, depending on the facility and the availability of facility staff or contractors to provide on-the-job training, to complete all the certification requirements to become certified professional controllers. Individuals who have had prior controller experience normally take less time to become fully certified. Controllers who fail to complete either the academy or the on-the-job portions of the training usually are dismissed. Controllers must pass a physical examination each year and a job performance examination twice each year. Failure to become certified in any position at a facility within a specified time also may result in dismissal. Controllers also are subject to drug screening as a condition of continuing employment.

Other qualifications. Air traffic controllers must be articulate to give pilots directions quickly and clearly. Intelligence and a good memory also are important because controllers constantly receive information that they must immediately grasp, interpret, and remember. Decisiveness also is required because controllers often have to make quick decisions. The ability to concentrate is crucial because controllers must make these decisions in the midst of noise and other distractions.

Advancement. At airports, new controllers begin by supplying pilots with basic flight data and airport information. They then advance to the position of ground controller, then local controller,

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Air traffic controllers	53-2021	25,000	28,000	2,600	10

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

departure controller, and, finally, arrival controller. At an air route traffic control center, new controllers first deliver printed flight plans to teams, gradually advancing to radar associate controller and then to radar controller.

Controllers can transfer to jobs at different locations or advance to supervisory positions, including management or staff jobs—such as air traffic control data systems computer specialist—in air traffic control, and top administrative jobs in the FAA. However, there are only limited opportunities for a controller to switch from a position in an enroute center to a tower. Contract flight service station working conditions may vary somewhat from the FAA.

Employment

Air traffic controllers held about 25,000 jobs in 2006. The vast majority were employed by the FAA. Air traffic controllers work at airports—in towers and flight service stations—and in air route traffic control centers. Some professional controllers conduct research at the FAA's national experimental center near Atlantic City, NJ. Others serve as instructors at the FAA Academy in Oklahoma City. A small number of civilian controllers work for the U.S. Department of Defense. In addition to controllers employed by the federal government, some work for private air traffic control companies providing service to non-FAA towers and contract flight service stations.

Job Outlook

Most employment opportunities are expected to result from the need to replace workers who retire or leave the occupation for other reasons; graduates of an FAA training program have good prospects.

Employment change. Employment of air traffic controllers is projected to grow 10 percent from 2006 to 2016, about as fast as the average for all occupations. Increasing air traffic will require more controllers to handle the additional work. Job growth, however, is not expected to keep pace with the increasing number of aircraft flying. New computerized systems will assist the controller by automatically making many of the routine decisions. This will allow controllers to handle more traffic, thus increasing their productivity. In addition, federal budget constraints may limit hiring of air traffic controllers.

Job prospects. Most job opportunities are expected as the result of replacement needs from workers leaving the occupation. The majority of today's air traffic controllers will be eligible to retire over the next decade, although not all are expected to do so. Nevertheless, replacement needs will result in job opportunities each year for those graduating from the FAA training programs. Despite the increasing number of jobs coming open, competition to get into the FAA training programs is expected to remain keen, as there generally are many more applicants to get into the schools than there are openings, but those who graduate have good prospects of getting a job as a controller.

Air traffic controllers who continue to meet the proficiency and medical requirements enjoy more job security than do most workers. The demand for air travel and the workloads of air traffic controllers decline during recessions, but controllers seldom are laid off.

Earnings

Air traffic controllers earn relatively high pay and have good benefits. Median annual earnings of air traffic controllers in May 2006 were $117,240. The middle 50 percent earned between $86,860 and $142,210. The lowest 10 percent earned less than $59,410, and the highest 10 percent earned more than $145,600. The average annual salary, excluding overtime earnings, for air traffic controllers in the federal government—which employs 90 percent of all controllers—was $122,220 in May 2006.

The Air Traffic Control pay system classifies each air traffic facility into one of eight levels with corresponding pay bands. Under this pay system, controllers' salaries are determined by the rating of the facility. Higher ratings usually mean higher controller salaries and greater demands on the controller's judgment, skill, and decision-making ability.

Depending on length of service, air traffic controllers receive 13 to 26 days of paid vacation and 13 days of paid sick leave each year, in addition to life insurance and health benefits. Controllers also can retire at an earlier age and with fewer years of service than other federal employees. Air traffic controllers are eligible to retire at age 50 with 20 years of service as an active air traffic controller or after 25 years of active service at any age. There is a mandatory retirement age of 56 for controllers who manage air traffic. However, federal law provides for exemptions to the mandatory age of 56, up to age 61, for controllers having exceptional skills and experience. Earnings and benefits for controllers working in contract towers or flight service stations may vary.

Related Occupations

Airfield operations specialists also are involved in the direction and control of traffic in air transportation.

Sources of Additional Information

Aircraft Pilots and Flight Engineers

(O*NET 53-2011.00 and 53-2012.00)

Significant Points

- Regional and low-cost airlines offer the best opportunities; pilots attempting to get jobs at the major airlines will face strong competition.
- Pilots usually start with smaller commuter and regional airlines to acquire the experience needed to qualify for higher paying jobs with national or major airlines.
- Many pilots have learned to fly in the military, but growing numbers have college degrees with flight training from civilian flying schools that are certified by the Federal Aviation Administration (FAA).

- Earnings of airline pilots are among the highest in the nation.

Nature of the Work

Pilots are highly trained professionals who either fly airplanes or helicopters to carry out a wide variety of tasks. Most are *airline pilots, copilots*, and *flight engineers* who transport passengers and cargo. However, 1 out of 5 pilots is a *commercial pilot* involved in dusting crops, spreading seed for reforestation, testing aircraft, flying passengers and cargo to areas not served by regular airlines, directing firefighting efforts, tracking criminals, monitoring traffic, and rescuing and evacuating injured persons.

Before departure, pilots plan their flights carefully. They thoroughly check their aircraft to make sure that the engines, controls, instruments, and other systems are functioning properly. They also make sure that baggage or cargo has been loaded correctly. They confer with flight dispatchers and aviation weather forecasters to find out about weather conditions en route and at their destination. Based on this information, they choose a route, altitude, and speed that will provide the safest, most economical, and smoothest flight. When flying under instrument flight rules—procedures governing the operation of the aircraft when there is poor visibility—the pilot in command, or the company dispatcher, normally files an instrument flight plan with air traffic control so that the flight can be coordinated with other air traffic.

Takeoff and landing are the most difficult parts of the flight, and require close coordination between the two pilots. For example, as the plane accelerates for takeoff, the pilot who is flying the take off concentrates on the runway while the other pilot scans the instrument panel. To calculate the speed they must attain to become airborne, pilots consider the altitude of the airport, outside temperature, weight of the plane, and speed and direction of the wind. The moment the plane reaches takeoff speed, the nonflying pilot informs the flying pilot, who then pulls back on the controls to raise the nose of the plane. Captains and first officers usually alternate flying each leg from takeoff to landing.

Unless the weather is bad, the flight itself is relatively routine. Airplane pilots, with the assistance of autopilot and the flight management computer, steer the plane along their planned route and are monitored by the air traffic control stations they pass along the way. They regularly scan the instrument panel to check their fuel supply; the condition of their engines; and the air-conditioning, hydraulic, and other systems. Pilots may request a change in altitude or route if circumstances dictate. For example, if the ride is rougher than expected, pilots may ask air traffic control if pilots flying at other altitudes have reported better conditions; if so, they may request an altitude change. This procedure also may be used to find a stronger tailwind or a weaker headwind to save fuel and increase speed. In contrast, because helicopters are used for short trips at relatively low altitude, helicopter pilots must be constantly on the lookout for trees, bridges, power lines, transmission towers, and other dangerous obstacles as well as low-flying general aviation aircraft. Regardless of the type of aircraft, all pilots must monitor warning devices designed to help detect sudden shifts in wind conditions that can cause crashes.

Pilots have many nonflying duties that include keeping records, scheduling flights, arranging for major maintenance, and performing minor aircraft maintenance and repairs.

Pilots must rely completely on their instruments when visibility is poor. On the basis of altimeter readings, they know how high above ground they are and whether they can fly safely over mountains and other obstacles. Special navigation radios give pilots precise information that, with the help of special charts, tells them their exact position. Other very sophisticated equipment provides directions to a point just above the end of a runway and enables pilots to land completely without an outside visual reference. Once on the ground, pilots must complete records on their flight and the aircraft maintenance status for their company and the FAA.

The number of nonflying duties that pilots have depends on the employment setting. Airline pilots have the services of large support staffs and, consequently, perform few nonflying duties. However, because of the large numbers of passengers, airline pilots may be called upon to coordinate handling of disgruntled or disruptive passengers. Also, under the Federal Flight Deck Officer program airline pilots who undergo rigorous training and screening are deputized as federal law enforcement officers and are issued firearms to protect the cockpit against intruders and hijackers. Pilots employed by other organizations, such as charter operators or businesses, have many other duties. They may load the aircraft, handle all passenger luggage to ensure a balanced load, and supervise refueling; other nonflying responsibilities include keeping records, scheduling flights, arranging for major maintenance, and performing minor aircraft maintenance and repairs.

Except on small aircraft, two pilots usually make up the cockpit crew. Generally, the most experienced pilot, the *captain*, is in command and supervises all other crew members. The pilot and the copilot, often called the first officer, share flying and other duties, such as communicating with air traffic controllers and monitoring the instruments. Some large aircraft have a third crewmember, the flight engineer, who assists the pilots by monitoring and operating many of the instruments and systems, making minor in-flight repairs, and watching for other aircraft. The flight engineer also assists the pilots with the company, air traffic control, and cabin crew communications. New technology can perform many flight tasks, however, and virtually all new aircraft now fly with only two pilots, who rely more heavily on computerized controls.

Some pilots are flight instructors. They teach their students in ground-school classes, in simulators, and in dual-controlled planes and helicopters. A few specially trained pilots are examiners or check pilots. They periodically fly with other pilots or pilot's license applicants to make sure that they are proficient.

Work environment. Most pilots spend a considerable amount of time away from home because the majority of flights involve overnight layovers. When pilots are away from home, the airlines provide hotel accommodations, transportation between the hotel and airport, and an allowance for meals and other expenses.

Airline pilots, especially those on international routes, often experience jet lag—fatigue caused by many hours of flying through different time zones. To guard against pilot fatigue, which could result in unsafe flying conditions, the FAA requires airlines to allow pilots at least 8 hours of uninterrupted rest in the 24 hours before finishing their flight duty.

Commercial pilots face other types of job hazards. The work of test pilots, who check the flight performance of new and experimental planes, may be dangerous. Pilots who are crop-dusters may be exposed to toxic chemicals and seldom have the benefit of a regular landing strip. Helicopter pilots involved in rescue and police work may be subject to personal injury.

Although flying does not involve much physical effort, the mental stress of being responsible for a safe flight, regardless of the weather, can be tiring. Pilots must be alert and quick to react if something goes wrong, particularly during takeoff and landing.

FAA regulations limit flying time of airline pilots of large aircraft to a maximum of 100 hours a month or 1,000 hours a year. Most airline pilots fly an average of 65 to 75 hours a month and work at least an additional 65 to 75 hours a month performing nonflying duties. Most pilots have variable work schedules, working several days on, then several days off. Airlines operate flights at all hours of the day and night, so work schedules often are irregular. Flight assignments are based on seniority; the sooner pilots are hired, the stronger their bidding power is for preferred assignments.

Commercial pilots also may have irregular schedules, flying 30 hours one month and 90 hours the next. Because these pilots frequently have many nonflying responsibilities, they have much less free time than do airline pilots. Except for corporate flight department pilots, most commercial pilots do not remain away from home overnight. But, they may work odd hours. However, if the company owns a fleet of planes, pilots may fly a regular schedule.

Flight instructors may have irregular and seasonal work schedules, depending on their students' available time and the weather. Instructors frequently work in the evening or on weekends.

Training, Other Qualifications, and Advancement

All pilots who are paid to transport passengers or cargo must have a commercial pilot's license with an instrument rating issued by the FAA. Helicopter pilots also must hold a commercial pilot's license with a helicopter rating.

Education and training. Although some small airlines hire high school graduates, most airlines require at least 2 years of college and prefer to hire college graduates. In fact, most entrants to this occupation have a college degree. Because the number of college-educated applicants continues to increase, many employers are making a college degree an educational requirement. For example, test pilots often are required to have an engineering degree.

Pilots also need flight experience to qualify for a license. Completing classes at a flight school approved by the FAA can reduce the amount of flight experience required for a pilot's license. In 2006, the FAA certified about 600 civilian flying schools, including some colleges and universities that offer degree credit for pilot training. Initial training for airline pilots typically includes a week of company indoctrination; 3 to 6 weeks of ground school and simulator training; and 25 hours of initial operating experience, including a check-ride with an FAA aviation safety inspector. Once trained, pilots are required to attend recurrent training and simulator checks once or twice a year throughout their career.

Licensure. To qualify for FAA licensure, applicants must be at least 18 years old and have at least 250 hours of flight experience.

The U.S. Armed Forces have always been an important source of experienced pilots because of the extensive flying time and experience on jet aircraft and helicopters. Those without Armed Forces training may become pilots by attending flight schools or by taking lessons from FAA-certified flight instructors. Applicants also must pass a strict physical examination to make sure that they are in good health and have 20/20 vision with or without glasses, good hearing, and no physical handicaps that could impair their performance. They must pass a written test that includes questions on the principles of safe flight, navigation techniques, and FAA regulations, and must demonstrate their flying ability to FAA or designated examiners.

To fly during periods of low visibility, pilots must be rated by the FAA to fly by instruments. Pilots may qualify for this rating by having the required hours of flight experience, including 40 hours of experience in flying by instruments; they also must pass a written examination on procedures and FAA regulations covering instrument flying and demonstrate to an examiner their ability to fly by instruments. Requirements for the instrument rating vary depending on the certification level of flight school.

Airline pilots must fulfill additional requirements. Captains must have an airline transport pilot's license. Applicants for this license must be at least 23 years old and have a minimum of 1,500 hours of flying experience, including night and instrument flying, and must pass FAA written and flight examinations. Usually, they also have one or more advanced ratings depending on the requirements of their particular job. Because pilots must be able to make quick decisions and accurate judgments under pressure, many airline companies reject applicants who do not pass required psychological and aptitude tests. All licenses are valid so long as a pilot can pass the periodic physical and eye examinations and tests of flying skills required by the FAA and company regulations.

Other qualifications. Depending on the type of aircraft, new airline pilots start as first officers or flight engineers. Although some airlines favor applicants who already have a flight engineer's license, they may provide flight engineer training for those who have only the commercial license. Many pilots begin with smaller regional or commuter airlines, where they obtain experience flying passengers on scheduled flights into busy airports in all weather conditions. These jobs often lead to higher paying jobs with bigger, national or major airlines.

Companies other than airlines usually require less flying experience. However, a commercial pilot's license is a minimum requirement, and employers prefer applicants who have experience in the type of craft they will be flying. New employees usually start as first officers, or fly less sophisticated equipment.

Advancement. Advancement for pilots usually is limited to other flying jobs. Many pilots start as flight instructors, building up their flying hours while they earn money teaching. As they become more experienced, these pilots occasionally fly charter planes or perhaps get jobs with small air transportation firms, such as air-taxi companies. Some advance to flying corporate planes. A small number get flight engineer jobs with the airlines.

In the airlines, advancement usually depends on seniority provisions of union contracts. After 1 to 5 years, flight engineers advance according to seniority to first officer and, after 5 to 15 years, to captain. Seniority also determines which pilots get the more desirable routes. In a nonairline job, a first officer may advance to captain and, in large companies, to chief pilot or director of aviation in charge of aircraft scheduling, maintenance, and flight procedures.

Employment

Civilian aircraft pilots and flight engineers held about 107,000 jobs in 2006. About 79,000 worked as airline pilots, copilots, and flight engineers. The rest were commercial pilots who worked as flight

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Aircraft pilots and flight engineers	53-2010	107,000	121,000	14,000	13
Airline pilots, copilots, and flight engineers	53-2011	79,000	90,000	10,000	13
Commercial pilots	53-2012	28,000	31,000	3,600	13

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

instructors at local airports or for large businesses that fly company cargo and executives in their own airplanes or helicopters. Some commercial pilots flew small planes for air-taxi companies, usually to or from lightly traveled airports not served by major airlines. Others worked for a variety of businesses, performing tasks such as dusting crops, inspecting pipelines, or conducting sightseeing trips.

Pilots are located across the country, but airline pilots usually are based near major metropolitan airports or airports operating as hubs for the major airlines.

Federal, state, and local governments employed pilots. A few pilots were self-employed.

Job Outlook

Regional airlines and low-cost carriers will present the best opportunities; pilots attempting to get jobs at the major airlines will face strong competition.

Employment change. Employment of aircraft pilots and flight engineers is projected to grow 13 percent from 2006 to 2016, about as fast as the average for all occupations. Population growth and an expanding economy are expected to boost the demand for air travel, contributing to job growth. New jobs will be created as airlines expand their capacity to meet this rising demand by increasing the number of planes in operation. However, employment growth will be limited by productivity improvements as airlines switch to larger planes and adopt the low-cost carrier model that emphasizes faster turnaround times for flights, keeping more pilots in the air rather than waiting on the ground. Also, fewer flight engineers will be needed as new planes requiring only two pilots replace older planes that require flight engineers.

Job prospects. Job opportunities are expected to continue to be better with the regional airlines and low-cost carriers, which are growing faster than the major airlines. Opportunities with air cargo carriers also should arise because of increasing security requirements for shipping freight on passenger airlines, growth in electronic commerce, and increased demand for global freight. Business, corporate, and on-demand air taxi travel also should provide some new jobs for pilots.

Pilots attempting to get jobs at the major airlines will face strong competition, as those firms tend to attract many more applicants than the number of job openings. Applicants also will have to compete with laid-off pilots for any available jobs. Pilots who have logged the greatest number of flying hours using sophisticated equipment typically have the best prospects. For this reason, military pilots often have an advantage over other applicants.

In the long run, demand for air travel is expected to grow along with the population and the economy. In the short run, however, employment opportunities of pilots generally are sensitive to cyclical swings in the economy. During recessions, when a decline in the demand for air travel forces airlines to curtail the number of flights, airlines may temporarily furlough some pilots.

Earnings

Earnings of aircraft pilots and flight engineers vary greatly depending whether they work as airline or commercial pilots. Earnings of airline pilots are among the highest in the nation, and depend on factors such as the type, size, and maximum speed of the plane and the number of hours and miles flown. For example, pilots who fly jet aircraft usually earn higher salaries than pilots who fly turboprops. Airline pilots and flight engineers may earn extra pay for night and international flights. In May 2006, median annual earnings of airline pilots, copilots, and flight engineers were $141,090.

Median annual earnings of commercial pilots were $57,480 in May 2006. The middle 50 percent earned between $40,780 and $83,760. The lowest 10 percent earned less than $28,450, and the highest 10 percent earned more than $115,220.

Airline pilots usually are eligible for life and health insurance plans. They also receive retirement benefits and, if they fail the FAA physical examination at some point in their careers, they get disability payments. In addition, pilots receive an expense allowance, or "per diem," for every hour they are away from home. Some airlines also provide allowances to pilots for purchasing and cleaning their uniforms. As an additional benefit, pilots and their immediate families usually are entitled to free or reduced-fare transportation on their own and other airlines.

More than half of all aircraft pilots are members of unions. Most of the pilots who fly for the major airlines are members of the Air Line Pilots Association, International, but those employed by one major airline are members of the Allied Pilots Association.

Related Occupations

Although they are not in the cockpit, air traffic controllers and airfield operations specialists also play an important role in making sure flights are safe and on schedule, and participate in many of the decisions that pilots must make.

Sources of Additional Information

For information about job opportunities, salaries, and qualifications, write to the personnel manager of the particular airline.

Material Moving Occupations

(O*NET 53-1021.00, 53-7011.00, 53-7021.00, 53-7031.00, 53-7032.00, 53-7033.00, 53-7041.00, 53-7051.00, 53-7061.00, 53-7062.00, 53-7063.00, 53-7064.00, 53-7071.00, 53-7072.00, 53-7073.00, 53-7081.00, 53-7111.00, 53-7121.00, and 53-7199.99)

Significant Points

- Despite little or no change in employment, job openings should be plentiful because these occupations are very large and numerous openings will be created to replace workers who leave them.
- Most jobs require little work experience or training.
- Pay is low, and the seasonal nature of the work may reduce earnings.

Nature of the Work

Material moving workers are categorized into two groups—operators and laborers. *Operators* use machinery to move construction materials, earth, petroleum products, and other heavy materials. Generally, they move materials over short distances—around construction sites, factories, or warehouses. Some move materials onto or off of trucks and ships. Operators control equipment by moving levers, wheels, and/or foot pedals; operating switches; or turning dials. They also may set up and inspect equipment, make adjustments, and perform minor maintenance or repairs.

Laborers and *hand material movers* move freight, stock, or other materials by hand; clean vehicles, machinery, and other equipment; feed materials into or remove materials from machines or equipment; and pack or package products and materials.

Material moving occupations are classified by the type of equipment they operate or the goods they handle. Each piece of equipment requires different skills, as do different types of loads. (For information on operating engineers; paving, surfacing, and tamping equipment operators; and pile-driver operators, see the statement on construction equipment operators elsewhere in the *Handbook*.)

Industrial truck and tractor operators drive and control industrial trucks or tractors equipped to move materials around warehouses, storage yards, factories, construction sites, or other worksites. A typical industrial truck, often called a forklift or lift truck, has a hydraulic lifting mechanism and forks for moving heavy and large objects. Industrial truck and tractor operators also may operate tractors that pull trailers loaded with materials, goods, or equipment within factories and warehouses or around outdoor storage areas.

Many job openings are expected in material moving occupations.

Excavating and loading machine and dragline operators tend or operate machinery equipped with scoops, shovels, or buckets to dig and load sand, gravel, earth, or similar materials into trucks or onto conveyors. Construction and mining industries employ the majority of excavation and loading machine and dragline operators. *Dredge operators* excavate waterways, removing sand, gravel, rock, or other materials from harbors, lakes, rivers, and streams. Dredges are used primarily to maintain navigable channels but also are used to restore wetlands and other aquatic habitats; reclaim land; and create and maintain beaches. *Underground mining loading machine operators* use underground loading machines to load coal, ore, or rock into shuttles and mine cars or onto conveyors. Loading equipment may include power shovels, hoisting engines equipped with cable-drawn scrapers or scoops, and machines equipped with gathering arms and conveyors.

Crane and tower operators work mechanical boom and cable or tower and cable equipment to lift and move materials, machinery, and other heavy objects. Operators extend and retract horizontally mounted booms and lower and raise hooks attached to load lines. Most operators are guided by other workers using hand signals or a radio. Operators position loads from an onboard console or from a remote console at the site. While crane and tower operators are noticeable at office building and other construction sites, the biggest group works in primary metal, metal fabrication, and transportation equipment manufacturing industries that use heavy, bulky materials. Operators also work at major ports, loading and unloading large containers on and off ships. *Hoist and winch operators* control movement of cables, cages, and platforms to move workers and materials for manufacturing, logging, and other industrial operations. They work in positions such as derrick operators and hydraulic boom operators. Many hoist and winch operators are found in manufacturing or construction industries.

Pump operators tend, control, and operate pump and manifold systems that transfer gases, oil, or other materials to vessels or equipment. They maintain the equipment and regulate the flow of materials according to a schedule set up by petroleum Engineers or production supervisors. *Gas compressor and gas pumping station operators* operate steam, gas, electric motor, or internal combustion engine-driven compressors. They transmit, compress, or recover gases, such as butane, nitrogen, hydrogen, and natural gas. *Wellhead pumpers* operate pumps and auxiliary equipment to produce flows of oil or gas from extraction sites.

Tank car, truck, and ship loaders operate ship-loading and -unloading equipment, conveyors, hoists, and other specialized material-handling equipment such as railroad tank car-unloading equipment. They may gauge or sample shipping tanks and test them for leaks. *Conveyor operators and tenders* control and tend conveyor systems that move materials to or from stockpiles, processing stations, departments, or vehicles. *Shuttle car operators* run diesel or electric-powered shuttle cars in underground mines, transporting materials from the working face to mine cars or conveyors.

Laborers and hand freight, stock, and material movers manually move materials and perform other unskilled, general labor. These workers move freight, stock, and other materials to and from storage and production areas, loading docks, delivery vehicles, ships, and containers. Their specific duties vary by industry and work setting. In factories, they may move raw materials or finished goods

between loading docks, storage areas, and work areas, as well as sort materials and supplies and prepare them according to their work orders. Specialized workers within this group include baggage and cargo handlers—who work in transportation industries—and truck loaders and unloaders.

Hand packers and packagers manually pack, package, or wrap a variety of materials. They may inspect items for defects, label cartons, stamp information on products, keep records of items packed, and stack packages on loading docks. This group also includes order fillers, who pack materials for shipment, as well as grocery store courtesy clerks. In grocery stores, they may bag groceries, carry packages to customers' cars, and return shopping carts to designated areas.

Machine feeders and offbearers feed materials into or remove materials from equipment or machines tended by other workers.

Cleaners of vehicles and equipment clean machinery, vehicles, storage tanks, pipelines, and similar equipment using water and cleaning agents, vacuums, hoses, brushes, cloths, or other cleaning equipment.

Refuse and recyclable material collectors gather refuse and recyclables from homes and businesses into their trucks for transport to a dump, landfill, or recycling center. They lift and empty garbage cans or recycling bins by hand or, using hydraulic lift trucks, pick up and empty dumpsters. They work along scheduled routes.

Work environment. Material moving work tends to be repetitive and physically demanding. Workers may lift and carry heavy objects and stoop, kneel, crouch, or crawl in awkward positions. Some work at great heights and some work outdoors—regardless of weather and climate. Some jobs expose workers to fumes, odors, loud noises, harmful materials and chemicals, or dangerous machinery. To protect their eyes, respiratory systems, and hearing, these workers wear safety clothing, such as gloves, hardhats, and other safety devices such as respirators. These jobs have become much less dangerous as safety equipment—such as overhead guards on lift trucks—has become common. Accidents usually can be avoided by observing proper operating procedures and safety practices.

Material movers generally work eight-hour shifts—though longer shifts are not uncommon. In industries that work around the clock, material movers may work overnight shifts. Some do this because their employers do not want to disturb customers during normal business hours. Refuse and recyclable material collectors often work shifts starting at 5 or 6 a.m. Some material movers work only during certain seasons, such as when the weather permits construction activity.

Training, Other Qualifications, and Advancement

Many material moving occupations require little or no formal training. Most training for these occupations is done on the job. For those jobs requiring physical exertion, employers may require that applicants pass a physical exam. Some employers also require drug testing or background checks.

Education and training. Material movers generally learn skills informally, on the job, from more experienced workers or their supervisors. Some employers prefer applicants with a high school diploma, but most simply require workers to be at least 18 years old and physically able to perform the work.

Workers who handle toxic chemicals or use industrial trucks or other dangerous equipment must receive specialized training in safety awareness and procedures. Many of the training requirements are standardized through the U.S. Occupational Safety and Health Administration. This training is usually provided by the employer. Employers also must certify that each operator has received the training and evaluate each operator at least once every 3 years.

For other operators, such as crane operators and those working with specialized loads, there are some training and apprenticeship programs available, such as that offered by the International Union of Operating Engineers. Apprenticeships combine paid on-the-job training with classroom instruction.

Licensure. Fifteen states and 6 cities have laws requiring crane operators to be licensed. Licensing requirements typically include a written as well as a skills test to demonstrate that the licensee can operate a crane safely.

Certification and other qualifications. Some types of equipment operators can become certified by professional associations, such as the National Commission for the Certification of Crane Operators, and some employers may require operators to be certified.

Material moving equipment operators need a good sense of balance, the ability to judge distances, and eye-hand-foot coordination. For jobs that involve dealing with the public, such as grocery store courtesy clerks, workers should be pleasant and courteous. Most jobs require basic arithmetic skills and the ability to read procedural manuals, to understand orders, and other billing documents. Mechanical aptitude and training in automobile or diesel mechanics can be helpful because some operators may perform basic maintenance on their equipment. Experience operating mobile equipment—such as tractors on farms or heavy equipment in the Armed Forces—is an asset. As material moving equipment becomes more advanced, workers will need to be increasingly comfortable with technology.

Advancement. In many of these occupations, experience may allow workers to qualify or become trainees for jobs such as construction trades workers; assemblers or other production workers; motor vehicle operators; or vehicle and mobile equipment mechanics, installers, and repairers. In many workplaces new employees gain experience in a material moving position before being promoted to a better paying and more highly skilled job. Some may eventually advance to become supervisors.

Employment

Material movers held 4.8 million jobs in 2006. They were distributed among the detailed occupations as follows:

Laborers and freight, stock, and material movers, hand	2,416,000
Packers and packagers, hand	834,000
Industrial truck and tractor operators	637,000
Cleaners of vehicles and equipment	368,000
Machine feeders and offbearers	148,000
Refuse and recyclable material collectors	136,000
Excavating and loading machine and dragline operators	80,000
Conveyor operators and tenders	50,000
Crane and tower operators	46,000
Tank car, truck, and ship loaders	16,000
Wellhead pumpers	14,000
Pump operators, except wellhead pumpers	11,000
Gas compressor and gas pumping station operators	4,200
Loading machine operators, underground mining	3,100
Hoist and winch operators	3,000
Shuttle car operators	2,900
Dredge operators	2,100
Material moving workers, all other	54,000

About 29 percent of all material movers worked in the wholesale trade or retail trade industries. Another 21 percent worked in manufacturing; 16 percent in transportation and warehousing; 4 percent in construction and mining; and 14 percent in the employment services industry, on a temporary or contract basis. For example, companies that need workers for only a few days, to move materials or to clean up a site, may contract with temporary help agencies spe-

cializing in providing suitable workers on a short-term basis. A small proportion of material movers were self-employed.

Material movers work in every part of the country. Some work in remote locations on large construction projects such as highways and dams, while others work in factories, warehouses, or mining operations.

Job Outlook

Job openings should be numerous because these occupations are very large and turnover is relatively high, even though little or no change in employment is expected because of automation.

Employment change. Employment in material moving occupations is projected to decline by 1 percent between 2006 and 2016, which is considered little or no change in employment. Improvements in equipment, such as automated storage and retrieval systems and conveyors, will continue to raise productivity and moderate the demand for material movers.

Job growth for material movers depends on the growth or decline of employing industries and the type of equipment the workers operate or the materials they handle. Employment will grow in the warehousing and storage industry as more firms contract out their warehousing functions to this industry. For example, a frozen food manufacturer may reduce its costs by outsourcing these functions to a refrigerated warehousing firm, which can more efficiently deal with the specialized storage needs of frozen food. Jobs in mining are expected to decline due to continued productivity increases within that industry. Opportunities for material movers will also decline in manufacturing due to productivity improvements and outsourcing of warehousing and other activities that depend on material movers. Job growth generally will be slower in large establishments, which can afford to invest in automated systems for their material moving needs.

Construction is very sensitive to changes in economic conditions, so the number of job openings in this industry will fluctuate. Although increasing automation will eliminate some routine tasks, new jobs will be created by the need to operate and maintain new equipment. Additionally, firms are more likely initially to use workers when expanding their businesses as opposed to using automated systems due to the large fixed costs associated with such systems.

Job prospects. Despite the little or no employment growth expected, job openings should be plentiful due to the fact that these occupations are very large and there will be a relatively high number of openings created by the need replace workers who transfer to other occupations or who retire or leave the labor force for other reasons—characteristic of occupations requiring little prior or formal training.

Earnings

Median hourly earnings of material moving workers in May 2006 were relatively low, as indicated by the following tabulation:

Gas compressor and gas pumping station operators	$21.83
Pump operators, except wellhead pumpers	19.13
Shuttle car operators	18.78
Crane and tower operators	18.77
Loading machine operators, underground mining	17.91
Wellhead pumpers	17.38
Dredge operators	16.26
Hoist and winch operators	16.16
Excavating and loading machine and dragline operators	15.83
Tank car, truck, and ship loaders	15.37
Refuse and recyclable material collectors	13.93
Industrial truck and tractor operators	13.11
Conveyor operators and tenders	13.09
Machine feeders and offbearers	10.88
Laborers and freight, stock, and material movers, hand	10.20
Cleaners of vehicles and equipment	8.68
Packers and packagers, hand	8.48
Material moving workers, all other	14.55

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Material moving occupations	53-7000	4,825,000	4,800,000	-25,000	-1
Conveyor operators and tenders	53-7011	50,000	46,000	-3,700	-7
Crane and tower operators	53-7021	46,000	48,000	1,300	3
Dredge, excavating, and loading machine operators	53-7030	85,000	92,000	6,900	8
Dredge operators	53-7031	2,100	2,300	100	7
Excavating and loading machine and dragline operators	53-7032	80,000	87,000	6,700	8
Loading machine operators, underground mining	53-7033	3,100	3,200	100	4
Hoist and winch operators	53-7041	3,000	3,000	0	-1
Industrial truck and tractor operators	53-7051	637,000	624,000	-13,000	-2
Laborers and material movers, hand	53-7060	3,766,000	3,741,000	-25,000	-1
Cleaners of vehicles and equipment	53-7061	368,000	420,000	52,000	14
Laborers and freight, stock, and material movers, hand	53-7062	2,416,000	2,466,000	50,000	2
Machine feeders and offbearers	53-7063	148,000	125,000	-22,000	-15
Packers and packagers, hand	53-7064	834,000	730,000	-104,000	-12
Pumping station operators	53-7070	29,000	25,000	-3,800	-13
Gas compressor and gas pumping station operators	53-7071	4,200	3,400	-700	-17
Pump operators, except wellhead pumpers	53-7072	11,000	9,200	-1,300	-13
Wellhead pumpers	53-7073	14,000	13,000	-1,700	-12
Refuse and recyclable material collectors	53-7081	136,000	146,000	10,000	7
Shuttle car operators	53-7111	2,900	2,600	-200	-8
Tank car, truck, and ship loaders	53-7121	16,000	18,000	1,500	9
Material moving workers, all other	53-7199	54,000	54,000	400	1

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Wages vary according to experience and job responsibilities. Wages usually are higher in metropolitan areas. Seasonal peaks and lulls in workload can affect the number of hours scheduled which affects earnings. Some crane operators, such as those unloading containers from ships at major ports earn substantially more then their counterparts in other industries or establishments. Certified crane operators tend to have a slightly higher hourly rate than those who are not certified.

Related Occupations

Other workers who operate mechanical equipment include construction equipment operators; machine setters, operators, and tenders—metal and plastic; rail transportation workers; and truck drivers and driver/sales workers. Other entry-level workers who perform mostly physical work include agricultural workers; building cleaning workers; construction laborers; forest, conservation, and logging workers; and grounds maintenance workers.

Motor Vehicle Operators

Bus Drivers

(O*NET 53-3021.00 and 53-3022.00)

Significant Points

- Opportunities should be good, particularly for school bus drivers; applicants for higher-paying public transit bus driver positions may encounter competition.
- State and federal governments establish bus driver qualifications and standards, which include a commercial driver's license.
- Work schedules vary considerably among various types of bus drivers.
- Bus drivers must possess strong customer service skills, including communication skills and the ability to manage large groups of people with varying needs.

Nature of the Work

Bus drivers provide transportation for millions of people, from commuters to school children to vacationers. There are two major kinds of bus drivers. *Transit and intercity bus drivers* transport people within or across states, along routes run within a metropolitan area or county, or on chartered excursions and tours. *School bus drivers* take children to and from schools and related events.

Bus drivers pick up and drop off passengers at bus stops, stations, or—in the case of students—at regularly scheduled neighborhood locations, all according to strict time schedules. Drivers must operate vehicles safely, sometimes in heavy traffic. They also cannot let light traffic put them ahead of schedule so that they miss passengers. Bus drivers drive a range of vehicles from 15-passenger buses to 60-foot articulated buses that can carry more than 100 passengers.

Local transit and intercity bus drivers stock up on tickets or transfers and prepare trip reports after reporting to their assigned terminal or garage. In some transportation firms, maintenance departments are responsible for keeping vehicles in good condition; in others, drivers check their vehicle's tires, brakes, windshield wipers, lights, oil, fuel, and water supply before beginning their routes. Drivers usually verify that the bus has safety equipment, such as fire extinguishers, first aid kits, and emergency reflectors.

During their shift, local transit and intercity bus drivers collect fares; answer questions about schedules, routes, and transfer points; and sometimes announce stops. Intercity bus drivers may make only a single one-way trip to a distant city or a round trip each day. They may stop at towns just a few miles apart or only at large cities hundreds of miles apart. Local transit bus drivers may make several trips each day over the same city and suburban streets, stopping as frequently as every few blocks.

Local transit bus drivers submit daily trip reports with a record of trips, significant schedule delays, and mechanical problems. Intercity drivers who drive across state or national boundaries must comply with U.S. Department of Transportation regulations. These include completing vehicle inspection reports and recording dis-

Bus drivers are responsible for the safety of passengers.

tances traveled and the times they spend driving, performing other duties, and off duty.

Some intercity drivers operate motor coaches that transport passengers on chartered trips and sightseeing tours. Drivers routinely interact with customers and tour guides to make the trip as comfortable and informative as possible. They are directly responsible for keeping to strict schedules, adhering to the guidelines of the tour's itinerary, and ensuring the overall success of the trip. These drivers act as customer service representatives, tour guides, program directors, and safety guides. Trips frequently last more than a day. The driver may be away for more than a week if assigned to an extended tour.

School bus drivers usually drive the same routes each day, stopping to pick up pupils in the morning and returning them to their homes in the afternoon. Some school bus drivers also transport students and teachers on field trips or to sporting events. In addition to driving, some school bus drivers work part time in the school system as janitors, mechanics, or classroom assistants when not driving buses.

Bus drivers must be alert to prevent accidents, especially in heavy traffic or in bad weather, and to avoid sudden stops or swerves that jar passengers. School bus drivers must exercise particular caution when children are getting on or off the bus. They must maintain order on their bus and enforce school safety standards by allowing only students to board. In addition, they must know and enforce the school system's rules regarding student conduct. As the number of students with physical or behavioral disabilities increases, school bus drivers must learn how to accommodate their special needs.

Some school bus drivers can take their bus home or park it in a more convenient area rather than reporting to an assigned terminal or garage. School bus drivers do not collect fares. Instead, they prepare weekly reports on the number of students, trips or "runs," work hours, miles, and fuel consumption. Their supervisors set time schedules and routes for the day or week.

Work environment. Driving a bus through heavy traffic while dealing with passengers is more stressful and fatiguing than physically strenuous. Many drivers enjoy the opportunity to work without direct supervision, with full responsibility for their bus and passengers. To improve working conditions and retain drivers, many bus lines provide ergonomically designed seats and controls for drivers. Many bus companies use Global Positioning Systems to help dispatchers manage their bus fleets and help drivers navigate.

Work schedules vary considerably among various types of bus drivers. Intercity bus drivers may work nights, weekends, and holidays and often spend nights away from home, during which they stay in hotels at company expense. Senior drivers with regular routes have regular weekly work schedules, but others do not have regular schedules and must be prepared to report for work on short notice. They report for work only when called for a charter assignment or to drive extra buses on a regular route. Intercity bus travel and charter work tend to be seasonal. From May through August, drivers might work the maximum number of hours per week that regulations allow. During winter, junior drivers might work infrequently, except for busy holiday travel periods, and may be furloughed at times.

School bus drivers work only when schools are in session. Many work 20 hours a week or less, driving one or two routes in the morning and afternoon. Drivers taking field or athletic trips, or who also have midday kindergarten routes, may work more hours a week.

Regular local transit bus drivers usually have a five-day workweek; Saturdays and Sundays are considered regular workdays. Some drivers work evenings and after midnight. To accommodate commuters, many work "split shifts"—for example, 6 a.m. to 10 a.m. and 3 p.m. to 7 p.m., with time off in between.

Intercity bus drivers operating tour and charter buses may work any day and all hours of the day, including weekends and holidays. Their hours are dictated by the destinations, schedules, and itineraries of chartered tours. Like all commercial drivers, their weekly hours must be consistent with the Department of Transportation's rules and regulations concerning hours of service. For example, drivers may drive for 10 hours and work for up to 15 hours—including driving and non-driving duties—before having 8 hours off duty. Drivers may only drive for 60 hours in 7 days or 70 hours in 8 days. They are required to document their time in a logbook.

Training, Other Qualifications, and Advancement

State and federal governments establish bus driver qualifications and standards, which include a commercial driver's license (CDL) with the proper endorsements. Many employers provide several weeks of training and help new employees obtain their CDL. Other employers prefer those with truck or other driving experience.

Education and training. Many employers prefer high school graduates and require a written test of ability to follow complex bus schedules. Some intercity and public transit bus companies require several years of experience driving a bus or truck. Most intercity bus companies and local transit systems give driver trainees 2 to 8 weeks of classroom and behind-the-wheel instruction. In the classroom, trainees learn Department of Transportation and company work rules, safety regulations, state and municipal driving regulations, and safe driving practices. They also learn to read schedules, determine fares, keep records, and deal courteously with passengers.

School bus drivers receive between 1 and 4 weeks of driving instruction and classroom training on state and local laws, regulations, and policies; safe driving practices; driver-pupil relations; first aid; emergency evacuation procedures; and the special needs of students who are disabled or emotionally troubled. School bus drivers also must be aware of the school system's rules for discipline and conduct for bus drivers and the students they transport. Many people who become school bus drivers have never driven any vehicle larger than an automobile.

During training, all bus drivers practice driving on set courses. They practice turns and zigzag maneuvers, backing up, and driving in narrow lanes. Then, they drive in light traffic and, eventually, on congested highways and city streets. They also make trial runs without passengers to improve their driving skills and learn the routes. Local transit trainees memorize and drive each of the runs operating out of their assigned garage. New drivers make regularly scheduled trips with passengers, accompanied by an experienced driver who gives helpful tips, answers questions, and evaluates the new driver's performance. Most bus drivers get brief supplemental training periodically to stay informed of safety issues and regulatory changes.

Licensure. Bus driver qualifications and standards are established by state and federal regulations. All drivers must comply with federal regulations and with any state regulations that exceed federal requirements. Federal regulations require drivers who operate commercial motor vehicles in excess of 26,000 pounds gross vehicle weight rating or designed to carry 16 or more people, including the driver, to hold a commercial driver's license with the appropriate endorsements from the state in which they live. As with all commercial drivers, bus drivers who drive across state or national boundaries, as motor coach drivers frequently do, must comply with U.S.

Department of Transportation regulations, state regulations, and the regulations of other countries.

To qualify for a commercial driver's license, applicants must pass a knowledge test on rules and regulations and then demonstrate in a skills test that they can operate a bus safely. A national database records all driving violations incurred by people who hold commercial licenses, and a state may not issue a license to a person who has already had a license suspended or revoked in another state. To be issued a commercial license, a driver must surrender all other driver's licenses. All bus drivers must also have a passenger endorsement for their license, which requires passing a knowledge test and demonstrating the necessary skills in a vehicle of the same type as the one they would be driving on the job. Information on how to apply for a commercial driver's license and each type of endorsement can be obtained from state motor vehicle administrations.

Although many states allow those who are 18 years of age and older to drive buses within state borders, the U.S. Department of Transportation establishes minimum qualifications for bus drivers engaged in interstate commerce. Federal Motor Carrier Safety Regulations require drivers to be at least 21 years old and to pass a physical examination once every 2 years. The main physical requirements include good hearing, at least 20/40 vision with or without glasses or corrective lenses, and a 70-degree field of vision in each eye. Drivers cannot be colorblind. They must be able to hear a forced whisper in one ear at not less than 5 feet, with or without a hearing aide. Drivers must have normal blood pressure and normal use of their arms and legs. They may not use any controlled substances, unless prescribed by a licensed physician. People with epilepsy or with diabetes controlled by insulin are not permitted to be interstate bus drivers. Federal regulations also require employers to test their drivers for alcohol and drug use as a condition of employment and require periodic random tests of the drivers while they are on duty. In addition, a driver must not have been convicted of a felony involving the use of a motor vehicle or a crime involving drugs, driving under the influence of drugs or alcohol, refusing to submit to an alcohol test required by a state or its implied consent laws or regulations, leaving the scene of a crime, or causing a fatality through negligent operation of a commercial vehicle.

All drivers also must be able to read and speak English well enough to read road signs, prepare reports, and communicate with law enforcement officers and the public. In addition, drivers must take a written examination on the Motor Carrier Safety Regulations of the U.S. Department of Transportation.

School bus drivers are required to obtain a commercial driver's license with a school bus endorsement from the state in which they live. To receive this endorsement, they must pass a written test and demonstrate necessary skills in a bus of the same type that they would be driving on their route. Both of these tests are specific to school buses and are in addition to the testing required to receive a commercial license and the passenger endorsement.

Other qualifications. Many intercity and public transit bus companies prefer applicants who are at least 24 years old. Because bus drivers deal with passengers, they must be courteous. They need an even temperament and emotional stability because driving in heavy, fast-moving, or stop-and-go traffic and dealing with passengers can be stressful. Drivers must have strong customer service skills, including communication skills and the ability to coordinate and manage large groups of people. In some states, school bus drivers must pass a background investigation to uncover any criminal record or history of mental problems.

Advancement. New intercity and local transit drivers usually are placed on an "extra" list to drive chartered runs, extra buses on regular runs, and special runs, such as those during morning and evening rush hours and to sports events. New drivers also substitute for regular drivers who are ill or on vacation. New drivers remain on the extra list and may work only part time, perhaps for several years, until they have enough seniority to get a regular run.

Senior drivers may bid for the runs that they prefer, such as those with more work hours, lighter traffic, weekends off, or—in the case of intercity bus drivers—higher earnings or fewer workdays per week.

Opportunities for promotion are generally limited. However, experienced drivers may become supervisors or dispatchers—assigning buses to drivers, checking whether drivers are on schedule, rerouting buses to avoid blocked streets or other problems, and dispatching extra vehicles and service crews to scenes of accidents and breakdowns. In transit agencies with rail systems, drivers may become train operators or station attendants. Some bus drivers become either instructors of new bus drivers or master-instructors, who train new instructors. Few drivers become managers. Promotion in publicly owned bus systems is often determined by competitive civil service examination. Some motor coach drivers purchase their own equipment and open their own business.

Employment

Bus drivers held about 653,000 jobs in 2006. About 34 percent worked part time. Around 70 percent of all bus drivers were school bus drivers working primarily for school systems or for companies providing school bus services under contract. Most of the remainder worked for private and local government transit systems; some also worked for intercity and charter bus lines.

Job Outlook

Average job growth and good employment opportunities are expected for bus drivers. Those seeking higher paying public transit bus driver positions may encounter competition. Individuals who have good driving records and who are willing to work a part-time or irregular schedule will probably have the best job prospects.

Employment change. Overall employment of bus drivers is expected to grow 10 percent between 2006 and 2016, about as fast as the average for all occupations. New drivers will be needed primarily to meet the transportation needs of the growing general population and school-aged population.

Employment growth for local transit and intercity bus drivers is projected to be 13 percent over the 2006–2016 decade, about as fast as average for all occupations, primarily because of the increasing

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Bus drivers	53-3020	653,000	721,000	67,000	10
Bus drivers, transit and intercity	53-3021	198,000	223,000	25,000	13
Bus drivers, school	53-3022	455,000	497,000	42,000	9

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

popularity of mass transit due to congestion and rising fuel prices and the demand for transit services in expanding metropolitan areas. Competition from other modes of transportation—airplane, train, or automobile—will temper job growth among intercity bus drivers. Most growth in intercity bus transportation will occur in group charters to locations not served by other modes of transportation. Like automobiles, buses have a far greater number of possible destinations than airplanes or trains. Since they offer greater cost savings and convenience than automobiles do, buses usually are the most economical option for tour groups traveling to out-of-the-way destinations.

The number of school bus drivers is expected to increase 9 percent over the next 10 years, which is also about as fast as the average for all occupations. This growth is somewhat slower than in the past. School enrollments are projected to increase in 37 states, decrease in 12 states and stay constant in 1 state. However, the net effect will still be a slowdown in the rate of school enrollment and, therefore, in employment growth of school bus drivers. This, as well as the part-time nature of the occupation, will result in most openings for school bus drivers being to replace those who leave the occupation.

Job prospects. People seeking jobs as bus drivers likely will have good opportunities. Employment growth will create jobs, but most job openings are expected because of the need to replace workers who take jobs in other occupations or who retire or leave the occupation for other reasons.

Individuals who have good driving records and who are willing to work a part-time or irregular schedule probably will have the best job prospects. School bus driving jobs, particularly in rapidly growing suburban areas, should be easiest to acquire because most are part-time positions with high turnover and less training required than for other bus-driving jobs. Those seeking higher paying public transit bus driver positions may encounter competition. Opportunities for intercity driving positions should be good, although employment prospects for motor coach drivers will depend on tourism, which fluctuates with the economy.

Full-time bus drivers rarely are laid off during recessions. In local transit and intercity bus systems, if the number of passengers decreases, employers might reduce the hours of part-time bus drivers or consolidate routes since fewer buses would be required. Seasonal layoffs are common. Many intercity bus drivers with little seniority, for example, are furloughed during the winter when regularly scheduled and charter business declines. School bus drivers seldom work during the summer or school holidays.

Earnings

Median hourly wage-and-salary earnings of transit and intercity bus drivers were $15.43 in May 2006. The middle 50 percent earned between $11.56 and $19.86 per hour. The lowest 10 percent earned less than $9.26, and the highest 10 percent earned more than $24.08 per hour. Median hourly earnings in the industries employing the largest numbers of transit and intercity bus drivers were:

Interurban and rural bus transportation	$17.16
Urban transit systems	14.07
School and employee bus transportation	12.35
Other transit and ground passenger transportation	11.51
Charter bus industry	11.50

Median hourly wage-and-salary earnings of school bus drivers were $11.93 in May 2006. The middle 50 percent earned between $8.99 and $14.82 per hour. The lowest 10 percent earned less than $6.58, and the highest 10 percent earned more than $17.61 per hour. Median hourly earnings in the industries employing the largest numbers of school bus drivers were:

School and employee bus transportation	$12.55
Elementary and secondary schools	11.59
Other transit and ground passenger transportation	11.11
Child day care services	9.50
Individual and family services	9.17

The benefits bus drivers receive from their employers vary greatly. Most intercity and local transit bus drivers receive paid health and life insurance, sick leave, vacation leave, and free bus rides on any of the regular routes of their line or system. School bus drivers receive sick leave, and many are covered by health and life insurance and pension plans. Because they generally do not work when school is not in session, they do not get vacation leave.

About 41 percent of bus drivers were members of or were covered by union contracts in 2006. Many intercity and local transit bus drivers are members of the Amalgamated Transit Union. Some drivers belong to the United Transportation Union or to the International Brotherhood of Teamsters.

Related Occupations

Other workers who drive vehicles on highways and city streets include taxi drivers and chauffeurs, and truck drivers and driver/sales workers. Some local transit bus drivers enter rail transportation occupations by becoming subway or light rail operators.

Taxi Drivers and Chauffeurs

(O*NET 53-3041.00)

Significant Points

- Taxi drivers and chauffeurs may work any schedule, including full-time, part-time, night, evening, weekend, and on a seasonal basis.
- Many taxi drivers like the independent, unsupervised work of driving their automobile.
- Local governments set license standards for driving experience and training; many taxi and limousine companies set higher standards.
- Job opportunities should be plentiful; applicants with good driving records, good customer service instincts, and the ability to work flexible schedules should have the best prospects.

Nature of the Work

Anyone who has been in a large city knows the importance of taxi and limousine services. Taxi drivers and chauffeurs take passengers to and from their homes, workplaces, and recreational pursuits, such as dining, entertainment, and shopping, and to and from business-related events. These professional drivers also help out-of-town business people and tourists get around in unfamiliar surroundings. Some drivers offer sight-seeing services around their city.

Drivers must be alert to conditions on the road, especially in heavy and congested traffic or in bad weather. They must take precautions to prevent accidents and avoid sudden stops, turns, and other driving maneuvers that would jar passengers.

Taxi drivers. At the beginning of their driving shift, taxi drivers usually report to a taxicab service or garage where they are assigned a vehicle, most frequently a large, conventional automobile modified for commercial passenger transport. They record their name, the date, and the cab's identification number on a trip sheet. Drivers check the cab's fuel and oil levels and make sure that the lights, brakes, and windshield wipers are in good working order. Drivers adjust rear and side mirrors and their seat for comfort. Any equipment or part not in good working order is reported to the dispatcher or company mechanic.

Taxi drivers pick up passengers by "cruising" for fares, prearranging pickups, and picking up passengers from taxi stands in high-traffic areas. In urban areas, many passengers flag down drivers cruising the streets. Customers also may prearrange a pickup by calling a cab company and giving a location, approximate pickup time, and destination. The cab company dispatcher then relays the information to a driver by two-way radio, cellular telephone, or onboard computer. Outside of urban areas, the majority of trips are dispatched in this manner. Drivers also pick up passengers waiting at cabstands or in taxi lines at airports, train stations, hotels, restaurants, and other places where people frequently seek taxis.

Some taxi commissions force cabs to specialize in either cruising or prearranged pick ups. In other cases, not all drivers are allowed to pick up riders in certain parts of a city (a business district) or at certain landmarks (a convention center or airport). These restrictions aim to make taxis available to people in areas that drivers find less profitable.

Good drivers are familiar with streets in the areas they serve so they can choose the most efficient route to destinations. They know the locations of frequently requested destinations, such as airports, bus and railroad terminals, convention centers, hotels, and other points of interest. In case of emergency, drivers should know the location of fire and police stations as well as hospitals.

Upon reaching the destination, drivers determine the fare and announce it to their riders. Each jurisdiction determines the rate and structure of the fare system covering licensed taxis. In many cabs, a taximeter measures the fare based on the distance covered and the amount of time the trip took. Drivers turn on the meter when passengers enter the cab and turn it off when they reach the final destination. The fare also may include surcharges to help cover fuel costs as well as fees for additional passengers, tolls, handling luggage, and a drop charge—an additional flat fee added for use of the cab. In some cases, fares are determined by a system of zones through which the taxi passes during a trip.

Passengers usually add a tip or gratuity to the fare. The amount of the gratuity depends, in part, on the passengers' satisfaction with the quality and efficiency of the ride and the courtesy of the driver.

Drivers issue receipts upon request by the passenger. They enter onto the trip sheet all information regarding the trip, including the place and time of pickup and drop off and the total fee; these logs help taxi company management check drivers' activity and efficiency. Drivers also must fill out accident reports when necessary.

Taxi drivers may work shifts at all times of the day and night.

Some drivers transport individuals with special needs, such as those with disabilities and the elderly. These drivers, known as *paratransit drivers*, operate specially equipped vehicles designed to accommodate a variety of needs in non-emergency situations. Although special certification is not necessary, some additional training on the equipment and passenger needs may be required.

Chauffeurs. Chauffeurs operate limousines, vans, and private cars for limousine companies, private businesses, government agencies, and wealthy individuals. Chauffeur service differs from taxi service in that all trips are prearranged. Many chauffeurs transport customers in large vans between hotels and airports, bus terminals, or train stations. Others drive luxury automobiles, such as limousines, to business events, entertainment venues, and social events. Still others provide full-time personal transportation for wealthy families and private companies.

At the beginning of the workday, chauffeurs prepare their automobiles or vans for use. They inspect the vehicle for cleanliness and, when needed, clean the interior and wash the exterior body, windows, and mirrors. They check fuel and oil levels and make sure the lights, tires, brakes, and windshield wipers work. Chauffeurs may perform routine maintenance and make minor repairs, such as changing tires or adding oil and other fluids. If a vehicle requires a more complicated repair, they take it to a professional mechanic.

Chauffeurs cater to passengers by providing attentive customer service and paying attention to detail. They help riders into the car by holding open doors, holding umbrellas when it is raining, and loading packages and luggage into the trunk of the car. Chauffeurs may perform errands for their employers such as delivering packages or picking up clients arriving at airports. To ensure a pleasurable ride in their limousines, many chauffeurs offer conveniences and luxuries such as newspapers, magazines, music, drinks, televisions, and telephones. Increasingly, chauffeurs work as full-service executive assistants, simultaneously acting as driver, secretary, and itinerary planner.

Work environment. Taxi drivers and chauffeurs occasionally have to load and unload heavy luggage and packages. Driving for long periods can be tiring and uncomfortable, especially in densely populated urban areas. Taxi drivers risk robbery because they work alone and often carry large amounts of cash.

Design improvements in newer cars have reduced the stress and increased the comfort and efficiency of drivers. Many regulatory bodies overseeing taxi and chauffeur services require standard amenities such as air-conditioning and general upkeep of the vehi-

cles. Some modern taxicabs also are equipped with sophisticated tracking devices, fare meters, and dispatching equipment. Satellites and tracking systems link many of these state-of-the-art vehicles with company headquarters. In a matter of seconds, dispatchers can deliver directions, traffic advisories, weather reports, and other important communications to drivers anywhere in the area. The satellite link also allows dispatchers to track vehicle location, fuel consumption, and engine performance. Automated dispatch systems help dispatchers locate the closest driver to a customer in order to minimize individual wait time and increase the quality of service. Drivers easily can communicate with dispatchers to discuss delivery schedules and courses of action if there are mechanical problems. When threatened with crime or violence, drivers may have special "trouble lights" to alert authorities of emergencies.

Work hours of taxi drivers and chauffeurs vary greatly. Some jobs offer full-time or part-time employment with work hours that can change from day to day or remain the same. It is often necessary for drivers to report to work on short notice. Chauffeurs who work for a single employer may be on call much of the time. Evening and weekend work is common for drivers and chauffeurs employed by limousine and taxicab services.

Whereas the needs of the client or employer dictate the work schedule for chauffeurs, the work of taxi drivers is much less structured. Working free of supervision, they may break for a meal or a rest whenever their vehicle is unoccupied. Many taxi drivers like the independent, unsupervised work of driving.

This occupation is attractive to individuals, such as college and postgraduate students, seeking flexible work schedules and to anyone seeking a second source of income. Other service workers, such as ambulance drivers and police officers, sometimes moonlight as taxi drivers or chauffeurs.

Full-time taxi drivers usually work one shift a day, which may last 8 to 12 hours. Part-time drivers may work half a shift each day, or work a full shift once or twice a week. Drivers may work shifts at all times of the day and night because most taxi companies offer services 24 hours a day. Early morning and late night shifts are not uncommon. Drivers work long hours during holidays, weekends, and other special times when demand for their services is heavier. Independent drivers set their own hours and schedules.

Training, Other Qualifications, and Advancement

Local governments set licensing standards and requirements for taxi drivers and chauffeurs, which may include minimum amounts of driving experience and training. Many taxi and limousine companies set higher standards than those required by law. It is common for companies to review an applicant's medical, credit, criminal, and driving record. In addition, many companies require an applicant to be at least 21 years old, which is higher than the age typically required by law. Most companies also prefer that an applicant be a high school graduate.

Education and training. Little formal education is needed for taxi drivers or chauffeurs, but most have at least a high school diploma, GED, or its equivalent. Drivers need to be able to communicate effectively, use basic math, and often need knowledge of basic mechanics. Beyond having these skills, most drivers take a course offered by the government or their employer.

Some taxi and limousine companies give new drivers on-the-job training. This training typically is informal and often lasts only about a week. Companies show drivers how to operate the taximeter and communications equipment and how to complete paperwork. Other topics covered may include driver safety and the best routes to popular sightseeing and entertainment destinations. Many companies have contracts with social service agencies and transportation services to transport elderly and disabled citizens in nonemergency situations. To support these services, new drivers may get special training in how to handle wheelchair lifts and other mechanical devices.

Licensure. People interested in driving a taxicab or a limousine first must have a regular automobile driver's license. Usually, applicants then must get a taxi driver or chauffeur's license, commonly called a "hack" license. Some states require only a passenger endorsement, which allows the driver to carry passengers in the vehicle, on a regular driver's license; some require only that drivers be certified by their employer; but the federal government requires a commercial driver's license with a passenger endorsement for drivers transporting 16 or more passengers.

While states set licensing requirements, local regulatory bodies usually set other terms and conditions. These often include requirements for training, which can vary greatly. Some localities require new drivers to enroll in up to 80 hours of classroom instruction, to take an exam, or both before they are allowed to work, Applicants must know local geography, motor vehicle laws, safe driving practices, and relevant regulations. Often, they must also display some aptitude for customer service. Some localities require an English proficiency test, usually in the form of listening comprehension; applicants who do not pass the English exam must take an English course in addition to any formal driving programs.

Some classroom instruction includes route management, map reading, and service for passengers with disabilities. Many taxicab or limousine companies sponsor applicants, giving them a temporary permit that allows them to drive before they have finished the training program and passed the test. Some jurisdictions, such as New York City, have discontinued this practice and now require driver applicants to complete the licensing process before operating a taxi or limousine.

Other qualifications. Taxi drivers and chauffeurs work almost exclusively with the public, and should be able to get along with many different types of people. They must be patient when waiting for passengers and when dealing with rude customers. It also is helpful for drivers to be tolerant and level-headed when driving in heavy and congested traffic. Drivers should be dependable since passengers expect to be picked up at a prearranged time and taken to the correct destination. To be successful, drivers must be responsible and self-motivated because they work with little supervision. Increasingly, companies encourage drivers to develop their own loyal customer base, so as to improve their business.

Many municipalities and taxicab and chauffeur companies require drivers to have a neat appearance. Many chauffeurs wear formal attire, such as a tuxedo, a coat and tie, a dress, or a uniform and cap.

Advancement. Taxi drivers and chauffeurs have limited advancement opportunities. Experienced drivers may obtain preferred routes or shifts. Some advance to become lead drivers, who help to train new drivers. Others take dispatching and managerial positions. Many managers start their careers as drivers. Some people start their own limousine companies.

In small and medium-size communities, drivers sometimes are able to buy their own taxi, limousine, or other type of automobile and go into business for themselves. These independent owner-drivers require an additional permit allowing them to operate their vehicle as a company. Some big cities limit the number of operating permits. In these cities, drivers become owner-drivers by buying permits from owner-drivers who leave the business, or by purchasing or leasing them from the city. Although many owner-drivers are successful, some fail to cover expenses and eventually lose their permits and automobiles. Individuals starting their own taxi com-

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Taxi drivers and chauffeurs	53-3041	229,000	258,000	30,000	13

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

pany face many obstacles because of the difficulty in running a small fleet. The lack of dispatch and maintenance facilities often is hard for an owner to overcome. Chauffeurs often have a good deal of success and many companies begin as an individually owned and operated business.

For both taxi and limousine service owners, good business sense and courses in accounting, business, and business arithmetic can help an owner-driver to be successful. Knowledge of mechanics enables owner-drivers to perform their own routine maintenance and minor repairs to cut expenses.

Employment

Taxi drivers and chauffeurs held about 229,000 jobs in 2006. About 30 percent of taxi drivers and chauffeurs were self-employed.

Job Outlook

Employment is expected to grow about as fast as average. Job opportunities should be plentiful because of the need to replace the many people who work in this occupation for short periods and then leave. Applicants with good driving records, good customer service instincts, and the ability to work flexible schedules should have the best prospects.

Employment change. Employment of taxi drivers and chauffeurs is expected to grow 13 percent during the 2006–2016 projection period—about as fast as the average for all occupations—as local and suburban travel increases. Job growth also will stem from federal legislation requiring increased services for people with disabilities. Demand for paratransit drivers will grow in response to the increase in the number of elderly people, who often have difficulty driving and using public transportation.

Job prospects. People seeking jobs as taxi drivers and chauffeurs are expected to have plentiful opportunities because of the need to replace the many people who work in this occupation for short periods and then transfer to other occupations or leave the labor force. Earnings, work hours, and working conditions vary greatly, depending on economic and regulatory conditions. Applicants with good driving records, good customer service instincts, and the ability to work flexible schedules should have the best prospects.

The number of job opportunities can fluctuate with the overall movements of the economy because the demand for taxi and limousine transportation depends on travel and tourism. During economic slowdowns, drivers seldom are laid off, but they may have to increase their work hours, and earnings may decline. When the economy is strong, job prospects are numerous as many drivers transfer to other occupations. Extra drivers may be hired during holiday seasons as well as during peak travel and tourist times.

Rapidly growing metropolitan areas and cities experiencing economic growth should offer the best job opportunities.

Earnings

Earnings of taxi drivers and chauffeurs vary greatly, depending on factors such as the number of hours worked, regulatory conditions, customers' tips, and geographic location. Hybrid vehicles, which have improved gas mileage, offer taxi drivers better earnings because drivers pay for their gas out of pocket. Median hourly earnings of salaried taxi drivers and chauffeurs, including tips, were $9.78 in May 2006. The middle 50 percent earned between $8.00 and $12.19 an hour. The lowest 10 percent earned less than $6.85, and the highest 10 percent earned more than $15.80 an hour. Median hourly earnings in the industries employing the largest numbers of taxi drivers and chauffeurs were:

Taxi and limousine service	$10.62
Other transit and ground passenger transportation	9.32
Traveler accommodation	9.09
Individual and family services	8.94
Automobile dealers	8.86

Many taxi drivers and chauffeurs are *lease drivers*. These drivers pay a daily, weekly, or monthly fee to the company allowing them to lease their vehicles. In the case of limousines, leasing also permits the driver access to the company's dispatch system. The fee also may include charges for vehicle maintenance, insurance, and a deposit on the vehicle. Lease drivers may take their cars home with them when they are not on duty.

Most taxi drivers and chauffeurs do not receive benefits. This is unlikely to change because companies have little incentive to offer them. However, a few cities have made an attempt to provide health insurance for drivers.

Related Occupations

Other workers who have similar jobs include bus drivers and truck drivers and driver/sales workers.

Sources of Additional Information

Information on necessary permits and the registration of taxi drivers and chauffeurs is available from local government agencies that regulate taxicabs. Questions regarding licensing should be directed to your state motor vehicle administration. For information about work opportunities as a taxi driver or chauffeur, contact local taxi or limousine companies or state employment service offices in your area.

For general information about the work of taxi drivers, chauffeurs, and paratransit drivers, contact

➤ Taxicab, Limousine and Paratransit Association, 3849 Farragut Ave., Kensington, MD 20895.

For general information about the work of limousine drivers, contact

➤ National Limousine Association, 49 S. Maple Ave., Marlton, NJ 08053. Internet: http://www.limo.org

Truck Drivers and Driver/Sales Workers

(O*NET 53-3031.00, 53-3032.00, and 53-3033.00)

Significant Points

- Overall job opportunities should be favorable.
- Competition is expected for jobs offering the highest earnings or most favorable work schedules.

- A commercial driver's license is required to operate large trucks.

Nature of the Work

Truck drivers are a constant presence on the nation's highways and interstates. They deliver everything from automobiles to canned food. Firms of all kinds rely on trucks to pick up and deliver goods because no other form of transportation can deliver goods door-to-door. Even though many goods travel at least part of their journey by ship, train, or airplane, almost everything is carried by trucks at some point.

Before leaving the terminal or warehouse, truck drivers check the fuel level and oil in their trucks. They also inspect the trucks to make sure that the brakes, windshield wipers, and lights are working and that a fire extinguisher, flares, and other safety equipment are aboard and in working order. Drivers make sure their cargo is secure and adjust the mirrors so that both sides of the truck are visible from the driver's seat. Drivers report equipment that is inoperable, missing, or loaded improperly to the dispatcher.

Drivers keep a log of their activities, as required by the U.S. Department of Transportation, to the condition of the truck, and the circumstances of any accidents.

Heavy truck and tractor-trailer drivers operate trucks or vans with a capacity of at least 26,000 pounds Gross Vehicle Weight (GVW). They transport goods including cars, livestock, and other materials in liquid, loose, or packaged form. Many routes are from city to city and cover long distances. Some companies use two drivers on very long runs—one drives while the other sleeps in a berth behind the cab. These "sleeper" runs can last for days, or even weeks. Trucks on sleeper runs typically stop only for fuel, food, loading, and unloading.

Some heavy truck and tractor-trailer drivers who have regular runs transport freight to the same city on a regular basis. Other drivers perform ad hoc runs because shippers request varying service to different cities every day.

Long-distance heavy truck and tractor-trailer drivers spend most of their working time behind the wheel but also may have to load or unload their cargo. This is especially common when drivers haul specialty cargo because they may be the only ones at the destination familiar with procedures or certified to handle the materials. Auto-transport drivers, for example, position cars on the trailers at the manufacturing plant and remove them at the dealerships. When picking up or delivering furniture, drivers of long-distance moving vans hire local workers to help them load or unload.

Overall job opportunities for truck drivers should be favorable.

Light or delivery services truck drivers operate vans and trucks weighing less than 26,000 pounds GVW. They pick up or deliver merchandise and packages within a specific area. This may include short "turnarounds" to deliver a shipment to a nearby city, pick up another loaded truck or van, and drive it back to their home base the same day. These services may require use of electronic delivery tracking systems to track the whereabouts of the merchandise or packages. Light or delivery services truck drivers usually load or unload the merchandise at the customer's place of business. They may have helpers if there are many deliveries to make during the day or if the load requires heavy moving. Typically, before the driver arrives for work, material handlers load the trucks and arrange items for ease of delivery. Customers must sign receipts for goods and pay drivers the balance due on the merchandise if there is a cash-on-delivery arrangement. At the end of the day, drivers turn in receipts, payments, records of deliveries made, and any reports on mechanical problems with their trucks.

A driver's responsibilities and assignments change according to the type of loads transported and their vehicle's size. The duration of runs depends on the types of cargo and the destinations. Local drivers may provide daily service for a specific route or region, while other drivers make longer, intercity and interstate deliveries. Interstate and intercity cargo tends to vary from job to job more than local cargo does.

Some local truck drivers have sales and customer service responsibilities. The primary responsibility of *driver/sales workers*, or *route drivers*, is to deliver and sell their firms' products over established routes or within an established territory. They sell goods such as food products, including restaurant takeout items, or pick up and deliver items such as laundry. Their response to customer complaints and requests can make the difference between a large order and a lost customer. Route drivers may also take orders and collect payments.

The duties of driver/sales workers vary according to their industry, the policies of their employer, and the emphasis placed on their sales responsibility. Most have wholesale routes that deliver to businesses and stores, rather than to homes. For example, wholesale bakery driver/sales workers deliver and arrange bread, cakes, rolls, and other baked goods on display racks in grocery stores. They estimate how many of each item to stock by paying close attention to what is selling. They may recommend changes in a store's order or encourage the manager to stock new bakery products. Laundries that rent linens, towels, work clothes, and other items employ driver/sales workers to visit businesses regularly to replace soiled laundry. Their duties also may include soliciting new customers along their sales route.

After completing their route, driver/sales workers place orders for their next deliveries based on product sales and customer requests.

Satellites and the Global Positioning System link many trucks with their company's headquarters. Troubleshooting information, directions, weather reports, and other important communications can be instantly relayed to the truck. Drivers can easily communicate with the dispatcher to discuss delivery schedules and what to do in the event of mechanical problems. The satellite link also allows the dispatcher to track the truck's location, fuel consumption, and engine performance. Some drivers also work with computerized

inventory tracking equipment. It is important for the producer, warehouse, and customer to know their products' location at all times so they can maintain a high quality of service.

Work environment. Truck driving has become less physically demanding because most trucks now have more comfortable seats, better ventilation, and improved, ergonomically designed cabs. Although these changes make the work environment less taxing, driving for many hours at a stretch, loading and unloading cargo, and making many deliveries can be tiring. Local truck drivers, unlike long-distance drivers, usually return home in the evening. Some self-employed long-distance truck drivers who own and operate their trucks spend most of the year away from home.

The U.S. Department of Transportation governs work hours and other working conditions of truck drivers engaged in interstate commerce. A long-distance driver may drive for 11 hours and work for up to 14 hours—including driving and non-driving duties—after having 10 hours off-duty. A driver may not drive after having worked for 60 hours in the past 7 days or 70 hours in the past 8 days unless they have taken at least 34 consecutive hours off. Most drivers are required to document their time in a logbook. Many drivers, particularly on long runs, work close to the maximum time permitted because they typically are compensated according to the number of miles or hours they drive. Drivers on long runs face boredom, loneliness, and fatigue. Drivers often travel nights, holidays, and weekends to avoid traffic delays.

Local truck drivers frequently work 50 or more hours a week. Drivers who handle food for chain grocery stores, produce markets, or bakeries typically work long hours—starting late at night or early in the morning. Although most drivers have regular routes, some have different routes each day. Many local truck drivers, particularly driver/sales workers, load and unload their own trucks. This requires considerable lifting, carrying, and walking each day.

Training, Other Qualifications, and Advancement

A commercial driver's license (CDL) is required to drive large trucks and a regular driver's license is required to drive all other trucks. Training for the CDL is offered by many private and public vocational-technical schools. Many jobs driving smaller trucks require only brief on-the-job training.

Education and training. Taking driver-training courses is a good way to prepare for truck driving jobs and to obtain a commercial drivers license (CDL). High school courses in driver training and automotive mechanics also may be helpful. Many private and public vocational-technical schools offer tractor-trailer driver training programs. Students learn to maneuver large vehicles on crowded streets and in highway traffic. They also learn to inspect trucks and freight for compliance with regulations. Some states require prospective drivers to complete a training course in basic truck driving before getting their CDL.

Completion of a program does not guarantee a job. Some programs provide only a limited amount of actual driving experience. People interested in attending a driving school should check with local trucking companies to make sure the school's training is acceptable. The Professional Truck Driver Institute (PTDI), a nonprofit organization established by the trucking industry, manufacturers, and others, certifies driver-training courses at truck driver training schools that meet industry standards and Federal Highway Administration guidelines for training tractor-trailer drivers.

Training given to new drivers by employers is usually informal and may consist of only a few hours of instruction from an experienced driver, sometimes on the new employee's own time. New drivers may also ride with and observe experienced drivers before getting their own assignments. Drivers receive additional training to drive special types of trucks or handle hazardous materials. Some companies give 1 to 2 days of classroom instruction covering general duties, the operation and loading of a truck, company policies, and the preparation of delivery forms and company records. Driver/sales workers also receive training on the various types of products their company carries so that they can effectively answer questions about the products and more easily market them to their customers.

New drivers sometimes start on panel trucks or other small straight trucks. As they gain experience and show competent driving skills, new drivers may advance to larger, heavier trucks and finally to tractor-trailers.

Licensure. State and federal regulations govern the qualifications and standards for truck drivers. All drivers must comply with federal regulations and any state regulations that are in excess of those federal requirements. Truck drivers must have a driver's license issued by the state in which they live, and most employers require a clean driving record. Drivers of trucks designed to carry 26,000 pounds or more—including most tractor-trailers, as well as bigger straight trucks—must obtain a commercial driver's license. All truck drivers who operate trucks transporting hazardous materials must obtain a CDL, regardless of truck size. In order to receive the hazardous materials endorsement, a driver must be fingerprinted and submit to a criminal background check by the Transportation Security Administration. In many states, a regular driver's license is sufficient for driving light trucks and vans.

To qualify for a CDL, an applicant must have a clean driving record, pass a written test on rules and regulations, and demonstrate that they can operate a commercial truck safely. A national database permanently records all driving violations committed by those with a CDL. A state will check these records and deny a CDL to those who already have a license suspended or revoked in another state. Licensed drivers must accompany trainees until they get their own CDL. A person may not hold more than one license at a time and must surrender any other licenses when a CDL is issued. Information on how to apply for a CDL may be obtained from state motor vehicle administrations.

Many states allow those who are as young as 18 years old to drive trucks within their borders. To drive a commercial vehicle between states one must be at least 21 years of age, according to the Federal Motor Carrier Safety Regulations published by the U.S. Department of Transportation (U.S. DOT). Regulations also require drivers to pass a physical examination once every 2 years. Physical qualifications include good hearing, at least 20/40 vision with glasses or corrective lenses, and a 70-degree field of vision in each eye. Drivers may not be colorblind. Drivers must also be able to hear a forced whisper in one ear at not less than 5 feet, with a hearing aid if needed. Drivers must have normal use of arms and legs and normal blood pressure. People with epilepsy or diabetes controlled by insulin are not permitted to be interstate truck drivers.

Federal regulations also require employers to test their drivers for alcohol and drug use as a condition of employment and require periodic random tests of the drivers while they are on duty. Drivers may not use any controlled substances, unless prescribed by a licensed physician. A driver must not have been convicted of a felony involving the use of a motor vehicle or a crime involving drugs, driving under the influence of drugs or alcohol, refusing to submit to an alcohol test required by a state or its implied consent laws or regulations, leaving the scene of a crime, or causing a fatality through negligent operation of a motor vehicle. All drivers must be able to read and speak English well enough to read road signs, prepare reports, and communicate with law enforcement officers and the public.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Driver/sales workers and truck drivers	53-3030	3,356,000	3,614,000	258,000	8
Driver/sales workers	53-3031	445,000	421,000	-24,000	-5
Truck drivers, heavy and tractor-trailer	53-3032	1,860,000	2,053,000	193,000	10
Truck drivers, light or delivery services	53-3033	1,051,000	1,140,000	89,000	8

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Other qualifications. Many trucking companies have higher standards than those described here. Many firms require that drivers be at least 22 years old, be able to lift heavy objects, and have driven trucks for 3 to 5 years. Many prefer to hire high school graduates and require annual physical examinations. Companies have an economic incentive to hire less risky drivers, as good drivers use less fuel and cost less to insure.

Drivers must get along well with people because they often deal directly with customers. Employers seek driver/sales workers who speak well and have self-confidence, initiative, tact, and a neat appearance. Employers also look for responsible, self-motivated individuals who are able to work well with little supervision.

Advancement. Although most new truck drivers are assigned to regular driving jobs immediately, some start as extra drivers—substituting for regular drivers who are ill or on vacation. Extra drivers receive a regular assignment when an opening occurs.

Truck drivers can advance to driving runs that provide higher earnings, preferred schedules, or better working conditions. Local truck drivers may advance to driving heavy or specialized trucks or transfer to long-distance truck driving. Working for companies that also employ long-distance drivers is the best way to advance to these positions. Few truck drivers become dispatchers or managers.

Many long-distance truck drivers purchase trucks and go into business for themselves. Although some of these owner-operators are successful, others fail to cover expenses and go out of business. Owner-operators should have good business sense as well as truck driving experience. Courses in accounting, business, and business mathematics are helpful. Knowledge of truck mechanics can enable owner-operators to perform their own routine maintenance and minor repairs.

Employment

Truck drivers and driver/sales workers held about 3.4 million jobs in 2006. Of these workers, 445,000 were driver/sales workers and 2.9 million were truck drivers. Most truck drivers find employment in large metropolitan areas or along major interstate roadways where trucking, retail, and wholesale companies tend to have their distribution outlets. Some drivers work in rural areas, providing specialized services such as delivering newspapers to customers.

The truck transportation industry employed 26 percent of all truck drivers and driver/sales workers in the United States. Another 25 percent worked for companies engaged in wholesale or retail trade. The remaining truck drivers and driver/sales workers were distributed across many industries, including construction and manufacturing.

Around 9 percent of all truck drivers and driver/sales workers were self-employed. Of these, a significant number were owner-operators who either served a variety of businesses independently or leased their services and trucks to a trucking company.

Job Outlook

Overall job opportunities should be favorable for truck drivers, although opportunities may vary greatly in terms of earnings, weekly work hours, number of nights spent on the road, and quality of equipment. Competition is expected for jobs offering the highest earnings or most favorable work schedules. Average growth is expected.

Employment change. Overall employment of truck drivers and driver/sales workers is expected to increase by 8 percent over the 2006–2016 decade, which is about as fast as the average for all occupations, due to growth in the economy and in the amount of freight carried by truck. Because it is such a large occupation, truck drivers will have a very large number of new jobs arise, over 258,000 over the 2006–2016 period. Competing forms of freight transportation—rail, air, and ship transportation—require trucks to move the goods between ports, depots, airports, warehouses, retailers, and final consumers who are not connected to these other modes of transportation. Demand for long-distance drivers will remain strong because they can transport perishable and time-sensitive goods more effectively than alternate modes of transportation.

Job prospects. Job opportunities should be favorable for truck drivers. In addition to growth in demand for truck drivers, numerous job openings will occur as experienced drivers leave this large occupation to transfer to other fields of work, retire, or leave the labor force for other reasons. Jobs vary greatly in terms of earnings, weekly work hours, the number of nights spent on the road, and quality of equipment. There may be competition for the jobs with the highest earnings and most favorable work schedules. There will be more competition for jobs with local carriers than for those with long-distance carriers because of the more desirable working conditions of local carriers.

Job opportunities may vary from year to year since the output of the economy dictates the amount of freight to be moved. Companies tend to hire more drivers when the economy is strong and their services are in high demand. When the economy slows, employers hire fewer drivers or may lay off some drivers. Independent owner-operators are particularly vulnerable to slowdowns. Industries least likely to be affected by economic fluctuation, such as grocery stores, tend to be the most stable employers of truck drivers and driver/sales workers.

Earnings

Median hourly earnings of heavy truck and tractor-trailer drivers were $16.85 in May 2006. The middle 50 percent earned between $13.33 and $21.04 an hour. The lowest 10 percent earned less than $10.80, and the highest 10 percent earned more than $25.39 an hour. Median hourly earnings in the industries employing the largest numbers of heavy truck and tractor-trailer drivers in May 2006 were:

General freight trucking	$18.38
Grocery and related product wholesalers	18.01
Specialized freight trucking	16.40

Cement and concrete product manufacturing	15.26
Other specialty trade contractors	14.94

Median hourly earnings of light or delivery services truck drivers were $12.17 in May 2006. The middle 50 percent earned between $9.31 and $16.16 an hour. The lowest 10 percent earned less than $7.47, and the highest 10 percent earned more than $21.23 an hour. Median hourly earnings in the industries employing the largest numbers of light or delivery services truck drivers in May 2006 were:

Couriers	$17.80
General freight trucking	15.33
Grocery and related product wholesalers	12.84
Building material and supplies dealers	11.54
Automotive parts, accessories, and tire stores	8.38

Median hourly earnings of driver/sales workers, including commissions, were $9.99 in May 2006. The middle 50 percent earned between $7.12 and $15.00 an hour. The lowest 10 percent earned less than $6.19, and the highest 10 percent earned more than $20.30 an hour. Median hourly earnings in the industries employing the largest numbers of driver/sales workers in May 2006 were:

Drycleaning and laundry services	$14.81
Direct selling establishments	13.72
Grocery and related product wholesalers	12.37
Full-service restaurants	7.11
Limited-service eating places	7.02

Local truck drivers tend to be paid by the hour, with extra pay for working overtime. Employers pay long-distance drivers primarily by the mile. The per-mile rate can vary greatly from employer to employer and may even depend on the type of cargo being hauled. Some long-distance drivers are paid a percent of each load's revenue. Typically, earnings increase with mileage driven, seniority, and the size and type of truck driven. Most driver/sales workers receive commissions based on their sales in addition to their hourly wages.

Most self-employed truck drivers are primarily engaged in long-distance hauling. Many truck drivers are members of the International Brotherhood of Teamsters. Some truck drivers employed by companies outside the trucking industry are members of unions representing the plant workers of the companies for which they work.

Related Occupations

Other driving occupations include ambulance drivers and attendants, except emergency medical technicians; bus drivers; and taxi drivers and chauffeurs. Another occupation involving sales duties is sales representatives, wholesale and manufacturing.

Sources of Additional Information

Information on truck driver employment opportunities is available from local trucking companies and local offices of the state employment service.

Rail Transportation Occupations

(O*NET 53-4011.00, 53-4012.00, 53-4013.00, 53-4021.00, 53-4031.00, 53-4041.00, and 53-4099.99)

Significant Points

- Opportunities are expected to be good for qualified applicants because a large number of workers are expected to retire or leave these occupations in the next decade.
- Seventy-four percent of these workers are members of unions, and earnings are relatively high.

Nature of the Work

Rail transportation workers are employed by three different types of railroads: freight, passenger, and urban transit (subway and light-rail). Freight railroads transport billions of tons of goods to destinations within the U.S. and to ports to be shipped abroad. Passenger railroads deliver millions of passengers and long-distance commuters to destinations throughout the country. Subways and light-rail systems move passengers within metropolitan areas and their surrounding suburbs. All of these modes of rail transportation require employees to operate, oversee, and assist in rail operations. Rail transportation workers not only work on trains, but also can be found working in rail yards where railcars are inspected, repaired, coupled, and uncoupled as necessary.

Locomotive Engineers operate large trains carrying cargo or passengers between stations. Most engineers run diesel-electric locomotives, although a few operate locomotives powered by battery or externally supplied electricity. Before each run, engineers check the mechanical condition of their locomotives, making any minor adjustments necessary and documenting issues that require more thorough inspection. While trains are in motion, engineers move controls such as throttles and airbrakes. They also monitor instruments that measure speed, amperage, battery charge, and air pressure, both in the brake lines and in the main reservoir. Engineers must have thorough knowledge of their routes and must be constantly aware of the condition and makeup of their train, because trains react differently to the grade and condition of the rail, the number of cars, the ratio of empty cars to loaded cars, and the amount of slack in the train.

Railroad conductors coordinate all activities of freight or passenger train crews. Conductors assigned to freight trains review schedules, switching orders, waybills, and shipping records to obtain loading and unloading information regarding their cargo. In addition, they are responsible for the distribution of tonnage in the train and the operation of freight cars within rail yards and terminals that use remote control locomotive technology. Conductors assigned to passenger trains also ensure passenger safety and comfort as they go about collecting tickets and fares, making announcements for the benefit of passengers, and coordinating the activities of the crew.

Rail transportation workers may spend significant time on the road.

Before trains leave a terminal, the conductor and the engineer discuss any concerns regarding the train's route, timetable, and cargo. During runs and in rail yards, engineers and conductors interface electronically with monitoring equipment, traffic control center personnel, dispatchers, and personnel on other trains to issue or receive information concerning stops, delays, and the locations of trains. While engineers interpret and comply with orders, signals, speed limits, and railroad rules and regulations, conductors use dispatch or electronic monitoring devices to relay information about equipment problems on the train or the rails. Conductors may arrange for the removal of defective cars from the train for repairs at the nearest station or stop, and discuss alternative routes with the engineer and dispatcher if there is a defect in, or obstruction on, the rails.

Railroad brake operators assist with the coupling and uncoupling of cars as well as operate some switches. In an effort to reduce costs, most railroads have phased out brake operators, and many trains use only an engineer and a conductor. *Signal operators* install, maintain, and repair the signals on tracks and in yards.

Yardmasters, where present, coordinate the activities of workers engaged in railroad yard operations. These activities, which are also performed by conductors, include making up or breaking up trains and switching inbound or outbound traffic to a specific section of the line. Some cars are sent to unload their cargo on special tracks, while others are moved to different tracks to await assembly into new trains, based on their destinations. Yardmasters tell yard engineers or other personnel where to move the cars to fit the planned train configuration. Switches—many of them operated remotely by computer—divert trains or railcars to the proper track for coupling and uncoupling.

Also included in rail transportation occupations are several smaller occupations. *Switch operators* control the track switches within a rail yard. In rail yards without remote control technology, *rail yard engineers* operate engines within the rail yard. Similarly, *hostlers* operate engines—without attached cars—within the yard, as well as driving them to and from maintenance shops.

In contrast to other rail transportation workers, subway and streetcar operators generally work for public transit authorities instead of railroads. *Subway operators* control trains that transport passengers through cities and their suburbs. The trains run in underground tunnels, on the surface, or on elevated tracks. Operators must stay alert to observe signals along the track that indicate when they must start, slow, or stop their train. They also make announcements to riders, may open and close the doors of the train, and ensure that passengers get on and off the subway safely. Increasingly, the train's speed and the amount of time spent at each station are controlled by computers and not by the operator. During breakdowns or emergencies, operators contact their dispatcher or supervisor and may have to evacuate cars.

Streetcar operators drive electric-powered streetcars, trolleys, or light-rail vehicles that transport passengers around metropolitan areas. Some tracks may be built directly into street pavement or have grade crossings, so operators must observe traffic signals and cope with car and truck traffic. Operators start, slow, and stop their cars so that passengers may get on and off easily. Operators may collect fares and issue change and transfers. They also interact with passengers who have questions about fares, schedules, and routes.

Work environment. Rail transportation employees work nights, weekends, and holidays to operate trains that run 24 hours a day, 7 days a week. Many work more than a 40-hour workweek, although minimum rest hours are mandated by federal regulations. Engineers and conductors may be placed on an "extra board" on which workers receive assignments only when a railroad needs substitutes for workers who are absent because of vacation, illness, or other reasons. Seniority usually dictates who receives the more desirable shifts, as do union agreements at large unionized railroads. Working conditions vary by the mode of rail transport.

Freight trains generally are dispatched according to the needs of customers; as a result train crews may have irregular schedules. It is common for workers to place their name on a list and wait for their turn to work. Jobs usually are assigned on short notice and often at odd hours. Working weekends is common in freight train transportation. Those who work on trains operating between points hundreds of miles apart may spend consecutive nights away from home. Because of the distances involved on some routes, many railroad employees work without direct supervision.

Workers on passenger trains ordinarily have regular and reliable shifts. Also, the appearance, temperature, and accommodations of passenger trains are more comfortable than those of freight trains.

Rail yard workers spend most of their time outdoors and work regardless of weather conditions. These workers climb up and down equipment, which can be strenuous and dangerous if safety rules are not followed. The work of conductors and engineers on local runs, on which trains frequently stop at stations or local rail yards to pick up and deliver cars, is physically demanding as well.

Training, Other Qualifications, and Advancement

Rail transportation workers start out in a variety of positions as they gain experience needed for more demanding assignments. Rail transportation workers generally start out training to become a conductor before they may be considered for an engineer position. Engineer positions require federal licensure, and nearly all rail transportation workers complete formal classroom and hands-on training before beginning work. Most applicants must pass a drug screening, background check, and physical examination before being hired.

Education and training. Railroads require that applicants have a minimum of a high school diploma or its equivalent, and most training is done through a company's formal training program and on-the-job training. Entry-level jobs and rail yard jobs usually require the successful completion of a company training program before workers are allowed to begin. For brake and signal operator jobs, railroad firms will train applicants either in a company program or—especially with smaller railroads—at an outside training facility. Typical training programs combine classroom and on-site training lasting from a few weeks to a few months. Entry-level conductors are either trained by their employers or are required to

complete a formal conductor training program through a community college.

Most transit systems that operate subways and streetcars also operate buses. In these systems, subway or streetcar operators usually gain experience by first driving buses. New operators then complete training programs that last from a few weeks to 6 months. At the end of the period of classroom and on-the-job training, operators usually must pass qualifying examinations covering the operating system, troubleshooting, and evacuation and emergency procedures.

Licensure. Locomotive Engineers are unique within rail transportation occupations in that they must be federally licensed to operate freight and passenger trains. Federal regulations require beginning engineers to complete a formal engineer training program, including classroom, simulator, and hands-on instruction in locomotive operation. The instruction usually is administered by the rail company in programs approved by the Federal Railroad Administration. At the end of the training period, candidates must pass a hearing and visual acuity test, a safety conduct background check, a railroad operation knowledge test, and a skills performance test before receiving an engineer's license.

Engineers must periodically pass an operational rules efficiency test to maintain their licensure. The test is an unannounced event requiring engineers to take active or responsive action in certain situations, such as maintaining a particular speed through a curve or yard or complying with a signal.

For yard occupations, a commercial driver's license may be required because these workers often operate trucks and other heavy vehicles.

Other qualifications. Rail transportation workers must have good hearing, eyesight, and color vision, as well as good hand-eye coordination, manual dexterity, and mechanical aptitude. Physical stamina is required for most rail transportation jobs. Applicants for locomotive engineer jobs and some conductor jobs must be at least 21 years old.

All applicants must be in good health, have good communication skills, and be able to make quick, responsible judgments. Employers require railroad transportation job applicants to pass a physical examination, drug and alcohol screening, and a criminal background check. Under federal regulation, all persons licensed to operate engines are subject to random drug and alcohol testing while on duty, and engineers also undergo periodic physical examinations. In some cases, engineers who fail to meet these physical and conduct standards are restricted to yard service, trained to perform other work, or discharged.

Advancement. Most railroad transportation workers begin as a laborer, brake operator, or conductor after completing training on signals, timetables, operating rules, and related subjects. Although new employees may be hired as conductors, seniority determines whether an employee may hold a conductor position full-time. Employers almost always fill engineer positions with workers who have experience in other railroad-operating occupations. Subway and streetcar operators with sufficient seniority can advance to station manager or another supervisory position.

Employment

Rail transportation workers held 125,000 jobs in 2006, distributed among the detailed occupations as follows:

Locomotive engineers and operators	47,000
Railroad conductors and yardmasters	40,000
Railroad brake, signal, and switch operators	25,000
Subway and streetcar operators	6,900
Rail transportation workers, all other	6,800

Most rail transportation workers were employed in the rail transportation industry or support activities for the industry. Rail transportation and rail transportation support activities made up 109,000 jobs in 2006. The rest worked primarily for local governments as subway and streetcar operators, who held 11,000 jobs, while 1,700 workers were employed in mining and manufacturing establishments that operate their own locomotives to move railcars containing ore, coal, and other bulk materials.

Job Outlook

Although employment in most railroad transportation occupations is expected to change little through the year 2016, opportunities are expected to be good for qualified applicants, in large part due to the number of workers expected to retire or leave these occupations in the next decade.

Employment change. Employment is expected to increase by 1 percent, which is considered little or no change. This will occur despite expected increases in the amount of freight volume, which will be due to railroads' advantages over other modes of shipping.

Demand for railroad freight service will grow as the economy and the intermodal transportation of goods continue to expand. Intermodal transportation involves loading cargo in large containers that can be moved by ship, rail, or truck. Improved delivery times and on time service along with reduced shipping rates will help railroads compete with other modes of transportation, such as trucks, ships, and aircraft. Railroads will also benefit from congested highways and relative savings on rising fuel costs. However, technology will allow railroads to improve productivity and consolidate duties, which will offset the need for new employees in occupations not essential for railroad operations. For example, the need for rail yard engineers who operate trains inside rail yards will see a rapid decline as a result of remote control locomotive technology, while employment of locomotive engineers will grow as fast as the average because of the continued need for train operators on open rail. For similar reasons, railroad brake, signal, and switch operators and other rail transportation occupations will see a decline in employment, whereas railroad conductors will continue to be necessary for

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16 Number	Change, 2006-16 Percent
Rail transportation occupations	53-4000	125,000	127,000	1,800	1
Locomotive engineers and operators	53-4010	47,000	48,000	1,300	3
Railroad brake, signal, and switch operators	53-4021	25,000	22,000	-2,800	-11
Railroad conductors and yardmasters	53-4031	40,000	44,000	3,600	9
Subway and streetcar operators	53-4041	6,900	7,800	800	12
Rail transportation workers, all other	53-4099	6,800	5,500	-1,300	-19

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

train operation for the foreseeable future and are expected to grow about as fast as average through 2016.

Passenger rail service is anticipated to increase volume on pace with the growing population, as are public transit authorities. Employment of subway and streetcar operators will see average growth due to increased demand for light-rail transportation systems around the country.

Job prospects. Opportunities for rail transportation workers will be favorable as a large number of older workers are expected to retire over the next decade. Other workers will leave the occupation for various personal and professional reasons, creating further opportunities. Prospects will be best for those positions that are also expected to see growth, for example locomotive engineers and conductors. There will also be job opportunities for those positions that are expected to decline, for example brake, signal, and switch operators. These openings will be the result of retirements and other separations. Entry-level occupations such as brake operator and conductor should be plentiful for applicants with clean drug and criminal records. Opportunities for long-distance train crews are also expected to be good as many of those working in the yards prefer not to travel long distances.

Earnings

Median hourly earnings of rail transportation occupations in May 2006 are indicated in the tabulation below. These earnings were relatively high, compared to $12.17 per hour for all transportation occupations.

Locomotive engineers	$27.88
Railroad conductors and yardmasters	26.70
Subway and streetcar operators	23.55
Railroad brake, signal, and switch operators	23.49

Most railroad transportation workers are paid according to miles traveled or hours worked, whichever leads to higher earnings. Factors such as seniority, job assignments, and location impact potential earnings.

Seventy-four percent of railroad transportation workers are members of unions compared to 12 percent for all occupations. Many different railroad unions represent various crafts on the railroads. Among the largest of the railroad employee unions are the United Transportation Union and the Brotherhood of Locomotive Engineers and Trainmen. Many subway operators are members of the Amalgamated Transit Union, while others belong to the Transport Workers Union of North America.

Related Occupations

Other related transportation workers include bus drivers, truck drivers and driver/sales workers, and those working in water transportation occupations. Employees who repair and maintain railroad rolling stock are included in heavy vehicle and mobile equipment service technicians and mechanics. Rail transportation workers sometimes work closely with workers in material moving occupations to load and unload freight.

Sources of Additional Information

To obtain information on employment opportunities, contact either the employment offices of railroads and rail transit systems or state employment service offices.

Water Transportation Occupations

(O*NET 53-5011.00, 53-5021.00, 53-5021.01, 53-5021.02, 53-5021.03, 53-5022.00, and 53-5031.00)

Significant Points

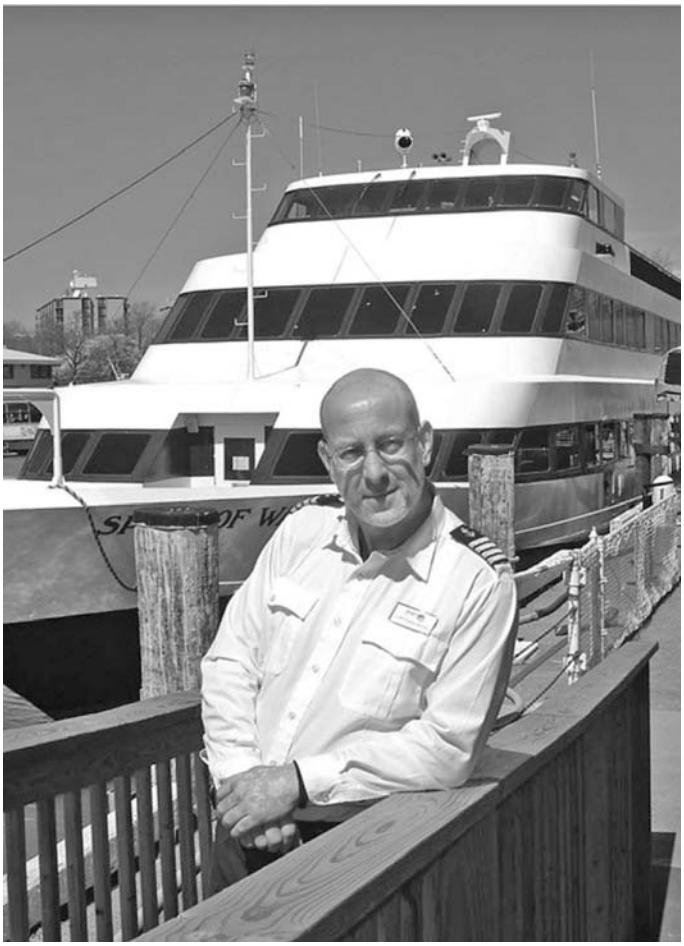
- Merchant mariners spend extended periods at sea.
- Entry, training, and educational requirements for many water transportation occupations are established and regulated by the U.S. Coast Guard.
- Faster-than-average growth and good job opportunities are expected.

Nature of the Work

The movement of huge amounts of cargo, as well as passengers, between nations and within our nation depends on workers in water transportation occupations, also known on commercial ships as merchant mariners. They operate and maintain deep-sea merchant ships, tugboats, towboats, ferries, dredges, offshore supply vessels, excursion vessels, and other waterborne craft on the oceans, the Great Lakes, rivers, canals, and other waterways, as well as in harbors. (Workers who operate watercraft used in commercial fishing are described in the section on fishers and fishing vessel operators elsewhere in the *Handbook*.)

Captains, mates, and pilots of water vessels command or supervise the operations of ships and water vessels, both within domestic waterways and on the deep sea. *Captains* or *masters* are in overall command of the operation of a vessel, and they supervise the work of all other officers and crew. Together with their department heads, captains ensure that proper procedures and safety practices are followed, check to make sure that machinery and equipment are in good working order, and oversee the loading and discharging of cargo or passengers. They also maintain logs and other records tracking the ships' movements, efforts at controlling pollution, and cargo and passengers carried.

Deck officers or *mates* direct the routine operation of the vessel for the captain during the shifts when they are on watch. On smaller vessels, there may be only one mate (called a *pilot* on some inland



Captains direct all operations on their vessels.

towing vessels), who alternates watches with the captain. The mate would assume command of the ship if the captain became incapacitated. When more than one mate is necessary aboard a ship, they typically are designated chief mate or first mate, second mate, third mate, etc. Mates also supervise and coordinate activities of the crew aboard the ship. Captains and mates determine the course and speed of the vessel, maneuvering to avoid hazards and continuously monitoring the vessel's position with charts and navigational aides. Captains and mates oversee crew members who steer the vessel, determine its location, operate engines, communicate with other vessels, perform maintenance, handle lines, and operate equipment on the vessel. They inspect the cargo holds during loading to ensure that the load is stowed according to specifications and regulations. Captains and mates also supervise crew members engaged in maintenance and the primary upkeep of the vessel.

Pilots guide ships in and out of harbors, through straits, and on rivers and other confined waterways where a familiarity with local water depths, winds, tides, currents, and hazards such as reefs and shoals are of prime importance. Pilots on river and canal vessels usually are regular crew members, like mates. Harbor pilots are generally independent contractors who accompany vessels while they enter or leave port. Harbor pilots may pilot many ships in a single day.

Ship engineers operate, maintain, and repair propulsion engines, boilers, generators, pumps, and other machinery. Merchant marine vessels usually have four engineering officers: A chief engineer and a first, second, and third assistant engineer. Assistant engineers stand periodic watches, overseeing the safe operation of engines and machinery.

Marine oilers and more experienced *qualified members of the engine department*, or QMEDs, assist the engineers to maintain the vessel in proper running order in the engine spaces below decks. These workers lubricate gears, shafts, bearings, and other moving parts of engines and motors; read pressure and temperature gauges; record data; and sometimes assist with repairs and adjust machinery.

Sailors or *deckhands* operate the vessel and its deck equipment under the direction of the ship's officers and keep the nonengineering areas in good condition. They stand watch, looking out for other vessels and obstructions in the ship's path, as well as for navigational aids such as buoys and lighthouses. They also steer the ship, measure water depth in shallow water, and maintain and operate deck equipment such as lifeboats, anchors, and cargo-handling gear. On vessels handling liquid cargo, mariners designated as *pumpmen* hook up hoses, operate pumps, and clean tanks; on tugboats or tow vessels, they tie barges together into tow units, inspect them periodically, and disconnect them when the destination is reached. When docking or departing, they handle lines. They also perform routine maintenance chores, such as repairing lines, chipping rust, and painting and cleaning decks or other areas. Experienced sailors are designated *able seamen* on oceangoing vessels, but may be called simply deckhands on inland waters; larger vessels usually have a *boatswain*, or *head seaman*.

A typical deep-sea merchant ship has a captain, three deck officers or mates, a chief engineer and three assistant engineers, plus six or more seamen, such as able seamen, oilers, QMEDs, and a cook. The size and service of the ship determine the number of crewmembers for a particular voyage. Small vessels operating in harbors, on rivers, or along the coast may have a crew comprising only a captain and one deckhand. On smaller vessels the cooking responsibilities usually fall under the deckhands' duties.

On larger coastal ships, the crew may include a captain, a mate or pilot, an engineer, and seven or eight seamen. Some ships may have special unlicensed positions for entry level apprentice trainees. Unlicensed positions on a large ship may include a full-time cook, an electrician, and machinery mechanics.

Motorboat operators operate small, motor-driven boats that carry six or fewer passengers on fishing charters. They also take depth soundings in turning basins and serve as liaisons between ships, between ship and shore, between harbors and beaches, or on area patrol.

Work environment. Water transportation workers' schedules vary based upon the type of ship and length of voyage. While on the water, crews are normally on duty for half of the day, 7 days a week.

Merchant mariners on survey and long distance cargo vessels can spend extended periods at sea. Most deep-sea mariners are hired for one or more voyages that last for several months; there is no job security after that. The length of time between voyages varies depending on job availability and personal preference.

Workers on supply vessels transport workers, supplies (water, drilling mud, fuel, and food), and equipment to oil and gas drilling platforms mostly in the Gulf of Mexico. Their voyages can last a few hours to a couple of weeks. As oil and gas exploration pushes into deeper waters, these trips take more time.

Workers on tugs and barges operate on the rivers, lakes, inland waterways, and along the coast. Most tugs have two crews and operate constantly. The crews will alternate, each working for two to three weeks and then taking two to three weeks off.

Many of those employed on Great Lakes ships work 60 days and have 30 days off, but do not work in the winter when the lakes are frozen. Others work steadily for a week or a month and then have an

extended period off. Those on smaller vessels, such as tugs, supply boats and Great Lakes ships, are normally assigned to one vessel and have steady employment.

Workers on ferries transporting commuters work on weekdays in the morning and evening. Other ferries make frequent trips lasting a few hours. Ferries servicing vacation destinations often operate on seasonal schedules. Workers in harbors generally have year-round work. Work in harbors and on ferries is sought after because workers return home every day.

People holding water transportation jobs work in all kinds of weather, except when frozen waters make travel impossible. Although merchant mariners try to avoid severe storms while at sea, working in damp and cold conditions often is inevitable. While it is uncommon for vessels to suffer disasters such as fire, explosion, or a sinking, workers face the possibility that they may have to abandon their craft on short notice if it collides with other vessels or runs aground. They also risk injury or death from falling overboard and hazards associated with working with machinery, heavy loads, and dangerous cargo. However, modern safety management procedures, advanced emergency communications, and effective international rescue systems have greatly improved mariner safety.

Many companies are working to improve the living conditions on vessels to reduce employee turnover. Most of the nation's newest vessels are air conditioned, soundproofed to reduce machinery noise, and equipped with comfortable living quarters. Some companies have added improved entertainment systems and hired full-time cooks. These amenities lessen the difficulty of spending long periods away from home. Advances in communications, particularly e-mail, better link mariners to their families. Nevertheless, some mariners dislike the long periods away from home and the confinement aboard ship and consequently leave the occupation.

Training, Other Qualifications, and Advancement

Entry, training, and educational requirements for many water transportation occupations are established and regulated by the U.S. Coast Guard. Most officers and operators of commercially operated vessels must be licensed by the Coast Guard, which offers various kinds of licenses, depending on the position, body of water, and type of vessel. Individuals must be relicensed when they change the type of ship or the body of water they are on.

Education and training. Entry-level workers are classified as ordinary seamen or deckhands. Workers take some basic training, lasting a few days, in areas such as first aid and firefighting.

There are two paths of education and training for a deck officer or an engineer: applicants must either accumulate thousands of hours of experience while working as a deckhand, or graduate from the U.S. Merchant Marine Academy or another maritime academy. In both cases, applicants must pass a written examination. It is difficult to pass the examination without substantial formal schooling or independent study. The academies offer a four-year academic program leading to a bachelor-of-science degree, a license (issued only by the Coast Guard) as a third mate (deck officer) or third assistant engineer (engineering officer), and, if the person chooses, a commission as ensign in the U.S. Naval Reserve, Merchant Marine Reserve, or Coast Guard Reserve. With experience and additional training, third officers may qualify for higher rank. Generally officers on deep water vessels are academy graduates and those in supply boats, inland waterways, and rivers rose to their positions through years of experience.

Harbor pilot training usually consists of an extended apprenticeship with a towing company or a harbor pilots' association. Entrants may be able seamen or licensed officers.

Licensure. Coast Guard licensing requirements vary by occupational specialty, type of vessel, and by body of water (river, inland waterway, Great Lakes, and oceans.) The requirements increase as the skill level of the occupational specialty increases and the size of the vessel increases.

Entry-level seamen or deckhands on vessels operating in harbors or on rivers or other waterways do not need a license. All others working on larger, ocean-going vessels do need a license. To get the basic entry-level license, workers must pass a drug screen, take a medical exam, and be U.S. citizens.

Workers on ocean-going or Great Lakes vessels need specialty licenses to work as engineering officers, or deck officers. On rivers or inland waterways, only the captain or anyone who steers the boat needs a license. For more information on licensing requirements see the Coast Guard's Web site listed in the sources of additional information. Radio operators are licensed by the Federal Communications Commission.

Other qualifications. Most positions require excellent health, good vision, and color perception. Good general physical condition is needed because many jobs require the ability to lift heavy objects, withstand heat and cold, stand or stoop for long periods of time, dexterity to maneuver through tight spaces, and good balance on uneven and wet surfaces and in rough water.

Advancement. Experience and passing exams are required to advance. Deckhands who wish to advance must decide whether they want to work in the wheelhouse or the engine room. They will then assist the engineers or deck officers. With experience, assistant engineers and deck offices can advance to become chief engineers or captains. On smaller boats, such as tugs, a captain may choose to become self-employed by buying a boat and working as an owner-operator.

Employment

Water transportation workers held more than 84,000 jobs in 2006. The total number who worked at some point in the year was significantly larger because many merchant marine officers and seamen worked only part of the year. The following tabulation shows employment in the occupations that make up this group:

Captains, mates, and pilots of water vessels	34,000
Sailors and marine oilers	33,000
Ship engineers	15,000
Motorboat operators	3,000

About 40 percent of all workers were employed in water transportation services. About 17 percent worked in inland water transportation—primarily the Mississippi River system—while the other 23 percent were employed in water transportation on the deep seas, along the coasts, and on the Great Lakes. Another 24 percent worked in establishments related to port and harbor operations, marine cargo handling, or navigational services to shipping. Governments employed 9 percent of all water transportation workers, many of whom worked on supply ships and are civilian mariners of the Navy Department's Military Sealift Command.

Job Outlook

Employment in water transportation occupations is projected to grow faster than average. Good job opportunities are expected.

Employment change. Employment in water transportation occupations is projected to grow 16 percent over the 2006–2016 period, faster than the average for all occupations. Job growth will stem from increasing tourism and growth in offshore oil and gas production. Employment will also increase in and around major port cities due to rapidly increasing international trade.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Water transportation occupations	53-5000	84,000	98,000	14,000	16
Sailors and marine oilers	53-5011	33,000	38,000	5,200	16
Ship and boat captains and operators	53-5020	37,000	43,000	6,300	17
Captains, mates, and pilots of water vessels	53-5021	34,000	40,000	6,000	18
Motorboat operators	53-5022	3,000	3,300	300	11
Ship engineers	53-5031	15,000	17,000	2,100	14

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Employment in deep-sea shipping for American mariners is expected to remain stable. A fleet of deep-sea U.S.-flagged ships is considered vital to the nation's defense, so some receive federal support through a maritime security subsidy and other provisions in laws that limit certain federal cargoes to ships that fly the U.S. flag.

Employment growth also is expected in passenger cruise ships within U.S. waters. Vessels that operate between U.S. ports are required by law to be U.S.-flagged vessels. The staffing needs for several new U.S. flagged cruise ships that will travel to the Hawaiian Islands will create new opportunities for employment. In addition, increasing use of ferries to handle commuter traffic around major metropolitan areas should increase employment.

Some growth in water transportation occupations is projected in vessels operating in the Great Lakes and inland waterways. Growth will be driven by increasing demand for bulk products, such as coal, iron ore, petroleum, sand and gravel, grain, and chemicals. Since current pipelines cannot transport ethanol, some growth will come from shipping ethanol. Problems with congestion in the rail transportation system will increase demand for inland water transportation.

Job prospects. Good job opportunities will result from growth and the need to replace those leaving the occupation. Most water transportation occupations require workers to be away from home for extended periods of time, causing some to leave these jobs.

Maritime academy graduates who have not found licensed shipboard jobs in the U.S. merchant marine find jobs in related industries. Many academy graduates are ensigns in the Naval or Coast Guard Reserve; some are selected or apply for active duty in those branches of the Service. Some find jobs as seamen on U.S.-flagged or foreign-flagged vessels, tugboats, and other watercraft or enter civilian jobs with the U.S. Navy or Coast Guard. Some take land-based jobs with shipping companies, marine insurance companies, manufacturers of boilers or related machinery, or other related jobs.

Earnings

Earnings vary widely with the particular water transportation position and the worker's experience. Earnings are higher than most other occupations with similar educational requirements for entry-level positions. While wages are lower for sailors than for mates and engineers, sailors' on-board experience is important for advancing into those higher paying positions. Workers are normally paid by the day. Since companies provide food and housing at sea and it is difficult to spend money while working, sailors are able to save a large portion of their pay.

Median annual wage-and-salary earnings of sailors and marine oilers were $30,630 in May 2006. The middle 50 percent earned between $23,790 and $39,380. The lowest 10 percent had earnings of less than $19,220, while the top 10 percent earned over $49,650.

Median annual wage-and-salary earnings of captains, mates, and pilots of water vessels were $53,430 in May 2006. The middle 50 percent earned between $38,880 and $69,570. The lowest 10 percent had earnings of less than $29,360, while the top 10 percent earned over $89,230. Annual pay for captains of larger vessels, such as container ships, oil tankers, or passenger ships may exceed $100,000, but only after many years of experience. Similarly, earnings of captains of tugboats are dependent on the port and the nature of the cargo.

Median annual wage-and-salary earnings of ship engineers were $54,820 in May 2006. The middle 50 percent earned between $41,190 and $74,360. The lowest 10 percent had earnings of less than $34,140, while the top 10 percent earned over $92,860.

Median annual wage-and-salary earnings of motorboat operators were $32,350 in May 2006. The middle 50 percent earned between $23,340 and $45,850. The lowest 10 percent had earnings of less than $17,270, while the top 10 percent earned over $55,170.

The rate of unionization for these workers is about 16 percent, higher than the average for all occupations. Unionization rates vary by region. In unionized areas, merchant marine officers and seamen, both veterans and beginners, are hired for voyages through union hiring halls or directly by shipping companies. Hiring halls rank the candidates by the length of time the person has been out of work and fill open slots accordingly. Most major seaports have hiring halls.

Related Occupations

Workers in other occupations who make their living on the seas and coastal waters include fishers and fishing vessel operators and members of the Navy and the Coast Guard. Heavy vehicle and mobile equipment service technicians and mechanics perform work similar to shipboard engineers.

Job Opportunities in the Armed Forces

(O*NET 55-1011.00, 55-1012.00, 55-1013.00, 55-1014.00, 55-1015.00, 55-1016.00, 55-1017.00, 55-1019.99, 55-2011.00, 55-2012.00, 55-2013.00, 55-3011.00, 55-3012.00, 55-3013.00, 55-3014.00, 55-3015.00, 55-3016.00, 55-3017.00, 55-3018.00, and 55-3019.99)

Significant Points

- Some training and duty assignments are hazardous, even in peacetime; hours and working conditions can be arduous and vary substantially, and personnel must strictly conform to military rules at all times.
- Enlisted personnel need at least a high school diploma or its equivalent while officers need a bachelor's or graduate degree.
- Opportunities should be excellent in all branches of the Armed Forces for applicants who meet designated standards.
- Military personnel are eligible for retirement after 20 years of service.

Nature of the Work

Maintaining a strong national defense requires workers who can do such diverse tasks as run a hospital, command a tank, program a computer system, operate a nuclear reactor, or repair and maintain a helicopter. The military provides training and work experience in these and many other fields for more than 2.6 million people. More than 1.4 million people serve in the active Army, Navy, Marine Corps, and Air Force, and more than 1.2 million serve in their Reserve components and the Air and Army National Guard. The Coast Guard, which is also discussed in this *Handbook* statement, is part of the Department of Homeland Security.

The military distinguishes between enlisted and officer careers. Enlisted personnel, who make up about 84 percent of the Armed Forces, carry out the fundamental operations of the military in combat, administration, construction, engineering, health care, human services, and other areas. Officers, who make up the remaining 16 percent of the Armed Forces, are the leaders of the military, supervising and managing activities in every occupational specialty.

The sections that follow discuss the major occupational groups for enlisted personnel and officers.

Enlisted occupational groups. *Administrative careers* include a wide variety of positions. The military must keep accurate information for planning and managing its operations. Both paper and electronic records are kept on personnel and on equipment, funds, supplies, and all other aspects of the military. Administrative personnel record information, prepare reports, maintain files, and review information to assist military officers. Personnel may work in a specialized area such as finance, accounting, legal affairs, maintenance, supply, or transportation.

Combat specialty occupations include enlisted specialties such as infantry, artillery, and Special Forces, whose members operate weapons or execute special missions during combat. People in these occupations normally specialize by type of weapon system or combat operation. These personnel maneuver against enemy forces and position and fire artillery, guns, mortars, and missiles to destroy enemy positions. They also may operate tanks and amphibious assault vehicles in combat or scouting missions. When the military has especially difficult or specialized missions to perform, they call upon Special Forces teams. These elite combat forces maintain a constant state of readiness to strike anywhere in the world on a moment's notice. Team members from the Special Forces conduct offensive raids, demolitions, intelligence, search-and-rescue missions, and other operations from aboard aircraft, helicopters, ships, or submarines.

Construction occupations in the military include personnel who build or repair buildings, airfields, bridges, foundations, dams, bunkers, and the electrical and plumbing components of these structures. Personnel in construction occupations operate bulldozers, cranes, graders, and other heavy equipment. Construction specialists also may work with engineers and other building specialists as part of military construction teams. Some personnel specialize in areas such as plumbing or electrical wiring. Plumbers and pipefitters install and repair the plumbing and pipe systems needed in buildings and on aircraft and ships. Building electricians install and repair electrical-wiring systems in offices, airplane hangars, and other buildings on military bases.

Electronic and electrical equipment repair personnel repair and maintain electronic and electrical equipment used in the military. Repairers normally specialize by type of equipment, such as avionics, computer, optical, communications, or weapons systems. For example, electronic instrument repairers install, test, maintain, and repair a wide variety of electronic systems, including navigational controls and biomedical instruments. Weapons maintenance techni-

Many Marines are in combat specialty occupations.

cians maintain and repair weapons used by combat forces; most of these weapons have electronic components and systems that assist in locating targets and in aiming and firing the weapon.

Engineering, science, and technical personnel in the military require specific knowledge to operate technical equipment, solve complex problems, or provide and interpret information. Personnel normally specialize in one area, such as space operations, information technology, environmental health and safety, or intelligence. Space operations specialists use and repair ground-control command equipment related to spacecraft, including electronic systems that track the location and operation of a craft. Information technology specialists develop software programs and operate computer systems. Environmental health and safety specialists inspect military facilities and food supplies for the presence of disease, germs, or other conditions hazardous to health and the environment. Intelligence specialists gather and study aerial photographs and various types of radar and surveillance systems to discover information needed by the military.

Health care personnel assist medical professionals in treating and providing services for men and women in the military. They may work as part of a patient-service team in close contact with doctors, dentists, nurses, and physical therapists. Some specialize in emergency medical treatment, the operation of diagnostic tools such as X-ray and ultrasound equipment, laboratory testing of tissue and blood samples, maintaining pharmacy supplies or patients' records, constructing and repairing dental equipment or eyeglasses, or some other health care task.

Human resources development specialists recruit and place qualified personnel and provide training programs. Personnel in this career area normally specialize by activity. For example, recruiting specialists provide information about military careers to young people, parents, schools, and local communities and explain the Armed Service's employment and training opportunities, pay and benefits, and service life. Personnel specialists collect and store information about the people in the military, including information on their previous and current training, job assignments, promotions, and health. Training specialists and instructors teach classes, give demonstrations, and teach military personnel how to perform their jobs.

Machine operator and production personnel operate industrial equipment, machinery, and tools to fabricate and repair parts for a variety of items and structures. They may operate engines, turbines, nuclear reactors, and water pumps. Often, they specialize by type of work performed. Welders and metalworkers, for instance, work with various types of metals to repair or form the structural parts of ships, submarines, buildings, or other equipment. Survival equipment specialists inspect, maintain, and repair survival equipment such as parachutes and aircraft life support equipment.

Media and public affairs personnel assist with the public presentation and interpretation of military information and events. They take and develop photographs; film, record, and edit audio and video programs; present news and music programs; and produce artwork, drawings, and other visual displays. Other public affairs specialists act as interpreters and translators to convert written or spoken foreign languages into English or other languages.

Protective service personnel include those who enforce military laws and regulations and provide emergency response to natural and human-made disasters. For example, military police control traffic, prevent crime, and respond to emergencies. Other law enforcement and security specialists investigate crimes committed on military property and guard inmates in military correctional facilities. Firefighters put out, control, and help prevent fires in buildings, on aircraft, and aboard ships.

A sailor in the Navy updates a status board on a ship.

Support service personnel provide subsistence services and support the morale and well-being of military personnel and their families. Food service specialists prepare all types of food in dining halls, hospitals, and ships. Counselors help military personnel and their families deal with personal issues. They work as part of a team that may include social workers, psychologists, medical officers, chaplains, personnel specialists, and commanders. Religious program specialists assist chaplains with religious services, religious education programs, and related administrative duties.

Transportation and material handling specialists ensure the safe transport of people and cargo. Most personnel within this occupational group are classified according to mode of transportation, such as aircraft, motor vehicle, or ship. Aircrew members operate equipment on aircraft. Vehicle drivers operate all types of heavy military vehicles, including fuel or water tank trucks, semi-trailers, heavy troop transports, and passenger buses. Quartermasters and boat operators navigate and pilot many types of small watercraft, including tugboats, gunboats, and barges. Cargo specialists load and unload military supplies, using equipment such as forklifts and cranes.

Vehicle and machinery mechanics conduct preventive and corrective maintenance on aircraft, automotive and heavy equipment, heating and cooling systems, marine engines, and powerhouse station equipment. These workers typically specialize by the type of equipment that they maintain. For example, aircraft mechanics inspect, service, and repair helicopters, airplanes, and drones. Automotive and heavy equipment mechanics maintain and repair vehicles such as humvees, trucks, tanks, self-propelled missile launchers, and other combat vehicles. They also repair bulldozers, power shovels, and other construction equipment. Heating and cooling mechanics install and repair air-conditioning, refrigeration, and heating equipment. Marine engine mechanics repair and maintain gasoline and diesel engines on ships, boats, and other watercraft. They also repair shipboard mechanical and electrical equipment. Powerhouse mechanics install, maintain, and repair electrical and mechanical equipment in power-generating stations.

Officer occupational groups. *Combat specialty officers* plan and direct military operations, oversee combat activities, and serve as combat leaders. This category includes officers in charge of tanks and other armored assault vehicles, artillery systems, Special Forces, and infantry. Combat specialty officers normally specialize by the type of unit that they lead. Within the unit, they may specialize by type of weapon system. Artillery and missile system officers, for example, direct personnel as they target, launch, test, and maintain various types of missiles and artillery. Special operations officers lead their units in offensive raids, demolitions, intelligence gathering, and search-and-rescue missions.

Engineering, science, and technical officers have a wide range of responsibilities based on their area of expertise. They lead or perform activities in areas such as space operations, environmental health and safety, and engineering. These officers may direct the operations of communications centers or the development of complex computer systems. Environmental health and safety officers study the air, ground, and water to identify and analyze sources of pollution and its effects. They also direct programs to control safety and health hazards in the workplace. Other personnel work as aerospace engineers to design and direct the development of military aircraft, missiles, and spacecraft.

Executive, administrative, and managerial officers oversee and direct military activities in key functional areas such as finance, accounting, health administration, international relations, and supply. Health services administrators, for instance, are responsible for the overall quality of care provided at the hospitals and clinics they operate. They must ensure that each department works together. As another example, purchasing and contracting managers negotiate and monitor contracts for the purchase of the billions of dollars worth of equipment, supplies, and services that the military buys from private industry each year.

Health care officers provide health services at military facilities, on the basis of their area of specialization. Officers who examine, diagnose, and treat patients with illness, injury, or disease include physicians, registered nurses, and dentists. Other health care officers provide therapy, rehabilitative treatment, and additional services for patients. Physical and occupational therapists plan and administer therapy to help patients adjust to disabilities, regain independence, and return to work. Speech therapists evaluate and treat patients with hearing and speech problems. Dietitians manage food service facilities and plan meals for hospital patients and for outpatients who need special diets. Pharmacists manage the purchase, storage, and dispensing of drugs and medicines. Physicians and surgeons in this occupational group provide the majority of medical services to the military and their families. dentists treat diseases, disorders, and injuries of the mouth. Optometrists treat vision problems by prescribing eyeglasses or contact lenses. Psychologists provide mental health care and also conduct research on behavior and emotions.

Human resource development officers manage recruitment, placement, and training strategies and programs in the military. Recruiting managers direct recruiting efforts and provide information about military careers to young people, parents, schools, and local communities. Personnel managers direct military personnel functions such as job assignment, staff promotion, and career counseling. Training and education directors identify training needs and develop and manage educational programs designed to keep military personnel current in the skills they need.

Media and public affairs officers oversee the development, production, and presentation of information or events for the public. These officers may produce and direct motion pictures, videos, and television and radio broadcasts that are used for training, news, and entertainment. Some plan, develop, and direct the activities of military bands. Public information officers respond to inquiries about military activities and prepare news releases and reports to keep the public informed.

Protective service officers are responsible for the safety and protection of individuals and property on military bases and vessels. Emergency management officers plan and prepare for all types of natural and human-made disasters. They develop warning, control, and evacuation plans to be used in the event of a disaster. Law enforcement and security officers enforce all applicable laws on military bases and investigate crimes when the law has been broken.

Support services officers manage food service activities and perform services in support of the morale and well-being of military personnel and their families. Food services managers oversee the preparation and delivery of food services within dining facilities located on military installations and vessels. Social workers focus on improving conditions that cause social problems such as drug and alcohol abuse, racism, and sexism. Chaplains conduct worship services for military personnel and perform other spiritual duties according to the beliefs and practices of all religious faiths.

Transportation officers manage and perform activities related to the safe transport of military personnel and material by air and water. These officers normally specialize by mode of transportation or area of expertise because, in many cases, they must meet licensing and certification requirements. Pilots in the military fly various types of specialized airplanes and helicopters to carry troops and equipment and to execute combat missions. Navigators use radar, radio, and other navigation equipment to determine their position and plan their route of travel. Officers on ships and submarines work as a team to manage the various departments aboard their vessels. Ship engineers direct engineering departments aboard ships and submarines, including engine operations, maintenance, repair, heating, and power generation.

Work environment. Most military personnel live and work on or near military bases and facilities throughout the United States and the world. These bases and facilities usually offer comfortable housing and amenities, such as stores and recreation centers. Service members move regularly to complete their training or to meet the needs of their branch of service. Some are deployed to defend

Some Army personnel are construction specialists.

national interests. Military personnel must be physically fit, mentally stable, and ready to participate in or support combat missions that maybe difficult and dangerous and involve time away from family. Some, however, are never deployed near combat areas. Specific work environments and conditions depend on branch of service, occupational specialty, and other factors.

In many circumstances, military personnel work standard hours, but personnel must be prepared to work long hours to fulfill missions, and they must conform to strict military rules at all times. Work hours depend on occupational specialty and mission.

Training, Other Qualifications, and Advancement

To join the military, people must meet age, educational, aptitude, physical, and character requirements. These requirements vary by branch of service and vary between officers, who usually have a college degree, and enlisted personnel, who often do not. People are assigned an occupational specialty based on their aptitude, former training, and the needs of the military. All service members must sign a contract and commit to a minimum term of service. After joining the military, all receive general and occupation-specific training.

People thinking about enlisting in the military should learn as much as they can about military life before making a decision. Doing so is especially important if you are thinking about making the military a career. Speaking to friends and relatives with military experience is a good idea. Find out what the military can offer you and what it will expect in return. Then, talk to a recruiter, who can determine whether you qualify for enlistment, explain the various enlistment options, and tell you which military occupational specialties currently have openings. Bear in mind that the recruiter's job is to recruit promising applicants into his or her branch of military service, so the information that the recruiter gives you is likely to stress the positive aspects of military life in the branch in which he or she serves.

Ask the recruiter for the branch you have chosen to assess your chances of being accepted for training in the occupation of your choice, or, better still, take the aptitude exam to see how well you score. The military uses this exam as a placement exam, and test scores largely determine an individual's chances of being accepted into a particular training program. Selection for a particular type of training depends on the needs of the service, your general and technical aptitudes, and your personal preference. Because all prospective recruits are required to take the exam, those who do so before committing themselves to enlist have the advantage of knowing in advance whether they stand a good chance of being accepted for training in a particular specialty. The recruiter can schedule you for the Armed Services Vocational Aptitude Battery without any obligation. Many high schools offer the exam as an easy way for students to explore the possibility of a military career, and the test also affords an insight into career areas in which the student has demonstrated aptitudes and interests. The exam is not part of the process of joining the military as an officer.

If you decide to join the military, the next step is to pass the physical examination and sign an enlistment contract. Negotiating the contract involves choosing, qualifying for, and agreeing on a number of enlistment options, such as the length of active-duty time, which may vary according to the option. Most active-duty programs have first-term enlistments of 4 years, although there are some two-year, three-year, and six-year programs. The contract also will state the date of enlistment and other options—for example, bonuses and the types of training to be received. If the service is unable to fulfill any of its obligations under the contract, such as providing a certain kind of training, the contract may become null and void.

The Air Force's fleet of planes need regular maintenance to ensure readiness.

All branches of the Armed Services offer a delayed entry program (DEP) by which an individual can delay entry into active duty for up to 1 year after enlisting. High school students can enlist during their senior year and enter a service after graduation. Others choose this program because the job training they desire is not currently available, but will be within the coming year, or because they need time to arrange their personal affairs.

The process of joining the military as an officer is different. Officers must meet educational, physical, and character requirements, but they do not take an aptitude test, for example. The education and training section that follows includes more information.

Education and training. All branches of the Armed Forces usually require their members to be high school graduates or have equivalent credentials, such as a GED. In 2006, more than 98 percent of recruits were high school graduates. Officers usually need a bachelor's or graduate degree. Training varies for enlisted and officer personnel and varies by occupational specialty.

Enlisted personnel training. Following enlistment, new members of the Armed Forces undergo initial-entry training, better known as "basic training" or "boot camp." Through courses in military skills and protocol recruit training provides a 6- to 13-week introduction to military life. Days and nights are carefully structured and include rigorous physical exercise designed to improve strength and endurance and build each unit's cohesion.

Following basic training, most recruits take additional training at technical schools that prepare them for a particular military occupational specialty. The formal training period generally lasts from 10 to 20 weeks, although training for certain occupations—nuclear power plant operator, for example—may take as long as a year. Recruits not assigned to classroom instruction receive on-the-job training at their first duty assignment.

Many service people get college credit for the technical training they receive on duty, which, combined with off-duty courses, can lead to an associate degree through programs in community colleges such as the Community College of the Air Force. In addition to on-duty training, military personnel may choose from a variety of educational programs. Most military installations have tuition assistance programs for people wishing to take courses during off-duty hours. The courses may be correspondence courses or courses in degree programs offered by local colleges or universities. Tuition assistance pays up to 100 percent of college costs up to a credit-hour and annual limit. Each branch of the service provides opportunities for full-time study to a limited number of exceptional applicants.

Military personnel accepted into these highly competitive programs receive full pay, allowances, tuition, and related fees. In return, they must agree to serve an additional amount of time in the service. Other highly selective programs enable enlisted personnel to qualify as commissioned officers through additional military training.

Warrant officer training. Warrant officers are technical and tactical leaders who specialize in a specific technical area; for example, Army aviators make up one group of warrant officers. The Army Warrant Officer Corps constitutes less than 5 percent of the total Army. Although the Corps is small in size, its level of responsibility is high. Its members receive extended career opportunities, worldwide leadership assignments, and increased pay and retirement benefits. Selection to attend the Warrant Officer Candidate School is highly competitive and restricted to those who meet rank and length-of-service requirements. The only exception is the Army aviator warrant officer, which has no prior military service requirements.

Officer training. Officer training in the Armed Forces is provided through the federal service academies (Military, Naval, Air Force, and Coast Guard); the Reserve Officers Training Corps (ROTC) program offered at many colleges and universities; Officer Candidate School (OCS) or Officer Training School (OTS); the National Guard (State Officer Candidate School programs); the Uniformed Services University of Health Sciences; and other programs. All are highly selective and are good options for those wishing to make the military a career. Some are directly appointed. People interested in obtaining training through the federal service academies must be unmarried and without dependants to enter and graduate, while those seeking training through OCS, OTS, or ROTC need not be single.

Federal service academies provide a four-year college program leading to a Bachelor of Science (B.S.) degree. Midshipmen or cadets are provided free room and board, tuition, medical and dental care, and a monthly allowance. Graduates receive regular or reserve commissions and have a five-year active-duty obligation or more if they are entering flight training.

To become a candidate for appointment as a cadet or midshipman in one of the service academies, applicants are required to obtain a nomination from an authorized source, usually a member of Congress. Candidates do not need to know a member of Congress personally to request a nomination. Nominees must have an academic record of the requisite quality, college aptitude test scores above an established minimum, and recommendations from teachers or school officials; they also must pass a medical examination. Appointments are made from the list of eligible nominees. Appointments to the Coast Guard Academy, however, are based strictly on merit and do not require a nomination.

ROTC programs train students in 273 Army, 130 Navy and Marine Corps, and 144 Air Force units at participating colleges and universities. Trainees take 3 to 5 hours of military instruction a week, in addition to regular college courses. After graduation, they may serve as officers on active duty for a stipulated period. Some may serve their obligation in the Reserves or National Guard. In the last 2 years of an ROTC program, students typically receive a monthly allowance while attending school, as well as additional pay

Table 1. Military rank and employment for active duty personnel, January 2007

Grade	Rank and title				
	Army	Navy	Air Force	Marine Corps	Total Employment
Commissioned officers:

for summer training. ROTC scholarships for 2, 3, and 4 years are available on a competitive basis. All scholarships pay for tuition and have allowances for textbooks, supplies, and other costs.

College graduates can earn a commission in the Armed Forces through OCS or OTS programs in the Army, Navy, Air Force, Marine Corps, Coast Guard, and National Guard. These programs consist of several weeks of intensive academic, physical, and leadership training. These officers generally must serve their obligation on active duty.

Those with training in certain health professions may qualify for direct appointment as officers. In the case of people studying for the health professions, financial assistance and internship opportunities are available from the military in return for specified periods of military service. Prospective medical students can apply to the Uniformed Services University of Health Sciences, which offers a salary and free tuition in a program leading to a Doctor of Medicine (M.D.) degree. In return, graduates must serve for 7 years in either the military or the Public Health Service. Direct appointments also are available for those qualified to serve in other specialty areas, such as the judge advocate general (legal) or chaplain corps. Flight training is available to commissioned officers in each branch of the Armed Forces. In addition, the Army has a direct enlistment option to become a warrant officer aviator.

Other qualifications. In order to join the services, enlisted personnel must sign a legal agreement called an enlistment contract, which usually involves a commitment of up to 8 years of service. Depending on the terms of the contract, 2 to 6 years are spent on active duty, and the balance is spent in the National Guard or Reserves. The enlistment contract obligates the service to provide the agreed-upon job, rating, pay, cash bonuses for enlistment in certain occupations, medical and other benefits, occupational training, and continuing education. In return, enlisted personnel must serve satisfactorily for the period specified.

Requirements for each service vary, but certain qualifications for enlistment are common to all branches. In order to enlist, usually one must be at least 17 years old, be a U.S. citizen or an alien holding permanent resident status, not have a felony record, and possess a birth certificate. Applicants who are 17 years old must have the consent of a parent or legal guardian before entering the service. For active service in the Army, the maximum age is 42; for the Navy and Air Force the maximum age is 35. Coast Guard enlisted personnel must enter active duty before their 28th birthday, whereas Marine Corps enlisted personnel must not be over the age of 29 when entering. Applicants must pass a written examination—the Armed Services Vocational Aptitude Battery—and meet certain minimum physical standards, such as height, weight, vision, and overall health. Officers must meet different age and physical standards depending on their branch of service.

Women are eligible to enter most military specialties; for example, they may become mechanics, missile maintenance technicians, heavy equipment operators, and fighter pilots, or they may enter into medical care, administrative support, and intelligence specialties. Generally, only occupations involving direct exposure to combat are excluded.

Advancement. Each service has different criteria for promoting personnel. Generally, the first few promotions for both enlisted and officer personnel come easily; subsequent promotions are much more competitive. Criteria for promotion may include time in service and in grade, job performance, a fitness report (supervisor's recommendation), and passing scores on written examinations. Table 1 shows the officer, warrant officer, and enlisted ranks by service.

Employment

In 2007, more than 2.6 million people served in the Armed Forces. More than 1.4 million were on active duty—about 505,000 in the Army, 339,000 in the Navy, 340,000 in the Air Force, and 179,000 in the Marine Corps. In addition, more than 1.2 million people served in their Reserve components and the Air and Army National Guard, and 40,000 individuals served in the Coast Guard, which is now part of the Department of Homeland Security. Table 2 shows the occupational composition of the active-duty enlisted personnel in January 2007; table 3 presents similar information for active-duty officers, including noncommissioned warrant officers.

Military personnel are stationed throughout the United States and in many countries around the world. About half of all military jobs in the U.S. are located in California, Texas, North Carolina, Virginia, Florida, and Georgia. Approximately 250,000 service members were deployed in support of Operations Enduring Freedom and Iraqi Freedom as of April 30, 2007. An additional 363,000 individuals were stationed outside the United States, including 168,000 assigned to ships at sea. About 105,000 were stationed in Europe, mainly in Germany, and another 70,000 were assigned to East Asia and the Pacific area, mostly in Japan and the Republic of Korea.

Job Outlook

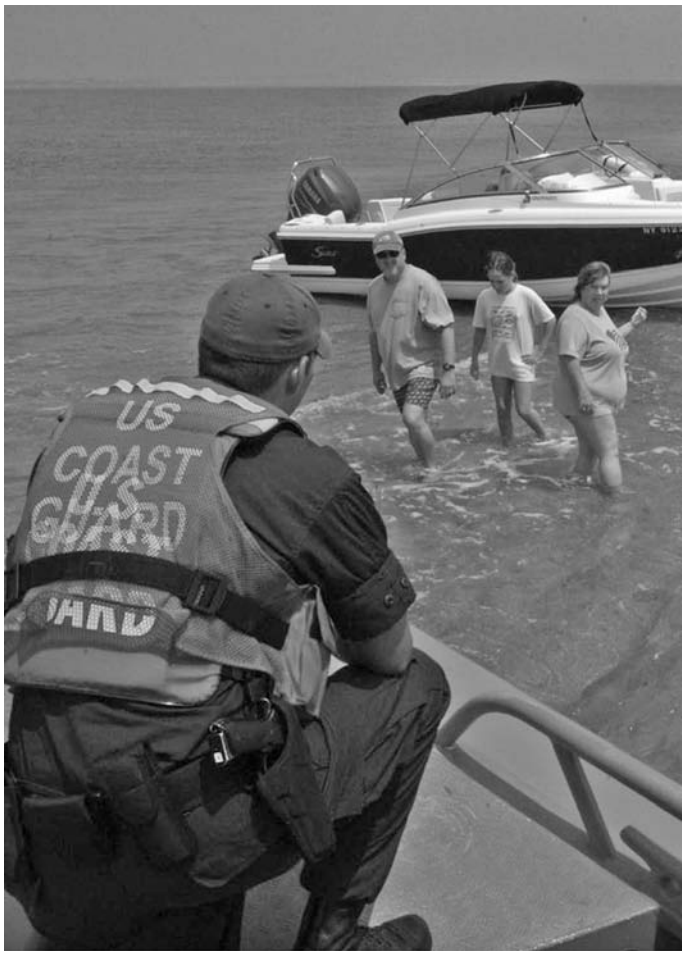
Opportunities should be excellent for qualified individuals in all branches of the Armed Forces through 2016.

Table 3. Military officer personnel by broad occupational category and branch of service, January 2007

Occupational Group - Officer	Army	Air Force	Coast Guard	Marine Corps	Navy	Total, all services
Combat specialty occupations	19,421	2,861	81	4,684	1,260	28,307
Engineering, science, and technical occupations	20,189	19,852	1,057	3,639	7,873	52,610
Executive, administrative, and managerial occupations	11,262	9,013	231	2,572	5,437	28,515
Health care occupations	9,953	8,970	5	—	7,737	26,665
Human resource development occupations	2,151	2,275	184	293	643	5,546
Media and public affairs occupations	237	408	19	170	265	1,099
Protective service occupations	2,611	1,229	96	327	275	4,538
Support services occupations	1,596	768	—	38	884	3,286
Transportation occupations	13,112	23,540	1,736	7,188	27,049	72,625
Total, by service (1)	82,884	69,284	7,853	18,998	51,558	230,577

(1) Occupational employment does not sum to totals because occupational information is not available for all personnel.
SOURCE: U.S. Department of Defense, Defense Manpower Data Center

Employment change. The United States spends a significant portion of its overall budget on national defense. Despite reductions in personnel due to the elimination of the threats of the Cold War, the number of active-duty personnel is expected to remain roughly constant through 2016. However, recent conflicts and the resulting strain on the military may lead to an increase in the number of active-duty personnel. The current goal of the Armed Forces is to maintain a force sufficient to fight and win two major regional conflicts at the same time. Political events, however, could lead to a significant restructuring with or without an increase in size.



The Coast Guard patrols U.S. waterways and helps people in distress.

Job prospects. Opportunities should be excellent for qualified individuals in all branches of the Armed Forces through 2016. Many military personnel retire with a pension after 20 years of service, while they still are young enough to start a new career. About 168,000 personnel must be recruited each year to replace those who complete their commitment or retire. Since the end of the draft in 1973, the military has met its personnel requirements with volunteers. When the economy is good and civilian employment opportunities generally are more favorable, it is more difficult for all the services to meet their recruitment quotas. It is also more difficult to meet these goals during times of war, when recruitment goals typically rise.

Educational requirements will continue to rise as military jobs become more technical and complex. High school graduates and applicants with a college background will be sought to fill the ranks of enlisted personnel, while virtually all officers will need at least a bachelor's degree and, in some cases, a graduate degree as well.

Earnings

The earnings structure for military personnel is shown in table 4. Most enlisted personnel started as recruits at Grade E-1 in 2007; however, those with special skills or above-average education started as high as Grade E-4. Most warrant officers had started at Grade W-1 or W-2, depending upon their occupational and academic qualifications and the branch of service of which they were a member, but warrant officer typically is not an entry-level occupation and, consequently, most of these individuals had previous military service. Most commissioned officers started at Grade O-1; some with advanced education started at Grade O-2, and some highly trained officers—for example, physicians and dentists—started as high as Grade O-3. Pay varies by total years of service as well as rank. Because it usually takes many years to reach the higher ranks, most personnel in higher ranks receive the higher pay rates awarded to those with many years of service.

In addition to receiving their basic pay, military personnel are provided with free room and board (or a tax-free housing and subsistence allowance), free medical and dental care, a military clothing allowance, military supermarket and department store shopping privileges, 30 days of paid vacation a year (referred to as leave), and travel opportunities. In many duty stations, military personnel may receive a housing allowance that can be used for off-base housing. This allowance can be substantial, but varies greatly by rank and duty station. For example, in fiscal year 2007, the average housing allowance for an E-4 with dependents was $1,151.24 per month; for a comparable individual without dependents, it was $910.66. The allowance for an O-4 with dependents was $1,856.97 per month; for

Table 4. Military basic monthly pay by grade for active duty personnel, April 2007

Grade	Years of service: Less than 2	Over 4	Over 8	Over 12	Over 16	Over 20
O-10	—	—	—	—	—	$13,659.00

SOURCE: U.S. Department of Defense—Defense Finance and Accounting Service

a comparable individual without dependents, it was $1,611.69. Other allowances are paid for foreign duty, hazardous duty, submarine and flight duty, and employment as a medical officer. Athletic and other facilities—such as gymnasiums, tennis courts, golf courses, bowling centers, libraries, and movie theaters—are available on many military installations. Military personnel are eligible for retirement benefits after 20 years of service.

The Veterans Administration (VA) provides numerous benefits to those who have served at least 24 months of continuous active duty in the Armed Forces. Veterans are eligible for free care in VA hospitals for all service-related disabilities, regardless of time served; those with other medical problems are eligible for free VA care if they are unable to pay the cost of hospitalization elsewhere. Admission to a VA medical center depends on the availability of beds, however. Veterans also are eligible for certain loans, including loans to purchase a home. Veterans, regardless of health, can convert a military life insurance policy to an individual policy with any participating company upon separation from the military. In addition, job counseling, testing, and placement services are available.

Veterans who participate in the Montgomery GI Bill Program receive education benefits. Under this program, Armed Forces personnel may elect to deduct up to $100 a month from their pay during the first 12 months of active duty, putting the money toward their future education. In fiscal year 2007, veterans who served on active duty for 3 or more years or who spent 2 years in active duty plus 4 years in the Selected Reserve received $1,075 a month in basic benefits for 36 months of full-time institutional training. Those who enlisted and serve less than 3 years received $873 a month for 36 months for the same. In addition, each service provides its own contributions to the enlistee's future education. The sum of the amounts from all these sources becomes the service member's educational fund. Upon separation from active duty, the fund can be used to finance educational costs at any VA-approved institution. Among those institutions which are approved by the VA are many vocational, correspondence, certification, business, technical, and flight training schools; community and junior colleges; and colleges and universities.

Sources of Additional Information

Each of the military services publishes handbooks, fact sheets, and pamphlets describing entrance requirements, training and advancement opportunities, and other aspects of military careers. These publications are widely available at all recruiting stations; at most state employment service offices; and in high schools, colleges, and public libraries. Information on educational and other veterans' benefits is available from VA offices located throughout the country.

In addition, the Defense Manpower Data Center, an agency of the Department of Defense, publishes *Military Career Guide Online*, a compendium of military occupational, training, and career information designed for use by students and jobseekers. This information is available on the Internet: http://www.todaysmilitary.com.

The *Occupational Outlook Quarterly* also provides information about military careers and training in its spring 2007 article "Military training for civilian careers (Or: How to gain practical experience while serving your country)," available online at http://www.bls.gov/opub/ooq/2007/spring/art02.pdf.

Occupations Not Studied in Detail

Employment in the hundreds of occupations covered in detail in the main body of the *Handbook* accounts for more than 133 million or 89 percent of all jobs in the economy. Although occupations covering the full spectrum of work are included, those requiring lengthy education or training generally are given the most attention.

This chapter presents summary data on 130 additional occupations, for which employment projections are prepared, but for which detailed occupational information is not developed. These occupations account for about 7 percent of all jobs. For each occupation, the *Occupational Information Network* (O*NET) code, a brief description of the nature of the work, the number of jobs in 2006, a phrase describing the projected employment change from 2006 to 2016, and the most significant source of postsecondary education or training are presented. For a complete list of O*NET codes cited in the *Handbook,* refer to a later chapter, "*Occupational Information Network* Coverage." For guidelines on interpreting the description of projected employment change, refer to "Occupational Information Included in the *Handbook.*"

The approximately 4 percent of all jobs not covered either in the detailed occupational descriptions in the main body of the *Handbook* or in the summary data presented in this chapter are mainly residual categories, such as "all other managers," for which little meaningful information could be developed.

Management, business, and financial occupations

Agents and business managers of artists, performers, and athletes

(O*NET 13-1011.00)

Represent and promote artists, performers, and athletes to prospective employers. May handle contract negotiations and other business matters for clients.

2006 employment: 25,000
Projected 2006–2016 employment change: About as fast as average
Most significant source of postsecondary education or training: Bachelor's or higher degree plus work experience

Compliance officers, except agriculture, construction, health and safety, and transportation

(O*NET 13-1041.00 13-1041.01, 13-1041.02, 13-1041.03, 13-1041.04, and 13-1041.06)

Examine, evaluate, and investigate eligibility for or conformity with laws and regulations governing contract compliance of licenses and permits and other compliance and enforcement inspection activities not classified elsewhere. Excludes tax examiners, collectors, and revenue agents and financial examiners.

2006 employment: 237,000
Projected 2006–2016 employment change: Slower than average
Most significant source of postsecondary education or training: Long-term on-the-job training

Credit analysts

(O*NET 13-2041.00)

Analyze current credit data and financial statements of individuals or firms to determine the degree of risk involved in extending credit or lending money. Prepare reports with this credit information for use in decision making.

2006 employment: 67,000
Projected 2006–2016 employment change: Little or no change
Most significant source of postsecondary education or training: Bachelor's degree

Emergency management specialists

(O*NET 13-1061.00)

Coordinate disaster response or crisis management activities, provide disaster-preparedness training, and prepare emergency plans and procedures for natural (e.g., hurricanes, floods, earthquakes), wartime, or technological (e.g., nuclear power plant emergencies, hazardous materials spills) disasters or hostage situations.

2006 employment: 12,000
Projected 2006–2016 employment change: About as fast as average
Most significant source of postsecondary education or training: Work experience in a related occupation

Financial examiners

(O*NET 13-2061.00)

Enforce or ensure compliance with laws and regulations governing financial and securities institutions and financial and real estate transactions. May examine, verify correctness of, or establish authenticity of records.

2006 employment: 26,000
Projected 2006–2016 employment change: About as fast as average
Most significant source of postsecondary education or training: Bachelor's degree

Legislators

(O*NET 11-1031.00)

Develop laws and statutes at the federal, state, or local level. Includes only elected officials.

2006 employment: 67,000
Projected 2006–2016 employment change: Little or no change
Most significant source of postsecondary education or training: Bachelor's or higher degree plus work experience

Loan counselors

(O*NET 13-2071.00)

Provide guidance to prospective loan applicants who have problems qualifying for traditional loans. Guidance may include determining the best type of loan and explaining loan requirements or restrictions.

2006 employment: 33,000
Projected 2006–2016 employment change: Slower than average
Most significant source of postsecondary education or training: Bachelor's degree

Logisticians

(O*NET 13-1081.00)

Analyze and coordinate the logistical functions of a firm or organization. Responsible for the entire life cycle of a product, including acquisition, distribution, internal allocation, delivery, and final disposal of resources.

2006 employment: 83,000
Projected 2006–2016 employment change: Faster than average
Most significant source of postsecondary education or training: Bachelor's degree

Postmasters and mail superintendents

(O*NET 11-9131.00)

Direct and coordinate operational, administrative, management, and supportive services of a U.S. post office or coordinate activities of workers engaged in postal and related work in assigned post office.

2006 employment: 26,000
Projected 2006–2016 employment change: Little or no change
Most significant source of postsecondary education or training: Work experience in a related occupation

Social and community service managers

(O*NET 11-9151.00)

Plan, organize, or coordinate the activities of a social service program or community outreach organization. Oversee the program or organization's budget and policies regarding participant involvement, program requirement, and benefits. Work may involve directing social workers, counselors, or probation officers.

2006 employment: 130,000
Projected 2006–2016 employment change: Much faster than average
Most significant source of postsecondary education or training: Bachelor's degree

Tax preparers

(O*NET 13-2082.00)

Prepare tax returns for individuals or small businesses, but do not have the background or responsibilities of an accredited or certified public accountant.

2006 employment: 100,000
Projected 2006–2016 employment change: Decline slowly
Most significant source of postsecondary education or training: Moderate-term on-the-job training

Transportation, storage, and distribution managers

(O*NET 11-3071.00, 11-3071.01, and 11-3071.02)

Plan, direct, or coordinate transportation, storage, or distribution activities in accordance with governmental policies and regulations. Includes logistics managers.

2006 employment: 94,000
Projected 2006–2016 employment change: About as fast as average
Most significant source of postsecondary education or training: Work experience in a related occupation

Professional and related occupations

Audio-visual collections specialists

(O*NET 25-9011.00)

Prepare, plan, and operate audio-visual teaching aids for use in education. May record, catalogue, and file audio-visual materials.

2006 employment: 7,300
Projected 2006–2016 employment change: Decline rapidly
Most significant source of postsecondary education or training: Bachelor's degree

City and regional planning aides

(O*NET 19-4061.01)

Compile data from various sources, such as maps, reports, and field and file investigations, for use by city planner in making planning studies.

2006 employment: 18,000
Projected 2006–2016 employment change: About as fast as average
Most significant source of postsecondary education or training: Associate degree

Clergy

(O*NET 21-2011.00)

Conduct religious worship and perform other spiritual functions associated with beliefs and practices of religious faith or denomination. Provide spiritual and moral guidance and assistance to members.

2006 employment: 404,000
Projected 2006–2016 employment change: Faster than average
Most significant source of postsecondary education or training: Master's degree

Dietetic technicians

(O*NET 29-2051.00)

Assist dieticians in the provision of food service and nutritional programs. Under the supervision of dieticians, may plan and produce meals based on established guidelines, teach principles of food and nutrition, or counsel individuals.

2006 employment: 25,000
Projected 2006–2016 employment change: Faster than average
Most significant source of postsecondary education or training: Postsecondary vocational award

Directors, religious activities and education

(O*NET 21-2021.00)

Direct and coordinate activities of a denominational group to meet religious needs of students. Plan, direct, or coordinate church school programs designed to promote religious education among church membership. May provide counseling and guidance relative to marital, health, financial, or religious problems.

2006 employment: 99,000
Projected 2006–2016 employment change: Faster than average
Most significant source of postsecondary education or training: Bachelor's degree

Farm and home management advisors

(O*NET 25-9021.00)

Advise, instruct, and assist individuals and families engaged in agriculture, agricultural-related processes, or home economics activities. Demonstrate procedures and apply research findings to solve problems; instruct and train in product development, sales, and the utilization of machinery and equipment to promote general welfare. Includes county agricultural agents, feed and farm management advisors, home economists, and extension service advisors.

2006 employment: 15,000
Projected 2006–2016 employment change: Slower than average
Most significant source of postsecondary education or training: Bachelor's degree

Law clerks

(O*NET 23-2092.00)

Assist lawyers or judges by researching or preparing legal documents. May meet with clients or assist lawyers and judges in court. Excludes lawyers and paralegal and legal assistants.

2006 employment: 37,000
Projected 2006–2016 employment change: Little or no change
Most significant source of postsecondary education or training: Bachelor's degree

Mathematical technicians

(O*NET 15-2091.00)

Apply standardized mathematical formulas, principles, and methodology to technological problems in engineering and physical sciences in relation to specific industrial and research objectives, processes, equipment, and products.

2006 employment: 1,300
Projected 2006–2016 employment change: About as fast as average
Most significant source of postsecondary education or training: Master's degree

Merchandise displayers and window trimmers

(O*NET 27-1026.00)

Plan and erect commercial displays, such as those in windows and interiors of retail stores and at trade exhibitions.

2006 employment: 87,000
Projected 2006–2016 employment change: About as fast as average
Most significant source of postsecondary education or training: Moderate-term on-the-job training

Orthotists and prosthetists

(O*NET 29-2091.00)

Assist patients with disabling conditions of limbs and spine, or with partial or total absence of limb, by fitting and preparing orthopedic braces and prostheses.

2006 employment: 5,700
Projected 2006–2016 employment change: About as fast as average
Most significant source of postsecondary education or training: Bachelor's degree

Psychiatric technicians

(O*NET 29-2053.00)

Care for mentally impaired or emotionally disturbed individuals, following physician instructions and hospital procedures. Monitor patients' physical and emotional well-being and report to medical staff. May participate in rehabilitation and treatment programs, help with personal hygiene, and administer oral medications and hypodermic injections.

2006 employment: 62,000
Projected 2006–2016 employment change: Decline slowly
Most significant source of postsecondary education or training: Postsecondary vocational award

Set and exhibit designers

(O*NET 27-1027.00)

Design special exhibits and movie, television, and theater sets. May study scripts, confer with directors, and conduct research to determine appropriate architectural styles.

2006 employment: 12,000
Projected 2006–2016 employment change: Faster than average
Most significant source of postsecondary education or training: Bachelor's degree

Social science research assistants

(O*NET 19-4061.00)

Assist social scientists in laboratory, survey, and other social research. May perform publication activities, laboratory analysis, quality control, or data management. Normally these individuals work under the direct supervision of a social scientist and assist in those activities that are more routine. Excludes graduate teaching assistants, who both teach and do research.

2006 employment: 18,000
Projected 2006–2016 employment change: About as fast as average
Most significant source of postsecondary education or training: Associate degree

Title examiners, abstractors, and searchers

(O*NET 23-2093.00)

Search real estate records, examine titles, or summarize pertinent legal or insurance details for a variety of purposes. May compile lists of mortgages, contracts, and other instruments pertaining to titles by searching public and private records for law firms, real estate agencies, or title insurance companies.

2006 employment: 69,000
Projected 2006–2016 employment change: Little or no change
Most significant source of postsecondary education or training: Moderate-term on-the-job training

Service occupations

Amusement and recreation attendants

(O*NET 39-3091.00)

Perform a variety of attending duties at amusement or recreation facilities. May schedule use of recreation facilities, maintain and provide equipment to participants of sporting events or recreational pursuits, or operate amusement concessions and rides.

2006 employment: 247,000
Projected 2006–2016 employment change: Much faster than average
Most significant source of postsecondary education or training: Short-term on-the-job training

Animal control workers

(O*NET 33-9011.00)

Handle animals for the purpose of investigations of mistreatment or control of abandoned, dangerous, or unattended animals.

2006 employment: 15,000
Projected 2006–2016 employment change: About as fast as average
Most significant source of postsecondary education or training: Moderate-term on-the-job training

Baggage porters and bellhops

(O*NET 39-6011.00)

Handle baggage for travelers at transportation terminals or for guests at hotels or similar establishments.

2006 employment: 49,000
Projected 2006–2016 employment change: About as fast as average
Most significant source of postsecondary education or training: Short-term on-the-job training

Concierges

(O*NET 39-6012.00)

Assist patrons at hotel, apartment, or office building with personal services. May take messages; arrange or give advice on transportation, business services, or entertainment; or monitor guest requests for housekeeping and maintenance.

2006 employment: 20,000
Projected 2006–2016 employment change: Faster than average
Most significant source of postsecondary education or training: Moderate-term on-the-job training

Costume attendants

(O*NET 39-3092.00)

Select, fit, and take care of costumes for cast members and aid entertainers.

2006 employment: 4,300
Projected 2006–2016 employment change: Faster than average
Most significant source of postsecondary education or training: Short-term on-the-job training

Crossing guards

(O*NET 33-9091.00)

Guide or control vehicular or pedestrian traffic at such places as streets, schools, railroad crossings, or construction sites.

2006 employment: 69,000
Projected 2006–2016 employment change: Little or no change
Most significant source of postsecondary education or training: Short-term on-the-job training

Embalmers

(O*NET 39-4011.00)

Prepare bodies for interment in conformity with legal requirements.

2006 employment: 9,000
Projected 2006–2016 employment change: Faster than average
Most significant source of postsecondary education or training: Postsecondary vocational award

First-line supervisors/managers of food preparation and serving workers

(O*NET 35-1012.00)

Supervise workers engaged in preparing and serving food.

2006 employment: 817,000
Projected 2006–2016 employment change: About as fast as average
Most significant source of postsecondary education or training: Work experience in a related occupation

First-line supervisors/managers of personal service workers

(O*NET 39-1021.00)

Supervise and coordinate activities of personal service workers, such as supervisors of flight attendants, hairdressers, or caddies.

2006 employment: 215,000
Projected 2006–2016 employment change: Faster than average
Most significant source of postsecondary education or training: Work experience in a related occupation

Funeral attendants

(O*NET 39-4021.00)

Perform a variety of tasks during a funeral, such as placing casket in parlor or chapel prior to service, arranging floral offerings or lights around casket, directing or escorting mourners, closing casket, and issuing and storing funeral equipment.

2006 employment: 33,000
Projected 2006–2016 employment change: Faster than average
Most significant source of postsecondary education or training: Short-term on-the-job training

Lifeguards, ski patrol, and other recreational protective services

(O*NET 33-9092.00)

Monitor recreational areas such as pools, beaches, or ski slopes to provide assistance and protection to participants.

2006 employment: 114,000
Projected 2006–2016 employment change: Faster than average
Most significant source of postsecondary education or training: Short-term on-the-job-training

Locker room, coatroom, and dressing room attendants

(O*NET 39-3093.00)

Provide personal items to patrons or customers in locker rooms, dressing rooms, or coatrooms.

2006 employment: 19,000
Projected 2006–2016 employment change: Much faster than average
Most significant source of postsecondary education or training: Short-term on-the-job training

Medical equipment preparers

(O*NET 31-9093.00)

Prepare, sterilize, install, or clean laboratory or health-care equipment. May perform routine laboratory tasks and operate or inspect equipment.

2006 employment: 45,000
Projected 2006–2016 employment change: Faster than average
Most significant source of postsecondary education or training: Short-term on-the-job training

Motion picture projectionists

(O*NET 39-3021.00)

Set up and operate motion picture projection and related sound reproduction equipment.

2006 employment: 11,000
Projected 2006–2016 employment change: Decline slowly
Most significant source of postsecondary education or training: Short-term on-the-job training

Parking enforcement workers

(O*NET 33-3041.00)

Patrol assigned area, such as public parking lot or section of city, to issue tickets to overtime parking violators and illegally parked vehicles.

2006 employment: 11,000
Projected 2006–2016 employment change: About as fast as average
Most significant source of postsecondary education or training: Short-term on-the-job training

Residential advisors

(O*NET 39-9041.00)

Coordinate activities for residents of boarding schools, college fraternities or sororities, college dormitories, or similar establishments. Order supplies and determine need for maintenance, repairs, and furnishings. May maintain household records and assign rooms. May refer residents to counseling resources if needed.

2006 employment: 57,000
Projected 2006–2016 employment change: Faster than average
Most significant source of postsecondary education or training: Short-term on-the-job training

Tour guides and escorts

(O*NET 39-6021.00)

Escort individuals or groups on sightseeing tours or through places of interest, such as industrial establishments, public buildings, and art galleries.

2006 employment: 40,000
Projected 2006–2016 employment change: Much faster than average
Most significant source of postsecondary education or training: Moderate-term on-the-job training

Transportation attendants, except flight attendants and baggage porters

(O*NET 39-6032.00)

Provide services to ensure the safety and comfort of passengers aboard ships, buses, or trains or within the station or terminal. Perform duties such as greeting passengers, explaining the use of safety equipment, serving meals or beverages, or answering questions related to travel.

2006 employment: 21,000
Projected 2006–2016 employment change: Faster than average
Most significant source of postsecondary education or training: Short-term on-the-job training

Transportation security screeners

(O*NET 33-9099.01)

Inspect baggage or cargo and screen passengers to detect and prevent potentially dangerous objects from being transported into secure areas or onto aircraft.

2006 employment: 82,700
Projected 2006–2016 employment change: About as fast as average
Most significant source of postsecondary education or training: Moderate-term on-the-job training

Travel guides

(O*NET 39-6022.00)

Plan, organize, and conduct long-distance cruises, tours, and expeditions for individuals or groups.

2006 employment: 4,700
Projected 2006–2016 employment change: About as fast as average
Most significant source of postsecondary education or training: Moderate-term on-the-job training

Ushers, lobby attendants, and ticket takers

(O*NET 39-3031.00)

Assist patrons at entertainment events by performing duties such as collecting admission tickets and passes from patrons, assisting in finding seats, searching for lost articles, and locating such facilities as restrooms and telephones.

2006 employment: 103,000
Projected 2006–2016 employment change: Faster than average
Most significant source of postsecondary education or training: Short-term on-the-job training

Veterinary assistants and laboratory animal caretakers

(O*NET 31-9096.00)

Feed, water, and examine pets and other nonfarm animals for signs of illness, disease, or injury in laboratories and animal hospitals and clinics. Clean and disinfect cages and work areas and sterilize laboratory and surgical equipment. May provide routine postoperative care, administer medication orally or topically, or prepare samples for laboratory examination under the supervision of veterinary or laboratory animal technologists or technicians, veterinarians, or scientists. Excludes nonfarm animal caretakers.

2006 employment: 75,000
Projected 2006–2016 employment change: Faster than average
Most significant source of postsecondary education or training: Short-term on-the-job training

Sales and related occupations

Door-to-door sales workers, news and street vendors, and related workers

(O*NET 41-9091.00)

Sell goods or services door-to-door or on the street.

2006 employment: 200,000
Projected 2006–2016 employment change: Slower than average
Most significant source of postsecondary education or training: Short-term on-the-job training

Parts salespersons

(O*NET 41-2022.00)

Sell spare and replacement parts and equipment in repair shop or parts store.

2006 employment: 238,000
Projected 2006–2016 employment change: Little or no change
Most significant source of postsecondary education or training: Moderate-term on-the-job training

Telemarketers

(O*NET 41-9041.00)

Solicit orders for goods and services over the telephone.

2006 employment: 395,000
Projected 2006–2016 employment change: Decline rapidly
Most significant source of postsecondary education or training: Short-term on-the-job training

Office and administrative support occupations

Correspondence clerks

(O*NET 43-4021.00)

Compose letters in reply to requests for merchandise, damage claims, credit and other information, delinquent accounts, incorrect billings, or unsatisfactory services. Duties may include gathering data to formulate reply and typing correspondence.

2006 employment: 17,000
Projected 2006–2016 employment change: About as fast as average
Most significant source of postsecondary education or training: Short-term on-the-job training

Court, municipal, and license clerks

(O*NET 43-4031.00, 43-4031.01, 43-4031.02, and 43-4031.03)

Perform clerical duties in courts of law, municipalities, and governmental licensing agencies and bureaus. May prepare docket of cases to be called, secure information for judges and court, prepare draft agendas or bylaws for town or city council, answer official correspondence, keep fiscal records and accounts, issue licenses or permits, record data, administer tests, or collect fees.

2006 employment: 115,000
Projected 2006–2016 employment change: About as fast as average
Most significant source of postsecondary education or training: Short-term on-the-job training

Insurance claims and policy processing clerks

(O*NET 43-9041.00, 43-9041.01, and 43-9041.02)

Process new insurance policies, modifications to existing policies, and claims forms. Obtain information from policyholders to verify the accuracy and completeness of information on claims forms, applications and related documents, and company records. Update existing policies and company records to reflect changes requested by policyholders and insurance company representatives. Excludes claims adjusters, examiners, and investigators.

2006 employment: 254,000
Projected 2006–2016 employment change: Little or no change
Most significant source of postsecondary education or training: Moderate-term on-the-job training

Mail clerks and mail machine operators, except Postal Service

(O*NET 43-9051.00)

Prepare incoming and outgoing mail for distribution. Use hand or mail-handling machines to time, stamp, open, read, sort, and route incoming mail and address, seal, stamp, fold, stuff, and affix postage to outgoing mail or packages. Duties may also include keeping necessary records and completed forms.

2006 employment: 152,000
Projected 2006–2016 employment change: Decline rapidly
Most significant source of postsecondary education or training: Short-term on-the-job training

New account clerks

(O*NET 43-4141.00)

Interview persons desiring to open bank accounts. Explain banking services available to prospective customers and assist them in preparing application form.

2006 employment: 81,000
Projected 2006–2016 employment change: Decline rapidly
Most significant source of postsecondary education or training: Work experience in a related occupation

Office machine operators, except computer

(O*NET 43-9071.00)

Operate one or more of a variety of office machines, such as photocopying, photographic, and duplicating machines or other office machines. Excludes computer operators, mail clerks and mail machine operators, and billing and posting clerks and machine operators.

2006 employment: 94,000
Projected 2006–2016 employment change: Decline slowly
Most significant source of postsecondary education or training: Short-term on-the-job training

Proofreaders and copy markers

(O*NET 43-9081.00)

Read transcript or proof type setup to detect and mark for correction any grammatical, typographical, or compositional errors. Excludes

workers whose primary duty is editing copy. Includes proofreaders of Braille.

2006 employment: 18,000
Projected 2006–2016 employment change: Slower than average
Most significant source of postsecondary education or training: Short-term on-the-job training

Statistical assistants

(O*NET 43-9111.00)

Compile and compute data according to statistical formulas for use in statistical studies. May perform actuarial computations and compile charts and graphs for use by actuaries. Includes actuarial clerks.

2006 employment: 23,000
Projected 2006–2016 employment change: About as fast as average
Most significant source of postsecondary education or training: Moderate-term on-the-job training

Farming, fishing, and forestry occupations

Hunters and trappers

(O*NET 45-3021.00)

Hunt and trap wild animals for human consumption, fur, feed, bait, or other purposes.

2006 employment: 500
Projected 2006–2016 employment change: Decline rapidly
Most significant source of postsecondary education or training: Moderate-term on-the-job training

Supervisors, farming, fishing, and forestry workers

(O*NET 45-1011.00, 45-1011.05, 45-1011.06, 45-1011.07, 45-1011.08, and 45-1012.00)

This broad occupation includes two detailed occupations—first-line supervisors/managers of farming, fishing, and forestry workers and farm labor contractors. First-line supervisors/managers of farming, fishing, and forestry workers directly supervise and coordinate the activities of agricultural, forestry, aquacultural, and related workers. Farm labor contractors recruit, hire, furnish, and supervise seasonal or temporary agricultural laborers for a fee. May transport, house, and provide meals for workers. Excludes first-line supervisors/managers of landscaping, lawn service, and groundskeeping workers.

2006 employment: 53,000
Projected 2006–2016 employment change: Little or no change
Most significant source of postsecondary education or training: Work experience in a related occupation

Construction and extraction occupations

Continuous mining machine operators

(O*NET 47-5041.00)

Operate self-propelled mining machines that rip coal, metal and nonmetal ores, rock, stone, or sand from the face and load it onto conveyors or into shuttle cars in a continuous operation.

2006 employment: 10,000
Projected 2006–2016 employment change: Slower than average
Most significant source of postsecondary education or training: Moderate-term on-the-job training

Derrick operators, oil and gas

(O*NET 47-5011.00)

Rig derrick equipment and operate pumps to circulate mud through drill hole.

2006 employment: 19,000
Projected 2006–2016 employment change: Decline slowly
Most significant source of postsecondary education or training: Moderate-term on-the-job training

Earth drillers, except oil and gas

(O*NET 47-5021.00)

Operate a variety of drills—such as rotary, churn, and pneumatic—to tap subsurface water and salt deposits, to remove core samples during mineral exploration or soil testing, and to facilitate the use of explosives in mining or construction. May use explosives. Includes horizontal and earth-boring machine operators.

2006 employment: 22,000
Projected 2006–2016 employment change: About as fast as average
Most significant source of postsecondary education or training: Moderate-term on-the-job training

Explosives workers, ordnance handling experts, and blasters

(O*NET 47-5031.00)

Place and detonate explosives to demolish structures or to loosen, remove, or displace earth, rock, or other materials. May perform specialized handling, storage, and accounting procedures. Includes seismograph shooters. Excludes earth drillers, except oil and gas who may also work with explosives.

2006 employment: 5,300
Projected 2006–2016 employment change: Little or no change
Most significant source of postsecondary education or training: Moderate-term on-the-job training

Fence erectors

(O*NET 47-4031.00)

Erect and repair metal and wooden fences and fence gates around highways, industrial establishments, residences, or farms, using hand and power tools.

2006 employment: 32,000
Projected 2006–2016 employment change: About as fast as average
Most significant source of postsecondary education or training: Moderate-term on-the-job training

First-line supervisors/managers of construction trades and extraction workers

(O*NET 47-1011.00)

Directly supervise and coordinate activities of construction or extraction workers.

2006 employment: 772,000
Projected 2006–2016 employment change: About as fast as average

Most significant source of postsecondary education or training: Work experience in a related occupation

Helpers—brickmasons, blockmasons, stonemasons, and tile and marble setters

(O*NET 47-3011.00)

Help brickmasons, blockmasons, stonemasons, or tile and marble setters by performing duties of lesser skill. Duties include using, supplying, or holding materials or tools and cleaning work area and equipment. Excludes apprentice workers, who should be reported with the appropriate skilled construction trade occupation. Excludes construction laborers who do not primarily assist brickmasons, blockmasons, and stonemasons or tile and marble setters.

2006 employment: 65,000
Projected 2006–2016 employment change: About as fast as average
Most significant source of postsecondary education or training: Short-term on-the-job training

Helpers—carpenters

(O*NET 47-3012.00)

Help carpenters by performing duties of lesser skill. Duties include using, supplying, or holding materials or tools and cleaning work area and equipment. Excludes apprentice workers, who should be reported with the appropriate skilled construction trade occupation. Excludes construction laborers who do not primarily assist carpenters.

2006 employment: 109,000
Projected 2006–2016 employment change: About as fast as average
Most significant source of postsecondary education or training: Short-term on-the-job training

Helpers—electricians

(O*NET 47-3013.00)

Help electricians by performing duties of lesser skill. Duties include using, supplying, or holding materials or tools and cleaning work area and equipment. Excludes apprentice workers, who should be reported with the appropriate skilled construction trade occupation. Excludes construction laborers who do not primarily assist electricians.

2006 employment: 105,000
Projected 2006–2016 employment change: About as fast as average
Most significant source of postsecondary education or training: Short-term on-the-job training

Helpers—extraction workers

(O*NET 47-5081.00)

Help extraction craft workers, such as earth drillers, blasters and explosives workers, derrick operators, and mining machine operators, by performing duties of lesser skill. Duties include supplying equipment or cleaning work area. Excludes apprentice workers.

2006 employment: 25,000
Projected 2006–2016 employment change: Little or no change
Most significant source of postsecondary education or training: Short-term on-the-job training

Helpers—painters, paperhangers, plasterers, and stucco masons

(O*NET 47-3014.00)

Help painters, paperhangers, plasterers, or stucco masons by performing duties of lesser skill. Duties include using, supplying, or holding materials or tools and cleaning work area and equipment. Excludes apprentice workers, who should be reported with the appropriate skilled construction trade occupation. Excludes construction laborers who do not primarily assist painters, paperhangers, plasterers, or stucco masons.

2006 employment: 24,000
Projected 2006–2016 employment change: Little or no change
Most significant source of postsecondary education or training: Short-term on-the-job training

Helpers—pipelayers, plumbers, pipefitters, and steamfitters

(O*NET 47-3015.00)

Help pipelayers, plumbers, pipefitters, or steamfitters by performing duties of lesser skill. Duties include using, supplying, or holding materials or tools and cleaning work area and equipment. Excludes apprentice workers, who should be reported with the appropriate skilled construction trade occupation. Excludes construction laborers who do not primarily assist pipelayers, plumbers, pipefitters, or steamfitters.

2006 employment: 85,000
Projected 2006–2016 employment change: About as fast as average
Most significant source of postsecondary education or training: Short-term on-the-job training

Helpers—roofers

(O*NET 47-3016.00)

Help roofers by performing duties of lesser skill. Duties include using, supplying, or holding materials or tools and cleaning work area and equipment. Excludes apprentice workers, who should be reported with the appropriate skilled construction trade occupation. Excludes construction laborers who do not primarily assist roofers.

2006 employment: 22,000
Projected 2006–2016 employment change: About as fast as average
Most significant source of postsecondary education or training: Short-term on-the-job training

Highway maintenance workers

(O*NET 47-4051.00)

Maintain highways, municipal and rural roads, airport runways, and rights-of-way. Duties include patching broken or eroded pavement and repairing guardrails, highway markers, and snow fences. May also mow or clear brush from along road or plow snow from roadway. Excludes tree trimmers and pruners.

2006 employment: 145,000
Projected 2006–2016 employment change: About as fast as average
Most significant source of postsecondary education or training: Moderate-term on-the-job training

Mine cutting and channeling machine operators

(O*NET 47-5042.00)

Operate machinery—such as longwall shears, plows, and cutting machines—to cut or channel along the face or seams of coal mines, stone quarries, or other mining surfaces to facilitate blasting, separating, or removing minerals or materials from mines or from the earth's surface. Includes shale planers.

2006 employment: 7,900
Projected 2006–2016 employment change: Slower than average
Most significant source of postsecondary education or training: Moderate-term on-the-job training

Rail-track laying and maintenance equipment operators

(O*NET 47-4061.00)

Lay, repair, and maintain track for standard or narrow-gauge railroad equipment used in regular railroad service or in plant yards, quarries, sand and gravel pits, and mines. Includes ballast cleaning machine operators and railroad bed tamping machine operators.

2006 employment: 15,000
Projected 2006–2016 employment change: Slower than average
Most significant source of postsecondary education or training: Moderate-term on-the-job training

Rock splitters, quarry

(O*NET 47-5051.00)

Separate blocks of rough dimension stone from quarry mass, using jackhammer and wedges.

2006 employment: 3,900
Projected 2006–2016 employment change: Much faster than average
Most significant source of postsecondary education or training: Moderate-term on-the-job training

Roof bolters, mining

(O*NET 47-5061.00)

Operate machinery to install roof support bolts in underground mine.

2006 employment: 4,300
Projected 2006–2016 employment change: Little or no change
Most significant source of postsecondary education or training: Moderate-term on-the-job training

Rotary drill operators, oil and gas

(O*NET 47-5012.00)

Set up or operate a variety of drills to remove petroleum products from the earth and to find and remove core samples for testing during oil and gas exploration.

2006 employment: 20,000
Projected 2006–2016 employment change: Decline slowly
Most significant source of postsecondary education or training: Moderate-term on-the-job training

Roustabouts, oil and gas

(O*NET 47-5071.00)

Assemble or repair oil field equipment, using hand and power tools. Perform other tasks as needed.

2006 employment: 44,000
Projected 2006–2016 employment change: Decline slowly
Most significant source of postsecondary education or training: Moderate-term on-the-job training

Septic tank servicers and sewer pipe cleaners

(O*NET 47-4071.00)

Clean and repair septic tanks, sewer lines, or drains. May patch walls and partitions of tank, replace damaged drain tile, or repair breaks in underground piping.

2006 employment: 24,000
Projected 2006–2016 employment change: About as fast as average
Most significant source of postsecondary education or training: Moderate-term on-the-job training

Service unit operators, oil, gas, and mining

(O*NET 47-5013.00)

Operate equipment to increase oil flow from producing wells or to remove stick pipe, casing, tools, or other obstructions from drilling wells. May also perform similar services in mining exploration operations. Includes fishing-tool technicians.

2006 employment: 28,000
Projected 2006–2016 employment change: Decline slowly
Most significant source of postsecondary education or training: Moderate-term on-the-job training

Installation, maintenance, and repair occupations

Bicycle repairers

(O*NET 49-3091.00)

Repair and service bicycles.

2006 employment: 8,600
Projected 2006–2016 employment change: About as fast as average
Most significant source of postsecondary education or training: Moderate-term on-the-job training

Commercial divers

(O*NET 49-9092.00)

Work below surface of water, using scuba gear to inspect, repair, remove, or install equipment and structures. May use a variety of power and hand tools, such as drills, sledgehammers, torches, and welding equipment. May conduct tests or experiments, rig explosives, or photograph structures or marine life. Excludes fishers and related fishing workers, athletes and sports competitors, and police and sheriff's patrol officers.

2006 employment: 3,100
Projected 2006–2016 employment change: Faster than average
Most significant source of postsecondary education or training: Postsecondary vocational award

Control and valve installers and repairers, except mechanical door

(O*NET 49-9012.00)

Install, repair, and maintain mechanical regulating and controlling devices, such as electric meters, gas regulators, thermostats, safety and flow valves, and other mechanical governors.

2006 employment: 43,000
Projected 2006–2016 employment change: Little or no change
Most significant source of postsecondary education or training: Moderate-term on-the-job training

Fabric menders, except garment

(O*NET 49-9093.00)

Repair tears, holes, and other defects in fabrics such as draperies, linens, parachutes, and tents.

2006 employment: 1,800
Projected 2006–2016 employment change: Little or no change
Most significant source of postsecondary education or training: Moderate-term on-the-job training

First-line supervisors/managers of mechanics, installers, and repairers

(O*NET 49-1011.00)

Supervise and coordinate the activities of mechanics, installers, and repairers. Excludes team or work leaders.

2006 employment: 465,000
Projected 2006–2016 employment change: About as fast as average
Most significant source of postsecondary education or training: Work experience in a related occupation

Helpers—installation, maintenance, and repair workers

(O*NET 49-9098.00)

Help installation, maintenance, and repair workers in maintenance, parts replacement, and repair of vehicles, industrial machinery, and electrical and electronic equipment. Perform duties such as furnishing tools, materials, and supplies to other workers; cleaning work area, machines, and tools; and holding materials or tools for other workers.

2006 employment: 163,000
Projected 2006–2016 employment change: About as fast as average
Most significant source of postsecondary education or training: Short-term on-the-job training

Locksmiths and safe repairers

(O*NET 49-9094.00)

Repair and open locks, make keys, change locks and safe combinations, and install and repair safes.

2006 employment: 26,000
Projected 2006–2016 employment change: Much faster than average
Most significant source of postsecondary education or training: Moderate-term on-the-job training

Manufactured building and mobile home installers

(O*NET 49-9095.00)

Move or install homes or prefabricated buildings.

2006 employment: 12,000
Projected 2006–2016 employment change: Decline slowly
Most significant source of postsecondary education or training: Moderate-term on-the-job training

Mechanical door repairers

(O*NET 49-9011.00)

Install, service, or repair opening and closing mechanisms of automatic doors and hydraulic door closers. Includes garage door mechanics.

2006 employment: 15,000
Projected 2006–2016 employment change: Faster than average
Most significant source of postsecondary education or training: Moderate-term on-the-job training

Recreational vehicle service technicians

(O*NET 49-3092.00)

Diagnose, inspect, adjust, repair, or overhaul recreational vehicles, including travel trailers. May specialize in maintaining gas, electrical, hydraulic, plumbing, or chassis/towing systems, as well as repairing generators, appliances, and interior components. Includes workers who perform customized van conversions. Excludes automotive service technicians and mechanics and bus and truck mechanics and diesel engine specialists who also work on recreational vehicles.

2006 employment: 14,000
Projected 2006–2016 employment change: Faster than average
Most significant source of postsecondary education or training: Long-term on-the-job training

Refractory materials repairers, except brickmasons

(O*NET 49-9045.00)

Build or repair furnaces, kilns, cupolas, boilers, converters, ladles, soaking pits, ovens, etc., using refractory materials.

2006 employment: 3,500
Projected 2006–2016 employment change: Decline rapidly
Most significant source of postsecondary education or training: Moderate-term on-the-job training

Riggers

(O*NET 49-9096.00)

Set up or repair rigging for construction projects, manufacturing plants, logging yards, or ships and shipyards or for the entertainment industry.

2006 employment: 12,000
Projected 2006–2016 employment change: Little or no change
Most significant source of postsecondary education or training: Short-term on-the-job training

Security and fire alarm systems installers

(O*NET 49-2098.00)

Install, program, maintain, and repair security and fire alarm wiring and equipment. Ensure that work is in accordance with relevant codes. Excludes electricians who do a broad range of electrical wiring.

2006 employment: 57,000

Projected 2006–2016 employment change: Faster than average
Most significant source of postsecondary education or training: Postsecondary vocational award

Signal and track switch repairers

(O*NET 49-9097.00)

Install, inspect, test, maintain, or repair electric gate crossings, signals, signal equipment, track switches, section lines, or intercommunications systems within a railroad system.

2006 employment: 7,200
Projected 2006–2016 employment change: Decline slowly
Most significant source of postsecondary education or training: Moderate-term on-the-job training

Tire repairers and changers

(O*NET 49-3093.00)

Repair and replace tires.

2006 employment: 106,000
Projected 2006–2016 employment change: Faster than average
Most significant source of postsecondary education or training: Short-term on-the-job training

Production occupations

Cementing and gluing machine operators and tenders

(O*NET 51-9191.00)

Operate or tend cementing and gluing machines to join items for further processing or to form a completed product. Processes include joining veneer sheets into plywood; gluing paper; and joining rubber and rubberized fabric parts, plastic, simulated leather, or other materials. Excludes shoe machine operators and tenders.

2006 employment: 23,000
Projected 2006–2016 employment change: Decline slowly
Most significant source of postsecondary education or training: Moderate-term on-the-job training

Chemical equipment operators and tenders

(O*NET 51-9011.00)

Operate or tend equipment to control chemical changes or reactions in the processing of industrial or consumer products. Equipment used includes devulcanizers, steam-jacketed kettles, and reactor vessels. Excludes chemical plant and system operators.

2006 employment: 53,000
Projected 2006–2016 employment change: Decline slowly
Most significant source of postsecondary education or training: Moderate-term on-the-job training

Chemical plant and system operators

(O*NET 51-8091.00)

Control or operate an entire chemical process or system of machines.

2006 employment: 53,000
Projected 2006–2016 employment change: Decline rapidly
Most significant source of postsecondary education or training: Long-term on-the-job training

Cleaning, washing, and metal pickling equipment operators and tenders

(O*NET 51-9192.00)

Operate or tend machines to wash or clean products, such as barrels or kegs, glass items, tin plate, food, pulp, coal, plastic, or rubber, to remove impurities.

2006 employment: 16,000
Projected 2006–2016 employment change: Decline rapidly
Most significant source of postsecondary education or training: Moderate-term on-the-job training

Cooling and freezing equipment operators and tenders

(O*NET 51-9193.00)

Operate or tend equipment, such as cooling and freezing units, refrigerators, batch freezers, and freezing tunnels, to cool or freeze products, food, blood plasma, and chemicals.

2006 employment: 11,000
Projected 2006–2016 employment change: Decline slowly
Most significant source of postsecondary education or training: Moderate-term on-the-job training

Crushing, grinding, and polishing machine setters, operators, and tenders

(O*NET 51-9021.00)

Set up, operate, or tend machines to crush, grind, or polish materials such as coal, glass, grain, stone, food, or rubber.

2006 employment: 42,000
Projected 2006–2016 employment change: Decline rapidly
Most significant source of postsecondary education or training: Moderate-term on-the-job training

Cutters and trimmers, hand

(O*NET 51-9031.00)

Use hand tools or hand-held power tools to cut and trim a variety of manufactured items, such as carpet, fabric, stone, glass, or rubber.

2006 employment: 29,000
Projected 2006–2016 employment change: Decline slowly
Most significant source of postsecondary education or training: Short-term on-the-job training

Cutting and slicing machine setters, operators, and tenders

(O*NET 51-9032.00)

Set up, operate, or tend machines that cut or slice materials such as glass, stone, cork, rubber, tobacco, food, paper, or insulating material. Excludes woodworking machine setters, operators, and tenders; cutting, punching, and press machine setters, operators, and tenders, metal and plastic; and textile cutting machine setters, operators, and tenders.

2006 employment: 79,000
Projected 2006–2016 employment change: Decline slowly
Most significant source of postsecondary education or training: Moderate-term on-the-job training

Etchers and engravers

(O*NET 51-9194.00)

Engrave or etch metal, wood, rubber, or other materials for identification or decorative purposes. Includes such workers as etcher-circuit processors, pantograph engravers, and silk screen etchers. Includes photoengravers with prepress technicians and workers.

2006 employment: 14,000
Projected 2006–2016 employment change: Decline slowly
Most significant source of postsecondary education or training: Long-term on-the-job training

Extruding, forming, pressing, and compacting machine setters, operators, and tenders

(O*NET 51-9041.00)

Set up, operate, or tend machines, such as glass forming machines, plodder machines, and tuber machines, to shape and form products such as glassware, food, rubber, soap, brick, tile, clay, wax, tobacco, or cosmetics. Excludes paper goods machine setters, operators, and tenders and shoe machine operators and tenders.

2006 employment: 81,000
Projected 2006–2016 employment change: Decline slowly
Most significant source of postsecondary education or training: Moderate-term on-the-job training

First-line supervisors/managers of production and operating workers

(O*NET 51-1011.00)

Supervise and coordinate the activities of production and operating workers, such as inspectors; precision workers; machine setters; and operators, assemblers, fabricators, and plant and system operators. Excludes team or work leaders.

2006 employment: 699,000
Projected 2006–2016 employment change: Decline slowly
Most significant source of postsecondary education or training: Work experience in a related occupation

Furnace, kiln, oven, drier, and kettle operators and tenders

(O*NET 51-9051.00)

Operate or tend heating equipment other than basic metal, plastic, or food processing equipment. Includes activities such as annealing glass, drying lumber, curing rubber, removing moisture from materials, or boiling soap.

2006 employment: 32,000
Projected 2006–2016 employment change: Decline slowly
Most significant source of postsecondary education or training: Moderate-term on-the-job training

Gas plant operators

(O*NET 51-8092.00)

Distribute or process gas for utility companies and others by controlling compressors to maintain specified pressures on main pipelines.

2006 employment: 12,000
Projected 2006–2016 employment change: Decline rapidly
Most significant source of postsecondary education or training: Long-term on-the-job training

Grinding and polishing workers, hand

(O*NET 51-9022.00)

Grind, sand, or polish a variety of metal, wood, stone, clay, plastic, or glass objects, using hand tools or hand-held power tools. Includes chippers, buffers, and finishers.

2006 employment: 45,000
Projected 2006–2016 employment change: Decline slowly
Most significant source of postsecondary education or training: Moderate-term on-the-job training

Helpers—production workers

(O*NET 51-9198.00)

Help production workers by performing duties of lesser skill. Duties include supplying or holding materials or tools and cleaning work area and equipment. Excludes apprentice workers.

2006 employment: 542,000
Projected 2006–2016 employment change: Little or no change
Most significant source of postsecondary education or training: Short-term on-the-job training

Mixing and blending machine setters, operators, and tenders

(O*NET 51-9023.00)

Set up, operate, or tend machines to mix or blend materials such as chemicals, tobacco, liquids, color pigments, or explosive ingredients. Excludes food batchmakers.

2006 employment: 143,000
Projected 2006–2016 employment change: Decline slowly
Most significant source of postsecondary education or training: Moderate-term on-the-job training

Molders, shapers, and casters, except metal and plastic

(O*NET 51-9195.00, 51-9195.03, 51-9195.04, 51-9195.05, and 51-9195.07)

Mold, shape, form, cast, or carve products such as food products, figurines, tile, pipes, and candles that consist of clay, glass, plaster, concrete, stone, or combinations of materials.

2006 employment: 56,000
Projected 2006–2016 employment change: Little or no change
Most significant source of postsecondary education or training: Moderate-term on-the-job training

Packaging and filling machine operators and tenders

(O*NET 51-9111.00)

Operate or tend machines to prepare industrial or consumer products for storage or shipment. Includes cannery workers who pack food products.

2006 employment: 386,000
Projected 2006–2016 employment change: Decline slowly
Most significant source of postsecondary education or training: Short-term on-the-job training

Paper goods machine setters, operators, and tenders

(O*NET 51-9196.00)

Set up, operate, or tend paper goods machines that perform a variety of functions, such as converting, sawing, corrugating, banding,

wrapping, boxing, stitching, forming, or sealing paper or paperboard sheets into products.

2006 employment: 113,000
Projected 2006–2016 employment change: Decline rapidly
Most significant source of postsecondary education or training: Moderate-term on-the-job training

Petroleum pump system operators, refinery operators, and gaugers

(O*NET 51-8093.00)

Control the operation of petroleum refining or processing units. May specialize in controlling manifold and pumping systems, gauging or testing oil in storage tanks, or regulating the flow of oil into pipelines.

2006 employment: 42,000
Projected 2006–2016 employment change: Decline rapidly
Most significant source of postsecondary education or training: Long-term on-the-job training

Separating, filtering, clarifying, precipitating, and still machine setters, operators, and tenders

(O*NET 51-9012.00)

Set up, operate, or tend continuous flow or vat-type equipment; filter presses; shaker screens; centrifuges; condenser tubes; precipitating, fermenting, or evaporating tanks; scrubbing towers; or batch stills. These machines extract, sort, or separate liquids, gases, or solids from other materials to recover a refined product. Includes dairy processing equipment operators. Excludes chemical equipment operators and tenders.

2006 employment: 44,000
Projected 2006–2016 employment change: Decline slowly
Most significant source of postsecondary education or training: Moderate-term on-the-job training

Tire builders

(O*NET 51-9197.00)

Operate machines to build tires from rubber components.

2006 employment: 23,000
Projected 2006–2016 employment change: Decline rapidly
Most significant source of postsecondary education or training: Moderate-term on-the-job training

Transportation and material moving occupations

Aircraft cargo handling supervisors

(O*NET 53-1011.00)

Direct ground crew in the loading, unloading, securing, and staging of aircraft cargo and baggage. Determine the quantity and orientation of cargo and compute aircraft center of gravity. May accompany aircraft as member of flight crew, monitor and handle cargo in flight, and assist and brief passengers on safety and emergency procedures. Includes loadmasters.

2006 employment: 5,800
Projected 2006–2016 employment change: Much faster than average
Most significant source of postsecondary education or training: Work experience in a related occupation

Airfield operations specialists

(O*NET 53-2022.00)

Ensure the safe takeoff and landing of commercial and military aircraft. Duties include coordination between air-traffic control and maintenance personnel, dispatching, using airfield landing and navigational aids, implementing airfield safety procedures, monitoring and maintaining flight records, and applying knowledge of weather information.

2006 employment: 4,900
Projected 2006–2016 employment change: About as fast as average
Most significant source of postsecondary education or training: Long-term on-the-job training

Ambulance drivers and attendants, except emergency medical technicians

(O*NET 53-3011.00)

Drive ambulance or assist ambulance drivers in transporting sick, injured, or convalescent persons. Assist in lifting patients.

2006 employment: 22,000
Projected 2006–2016 employment change: Much faster than average
Most significant source of postsecondary education or training: Moderate-term on-the-job training

Bridge and lock tenders

(O*NET 53-6011.00)

Operate and tend bridges, canal locks, and lighthouses to permit marine passage on inland waterways, near shores, and at danger points in waterway passages. May supervise such operations. Includes drawbridge operators, lock tenders and operators, and slip bridge operators.

2006 employment: 3,900
Projected 2006–2016 employment change: Decline slowly
Most significant source of postsecondary education or training: Short-term on-the-job training

First-line supervisors/managers of helpers, laborers, and material movers, hand

(O*NET 53-1031.00)

Supervise and coordinate the activities of helpers, laborers, or material movers.

2006 employment: 182,000
Projected 2006–2016 employment change: About as fast as average
Most significant source of postsecondary education or training: Work experience in a related occupation

First-line supervisors/managers of transportation and material moving machine and vehicle operators

(O*NET 53-1031.00)

Directly supervise and coordinate activities of transportation and material moving machine and vehicle operators and helpers.

2006 employment: 226,000
Projected 2006–2016 employment change: About as fast as average
Most significant source of postsecondary education or training: Work experience in a related occupation

Parking lot attendants

(O*NET 53-6021.00)

Park automobiles or issue tickets for customers in parking lot or garage. May collect fee.

2006 employment: 135,000
Projected 2006–2016 employment change: About as fast as average
Most significant source of postsecondary education or training: Short-term on-the-job training

Service station attendants

(O*NET 53-6031.00)

Service automobiles, buses, trucks, boats, and other automotive or marine vehicles with fuel, lubricants, and accessories. Collect payment for services and supplies. May lubricate vehicle; change motor oil; install antifreeze; or replace lights or other accessories, such as windshield wiper blades or fan belts. May repair or replace tires.

2006 employment: 96,000
Projected 2006–2016 employment change: About as fast as average
Most significant source of postsecondary education or training: Short-term on-the-job training

Traffic technicians

(O*NET 53-6041.00)

Conduct field studies to determine traffic volume, speed, effectiveness of signals, adequacy of lighting, and other factors influencing traffic conditions under direction of traffic engineer.

2006 employment: 6,900
Projected 2006–2016 employment change: About as fast as average
Most significant source of postsecondary education or training: Short-term on-the-job training

Transportation inspectors

(O*NET 53-6051.00, 53-6051.01, 53-6051.07, and 53-6051.08)

Inspect equipment or goods in connection with the safe transport of cargo or people. Includes rail transport inspectors, such as freight inspectors, car inspectors, rail inspectors, and other nonprecision inspectors of other types of transportation vehicles.

2006 employment: 26,000
Projected 2006–2016 employment change: Faster than average
Most significant source of postsecondary education or training: Work experience in a related occupation

Assumptions and Methods Used in Preparing Employment Projections

Occupational statements in the *Handbook* use one of seven phrases to describe the projected change in employment between 2006 and 2016. (See page 25.) These phrases are based on numerical projections developed using the Bureau of Labor Statistics (BLS) employment projections model system. Projections of occupational employment are the sixth and final step in the system; the six steps are listed in the discussion of methods below. A discussion of projections methods also is accessible on the Internet at: **http://www.bls.gov/emp/empmth01.htm** The November 2007 *Monthly Labor Review* presents a comprehensive discussion of the 2006-16 projections of the economy, labor force, and industry and occupation employment. The winter 2007-08 *Occupational Outlook Quarterly* presents the projections in a series of charts.

The projections reflect the knowledge and judgment of staff in the BLS Office of Occupational Statistics and Employment Projections and of knowledgeable people from other BLS offices, other government agencies, colleges and universities, industries, unions, professional societies, and trade associations, who furnished data and information, prepared reports, or reviewed the projections. BLS takes full responsibility, however, for the projections.

Assumptions. The information in the *Handbook* is based on an economic projection, which is characterized by slower growth in labor force (0.8 percent annually from 2006 to 2016 compared with 1.2 percent annually over the past 10-year period, 1996-2006), an expected unemployment rate of 5.0 percent in 2016, a slowdown in labor productivity (2.2 percent average annual growth compared with 2.6 percent annually over the 1996-2006 period), and an increasing deficit of foreign trade. The Federal budget deficit is assumed to grow due to growth in expenditures for Federal defense and for Medicare and Social Security. Other assumptions include consumer spending on durable goods that grows faster than consumer spending on services and nondurable goods. The declining share of nondurable goods as a percent of total consumer spending is expected to continue. Within services, consumer spending on medical care is expected to drive growth. Investment spending is expected to grow 3.1 percent annually from 2006 to 2016, slower than the 4.5 percent average annual growth in the previous 10 years. This slowdown will stem largely from a decline in the annual average growth rate of spending on computers and software. Expenditures for construction of residential structures will settle down after the 2005 record high to a 1.7 percent average annual growth rate over the 2006-16 projection period. Spending on nonresidential construction will grow faster than the historical pace—1.5 percent annually over the projection period, compared with 0.3 percent annual growth between 1996 and 2006.

Although BLS considers these assumptions reasonable, the economy may follow a different course, resulting in a different pattern of occupational growth. Real growth also could be different because most occupations are sensitive to a much wider variety of factors than those considered in the various projections models. Unforeseen changes in consumer, business, or government spending patterns and in the ways in which goods and services are produced could greatly alter the growth of individual occupations.

Methods. This section summarizes the steps involved in BLS projections of employment by occupation. BLS uses U.S. Census Bureau projections of the population by age, gender, and race, combined with projections of labor force participation rates—the percent of the specified group of the population working or seeking work—to arrive at estimates of the civilian labor force for the projected year.

BLS projections are developed in a series of six steps, each of which is based on separate projections procedures and models and various related assumptions. These six steps, or system components, deal with:

1. Size and demographic composition of the labor force
2. Growth of the aggregate economy
3. Final demand or gross domestic product (GDP)
4. Interindustry relationships (input-output)
5. Industry output and employment
6. Occupational employment

These components provide the overall analytical framework needed to develop detailed employment projections. Each component is developed in order, with the results of each used as input for successive components and with some results feeding back into earlier steps. Each step is repeated a number of times to ensure internal consistency as assumptions and results are reviewed and revised.

The projections of the labor force and assumptions about other demographic variables, fiscal and monetary policies, foreign economic activity, and energy prices and availability form the input to the macroeconomic model. This model projects GDP (sales to all final consuming sectors in the economy) and the distribution of GDP by its major demand components (consumer expenditures, investment, government consumption and gross investments, and exports and imports). Estimating the intermediate flows of goods and services—for example, the steel incorporated into automobiles—is the next step in the projections process. The resulting estimates of demand for goods and services are used to project industry output of final products as well as total output by industry.

Industry output of goods and services is then converted to industry employment. Studies of trends in productivity and technology are used to estimate future output per worker hour, and regression analysis is used to estimate worker hours. These estimates, along with output projections, are used to develop the final industry employment projections.

An industry-occupation matrix, also known as the national employment matrix, is used to project employment for wage

and salary workers. The matrix shows occupational staffing patterns—each occupation as a percent of employment in every industry. The matrix covering the 2006-16 period includes 311 detailed industries and 754 detailed occupations. Data for current staffing patterns in the matrix come from the BLS Occupational Employment Statistics (OES) surveys, which collect data from employers on a 3-year cycle.

The occupational staffing patterns for each industry were projected based on anticipated changes in the ways in which goods and services are produced, and were then applied to projected industry employment. The resulting employment was summed across industries to derive total wage and salary employment by occupation. Using this method, rapid employment growth is projected for health care workers, while employment of footwear manufacturing workers is expected to decline, reflecting the projected changes in the health care and footwear manufacturing industries, respectively.

Employment in an occupation also may grow or decline as a result of many other factors. For example, relatively fast growth is expected among computer support specialists as organizations continue to adopt increasingly sophisticated technology. On the other hand, automation, the expanding use of computers, and developments in computer software will result in declining employment among procurement clerks, order clerks, and word processors and typists. The projected-year matrix incorporates these expected changes.

Data on self-employed workers in each occupation come from the Current Population Survey (CPS). Numbers of self-employed workers were projected separately.

Replacement needs. In most occupations, replacement needs provide more job openings than growth. Replacement openings occur as people leave occupations. Some individuals transfer to other occupations as a step up the career ladder or to change careers; some stop working temporarily, perhaps to return to school or care for a family; other workers—retirees for example—leave the labor force permanently. A discussion of replacements and the methods used to prepare estimates is presented in *Occupational Projections and Training Data, 2008-09 Edition*, BLS Bulletin 2702.

Occupational Information Network Coverage

The *Occupational Information Network* (O*NET), which replaced the *Dictionary of Occupational Titles,* is used by public employment service offices to classify and place jobseekers. The O*NET was developed by job analysts. The information on job duties, knowledge and skills, education and training, and other occupational characteristics comes directly from workers and employers. Information on the O*NET is available from O*NET Project, U.S. Department of Labor/ETA, 200 Constitution Ave. NW, Room S-4231, Washington, DC 20210-0001. Telephone (202) 693-3660. Internet: http://www.doleta.gov/programs/onet/

The structure of the O*NET reflects the 2000 Standard Occupational Classification (SOC) system. With 822 detailed occupations, SOC represents the federal government's most recent effort to analyze the occupational structure in the United States and to provide a national occupational classification system. Information on the SOC, including its occupational structure, is available on the Internet: http://www.bls.gov/soc/

Occupational statements in this 2008–2009 edition of the *Handbook* list the O*NET codes that relate to or match the definitions used in the Bureau's Occupational Employment Statistics (OES) survey—the principal source of occupational employment data in the *Handbook*. All numbers listed also appear in the following table. The table is arranged by the O*NET code, followed by the O*NET title and the page number of the corresponding *Handbook* statement.

O*NET/SOC code	O*NET/SOC Title	Page
11-1011.00	Chief Executives	73
