Certification and advancement. The Universal Accreditation Board accredits public relations specialists who are members of the Public Relations Society of America and who participate in the Examination for Accreditation in Public Relations process. This process includes both a readiness review and an examination, which are designed for candidates who have at least 5 years of full-time work or teaching experience in public relations and who have earned a bachelor's degree in a communications-related field. The readiness review includes a written submission by each candidate, a portfolio review, and dialogue between the candidate and a three-member panel. Candidates who successfully advance through readiness review and pass the computer-based examination earn the Accredited in Public Relations (APR) designation.

The International Association of Business Communicators (IABC) also has an accreditation program for professionals in the communications field, including public relations specialists. Those who meet all the requirements of the program earn the Accredited Business Communicator (ABC) designation. Candidates must have at least 5 years of experience and a bachelor's degree in a communications field and must pass written and oral examinations. They also must submit a portfolio of work samples demonstrating involvement in a range of communications projects and a thorough understanding of communications planning.

Employers may consider professional recognition through accreditation as a sign of competence in this field, which could be especially helpful in a competitive job market.

Promotion to supervisory jobs may come to public relations specialists who show that they can handle more demanding assignments. In public relations firms, a beginner might be hired as a research assistant or account coordinator and be promoted to account executive, senior account executive, account manager, and eventually vice president. A similar career path is followed in corporate public relations, although the titles may differ.

Some experienced public relations specialists start their own consulting firms. (For more information on public relations managers, see the *Handbook* statement on advertising, marketing, promotions, public relations, and sales managers.)

Employment

Public relations specialists held about 243,000 jobs in 2006. They are concentrated in service-providing industries such as advertising and related services; health care and social assistance; educational services; and government. Others work for communications firms, financial institutions, and government agencies.

Public relations specialists are concentrated in large cities, where press services and other communications facilities are readily available and many businesses and trade associations have their headquarters. Many public relations consulting firms, for example, are in New York, Los Angeles, San Francisco, Chicago, and Washington, DC. There is a trend, however, for public relations jobs to be dispersed throughout the nation, closer to clients.

Job Outlook

Employment is projected to grow faster than average; however, keen competition is expected for entry-level jobs.

Employment change. Employment of public relations specialists is expected to grow by 18 percent from 2006 to 2016, faster than

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-2016	
				Number	Percent
Public relations specialists	27-3031	243,000	286,000	43,000	18

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

average for all occupations. The need for good public relations in an increasingly competitive business environment should spur demand for these workers in organizations of all types and sizes. Those with additional language capabilities also are in great demand.

Employment in public relations firms should grow as firms hire contractors to provide public relations services rather than support full-time staff.

Among detailed industries, the largest job growth will continue to be in advertising and related services.

Job prospects. Keen competition likely will continue for entry-level public relations jobs, as the number of qualified applicants is expected to exceed the number of job openings. Many people are attracted to this profession because of the high profile nature of the work. Opportunities should be best for college graduates who combine a degree in journalism, public relations, advertising, or another communications-related field with a public relations internship or other related work experience. Applicants without the appropriate educational background or work experience will face the toughest obstacles.

Additional job opportunities should result from the need to replace public relations specialists who retire or leave the occupation for other reasons.

Earnings

Median annual earnings for salaried public relations specialists were $47,350 in May 2006. The middle 50 percent earned between $35,600 and $65,310; the lowest 10 percent earned less than $28,080, and the top 10 percent earned more than $89,220. Median annual earnings in the industries employing the largest numbers of public relations specialists in May 2006 were:

Management of companies and enterprises	$52,940
Business, professional, labor, political, and similar organizations	51,400
Advertising and related services	49,980
Local government	47,550
Colleges, universities, and professional schools	43,330

Related Occupations

Public relations specialists create favorable attitudes among various organizations, interest groups, and the public through effective communication. Other workers with similar jobs include advertising, marketing, promotions, public relations, and sales managers; demonstrators, product promoters, and models; news analysts, reporters, and correspondents; lawyers; market and survey researchers; sales representatives, wholesale and manufacturing; and police and detectives involved in community relations.

Television, Video, and Motion Picture Camera Operators and Editors

(O*NET 27-4031.00 and 27-4032.00)

Significant Points

- Workers acquire their skills through on-the-job or formal postsecondary training.
- Keen competition for jobs is expected due to the large number of people who wish to enter the broadcasting and motion picture industries, where many camera operators and editors are employed.
- Those with the most experience and the most advanced computer skills will have the best job opportunities.

Nature of the Work

Television, video, and motion picture camera operators produce images that tell a story, inform or entertain an audience, or record an event. *Film and video editors* edit soundtracks, film, and video for the motion picture, cable, and broadcast television industries. Some camera operators do their own editing.

Camera operators use television, video, or motion picture cameras to shoot a wide range of material, including television series, studio programs, news and sporting events, music videos, motion pictures, documentaries, and training sessions. This material is constructed from many different shots by film and video editors. With the increase in digital technology, much of the editing work is now done on a computer. Many camera operators and editors are employed by independent television stations; local affiliate stations of television networks; large cable and television networks; or smaller, independent production companies.

Making commercial-quality movies and video programs requires technical expertise and creativity. Producing successful images requires choosing and presenting interesting material, selecting appropriate equipment, and applying a good eye and a steady hand to ensure smooth, natural movement of the camera.

Some camera operators film or videotape private ceremonies and special events, such as weddings and conference program sessions. Those who record these images on videotape are often called *videographers*. *Studio camera operators* work in a broadcast studio and usually videotape their subjects from a fixed position. *News camera operators*, also called *electronic news gathering (ENG) operators*, work as part of a reporting team, following newsworthy events as they unfold. To capture live events, they must anticipate the action and act quickly. ENG operators sometimes edit raw footage on the spot for relay to a television affiliate for broadcast.

Camera operators employed in the entertainment field use motion picture cameras to film movies, television programs, and commercials. Those who film motion pictures also are known as *cinematographers*. Some specialize in filming cartoons or special effects. Cinematographers may be an integral part of the action, using cameras in any of several different mounts. For example, the camera can be stationary and shoot whatever passes in front of the lens, or it can be mounted on a track, with the camera operator responsible for shooting the scene from different angles or directions. Wider use of digital cameras has enhanced the number of angles and the clarity that a camera operator can provide. Other camera operators sit on cranes and follow the action while crane operators move them into position. *Steadicam operators* mount a harness and carry the camera on their shoulders to provide a clear picture while they move

Film and video editors use computers to create a finished product.

about the action. Camera operators who work in the entertainment field often meet with directors, actors, editors, and camera assistants to discuss ways of filming, editing, and improving scenes.

Work environment. ENG operators and those who cover major events, such as conventions or sporting events, frequently travel locally and stay overnight or travel to distant places for longer periods. Camera operators filming television programs or motion pictures may travel to film on location.

Some camera operators—especially ENG operators covering accidents, natural disasters, civil unrest, or military conflicts—work in uncomfortable or even dangerous surroundings. Many camera operators must wait long hours in all kinds of weather for an event to take place and must stand or walk for long periods while carrying heavy equipment. ENG operators often work under strict deadlines.

Hours of work and working schedules for camera operators and editors vary considerably. Those employed by television and cable networks and advertising agencies usually work a five-day, 40-hour week; however, they may work longer hours to meet production schedules. ENG operators often work long, irregular hours and must be available to work on short notice. Camera operators and editors working in motion picture production also may work long, irregular hours.

Training, Other Qualifications, and Advancement

Television, video, and motion picture camera operators and editors usually acquire their skills through formal postsecondary training at vocational schools, colleges, universities, or photographic institutes. A bachelor's degree may be required for some positions, particularly those for film and video editors. Employers usually seek applicants with a good eye, imagination, and creativity, as well as a good technical understanding of how the camera operates.

Education and training. Many universities, community and junior colleges, vocational-technical institutes, and private trade and technical schools offer courses in camera operation and videography. Basic courses cover equipment, processes, and techniques. It is increasingly important for camera operators to have a good understanding of computer technology. Bachelor's degree programs, especially those including business courses, provide a well-rounded education. Film schools also may provide training on the artistic or aesthetic aspects of filmmaking.

Individuals interested in camera operations should subscribe to videographic newsletters and magazines, join audio-video clubs, and seek summer or part-time employment in cable and television networks, motion picture studios, or camera and video stores.

To enter the occupation, many camera operators first become production assistants to learn how film and video production works. In entry-level jobs they learn to set up lights, cameras, and other equipment. They also may receive routine assignments requiring adjustments to their cameras or decisions on what subject matter to capture. Camera operators in the film and television industries usually are hired for a project on the basis of recommendations from individuals such as producers, directors of photography, and camera assistants from previous projects or through interviews with the producer. ENG and studio camera operators who work for television affiliates usually start in small markets to gain experience.

Other qualifications. Camera operators need good eyesight, artistic ability, and hand-eye coordination. They should be patient, accurate, and detail oriented. Camera operators also should have good communication skills and, if needed, the ability to hold a camera by hand for extended periods.

Camera operators, who run their own businesses or do freelance work, need business skills as well as talent. These individuals must know how to submit bids, write contracts, get permission to shoot on locations that normally are not open to the public, obtain releases to use film or tape of people, price their services, secure copyright protection for their work, and keep financial records.

Advancement. With experience, operators may advance to more demanding assignments or to positions with larger or network television stations. Advancement for ENG operators may mean moving to larger media markets. Other camera operators and editors may become directors of photography for movie studios, advertising agencies, or television programs. Some teach at technical schools, film schools, or universities.

Employment

Television, video, and motion picture camera operators and editors held about 47,000 jobs in 2006. About 27,000 were camera operators and film and video editors held about 21,000 jobs.

Many are employed by independent television stations, local affiliate stations of television networks or broadcast groups, large cable and television networks, or smaller independent production companies. About 17 percent of camera operators and film editors were self-employed. Some self-employed camera operators contracted with television networks, documentary or independent filmmakers, advertising agencies, or trade show or convention sponsors to work on individual projects for a set fee, often at a daily rate.

Most of the salaried camera operators and editors were employed by television broadcasting stations or motion picture studios. More than half of the salaried film and video editors worked for motion picture studios. Most camera operators and editors worked in large metropolitan areas.

Job Outlook

Keen competition for jobs is expected due to the large number of people who wish to enter the broadcasting and motion picture industries, where many camera operators and editors are employed. Those with the most experience and the most advanced computer skills will have the best job opportunities. Employment is expected to grow about as fast as the average.

Employment change. Employment of camera operators and editors is expected to grow 12 percent over the 2006–2016 decade, which is about as fast as the average for all occupations through 2016. Rapid expansion of the entertainment market, especially motion picture production and distribution, will spur growth of camera operators. In addition, computer and Internet services will provide new outlets for interactive productions. Camera operators will be needed to film made-for-Internet broadcasts, such as live music

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-2016	
				Number	Percent
Television, video, and motion picture camera operators and editors	27-4030	47,000	53,000	5,700	12
Camera operators, television, video, and motion picture.....	27-4031	27,000	30,000	3,100	12
Film and video editors	27-4032	21,000	23,000	2,600	13

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

videos, digital movies, sports features, and general information or entertainment programming. These images can be delivered directly into the home either on compact discs or as streaming video over the Internet. Growth will be tempered, however, by the increased offshore production of motion pictures. Job growth in television broadcasting will be tempered by the use of automated cameras under the control of a single person working either on the studio floor or in a director's booth.

Job prospects. Television, video, and motion picture camera operators and editors can expect keen competition for job openings because of the large number of people who wish to enter the broadcasting and motion picture industries, where many of these workers are employed. The number of individuals interested in positions as videographers and movie camera operators usually is much greater than the number of openings. Those who succeed in landing a salaried job or attracting enough work to earn a living by freelancing are likely to be the most creative and highly motivated people, able to adapt to rapidly changing technologies and adept at operating a business. The change to digital cameras has increased the importance of strong computer skills. Those with the most experience and the most advanced computer skills will have the best job opportunities.

Earnings

Median annual earnings for television, video, and motion picture camera operators were $40,060 in May 2006. The middle 50 percent earned between $26,930 and $59,440. The lowest 10 percent earned less than $18,810, and the highest 10 percent earned more than $84,500. Median annual earnings were $44,010 in the motion picture and video industries and $32,200 in radio and television broadcasting.

Median annual earnings for film and video editors were $46,670 in May 2006. The middle 50 percent earned between $30,610 and $74,650. The lowest 10 percent earned less than $22,710, and the highest 10 percent earned more than $110,720. Median annual earnings were $53,580 in the motion picture and video industries, which employed the largest numbers of film and video editors.

Many camera operators who work in film or video are freelancers, whose earnings tend to fluctuate each year. Because most freelance camera operators purchase their own equipment, they incur considerable expense acquiring and maintaining cameras and accessories. Some camera operators belong to unions, including the International Alliance of Theatrical Stage Employees, and the National Association of Broadcast Employees and Technicians.

Related Occupations

Related arts and media occupations include artists and related workers, broadcast and sound engineering technicians and radio operators, graphic designers, and photographers.

Sources of Additional Information

For information about careers as a camera operator, contact

Writers and Editors

(O*NET 27-3041.00, 27-3042.00, 27-3043.00, 27-3043.04, and 27-3043.05)

Significant Points

- Most jobs in this occupation require a college degree, preferably in communications, journalism, or English, but a degree in a technical subject may be useful for technical writing positions.
- The outlook for most writing and editing jobs is expected to be competitive because many people are attracted to the occupation.
- Online publications and services are growing in number and sophistication, spurring the demand for writers and editors with Web or multimedia experience.

Nature of the Work

Writers and editors produce a wide variety of written materials delivered to an audience in an increasing number of ways. They develop content using any number of multimedia formats for readers, listeners, or viewers. Although many people write as part of their primary job, or on online chats or blogs, only writers and editors who are paid for their work are included in this occupation. (News analysts, reporters and correspondents, who gather information and prepare stories about newsworthy events, are described elsewhere in the *Handbook*.)

Writers fall into two main categories—writers and authors and technical writers. *Writers and authors* develop original written materials for books, magazines, trade journals, online publications, company newsletters, radio and television broadcasts, motion pictures, and advertisements. Their works are classified broadly as either fiction or nonfiction and writers often are identified by the type of writing they do—for example, novelists, playwrights, biographers, screenwriters, and textbook writers. Some freelance writers may be commissioned by a sponsor to write a script; others may be

contracted to write a book on the basis of a proposal in the form of a draft or an outline. Writers may produce materials for publication or performance, such as songwriters or scriptwriters.

Writers work with editors and publishers throughout the writing process to review edits, topics, and production schedules. Editors and publishers may assign topics to staff writers or review proposals from freelance writers. All writers conduct research on their topics, which they gather through personal observation, library and Internet research, and interviews. Writers, especially of nonfiction, are expected to establish their credibility with editors and readers through strong research and the use of appropriate sources and citations. Writers and authors then select the material they want to use, organize it, and use the written word to express story lines, ideas, or to convey information. With help from editors, they may revise or rewrite sections, searching for the best organization or the right phrasing.

Copy writers are a very specialized type of writer. They prepare advertising copy for use in publications or for broadcasting and they write other materials to promote the sale of a good or service. They often must work with the client to produce advertising themes or slogans and may be involved in the marketing of the product or service.

Technical writers put technical information into easily understandable language. They prepare product documentation, such as operating and maintenance manuals, catalogs, assembly instructions, and project proposals. Technical writers primarily are found in the information technology industry, writing operating instructions for online Help and documentation for computer programs. Many technical writers work with engineers on technical subject matters to prepare written interpretations of engineering and design specifications and other information for a general readership. Technical writers also may serve as part of a team conducting usability studies to help improve the design of a product that still is in the prototype stage. They plan and edit technical materials and oversee the preparation of illustrations, photographs, diagrams, and charts.

Most writers and editors have at least a basic familiarity with technology, regularly using personal computers, desktop or electronic publishing systems, scanners, and other electronic communications equipment. Many writers prepare material directly for the Internet. For example, they may write for electronic editions of newspapers or magazines, create short fiction or poetry, or produce technical documentation that is available only online. These writers also may prepare text for Web sites. As a result, they should be knowledgeable about graphic design, page layout, and multimedia software. In addition, they should be familiar with interactive technologies of the Web so that they can blend text, graphics, and sound together. Bloggers who are paid to write may be considered writers.

Many writers are considered *freelance writers*. They are self-employed and sell their work to publishers, publication enterprises, manufacturing firms, public relations departments, or advertising agencies. Sometimes, they contract with publishers first to write a book or an article. Others may be hired to complete specific short-term or recurring assignments, such as writing about a new product or contributing to an organization's quarterly newsletter.

Editors review, rewrite, and edit the work of writers. They also may do original writing. An editor's responsibilities vary with the employer and type and level of editorial position held. Editorial duties may include planning the content of books, technical journals, trade magazines, and other general-interest publications. Editors also review story ideas proposed by staff and freelance writers then decide what material will appeal to readers. They review and edit drafts of books and articles, offer comments to improve the work, and suggest possible titles. In addition, they may oversee the production of publications. In the book-publishing industry, an editor's primary responsibility is to review proposals for books and decide whether to buy the publication rights from the author.

Writers and editors use reference books and other resources to research or verify information.

Major newspapers and newsmagazines usually employ several types of editors. The *executive editor* oversees *assistant editors*, and generally has the final say about what stories are published and how they are covered. Assistant editors have responsibility for particular subjects, such as local news, international news, feature stories, or sports. The *managing editor* usually is responsible for the daily operation of the news department. *Assignment editors* determine which reporters will cover a given story. *Copy editors* mostly review and edit a reporter's copy for accuracy, content, grammar, and style.

In smaller organizations—such as small daily or weekly newspapers—a single editor may do everything or share responsibility with only a few other people. Executive and managing editors typically hire writers, reporters, and other employees. They also plan budgets and negotiate contracts with freelance writers, sometimes called "stringers" in the news industry.

Editors often have assistants, many of whom hold entry-level jobs. These assistants, frequently called copy editors, review copy for errors in grammar, punctuation, and spelling and check the copy for readability, style, and agreement with editorial policy. They suggest revisions, such as changing words and rearranging sentences and paragraphs, to improve clarity or accuracy. They also carry out research for writers and verify facts, dates, and statistics. In addition, they may arrange page layouts of articles, photographs, and advertising; compose headlines; and prepare copy for printing. *Publication assistants* who work for publishing houses may read and evaluate manuscripts submitted by freelance writers, proofread printers' galleys, and answer letters about published material. Assistants on small newspapers or in radio stations compile articles available from wire services or the Internet, answer phones, and make photocopies.

Work environment. While some writers and editors work in comfortable, private offices, others work in noisy rooms filled with the sounds of keyboards and the voices of other writers tracking down

information or interviewing sources. The search for information sometimes requires that writers travel to diverse workplaces, such as factories, offices, or laboratories, but many find their material through telephone interviews, the library, and the Internet.

Advances in electronic communications have changed the work environment for many writers. Laptop computers and wireless communications technologies allow growing numbers of writers to work from home and on the road. The ability to e-mail, transmit and download stories, research, or review materials using the Internet allows writers and editors greater flexibility in where and how they complete assignments.

Some writers keep regular office hours, either to maintain contact with sources and editors or to establish a writing routine, but most writers set their own hours. Many writers—especially freelance writers—are paid per assignment; therefore, they work any number of hours necessary to meet a deadline. As a result, writers must be willing to work evenings, nights, or weekends to produce a piece acceptable to an editor or client by the publication deadline. Those who prepare morning or weekend publications and broadcasts also may regularly work nights, early mornings, and weekends.

While many freelance writers enjoy running their own businesses and the advantages of working flexible hours, most routinely face the pressures of juggling multiple projects with competing demands and the continual need to find new work. Deadline pressures and long, erratic work hours—often part of the daily routine in these jobs—may cause stress, fatigue, or burnout. In addition, the use of computers for extended periods may cause some individuals to experience back pain, eyestrain, or fatigue.

Training, Other Qualifications, and Advancement

A college degree generally is required for a position as a writer or editor. Good facility with computers and communications equipment is necessary in order to stay in touch with sources, editors, and other writers while working on assignments, whether from home, an office, or while traveling.

Education and training. Some employers look for a broad liberal arts background, while others prefer to hire people with degrees in communications, journalism, or English. For those who specialize in a particular area, such as fashion, business, or law, additional background in the chosen field is expected. Increasingly, technical writing requires a degree in, or some knowledge about, a specialized field—for example, engineering, business, or one of the sciences. Knowledge of a second language is helpful for some positions. A background in web design, computer graphics, or other technology field is increasingly practical, because of the growing use of graphics and representational design in developing technical documentation. In many cases, people with good writing skills may transfer from jobs as technicians, scientists, or engineers into jobs as writers or editors. Others begin as research assistants or as trainees in a technical information department, develop technical communication skills, and then assume writing duties.

Other qualifications. Writers and editors must be able to express ideas clearly and logically and should enjoy writing. Creativity, curiosity, a broad range of knowledge, self-motivation, and perseverance also are valuable. Writers and editors must demonstrate good judgment and a strong sense of ethics in deciding what material to publish. In addition, the ability to concentrate amid confusion and to work under pressure often is essential. Editors also need tact and the ability to guide and encourage others in their work.

Familiarity with electronic publishing, graphics, and video production increasingly is needed. Use of electronic and wireless communications equipment to send e-mail, transmit work, and review copy often is necessary. Online newspapers and magazines require knowledge of computer software used to combine online text with graphics, audio, video, and animation.

High school and college newspapers, literary magazines, community newspapers, and radio and television stations all provide valuable—but sometimes unpaid—practical writing experience. Many magazines, newspapers, and broadcast stations have internships for students. Interns write short pieces, conduct research and interviews, and learn about the publishing or broadcasting business.

Advancement. In small firms, beginning writers and editors hired as assistants may actually begin writing or editing material right away. Opportunities for advancement and also full-time work can be limited, however. Many small or not-for-profit organizations either do not have enough regular work or cannot afford to employ writers on a full-time basis. However, they routinely contract out work to freelance writers.

In larger businesses, jobs usually are more formally structured. Beginners generally do research, fact check articles, or copy edit drafts. Advancement to full-scale writing or editing assignments may occur more slowly for newer writers and editors in larger organizations than for employees of smaller companies. Advancement often is more predictable, though, coming with the assignment of more important articles.

Advancement for writers, especially freelancers, often means working on larger, more complex projects for better known publications or for more money. Building a reputation and establishing a track record for meeting deadlines also makes it easier to get future assignments. Experience, credibility, and reliability often lead to long-term freelance relationships with the same publications and to contacts with editors who will seek you out for particular assignments.

The growing popularity of blogging could allow some writers to get their work read. For example, a few well-written blogs may garner some recognition for the author and may lead to a few paid pieces in other print or electronic publications. Some established staff writers contribute to blogs on the on-line versions of publications in conjunction with their routine work. However, most bloggers do not earn a considerable amount of money writing their blogs.

Employment

Writers and editors held about 306,000 jobs in 2006. More than one-third were self-employed Writers and authors held about 135,000 jobs; editors, about 122,000 jobs; and technical writers, about 49,000 jobs. About one-third of the salaried jobs for writers and editors were in the information sector, which includes newspaper, periodical, book, and directory publishers; radio and television broadcasting; software publishers; motion picture and sound-recording industries; Internet service providers, Web search portals and data-processing services; and Internet publishing and broadcasting. Substantial numbers also worked in professional, scientific, and technical services. Other salaried writers and editors work in computer systems design and related services, public and private educational services, and religious organizations.

Jobs with major book publishers, magazines, broadcasting companies, advertising agencies, and public relations firms are concentrated in New York, Chicago, Los Angeles, Boston, Philadelphia, and San Francisco. However, many writers work outside these cities and travel regularly to meet with personnel at the headquarters. Jobs with newspapers, business and professional journals, and technical

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-2016	
				Number	Percent
Writers and editors	27-3040	306,000	336,000	30,000	10
Editors	27-3041	122,000	124,000	2,800	2
Technical writers	27-3042	49,000	59,000	9,600	20
Writers and authors	27-3043	135,000	153,000	17,000	13

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

and trade magazines are more widely dispersed throughout the country. Technology permits writers and editors to work from distant and remote locations and still communicate with editors and publishers. As a result, geographic concentration is less of a requirement for many writing or editing positions than it once was.

Thousands of other individuals work primarily as freelance writers, earning income from their articles, books, and less commonly, television and movie scripts. Many support themselves with income derived from other sources.

Job Outlook

Employment of writers and editors is expected to grow about as fast as the average for all occupations. Competition is expected for writing and editing jobs because many people with the appropriate training and talent are attracted to the occupation.

Employment change. Employment of writers and editors is expected to grow 10 percent, or about as fast as the average for all occupations, from 2006 to 2016. Employment of salaried writers and editors is expected to increase as demand grows for web-based publications. Technical writing, blogging, and other writing for interactive media that provide readers with nearly real-time information will provide opportunities for writers. Print magazines and other periodicals increasingly are developing market niches, appealing to readers with special interests, and making Internet-only content available on their websites. Businesses and organizations are developing newsletters and websites, and more companies are publishing materials directly for the Internet. Online publications and services are growing in number and sophistication, spurring the demand for writers and editors, especially those with Web experience. Professional, scientific, and technical services firms, including advertising and public relations agencies, also are growing and should be another source of new jobs.

Job prospects. Opportunities should be best for technical writers and those with training in a specialized field. Demand for technical writers and writers with expertise in areas such as law, medicine, or economics is expected to increase because of the continuing expansion of scientific and technical information and the need to communicate it to others. Legal, scientific, and technological developments and discoveries generate demand for people to interpret technical information for a more general audience. Rapid growth and change in the high-technology and electronics industries result in a greater need for people to write users' guides, instruction manuals, and training materials. This work requires people who not only are technically skilled as writers, but also are familiar with the subject area.

In addition to job openings created by employment growth, some openings will arise as experienced workers retire, transfer to other occupations, or leave the labor force. Replacement needs are relatively high in this occupation because many freelancers leave because they cannot earn enough money.

Earnings

Median annual earnings for salaried writers and authors were $48,640 in May 2006. The middle 50 percent earned between $34,850 and $67,820. The lowest 10 percent earned less than $25,430, and the highest 10 percent earned more than $97,700. Median annual earnings were $50,650 in advertising and related services and $40,880 in newspaper, periodical, book, and directory publishers.

Median annual earnings for salaried editors were $46,990 in May 2006. The middle 50 percent earned between $35,250 and $64,140. The lowest 10 percent earned less than $27,340, and the highest 10 percent earned more than $87,400. Median annual earnings of those working for newspaper, periodical, book, and directory publishers were $45,970.

Median annual earnings for salaried technical writers were $58,050 in May 2006. The middle 50 percent earned between $45,130 and $73,750. The lowest 10 percent earned less than $35,520, and the highest 10 percent earned more than $91,720. Median annual earnings in computer systems design and related services were $59,830.

According to the Society for Technical Communication, the median annual salary for entry-level technical writers was $40,400 in 2005. The median annual salary for midlevel nonsupervisory technical writers was $52,140, and for senior nonsupervisory technical writers, $69,000.

Related Occupations

Writers and editors communicate ideas and information. Other communications occupations include announcers; interpreters and translators; news analysts, reporters, and correspondents; and public relations specialists.

Health Diagnosing and Treating Occupations

Audiologists

(O*NET 29-1121.00)

Significant Points

- More than half work in health care facilities; many others are employed by educational services.
- A master's degree in audiology (hearing) is the standard level of education required; however, a doctoral degree is becoming more common for new entrants.
- Few openings are expected because of the small size of the occupation.
- Job prospects will be favorable for those possessing the doctoral (Au.D.) degree.

Nature of the Work

Audiologists work with people who have hearing, balance, and related ear problems. They examine individuals of all ages and identify those with the symptoms of hearing loss and other auditory, balance, and related sensory and neural problems. They then assess the nature and extent of the problems and help the individuals manage them. Using audiometers, computers, and other testing devices, they measure the loudness at which a person begins to hear sounds, the ability to distinguish between sounds, and the impact of hearing loss on an individual's daily life. In addition, audiologists use computer equipment to evaluate and diagnose balance disorders. Audiologists interpret these results and may coordinate them with medical, educational, and psychological information to make a diagnosis and determine a course of treatment.

Hearing disorders can result from a variety of causes including trauma at birth, viral infections, genetic disorders, exposure to loud noise, certain medications, or aging. Treatment may include examining and cleaning the ear canal, fitting and dispensing hearing aids, and fitting and programming cochlear implants. Audiologic treatment also includes counseling on adjusting to hearing loss, training on the use of hearing instruments, and teaching communication strategies for use in a variety of environments. For example, they may provide instruction in listening strategies. Audiologists also may recommend, fit, and dispense personal or large area amplification systems and alerting devices.

Audiologists usually work at a desk or table in clean, comfortable surroundings.

In audiology clinics, audiologists may independently develop and carry out treatment programs. They keep records on the initial evaluation, progress, and discharge of patients. In other settings, audiologists may work with other health and education providers as part of a team in planning and implementing services for children and adults. Audiologists who diagnose and treat balance disorders often work in collaboration with physicians, and physical and occupational therapists.

Some audiologists specialize in work with the elderly, children, or hearing-impaired individuals who need special treatment programs. Others develop and implement ways to protect workers' hearing from on-the-job injuries. They measure noise levels in workplaces and conduct hearing protection programs in factories and in schools and communities.

Audiologists who work in private practice also manage the business aspects of running an office, such as developing a patient base, hiring employees, keeping records, and ordering equipment and supplies.

A few audiologists conduct research on types of, and treatment for, hearing, balance, and related disorders. Others design and develop equipment or techniques for diagnosing and treating these disorders.

Work environment. Audiologists usually work at a desk or table in clean, comfortable surroundings. The job is not physically demanding but does require attention to detail and intense concentration. The emotional needs of patients and their families may be demanding. Most full-time audiologists work about 40 hours per week, which may include weekends and evenings to meet the needs of patients. Some work part time. Those who work on a contract basis may spend a substantial amount of time traveling between facilities.

Training, Other Qualifications, and Advancement

All states require audiologists to be licensed or registered. Licensure or registration requires at least a master's degree in audiology; however, a first professional, or doctoral, degree is becoming increasingly necessary.

Education and training. Individuals must have at least a master's degree in audiology to qualify for a job. However, a first professional or doctoral degree is becoming more common. As of early 2007, eight states required a doctoral degree or its equivalent. The professional doctorate in audiology (Au.D.) requires approximately 8 years of university training and supervised professional experience.

In early 2007, the Accreditation Commission of Audiology Education accredited more than 50 Au.D. programs and the Council on Academic Accreditation in Audiology and Speech-Language Pathology (CAA) accredited over 70 graduate programs in audiology. Graduation from an accredited program may be required to obtain a license in some states. Requirements for admission to programs in audiology include courses in English, mathematics, physics, chemistry, biology, psychology, and communication. Graduate coursework in audiology includes anatomy; physiology; physics; genetics; normal and abnormal communication development; auditory, balance, and neural systems assessment and treatment; diagnosis and treatment; pharmacology; and ethics.

Licensure and certification. Audiologists are regulated by licensure or registration in all 50 states. Forty-one states have continuing

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-2016	
				Number	Percent
Audiologists	29-1121	12,000	13,000	1,200	10

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

education requirements for licensure renewal, the number of hours required varies by state. Twenty states and the District of Columbia also require audiologists to have a Hearing Aid Dispenser license to dispense hearing aids; for the remaining 30 states, an audiologist license is all that is needed to dispense hearing aids. Third-party payers generally require practitioners to be licensed to qualify for reimbursement. States set requirements for education, mandating a master's or doctoral degree, as well as other requirements. For information on the specific requirements of your state, contact that state's licensing board.

In some states, specific certifications from professional associations satisfy some or all of the requirements for state licensure. Certification can be obtained from two certifying bodies. Audiologists can earn the Certificate of Clinical Competence in Audiology (CCC-A) offered by the American Speech-Language-Hearing Association; they may also be certified through the American Board of Audiology.

Other qualifications. Audiologists should be able to effectively communicate diagnostic test results, diagnoses, and proposed treatments in a manner easily understood by their patients. They must be able to approach problems objectively and provide support to patients and their families. Because a patient's progress may be slow, patience, compassion, and good listening skills are necessary.

It is important for audiologists to be aware of new diagnostic and treatment technologies. Most audiologists participate in continuing education courses to learn new methods and technologies.

Advancement. With experience, audiologists can advance to open their own private practice. Audiologist working in hospitals and clinics can advance to management or supervisory positions.

Employment

Audiologists held about 12,000 jobs in 2006. More than half of all jobs were in health care facilities—offices of physicians or other health practitioners, including audiologists; hospitals; and outpatient care centers. About 13 percent of jobs were in educational services, including elementary and secondary schools. Other jobs for audiologists were in health and personal care stores, including hearing aid stores; scientific research and development services; and state and local governments.

A small number of audiologists were self-employed in private practice. They provided hearing health care services in their own offices or worked under contract for schools, health care facilities, or other establishments.

Job Outlook

Average employment growth is projected. However, because of the small size of the occupation, few job openings are expected. Job prospects will be favorable for those possessing the Au.D. degree.

Employment change. Employment of audiologists is expected to grow 10 percent from 2006 to 2016, about as fast as the average for all occupations. Hearing loss is strongly associated with aging, so rapid growth in older population groups will cause the number of people with hearing and balance impairments to increase markedly. Medical advances also are improving the survival rate of premature infants and trauma victims, who then need assessment and sometimes treatment. Greater awareness of the importance of early identification and diagnosis of hearing disorders in infants also will increase employment. A number of states require that newborns be screened for hearing loss and receive appropriate early intervention services.

Employment in educational services will increase along with growth in elementary and secondary school enrollments, including enrollment of special education students.

Growth in employment of audiologists will be moderated by limitations on reimbursements made by third-party payers for the tests and services they provide.

Job prospects. Job prospects will be favorable for those possessing the Au.D. degree. Only a few job openings for audiologists will arise from the need to replace those who leave the occupation, because the occupation is relatively small and workers tend to stay in this occupation until they retire.

Earnings

Median annual earnings of wage-and-salary audiologists were $57,120 in May 2006. The middle 50 percent earned between $47,220 and $70,940. The lowest 10 percent earned less than $38,370, and the highest 10 percent earned more than $89,160. Some employers may pay for continuing education courses.

Related Occupations

Audiologists specialize in the prevention, diagnosis, and treatment of hearing problems. Workers in related occupations include occupational therapists, optometrists, physical therapists, psychologists, recreational therapists, rehabilitation counselors, and speech-language pathologists.

Sources of Additional Information

State licensing boards can provide information on licensure requirements. State departments of education can supply information on certification requirements for those who wish to work in public schools.

Chiropractors

(O*NET 29-1011.00)

Significant Points

- Job prospects should be good; employment is expected to grow faster than average because of increasing consumer demand for alternative health care.
- Chiropractors must be licensed, requiring two to four years of undergraduate education, the completion of a four-year chiropractic college course, and passing scores on national and state examinations.
- About 52 percent of chiropractors are self-employed.
- Earnings are relatively low in the beginning but increase as the practice grows.

Nature of the Work

Chiropractors, also known as *doctors of chiropractic* or *chiropractic physicians*, diagnose and treat patients with health problems of the musculoskeletal system and treat the effects of those problems on the nervous system and on general health. Many chiropractic treatments deal specifically with the spine and the manipulation of the spine. Chiropractic medicine is based on the principle that spinal joint misalignments interfere with the nervous system and can result in lower resistance to disease and many different conditions of diminished health.

Chiropractors provide natural, drugless, nonsurgical health treatments to patients, including spinal adjustments.

The chiropractic approach to health care stresses the patient's overall health. Chiropractors provide natural, drugless, nonsurgical health treatments, relying on the body's inherent recuperative abilities. They also recognize that many factors affect health, including exercise, diet, rest, environment, and heredity. Chiropractors recommend changes in lifestyle that affect those factors. In some situations, chiropractors refer patients to or consult with other health practitioners.

Like other health practitioners, chiropractors follow a standard routine to get information needed to diagnose and treat patients. They take the patient's medical history; conduct physical, neurological, and orthopedic examinations; and may order laboratory tests. X rays and other diagnostic images are important tools because of the chiropractor's emphasis on the spine and its proper function. Chiropractors also analyze the patient's posture and spine using a specialized technique. For patients whose health problems can be traced to the musculoskeletal system, chiropractors manually adjust the spinal column.

Some chiropractors use other alternative medicines in their practices, including therapies using water, light, massage, ultrasound, electric, acupuncture, and heat. They also may apply supports such as straps, tapes, and braces to manually adjust the spine. Chiropractors counsel patients about health concepts such as nutrition, exercise, changes in lifestyle, and stress management, but chiropractors do not prescribe drugs or perform surgery.

In addition to general chiropractic practice, some chiropractors specialize in sports injuries, neurology, orthopedics, pediatrics, nutrition, internal disorders, or diagnostic imaging.

Many chiropractors are solo or group practitioners who also have the administrative responsibilities of running a practice. In larger offices, chiropractors delegate these tasks to office managers and chiropractic assistants. Chiropractors in private practice are responsible for developing a patient base, hiring employees, and keeping records.

Work environment. Chiropractors work in clean, comfortable offices. Like other health practitioners, chiropractors are sometimes on their feet for long periods. Chiropractors who take X rays must employ appropriate precautions against the dangers of repeated exposure to radiation.

Chiropractors work, on average, about 40 hours per week, although longer hours are not uncommon. Solo practitioners set their own hours but may work evenings or weekends to accommodate patients. Like other health care practitioners, chiropractors in a group practice will sometimes be on call or treat patients of other chiropractors in the group.

Training, Other Qualifications, and Advancement

Chiropractors must be licensed, which requires 2 to 4 years of undergraduate education, the completion of a four-year chiropractic college course, and passing scores on national and state examinations.

Education and training. In 2007, 16 chiropractic programs and 2 chiropractic institutions in the United States were accredited by the Council on Chiropractic Education. Applicants must have at least 90 semester hours of undergraduate study leading toward a bachelor's degree, including courses in English, the social sciences or humanities, organic and inorganic chemistry, biology, physics, and psychology. Many applicants have a bachelor's degree, which may eventually become the minimum entry requirement. Several chiro-

practic colleges offer prechiropractic study, as well as a bachelor's degree program. Recognition of prechiropractic education offered by chiropractic colleges varies among the states.

Chiropractic programs require a minimum of 4,200 hours of combined classroom, laboratory, and clinical experience. During the first 2 years, most chiropractic programs emphasize classroom and laboratory work in sciences such as anatomy, physiology, public health, microbiology, pathology, and biochemistry. The last 2 years focus on courses in manipulation and spinal adjustment and provide clinical experience in physical and laboratory diagnosis, neurology, orthopedics, geriatrics, physiotherapy, and nutrition. Chiropractic programs and institutions grant the degree of Doctor of Chiropractic.

Chiropractic colleges also offer postdoctoral training in orthopedics, neurology, sports injuries, nutrition, rehabilitation, radiology, industrial consulting, family practice, pediatrics, and applied chiropractic sciences. Once such training is complete, chiropractors may take specialty exams leading to "diplomate" status in a given specialty. Exams are administered by specialty chiropractic associations.

Licensure. All states and the District of Columbia regulate the practice of chiropractic and grant licenses to chiropractors who meet the educational and examination requirements established by the state. Chiropractors can practice only in states where they are licensed. Some states have agreements permitting chiropractors licensed in one state to obtain a license in another without further examination, provided that their educational, examination, and practice credentials meet state specifications.

Most state licensing boards require at least 2 years of undergraduate education, but an increasing number are requiring a four-year bachelor's degree. All boards require the completion of a four-year program at an accredited chiropractic college leading to the Doctor of Chiropractic degree.

For licensure, most state boards recognize either all or part of the four-part test administered by the National Board of Chiropractic Examiners. State examinations may supplement the National Board tests, depending on state requirements. All states except New Jersey require the completion of a specified number of hours of continuing education each year in order to maintain licensure. Chiropractic associations and accredited chiropractic programs and institutions offer continuing education programs.

Other qualifications. Chiropractic requires keen observation to detect physical abnormalities. It also takes considerable manual dexterity, but not unusual strength or endurance, to perform adjustments. Chiropractors should be able to work independently and handle responsibility. As in other health-related occupations, empathy, understanding, and the desire to help others are good qualities for dealing effectively with patients.

Advancement. Newly licensed chiropractors can set up a new practice, purchase an established one, or enter into partnership with an established practitioner. They also may take a salaried position with an established chiropractor, a group practice, or a health care facility.

Employment

Chiropractors held about 53,000 jobs in 2006. Most chiropractors work in a solo practice, although some are in group practice or work for other chiropractors. A small number teach, conduct research at chiropractic institutions, or work in hospitals and clinics. Approximately 52 percent of chiropractors were self employed.

Many chiropractors are located in small communities. However, the distribution of chiropractors is not geographically uniform. This occurs primarily because new chiropractors frequently establish their practices in close proximity to one of the few chiropractic educational institutions.

Job Outlook

Employment is expected to grow faster than average because of increasing consumer demand for alternative health care. Job prospects should be good.

Employment change. Employment of chiropractors is expected to increase 14 percent between 2006 and 2016, faster than the average for all occupations. Projected job growth stems from increasing consumer demand for alternative health care. Because chiropractors emphasize the importance of healthy lifestyles and do not prescribe drugs or perform surgery, chiropractic care is appealing to many health-conscious Americans. Chiropractic treatment of the back, neck, extremities, and joints has become more accepted as a result of research and changing attitudes about alternative, noninvasive health care practices. The rapidly expanding older population, with its increased likelihood of mechanical and structural problems, also will increase demand for chiropractors.

Demand for chiropractic treatment, however, is related to the ability of patients to pay, either directly or through health insurance. Although more insurance plans now cover chiropractic services, the extent of such coverage varies among plans. Chiropractors must educate communities about the benefits of chiropractic care in order to establish a successful practice.

Job prospects. Job prospects for new chiropractors are expected to be good. In this occupation, replacement needs arise almost entirely from retirements. Chiropractors usually remain in the occupation until they retire; few transfer to other occupations. Establishing a new practice will be easiest in areas with a low concentration of chiropractors.

Earnings

Median annual earnings of salaried chiropractors were $65,220 in 2006. The middle 50 percent earned between $45,710 and $96,500 a year.

In 2005, the mean salary for chiropractors was $104,363 according to a survey conducted by *Chiropractic Economics* magazine.

In chiropractic, as in other types of independent practice, earnings are relatively low in the beginning and increase as the practice grows. Geographic location and the characteristics and qualifications of the practitioner also may influence earnings.

Salaried chiropractors typically receive heath insurance and retirement benefits from their employers, whereas self-employed chiropractors must provide for their own health insurance and retirement.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-2016	
				Number	Percent
Chiropractors	29-1011	53,000	60,000	7,600	14

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Related Occupations

Chiropractors treat patients and work to prevent bodily disorders and injuries. So do athletic trainers, massage therapists, occupational therapists, physical therapists, physicians and surgeons, podiatrists, and veterinarians.

Dentists

(O*NET 29-1021.00, 29-1022.00, 29-1023.00, 29-1024.00, and 29-1029.99)

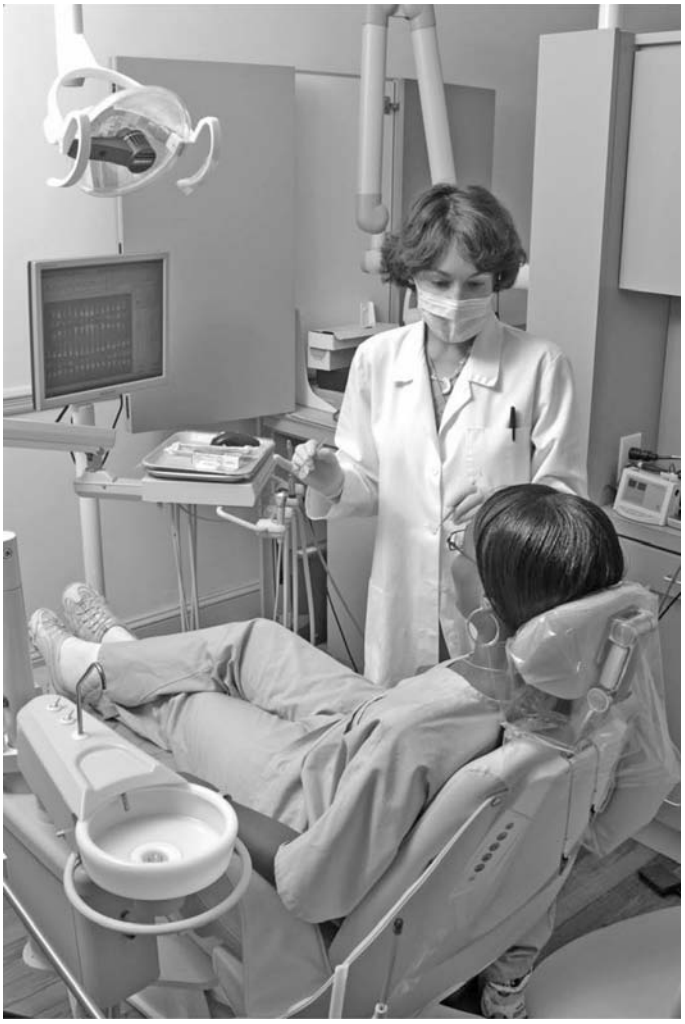
Significant Points

- Most dentists are solo practitioners.
- Dentists usually complete at least 8 years of education beyond high school.
- Average employment growth will generate some job openings, but most openings will result from the need to replace the large number of dentists expected to retire.
- Job prospects should be good.

Nature of the Work

Dentists diagnose and treat problems with teeth and tissues in the mouth, along with giving advice and administering care to help prevent future problems. They provide instruction on diet, brushing, flossing, the use of fluorides, and other aspects of dental care. They remove tooth decay, fill cavities, examine X rays, place protective plastic sealants on children's teeth, straighten teeth, and repair fractured teeth. They also perform corrective surgery on gums and supporting bones to treat gum diseases. Dentists extract teeth and make models and measurements for dentures to replace missing teeth. They also administer anesthetics and write prescriptions for antibiotics and other medications.

Dentists use a variety of equipment, including X-ray machines, drills, mouth mirrors, probes, forceps, brushes, and scalpels. They wear masks, gloves, and safety glasses to protect themselves and their patients from infectious diseases.



Dentists use various equipment to diagnose and treat problems with teeth and tissues in the mouth.

Dentists in private practice oversee a variety of administrative tasks, including bookkeeping and the buying of equipment and supplies. They may employ and supervise dental hygienists, dental assistants, dental laboratory technicians, and receptionists. (These occupations are described elsewhere in the *Handbook.*)

Most dentists are general practitioners, handling a variety of dental needs. Other dentists practice in any of nine specialty areas. *Orthodontists,* the largest group of specialists, straighten teeth by applying pressure to the teeth with braces or retainers. The next largest group, *oral and maxillofacial surgeons*, operates on the mouth and jaws. The remainder may specialize as *pediatric dentists* (focusing on dentistry for children); *periodontists* (treating gums and bone supporting the teeth); *prosthodontists* (replacing missing teeth with permanent fixtures, such as crowns and bridges, or with removable fixtures such as dentures); *endodontists* (performing root canal therapy); *public health dentists* (promoting good dental health and preventing dental diseases within the community); *oral pathologists* (studying oral diseases); or *oral and maxillofacial radiologists* (diagnosing diseases in the head and neck through the use of imaging technologies).

Work environment. Most dentists are solo practitioners, meaning that they own their own businesses and work alone or with a small staff. Some dentists have partners, and a few work for other dentists as associate dentists.

Most dentists work 4 or 5 days a week. Some work evenings and weekends to meet their patients' needs. The number of hours worked varies greatly among dentists. Most full-time dentists work between 35 and 40 hours a week. However, others, especially those who are trying to establish a new practice, work more. Also, experienced dentists often work fewer hours. It is common for dentists to continue in part-time practice well beyond the usual retirement age.

Training, Other Qualifications, and Advancement

All 50 states and the District of Columbia require dentists to be licensed. To qualify for a license in most states, candidates must graduate from an accredited dental school and pass written and practical examinations.

Education and training. In 2006, there were 56 dental schools accredited by the American Dental Association's (ADA's) Commission on Dental Accreditation. Dental schools require a minimum of 2 years of college-level predental education prior to admittance. Most dental students have at least a bachelor's degree before entering dental school, although a few applicants are accepted to dental school after 2 or 3 years of college and complete their bachelor's degree while attending dental school.

High school and college students who want to become dentists should take courses in biology, chemistry, physics, health, and mathematics. College undergraduates planning on applying to dental school are required to take many science courses. Because of this, some choose a major in a science, such as biology or chemistry, while others take the required science coursework while pursuing a major in another subject.

All dental schools require applicants to take the Dental Admissions Test (DAT). When selecting students, schools consider scores earned on the DAT, applicants' grade point averages, and information gathered through recommendations and interviews. Competition for admission to dental school is keen.

Dental school usually lasts 4 academic years. Studies begin with classroom instruction and laboratory work in science, including anatomy, microbiology, biochemistry, and physiology. Beginning courses in clinical sciences, including laboratory techniques, are also completed. During the last 2 years, students treat patients, usually in dental clinics, under the supervision of licensed dentists. Most dental schools award the degree of Doctor of Dental Surgery (DDS). Others award an equivalent degree, Doctor of Dental Medicine (DMD).

Some dental school graduates work for established dentists as associates for 1 to 2 years to gain experience and save money to equip an office of their own. Most dental school graduates, however, purchase an established practice or open a new one immediately after graduation.

Licensure. Licensing is required to practice as a dentist. In most states, licensure requires passing written and practical examinations in addition to having a degree from an accredited dental school. Candidates may fulfill the written part of the state licensing requirements by passing the National Board Dental Examinations. Individual states or regional testing agencies administer the written or practical examinations.

In 2006, 17 states licensed or certified dentists who intended to practice in a specialty area. Requirements include 2 to 4 years of postgraduate education and, in some cases, the completion of a special state examination. Most state licenses permit dentists to engage in both general and specialized practice.

Other qualifications. Dentistry requires diagnostic ability and manual skills. Dentists should have good visual memory, excellent judgment regarding space, shape, and color, a high degree of manual dexterity, and scientific ability. Good business sense, self-discipline, and good communication skills are helpful for success in private practice.

Advancement. Dentists who want to teach or conduct research usually spend an additional 2 to 5 years in advanced dental training, in programs operated by dental schools or hospitals. A recent survey by the American Dental Education Association showed that 11 percent of new graduates enrolled in postgraduate training programs to prepare for a dental specialty.

Employment

Dentists held about 161,000 jobs in 2006. Employment was distributed among general practitioners and specialists as follows:

Dentists, general	136,000
Orthodontists	9,200
Oral and maxillofacial surgeons	7,700
Prosthodontists	1,000
Dentists, all other specialists	6,900

About one-third of dentists were self-employed and not incorporated. Almost all dentists work in private practice. According to the ADA, about 3 out of 4 dentists in private practice are sole proprietors, and 1 in 7 belongs to a partnership. A few salaried dentists work in hospitals and offices of physicians.

Job Outlook

Average employment growth will generate some job openings, but most openings will result from the need to replace the large number of dentists expected to retire. Job prospects should be good as new dentists take over established practices or start their own.

Employment change. Employment of dentists is projected to grow nine percent through 2016, about as fast as the average for all occupations. The demand for dental services is expected to continue to increase. The overall population is growing, particularly the number of older people, which will increase the demand for dental care. As members of the baby-boom generation advance into middle age, a large number will need complicated dental work, such as bridges. In addition, elderly people are more likely to retain their teeth than

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-2016	
				Number	Percent
Dentists	29-1020	161,000	176,000	15,000	9
Dentists, general	29-1021	136,000	149,000	13,000	9
Oral and maxillofacial surgeons	29-1022	7,700	8,400	700	9
Orthodontists	29-1023	9,200	10,000	800	9
Prosthodontists	29-1024	1,000	1,100	100	11
Dentists, all other specialists	29-1029	6,900	7,400	500	7

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

were their predecessors, so they will require much more care than in the past. The younger generation will continue to need preventive checkups despite an overall increase in the dental health of the public over the last few decades. Recently, some private insurance providers have increased their dental coverage. If this trend continues, those with new or expanded dental insurance will be more likely to visit a dentist than in the past. Also, while they are currently a small proportion of dental expenditures, cosmetic dental services, such as fitting braces for adults as well as children and providing teeth-whitening treatments, have become increasingly popular.

However, employment of dentists is not expected to keep pace with the increased demand for dental services. Productivity increases from new technology, as well as having dental hygienists and assistants perform some tasks, will allow dentists to perform more work than they have in the past. As their practices expand, dentists are likely to hire more hygienists and dental assistants to handle routine services.

Dentists will increasingly provide care and instruction aimed at preventing the loss of teeth, rather than simply providing treatments such as fillings. Improvements in dental technology also will allow dentists to offer more effective and less painful treatment to their patients.

Job prospects. As an increasing number of dentists from the baby-boom generation reach retirement age, many of them will retire or work fewer hours. However, the number of applicants to, and graduates from, dental schools has increased in recent years. Therefore, younger dentists will be able to take over the work from older dentists who retire or cut back on hours, as well as provide dental services to accommodate the growing demand.

Demand for dental services tends to follow the business cycle, primarily because these services usually are paid for either by the patient or by private insurance companies. As a result, during slow times in the economy, demand for dental services can decrease; dentists may have difficulty finding employment, or if already in an established practice, they may work fewer hours because of reduced demand.

Earnings

Median annual earnings of salaried dentists were $136,960 in May 2006. Earnings vary according to number of years in practice, location, hours worked, and specialty. Self-employed dentists in private practice tend to earn more than do salaried dentists.

Dentists who are salaried often receive benefits paid by their employer, with health insurance and malpractice insurance being among the most common. However, like other business owners, self-employed dentists must provide their own health insurance, life insurance, retirement plans, and other benefits.

Related Occupations

Dentists examine, diagnose, prevent, and treat diseases and abnormalities. Chiropractors, optometrists, physicians and surgeons, podiatrists, psychologists, and veterinarians do similar work.

Sources of Additional Information

For information on dentistry as a career, a list of accredited dental schools, and a list of state boards of dental examiners, contact

➤ American Dental Association, Commission on Dental Accreditation, 211 E. Chicago Ave., Chicago, IL 60611. Internet: http://www.ada.org

For information on admission to dental schools, contact

➤ American Dental Education Association, 1400 K St. NW, Suite 1100, Washington, DC 20005. Internet: http://www.adea.org

Persons interested in practicing dentistry should obtain the requirements for licensure from the board of dental examiners of the state in which they plan to work.

To obtain information on scholarships, grants, and loans, including federal financial aid, prospective dental students should contact the office of student financial aid at the schools to which they apply.

Dietitians and Nutritionists

(O*NET 29-1031.00)

Significant Points

- Most jobs are in hospitals, nursing care facilities, outpatient care centers, and offices of physicians or other health practitioners.
- Dietitians and nutritionists need at least a bachelor's degree in dietetics, foods and nutrition, food service systems management, or a related area; licensure, certification, or registration requirements vary by state.
- Employment is projected to grow about as fast as the average for all occupations; however, growth may be constrained if employers substitute other workers for dietitians and if limitations are placed on insurance reimbursement for dietetic services.
- Good job opportunities are expected.

Nature of the Work

Dietitians and nutritionists plan food and nutrition programs, supervise meal preparation, and oversee the serving of meals. They prevent and treat illnesses by promoting healthy eating habits and recommending dietary modifications. For example, dietitians might teach a patient with high blood pressure how to use less salt when preparing meals, or create a diet reduced in fat and sugar for an overweight patient.

Dietitians manage food service systems for institutions such as hospitals and schools, promote sound eating habits through education, and conduct research. Many dietitians specialize, becoming a clinical dietitian, community dietitian, management dietitian, or consultant.

Clinical dietitians provide nutritional services to patients in hospitals, nursing care facilities, and other institutions. They assess patients' nutritional needs, develop and implement nutrition programs, and evaluate and report the results. They also confer with doctors and other health care professionals to coordinate medical and nutritional needs. Some clinical dietitians specialize in managing the weight of overweight patients or in the care of renal (kidney), diabetic, or critically ill patients. In addition, clinical dietitians in nursing care facilities, small hospitals, or correctional facilities may manage the food service department.

Community dietitians counsel individuals and groups on nutritional practices designed to prevent disease and promote health. Working in places such as public health clinics, home health agencies, and health maintenance organizations, community dietitians evaluate individual needs, develop nutritional care plans, and instruct individuals and their families. Dietitians working in home health agencies provide instruction on grocery shopping and food preparation to the elderly, children, and individuals with special needs.

Increased public interest in nutrition has led to job opportunities in food manufacturing, advertising, and marketing. In these areas, dietitians analyze foods, prepare literature for distribution, or report on issues such as dietary fiber, vitamin supplements, or the nutritional content of recipes.

Dietitians and nutritionists plan food and nutrition programs to reach the client's health goals.

Management dietitians oversee large-scale meal planning and preparation in health care facilities, company cafeterias, prisons, and schools. They hire, train, and direct other dietitians and food service workers; budget for and purchase food, equipment, and supplies; enforce sanitary and safety regulations; and prepare records and reports.

Consultant dietitians work under contract with health care facilities or in their own private practice. They perform nutrition screenings for their clients and offer advice on diet-related concerns such as weight loss and cholesterol reduction. Some work for wellness programs, sports teams, supermarkets, and other nutrition-related businesses. They may consult with food service managers, providing expertise in sanitation, safety procedures, menu development, budgeting, and planning.

Work environment. Dietitians and nutritionists usually work in clean, well-lighted, and well-ventilated areas. However, some work in hot, congested kitchens. Many dietitians and nutritionists are on their feet for much of the workday.

Most full-time dietitians and nutritionists work a regular 40-hour week, although some work weekends. About 1 in 3 worked part time in 2006.

Training, Other Qualifications, and Advancement

Dietitians and nutritionists need at least a bachelor's degree. Licensure, certification, or registration requirements vary by state.

Education and training. Becoming a dietitian or nutritionist usually requires at least a bachelor's degree in dietetics, foods and nutrition, food service systems management, or a related area. Graduate degrees also are available. College students in these majors take courses in foods, nutrition, institution management, chemistry, biochemistry, biology, microbiology, and physiology. Other suggested courses include business, mathematics, statistics, computer science, psychology, sociology, and economics. High school students interested in becoming a dietitian or nutritionist should take courses in biology, chemistry, mathematics, health, and communications.

As of 2007, there were 281 bachelor's degree programs and 22 master's degree programs approved by the American Dietetic Association's Commission on Accreditation for Dietetics Education.

Licensure. Of the 48 states and jurisdictions with laws governing dietetics, 35 require licensure, 12 require statutory certification, and 1 requires registration. Requirements vary by state. As a result, interested candidates should determine the requirements of the state in which they want to work before sitting for any exam.

In states that require licensure, only people who are licensed can work as dietitians and nutritionists. States that require statutory certification limit the use of occupational titles to people who meet certain requirements; individuals without certification can still practice as a dietitian or nutritionist but without using certain titles. Registration is the least restrictive form of state regulation of dietitians and nutritionists. Unregistered people are permitted to practice as a dietitian or nutritionist.

Certification and other qualifications. Although not required, the Commission on Dietetic Registration of the American Dietetic Association awards the Registered Dietitian credential to those who pass an exam after completing academic coursework and a supervised internship. This certification is different from the statutory certification regulated by some states and discussed in the previous section. To maintain a Registered Dietitian status, workers must complete at least 75 credit hours in approved continuing education classes every 5 years.

A supervised internship, required for certification, can be completed in one of two ways. The first requires the completion of a program accredited by the Commission on Dietetic Registration. As of 2007, there were 53 accredited programs that combined academic and supervised practice experience and generally lasted 4 to 5 years. The second option requires the completion of 900 hours of supervised practice experience in any of the 265 accredited internships. These internships may be full-time programs lasting 6 to 12 months or part-time programs lasting 2 years.

Advancement. Experienced dietitians may advance to management positions, such as assistant director, associate director, or director of a dietetic department, or may become self-employed. Some dietitians specialize in areas such as renal, diabetic, cardiovascular, or pediatric dietetics. Others leave the occupation to become sales representatives for equipment, pharmaceutical, or food manufacturers. A master's degree can help some workers to advance their careers, particularly in career paths related to research, advanced clinical positions, or public health.

Employment

Dietitians and nutritionists held about 57,000 jobs in 2006. More than half of all jobs were in hospitals, nursing care facilities, outpatient care centers, or offices of physicians and other health practitioners. State and local government agencies provided additional jobs—mostly in correctional facilities, health departments, and other public-health-related areas. Some dietitians and nutritionists were employed in special food services, an industry made up of firms providing food services on contract to facilities such as colleges and universities, airlines, correctional facilities, and company cafeterias.

Other jobs were in public and private educational services, community care facilities for the elderly (which includes assisted-living facilities), individual and family services, home health care services, and the federal government—mostly in the U.S. Department of Veterans Affairs. Some dietitians were self-employed, working as consultants to facilities such as hospitals and nursing care facilities or providing dietary counseling to individuals.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-2016 Number	Change, 2006-2016 Percent
Dietitians and nutritionists	29-1031	57,000	62,000	4,900	9

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Job Outlook

Average employment growth is projected. Good job opportunities are expected, especially for dietitians with specialized training, an advanced degree, or certifications beyond the particular state's minimum requirement.

Employment change. Employment of dietitians and nutritionists is expected to increase 9 percent during the 2006–2016 projection decade, about as fast as the average for all occupations. Job growth will result from an increasing emphasis on disease prevention through improved dietary habits. A growing and aging population will boost demand for nutritional counseling and treatment in hospitals, residential care facilities, schools, prisons, community health programs, and home health care agencies. Public interest in nutrition and increased emphasis on health education and prudent lifestyles also will spur demand, especially in food service management.

Employment growth, however, may be constrained if some employers substitute other workers, such as health educators, food service managers, and dietetic technicians, to do work related to nutrition. Also, demand for nutritional therapy services is related to the ability of patients to pay, either out-of-pocket or through health insurance, and although more insurance plans now cover nutritional therapy services, the extent of such coverage varies among plans. Growth may be curbed by limitations on insurance reimbursement for dietetic services.

Hospitals will continue to employ a large number of dietitians and nutritionists to provide medical nutritional therapy and plan meals. But hospitals also will continue to contract with outside agencies for food service and move medical nutritional therapy to outpatient care facilities, slowing job growth in hospitals relative to food service, outpatient facilities, and other employers.

The number of dietitian positions in nursing care facilities is expected to decline, as these establishments continue to contract with outside agencies for food services. However, employment is expected to grow rapidly in contract providers of food services, in outpatient care centers, and in offices of physicians and other health practitioners.

Finally, with increased public awareness of obesity and diabetes, Medicare coverage may be expanded to include medical nutrition therapy for renal and diabetic patients, creating job growth for dietitians and nutritionists specializing in those diseases.

Job prospects. In addition to employment growth, job openings will result from the need to replace experienced workers who retire or leave the occupation for other reasons. Overall, job opportunities will be good for dietitians and nutritionists, particularly for licensed and registered dietitians. Job opportunities should be particularly good in outpatient care facilities, offices of physicians, and food service management. Dietitians and nutritionists without a bachelor's degree will face keen competition for jobs.

Dietitians with specialized training, an advanced degree, or certifications beyond the particular state's minimum requirement will experience the best job opportunities. Those specializing in renal and diabetic nutrition or gerontological nutrition will benefit from the growing number of diabetics and the aging of the population.

Earnings

Median annual earnings of dietitians and nutritionists were $46,980 in May 2006. The middle 50 percent earned between $38,430 and $57,090. The lowest 10 percent earned less than $29,860, and the highest 10 percent earned more than $68,330. Median annual earnings in the industries employing the largest numbers of dietitians and nutritionists in May 2006 were:

Outpatient care centers	$49,950
General medical and surgical hospitals	47,320
State government	46,690
Nursing care facilities	46,660
Local government	43,250

According to the American Dietetic Association, median annualized wages for registered dietitians in 2005 varied by practice area as follows: $53,800 in consultation and business; $60,000 in food and nutrition management; $60,200 in education and research; $48,800 in clinical nutrition/ambulatory care; $50,000 in clinical nutrition/long-term care; $44,800 in community nutrition; and $45,000 in clinical nutrition/acute care. Salaries also vary by years in practice, education level, and geographic region.

Related Occupations

Workers in other occupations who may apply the principles of dietetics include food service managers, health educators, dietetic technicians, and registered nurses.

Occupational Therapists

(O*NET 29-1122.00)

Significant Points

- Employment is expected to grow much faster than average and job opportunities should be good, especially for therapists treating the elderly.
- Occupational therapists must be licensed, requiring a master's degree in occupational therapy, 6 months of supervised fieldwork, and passing scores on national and state examinations.
- Occupational therapists are increasingly taking on supervisory roles, allowing assistants and aides to work more closely with clients under the guidance of a therapist.

- More than a quarter of occupational therapists work part time.

Nature of the Work

Occupational therapists help patients improve their ability to perform tasks in living and working environments. They work with individuals who suffer from a mentally, physically, developmentally, or emotionally disabling condition. Occupational therapists use treatments to develop, recover, or maintain the daily living and work skills of their patients. The therapist helps clients not only to improve their basic motor functions and reasoning abilities, but also to compensate for permanent loss of function. The goal is to help clients have independent, productive, and satisfying lives.

Occupational therapists help clients to perform all types of activities, from using a computer to caring for daily needs such as dressing, cooking, and eating. Physical exercises may be used to increase strength and dexterity, while other activities may be chosen to improve visual acuity or the ability to discern patterns. For example, a client with short-term memory loss might be encouraged to make lists to aid recall, and a person with coordination problems might be assigned exercises to improve hand-eye coordination. Occupational therapists also use computer programs to help clients improve decision-making, abstract-reasoning, problem-solving, and perceptual skills, as well as memory, sequencing, and coordination—all of which are important for independent living.

Patients with permanent disabilities, such as spinal cord injuries, cerebral palsy, or muscular dystrophy, often need special instruction to master certain daily tasks. For these individuals, therapists demonstrate the use of adaptive equipment, including wheelchairs, orthoses, eating aids, and dressing aids. They also design or build special equipment needed at home or at work, including computer-aided adaptive equipment. They teach clients how to use the equipment to improve communication and control various situations in their environment.

Some occupational therapists treat individuals whose ability to function in a work environment has been impaired. These practitioners might arrange employment, evaluate the work space, plan work activities, and assess the client's progress. Therapists also may collaborate with the client and the employer to modify the work environment so that the client can successfully complete the work.

Occupational therapists help people improve their ability to perform tasks in their daily living and working environments.

Assessing and recording a client's activities and progress is an important part of an occupational therapist's job. Accurate records are essential for evaluating clients, for billing, and for reporting to physicians and other health care providers.

Occupational therapists may work exclusively with individuals in a particular age group or with a particular disability. In schools, for example, they evaluate children's capabilities, recommend and provide therapy, modify classroom equipment, and help children participate in school activities. A therapist may work with children individually, lead small groups in the classroom, consult with a teacher, or serve on an administrative committee. Some therapists provide early intervention therapy to infants and toddlers who have, or are at risk of having, developmental delays. Therapies may include facilitating the use of the hands and promoting skills for listening, following directions, social play, dressing, or grooming.

Other occupational therapists work with elderly patients. These therapists help the elderly lead more productive, active, and independent lives through a variety of methods. Therapists with specialized training in driver rehabilitation assess an individual's ability to drive using both clinical and on-the-road tests. The evaluations allow the therapist to make recommendations for adaptive equipment, training to prolong driving independence, and alternative transportation options. Occupational therapists also work with clients to assess their homes for hazards and to identify environmental factors that contribute to falls.

Occupational therapists in mental health settings treat individuals who are mentally ill, developmentally challenged, or emotionally disturbed. To treat these problems, therapists choose activities that help people learn to engage in and cope with daily life. Activities might include time management skills, budgeting, shopping, homemaking, and the use of public transportation. Occupational therapists also work with individuals who are dealing with alcoholism, drug abuse, depression, eating disorders, or stress-related disorders.

Work environment. In large rehabilitation centers, therapists may work in spacious rooms equipped with machines, tools, and other devices generating noise. The work can be tiring because therapists are on their feet much of the time. Those providing home health care services may spend time driving from appointment to appointment. Therapists also face hazards such as back strain from lifting and moving clients and equipment.

Occupational therapists in hospitals and other health care and community settings usually work a 40-hour week. Those in schools may participate in meetings and other activities during and after the school day. In 2006, more than a quarter of occupational therapists worked part time.

Training, Other Qualifications, and Advancement

Occupational therapists must be licensed, requiring a master's degree in occupational therapy, 6 months of supervised fieldwork, and passing scores on national and state examinations.

Education and training. A master's degree or higher in occupational therapy is the minimum requirement for entry into the field. In 2007, 124 master's degree programs offered entry-level education, 66 programs offered a combined bachelor's and master's degree, and 5 offered an entry-level doctoral degree. Most schools have full-time programs, although a growing number are offering weekend or part-time programs as well. Coursework in occupational therapy programs include the physical, biological, and behavioral sciences as well as the application of occupational therapy theory

and skills. Programs also require the completion of 6 months of supervised fieldwork.

People considering this profession should take high school courses in biology, chemistry, physics, health, art, and the social sciences. College admissions offices also look favorably on paid or volunteer experience in the health care field. Relevant undergraduate majors include biology, psychology, sociology, anthropology, liberal arts, and anatomy.

Licensure. All states, Puerto Rico, Guam, and the District of Columbia regulate the practice of occupational therapy. To obtain a license, applicants must graduate from an accredited educational program and pass a national certification examination. Those who pass the exam are awarded the title "Occupational Therapist Registered (OTR)." Some states have additional requirements for therapists who work in schools or early intervention programs. These requirements may include education-related classes, an education practice certificate, or early intervention certification.

Other qualifications. Occupational therapists need patience and strong interpersonal skills to inspire trust and respect in their clients. Patience is necessary because many clients may not show rapid improvement. Ingenuity and imagination in adapting activities to individual needs are assets. Those working in home health care services also must be able to adapt to a variety of settings.

Advancement. Occupational therapists are expected to continue their professional development by participating in continuing education courses and workshops. In fact, a number of states require continuing education as a condition of maintaining licensure.

Therapists are increasingly taking on supervisory roles. Because of rising health care costs, third-party payers are beginning to encourage occupational therapist assistants and aides to take more hands-on responsibility for clients. Occupational therapists can choose to advance their careers by taking on administrative duties and supervising assistants and aides.

Occupational therapists also can advance by specializing in a clinical area and gaining expertise in treating a certain type of patient or ailment. Therapists have specialized in gerontology, mental health, pediatrics, and physical rehabilitation. In addition, some occupational therapists choose to teach classes in accredited occupational therapy educational programs.

Employment

Occupational therapists held about 99,000 jobs in 2006. About 1 in 10 occupational therapists held more than one job. The largest number of jobs was in hospitals. Other major employers were offices of other health practitioners (including offices of occupational therapists), public and private educational services, and nursing care facilities. Some occupational therapists were employed by home health care services, outpatient care centers, offices of physicians, individual and family services, community care facilities for the elderly, and government agencies.

A small number of occupational therapists were self-employed in private practice. These practitioners treated clients referred by other health professionals. They also provided contract or consulting services to nursing care facilities, schools, adult day care programs, and home health care agencies.

Job Outlook

Employment of occupational therapists is expected to grow much faster than the average for all occupations. Job opportunities should be good, especially for occupational therapists treating the elderly.

Employment change. Employment of occupational therapists is expected to increase 23 percent between 2006 and 2016, much faster than the average for all occupations. The increasing elderly population will drive growth in the demand for occupational therapy services. In the short run, the impact of proposed federal legislation imposing limits on reimbursement for therapy services may adversely affect the job market for occupational therapists. However, over the long run, the demand for occupational therapists should continue to rise as a result of the increasing number of individuals with disabilities or limited function who require therapy services. The baby-boom generation's movement into middle age, a period when the incidence of heart attack and stroke increases, will spur demand for therapeutic services. Growth in the population 75 years and older—an age group that suffers from high incidences of disabling conditions—also will increase demand for therapeutic services. In addition, medical advances now enable more patients with critical problems to survive—patients who ultimately may need extensive therapy.

Hospitals will continue to employ a large number of occupational therapists to provide therapy services to acutely ill inpatients. Hospitals also will need occupational therapists to staff their outpatient rehabilitation programs.

Employment growth in schools will result from the expansion of the school-age population, the extension of services for disabled students, and an increasing prevalence of sensory disorders in children. Therapists will be needed to help children with disabilities prepare to enter special education programs.

Job prospects. Job opportunities should be good for licensed occupational therapists in all settings, particularly in acute hospital, rehabilitation, and orthopedic settings because the elderly receive most of their treatment in these settings. Occupational therapists with specialized knowledge in a treatment area also will have increased job prospects. Driver rehabilitation and fall-prevention training for the elderly are emerging practice areas for occupational therapy.

Earnings

Median annual earnings of occupational therapists were $60,470 in May 2006. The middle 50 percent earned between $50,450 and $73,710. The lowest 10 percent earned less than $40,840, and the highest 10 percent earned more than $89,450. Median annual earnings in the industries employing the largest numbers of occupational therapists in May 2006 were:

Home health care services	$67,600
Nursing care facilities	64,750
Offices of physical, occupational and speech therapists, and audiologists	62,290
General medical and surgical hospitals	61,610
Elementary and secondary schools	54,260

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-2016	
				Number	Percent
Occupational therapists	29-1122	99,000	122,000	23,000	23

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Related Occupations

Occupational therapists use specialized knowledge to help individuals perform daily living skills and achieve maximum independence. Other workers performing similar duties include athletic trainers, audiologists, chiropractors, physical therapists, recreational therapists, rehabilitation counselors, respiratory therapists, and speech-language pathologists.

Sources of Additional Information

For more information on occupational therapy as a career, contact

➤ American Occupational Therapy Association, 4720 Montgomery Ln., Bethesda, MD 20824-1220. Internet: http://www.aota.org

For information regarding the requirements to practice as an occupational therapist in schools, contact the appropriate occupational therapy regulatory agency for your state.

Optometrists

(O*NET 29-1041.00)

Significant Points

- Admission to optometry school is competitive.
- To be licensed, optometrists must earn a Doctor of Optometry degree from an accredited optometry school and pass the appropriate exams administered by the National Board of Examiners in Optometry.
- Employment is expected to grow as fast as average in response to the vision care needs of a growing and aging population.

Nature of the Work

Optometrists, also known as *doctors of optometry*, or *ODs*, are the main providers of vision care. They examine people's eyes to diagnose vision problems, such as nearsightedness and farsightedness, and they test patients' depth and color perception and ability to focus and coordinate the eyes. Optometrists may prescribe eyeglasses or contact lenses, or they may prescribe or provide other treatments, such as vision therapy or low-vision rehabilitation.

Optometrists also test for glaucoma and other eye diseases and diagnose conditions caused by systemic diseases such as diabetes and high blood pressure, referring patients to other health practitioners as needed. They administer drugs to patients to aid in the diagnosis of vision problems and to treat eye diseases. Optometrists often provide preoperative and postoperative care to cataract patients, as well as to patients who have had laser vision correction or other eye surgery.

Most optometrists are in general practice. Some specialize in work with the elderly, children, or partially sighted persons who need specialized visual devices. Others develop and implement ways to protect workers' eyes from on-the-job strain or injury. Some specialize in contact lenses, sports vision, or vision therapy. A few teach optometry, perform research, or consult.

Most optometrists are private practitioners who also handle the business aspects of running an office, such as developing a patient base, hiring employees, keeping paper and electronic records, and ordering equipment and supplies. Optometrists who operate franchise optical stores also may have some of these duties.

Optometrists should not be confused with ophthalmologists or dispensing opticians. *Ophthalmologists* are physicians who perform eye surgery, as well as diagnose and treat eye diseases and injuries. Like optometrists, they also examine eyes and prescribe eyeglasses and contact lenses. *Dispensing opticians* fit and adjust eyeglasses and, in some states, may fit contact lenses according to prescriptions written by ophthalmologists or optometrists. (See the sections on physicians and surgeons; and opticians, dispensing, elsewhere in the *Handbook*.)

Optometrists use specialized equipment to test vision and detect diseases of the eye.

Work environment. Optometrists work in places—usually their own offices—that are clean, well lighted, and comfortable. Most full-time optometrists work about 40 hours a week. Many work weekends and evenings to suit the needs of patients. Emergency calls, once uncommon, have increased with the passage of therapeutic-drug laws expanding optometrists' ability to prescribe medications.

Optometrists who work in solo practice or with a partner tend to work longer hours because they must tend to administrative duties in addition to their medical ones. According to the American Optometric Association surveys, optometrists worked about 49 hours per week, on average, in 2004, and were available to see patients about 38 hours per week.

Training, Other Qualifications, and Advancement

The Doctor of Optometry degree requires the completion of a four-year program at an accredited optometry school, preceded by at least three years of preoptometric study at an accredited college or university. All states require optometrists to be licensed.

Education and training. Optometrists need a Doctor of Optometry degree, which requires the completion of a four-year program at an accredited optometry school. In 2006, there were 16 colleges of optometry in the U.S. and 1 in Puerto Rico that offered programs accredited by the Accreditation Council on Optometric Education of the American Optometric Association. Requirements for admission to optometry schools include college courses in English, mathematics, physics, chemistry, and biology. Because a strong background in science is important, many applicants to optometry school major in a science, such as biology or chemistry as undergraduates. Others major in another subject and take many science courses offering laboratory experience.

Admission to optometry school is competitive. Applicants must take the Optometry Admissions Test, which measures academic ability and scientific comprehension. As a result, most applicants take the test after their sophomore or junior year in college, allowing them an opportunity to take the test again and raise their score. A few applicants are accepted to optometry school after 3 years of college and complete their bachelor's degree while attending optometry school. However, most students accepted by a school or

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-2016	
				Number	Percent
Optometrists	29-1041	33,000	36,000	3,700	11

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

college of optometry have completed an undergraduate degree. Each institution has its own undergraduate prerequisites, so applicants should contact the school or college of their choice for specific requirements.

Optometry programs include classroom and laboratory study of health and visual sciences and clinical training in the diagnosis and treatment of eye disorders. Courses in pharmacology, optics, vision science, biochemistry, and systemic diseases are included.

One-year postgraduate clinical residency programs are available for optometrists who wish to obtain advanced clinical competence. Specialty areas for residency programs include family practice optometry, pediatric optometry, geriatric optometry, vision therapy and rehabilitation, low-vision rehabilitation, cornea and contact lenses, refractive and ocular surgery, primary eye care optometry, and ocular disease.

Licensure. All states and the District of Columbia require that optometrists be licensed. Applicants for a license must have a Doctor of Optometry degree from an accredited optometry school and must pass both a written National Board examination and a National, regional, or state clinical examination. The written and clinical examinations of the National Board of Examiners in Optometry usually are taken during the student's academic career. Many states also require applicants to pass an examination on relevant state laws. Licenses must be renewed every 1 to 3 years and, in all states, continuing education credits are needed for renewal.

Other qualifications. Business ability, self-discipline, and the ability to deal tactfully with patients are important for success. The work of optometrists also requires attention to detail and manual dexterity.

Advancement. Optometrists wishing to teach or conduct research may study for a master's degree or Ph.D. in visual science, physiological optics, neurophysiology, public health, health administration, health information and communication, or health education.

Employment

Optometrists held about 33,000 jobs in 2006. Salaried jobs for optometrists were primarily in offices of optometrists; offices of physicians, including ophthalmologists; and health and personal care stores, including optical goods stores. A few salaried jobs for optometrists were in hospitals, the federal government, or outpatient care centers including health maintenance organizations. Nearly 25 percent of optometrists are self-employed. According to a 2005 survey by the American Optometric Association most self-employed optometrists worked in private practice or in partnership with other health care professionals. A small number worked for optical chains or franchises or as independent contractors.

Job Outlook

Employment of optometrists is expected to grow as fast as average for all occupations through 2016, in response to the vision care needs of a growing and aging population. Greater recognition of the importance of vision care, along with growth in employee vision care plans, will also spur job growth.

Employment change. Employment of optometrists is projected to grow 11 percent between 2006 and 2016. A growing population that recognizes the importance of good eye care will increase demand for optometrists. Also, an increasing number of health insurance plans that include vision care, should generate more job growth.

As the population ages, there will likely be more visits to optometrists and ophthalmologists because of the onset of vision problems that occur at older ages, such as cataracts and glaucoma. In addition, increased incidences of diabetes and hypertension in the general population as well as in the elderly will generate greater demand for optometric services as these diseases often affect eyesight.

Employment of optometrists would grow more rapidly if not for productivity gains expected to allow each optometrist to see more patients. These expected gains stem from greater use of optometric assistants and other support personnel, who can reduce the amount of time optometrists need with each patient.

The increasing popularity of laser surgery to correct some vision problems may reduce some of the demand for optometrists as patients often do not require eyeglasses afterward. But optometrists still will be needed to provide preoperative and postoperative care for laser surgery patients.

Job prospects. Job opportunities for optometrists should be very good over the next decade. Demand is expected to be much higher, and because there are only 16 schools of optometry, the number of students who can get a degree in optometry is limited. In addition to growth, the need to replace optometrists who retire or leave the occupation for other reasons will create more employment opportunities.

Earnings

Median annual earnings of salaried optometrists were $91,040 in May 2006. The middle 50 percent earned between $66,530 and $118,490. Median annual earnings of salaried optometrists in offices of optometrists were $86,760. Salaried optometrists tend to earn more initially than do optometrists who set up their own practices. In the long run, however, those in private practice usually earn more.

According to the American Optometric Association, median net annual income for all optometrists, including the self-employed, was $105,000 in 2006. The middle 50 percent earned between $84,000 and $150,000.

Self-employed optometrists, including those working in partnerships, must provide their own benefits. Optometrists employed by others typically enjoy paid vacation, sick leave, and pension contributions.

Related Occupations

Other workers who apply scientific knowledge to prevent, diagnose, and treat disorders and injuries are chiropractors, dentists, physicians and surgeons, psychologists, podiatrists, and veterinarians.

Additional career information is available from

➤ American Optometric Association, Educational Services, 243 N. Lindbergh Blvd., St. Louis, MO 63141. Internet: http://www.aoa.org

The board of optometry in each state can supply information on licensing requirements.

For information on specific admission requirements and sources of financial aid, contact the admissions officers of individual optometry schools.

Pharmacists

(O*NET 29-1051.00)

Significant Points

- Excellent job opportunities are expected.
- Earnings are high, but some pharmacists are required to work nights, weekends, and holidays.
- Pharmacists are becoming more involved in counseling patients and planning drug therapy programs.
- A license is required; the prospective pharmacist must graduate from an accredited college of pharmacy and pass a series of examinations.

Nature of the Work

Pharmacists distribute prescription drugs to individuals. They also advise their patients, as well as physicians and other health practitioners, on the selection, dosages, interactions, and side effects of medications. Pharmacists monitor the health and progress of patients to ensure the safe and effective use of medication. Compounding—the actual mixing of ingredients to form medications—is a small part of a pharmacist's practice, because most medicines are produced by pharmaceutical companies in a standard dosage and drug delivery form. Most pharmacists work in a community setting, such as a retail drugstore, or in a health care facility, such as a hospital, nursing home, mental health institution, or neighborhood health clinic.

Pharmacists in community pharmacies dispense medications, counsel patients on the use of prescription and over-the-counter medications, and advise physicians about patients' medication therapy. They also advise patients about general health topics such as diet, exercise, and stress management, and provide information on products such as durable medical equipment or home health care supplies. In addition, they may complete third-party insurance forms and other paperwork. Those who own or manage community pharmacies may sell non-health-related merchandise, hire and supervise personnel, and oversee the general operation of the pharmacy. Some community pharmacists provide specialized services to help patients with conditions such as diabetes, asthma, smoking cessation, or high blood pressure; others also are trained to administer vaccinations.

Pharmacists in health care facilities dispense medications and advise the medical staff on the selection and effects of drugs. They may make sterile solutions to be administered intravenously. They also plan, monitor and evaluate drug programs or regimens. They may counsel hospitalized patients on the use of drugs before the patients are discharged.

Pharmacists counsel patients and answer questions about medications.

Pharmacists who work in home health care monitor drug therapy and prepare infusions—solutions that are injected into patients—and other medications for use in the home.

Some pharmacists specialize in specific drug therapy areas, such as intravenous nutrition support, oncology (cancer), nuclear pharmacy (used for chemotherapy), geriatric pharmacy, and psychiatric pharmacy (the use of drugs to treat mental disorders).

Most pharmacists keep confidential computerized records of patients' drug therapies to prevent harmful drug interactions. Pharmacists are responsible for the accuracy of every prescription that is filled, but they often rely upon Pharmacy technicians and pharmacy aides to assist them in the dispensing process. Thus, the pharmacist may delegate prescription-filling and administrative tasks and supervise their completion. Pharmacists also frequently oversee pharmacy students serving as interns.

Increasingly, pharmacists are pursuing nontraditional pharmacy work. Some are involved in research for pharmaceutical manufacturers, developing new drugs and testing their effects. Others work in marketing or sales, providing clients with expertise on the use, effectiveness, and possible side effects of drugs. Some pharmacists work for health insurance companies, developing pharmacy benefit packages and carrying out cost-benefit analyses on certain drugs. Other pharmacists work for the government, managed care organizations, public health care services, the armed services, or pharmacy associations. Finally, some pharmacists are employed full time or part time as college faculty, teaching classes and performing research in a wide range of areas.

Work environment. Pharmacists work in clean, well-lighted, and well-ventilated areas. Many pharmacists spend most of their workday on their feet. When working with sterile or dangerous pharmaceutical products, pharmacists wear gloves, masks, and other protective equipment.

Most full-time salaried pharmacists work approximately 40 hours a week, and about 10 percent work more than 50 hours. Many community and hospital pharmacies are open for extended hours or around the clock, so pharmacists may be required to work nights, weekends, and holidays. Consultant pharmacists may travel to nursing homes or other facilities to monitor patients' drug therapy. About 16 percent of pharmacists worked part time in 2006.

Training, Other Qualifications, and Advancement

A license is required in all states, the District of Columbia, and all U.S. territories. In order to obtain a license, pharmacists must earn

a Doctor of Pharmacy (Pharm.D.) degree from a college of pharmacy and pass several examinations.

Education and training. Pharmacists must earn a Pharm.D. degree from an accredited college or school of pharmacy. The Pharm.D. degree has replaced the Bachelor of Pharmacy degree, which is no longer being awarded. To be admitted to a Pharm.D. program, an applicant must have completed at least 2 years of postsecondary study, although most applicants have completed 3 or more years. Other entry requirements usually include courses in mathematics and natural sciences, such as chemistry, biology, and physics, as well as courses in the humanities and social sciences. In 2007, 92 colleges and schools of pharmacy were accredited to confer degrees by the Accreditation Council for Pharmacy Education (ACPE). About 70 percent of Pharm.D. programs require applicants to take the Pharmacy College Admissions Test (PCAT).

Courses offered at colleges of pharmacy are designed to teach students about all aspects of drug therapy. In addition, students learn how to communicate with patients and other health care providers about drug information and patient care. Students also learn professional ethics, concepts of public health, and medication distribution systems management. In addition to receiving classroom instruction, students in Pharm.D. programs spend about one-forth of their time in a variety of pharmacy practice settings under the supervision of licensed pharmacists.

In the 2006–2007 academic year, 70 colleges of pharmacy also awarded the master-of-science degree or the Ph.D. degree. Both degrees are awarded after the completion of a Pharm.D. degree and are designed for those who want additional clinical, laboratory, and research experience. Areas of graduate study include pharmaceutics and pharmaceutical chemistry (physical and chemical properties of drugs and dosage forms), pharmacology (effects of drugs on the body), and pharmacy administration. Many master's and Ph.D. degree holders go on to do research for a drug company or teach at a university.

Other options for pharmacy graduates who are interested in further training include one-year or two-year residency programs or fellowships. Pharmacy residencies are postgraduate training programs in pharmacy practice and usually require the completion of a research project. These programs are often mandatory for pharmacists who wish to work in hospitals. Pharmacy fellowships are highly individualized programs that are designed to prepare participants to work in a specialized area of pharmacy, such clinical practice or research laboratories. Some pharmacists who own their own pharmacy obtain a master's degree in business administration (MBA). Others may obtain a degree in public administration or public health.

Licensure. A license to practice pharmacy is required in all states, the District of Columbia, and all U.S. territories. To obtain a license, a prospective pharmacist must graduate from a college of pharmacy that is accredited by the ACPE and pass a series of examinations. All states, U.S. territories, and the District of Columbia require the North American Pharmacist Licensure Exam (NAPLEX), which tests pharmacy skills and knowledge. Forty-four states and the District of Columbia also require the Multistate Pharmacy Jurisprudence Exam (MPJE), which tests pharmacy law. Both exams are administered by the National Association of Boards of Pharmacy (NABP). Each of the eight states and territories that do not require the MJPE has its own pharmacy law exam. In addition to the NAPLEX and MPJE, some states and territories require additional exams that are unique to their jurisdiction.

All jurisdictions except California currently grant license transfers to qualified pharmacists who already are licensed by another jurisdiction. Many pharmacists are licensed to practice in more than one jurisdiction. Most jurisdictions require continuing education for license renewal. Persons interested in a career as a pharmacist should check with individual jurisdiction boards of pharmacy for details on license renewal requirements and license transfer procedures.

Graduates of foreign pharmacy schools may also qualify for licensure in some U.S. states and territories. These individuals must apply for certification from the Foreign Pharmacy Graduate Examination Committee (FPGEC). Once certified, they must pass the Foreign Pharmacy Graduate Equivalency Examination (FPGEE), Test of English as a Foreign Language (TOEFL) exam, and Test of Spoken English (TSE) exam. They then must pass all of the exams required by the licensing jurisdiction, such as the NAPLEX and MJPE. Applicants who graduated from programs accredited by the Canadian Council for Accreditation of Pharmacy Programs (CCAPP) between 1993 and 2004 are exempt from FPGEC certification and examination requirements.

Other qualifications. Prospective pharmacists should have scientific aptitude, good interpersonal skills, and a desire to help others. They also must be conscientious and pay close attention to detail, because the decisions they make affect human lives.

Advancement. In community pharmacies, pharmacists usually begin at the staff level. Pharmacists in chain drugstores may be promoted to pharmacy supervisor or manager at the store level, then to manager at the district or regional level, and later to an executive position within the chain's headquarters. Hospital pharmacists may advance to supervisory or administrative positions. After they gain experience and secure the necessary capital, some pharmacists become owners or part owners of independent pharmacies. Pharmacists in the pharmaceutical industry may advance in marketing, sales, research, quality control, production, or other areas.

Employment

Pharmacists held about 243,000 jobs in 2006. About 62 percent worked in community pharmacies that were either independently owned or part of a drugstore chain, grocery store, department store, or mass merchandiser. Most community pharmacists were salaried employees, but some were self-employed owners. About 23 percent of pharmacists worked in hospitals. A small proportion worked in mail-order and Internet pharmacies, pharmaceutical wholesalers, offices of physicians, and the federal government.

Job Outlook

Employment is expected to increase much faster than the average through 2016. As a result of rapid growth and the need to replace workers who leave the occupation, job prospects should be excellent.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-2016	
				Number	Percent
Pharmacists	29-1051	243,000	296,000	53,000	22

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Employment change. Employment of pharmacists is expected to grow by 22 percent between 2006 and 2016, which is much faster than the average for all occupations. The increasing numbers of middle-aged and elderly people—who use more prescription drugs than younger people—will continue to spur demand for pharmacists throughout the projection period. Other factors likely to increase the demand for pharmacists include scientific advances that will make more drug products available and the coverage of prescription drugs by a greater number of health insurance plans and Medicare.

As the use of prescription drugs increases, demand for pharmacists will grow in most practice settings, such as community pharmacies, hospital pharmacies, and mail-order pharmacies. As the population ages, assisted living facilities and home care organizations should see particularly rapid growth. Demand will also increase as cost conscious insurers, in an attempt to improve preventative care, use pharmacists in areas such as patient education and vaccination administration.

Demand is also increasing in managed care organizations where pharmacists analyze trends and patterns in medication use, and in pharmacoeconomics—the cost and benefit analysis of different drug therapies. New jobs also are being created in disease management—the development of new methods for curing and controlling diseases—and in sales and marketing. Rapid growth is also expected in pharmacy informatics—the use of information technology to improve patient care.

Job prospects. Excellent opportunities are expected for pharmacists over the 2006 to 2016 period. Job openings will result from rapid employment growth, and from the need to replace workers who retire or leave the occupation for other reasons.

Earnings

Median annual of wage-and-salary pharmacists in May 2006 were $94,520. The middle 50 percent earned between $83,180 and $108,140 a year. The lowest 10 percent earned less than $67,860, and the highest 10 percent earned more than $119,480 a year. Median annual earnings in the industries employing the largest numbers of pharmacists in May 2006 were:

Department stores	$99,050
Grocery stores	95,600
Pharmacies and drug stores	94,640
General medical and surgical hospitals	93,640

According to a 2006 survey by *Drug Topics Magazine*, pharmacists in retail settings earned an average of $92,291 per year, while pharmacists in institutional settings earned an average of $97,545. Full-time pharmacists earned an average of $102,336, while part-time pharmacists earned an average of $55,589.

Related Occupations

Pharmacy technicians and pharmacy aides also work in pharmacies. Persons in other professions who may work with pharmaceutical compounds include biological scientists, medical scientists, and chemists and materials scientists. Increasingly, pharmacists are involved in patient care and therapy, work that they have in common with physicians and surgeons.

Physical Therapists

(O*NET 29-1123.00)

Significant Points

- Employment is expected to increase much faster than average.
- Job opportunities should be good, particularly in acute hospital, rehabilitation, and orthopedic settings.
- Physical therapists need a master's degree from an accredited physical therapy program and a state license, requiring passing scores on national and state examinations.
- About 6 out of 10 physical therapists work in hospitals or in offices of physical therapists.

Nature of the Work

Physical therapists provide services that help restore function, improve mobility, relieve pain, and prevent or limit permanent physical disabilities of patients suffering from injuries or disease. They restore, maintain, and promote overall fitness and health. Their patients include accident victims and individuals with disabling conditions such as low-back pain, arthritis, heart disease, fractures, head injuries, and cerebral palsy.

Therapists examine patients' medical histories and then test and measure the patients' strength, range of motion, balance and coordination, posture, muscle performance, respiration, and motor function. Next, physical therapists develop plans describing a treatment strategy and its anticipated outcome.

Treatment often includes exercise, especially for patients who have been immobilized or who lack flexibility, strength, or endurance. Physical therapists encourage patients to use their muscles to increase their flexibility and range of motion. More advanced exercises focus on improving strength, balance, coordination, and endurance. The goal is to improve how an individual functions at work and at home.

Physical therapists also use electrical stimulation, hot packs or cold compresses, and ultrasound to relieve pain and reduce swelling. They may use traction or deep-tissue massage to relieve pain and improve circulation and flexibility. Therapists also teach patients to use assistive and adaptive devices, such as crutches, prostheses, and wheelchairs. They also may show patients how to do exercises at home to expedite their recovery.

Physical therapists use traction or deep-tissue massage to relieve pain.

As treatment continues, physical therapists document the patient's progress, conduct periodic examinations, and modify treatments when necessary.

Physical therapists often consult and practice with a variety of other professionals, such as physicians, dentists, nurses, educators, social workers, occupational therapists, speech-language pathologists, and audiologists.

Some physical therapists treat a wide range of ailments; others specialize in areas such as pediatrics, geriatrics, orthopedics, sports medicine, neurology, and cardiopulmonary physical therapy.

Work environment. Physical therapists practice in hospitals, clinics, and private offices that have specially equipped facilities. They also treat patients in hospital rooms, homes, or schools. These jobs can be physically demanding because therapists often have to stoop, kneel, crouch, lift, and stand for long periods. In addition, physical therapists move heavy equipment and lift patients or help them turn, stand, or walk.

In 2006, most full-time physical therapists worked a 40-hour week; some worked evenings and weekends to fit their patients' schedules. About 1 in 5 physical therapists worked part time.

Training, Other Qualifications, and Advancement

Physical therapists need a master's degree from an accredited physical therapy program and a state license, requiring passing scores on national and state examinations.

Education and training. According to the American Physical Therapy Association, there were 209 accredited physical therapist education programs in 2007. Of the accredited programs, 43 offered master's degrees and 166 offered doctoral degrees. Only master's degree and doctoral degree programs are accredited, in accordance with the Commission on Accreditation in Physical Therapy Education. In the future, a doctoral degree might be the required entry-level degree. Master's degree programs typically last 2 years, and doctoral degree programs last 3 years.

Physical therapist education programs start with basic science courses such as biology, chemistry, and physics and then introduce specialized courses, including biomechanics, neuroanatomy, human growth and development, manifestations of disease, examination techniques, and therapeutic procedures. Besides getting classroom and laboratory instruction, students receive supervised clinical experience.

Among the undergraduate courses that are useful when one applies to a physical therapist education program are anatomy, biology, chemistry, social science, mathematics, and physics. Before granting admission, many programs require volunteer experience in the physical therapy department of a hospital or clinic. For high school students, volunteering with the school athletic trainer is a good way to gain experience.

Licensure. All states require physical therapists to pass national and state licensure exams before they can practice. They must also graduate from an accredited physical therapist education program.

Other qualifications. Physical therapists should have strong interpersonal skills so that they can educate patients about their physical therapy treatments and communicate with patients' families. Physical therapists also should be compassionate and possess a desire to help patients.

Advancement. Physical therapists are expected to continue their professional development by participating in continuing education courses and workshops. In fact, a number of states require continuing education as a condition of maintaining licensure.

Employment

Physical therapists held about 173,000 jobs in 2006. The number of jobs is greater than the number of practicing physical therapists because some physical therapists hold two or more jobs. For example, some may work in a private practice, but also work part time in another health care facility.

About 6 out of 10 physical therapists worked in hospitals or in offices of physical therapists. Other jobs were in the home health care services industry, nursing care facilities, outpatient care centers, and offices of physicians. Some physical therapists were self-employed in private practices, seeing individual patients and contracting to provide services in hospitals, rehabilitation centers, nursing care facilities, home health care agencies, adult day care programs, and schools. Physical therapists also teach in academic institutions and conduct research.

Job Outlook

Employment of physical therapists is expected to grow much faster than average. Job opportunities will be good, especially in acute hospital, rehabilitation, and orthopedic settings.

Employment change. Employment of physical therapists is expected to grow 27 percent from 2006 to 2016, much faster than

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-2016	
				Number	Percent
Physical therapists	29-1123	173,000	220,000	47,000	27

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

the average for all occupations. The impact of proposed federal legislation imposing limits on reimbursement for therapy services may adversely affect the short-term job outlook for physical therapists. However, the long-run demand for physical therapists should continue to rise as new treatments and techniques expand the scope of physical therapy practices. Moreover, demand will be spurred by the increasing numbers of individuals with disabilities or limited function.

The increasing elderly population will drive growth in the demand for physical therapy services. The elderly population is particularly vulnerable to chronic and debilitating conditions that require therapeutic services. Also, the baby-boom generation is entering the prime age for heart attacks and strokes, increasing the demand for cardiac and physical rehabilitation. And increasing numbers of children will need physical therapy as technological advances save the lives of a larger proportion of newborns with severe birth defects.

Future medical developments also should permit a higher percentage of trauma victims to survive, creating additional demand for rehabilitative care. In addition, growth may result from advances in medical technology that could permit the treatment of an increasing number of disabling conditions that were untreatable in the past.

Widespread interest in health promotion also should increase demand for physical therapy services. A growing number of employers are using physical therapists to evaluate worksites, develop exercise programs, and teach safe work habits to employees.

Job prospects. Job opportunities will be good for licensed physical therapists in all settings. Job opportunities should be particularly good in acute hospital, rehabilitation, and orthopedic settings, where the elderly are most often treated. Physical therapists with specialized knowledge of particular types of treatment also will have excellent job prospects.

Earnings

Median annual earnings of physical therapists were $66,200 in May 2006. The middle 50 percent earned between $55,030 and $78,080. The lowest 10 percent earned less than $46,510, and the highest 10 percent earned more than $94,810. Median annual earnings in the industries employing the largest numbers of physical therapists in May 2006 were:

Home health care services	$70,920
Nursing care facilities	68,650
General medical and surgical hospitals	66,630
Offices of physicians	65,900
Offices of physical, occupational and speech therapists, and audiologists	65,150

Related Occupations

Physical therapists rehabilitate people with physical disabilities. Others who work in the rehabilitation field include audiologists, chiropractors, occupational therapists, recreational therapists, rehabilitation counselors, respiratory therapists, and speech-language pathologists.

Sources of Additional Information

Additional career information and a list of accredited educational programs in physical therapy are available from

➤ American Physical Therapy Association, 1111 N. Fairfax St., Alexandria, VA 22314-1488. Internet: http://www.apta.org

Physician Assistants

(O*NET 29-1071.00)

Significant Points

- Physician assistant programs usually last at least 2 years; admission requirements vary by program, but many require at least 2 years of college and some health care experience.
- All states require physician assistants to complete an accredited education program and to pass a national exam in order to obtain a license.
- Employment is projected to grow much faster than average as health care establishments increasingly use physician assistants to contain costs.
- Job opportunities should be good, particularly in rural and inner-city clinics.

Nature of the Work

Physician assistants (PAs) practice medicine under the supervision of physicians and surgeons. They should not be confused with Medical assistants, who perform routine clinical and clerical tasks. (Medical assistants are discussed elsewhere in the *Handbook*.) PAs are formally trained to provide diagnostic, therapeutic, and preventive health care services, as delegated by a physician. Working as members of the health care team, they take medical histories, examine and treat patients, order and interpret laboratory tests and x rays, and make diagnoses. They also treat minor injuries, by suturing, splinting, and casting. PAs record progress notes, instruct and counsel patients, and order or carry out therapy. In 48 states and the District of Columbia, physician assistants may prescribe some medications. In some establishments, a PA is responsible for managerial duties, such as ordering medical supplies or equipment and supervising technicians and assistants.

Physician assistants may be the principal care providers in rural or inner city clinics, where a physician is present for only one or two days each week.

Physician assistants work under the supervision of a physician. However, PAs may be the principal care providers in rural or inner city clinics where a physician is present for only one or two days each week. In such cases, the PA confers with the supervising physician and other medical professionals as needed and as required by law. PAs also may make house calls or go to hospitals and nursing care facilities to check on patients, after which they report back to the physician.

The duties of physician assistants are determined by the supervising physician and by state law. Aspiring PAs should investigate the laws and regulations in the states in which they wish to practice.

Many PAs work in primary care specialties, such as general internal medicine, pediatrics, and family medicine. Other specialty areas include general and thoracic surgery, emergency medicine, orthopedics, and geriatrics. PAs specializing in surgery provide preoperative and postoperative care and may work as first or second assistants during major surgery.

Work environment. Although PAs usually work in a comfortable, well-lighted environment, those in surgery often stand for long periods. At times, the job requires a considerable amount of walking. Schedules vary according to the practice setting, and often depend on the hours of the supervising physician. The workweek of hospital-based PAs may include weekends, nights, or early morning hospital rounds to visit patients. These workers also may be on call. PAs in clinics usually work a 40-hour week.

Training, Other Qualifications, and Advancement

Physician assistant programs usually last at least 2 years. Admission requirements vary by program, but many require at least 2 years of college and some health care experience. All states require that PAs complete an accredited, formal education program and pass a national exam to obtain a license.

Education and training. Physician assistant education programs usually last at least two years and are full time. Most programs are in schools of allied health, academic health centers, medical schools, or four-year colleges; a few are in community colleges, the military, or hospitals. Many accredited PA programs have clinical teaching affiliations with medical schools.

In 2007, 136 education programs for physician assistants were accredited or provisionally accredited by the American Academy of Physician Assistants. More than 90 of these programs offered the option of a master's degree, and the rest offered either a bachelor's degree or an associate degree. Most applicants to PA educational programs already have a bachelor's degree.

Admission requirements vary, but many programs require 2 years of college and some work experience in the health care field. Students should take courses in biology, English, chemistry, mathematics, psychology, and the social sciences. Many PAs have prior experience as registered nurses, and others come from varied backgrounds, including military corpsman or medics and allied health occupations such as respiratory therapists, physical therapists, and emergency medical technicians and paramedics.

PA education includes classroom instruction in biochemistry, pathology, human anatomy, physiology, microbiology, clinical pharmacology, clinical medicine, geriatric and home health care, disease prevention, and medical ethics. Students obtain supervised clinical training in several areas, including family medicine, internal medicine, surgery, prenatal care and gynecology, geriatrics, emergency medicine, psychiatry, and pediatrics. Sometimes, PA students serve one or more of these rotations under the supervision of a physician who is seeking to hire a PA. The rotations often lead to permanent employment.

Licensure. All states and the District of Columbia have legislation governing the qualifications or practice of physician assistants. All jurisdictions require physician assistants to pass the Physician Assistant National Certifying Examination, administered by the National Commission on Certification of Physician Assistants (NCCPA) and open only to graduates of accredited PA education programs. Only those successfully completing the examination may use the credential "Physician Assistant-Certified." To remain certified, PAs must complete 100 hours of continuing medical education every 2 years. Every 6 years, they must pass a recertification examination or complete an alternative program combining learning experiences and a take-home examination.

Other qualifications. Physician assistants must have a desire to serve patients and be self-motivated. PAs also must have a good bedside manner, emotional stability, and the ability to make decisions in emergencies. Physician assistants must be willing to study throughout their career to keep up with medical advances.

Certification and advancement. Some PAs pursue additional education in a specialty such as surgery, neonatology, or emergency medicine. PA postgraduate educational programs are available in areas such as internal medicine, rural primary care, emergency medicine, surgery, pediatrics, neonatology, and occupational medicine. Candidates must be graduates of an accredited program and be certified by the NCCPA.

As they attain greater clinical knowledge and experience, PAs can advance to added responsibilities and higher earnings. However, by the very nature of the profession, clinically practicing PAs always are supervised by physicians.

Employment

Physician assistants held about 66,000 jobs in 2006. The number of jobs is greater than the number of practicing PAs because some hold two or more jobs. For example, some PAs work with a supervising physician, but also work in another practice, clinic, or hospital. According to the American Academy of Physician Assistants, about 15 percent of actively practicing PAs worked in more than one clinical job concurrently in 2006.

More than half of jobs for PAs were in the offices of physicians. About a quarter were in hospitals, public or private. The rest were mostly in outpatient care centers, including health maintenance organizations; the federal government; and public or private colleges, universities, and professional schools. A few were self-employed.

Job Outlook

Employment is expected to grow much faster than the average as health care establishments increasingly use physician assistants to contain costs. Job opportunities for PAs should be good, particularly

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-2016	
				Number	Percent
Physician assistants	29-1071	66,000	83,000	18,000	27

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

in rural and inner city clinics, as these settings typically have difficulty attracting physicians.

Employment change. Employment of physician assistants is expected to grow 27 percent from 2006 to 2016, much faster than the average for all occupations. Projected rapid job growth reflects the expansion of health care industries and an emphasis on cost containment, which results in increasing use of PAs by health care establishments.

Physicians and institutions are expected to employ more PAs to provide primary care and to assist with medical and surgical procedures because PAs are cost-effective and productive members of the health care team. Physician assistants can relieve physicians of routine duties and procedures. Telemedicine—using technology to facilitate interactive consultations between physicians and physician assistants—also will expand the use of physician assistants.

Besides working in traditional office-based settings, PAs should find a growing number of jobs in institutional settings such as hospitals, academic medical centers, public clinics, and prisons. PAs also may be needed to augment medical staffing in inpatient teaching hospital settings as the number of hours physician residents are permitted to work is reduced, encouraging hospitals to use PAs to supply some physician resident services.

Job prospects. Job opportunities for PAs should be good, particularly in rural and inner-city clinics because those settings have difficulty attracting physicians. In addition to job openings from employment growth, openings will result from the need to replace physician assistants who retire or leave the occupation permanently during the 2006–2016 decade. Opportunities will be best in states that allow PAs a wider scope of practice, such as allowing PAs to prescribe medications.

Earnings

Median annual earnings of wage-and-salary physician assistants were $74,980 in May 2006. The middle 50 percent earned between $62,430 and $89,220. The lowest 10 percent earned less than $43,100, and the highest 10 percent earned more than $102,230. Median annual earnings in the industries employing the largest numbers of physician assistants in May 2006 were:

Outpatient care centers	$80,960
General medical and surgical hospitals	76,710
Offices of physicians	74,160

According to the American Academy of Physician Assistants, median income for physician assistants in full-time clinical practice was $80,356 in 2006; median income for first-year graduates was $69,517. Income varies by specialty, practice setting, geographical location, and years of experience. Employers often pay for their employees' liability insurance, registration fees with the Drug Enforcement Administration, state licensing fees, and credentialing fees.

Related Occupations

Other health care workers who provide direct patient care that requires a similar level of skill and training include audiologists, occupational therapists, physical therapists, registered nurses, and speech-language pathologists.

Physicians and Surgeons

(O*NET 29-1061.00, 29-1062.00, 29-1063.00, 29-1064.00, 29-1065.00, 29-1066.00, 29-1067.00, and 29-1069.99)

Significant Points

- Many physicians and surgeons work long, irregular hours; more than one-third of full-time physicians worked 60 hours or more a week in 2006.
- Acceptance to medical school is highly competitive.
- Formal education and training requirements are among the most demanding of any occupation, but earnings are among the highest.
- Job opportunities should be very good, particularly in rural and low-income areas.

Nature of the Work

Physicians and surgeons diagnose illnesses and prescribe and administer treatment for people suffering from injury or disease. Physicians examine patients, obtain medical histories, and order, perform, and interpret diagnostic tests. They counsel patients on diet, hygiene, and preventive health care.

There are two types of physicians: *M.D.—Doctor of Medicine*—and *D.O.—Doctor of Osteopathic Medicine.* M.D.s also are known as *allopathic physicians.* While both M.D.s and D.O.s may use all accepted methods of treatment, including drugs and surgery, D.O.s place special emphasis on the body's musculoskeletal system, preventive medicine, and holistic patient care. D.O.s are most likely to be primary care specialists although they can be found in all specialties. About half of D.O.s practice general or family medicine, general internal medicine, or general pediatrics.

Physicians work in one or more of several specialties, including, but not limited to, anesthesiology, family and general medicine, general internal medicine, general pediatrics, obstetrics and gynecology, psychiatry, and surgery.

Anesthesiologists focus on the care of surgical patients and pain relief. Like other physicians, they evaluate and treat patients and direct the efforts of their staffs. Through continual monitoring and assessment, these critical care specialists are responsible for maintenance of the patient's vital life functions—heart rate, body temperature, blood pressure, breathing—during surgery. They also work outside of the operating room, providing pain relief in the intensive care unit, during labor and delivery, and for those who suffer from chronic pain. Anesthesiologists confer with other physicians and surgeons about appropriate treatments and procedures before, during, and after operations.

Family and general practitioners often provide the first point of contact for people seeking health care, by acting as the traditional family doctor. They assess and treat a wide range of conditions, from sinus and respiratory infections to broken bones. Family and general practitioners typically have a base of regular, long-term patients. These doctors refer patients with more serious conditions to specialists or other health care facilities for more intensive care.

Physicians increasingly practice in groups or health care organizations that provide backup coverage and allow for more time off.

General internists diagnose and provide nonsurgical treatment for a wide range of problems that affect internal organ systems, such as the stomach, kidneys, liver, and digestive tract. Internists use a variety of diagnostic techniques to treat patients through medication or hospitalization. Like general practitioners, general internists commonly act as primary care specialists. They treat patients referred from other specialists, and, in turn they refer patients to other specialists when more complex care is required.

General pediatricians care for the health of infants, children, teenagers, and young adults. They specialize in the diagnosis and treatment of a variety of ailments specific to young people and track patients' growth to adulthood. Like most physicians, pediatricians work with different health care workers, such as nurses and other physicians, to assess and treat children with various ailments. Most of the work of pediatricians involves treating day-to-day illnesses—minor injuries, infectious diseases, and immunizations—that are common to children, much as a general practitioner treats adults. Some pediatricians specialize in pediatric surgery or serious medical conditions, such as autoimmune disorders or serious chronic ailments.

Obstetricians and gynecologists (OB/GYNs) specialize in women's health. They are responsible for women's general medical care, and they also provide care related to pregnancy and the reproductive system. Like general practitioners, OB/GYNs attempt to prevent, diagnose, and treat general health problems, but they focus on ailments specific to the female anatomy, such as cancers of the breast or cervix, urinary tract and pelvic disorders, and hormonal disorders. OB/GYNs also specialize in childbirth, treating and counseling women throughout their pregnancy, from giving prenatal diagnoses to assisting with delivery and providing postpartum care.

Psychiatrists are the primary caregivers in the area of mental health. They assess and treat mental illnesses through a combination of psychotherapy, psychoanalysis, hospitalization, and medication. Psychotherapy involves regular discussions with patients about their problems; the psychiatrist helps them find solutions through changes in their behavioral patterns, the exploration of their past experiences, or group and family therapy sessions. Psychoanalysis involves long-term psychotherapy and counseling for patients. In many cases, medications are administered to correct chemical imbalances that cause emotional problems. Psychiatrists also may administer electroconvulsive therapy to those of their patients who do not respond to, or who cannot take, medications.

Surgeons specialize in the treatment of injury, disease, and deformity through operations. Using a variety of instruments, and with patients under anesthesia, a surgeon corrects physical deformities, repairs bone and tissue after injuries, or performs preventive surgeries on patients with debilitating diseases or disorders. Although a large number perform general surgery, many surgeons choose to specialize in a specific area. One of the most prevalent specialties is orthopedic surgery: the treatment of the musculoskeletal system. Others include neurological surgery (treatment of the brain and nervous system), cardiovascular surgery, otolaryngology (treatment of the ear, nose, and throat), and plastic or reconstructive surgery. Like other physicians, surgeons also examine patients, perform and interpret diagnostic tests, and counsel patients on preventive health care.

Other physicians and surgeons work in a number of other medical and surgical specialists, including allergists, cardiologists, dermatologists, emergency physicians, gastroenterologists, ophthalmologists, pathologists, and radiologists.

Work environment. Many physicians—primarily general and family practitioners, general internists, pediatricians, OB/GYNs, and psychiatrists—work in small private offices or clinics, often assisted by a small staff of nurses and other administrative personnel. Increasingly, physicians are practicing in groups or health care organizations that provide backup coverage and allow for more time off. Physicians in a group practice or health care organization often work as part of a team that coordinates care for a number of patients; they are less independent than the solo practitioners of the past. Surgeons and anesthesiologists usually work in well-lighted, sterile environments while performing surgery and often stand for long periods. Most work in hospitals or in surgical outpatient centers.

Many physicians and surgeons work long, irregular hours. Over one-third of full-time physicians and surgeons worked 60 hours or more a week in 2006. Only 8 percent of all physicians and surgeons worked part-time, compared with 15 percent for all occupations. Physicians and surgeons must travel frequently between office and hospital to care for their patients. While on call, a physician will deal with many patients' concerns over the phone and make emergency visits to hospitals or nursing homes.

Training, Other Qualifications, and Advancement

The common path to practicing as a physician requires 8 years of education beyond high school and 3 to 8 additional years of internship and residency. All states, the District of Columbia, and U.S. territories license physicians.

Education and training. Formal education and training requirements for physicians are among the most demanding of any occupation—4 years of undergraduate school, 4 years of medical school, and 3 to 8 years of internship and residency, depending on the specialty selected. A few medical schools offer combined undergraduate and medical school programs that last 6 years rather than the customary 8 years.

Premedical students must complete undergraduate work in physics, biology, mathematics, English, and inorganic and organic chemistry. Students also take courses in the humanities and the social sciences. Some students volunteer at local hospitals or clinics to gain practical experience in the health professions.

The minimum educational requirement for entry into medical school is 3 years of college; most applicants, however, have at least a bachelor's degree, and many have advanced degrees. There are 146 medical schools in the United States—126 teach allopathic medicine and award a Doctor of Medicine (M.D.) degree; 20 teach osteopathic medicine and award the Doctor of Osteopathic Medicine (D.O.) degree.

Acceptance to medical school is highly competitive. Applicants must submit transcripts, scores from the Medical College Admission

Test, and letters of recommendation. Schools also consider an applicant's character, personality, leadership qualities, and participation in extracurricular activities. Most schools require an interview with members of the admissions committee.

Students spend most of the first 2 years of medical school in laboratories and classrooms, taking courses such as anatomy, biochemistry, physiology, pharmacology, psychology, microbiology, pathology, medical ethics, and laws governing medicine. They also learn to take medical histories, examine patients, and diagnose illnesses. During their last 2 years, students work with patients under the supervision of experienced physicians in hospitals and clinics, learning acute, chronic, preventive, and rehabilitative care. Through rotations in internal medicine, family practice, obstetrics and gynecology, pediatrics, psychiatry, and surgery, they gain experience in the diagnosis and treatment of illness.

Following medical school, almost all M.D.s enter a residency—graduate medical education in a specialty that takes the form of paid on-the-job training, usually in a hospital. Most D.O.s serve a 12-month rotating internship after graduation and before entering a residency, which may last 2 to 6 years.

A physician's training is costly. According to the Association of American Medical Colleges, in 2004 more than 80 percent of medical school graduates were in debt for educational expenses.

Licensure and certification. All states, the District of Columbia, and U.S. territories license physicians. To be licensed, physicians must graduate from an accredited medical school, pass a licensing examination, and complete 1 to 7 years of graduate medical education. Although physicians licensed in one state usually can get a license to practice in another without further examination, some states limit reciprocity. Graduates of foreign medical schools generally can qualify for licensure after passing an examination and completing a U.S. residency.

M.D.s and D.O.s seeking board certification in a specialty may spend up to 7 years in residency training, depending on the specialty. A final examination immediately after residency or after 1 or 2 years of practice also is necessary for certification by a member board of the American Board of Medical Specialists (ABMS) or the American Osteopathic Association (AOA). The ABMS represents 24 boards related to medical specialties ranging from allergy and immunology to urology. The AOA has approved 18 specialty boards, ranging from anesthesiology to surgery. For certification in a subspecialty, physicians usually need another 1 to 2 years of residency.

Other qualifications. People who wish to become physicians must have a desire to serve patients, be self-motivated, and be able to survive the pressures and long hours of medical education and practice. Physicians also must have a good bedside manner, emotional stability, and the ability to make decisions in emergencies. Prospective physicians must be willing to study throughout their career to keep up with medical advances.

Advancement. Some physicians and surgeons advance by gaining expertise in specialties and subspecialties and by developing a reputation for excellence among their peers and patients. Many physicians and surgeons start their own practice or join a group practice. Others teach residents and other new doctors, and some advance to supervisory and managerial roles in hospitals, clinics, and other settings.

Employment

Physicians and surgeons held about 633,000 jobs in 2006; approximately 15 percent were self-employed. About half of wage-and-salary physicians and surgeons worked in offices of physicians, and 18 percent were employed by hospitals. Others practiced in federal, state, and local governments, including colleges, universities, and professional schools; private colleges, universities, and professional schools; and outpatient care centers.

According to 2005 data from the American Medical Association (AMA), about one half of physicians in patient care were in primary care, but not in a subspecialty of primary care. (See table 1.)

Table 1. Percent distribution of active physicians in patient care by specialty, 2005

	Percent
Total	100.0
Primary care	40.4
Family medicine and general practice	12.3
Internal medicine	15.0
Obstetrics & gynecology	5.5
Pediatrics	7.5
Specialties	59.6
Anesthesiology	5.2
Psychiatry	5.1
Surgical specialties, selected	10.8
All other specialties	38.5

SOURCE: American Medical Association, Physician Characteristics and Distribution in the US, 2007.

A growing number of physicians are partners or wage-and-salary employees of group practices. Organized as clinics or as associations of physicians, medical groups can more easily afford expensive medical equipment, can share support staff, and benefit from other business advantages.

According to the AMA, the New England and Middle Atlantic states have the highest ratio of physicians to population; the South Central and Mountain states have the lowest. D.O.s are more likely than M.D.s to practice in small cities and towns and in rural areas. M.D.s tend to locate in urban areas, close to hospitals and education centers.

Job Outlook

Employment of physicians and surgeons is expected to grow faster than the average for all occupations. Job opportunities should be very good, especially for physicians and surgeons willing to practice in specialties—including family practice, internal medicine, and OB/GYN—or in rural and low-income areas where there is a perceived shortage of medical practitioners.

Employment change. Employment of physicians and surgeons is projected to grow 14 percent from 2006 to 2016, faster than the average for all occupations. Job growth will occur because of continued expansion of health care related industries. The growing and aging population will drive overall growth in the demand for physician services, as consumers continue to demand high levels of care using the latest technologies, diagnostic tests, and therapies.

Demand for physicians' services is highly sensitive to changes in consumer preferences, health care reimbursement policies, and legislation. For example, if changes to health coverage result in consumers facing higher out-of-pocket costs, they may demand fewer physician services. Patients relying more on other health care providers—such as physician assistants, nurse practitioners, optometrists, and nurse anesthetists—also may temper demand for physician services. In addition, new technologies will increase physician productivity. These technologies include electronic medical records, test and prescription orders, billing, and scheduling.

Job prospects. Opportunities for individuals interested in becoming physicians and surgeons are expected to be very good. In addi-

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-2016 Number	Change, 2006-2016 Percent
Physicians and surgeons	29-1060	633,000	723,000	90,000	14

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

tion to job openings from employment growth, numerous openings will result from the need to replace physicians and surgeons who retire over the 2006–2016 decade.

Unlike their predecessors, newly trained physicians face radically different choices of where and how to practice. New physicians are much less likely to enter solo practice and more likely to take salaried jobs in group medical practices, clinics, and health networks.

Reports of shortages in some specialties, such as general or family practice, internal medicine, and OB/GYN, or in rural or low-income areas should attract new entrants, encouraging schools to expand programs and hospitals to increase available residency slots. However, because physician training is so lengthy, employment change happens gradually. In the short term, to meet increased demand, experienced physicians may work longer hours, delay retirement, or take measures to increase productivity, such as using more support staff to provide services. Opportunities should be particularly good in rural and low-income areas, as some physicians find these areas unattractive because of less control over work hours, isolation from medical colleagues, or other reasons.

Earnings

Earnings of physicians and surgeons are among the highest of any occupation. The Medical Group Management Association's Physician Compensation and Production Survey, reports that median total compensation for physicians in 2005 varied by specialty, as shown in table 2. Total compensation for physicians reflects the amount reported as direct compensation for tax purposes, plus all voluntary salary reductions. Salary, bonus and incentive payments, research stipends, honoraria, and distribution of profits were included in total compensation.

Table 2. Median compensation for physicians, 2005

Specialty	Less than two years in specialty	Over one year in specialty
Anesthesiology	$259,948	$321,686
Surgery: General	228,839	282,504
Obstetrics/gynecology: General	203,270	247,348
Psychiatry: General	173,922	180,000
Internal medicine: General	141,912	166,420
Pediatrics: General	132,953	161,331
Family practice (without obstetrics)	137,119	156,010

SOURCE: Medical Group Management Association, Physician Compensation and Production Report, 2005.

Self-employed physicians—those who own or are part owners of their medical practice—generally have higher median incomes than salaried physicians. Earnings vary according to number of years in practice, geographic region, hours worked, skill, personality, and professional reputation. Self-employed physicians and surgeons must provide for their own health insurance and retirement.

Podiatrists

(O*NET 29-1081.00)

Significant Points

- Podiatrists must be licensed, requiring three to four years of undergraduate education, the completion of a four-year podiatric college program, and passing scores on national and state examinations.
- While the occupation is small, job opportunities should be good for entry-level graduates of accredited podiatric medicine programs.

- Opportunities for newly trained podiatrists will be better in group medical practices, clinics, and health networks than in traditional, solo practices.
- Podiatrists enjoy very high earnings.

Nature of the Work

Americans spend a great deal of time on their feet. As the nation becomes more active across all age groups, the need for foot care will become increasingly important.

The human foot is a complex structure. It contains 26 bones—plus muscles, nerves, ligaments, and blood vessels—and is designed for balance and mobility. The 52 bones in the feet make up about one-fourth of all the bones in the human body. Podiatrists, also known as *doctors of podiatric medicine* (DPMs), diagnose and treat disorders, diseases, and injuries of the foot and lower leg.

Podiatrists treat corns, calluses, ingrown toenails, bunions, heel spurs, and arch problems; ankle and foot injuries, deformities, and infections; and foot complaints associated with diabetes and other diseases. To treat these problems, podiatrists prescribe drugs and physical therapy, set fractures, and perform surgery. They also fit corrective shoe inserts called orthotics, design plaster casts and strappings to correct deformities, and design custom-made shoes. Podiatrists may use a force plate or scanner to help design the orthotics: patients walk across a plate connected to a computer that "reads" their feet, picking up pressure points and weight distribution. From the computer readout, podiatrists order the correct design or recommend another kind of treatment.

To diagnose a foot problem, podiatrists also order X rays and laboratory tests. The foot may be the first area to show signs of serious conditions such as arthritis, diabetes, and heart disease. For example, patients with diabetes are prone to foot ulcers and infections because of poor circulation. Podiatrists consult with and refer patients to other health practitioners when they detect symptoms of these disorders.

Podiatrists diagnose and treat disorders of the feet and ankles.

Most podiatrists have a solo practice, although more are forming group practices with other podiatrists or health practitioners. Some specialize in surgery, orthopedics, primary care, or public health. Besides these board-certified specialties, podiatrists may practice other specialties, such as sports medicine, pediatrics, dermatology, radiology, geriatrics, or diabetic foot care.

Podiatrists who are in private practice are responsible for running a small business. They may hire employees, order supplies, and keep records, among other tasks. In addition, some educate the community on the benefits of foot care through speaking engagements and advertising.

Work environment. Podiatrists usually work in small private offices or clinics, sometimes supported by a small staff of assistants and other administrative personnel. They also may spend time visiting patients in nursing homes or performing surgery at hospitals or ambulatory surgical centers. Podiatrists with private practices set their own hours but may work evenings and weekends to accommodate their patients. Podiatrists usually treat fewer emergencies than other doctors.

Training, Other Qualifications, and Advancement

Podiatrists must be licensed, requiring three to four years of undergraduate education, the completion of a four-year podiatric college program, and passing scores on national and state examinations.

Education and training. Prerequisites for admission to a college of podiatric medicine include the completion of at least 90 semester hours of undergraduate study, an acceptable grade point average, and suitable scores on the Medical College Admission Test. (Some colleges also may accept the Dental Admission Test or the Graduate Record Exam.)

Admission to podiatric colleges usually requires at least 8 semester hours each of biology, inorganic chemistry, organic chemistry, and physics and at least 6 hours of English. The science courses should be those designed for premedical students. Extracurricular and community activities, personal interviews, and letters of recommendation are also important. About 95 percent of podiatric students have at least a bachelor's degree.

In 2007, there were seven colleges of podiatric medicine fully accredited by the Council on Podiatric Medical Education. Colleges of podiatric medicine offer a four-year program whose core curriculum is similar to that in other schools of medicine. During the first 2 years, students receive classroom instruction in basic sciences, including anatomy, chemistry, pathology, and pharmacology. Third-year and fourth-year students have clinical rotations in private practices, hospitals, and clinics. During these rotations, they learn how to take general and podiatric histories, perform routine physical examinations, interpret tests and findings, make diagnoses, and perform therapeutic procedures. Graduates receive the degree of Doctor of Podiatric Medicine (DPM).

Most graduates complete a hospital-based residency program after receiving a DPM. Residency programs last from two to four years. Residents receive advanced training in podiatric medicine and surgery and serve clinical rotations in anesthesiology, internal medicine, pathology, radiology, emergency medicine, and orthopedic and general surgery. Residencies lasting more than one year provide more extensive training in specialty areas.

Licensure. All states and the District of Columbia require a license for the practice of podiatric medicine. Each state defines its

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-2016	
				Number	Percent
Podiatrists	29-1081	12,000	13,000	1,100	9

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

own licensing requirements, although many states grant reciprocity to podiatrists who are licensed in another state. Applicants for licensure must be graduates of an accredited college of podiatric medicine and must pass written and oral examinations. Some states permit applicants to substitute the examination of the National Board of Podiatric Medical Examiners, given in the second and fourth years of podiatric medical college, for part or all of the written state examination. In general, states require a minimum of two years of postgraduate residency training in an approved health care institution. For licensure renewal, most states require continuing education.

Other qualifications. People planning a career in podiatry should have scientific aptitude, manual dexterity, interpersonal skills, and a friendly bedside manner. In private practice, podiatrists also should have good business sense.

Certification and advancement. There are a number of certifying boards for the podiatric specialties of orthopedics, primary medicine, and surgery. Certification has requirements beyond licensure. Each board requires advanced training, the completion of written and oral examinations, and experience as a practicing podiatrist. Most managed-care organizations prefer board-certified podiatrists.

Podiatrists may advance to become professors at colleges of podiatric medicine, department chiefs in hospitals, or general health administrators.

Employment

Podiatrists held about 12,000 jobs in 2006. About 24 percent of podiatrists were self-employed. Most podiatrists were solo practitioners, although more are entering group practices with other podiatrists or other health practitioners. Solo practitioners primarily were unincorporated self-employed workers, although some also were incorporated wage and salary workers in offices of other health practitioners. Other podiatrists were employed by hospitals, long-term care facilities, the federal government, and municipal health departments.

Job Outlook

Employment is expected to increase about as fast as average because of increasing consumer demand for podiatric medicine services. Job prospects should be good.

Employment change. Employment of podiatrists is expected to increase 9 percent from 2006 to 2016, about as fast as the average for all occupations. More people will turn to podiatrists for foot care because of the rising number of injuries sustained by a more active and increasingly older population.

Medicare and most private health insurance programs cover acute medical and surgical foot services, as well as diagnostic X rays and leg braces. Details of such coverage vary among plans. However, routine foot care, including the removal of corns and calluses, is not usually covered unless the patient has a systemic condition that has resulted in severe circulatory problems or areas of desensitization in the legs or feet. Like dental services, podiatric care is often discretionary and, therefore, more dependent on disposable income than some other medical services.

Employment of podiatrists would grow even faster were it not for continued emphasis on controlling the costs of specialty health care. Insurers will balance the cost of sending patients to podiatrists against the cost and availability of substitute practitioners, such as physicians and physical therapists.

Job prospects. Although the occupation is small and most podiatrists continue to practice until retirement, job opportunities should be good for entry-level graduates of accredited podiatric medicine programs. Job growth and replacement needs should create enough job openings for the supply of new podiatric medicine graduates. Opportunities will be better for board-certified podiatrists because many managed-care organizations require board certification. Newly trained podiatrists will find more opportunities in group medical practices, clinics, and health networks than in traditional solo practices. Establishing a practice will be most difficult in the areas surrounding colleges of podiatric medicine, where podiatrists concentrate.

Earnings

Podiatrists enjoy very high earnings. Median annual earnings of salaried podiatrists were $108,220 in 2006. Additionally, a survey by *Podiatry Management Magazine* reported median net income of $114,000 in 2006. Podiatrists in partnerships tended to earn higher net incomes than those in solo practice. A salaried podiatrist typically receives heath insurance and retirement benefits from their employer, whereas self-employed chiropractors must provide for their own health insurance and retirement. Also, solo practitioners must absorb the costs of running their own offices.

Related Occupations

Other workers, who apply medical knowledge to prevent, diagnose, and treat muscle and bone disorders and injuries include athletic trainers, chiropractors, massage therapists, occupational therapists, physical therapists, and physicians and surgeons. Workers who specialize in developing orthopedic shoe inserts, braces, and prosthetic limbs are orthotists and prosthetists.

Radiation Therapists

(O*NET 29-1124.00)

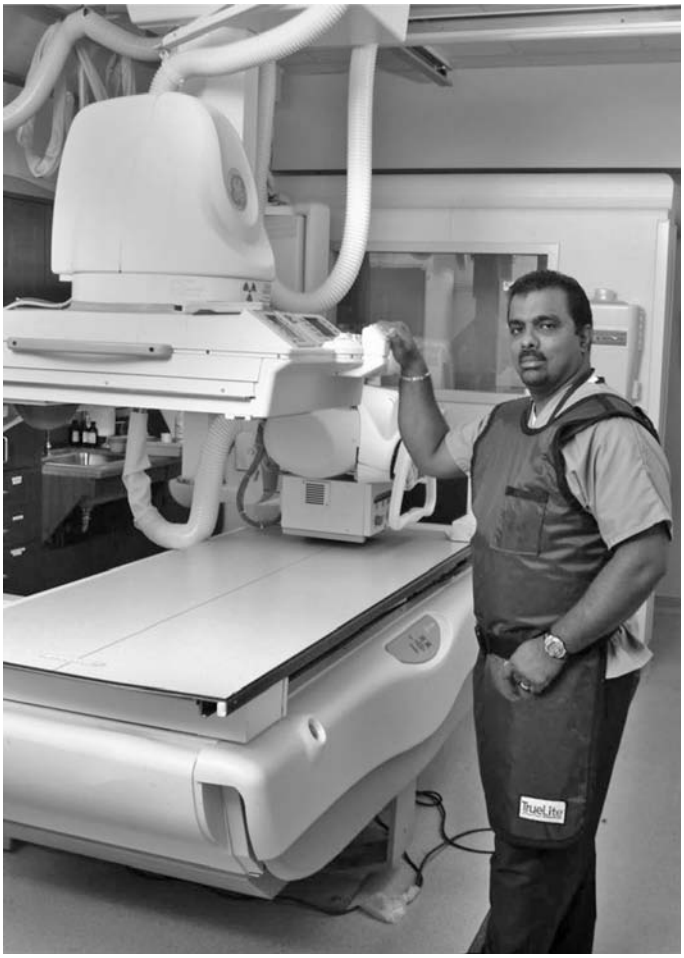
Significant Points

- A bachelor's degree, associate degree, or certificate in radiation therapy is generally required.
- Good job opportunities are expected.
- Employment is projected to grow much faster than the average for all occupations.

Nature of the Work

Treating cancer in the human body is the principal use of radiation therapy. As part of a medical radiation oncology team, radiation therapists use machines—called linear accelerators—to administer radiation treatment to patients. Linear accelerators, used in a procedure called external beam therapy, project high-energy X rays at targeted cancer cells. As the X rays collide with human tissue, they produce highly energized ions that can shrink and eliminate cancerous tumors. Radiation therapy is sometimes used as the sole treatment for cancer, but is usually used in conjunction with chemotherapy or surgery.

The first step in the radiation therapy process is simulation. During simulation, the radiation therapist uses an X-ray imaging machine or computer tomography (CT) scan to pinpoint the location of the tumor. The therapist then positions the patient and adjusts the linear accelerator so that, when treatment begins, radiation exposure is concentrated on the tumor cells. The radiation therapist then develops a treatment plan in conjunction with a radiation oncologist (a physician who specializes in therapeutic radiology), and a dosimetrist (a technician who calculates the dose of radiation that will be used for treatment). The therapist later explains the treatment plan to the patient and answers any questions that the patient may have.



Radiation therapists work in hospitals and cancer treatment centers.

The next step in the process is treatment. To begin, the radiation therapist positions the patient and adjusts the linear accelerator according to the guidelines established in simulation. Then, from a separate room that is protected from the X-ray radiation, the therapist operates the linear accelerator and monitors the patient's condition through a TV monitor and an intercom system. Treatment can take anywhere from 10 to 30 minutes and is usually administered once a day, 5 days a week, for 2 to 9 weeks.

During the treatment phase, the radiation therapist monitors the patient's physical condition to determine if any adverse side effects are taking place. The therapist must also be aware of the patient's emotional well-being. Because many patients are under stress and are emotionally fragile, it is important for the therapist to maintain a positive attitude and provide emotional support.

Radiation therapists keep detailed records of their patients' treatments. These records include information such as the dose of radiation used for each treatment, the total amount of radiation used to date, the area treated, and the patient's reactions. Radiation oncologists and dosimetrists review these records to ensure that the treatment plan is working, to monitor the amount of radiation exposure that the patient has received, and to keep side effects to a minimum.

Radiation therapists also assist medical radiation physicists, workers who monitor and adjust the linear accelerator. Because radiation therapists often work alone during the treatment phase, they need to be able to check the linear accelerator for problems and make any adjustments that are needed. Therapists also may assist dosimetrists with routine aspects of dosimetry, the process used to calculate radiation dosages.

Work environment. Radiation therapists work in hospitals or in cancer treatment centers. These places are clean, well lighted, and well ventilated. Therapists do a considerable amount of lifting and must be able to help disabled patients get on and off treatment tables. They spend most of their time on their feet.

Radiation therapists generally work 40 hours a week, and unlike those in other health care occupations, they normally work only during the day. However, because radiation therapy emergencies do occur, some therapists are required to be on call and may have to work outside of their normal hours.

Working with cancer patients can be stressful, but many radiation therapists also find it rewarding. Because they work around radioactive materials, radiation therapists take great care to ensure that they are not exposed to dangerous levels of radiation. Following standard safety procedures can prevent overexposure.

Training, Other Qualifications, and Advancement

A bachelor's degree, associate degree, or certificate in radiation therapy generally is required. Many states also require radiation therapists to be licensed. With experience, therapists can advance to managerial positions.

Education and training. Employers usually require applicants to complete an associate or a bachelor's degree program in radiation therapy. Individuals also may become qualified by completing an associate or a bachelor's degree program in radiography, which is the study of radiological imaging, and then completing a 12-month

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-2016	
				Number	Percent
Radiation therapists	29-1124	15,000	18,000	3,600	25

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

certificate program in radiation therapy. Radiation therapy programs include core courses on radiation therapy procedures and the scientific theories behind them. In addition, such programs often include courses on human anatomy and physiology, physics, algebra, precalculus, writing, public speaking, computer science, and research methodology. In 2007 there were 123 radiation therapy programs accredited by the American Registry of Radiologic Technologists (ARRT).

Licensure. In 2007, 32 states required radiation therapists to be licensed by a state accrediting board. Licensing requirements vary by state, but many states require applicants to pass the ARRT certification examination. Further information is available from individual state licensing offices.

Certification and other qualifications. Some states, as well as many employers, require that radiation therapists be certified by ARRT. To become ARRT-certified, an applicant must complete an accredited radiation therapy program, adhere to ARRT ethical standards, and pass the ARRT certification examination. The examination and accredited academic programs cover radiation protection and quality assurance, clinical concepts in radiation oncology, treatment planning, treatment delivery, and patient care and education. Candidates also must demonstrate competency in several clinical practices including patient care activities; simulation procedures; dosimetry calculations; fabrication of beam modification devices; low-volume, high-risk procedures, and the application of radiation.

ARRT certification is valid for 1 year, after which therapists must renew their certification. Requirements for renewal include abiding by the ARRT ethical standards, paying annual dues, and satisfying continuing education requirements. Continuing education requirements must be met every 2 years and include either the completion of 24 credits of radiation therapy-related courses or the attainment of ARRT certification in a discipline other than radiation therapy. Certification renewal, however, may not be required by all states or employers that require initial certification.

All radiation therapists need good communication skills because their work involves a great deal of patient interaction. Individuals interested in becoming radiation therapists should be psychologically capable of working with cancer patients. They should be caring and empathetic because they work with patients who are ill and under stress. They should be able to keep accurate, detailed records. They also should be physically fit because they work on their feet for long periods and lift and move disabled patients.

Advancement. Experienced radiation therapists may advance to manage radiation therapy programs in treatment centers or other health care facilities. Managers generally continue to treat patients while taking on management responsibilities. Other advancement opportunities include teaching, technical sales, and research. With additional training and certification, therapists also can become dosimetrists, who use complex mathematical formulas to calculate proper radiation doses.

Employment

Radiation therapists held about 15,000 jobs in 2006. About 73 percent worked in hospitals, and about 17 percent worked in the offices of physicians. A small proportion worked in outpatient care centers.

Job Outlook

Employment is expected to increase much faster than the average from 2006 to 2016, and job prospects should be good.

Employment change. Employment of radiation therapists is projected to grow by 25 percent between 2006 and 2016, which is much faster than the average for all occupations. As the U.S. population grows and an increasing share of it is in the older age groups, the number of people needing treatment is expected to increase and to spur demand for radiation therapists. In addition, as radiation technology advances and is able to treat more types of cancer, radiation therapy will be prescribed more often.

Job prospects. Job prospects are expected to be good. Job openings will result from employment growth and from the need to replace workers who retire or leave the occupation for other reasons. Applicants who are certified should have the best opportunities.

Earnings

Median annual earnings of wage-and-salary radiation therapists were $66,170 in May 2006. The middle 50 percent earned between $54,170 and $78,550. The lowest 10 percent earned less than $44,840, and the highest 10 percent earned more than $92,110. Median annual earnings in the industries that employed the largest numbers of radiation therapists in May 2006 are as follows:

Outpatient care centers	$73,810
Offices of physicians	70,050
General medical and surgical hospitals	63,580

Some employers also reimburse their employees for the cost of continuing education.

Related Occupations

Radiation therapists use advanced machinery to administer medical treatment to patients. Other occupations that perform similar duties include radiologic technologists and technicians, diagnostic medical sonographers, nuclear medicine technologists, cardiovascular technologists and technicians, dental hygienists, respiratory therapists, physical therapist assistants and aides, registered nurses, and physicians and surgeons.

Other occupations that build relationships with patients and provide them with emotional support include nursing, psychiatric, and home health aides; counselors; psychologists; social workers; and social and human service assistants.

Recreational Therapists

(O*NET 29-1125.00)

Significant Points

- Recreational therapists will experience competition for jobs.
- A bachelor's degree in therapeutic recreation is the usual requirement for entry-level positions.
- Recreational therapists should be comfortable working with persons who are ill or who have disabilities.

Nature of the Work

Recreational therapists, also referred to as *therapeutic recreation specialists*, provide treatment services and recreation activities for individuals with disabilities or illnesses. Using a variety of techniques, including arts and crafts, animals, sports, games, dance and movement, drama, music, and community outings, therapists improve and maintain the physical, mental, and emotional well-being of their clients. Therapists help individuals reduce depression, stress, and anxiety; recover basic motor functioning and reasoning abilities; build confidence; and socialize effectively so that they can enjoy greater independence and reduce or eliminate the effects of their illness or disability. In addition, therapists help people with disabilities integrate into the community by teaching them how to use community resources and recreational activities. Recreational therapists are different from recreation workers, who organize recreational activities primarily for enjoyment. (Recreation workers are discussed elsewhere in the *Handbook*.)

In acute health care settings, such as hospitals and rehabilitation centers, recreational therapists treat and rehabilitate individuals with specific health conditions, usually in conjunction or collaboration with physicians, nurses, psychologists, social workers, and physical and occupational therapists. In long-term and residential care facilities, recreational therapists use leisure activities—especially structured group programs—to improve and maintain their clients' general health and well-being. They also may provide interventions to prevent the client from suffering further medical problems and complications.

Recreational therapists use various techniques, including cognitive tests, to treat clients and maintain their well-being.

Recreational therapists assess clients using information from observations, medical records, standardized assessments, the medical staff, the clients' families, and the clients themselves. They then develop and carry out therapeutic interventions consistent with the clients' needs and interests. For example, they may encourage clients who are isolated from others or who have limited social skills to play games with others, and they may teach right-handed people with right-side paralysis how to use their unaffected left side to throw a ball or swing a racket. Recreational therapists may instruct patients in relaxation techniques to reduce stress and tension, stretching and limbering exercises, proper body mechanics for participation in recreational activities, pacing and energy conservation techniques, and team activities. As they work, therapists observe and document a patient's participation, reactions, and progress.

Community-based recreational therapists may work in park and recreation departments, special-education programs for school districts, or assisted-living, adult day care, and substance abuse rehabilitation centers. In these programs, therapists use interventions to develop specific skills, while providing opportunities for exercise, mental stimulation, creativity, and fun. Those few who work in schools help counselors, teachers, and parents address the special needs of students, including easing disabled students' transition into adult life.

Work environment. Recreational therapists provide services in special activity rooms but also plan activities and prepare documentation in offices. When working with clients during community integration programs, they may travel locally to teach clients how to use public transportation and other public areas, such as parks, playgrounds, swimming pools, restaurants, and theaters. Therapists often lift and carry equipment. Recreational therapists generally work a 40-hour week that may include some evenings, weekends, and holidays.

Training, Other Qualifications, and Advancement

A bachelor's degree with a major or concentration in therapeutic recreation is the usual requirement for entry-level positions. Some states regulate recreational therapists, but requirements vary.

Education and training. Most entry-level recreational therapists need a bachelor's degree in therapeutic recreation, or in recreation with a concentration in therapeutic recreation. People may qualify for paraprofessional positions with an associate degree in therapeutic recreation or another subject related to health care. An associate degree in recreational therapy; training in art, drama, or music therapy; or qualifying work experience may be sufficient for activity director positions in nursing homes.

Approximately 130 academic programs prepare students to become recreational therapists. Most offer bachelor's degrees, although some also offer associate, master's, or doctoral degrees. Therapeutic recreation programs include courses in assessment, treatment and program planning, intervention design, and evaluation. Students also study human anatomy, physiology, abnormal psychology, medical and psychiatric terminology, characteristics of illnesses and disabilities, professional ethics, and the use of assistive devices and technology.

Licensure. Some states regulate recreational therapists through licensure, registration, or regulation of titles. Requirements vary by state. In 2006, North Carolina, Utah, and New Hampshire required licensure to practice as a recreational therapist.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-2016 Number	Change, 2006-2016 Percent
Recreational therapists	29-1125	25,000	26,000	900	4

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Certification and other qualifications. Although certification is usually voluntary, most employers prefer to hire candidates who are certified therapeutic recreation specialists. In 2006, about 3 out of 4 recreational therapists worked in a clinical setting, which often requires certification by the National Council for Therapeutic Recreation Certification. The council offers the Certified Therapeutic Recreation Specialist credential to candidates who have a bachelor's or graduate degree from an accredited educational institution, pass a written certification examination, and complete a supervised internship of at least 480 hours. Therapists must meet additional requirements to maintain certification.

Therapists can also earn certifications in specific areas, such as art therapy and aquatic therapy.

Recreational therapists must be comfortable working with people who are ill or disabled. Therapists must be patient, tactful, and persuasive when working with people who have a variety of special needs. Ingenuity, a sense of humor, and imagination are needed to adapt activities to individual needs, and good physical coordination is necessary to demonstrate or participate in recreational activities.

Advancement. Therapists may advance to supervisory or administrative positions. Some teach, conduct research, or consult for health or social services agencies.

Employment

Recreational therapists held about 25,000 jobs in 2006. About 70 percent were in nursing and residential care facilities and hospitals. Others worked in state and local government agencies and in community care facilities for the elderly, including assisted-living facilities. The rest worked primarily in residential mental retardation, mental health, and substance abuse facilities; individual and family services; federal government agencies; educational services; and outpatient care centers. Only a small number of therapists were self-employed, generally contracting with long-term care facilities or community agencies to develop and oversee programs.

Job Outlook

Overall employment of recreational therapists is expected to grow more slowly than the average for all occupations. Competition for jobs is expected.

Employment change. Employment of recreational therapists is expected to increase 4 percent from 2006 to 2016, slower than the average for all occupations. Employment of recreational therapists will grow to meet the therapy needs of the increasing number of older adults. In nursing care facilities—the largest industry employing recreational therapists—employment will grow slightly faster than the occupation as a whole as the number of older adults continues to grow. Fast employment growth is expected in the residential and outpatient settings that serve people who are physically disabled, cognitively disabled, or elderly or who have mental illness or substance abuse problems. Employment is expected to decline in hospitals, however, as services shift to outpatient settings and employers emphasize cost containment.

Health care facilities will support a growing number of jobs in adult day care and outpatient programs offering short-term mental health and alcohol or drug abuse services. Rehabilitation, home health care, and transitional programs will provide additional jobs.

Job prospects. Recreational therapists will experience competition for jobs. Job opportunities should be best for people with a bachelor's degree in therapeutic recreation or in recreation with courses in therapeutic recreation. Opportunities also should be good for therapists who hold specialized certifications such as aquatic therapy, meditation, or crisis intervention. Recreational therapists might experience more competition for jobs in certain regions of the country.

Earnings

Median annual earnings of recreational therapists were $34,990 in May 2006. The middle 50 percent earned between $26,780 and $44,850. The lowest 10 percent earned less than $20,880, and the highest 10 percent earned more than $55,530. Median annual earnings in the industries employing the largest numbers of recreational therapists in May 2006 were:

General medical and surgical hospitals	$39,320
State government	38,260
Psychiatric and substance abuse hospitals	37,560
Nursing care facilities	30,440
Community care facilities for the elderly	28,980

Related Occupations

Recreational therapists primarily design activities to help people with disabilities lead more fulfilling and independent lives. Other workers who have similar jobs are occupational therapists, physical therapists, recreation workers, rehabilitation counselors, and teachers—special education.

Registered Nurses

(O*NET 29-1111.00)

Significant Points

- Registered nurses constitute the largest health care occupation, with 2.5 million jobs.

- About 59 percent of jobs are in hospitals.
- The three major educational paths to registered nursing are a bachelor's degree, an associate degree, and a diploma from an approved nursing program.
- Registered nurses are projected to generate about 587,000 new jobs over the 2006–2016 period, one of the largest numbers among all occupations; overall job opportunities are expected to be excellent, but may vary by employment setting.

Nature of the Work

Registered nurses (RNs), regardless of specialty or work setting, treat patients, educate patients and the public about various medical conditions, and provide advice and emotional support to patients' family members. RNs record patients' medical histories and symptoms, help perform diagnostic tests and analyze results, operate medical machinery, administer treatment and medications, and help with patient follow-up and rehabilitation.

RNs teach patients and their families how to manage their illness or injury, explaining post-treatment home care needs; diet, nutrition, and exercise programs; and self-administration of medication and physical therapy. Some RNs work to promote general health by educating the public on warning signs and symptoms of disease. RNs also might run general health screening or immunization clinics, blood drives, and public seminars on various conditions.

When caring for patients, RNs establish a plan of care or contribute to an existing plan. Plans may include numerous activities, such as administering medication, including careful checking of dosages and avoiding interactions; starting, maintaining, and discontinuing intravenous (IV) lines for fluid, medication, blood, and blood products; administering therapies and treatments; observing the patient and recording those observations; and consulting with physicians and other health care clinicians. Some RNs provide direction to licensed practical nurses and nursing aids regarding patient care. RNs with advanced educational preparation and training may perform diagnostic and therapeutic procedures and may have prescriptive authority.

RNs can specialize in one or more areas of patient care. There generally are four ways to specialize. RNs can choose a particular work setting or type of treatment, such as perioperative nurses, who work in operating rooms and assist surgeons. RNs also may choose to specialize in specific health conditions, as do diabetes management nurses, who assist patients to manage diabetes. Other RNs specialize in working with one or more organs or body system types, such as dermatology nurses, who work with patients who have skin disorders. RNs also can choose to work with a well-defined population, such as geriatric nurses, who work with the elderly. Some RNs may combine specialties. For example, pediatric oncology nurses deal with children and adolescents who have cancer.

Registered nurses who work in schools provide general health care to students.

There are many options for RNs who specialize in a work setting or type of treatment. *Ambulatory care nurses* provide preventive care and treat patients with a variety of illnesses and injuries in physicians' offices or in clinics. Some ambulatory care nurses are involved in telehealth, providing care and advice through electronic communications media such as videoconferencing, the Internet, or by telephone. *Critical care nurses* provide care to patients with serious, complex, and acute illnesses or injuries that require very close monitoring and extensive medication protocols and therapies. Critical care nurses often work in critical or intensive care hospital units. *Emergency*, or *trauma, nurses* work in hospital or stand-alone emergency departments, providing initial assessments and care for patients with life-threatening conditions. Some emergency nurses may become qualified to serve as *transport nurses*, who provide medical care to patients who are transported by helicopter or airplane to the nearest medical facility. *Holistic nurses* provide care such as acupuncture, massage and aroma therapy, and biofeedback, which are meant to treat patients' mental and spiritual health in addition to their physical health. *Home health care nurses* provide at-home nursing care for patients, often as follow-up care after discharge from a hospital or from a rehabilitation, long-term care, or skilled nursing facility. *Hospice and palliative care nurses* provide care, most often in home or hospice settings, focused on maintaining quality of life for terminally ill patients. *Infusion nurses* administer medications, fluids, and blood to patients through injections into patients' veins. *Long-term care nurses* provide health care services on a recurring basis to patients with chronic physical or mental disorders, often in long-term care or skilled nursing facilities. *Medical-surgical nurses* provide health promotion and basic medical care to patients with various medical and surgical diagnoses. *Occupational health nurses* seek to prevent job-related injuries and illnesses, provide monitoring and emergency care services, and help employers implement health and safety standards. *Perianesthesia nurses* provide preoperative and postoperative care to patients undergoing anesthesia during surgery or other procedure. *Perioperative nurses* assist surgeons by selecting and handling instruments, controlling bleeding, and suturing incisions. Some of these nurses also can specialize in plastic and reconstructive surgery. *Psychiatric-mental health nurses* treat patients with personality and mood disorders. *Radiology nurses* provide care to patients undergoing diagnostic radiation procedures such as ultrasounds, magnetic resonance imaging, and radiation therapy for oncology diagnoses. *Rehabilitation nurses* care for patients with temporary and permanent disabilities. *Transplant nurses* care for both transplant recipients and living donors and monitor signs of organ rejection.

RNs specializing in a particular disease, ailment, or health care condition are employed in virtually all work settings, including physicians' offices, outpatient treatment facilities, home health care agencies, and hospitals. *Addictions nurses* care for patients seeking help with alcohol, drug, tobacco, and other addictions. *Intellectual and developmental disabilities nurses* provide care for patients with physical, mental, or behavioral disabilities; care may include help with feeding, controlling bodily functions, sitting or standing independently, and speaking or other communication. *Diabetes management nurses* help diabetics to manage their disease by teaching them

proper nutrition and showing them how to test blood sugar levels and administer insulin injections. *Genetics nurses* provide early detection screenings, counseling, and treatment of patients with genetic disorders, including cystic fibrosis and Huntington's disease. *HIV/AIDS nurses* care for patients diagnosed with HIV and AIDS. *Oncology nurses* care for patients with various types of cancer and may assist in the administration of radiation and chemotherapies and follow-up monitoring. *Wound, ostomy, and continence nurses* treat patients with wounds caused by traumatic injury, ulcers, or arterial disease; provide postoperative care for patients with openings that allow for alternative methods of bodily waste elimination; and treat patients with urinary and fecal incontinence.

RNs specializing in treatment of a particular organ or body system usually are employed in hospital specialty or critical care units, specialty clinics, and outpatient care facilities. *Cardiovascular nurses* treat patients with coronary heart disease and those who have had heart surgery, providing services such as postoperative rehabilitation. *Dermatology nurses* treat patients with disorders of the skin, such as skin cancer and psoriasis. *Gastroenterology nurses* treat patients with digestive and intestinal disorders, including ulcers, acid reflux disease, and abdominal bleeding. Some nurses in this field also assist in specialized procedures such as endoscopies, which look inside the gastrointestinal tract using a tube equipped with a light and a camera that can capture images of diseased tissue. *Gynecology nurses* provide care to women with disorders of the reproductive system, including endometriosis, cancer, and sexually transmitted diseases. *Nephrology nurses* care for patients with kidney disease caused by diabetes, hypertension, or substance abuse. *Neuroscience nurses* care for patients with dysfunctions of the nervous system, including brain and spinal cord injuries and seizures. *Ophthalmic nurses* provide care to patients with disorders of the eyes, including blindness and glaucoma, and to patients undergoing eye surgery. *Orthopedic nurses* care for patients with muscular and skeletal problems, including arthritis, bone fractures, and muscular dystrophy. *Otorhinolaryngology nurses* care for patients with ear, nose, and throat disorders, such as cleft palates, allergies, and sinus disorders. *Respiratory nurses* provide care to patients with respiratory disorders such as asthma, tuberculosis, and cystic fibrosis. *Urology nurses* care for patients with disorders of the kidneys, urinary tract, and male reproductive organs, including infections, kidney and bladder stones, and cancers.

RNs who specialize by population provide preventive and acute care in all health care settings to the segment of the population in which they specialize, including newborns (neonatology), children and adolescents (pediatrics), adults, and the elderly (gerontology or geriatrics). RNs also may provide basic health care to patients outside of health care settings in such venues as including correctional facilities, schools, summer camps, and the military. Some RNs travel around the United States and abroad providing care to patients in areas with shortages of health care workers.

Most RNs work as staff nurses as members of a team providing critical health care. However, some RNs choose to become advanced practice nurses, who work independently or in collaboration with physicians, and may focus on the provision of primary care services. *Clinical nurse specialists* provide direct patient care and expert consultations in one of many nursing specialties, such as psychiatric-mental health. *Nurse anesthetists* provide anesthesia and related care before and after surgical, therapeutic, diagnostic and obstetrical procedures. They also provide pain management and emergency services, such as airway management. *Nurse-midwives* provide primary care to women, including gynecological exams, family planning advice, prenatal care, assistance in labor and delivery, and neonatal care. *Nurse practitioners* serve as primary and specialty care providers, providing a blend of nursing and health care services to patients and families. The most common specialty areas for nurse practitioners are family practice, adult practice, women's health, pediatrics, acute care, and geriatrics. However, there are a variety of other specialties that nurse practitioners can choose, including neonatology and mental health. Advanced practice nurses can prescribe medications in all states and in the District of Columbia.

Some nurses have jobs that require little or no direct patient care, but still require an active RN license. *Case managers* ensure that all of the medical needs of patients with severe injuries and severe or chronic illnesses are met. *Forensics nurses* participate in the scientific investigation and treatment of abuse victims, violence, criminal activity, and traumatic accident. *Infection control nurses* identify, track, and control infectious outbreaks in health care facilities and develop programs for outbreak prevention and response to biological terrorism. *Legal nurse consultants* assist lawyers in medical cases by interviewing patients and witnesses, organizing medical records, determining damages and costs, locating evidence, and educating lawyers about medical issues. *Nurse administrators* supervise nursing staff, establish work schedules and budgets, maintain medical supply inventories, and manage resources to ensure high-quality care. *Nurse educators* plan, develop, implement, and evaluate educational programs and curricula for the professional development of student nurses and RNs. *Nurse informaticists* manage and communicate nursing data and information to improve decision making by consumers, patients, nurses, and other health care providers. RNs also may work as health care consultants, public policy advisors, pharmaceutical and medical supply researchers and salespersons, and medical writers and editors.

Work environment. Most RNs work in well-lighted, comfortable health care facilities. Home health and public health nurses travel to patients' homes, schools, community centers, and other sites. RNs may spend considerable time walking, bending, stretching, and standing. Patients in hospitals and nursing care facilities require 24-hour care; consequently, nurses in these institutions may work nights, weekends, and holidays. RNs also may be on call—available to work on short notice. Nurses who work in offices, schools, and other settings that do not provide 24-hour care are more likely to work regular business hours. About 21 percent of RNs worked part time in 2006, and 7 percent held more than one job.

Nursing has its hazards, especially in hospitals, nursing care facilities, and clinics, where nurses may be in close contact with individuals who have infectious diseases and with toxic, harmful, or potentially hazardous compounds, solutions, and medications. RNs must observe rigid, standardized guidelines to guard against disease and other dangers, such as those posed by radiation, accidental needle sticks, chemicals used to sterilize instruments, and anesthetics. In addition, they are vulnerable to back injury when moving patients, shocks from electrical equipment, and hazards posed by compressed gases. RNs also may suffer emotional strain from caring for patients suffering unrelieved intense pain, close personal contact with patients' families, the need to make critical decisions, and ethical dilemmas and concerns.

Training, Other Qualifications, and Advancement

The three major educational paths to registered nursing are a bachelor's degree, an associate degree, and a diploma from an approved nursing program. Nurses most commonly enter the occupation by completing an associate degree or bachelor's degree program. Individuals then must complete a national licensing examination in order to obtain a nursing license. Further training or education can

qualify nurses to work in specialty areas, and may help improve advancement opportunities.

Education and training. There are three major educational paths to registered nursing—a bachelor's of science degree in nursing (BSN), an associate degree in nursing (ADN), and a diploma. BSN programs, offered by colleges and universities, take about 4 years to complete. In 2006, 709 nursing programs offered degrees at the bachelor's level. ADN programs, offered by community and junior colleges, take about 2 to 3 years to complete. About 850 RN programs granted associate degrees. Diploma programs, administered in hospitals, last about 3 years. Only about 70 programs offered diplomas. Generally, licensed graduates of any of the three types of educational programs qualify for entry-level positions.

Many RNs with an ADN or diploma later enter bachelor's programs to prepare for a broader scope of nursing practice. Often, they can find an entry-level position and then take advantage of tuition reimbursement benefits to work toward a BSN by completing an RN-to-BSN program. In 2006, there were 629 RN-to-BSN programs in the United States. Accelerated master's degree in nursing (MSN) programs also are available by combining 1 year of an accelerated BSN program with 2 years of graduate study. In 2006, there were 149 RN-to-MSN programs.

Accelerated BSN programs also are available for individuals who have a bachelor's or higher degree in another field and who are interested in moving into nursing. In 2006, 197 of these programs were available. Accelerated BSN programs last 12 to 18 months and provide the fastest route to a BSN for individuals who already hold a degree. MSN programs also are available for individuals who hold a bachelor's or higher degree in another field.

Individuals considering nursing should carefully weigh the advantages and disadvantages of enrolling in a BSN or MSN program because, if they do, their advancement opportunities usually are broader. In fact, some career paths are open only to nurses with a bachelor's or master's degree. A bachelor's degree often is necessary for administrative positions and is a prerequisite for admission to graduate nursing programs in research, consulting, and teaching, and all four advanced practice nursing specialties—clinical nurse specialists, nurse anesthetists, nurse-midwives, and nurse practitioners. Individuals who complete a bachelor's receive more training in areas such as communication, leadership, and critical thinking, all of which are becoming more important as nursing care becomes more complex. Additionally, bachelor's degree programs offer more clinical experience in nonhospital settings. Education beyond a bachelor's degree can also help students looking to enter certain fields or increase advancement opportunities. In 2006, 448 nursing schools offered master's degrees, 108 offered doctoral degrees, and 58 offered accelerated BSN-to-doctoral programs.

All four advanced practice nursing specialties require at least a master's degree. Most programs include about 2 years of full-time study and require a BSN degree for entry; some programs require at least 1 to 2 years of clinical experience as an RN for admission. In 2006, there were 342 master's and post-master's programs offered for nurse practitioners, 230 master's and post-master's programs for clinical nurse specialists, 106 programs for nurse anesthetists, and 39 programs for nurse-midwives.

All nursing education programs include classroom instruction and supervised clinical experience in hospitals and other health care facilities. Students take courses in anatomy, physiology, microbiology, chemistry, nutrition, psychology and other behavioral sciences, and nursing. Coursework also includes the liberal arts for ADN and BSN students.

Supervised clinical experience is provided in hospital departments such as pediatrics, psychiatry, maternity, and surgery. A growing number of programs include clinical experience in nursing care facilities, public health departments, home health agencies, and ambulatory clinics.

Licensure and certification. In all states, the District of Columbia, and U.S. territories, students must graduate from an approved nursing program and pass a national licensing examination, known as the NCLEX-RN, in order to obtain a nursing license. Nurses may be licensed in more than one state, either by examination or by the endorsement of a license issued by another state. The Nurse Licensure Compact Agreement allows a nurse who is licensed and permanently resides in one of the member states to practice in the other member states without obtaining additional licensure. In 2006, 20 states were members of the Compact, while 2 more were pending membership. All states require periodic renewal of licenses, which may require continuing education.

Certification is common, and sometimes required, for the four advanced practice nursing specialties—clinical nurse specialists, nurse anesthetists, nurse-midwives, and nurse practitioners. Upon completion of their educational programs, most advanced practice nurses become nationally certified in their area of specialty. Certification also is available in specialty areas for all nurses. In some states, certification in a specialty is required in order to practice that specialty.

Foreign-educated and foreign-born nurses wishing to work in the United States must obtain a work visa. To obtain the visa, nurses must undergo a federal screening program to ensure that their education and licensure are comparable to that of a U.S. educated nurse, that they have proficiency in written and spoken English, and that they have passed either the Commission on Graduates of Foreign Nursing Schools (CGFNS) Qualifying Examination or the NCLEX-RN. CGFNS administers the VisaScreen Program. (The Commission is an immigration-neutral, nonprofit organization that is recognized internationally as an authority on credentials evaluation in the health care field.) Nurses educated in Australia, Canada (except Quebec), Ireland, New Zealand, and the United Kingdom, or foreign-born nurses who were educated in the United States, are exempt from the language proficiency testing. In addition to these national requirements, foreign-born nurses must obtain state licensure in order to practice in the United States. Each state has its own requirements for licensure.

Other qualifications. Nurses should be caring, sympathetic, responsible, and detail oriented. They must be able to direct or supervise others, correctly assess patients' conditions, and determine when consultation is required. They need emotional stability to cope with human suffering, emergencies, and other stresses.

Advancement. Some RNs start their careers as licensed practical nurses or nursing aides, and then go back to school to receive their RN degree. Most RNs begin as staff nurses in hospitals, and with experience and good performance often move to other settings or are promoted to more responsible positions. In management, nurses can advance from assistant unit manger or head nurse to more senior-level administrative roles of assistant director, director, vice president, or chief nurse. Increasingly, management-level nursing positions require a graduate or an advanced degree in nursing or health services administration. Administrative positions require leadership, communication and negotiation skills, and good judgment.

Some nurses move into the business side of health care. Their nursing expertise and experience on a health care team equip them to manage ambulatory, acute, home-based, and chronic care. Employers—including hospitals, insurance companies, pharmaceutical manufacturers, and managed care organizations, among others—need RNs for health planning and development, marketing,

consulting, policy development, and quality assurance. Other nurses work as college and university faculty or conduct research.

Employment

As the largest health care occupation, registered nurses held about 2.5 million jobs in 2006. Hospitals employed the majority of RNs, with 59 percent of jobs. Other industries also employed large shares of workers. About 8 percent of jobs were in offices of physicians, 5 percent in home health care services, 5 percent in nursing care facilities, 4 percent in employment services, and 3 percent in outpatient care centers. The remainder worked mostly in government agencies, social assistance agencies, and educational services. About 21 percent of RNs worked part time.

Job Outlook

Overall job opportunities for registered nurses are expected to be excellent, but may vary by employment and geographic setting. Employment of RNs is expected to grow much faster than the average for all occupations through 2016 and, because the occupation is very large, many new jobs will result. In fact, registered nurses are projected to generate 587,000 new jobs, among the largest number of new jobs for any occupation. Additionally, hundreds of thousands of job openings will result from the need to replace experienced nurses who leave the occupation.

Employment change. Employment of registered nurses is expected to grow 23 percent from 2006 to 2016, much faster than the average for all occupations. Growth will be driven by technological advances in patient care, which permit a greater number of health problems to be treated, and by an increasing emphasis on preventive care. In addition, the number of older people, who are much more likely than younger people to need nursing care, is projected to grow rapidly.

However, employment of RNs will not grow at the same rate in every industry. The projected growth rates for RNs in the industries with the highest employment of these workers are:

Offices of physicians	39%
Home health care services	39
Outpatient care centers, except mental health and substance abuse	34
Employment services	27
General medical and surgical hospitals, public and private	22
Nursing care facilities	20

Employment is expected to grow more slowly in hospitals—health care's largest industry—than in most other health care industries. While the intensity of nursing care is likely to increase, requiring more nurses per patient, the number of inpatients (those who remain in the hospital for more than 24 hours) is not likely to grow by much. Patients are being discharged earlier, and more procedures are being done on an outpatient basis, both inside and outside hospitals. Rapid growth is expected in hospital outpatient facilities, such as those providing same-day surgery, rehabilitation, and chemotherapy.

More and more sophisticated procedures, once performed only in hospitals, are being performed in physicians' offices and in outpatient care centers, such as freestanding ambulatory surgical and emergency centers. Accordingly, employment is expected to grow very fast in these places as health care in general expands.

Employment in nursing care facilities is expected to grow because of increases in the number of elderly, many of whom require long-term care. However, this growth will be relatively slower than in other health care industries because of the desire of patients to be treated at home or in residential care facilities, and the increasing availability of that type of care. The financial pressure on hospitals to discharge patients as soon as possible should produce more admissions to nursing and residential care facilities and to home health care. Job growth also is expected in units that provide specialized long-term rehabilitation for stroke and head injury patients, as well as units that treat Alzheimer's victims.

Employment in home health care is expected to increase rapidly in response to the growing number of older persons with functional disabilities, consumer preference for care in the home, and technological advances that make it possible to bring increasingly complex treatments into the home. The type of care demanded will require nurses who are able to perform complex procedures.

Rapid employment growth in employment services industry is expected as hospitals, physician's offices, and other health care establishments utilize temporary workers to fill short-term staffing needs. And as the demand for nurses grows, temporary nurses will be needed more often, further contributing to employment growth in this industry.

Job prospects. Overall job opportunities are expected to be excellent for registered nurses. Employers in some parts of the country and in certain employment settings report difficulty in attracting and retaining an adequate number of RNs, primarily because of an aging RN workforce and a lack of younger workers to fill positions. Enrollments in nursing programs at all levels have increased more rapidly in the past few years as students seek jobs with stable employment. However, many qualified applicants are being turned away because of a shortage of nursing faculty. The need for nursing faculty will only increase as many instructors near retirement. Many employers also are relying on foreign-educated nurses to fill vacant positions.

Even though overall employment opportunities for all nursing specialties are expected to be excellent, they can vary by employment setting. Despite the slower employment growth in hospitals, job opportunities should still be excellent because of the relatively high turnover of hospital nurses. RNs working in hospitals frequently work overtime and night and weekend shifts and also treat seriously ill and injured patients, all of which can contribute to stress and burnout. Hospital departments in which these working conditions occur most frequently—critical care units, emergency departments, and operating rooms—generally will have more job openings than other departments. To attract and retain qualified nurses, hospitals may offer signing bonuses, family-friendly work schedules, or subsidized training. A growing number of hospitals also are experimenting with online bidding to fill open shifts, in which nurses can volunteer to fill open shifts at premium wages. This can decrease the amount of mandatory overtime that nurses are required to work.

Although faster employment growth is projected in physicians' offices and outpatient care centers, RNs may face greater competition for these positions because they generally offer regular working hours and more comfortable working environments. There also may be some competition for jobs in employment services, despite a high rate of employment growth, because a large number of workers are attracted by the industry's relatively high wages and the flexibility of the work in this industry.

Generally, RNs with at least a bachelor's degree will have better job prospects than those without a bachelor's. In addition, all four advanced practice specialties—clinical nurse specialists, nurse practitioners, nurse-midwives, and nurse anesthetists—will be in high demand, particularly in medically underserved areas such as inner cities and rural areas. Relative to physicians, these RNs increasingly serve as lower-cost primary care providers.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-2016 Number	Change, 2006-2016 Percent
Registered nurses	29-1111	2,505,000	3,092,000	587,000	23

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Earnings

Median annual earnings of registered nurses were $57,280 in May 2006. The middle 50 percent earned between $47,710 and $69,850. The lowest 10 percent earned less than $40,250, and the highest 10 percent earned more than $83,440. Median annual earnings in the industries employing the largest numbers of registered nurses in May 2006 were:

Employment services	$64,260
General medical and surgical hospitals	58,550
Home health care services	54,190
Offices of physicians	53,800
Nursing care facilities	52,490

Many employers offer flexible work schedules, child care, educational benefits, and bonuses.

Related Occupations

Because of the number of specialties for registered nurses, and the variety of responsibilities and duties, many other health care occupations are similar in some aspect of the job. Other occupations that deal directly with patients when providing care include licensed practical and licensed vocational nurses, physicians and surgeons, athletic trainers, respiratory therapists, massage therapists, dietitians and nutritionists, occupational therapists, physical therapists, and emergency medical technicians and paramedics. Other occupations that use advanced medical equipment to treat patients include cardiovascular technologists and technicians, diagnostic medical sonographers, radiologic technologists and technicians, radiation therapists, and surgical technologists. Workers who also assist other health care professionals in providing care include nursing, psychiatric, and home health aides; physician assistants; and dental hygienists. Some nurses take on a management role, similar to medical and health services managers.

Respiratory Therapists

(O*NET 29-1126.00 and 29-2054.00)

Significant Points

- Job opportunities should be very good.
- An associate degree is the minimum educational requirement, but a bachelor's or master's degree may be important for advancement.
- All states, except Alaska and Hawaii, require respiratory therapists to be licensed.
- Hospitals will account for the vast majority of job openings, but a growing number of openings will arise in other settings.

Nature of the Work

Respiratory therapists and *respiratory therapy technicians*—also known as *respiratory care practitioners*—evaluate, treat, and care for patients with breathing or other cardiopulmonary disorders. Practicing under the direction of a physician, respiratory therapists assume primary responsibility for all respiratory care therapeutic treatments and diagnostic procedures, including the supervision of

Respiratory therapists sometimes conduct diagnostic tests to evaluate patients.

respiratory therapy technicians. Respiratory therapy technicians follow specific, well-defined respiratory care procedures under the direction of respiratory therapists and physicians.

In clinical practice, many of the daily duties of therapists and technicians overlap. However, therapists generally have greater responsibility than technicians. For example, respiratory therapists consult with physicians and other health care staff to help develop and modify patient care plans. Respiratory therapists also are more likely to provide complex therapy requiring considerable independent judgment, such as caring for patients on life support in intensive-care units of hospitals. In this *Handbook* statement, the term *respiratory therapist* includes both respiratory therapists and respiratory therapy technicians.

Respiratory therapists evaluate and treat all types of patients, ranging from premature infants whose lungs are not fully developed to elderly people whose lungs are diseased. Respiratory therapists provide temporary relief to patients with chronic asthma or emphysema, and they give emergency care to patients who are victims of a heart attack, stroke, drowning, or shock.

To evaluate patients, respiratory therapists interview them, perform limited physical examinations, and conduct diagnostic tests. For example, respiratory therapists test a patient's breathing capacity and determine the concentration of oxygen and other gases in a patient's blood. They also measure a patient's pH, which indicates the acidity or alkalinity of the blood. To evaluate a patient's lung capacity, respiratory therapists have the patient breathe into an instrument that measures the volume and flow of oxygen during inhalation and exhalation. By comparing the reading with the norm for the patient's age, height, weight, and sex, respiratory therapists can provide information that helps determine whether the patient has any lung deficiencies. To analyze oxygen, carbon dioxide, and blood pH levels, therapists draw an arterial blood sample, place it in a blood gas analyzer, and relay the results to a physician, who then makes treatment decisions.

To treat patients, respiratory therapists use oxygen or oxygen mixtures, chest physiotherapy, and aerosol medications—liquid medications suspended in a gas that forms a mist which is inhaled. They teach patients how to inhale the aerosol properly to ensure its effectiveness. When a patient has difficulty getting enough oxygen into his or her blood, therapists increase the patient's concentration of oxygen by placing an oxygen mask or nasal cannula on the patient and setting the oxygen flow at the level prescribed by a physician. Therapists also connect patients who cannot breathe on their own to ventilators that deliver pressurized oxygen into the lungs. The therapists insert a tube into the patient's trachea, or windpipe; connect the tube to the ventilator; and set the rate, volume, and oxygen concentration of the oxygen mixture entering the patient's lungs.

Therapists perform regular assessments of patients and equipment. If a patient appears to be having difficulty breathing or if the oxygen, carbon dioxide, or pH level of the blood is abnormal, therapists change the ventilator setting according to the doctor's orders or check the equipment for mechanical problems.

Respiratory therapists perform chest physiotherapy on patients to remove mucus from their lungs and make it easier for them to breathe. Therapists place patients in positions that help drain mucus, and then vibrate the patients' rib cages, often by tapping on the chest, and tell the patients to cough. Chest physiotherapy may be needed after surgery, for example, because anesthesia depresses respiration. As a result, physiotherapy may be prescribed to help get the patient's lungs back to normal and to prevent congestion. Chest physiotherapy also helps patients suffering from lung diseases, such as cystic fibrosis, that cause mucus to collect in the lungs.

Therapists who work in home care teach patients and their families to use ventilators and other life-support systems. In addition, these therapists visit patients in their homes to inspect and clean equipment, evaluate the home environment, and ensure that patients have sufficient knowledge of their diseases and the proper use of their medications and equipment. Therapists also make emergency visits if equipment problems arise.

In some hospitals, therapists perform tasks that fall outside their traditional role. Therapists are becoming involved in areas such as pulmonary rehabilitation, smoking cessation counseling, disease prevention, case management, and polysomnography—the diagnosis of breathing disorders during sleep, such as apnea. Respiratory therapists also increasingly treat critical care patients, either as part of surface and air transport teams or as part of rapid-response teams in hospitals.

Work environment. Respiratory therapists generally work between 35 and 40 hours a week. Because hospitals operate around the clock, therapists may work evenings, nights, or weekends. They spend long periods standing and walking between patients' rooms. In an emergency, therapists work under the stress of the situation. Respiratory therapists employed in home health care must travel frequently to patients' homes.

Respiratory therapists are trained to work with gases stored under pressure. Adherence to safety precautions and regular maintenance and testing of equipment minimize the risk of injury. As in many other health occupations, respiratory therapists are exposed to infectious diseases, but by carefully following proper procedures they can minimize the risks.

Training, Other Qualifications, and Advancement

An associate degree is the minimum educational requirement, but a bachelor's or master's degree may be important for advancement. All states, except Alaska and Hawaii, require respiratory therapists to be licensed.

Education and training. An associate degree is required to become a respiratory therapist. Training is offered at the postsecondary level by colleges and universities, medical schools, vocational-technical institutes, and the Armed Forces. Most programs

award associate or bachelor's degree and prepare graduates for jobs as advanced respiratory therapists. A limited number of associate degree programs lead to jobs as entry-level respiratory therapists. According to the Commission on Accreditation of Allied Health Education Programs (CAAHEP), 45 entry-level and 334 advanced respiratory therapy programs were accredited in the United States in 2006.

Among the areas of study in respiratory therapy programs are human anatomy and physiology, pathophysiology, chemistry, physics, microbiology, pharmacology, and mathematics. Other courses deal with therapeutic and diagnostic procedures and tests, equipment, patient assessment, cardiopulmonary resuscitation, the application of clinical practice guidelines, patient care outside of hospitals, cardiac and pulmonary rehabilitation, respiratory health promotion and disease prevention, and medical recordkeeping and reimbursement.

High school students interested in applying to respiratory therapy programs should take courses in health, biology, mathematics, chemistry, and physics. Respiratory care involves basic mathematical problem solving and an understanding of chemical and physical principles. For example, respiratory care workers must be able to compute dosages of medication and calculate gas concentrations.

Licensure and certification. A license is required to practice as a respiratory therapist, except in Alaska and Hawaii. Also, most employers require respiratory therapists to maintain a cardiopulmonary resuscitation (CPR) certification.

Licensure is usually based, in large part, on meeting the requirements for certification from the National Board for Respiratory Care (NBRC). The board offers the Certified Respiratory Therapist (CRT) credential to those who graduate from entry-level or advanced programs accredited by CAAHEP or the Committee on Accreditation for Respiratory Care (CoARC) and who also pass an exam.

The board also awards the Registered Respiratory Therapist (RRT) to CRTs who have graduated from advanced programs and pass two separate examinations. Supervisory positions and intensive-care specialties usually require the RRT.

Other qualifications. Therapists should be sensitive to a patient's physical and psychological needs. Respiratory care practitioners must pay attention to detail, follow instructions, and work as part of a team. In addition, operating advanced equipment requires proficiency with computers.

Advancement. Respiratory therapists advance in clinical practice by moving from general care to the care of critically ill patients who have significant problems in other organ systems, such as the heart or kidneys. Respiratory therapists, especially those with a bachelor's or master's degree, also may advance to supervisory or managerial positions in a respiratory therapy department. Respiratory therapists in home health care and equipment rental firms may become branch managers. Some respiratory therapists advance by moving into teaching positions. Some others use the knowledge gained as a respiratory therapist to work in another industry, such as developing, marketing, or selling pharmaceuticals and medical devices.

Employment

Respiratory therapists held about 122,000 jobs in 2006. About 79 percent of jobs were in hospitals, mainly in departments of respiratory care, anesthesiology, or pulmonary medicine. Most of the remaining jobs were in offices of physicians or other health practitioners, consumer-goods rental firms that supply respiratory equipment for home use, nursing care facilities, and home health care services. Holding a second job is relatively common for respiratory therapists. About 12 percent held another job, compared with 5 percent of workers in all occupations.

Job Outlook

Faster-than-average employment growth is projected for respiratory therapists. Job opportunities should be very good, especially for respiratory therapists with cardiopulmonary care skills or experience working with infants.

Employment change. Employment of respiratory therapists is expected to grow 19 percent from 2006 to 2016, faster than the average for all occupations. The increasing demand will come from substantial growth in the middle-aged and elderly population—a development that will heighten the incidence of cardiopulmonary disease. Growth in demand also will result from the expanding role of respiratory therapists in case management, disease prevention, emergency care, and the early detection of pulmonary disorders.

Older Americans suffer most from respiratory ailments and cardiopulmonary diseases such as pneumonia, chronic bronchitis, emphysema, and heart disease. As their numbers increase, the need for respiratory therapists is expected to increase as well. In addition, advances in inhalable medications and in the treatment of lung transplant patients, heart attack and accident victims, and premature infants (many of whom are dependent on a ventilator during part of their treatment) will increase the demand for the services of respiratory care practitioners.

Job prospects. Job opportunities are expected to be very good. The vast majority of job openings will continue to be in hospitals. However, a growing number of openings are expected to be outside of hospitals, especially in home health care services, offices of physicians or other health practitioners, consumer-goods rental firms, or in the employment services industry as a temporary worker in various settings.

Earnings

Median annual earnings of wage-and-salary respiratory therapists were $47,420 in May 2006. The middle 50 percent earned between $40,840 and $56,150. The lowest 10 percent earned less than $35,200, and the highest 10 percent earned more than $64,190.

Median annual earnings of wage-and-salary respiratory therapy technicians were $39,120 in May 2006. The middle 50 percent earned between $32,050 and $46,930. The lowest 10 percent earned less than $25,940, and the highest 10 percent earned more than $56,220.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-2016	
				Number	Percent
Respiratory therapists	—	122,000	145,000	23,000	19
Respiratory therapists	29-1126	102,000	126,000	23,000	23
Respiratory therapy technicians	29-2054	19,000	19,000	200	1

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Related Occupations

Under the supervision of a physician, respiratory therapists administer respiratory care and life support to patients with heart and lung difficulties. Other workers who care for, treat, or train people to improve their physical condition include registered nurses, occupational therapists, physical therapists, radiation therapists, and athletic trainers. Respiratory care practitioners work with advanced medical technology, as do other health care technicians including cardiovascular technologists and technicians, nuclear medicine technologists, radiologic technologists and technicians, and diagnostic medical sonographers.

Speech-Language Pathologists

(O*NET 29-1127.00)

Significant Points

- About half work in educational services; most others are employed by health care and social assistance facilities.
- A master's degree in speech-language pathology is the standard credential required for licensing in most states.
- Excellent job opportunities are expected.

Nature of the Work

Speech-language pathologists, sometimes called *speech therapists*, assess, diagnose, treat, and help to prevent disorders related to speech, language, cognitive-communication, voice, swallowing, and fluency.

Speech-language pathologists work with people who cannot produce speech sounds or cannot produce them clearly; those with speech rhythm and fluency problems, such as stuttering; people with voice disorders, such as inappropriate pitch or harsh voice; those with problems understanding and producing language; those who wish to improve their communication skills by modifying an accent; and those with cognitive communication impairments, such as attention, memory, and problem solving disorders. They also work with people who have swallowing difficulties.

Speech, language, and swallowing difficulties can result from a variety of causes including stroke, brain injury or deterioration, developmental delays or disorders, learning disabilities, cerebral palsy, cleft palate, voice pathology, mental retardation, hearing loss, or emotional problems. Problems can be congenital, developmental, or acquired. Speech-language pathologists use special instruments and qualitative and quantitative assessment methods, including standardized tests, to analyze and diagnose the nature and extent of impairments.

Speech-language pathologists tailor a plan of care for each patient.

Speech-language pathologists develop an individualized plan of care, tailored to each patient's needs. For individuals with little or no speech capability, speech-language pathologists may select augmentative or alternative communication methods, including automated devices and sign language, and teach their use. They teach patients how to make sounds, improve their voices, or increase their oral or written language skills to communicate more effectively. They also teach individuals how to strengthen muscles or use compensatory strategies to swallow without choking or inhaling food or liquid. Speech-language pathologists help patients develop, or recover, reliable communication and swallowing skills so patients can fulfill their educational, vocational, and social roles.

Speech-language pathologists keep records on the initial evaluation, progress, and discharge of clients. This helps pinpoint problems, tracks client progress, and justifies the cost of treatment when applying for reimbursement. They counsel individuals and their families concerning communication disorders and how to cope with the stress and misunderstanding that often accompany them. They also work with family members to recognize and change behavior patterns that impede communication and treatment and show them communication-enhancing techniques to use at home.

Most speech-language pathologists provide direct clinical services to individuals with communication or swallowing disorders. In medical facilities, they may perform their job in conjunction with physicians, social workers, psychologists, and other therapists. Speech-language pathologists in schools collaborate with teachers, special educators, interpreters, other school personnel, and parents to develop and implement individual or group programs, provide counseling, and support classroom activities.

Some speech-language pathologists conduct research on how people communicate. Others design and develop equipment or techniques for diagnosing and treating speech problems.

Work environment. Speech-language pathologists usually work at a desk or table in clean comfortable surroundings. In medical settings, they may work at the patient's bedside and assist in positioning the patient. In schools, they may work with students in an office or classroom. Some work in the client's home.

Although the work is not physically demanding, it requires attention to detail and intense concentration. The emotional needs of clients and their families may be demanding. Most full-time speech-language pathologists work 40 hours per week. Those who work on

a contract basis may spend a substantial amount of time traveling between facilities.

Training, Other Qualifications, and Advancement

A master's degree is the most common level of education among speech-language pathologists. Licensure or certification requirements also exist, but vary by state.

Education and training. Most speech-language pathologist jobs require a master's degree. In 2007, more than 230 colleges and universities offered graduate programs in speech-language pathology accredited by the Council on Academic Accreditation in Audiology and Speech-Language Pathology. While graduation from an accredited program is not always required to become a speech-language pathologist, it may be helpful in obtaining a license or may be required to obtain a license in some states.

Speech-language pathology courses cover anatomy, physiology, and the development of the areas of the body involved in speech, language, and swallowing; the nature of disorders; principles of acoustics; and psychological aspects of communication. Graduate students also learn to evaluate and treat speech, language, and swallowing disorders and receive supervised clinical training in communication disorders.

Licensure and certification. In 2007, 47 states regulated speech-language pathologists through licensure or registration. A passing score on the national examination on speech-language pathology, offered through the Praxis Series of the Educational Testing Service, is required. Other usual requirements include 300 to 375 hours of supervised clinical experience and 9 months of postgraduate professional clinical experience. Forty-one states have continuing education requirements for licensure renewal. Medicaid, Medicare, and private health insurers generally require a practitioner to be licensed to qualify for reimbursement.

Only 12 states require this same license to practice in the public schools. The other states issue a teaching license or certificate that typically requires a master's degree from an approved college or university. Some states will grant a provisional teaching license or certificate to applicants with a bachelor's degree, but a master's degree must be earned within 3 to 5 years. A few states grant a full teacher's certificate or license to bachelor's degree applicants.

In some states, the Certificate of Clinical Competence in Speech-Language Pathology (CCC-SLP) offered by the American Speech-Language-Hearing Association meets some or all of the requirements for licensure. To earn a CCC, a person must have a graduate degree from an accredited university, 400 hours of supervised clinical experience, complete a 36-week postgraduate clinical fellowship, and pass the Praxis Series examination in speech-language pathology administered by the Educational Testing Service. Contact your state's Licensing Board for details on your state's requirements.

Other qualifications. Speech-language pathologists should be able to effectively communicate diagnostic test results, diagnoses, and proposed treatment in a manner easily understood by their patients and their families. They must be able to approach problems objectively and be supportive. Because a patient's progress may be slow, patience, compassion, and good listening skills are necessary.

Advancement. As speech-language pathologists gain clinical experience and engage in continuing professional education, many develop expertise with certain populations, such as preschoolers and adolescents, or disorders, such as aphasia and learning disabilities. Some may obtain board recognition in a specialty area, such as child language, fluency, or feeding and swallowing. Experienced clinicians may become mentors or supervisors of other therapists or be promoted to administrative positions.

Employment

Speech-language pathologists held about 110,000 jobs in 2006. About half were employed in educational services, primarily in preschools and elementary and secondary schools. Others were employed in hospitals; offices of other health practitioners, including speech-language pathologists; nursing care facilities; home health care services; individual and family services; outpatient care centers; and child day care centers.

A few speech-language pathologists are self-employed in private practice. They contract to provide services in schools, offices of physicians, hospitals, or nursing care facilities, or work as consultants to industry.

Job Outlook

Average employment growth is projected. Job opportunities are expected to be excellent.

Employment change. Employment of speech-language pathologists is expected to grow 11 percent from 2006 to 2016, about as fast as the average for all occupations. As the members of the baby boom generation continue to age, the possibility of neurological disorders and associated speech, language, and swallowing impairments increases. Medical advances also are improving the survival rate of premature infants and trauma and stroke victims, who then need assessment and sometimes treatment.

Employment in educational services will increase with the growth in elementary and secondary school enrollments, including enrollment of special education students. Federal law guarantees special education and related services to all eligible children with disabilities. Greater awareness of the importance of early identification and diagnosis of speech and language disorders in young children will also increase employment.

In health care facilities, restrictions on reimbursement for therapy services may limit the growth of speech-language pathologist jobs in the near term. However, the long-run demand for therapists should continue to rise as growth in the number of individuals with disabilities or limited function spurs demand for therapy services.

The number of speech-language pathologists in private practice will rise because of the increasing use of contract services by hospitals, schools, and nursing care facilities.

Job prospects. The combination of growth in the occupation and an expected increase in retirements over the coming years should create excellent job opportunities for speech-language pathologists. Opportunities should be particularly favorable for those with the ability to speak a second language, such as Spanish. Job prospects also are expected to be especially favorable for those who are will-

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-2016	
				Number	Percent
Speech-language pathologists	29-1127	110,000	121,000	12,000	11

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

ing to relocate, particularly to areas experiencing difficulty in attracting and hiring speech-language pathologists.

Earnings

Median annual earnings of wage-and-salary speech-language pathologists were $57,710 in May 2006. The middle 50 percent earned between $46,360 and $72,410. The lowest 10 percent earned less than $37,970, and the highest 10 percent earned more than $90,400. Median annual earnings in the industries employing the largest numbers of speech-language pathologists were:

Nursing care facilities	$70,180
Offices of other health practitioners	63,240
General medical and surgical hospitals	61,970
Elementary and secondary schools	53,110

Some employers may reimburse speech-language pathologists for their required continuing education credits.

Related Occupations

Speech-language pathologists specialize in the prevention, diagnosis, and treatment of speech and language problems. Workers in related occupations include audiologists, occupational therapists, optometrists, physical therapists, psychologists, and recreational therapists. Speech-language pathologists in school systems often work closely with special education teachers in assisting students with disabilities.

Sources of Additional Information

State licensing boards can provide information on licensure requirements. State departments of education can supply information on certification requirements for those who wish to work in public schools.

For information on careers in speech-language pathology, a description of the CCC-SLP credential, and a listing of accredited graduate programs in speech-language pathology, contact

Veterinarians

(O*NET 29-1131.00)

Significant Points

- Veterinarians should have an affinity for animals and the ability to get along with their owners.
- Graduation from an accredited college of veterinary medicine and a state license are required.
- Competition for admission to veterinary school is keen; however, graduates should have excellent job opportunities.
- About 3 out of 4 veterinarians work in private practice.

Nature of the Work

Veterinarians care for the health of pets, livestock, and animals in zoos, racetracks, and laboratories. Some veterinarians use their skills to protect humans against diseases carried by animals and conduct clinical research on human and animal health problems. Others work in basic research, broadening our knowledge of animals and medical science, and in applied research, developing new ways to use knowledge.

Most veterinarians diagnose animal health problems; vaccinate against diseases, such as distemper and rabies; medicate animals suffering from infections or illnesses; treat and dress wounds; set fractures; perform surgery; and advise owners about animal feeding, behavior, and breeding.

According to the American Medical Veterinary Association, more than 70 percent of veterinarians who work in private medical practices predominately, or exclusively, treat small animals. Small-animal practitioners usually care for companion animals, such as dogs and cats, but also treat birds, reptiles, rabbits, ferrets, and other animals that can be kept as pets. About one-fourth of all veterinarians work in mixed animal practices, where they see pigs, goats, cattle, sheep, and some wild animals in addition to companion animals.

A small number of private-practice veterinarians work exclusively with large animals, mostly horses or cattle; some also care for various kinds of food animals. These veterinarians usually drive to farms or ranches to provide veterinary services for herds or individual animals. Much of this work involves preventive care to maintain the health of the animals. These veterinarians test for and vaccinate against diseases and consult with farm or ranch owners and managers regarding animal production, feeding, and housing issues. They also treat and dress wounds, set fractures, and perform surgery, including cesarean sections on birthing animals. Other veterinarians care for zoo, aquarium, or laboratory animals. Veterinarians of all types euthanize animals when necessary.

Veterinarians who treat animals use medical equipment such as stethoscopes, surgical instruments, and diagnostic equipment, including radiographic and ultrasound equipment. Veterinarians working in research use a full range of sophisticated laboratory equipment.

Veterinarians contribute to human as well as animal health. A number of veterinarians work with physicians and scientists as they research ways to prevent and treat various human health problems. For example, veterinarians contributed greatly in conquering malaria and yellow fever, solved the mystery of botulism, produced an anticoagulant used to treat some people with heart disease, and defined and developed surgical techniques for humans, such as hip and knee joint replacements and limb and organ transplants. Today, some determine the effects of drug therapies, antibiotics, or new surgical techniques by testing them on animals.

Some veterinarians are involved in food safety and inspection. Veterinarians who are livestock inspectors, for example, check animals for transmissible diseases, such as E. coli, advise owners on the treatment of their animals, and may quarantine animals. Veteri-

Most veterinarians perform clinical work in private practices on small animals.

narians who are meat, poultry, or egg product inspectors examine slaughtering and processing plants, check live animals and carcasses for disease, and enforce government regulations regarding food purity and sanitation. More veterinarians are finding opportunities in food security as they ensure that the nation has abundant and safe food supplies. Veterinarians involved in food security often work along the nation's borders as animal and plant health inspectors, where they examine imports and exports of animal products to prevent disease here and in foreign countries. Many of these workers are employed by the Department of Homeland Security or the Department of Agriculture's Animal and Plant Health Inspection Service division.

Work environment. Veterinarians in private or clinical practice often work long hours in a noisy indoor environment. Sometimes they have to deal with emotional or demanding pet owners. When working with animals that are frightened or in pain, veterinarians risk being bitten, kicked, or scratched.

Veterinarians in large-animal practice spend time driving between their office and farms or ranches. They work outdoors in all kinds of weather and may have to treat animals or perform surgery, under unsanitary conditions.

Veterinarians working in nonclinical areas, such as public health and research, have working conditions similar to those of other professionals in those lines of work. These veterinarians enjoy clean, well-lit offices or laboratories and spend much of their time dealing with people rather than animals.

Veterinarians often work long hours. Those in group practices may take turns being on call for evening, night, or weekend work; solo practitioners may work extended and weekend hours, responding to emergencies or squeezing in unexpected appointments.

Training, Other Qualifications, and Advancement

Veterinarians must obtain a Doctor of Veterinary Medicine degree and a state license. There is keen competition for admission to veterinary school.

Education and training. Prospective veterinarians must graduate with a Doctor of Veterinary Medicine (D.V.M. or V.M.D.) degree from a four-year program at an accredited college of veterinary medicine. There are 28 colleges in 26 states that meet accreditation standards set by the Council on Education of the American Veterinary Medical Association (AVMA).

The prerequisites for admission to veterinary programs vary. Many programs do not require a bachelor's degree for entrance, but all require a significant number of credit hours—ranging from 45 to 90 semester hours—at the undergraduate level. However, most of the students admitted have completed an undergraduate program and earned a bachelor's degree. Applicants without a degree face a difficult task gaining admittance.

Preveterinary courses should emphasize the sciences. Veterinary medical colleges typically require applicants to have taken classes in organic and inorganic chemistry, physics, biochemistry, general biology, animal biology, animal nutrition, genetics, vertebrate embryology, cellular biology, microbiology, zoology, and systemic physiology. Some programs require calculus; some require only statistics, college algebra and trigonometry, or pre-calculus. Most veterinary medical colleges also require some courses in English or literature, other humanities, and the social sciences. Increasingly, courses in general business management and career development have become a standard part of the curriculum to teach new graduates how to effectively run a practice.

In addition to satisfying preveterinary course requirements, applicants must submit test scores from the Graduate Record Examination (GRE), the Veterinary College Admission Test (VCAT), or the Medical College Admission Test (MCAT), depending on the preference of the college to which they are applying. Currently, 22 schools require the GRE, 4 require the VCAT, and 2 accept the MCAT.

There is keen competition for admission to veterinary school. The number of accredited veterinary colleges has remained largely the same since 1983, but the number of applicants has risen significantly. Only about 1 in 3 applicants was accepted in 2005.

New graduates with a Doctor of Veterinary Medicine degree may begin to practice veterinary medicine once they receive their license, but many new graduates choose to enter a one-year internship. Interns receive a small salary but often find that their internship experience leads to better paying opportunities later, relative to those of other veterinarians. Veterinarians who then seek board certification also must complete a three- to four-year residency program that provides intensive training in one of the 20 AVMA-recognized veterinary specialties including internal medicine, oncology, pathology, dentistry, nutrition, radiology, surgery, dermatology, anesthesiology, neurology, cardiology, ophthalmology, preventive medicine, and exotic small-animal medicine.

Licensure. All states and the District of Columbia require that veterinarians be licensed before they can practice. The only exemptions are for veterinarians working for some federal agencies and some state governments. Licensing is controlled by the states and is not strictly uniform, although all states require the successful completion of the D.V.M. degree—or equivalent education—and a passing grade on a national board examination, the North American Veterinary Licensing Exam. This eight-hour examination consists of 360 multiple-choice questions covering all aspects of veterinary medicine as well as visual materials designed to test diagnostic skills.

The Educational Commission for Foreign Veterinary Graduates grants certification to individuals trained outside the United States who demonstrate that they meet specified requirements for English language and clinical proficiency. This certification fulfills the educational requirement for licensure in all states.

Most states also require candidates to pass a state jurisprudence examination covering state laws and regulations. Some states do additional testing on clinical competency as well. There are few reciprocal agreements between states, veterinarians who wish to practice in a different state usually must first pass that state's examinations.

Other qualifications. When deciding whom to admit, some veterinary medical colleges place heavy consideration on a candidate's veterinary and animal experience. Formal experience, such as work with veterinarians or scientists in clinics, agribusiness, research, or some area of health science, is particularly advantageous. Less formal experience, such as working with animals on a farm or ranch or at a stable or animal shelter, also can be helpful. Students must demonstrate ambition and an eagerness to work with animals.

Prospective veterinarians must have good manual dexterity. They should have an affinity for animals and the ability to get along with their owners, especially pet owners, who usually have strong bonds with their pets. Veterinarians who intend to go into private practice should possess excellent communication and business skills, because they will need to manage their practice and employees successfully and to promote, market, and sell their services.

Advancement. Most veterinarians begin as employees in established group practices. Despite the substantial financial investment in equipment, office space, and staff, many veterinarians with experience eventually set up their own practice or purchase an established one.

Newly trained veterinarians can become U.S. Government meat and poultry inspectors, disease-control workers, animal welfare and

safety workers, epidemiologists, research assistants, or commissioned officers in the U.S. Public Health Service or various branches of the U.S. Armed Forces. A state license may be required.

Nearly all states have continuing education requirements for licensed veterinarians. Requirements differ by state and may involve attending a class or otherwise demonstrating knowledge of recent medical and veterinary advances.

Employment

Veterinarians held about 62,000 jobs in 2006. According to the American Veterinary Medical Association, about 3 out of 4 veterinarians were employed in a solo or group practice. Most others were salaried employees of another veterinary practice. Data from the U.S. Bureau of Labor Statistics show that the federal government employed about 1,400 civilian veterinarians, chiefly in the U.S. Departments of Agriculture, Health and Human Services, and, increasingly, Homeland Security. Other employers of veterinarians are state and local governments, colleges of veterinary medicine, medical schools, research laboratories, animal food companies, and pharmaceutical companies. A few veterinarians work for zoos, but most veterinarians caring for zoo animals are private practitioners who contract with the zoos to provide services, usually on a part-time basis.

In addition, many veterinarians hold veterinary faculty positions in colleges and universities and are classified as teachers. (See the statement on teachers—postsecondary elsewhere in the *Handbook*.)

Job Outlook

Employment is expected to increase much faster than average. Excellent job opportunities are expected.

Employment change. Employment of veterinarians is expected to increase 35 percent over the 2006–2016 decade, much faster than the average for all occupations. Veterinarians usually practice in animal hospitals or clinics and care primarily for companion animals. Recent trends indicate particularly strong interest in cats as pets. Faster growth of the cat population is expected to increase the demand for feline medicine and veterinary services, while demand for veterinary care for dogs should continue to grow at a more modest pace.

Many pet owners are relatively affluent and consider their pets a member of the family. These owners are becoming more aware of the availability of advanced care and are more willing to pay for intensive veterinary care than owners in the past. Furthermore, the number of pet owners purchasing pet insurance is rising, increasing the likelihood that considerable money will be spent on veterinary care.

More pet owners also will take advantage of nontraditional veterinary services, such as cancer treatment and preventive dental care. Modern veterinary services have caught up to human medicine; certain procedures, such as hip replacement, kidney transplants, and blood transfusions, which were once only available for humans, are now available for animals.

Continued support for public health and food and animal safety, national disease control programs, and biomedical research on human health problems will contribute to the demand for veterinarians, although the number of positions in these areas is limited. Homeland security also may provide opportunities for veterinarians involved in efforts to maintain abundant food supplies and minimize animal diseases in the U.S. and in foreign countries.

Job prospects. Excellent job opportunities are expected because there are only 28 accredited schools of veterinary medicine in the United States, resulting in a limited number of graduates—about 2,700—each year. However, applicants face keen competition for admission to veterinary school.

New graduates continue to be attracted to companion-animal medicine because they prefer to deal with pets and to live and work near heavily populated areas, where most pet owners live. Employment opportunities are good in cities and suburbs, but even better in rural areas because fewer veterinarians compete to work there.

Beginning veterinarians may take positions requiring evening or weekend work to accommodate the extended hours of operation that many practices are offering. Some veterinarians take salaried positions in retail stores offering veterinary services. Self-employed veterinarians usually have to work hard and long to build a sufficient client base.

The number of jobs for large-animal veterinarians is likely to grow more slowly than jobs for companion-animal veterinarians. Nevertheless, job prospects should be better for veterinarians who specialize in farm animals because of lower earnings in the farm-animal specialty and because many veterinarians do not want to work in rural or isolated areas.

Veterinarians with training in food safety and security, animal health and welfare, and public health and epidemiology should have the best opportunities for a career in the federal government.

Earnings

Median annual earnings of veterinarians were $71,990 in May 2006. The middle 50 percent earned between $56,450 and $94,880. The lowest 10 percent earned less than $43,530, and the highest 10 percent earned more than $133,150.

The average annual salary for veterinarians in the federal government was $84,335 in 2007.

According to a survey by the American Veterinary Medical Association, average starting salaries of veterinary medical college graduates in 2006 varied by type of practice as follows:

Large animals, exclusively	$61,029
Small animals, predominantly	57,117
Small animals, exclusively	56,241
Private clinical practice	55,031
Large animals, predominantly	53,397
Mixed animals	52,254
Equine (horses)	40,130

Related Occupations

Veterinarians prevent, diagnose, and treat diseases, disorders, and injuries in animals. Those who do similar work for humans include chiropractors, dentists, optometrists, physicians and surgeons, and

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-2016	
				Number	Percent
Veterinarians	29-1131	62,000	84,000	22,000	35

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

podiatrists. Veterinarians have extensive training in physical and life sciences, and some do scientific and medical research, as do biological scientists and medical scientists.

Animal care and service workers and veterinary technologists and technicians also work extensively with animals. Like veterinarians, they must have patience and feel comfortable with animals. However, the level of training required for these occupations is substantially less than that needed by veterinarians.

Health Technologists and Technicians

Athletic Trainers

(O*NET 29-9091.00)

Significant Points

- Long hours, sometimes including nights and weekends, are common.
- A bachelor's degree is usually the minimum requirement, but many athletic trainers hold a master's or doctoral degree.
- Employment is projected to grow much faster than average.
- Job prospects should be good in the health care industry, but competition is expected for positions with sports teams.

Nature of the Work

Athletic trainers help prevent and treat injuries for people of all ages. Their clients include everyone from professional athletes to industrial workers. Recognized by the American Medical Association as allied health professionals, athletic trainers specialize in the prevention, assessment, treatment, and rehabilitation of musculoskeletal injuries. Athletic trainers often are one of the first heath care providers on the scene when injuries occur, and therefore they must be able to recognize, evaluate, and assess injuries and provide immediate care when needed. They also are heavily involved in the rehabilitation and reconditioning of injuries. Athletic trainers should not be confused with fitness trainers or personal trainers, who are not health care workers, but rather train people to become physically fit. (Fitness workers are discussed elsewhere in the *Handbook*.)

Athletic trainers often help prevent injuries by advising on the proper use of equipment and applying protective or injury-preventive devices such as tape, bandages, and braces. Injury prevention also often includes educating people on what they should do to avoid putting themselves at risk for injuries.

Athletic trainers work under the supervision of a licensed physician and in cooperation with other health care providers. The level of medical supervision varies, depending upon the setting. Some athletic trainers meet with the team physician or consulting physician once or twice a week; others interact with a physician every day. The extent of the supervision ranges from discussing specific injuries and treatment options with a physician to performing evaluations and treatments as directed by a physician.

Athletic trainers often have administrative responsibilities. These may include regular meetings with an athletic director or other administrative officer to deal with budgets, purchasing, policy implementation, and other business-related issues.

Work environment. The work of athletic trainers requires frequent interaction with others. This includes consulting with physicians as well as frequent contact with athletes and patients to discuss and administer treatments, rehabilitation programs, injury-preventive practices, and other health-related issues. Many athletic trainers work indoors most of the time; others, especially those in some sports-related jobs, spend much of their time working outdoors. The job also might require standing for long periods, working with med-

Athletic trainers apply protective devices such as tape, bandages, and braces to help prevent injuries.

ical equipment or machinery, and being able to walk, run, kneel, crouch, stoop, or crawl. Travel may be required.

Schedules vary by work setting. Athletic trainers in nonsports settings generally have an established schedule—usually about 40 to 50 hours per week—with nights and weekends off. Athletic trainers working in hospitals and clinics may spend part of their time working at other locations doing outreach. Most commonly, these outreach programs include conducting athletic training services and speaking at high schools, colleges, and commercial businesses.

Athletic trainers in sports settings have schedules that are longer and more variable. These athletic trainers must be present for team practices and games, which often are on evenings and weekends, and their schedules can change on short notice when games and practices have to be rescheduled. As a result, athletic trainers in sports settings may regularly work 6 or 7 days per week, including late hours.

In high schools, athletic trainers who also teach may work 60 to 70 hours a week, or more. In National Collegiate Athletic Association Division I colleges and universities, athletic trainers generally work with one team; when that team's sport is in season, working at least 50 to 60 hours a week is common. Athletic trainers in smaller colleges and universities often work with several teams and have teaching responsibilities. During the off-season, a 40-hour to 50-hour work week may be normal in most settings. Athletic trainers for professional sports teams generally work the most hours per week. During training camps, practices, and competitions, they may be required to work up to 12 hours a day.

There is some stress involved with being an athletic trainer, as there is with most health-related occupations. Athletic trainers are responsible for their clients' health, and sometimes have to make quick decisions that could affect the health or career of their clients. Athletics trainers also can be affected by the pressure to win that is typical of competitive sports teams.

Training, Other Qualifications, and Advancement

A bachelor's degree is usually the minimum requirement to work as an athletic trainer, but many athletic trainers hold a master's or doctoral degree. In 2006, 46 states required athletic trainers to be licensed or hold some form of registration.

Education and training. A bachelor's degree from an accredited college or university is required for almost all jobs as an athletic trainer. In 2006, there were more than 350 accredited programs nationwide. Students in these programs are educated both in the classroom and in clinical settings. Formal education includes many science and health-related courses, such as human anatomy, physiology, nutrition, and biomechanics.

According to the National Athletic Trainers Association, 68 percent of athletic trainers have a master's or doctoral degree. Athletic trainers may need a master's or higher degree to be eligible for some positions, especially those in colleges and universities, and to increase their advancement opportunities. Because some positions in high schools involve teaching along with athletic trainer responsibilities, a teaching certificate or license could be required.

Licensure and certification. In 2006, 46 states required athletic trainers to be licensed or registered; this requires certification from the Board of Certification, Inc. (BOC). For certification, athletic trainers need a bachelor's degree from an accredited athletic training program. In addition, a successful candidate for BOC certification must pass a rigorous examination. To retain certification, credential holders must continue taking medical-related courses and adhere to the BOC standards of practice. In states where licensure is not required, certification is voluntary but may be helpful for those seeking jobs and advancement.

Other qualifications. Because all athletic trainers deal directly with a variety of people, they need good social and communication skills. They should be able to manage difficult situations and the stress associated with them, such as when disagreements arise with coaches, clients, or parents regarding suggested treatment. Athletic trainers also should be organized, be able to manage time wisely, be inquisitive, and have a strong desire to help people.

Advancement. There are a number ways for athletic trainers to advance or move into related positions. Assistant athletic trainers may become head athletic trainers and, eventually, athletic directors. Athletic trainers also might enter a physician group practice and assume a management role. Some athletic trainers move into sales and marketing positions, using their athletic trainer expertise to sell medical and athletic equipment.

Employment

Athletic trainers held about 17,000 jobs in 2006 and are found in every part of the country. Most athletic trainer jobs are related to sports, although an increasing number also work in nonsports settings. About 34 percent of athletic trainers worked in health care, including jobs in hospitals, offices of physicians, and offices of other health practitioners. Another 34 percent were found in public and private educational services, primarily in colleges, universities, and high schools. About 20 percent worked in fitness and recreational sports centers.

Job Outlook

Employment is projected to grow much faster than average. Job prospects should be good in the health care industry, but competition is expected for positions with sports teams.

Employment change. Employment of athletic trainers is expected to grow 24 percent from 2006 to 2016, much faster than the average for all occupations. Job growth will be concentrated in the health care industry, including hospitals and offices of health practitioners. Fitness and recreation sports centers also will provide many new jobs, as these establishments become more common and continue to need athletic trainers to care for their clients. Growth in positions with sports teams will be somewhat slower, however, as most professional sports clubs and colleges and universities already have complete athletic training staffs.

The demand for health care should grow dramatically as the result of advances in technology, increasing emphasis on preventive care, and an increasing number of older people who are more likely to need medical care. Athletic trainers will benefit from this expansion because they provide a cost-effective way to increase the number of health professionals in an office or other setting.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-2016	
				Number	Percent
Athletic trainers	29-9091	17,000	21,000	4,200	24

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Also, employers increasingly emphasize sports medicine, in which an immediate responder, such as an athletic trainer, is on site to help prevent injuries and provide immediate treatment for any injuries that do occur. Increased licensure requirements and regulation has led to a greater acceptance of athletic trainers as qualified health care providers. As a result, third-party reimbursement is expected to continue to grow for athletic training services.

As athletic trainers continue to expand their services, more employers are expected to use these workers to realize the cost savings of providing health care in-house. There should be strong demand for athletic trainers in settings outside the sports world, especially those that focus on health care. Continuing efforts to have an athletic trainer in every high school reflect concern for the health of student-athletes as well as efforts to provide more funding for schools, and may lead to growth in the number of athletic trainers employed in high schools.

Job prospects. Job prospects should be good for athletic trainers in the health care industry. Those looking for a position with a sports team, however, may face competition. Turnover among athletic trainers is limited. When working with sports teams, many athletic trainers prefer to continue to work with the same coaches, administrators, and players when a good working relationship already exists.

Because of relatively low turnover, the settings with the best job prospects will be the ones that are expected to have the most job growth, primarily positions in the heath care industry and fitness and recreational sports centers. Additional job opportunities are expected in elementary and secondary schools as more positions are created. Some of these positions also will require teaching responsibilities. There will be more competition for positions within colleges and universities as well as professional sports clubs.

The occupation is expected to continue to change over the next decade, including more administrative responsibilities, adapting to new technology, and working with larger populations, and job seekers must be able to adapt to these changes.

Earnings

Most athletic trainers work in full-time positions, and typically receive benefits. The salary of an athletic trainer depends on experience and job responsibilities, and varies by job setting. Median annual earnings of wage-and-salary athletic trainers were $36,560 in May 2006. The middle 50 percent earned between $28,920 and $45,690. The lowest 10 percent earned less than $21,940, while the top 10 percent earned more than $57,580.

Many employers pay for some of the continuing education required for athletic trainers to remain certified, although the amount covered varies from employer to employer.

Related Occupations

The American Medical Association recognizes athletic trainers as allied health professionals. They work under the direction of physicians and provide immediate and ongoing care for injuries. Also, they provide education and advice on the prevention of injuries and work closely with injured patients to rehabilitate and recondition injuries, often through therapy. Other occupations that may require similar responsibilities include emergency medical technicians and paramedics, physical therapists, physician assistants, registered nurses, licensed practical and licensed vocational nurses, recreational therapists, occupational therapists, respiratory therapists, chiropractors, podiatrists, and massage therapists.

There also are opportunities for athletic trainers to join the military, although they would not be classified as an athletic trainer. Enlisted soldiers and officers who are athletic trainers are usually placed in another program, such as health educator or training specialist, in which their skills are useful. (For information on military careers, see the *Handbook* statement on job opportunities in the Armed Forces.)

Cardiovascular Technologists and Technicians

(O*NET 29-2031.00)

Significant Points

- Employment is expected to grow much faster than average; technologists and technicians trained to perform certain procedures will be in particular demand.
- About 3 out of 4 jobs are in hospitals.
- The vast majority of workers complete a two-year junior or community college program.

Nature of the Work

Cardiovascular technologists and technicians assist physicians in diagnosing and treating cardiac (heart) and peripheral vascular (blood vessel) ailments.

Cardiovascular technologists and technicians schedule appointments perform ultrasound or cardiovascular procedures, review doctors' interpretations and patient files, and monitor patients' heart rates. They also operate and care for testing equipment, explain test procedures, and compare findings to a standard to identify problems. Other day-to-day activities vary significantly between specialties.

Cardiovascular technologists may specialize in any of three areas of practice: invasive cardiology, echocardiography, or vascular technology.

Invasive cardiology. Cardiovascular technologists specializing in invasive procedures are called *cardiology technologists*. They assist physicians with cardiac catheterization procedures in which a small tube, or catheter, is threaded through a patient's artery from a spot on the patient's groin to the heart. The procedure can determine whether a blockage exists in the blood vessels that supply the heart muscle. The procedure also can help to diagnose other problems. Part of the procedure may involve balloon angioplasty, which can be used to treat blockages of blood vessels or heart valves without the need for heart surgery. Cardiology technologists assist physicians as they insert a catheter with a balloon on the end to the point of the obstruction. Another procedure using the catheter is electrophysiology test, which help locate the specific areas of heart tissue that give rise to the abnormal electrical impulses that cause arrhythmias.

Technologists prepare patients for cardiac catheterization by first positioning them on an examining table and then shaving, cleaning, and administering anesthesia to the top of their leg near the groin. During the procedures, they monitor patients' blood pressure and heart rate with EKG equipment and notify the physician if something appears to be wrong. Technologists also may prepare and

About three out of four cardiovascular technologists and technicians work in hospitals.

monitor patients during open-heart surgery and during the insertion of pacemakers and stents that open up blockages in arteries to the heart and major blood vessels.

Noninvasive technology. Technologists who specialize in vascular technology or echocardiography perform noninvasive tests using. Tests are called "noninvasive" if they do not require the insertion of probes or other instruments into the patient's body. For example, procedures such as Doppler ultrasound transmit high-frequency sound waves into areas of the patient's body and then processes reflected echoes of the sound waves to form an image. Technologists view the ultrasound image on a screen and may record the image on videotape or photograph it for interpretation and diagnosis by a physician. As the technologist uses the instrument to perform scans and record images, technologists check the image on the screen for subtle differences between healthy and diseased areas, decide which images to include in the report to the physician, and judge whether the images are satisfactory for diagnostic purposes. They also explain the procedure to patients, record any additional medical history the patient relates, select appropriate equipment settings, and change the patient's position as necessary. (See the statement on diagnostic medical sonographers elsewhere in the *Handbook* to learn more about other sonographers.)

Vascular technology. Technicians who assist physicians in the diagnosis of disorders affecting the circulation are known as *vascular technologists* or *vascular sonographers*. Vascular technologists complete patients' medical history, evaluate pulses and assess blood flow in arteries and veins by listening to the vascular flow sounds for abnormalities, and assure the appropriate vascular test has been ordered. Then they perform a noninvasive procedure using ultrasound instruments to record vascular information such as vascular blood flow, blood pressure, oxygen saturation, cerebral circulation, peripheral circulation, and abdominal circulation. Many of these tests are performed during or immediately after surgery. Vascular technologists then provide a summary of findings to the physician to aid in patient diagnosis and management.

Echocardiography. This area of practice includes giving electrocardiograms (EKGs) and sonograms of the heart. Cardiovascular technicians who specialize in EKGs, stress testing, and those who perform Holter monitor procedures are known as cardiographic or *electrocardiograph* (or *EKG*) *technicians*.

To take a basic EKG, which traces electrical impulses transmitted by the heart, technicians attach electrodes to the patient's chest, arms, and legs, and then manipulate switches on an EKG machine to obtain a reading. An EKG is printed out for interpretation by the physician. This test is done before most kinds of surgery or as part of a routine physical examination, especially on persons who have reached middle age or who have a history of cardiovascular problems.

EKG technicians with advanced training perform Holter monitor and stress testing. For Holter monitoring, technicians place electrodes on the patient's chest and attach a portable EKG monitor to the patient's belt. Following 24 or more hours of normal activity by the patient, the technician removes a tape from the monitor and places it in a scanner. After checking the quality of the recorded impulses on an electronic screen, the technician usually prints the information from the tape for analysis by a physician. Physicians use the output from the scanner to diagnose heart ailments, such as heart rhythm abnormalities or problems with pacemakers.

For a treadmill stress test, EKG technicians document the patient's medical history, explain the procedure, connect the patient to an EKG monitor, and obtain a baseline reading and resting blood pressure. Next, they monitor the heart's performance while the patient is walking on a treadmill, gradually increasing the treadmill's speed to observe the effect of increased exertion. Like vascular technologists and cardiac sonographers, cardiographic technicians who perform EKG, Holter monitor, and stress tests are known as "noninvasive" technicians.

Technologists who use ultrasound to examine the heart chambers, valves, and vessels are referred to as *cardiac sonographers*, or *echocardiographers*. They use ultrasound instrumentation to create images called echocardiograms. An echocardiogram may be performed while the patient is either resting or physically active. Technologists may administer medication to physically active patients to assess their heart function. Cardiac sonographers also may assist physicians who perform transesophageal echocardiography, which involves placing a tube in the patient's esophagus to obtain ultrasound images.

Work environment. Cardiovascular technologists and technicians spend a lot of time walking and standing. Heavy lifting may be involved to move equipment or transfer patients. These workers wear heavy protective aprons while conducting some procedures. Those who work in catheterization laboratories may face stressful working conditions because they are in close contact with patients with serious heart ailments. For example, some patients may encounter complications that have life-or-death implications.

Some cardiovascular technologists and technicians may have the potential for radiation exposure, which is kept to a minimum by strict adherence to radiation safety guidelines. In addition, those who use sonography can be at an increased risk for musculoskeletal disorders such as carpel tunnel syndrome, neck and back strain, and eye strain. However, greater use of ergonomic equipment and an increasing awareness will continue to minimize such risks.

Technologists and technicians generally work a five-day, 40-hour week that may include weekends. Those in catheterization laboratories tend to work longer hours and may work evenings. They also may be on call during the night and on weekends.

Training, Other Qualifications, and Advancement

The most common level of education completed by cardiovascular technologists and technicians is an associate degree. Certification, although not required in all cases, is available.

Education and training. Although a few cardiovascular technologists, vascular technologists, and cardiac sonographers are currently trained on the job, most receive training in two- to four-year programs. The majority of technologists complete a two-year junior or community college program, but four-year programs are increasingly available. The first year is dedicated to core courses and is followed by a year of specialized instruction in either invasive, noninvasive cardiovascular, or noninvasive vascular technology. Those who are qualified in an allied health profession need to complete only the year of specialized instruction.

The Joint Review Committee on Education in Cardiovascular Technology reviews education programs seeking accreditation. The Commission on Accreditation of Allied Health Professionals (CAAHEP) accredits these education programs; as of 2006, there were 31 programs accredited in cardiovascular technology in the United States. Similarly, those who want to study echocardiography or vascular sonography may also attend CAAHEP accredited programs in diagnostic medical sonography. In 2006, there were 147 diagnostic medical sonography programs accredited by CAAHEP. Those who attend these accredited programs are eligible to obtain professional certification.

Unlike most other cardiovascular technologists and technicians, most EKG technicians are trained on the job by an EKG supervisor or a cardiologist. On-the-job training usually lasts about 8 to 16 weeks. Most employers prefer to train people already in the health care field—nursing aides, for example. Some EKG technicians are students enrolled in two-year programs to become technologists, working part time to gain experience and make contact with employers. One-year certification programs exist for basic EKGs, Holter monitoring, and stress testing.

Licensure and certification. Some states require workers in this occupation to be licensed. For information on a particular state, contact that state's medical board. Certification is available from two organizations: Cardiovascular Credentialing International (CCI) and the American Registry of Diagnostic Medical Sonographers (ARDMS). The CCI offers four certifications—Certified Cardiographic Technician (CCT), Registered Cardiac Sonographer (RCS), Registered Vascular Specialist (RVS), and Registered Cardiovascular Invasive Specialist (RCIS). The ARDMS offers Registered Diagnostic Cardiac Sonographer (RDCS) and Registered Vascular Technologist (RVT) credentials. Some states require certification as part of licensure. In other states, certification is not required but many employers prefer it.

Other qualifications. Cardiovascular technologists and technicians must be reliable, have mechanical aptitude, and be able to follow detailed instructions. A pleasant, relaxed manner for putting patients at ease is an asset. They must be articulate as they must communicate technically with physicians and also explain procedures simply to patients.

Advancement. Technologists and technicians can advance to higher levels of the profession as many institutions structure the occupation with multiple levels, each having an increasing amount of responsibility. Technologists and technicians also can advance into supervisory or management positions. Other common possibilities include working in an educational setting or conducting laboratory work.

Employment

Cardiovascular technologists and technicians held about 45,000 jobs in 2006. About 3 out of 4 jobs were in hospitals (public and private), primarily in cardiology departments. The remaining jobs were mostly in offices of physicians, including cardiologists, or in medical and diagnostic laboratories, including diagnostic imaging centers.

Job Outlook

Employment is expected to grow much faster than average; technologists and technicians trained to perform certain procedures will be in particular demand.

Employment change. Employment of cardiovascular technologists and technicians is expected to increase by 26 percent through the year 2016, much faster than the average for all occupations. Growth will occur as the population ages, because older people have a higher incidence of heart disease and other complications of the heart and vascular system. Procedures such as ultrasound are being performed more often as a replacement for more expensive and more invasive procedures. Due to advances in medicine and greater public awareness, signs of vascular disease can be detected earlier, creating demand for cardiovascular technologists and technicians to perform various procedures.

Employment of vascular technologists and echocardiographers will grow as advances in vascular technology and sonography reduce the need for more costly and invasive procedures. Electrophysiology is also becoming a rapidly growing specialty. However, fewer EKG technicians will be needed, as hospitals train nursing aides and others to perform basic EKG procedures. Individuals trained in Holter monitoring and stress testing are expected to have more favorable job prospects than those who can perform only a basic EKG.

Medicaid has relaxed some of the rules governing reimbursement for vascular exams, which is resulting in vascular studies becoming a more routine practice. As a result of increased use of these procedures, individuals with training in vascular studies should have more favorable employment opportunities.

Job prospects. Some additional job openings for cardiovascular technologists and technicians will arise from replacement needs as individuals transfer to other jobs or leave the labor force. Although growing awareness of musculoskeletal disorders has made prevention easier, some cardiovascular technologists and technicians have been forced to leave the occupation early because of this disorder.

It is not uncommon for cardiovascular technologists and technicians to move between the specialties within the occupation by obtaining certification in more than one specialty.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-2016	
				Number	Percent
Cardiovascular technologists and technicians	29-2031	45,000	57,000	12,000	26

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Earnings

Median annual earnings of cardiovascular technologists and technicians were $42,300 in May 2006. The middle 50 percent earned between $29,900 and $55,670. The lowest 10 percent earned less than $23,670, and the highest 10 percent earned more than $67,410. Median annual earnings of cardiovascular technologists and technicians in 2006 were $41,960 in offices of physicians and $41,950 in general medical and surgical hospitals.

Related Occupations

Cardiovascular technologists and technicians operate sophisticated equipment that helps physicians and other health practitioners to diagnose and treat patients. So do diagnostic medical sonographers, nuclear medicine technologists, radiation therapists, radiologic technologists and technicians, and respiratory therapists.

Clinical Laboratory Technologists and Technicians

(O*NET 29-2011.00 and 29-2012.00)

Significant Points

- Faster-than-average employment growth and excellent job opportunities are expected.
- Clinical laboratory technologists usually have a bachelor's degree with a major in medical technology or in one of the life sciences; clinical laboratory technicians generally need either an associate degree or a certificate.
- Most jobs will continue to be in hospitals, but employment will grow faster in other settings.

Nature of the Work

Clinical laboratory testing plays a crucial role in the detection, diagnosis, and treatment of disease. *Clinical laboratory technologists*—also referred to as *clinical laboratory scientists* or *medical technologists*—and *clinical laboratory technicians,* also known as *medical technicians* or *medical laboratory technicians,* perform most of these tests.

Clinical laboratory personnel look for bacteria, parasites, and other microorganisms; analyze the chemical content of fluids; match blood for transfusions; and test for drug levels in the blood that show how a patient is responding to treatment.

Clinical laboratory personnel examine and analyze body fluids, and cells. They look for bacteria, parasites, and other microorganisms; analyze the chemical content of fluids; match blood for transfusions; and test for drug levels in the blood that show how a patient is responding to treatment. Technologists also prepare specimens for examination, count cells, and look for abnormal cells in blood and body fluids. They use microscopes, cell counters, and other sophisticated laboratory equipment. They also use automated equipment and computerized instruments capable of performing a number of tests simultaneously. After testing and examining a specimen, they analyze the results and relay them to physicians.

With increasing automation and the use of computer technology, the work of technologists and technicians has become less hands-on and more analytical. The complexity of tests performed, the level of judgment needed, and the amount of responsibility workers assume depend largely on the amount of education and experience they have. Clinical laboratory technologists usually do more complex tasks than clinical laboratory technicians do.

Clinical laboratory technologists perform complex chemical, biological, hematological, immunologic, microscopic, and bacteriological tests. Technologists microscopically examine blood and other body fluids. They make cultures of body fluid and tissue samples, to determine the presence of bacteria, fungi, parasites, or other microorganisms. Technologists analyze samples for chemical content or a chemical reaction and determine concentrations of com-

pounds such as blood glucose and cholesterol levels. They also type and cross match blood samples for transfusions.

Clinical laboratory technologists evaluate test results, develop and modify procedures, and establish and monitor programs, to ensure the accuracy of tests. Some technologists supervise clinical laboratory technicians.

Technologists in small laboratories perform many types of tests, whereas those in large laboratories generally specialize. Clinical chemistry technologists, for example, prepare specimens and analyze the chemical and hormonal contents of body fluids. Microbiology technologists examine and identify bacteria and other microorganisms. Blood bank technologists, or immunohematology technologists, collect, type, and prepare blood and its components for transfusions. Immunology technologists examine elements of the human immune system and its response to foreign bodies. Cytotechnologists prepare slides of body cells and examine these cells microscopically for abnormalities that may signal the beginning of a cancerous growth. Molecular biology technologists perform complex protein and nucleic acid testing on cell samples.

Clinical laboratory technicians perform less complex tests and laboratory procedures than technologists do. Technicians may prepare specimens and operate automated analyzers, for example, or they may perform manual tests in accordance with detailed instructions. They usually work under the supervision of medical and clinical laboratory technologists or laboratory managers. Like technologists, clinical laboratory technicians may work in several areas of the clinical laboratory or specialize in just one. Phlebotomists collect blood samples, for example, and histotechnicians cut and stain tissue specimens for microscopic examination by pathologists.

Work environment. Clinical laboratory personnel are trained to work with infectious specimens. When proper methods of infection control and sterilization are followed, few hazards exist. Protective masks, gloves, and goggles often are necessary to ensure the safety of laboratory personnel.

Working conditions vary with the size and type of employment setting. Laboratories usually are well lighted and clean; however, specimens, solutions, and reagents used in the laboratory sometimes produce fumes. Laboratory workers may spend a great deal of time on their feet.

Hours of clinical laboratory technologists and technicians vary with the size and type of employment setting. In large hospitals or in independent laboratories that operate continuously, personnel usually work the day, evening, or night shift and may work weekends and holidays. Laboratory personnel in small facilities may work on rotating shifts, rather than on a regular shift. In some facilities, laboratory personnel are on call several nights a week or on weekends, in case of an emergency.

Training, Other Qualifications, and Advancement

Clinical laboratory technologist generally require a bachelor's degree in medical technology or in one of the life sciences; clinical laboratory technicians usually need an associate degree or a certificate.

Education and training. The usual requirement for an entry-level position as a clinical laboratory technologist is a bachelor's degree with a major in medical technology or one of the life sciences; however, it is possible to qualify for some jobs with a combination of education and on-the-job and specialized training. Universities and hospitals offer medical technology programs.

Bachelor's degree programs in medical technology include courses in chemistry, biological sciences, microbiology, mathematics, and statistics, as well as specialized courses devoted to knowledge and skills used in the clinical laboratory. Many programs also offer or require courses in management, business, and computer applications. The Clinical Laboratory Improvement Act requires technologists who perform highly complex tests to have at least an associate degree.

Medical and clinical laboratory technicians generally have either an associate degree from a community or junior college or a certificate from a hospital, a vocational or technical school, or the Armed Forces. A few technicians learn their skills on the job.

The National Accrediting Agency for Clinical Laboratory Sciences (NAACLS) fully accredits about 470 programs for medical and clinical laboratory technologists, medical and clinical laboratory technicians, histotechnologists and histotechnicians, cytogenetic technologists, and diagnostic molecular scientists. NAACLS also approves about 60 programs in phlebotomy and clinical assisting. Other nationally recognized agencies that accredit specific areas for clinical laboratory workers include the Commission on Accreditation of Allied Health Education Programs and the Accrediting Bureau of Health Education Schools.

Licensure. Some states require laboratory personnel to be licensed or registered. Licensure of technologists often requires a bachelor's degree and the passing of an exam, but requirements vary by state and specialty. Information on licensure is available from state departments of health or boards of occupational licensing.

Certification and other qualifications. Many employers prefer applicants who are certified by a recognized professional association. Associations offering certification include the Board of Registry of the American Society for Clinical Pathology, the American Medical Technologists, the National Credentialing Agency for Laboratory Personnel, and the Board of Registry of the American Association of Bioanalysts. These agencies have different requirements for certification and different organizational sponsors.

In addition to certification, employers seek clinical laboratory personnel with good analytical judgment and the ability to work under pressure. Technologists in particular are expected to be good at problem solving. Close attention to detail is also essential for laboratory personnel because small differences or changes in test substances or numerical readouts can be crucial to a diagnosis. Manual dexterity and normal color vision are highly desirable, and with the widespread use of automated laboratory equipment, computer skills are important.

Advancement. Technicians can advance and become technologists through additional education and experience. Technologists may advance to supervisory positions in laboratory work or may become chief medical or clinical laboratory technologists or laboratory managers in hospitals. Manufacturers of home diagnostic testing kits and laboratory equipment and supplies also seek experienced technologists to work in product development, marketing, and sales.

Professional certification and a graduate degree in medical technology, one of the biological sciences, chemistry, management, or education usually speeds advancement. A doctorate usually is needed to become a laboratory director. Federal regulation requires directors of moderately complex laboratories to have either a master's degree or a bachelor's degree, combined with the appropriate amount of training and experience.

Employment

Clinical laboratory technologists and technicians held about 319,000 jobs in 2006. More than half of jobs were in hospitals. Most of the remaining jobs were in offices of physicians and in medical and diagnostic laboratories. A small proportion was in educational services and in all other ambulatory health care services.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-2016 Number	Change, 2006-2016 Percent
Clinical laboratory technologists and technicians	29-2010	319,000	362,000	43,000	14
Medical and clinical laboratory technologists	29-2011	167,000	188,000	21,000	12
Medical and clinical laboratory technicians	29-2012	151,000	174,000	23,000	15

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Job Outlook

Rapid job growth and excellent job opportunities are expected. Most jobs will continue to be in hospitals, but employment will grow faster in other settings.

Employment change. Employment of clinical laboratory workers is expected to grow 14 percent between 2006 and 2016, faster than the average for all occupations. The volume of laboratory tests continues to increase with both population growth and the development of new types of tests.

Technological advances will continue to have opposing effects on employment. On the one hand, new, increasingly powerful diagnostic tests will encourage additional testing and spur employment. On the other, research and development efforts targeted at simplifying routine testing procedures may enhance the ability of nonlaboratory personnel—physicians and patients in particular—to perform tests now conducted in laboratories.

Although hospitals are expected to continue to be the major employer of clinical laboratory workers, employment is expected to grow faster in medical and diagnostic laboratories, offices of physicians, and all other ambulatory health care services.

Job prospects. Job opportunities are expected to be excellent because the number of job openings is expected to continue to exceed the number of job seekers. Although significant, job growth will not be the only source of opportunities. As in most occupations, many additional openings will result from the need to replace workers who transfer to other occupations, retire, or stop working for some other reason.

Earnings

Median annual wage-and-salary earnings of medical and clinical laboratory technologists were $49,700 in May 2006. The middle 50 percent earned between $41,680 and $58,560. The lowest 10 percent earned less than $34,660, and the highest 10 percent earned more than $69,260. Median annual earnings in the industries employing the largest numbers of medical and clinical laboratory technologists were:

Federal government	$57,360
Medical and diagnostic laboratories	50,740
General medical and surgical hospitals	49,930
Offices of physicians	45,420
Colleges, universities, and professional schools	45,080

Median annual wage-and-salary earnings of medical and clinical laboratory technicians were $32,840 in May 2006. The middle 50 percent earned between $26,430 and $41,020. The lowest 10 percent earned less than $21,830, and the highest 10 percent earned more than $50,250. Median annual earnings in the industries employing the largest numbers of medical and clinical laboratory technicians were:

General medical and surgical hospitals	$34,200
Colleges, universities, and professional schools	33,440
Offices of physicians	31,330
Medical and diagnostic laboratories	30,240
Other ambulatory health care services	29,560

According to the American Society for Clinical Pathology, median hourly wages of staff clinical laboratory technologists and technicians in 2005 in various specialties and laboratory types were:

	Hospital	Private clinic	Physician office laboratory
Cytotechnologist	$26.39	$31.64	$25.69
Histotechnologist	21.50	21.63	23.29
Medical technologist	21.77	20.00	20.00
Histotechnician	18.50	20.86	18.27
Medical laboratory technician	17.41	16.94	16.63
Phlebotomist	11.70	12.15	11.25

Related Occupations

Clinical laboratory technologists and technicians analyze body fluids, tissue, and other substances, using a variety of tests. Similar or related procedures are performed by chemists and materials scientists, science technicians, and veterinary technologists and technicians.

Dental Hygienists

(O*NET 29-2021.00)

Significant Points

- A degree from an accredited dental hygiene school and a state license are required for this job.
- Dental hygienists rank among the fastest-growing occupations.
- Job prospects are expected to remain excellent.
- More than half work part time, and flexible scheduling is a distinctive feature of this job.

Nature of the Work

Dental hygienists remove soft and hard deposits from teeth, teach patients how to practice good oral hygiene, and provide other preventive dental care. They examine patients' teeth and gums, recording the presence of diseases or abnormalities.

Dental hygienists use an assortment of different tools to complete their tasks. Hand and rotary instruments and ultrasonic devices are used to clean and polish teeth, including removing calculus, stains, and plaque. Hygienists use X-ray machines to take dental pictures, and sometimes develop the film. They may use models of teeth to explain oral hygiene, perform root planning as a periodontal therapy, or apply cavity-preventative agents such as fluorides and pit and fissure sealants. In some states, hygienists are allowed to administer anesthetics, while in others they administer local anesthetics using syringes. Some states also allow hygienists to place and carve filling materials, temporary fillings, and periodontal dressings; remove sutures; and smooth and polish metal restorations.

Dental hygienists also help patients develop and maintain good oral health. For example, they may explain the relationship between diet and oral health or inform patients how to select toothbrushes and show them how to brush and floss their teeth.

Dental hygienists use hand and rotary instruments to clean and polish teeth.

Hygienists sometimes make a diagnosis and other times may prepare clinical and laboratory diagnostic tests for the dentist to interpret. Hygienists sometimes work chair side with the dentist during treatment.

Work environment. Dental hygienists work in clean, well-lighted offices. Important health safeguards include strict adherence to proper radiological procedures and the use of appropriate protective devices when administering anesthetic gas. Dental hygienists also wear safety glasses, surgical masks, and gloves to protect themselves and patients from infectious diseases.

Flexible scheduling is a distinctive feature of this job. Full-time, part-time, evening, and weekend schedules are widely available. Dentists frequently hire hygienists to work only 2 or 3 days a week, so hygienists may hold jobs in more than one dental office. More than half of all dental hygienists worked part time—less than 35 hours a week.

Training, Other Qualifications, and Advancement

Prospective dental hygienists must become licensed in the state in which they wish to practice. A degree from an accredited dental hygiene school is usually required along with licensure examinations.

Education and training. A high school diploma and college entrance test scores are usually required for admission to a dental hygiene program. High school students interested in becoming a dental hygienist should take courses in biology, chemistry, and mathematics. Also, some dental hygiene programs require applicants to have completed at least 1 year of college. Specific entrance requirements vary from one school to another.

In 2006, there were 286 dental hygiene programs accredited by the Commission on Dental Accreditation. Most dental hygiene programs grant an associate degree, although some also offer a certificate, a bachelor's degree, or a master's degree. A minimum of an associate degree or certificate in dental hygiene is generally required for practice in a private dental office. A bachelor's or master's degree usually is required for research, teaching, or clinical practice in public or school health programs.

Schools offer laboratory, clinical, and classroom instruction in subjects such as anatomy, physiology, chemistry, microbiology, pharmacology, nutrition, radiography, histology (the study of tissue structure), periodontology (the study of gum diseases), pathology, dental materials, clinical dental hygiene, and social and behavioral sciences.

Licensure. Dental hygienists must be licensed by the state in which they practice. Nearly all states require candidates to graduate from an accredited dental hygiene school and pass both a written and clinical examination. The American Dental Association's Joint Commission on National Dental Examinations administers the written examination, which is accepted by all states and the District of Columbia. State or regional testing agencies administer the clinical examination. In addition, most states require an examination on the legal aspects of dental hygiene practice. Alabama is the only state that allows candidates to take its examinations if they have been trained through a state-regulated on-the-job program in a dentist's office.

Other qualifications. Dental hygienists should work well with others because they work closely with dentists and dental assistants as well as dealing directly with patients. Hygienists also need good manual dexterity, because they use dental instruments within a patient's mouth, with little room for error.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-2016 Number	Change, 2006-2016 Percent
Dental hygienists	29-2021	167,000	217,000	50,000	30

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Employment

Dental hygienists held about 167,000 jobs in 2006. Because multiple job holding is common in this field, the number of jobs exceeds the number of hygienists. Almost all jobs for dental hygienists were in offices of dentists. A very small number worked for employment services, offices of physicians, or other industries.

Job Outlook

Dental hygienists rank among the fastest-growing occupations, and job prospects are expected to remain excellent.

Employment change. Employment of dental hygienists is expected to grow 30 percent through 2016, much faster than the average for all occupations. This projected growth ranks dental hygienists among the fastest growing occupations, in response to increasing demand for dental care and the greater use of hygienists.

The demand for dental services will grow because of population growth, older people increasingly retaining more teeth, and a growing focus on preventative dental care. To meet this demand, facilities that provide dental care, particularly dentists' offices, will increasingly employ dental hygienists, and more hygienists per office, to perform services that have been performed by dentists in the past.

Job prospects. Job prospects are expected to remain excellent. Older dentists, who have been less likely to employ dental hygienists, are leaving the occupation and will be replaced by recent graduates, who are more likely to employ one or more hygienists. In addition, as dentists' workloads increase, they are expected to hire more hygienists to perform preventive dental care, such as cleaning, so that they may devote their own time to more complex procedures.

Earnings

Median hourly earnings of dental hygienists were $30.19 in May 2006. The middle 50 percent earned between $24.63 and $35.67 an hour. The lowest 10 percent earned less than $19.45, and the highest 10 percent earned more than $41.60 an hour.

Earnings vary by geographic location, employment setting, and years of experience. Dental hygienists may be paid on an hourly, daily, salary, or commission basis.

Benefits vary substantially by practice setting and may be contingent upon full-time employment. According to the American Dental Association, 86 percent of hygienists receive hospital and medical benefits.

Related Occupations

Other workers supporting health practitioners in an office setting include dental assistants, medical assistants, occupational therapist assistants and aides, physical therapist assistants and aides, physician assistants, and registered nurses. Dental hygienists sometimes work with radiation technology, as do radiation therapists.

Diagnostic Medical Sonographers

(O*NET 29-2032.00)

Significant Points

- Job opportunities should be favorable.
- Employment growth is expected to be faster than average as sonography becomes an increasingly attractive alternative to radiologic procedures.
- More than half of all sonographers are employed by hospitals, and most of the rest are employed by offices of physicians, medical and diagnostic laboratories, and mobile imaging services.
- Sonographers may train in hospitals, vocational-technical institutions, colleges and universities, and the Armed Forces; employers prefer those who trained in accredited programs and who are registered.

Nature of the Work

Diagnostic imaging embraces several procedures that aid in diagnosing ailments. The most familiar procedures are the X ray and the magnetic resonance imaging; however, not all imaging technologies use ionizing radiation or radio waves. Sonography, or ultrasonography, is the use of sound waves to generate an image for the assessment and diagnosis of various medical conditions. Sonography commonly is associated with obstetrics and the use of ultrasound imaging during pregnancy, but this technology has many other applications in the diagnosis and treatment of medical conditions throughout the body.

Diagnostic medical sonographers use special equipment to direct non-ionizing, high frequency sound waves into areas of the patient's body. Sonographers operate the equipment, which collects reflected echoes and forms an image that may be videotaped, transmitted, or photographed for interpretation and diagnosis by a physician.

Sonographers begin by explaining the procedure to the patient and recording any medical history that may be relevant to the condition being viewed. They then select appropriate equipment settings and direct the patient to move into positions that will provide the best view. To perform the exam, sonographers use a transducer, which transmits sound waves in a cone- or rectangle-shaped beam.

Diagnostic medical sonographers use special equipment to direct non-ionizing high-frequency sound waves into areas of the patient's body.

Although techniques vary with the area being examined, sonographers usually spread a special gel on the skin to aid the transmission of sound waves.

Viewing the screen during the scan, sonographers look for subtle visual cues that contrast healthy areas with unhealthy ones. They decide whether the images are satisfactory for diagnostic purposes and select which ones to store and show to the physician. Sonographers take measurements, calculate values, and analyze the results in preliminary findings for the physicians.

In addition to working directly with patients, diagnostic medical sonographers keep patient records and adjust and maintain equipment. They also may prepare work schedules, evaluate equipment purchases, or manage a sonography or diagnostic imaging department.

Diagnostic medical sonographers may specialize in obstetric and gynecologic sonography (the female reproductive system), abdominal sonography (the liver, kidneys, gallbladder, spleen, and pancreas), neurosonography (the brain), or breast sonography. In addition, sonographers may specialize in vascular sonography or cardiac sonography. (Vascular sonographers and cardiac sonographers are covered in the *Handbook* statement on cardiovascular technologists and technicians.)

Obstetric and gynecologic sonographers specialize in the imaging of the female reproductive system. Included in the discipline is one of the more well-known uses of sonography: examining the fetus of a pregnant woman to track the baby's growth and health.

Abdominal sonographers inspect a patient's abdominal cavity to help diagnose and treat conditions primarily involving the gallbladder, bile ducts, kidneys, liver, pancreas, spleen, and male reproductive system. Abdominal sonographers also are able to scan parts of the chest, although studies of the heart using sonography usually are done by echocardiographers.

Neurosonographers focus on the nervous system, including the brain. In neonatal care, neurosonographers study and diagnose neurological and nervous system disorders in premature infants. They also may scan blood vessels to check for abnormalities indicating a stroke in infants diagnosed with sickle-cell anemia. Like other sonographers, neurosonographers operate transducers to perform the sonogram, but use frequencies and beam shapes different from those used by obstetric and abdominal sonographers.

Breast sonographers use sonography to study diseases of the breasts. Sonography aids mammography in the detection of breast cancer. Breast sonography can also track tumors, blood supply conditions, and assist in the accurate biopsy of breast tissue. Breast sonographers use high-frequency transducers, made exclusively to study breast tissue.

Work environment. Sonographers typically work in health care facilities that are clean. They usually work at diagnostic imaging machines in darkened rooms, but also may perform procedures at patients' bedsides. Sonographers may be on their feet for long periods of time and may have to lift or turn disabled patients. In addition, the nature of their work can put sonographers at an increased risk for musculoskeletal disorders such as carpel tunnel syndrome, neck and back strain, and eye strain: however, greater use of ergonomic equipment and an increasing awareness will continue to minimize such risks.

Some sonographers work as contract employees and may travel to several health care facilities in an area. Similarly, some sonographers work with mobile imaging service providers and travel to patients and use mobile diagnostic imaging equipment to provide service in areas that otherwise do not have the access to such services.

Most full-time sonographers work about 40 hours a week. Hospital-based sonographers may have evening and weekend hours and times when they are on call and must be ready to report to work on short notice.

Training, Other Qualifications, and Advancement

Diagnostic medical sonography is an occupation where there is no preferred level of education and several avenues of education are widely accepted by employers. Although no level of education is preferred, employers do prefer sonographers who trained in accredited programs and who are registered.

Education and training. There are several avenues for entry into the field of diagnostic medical sonography. Sonographers may train in hospitals, vocational-technical institutions, colleges and universities, and the Armed Forces. Some training programs prefer applicants with a background in science or experience in other health care professions. Some also may consider high school graduates with courses in mathematics and science, as well as applicants with liberal arts backgrounds, but this practice is infrequent.

Colleges and universities offer formal training in both two- and four-year programs, culminating in an associate or a bachelor's degree. Two-year programs are most prevalent. Course work includes classes in anatomy, physiology, instrumentation, basic physics, patient care, and medical ethics.

A few one-year programs that may result in a certificate also are accepted as proper education by employers. These programs typically are satisfactory education for workers already in health care who seek to increase their marketability by training in sonography. These programs are not accredited.

The Commission on Accreditation for Allied Health Education Programs (CAAHEP) accredited 147 training programs in 2006. These programs typically are the formal training programs offered by colleges and universities. Some hospital programs are accredited as well.

Certification and other qualifications. Although no state requires licensure in diagnostic medical sonography, organizations such as the American Registry for Diagnostic Medical Sonography

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-2016	
				Number	Percent
Diagnostic medical sonographers	29-2032	46,000	54,000	8,700	19

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

(ARDMS) certify the skills and knowledge of sonographers through credentialing, including registration. Because registration provides an independent, objective measure of an individual's professional standing, many employers prefer to hire registered sonographers. Sonographers registered by the ARDMS are Registered Diagnostic Medical Sonographers (RDMS). Registration with ARDMS requires passing a general physical principles and instrumentation examination, in addition to passing an exam in a specialty such as obstetric and gynecologic sonography, abdominal sonography, or neurosonography. Sonographers must complete a required number of continuing education hours to maintain registration with the ARDMS and to stay abreast of technological advancements related to the occupation.

Sonographers need good communication and interpersonal skills because they must be able to explain technical procedures and results to their patients, some of whom may be nervous about the exam or the problems it may reveal. Good hand-eye coordination is particularly important to obtaining quality images. It is also important that sonographers enjoy learning because continuing education is the key to sonographers staying abreast of the ever-changing field of diagnostic medicine. A background in mathematics and science is helpful for sonographers as well.

Advancement. Sonographers specializing in one particular discipline often seek competency in others. For example, obstetric sonographers might seek training in abdominal sonography to broaden their opportunities and increase their marketability.

Sonographers may also have advancement opportunities in education, administration, research, sales, or technical advising.

Employment

Diagnostic medical sonographers held about 46,000 jobs in 2006. More than half of all sonographer jobs were in public and private hospitals. The rest were typically in offices of physicians, medical and diagnostic laboratories, and mobile imaging services.

Job Outlook

Faster-than-average employment growth is expected. Job opportunities should be favorable.

Employment change. Employment of diagnostic medical sonographers is expected to increase by about 19 percent through 2016—faster than the average for all occupations—as the population ages, increasing the demand for diagnostic imaging and therapeutic technology.

Additional job growth is expected as sonography becomes an increasingly attractive alternative to radiologic procedures, as patients seek safer treatment methods. Unlike most diagnostic imaging methods, sonography does not involve radiation, so harmful side effects and complications from repeated use are less likely for both the patient and the sonographer. Sonographic technology is expected to evolve rapidly and to spawn many new sonography procedures, such as 3D- and 4D-sonography for use in obstetric and ophthalmologic diagnosis. However, high costs and approval by the federal government may limit the rate at which some promising new technologies are adopted.

Hospitals will remain the principal employer of diagnostic medical sonographers. However, employment is expected to grow more rapidly in offices of physicians and in medical and diagnostic laboratories, including diagnostic imaging centers. Healthcare facilities such as these are expected to grow very rapidly through 2016 because of the strong shift toward outpatient care, encouraged by third-party payers and made possible by technological advances that permit more procedures to be performed outside the hospital.

Job prospects. Job opportunities should be favorable. In addition to job openings from growth, some openings will arise from the need to replace sonographers who retire or leave the occupation permanently for some other reason. Pain caused by musculoskeletal disorders has made it difficult for sonographers to perform well. Some are forced to leave the occupation early because of this disorder.

Earnings

Median annual earnings of diagnostic medical sonographers were $57,160 in May 2006. The middle 50 percent earned between $48,890 and $67,670 a year. The lowest 10 percent earned less than $40,960, and the highest 10 percent earned more than $77,520. Median annual earnings of diagnostic medical sonographers in May 2006 were $56,970 in offices of physicians and $56,850 in general medical and surgical hospitals.

Related Occupations

Diagnostic medical sonographers operate sophisticated equipment to help physicians and other health practitioners diagnose and treat patients. Workers in related occupations include cardiovascular technologists and technicians, clinical laboratory technologists and technicians, nuclear medicine technologists, radiologic technologists and technicians, and respiratory therapists.

Emergency Medical Technicians and Paramedics

(O*NET 29-2041.00)

Significant Points

- Employment is projected to grow faster than the average as paid positions replace unpaid volunteers.
- Emergency medical technicians and paramedics need formal training and certification, but requirements vary by state.
- Emergency services function 24 hours a day so emergency medical technicians and paramedics have irregular working hours.
- Opportunities will be best for those who have earned advanced certifications.

Nature of the Work

People's lives often depend on the quick reaction and competent care of emergency medical technicians (EMTs) and paramedics. Incidents as varied as automobile accidents, heart attacks, slips and falls, childbirth, and gunshot wounds all require immediate medical attention. EMTs and paramedics provide this vital service as they care for and transport the sick or injured to a medical facility.

In an emergency, EMTs and paramedics are typically dispatched by a 911 operator to the scene, where they often work with police and fire fighters. (Police and detectives and firefighting occupations are discussed elsewhere in the *Handbook*.) Once they arrive, EMTs and paramedics assess the nature of the patient's condition while trying to determine whether the patient has any pre-existing medical conditions. Following medical protocols and guidelines, they provide appropriate emergency care and, when necessary, transport the patient. Some paramedics are trained to treat patients with minor injuries on the scene of an accident or they may treat them at their home without transporting them to a medical facility. Emergency treatment is carried out under the medical direction of physicians.

EMTs and paramedics may use special equipment, such as backboards, to immobilize patients before placing them on stretchers and securing them in the ambulance for transport to a medical facility. These workers generally work in teams. During the transport of a patient, one EMT or paramedic drives while the other monitors the patient's vital signs and gives additional care as needed. Some paramedics work as part of a helicopter's flight crew to transport critically ill or injured patients to hospital trauma centers.

Emergency medical technicians and paramedics often work in pairs, where one person drives the ambulance and the other monitors the patient.

At the medical facility, EMTs and paramedics help transfer patients to the emergency department, report their observations and actions to emergency department staff, and may provide additional emergency treatment. After each run, EMTs and paramedics replace used supplies and check equipment. If a transported patient had a contagious disease, EMTs and paramedics decontaminate the interior of the ambulance and report cases to the proper authorities.

EMTs and paramedics also provide transportation for patients from one medical facility to another, particularly if they work for private ambulance services. Patients often need to be transferred to a hospital that specializes in their injury or illness or to a nursing home.

Beyond these general duties, the specific responsibilities of EMTs and paramedics depend on their level of qualification and training. The National Registry of Emergency Medical Technicians (NREMT) certifies emergency medical service providers at five levels: First Responder; EMT-Basic; EMT-Intermediate, which has two levels called 1985 and 1999; and Paramedic. Some states, however, have their own certification programs and use distinct names and titles.

The EMT-Basic represents the first component of the emergency medical technician system. An EMT trained at this level is prepared to care for patients at the scene of an accident and while transporting patients by ambulance to the hospital under medical direction. The EMT-Basic has the emergency skills to assess a patient's condition and manage respiratory, cardiac, and trauma emergencies.

The EMT-Intermediate has more advanced training. However, the specific tasks that those certified at this level are allowed to perform varies greatly from state to state.

EMT-Paramedics provide the most extensive pre-hospital care. In addition to carrying out the procedures of the other levels, paramedics may administer drugs orally and intravenously, interpret electrocardiograms (EKGs), perform endotracheal intubations, and use monitors and other complex equipment. However, like EMT-Intermediate, what paramedics are permitted to do varies by state.

Work environment. EMTs and paramedics work both indoors and out, in all types of weather. They are required to do considerable kneeling, bending, and heavy lifting. These workers risk noise-induced hearing loss from sirens and back injuries from lifting patients. In addition, EMTs and paramedics may be exposed to diseases such as hepatitis-B and AIDS, as well as violence from mentally unstable patients. The work is not only physically strenuous but can be stressful, sometimes involving life-or-death situations and suffering patients. Nonetheless, many people find the work exciting and challenging and enjoy the opportunity to help others.

EMTs and paramedics employed by fire departments work about 50 hours a week. Those employed by hospitals frequently work between 45 and 60 hours a week, and those in private ambulance services, between 45 and 50 hours. Some of these workers, especially those in police and fire departments, are on call for extended periods. Because emergency services function 24 hours a day, EMTs and paramedics have irregular working hours.

Training, Other Qualifications, and Advancement

Generally, a high school diploma is required to enter a training program to become an EMT or paramedic. Workers must complete a formal training and certification process.

Education and training. A high school diploma is usually required to enter a formal emergency medical technician training program. Training is offered at progressive levels: EMT-Basic, EMT-Intermediate, and EMT-Paramedic.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-2016	
				Number	Percent
Emergency medical technicians and paramedics	29-2041	201,000	240,000	39,000	19

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

At the EMT-Basic level, coursework emphasizes emergency skills, such as managing respiratory, trauma, and cardiac emergencies, and patient assessment. Formal courses are often combined with time in an emergency room or ambulance. The program provides instruction and practice in dealing with bleeding, fractures, airway obstruction, cardiac arrest, and emergency childbirth. Students learn how to use and maintain common emergency equipment, such as backboards, suction devices, splints, oxygen delivery systems, and stretchers. Graduates of approved EMT-Basic training programs must pass a written and practical examination administered by the state certifying agency or the NREMT.

At the EMT-Intermediate level, training requirements vary by state. The nationally defined levels (EMT-Intermediate 1985 and EMT-Intermediate 1999) typically require 30 to 350 hours of training based on scope of practice. Students learn advanced skills such the use of advanced airway devices, intravenous fluids, and some medications.

The most advanced level of training for this occupation is EMT-Paramedic. At this level, the caregiver receives training in anatomy and physiology as well as advanced medical skills. Most commonly, the training is conducted in community colleges and technical schools over 1 to 2 years and may result in an associate's degree. Such education prepares the graduate to take the NREMT examination and become certified as a Paramedic. Extensive related coursework and clinical and field experience is required. Refresher courses and continuing education are available for EMTs and paramedics at all levels.

Licensure. All 50 states require certification for each of the EMT levels. In most states and the District of Columbia registration with the NREMT is required at some or all levels of certification. Other states administer their own certification examination or provide the option of taking either the NREMT or state examination. To maintain certification, EMTs and paramedics must recertify, usually every 2 years. Generally, they must be working as an EMT or paramedic and meet a continuing education requirement.

Other qualifications. EMTs and paramedics should be emotionally stable, have good dexterity, agility, and physical coordination, and be able to lift and carry heavy loads. They also need good eyesight (corrective lenses may be used) with accurate color vision.

Advancement. Paramedics can become supervisors, operations managers, administrative directors, or executive directors of emergency services. Some EMTs and paramedics become instructors, dispatchers, or physician assistants; others move into sales or marketing of emergency medical equipment. A number of people become EMTs and paramedics to test their interest in health care before training as registered nurses, physicians, or other health workers.

Employment

EMTs and paramedics held about 201,000 jobs in 2006. Most career EMTs and paramedics work in metropolitan areas. Volunteer EMTs and paramedics are more common in small cities, towns, and rural areas. These individuals volunteer for fire departments, emergency medical services, or hospitals and may respond to only a few calls per month. About 30 percent of EMTs or paramedics belong to a union.

Paid EMTs and paramedics were employed in a number of industries. About 4 out of 10 worked as employees of private ambulance services. About 3 out of 10 worked in local government for fire departments, public ambulance services, and emergency medical services. Another 2 out of 10 worked full time in hospitals within the medical facility or responded to calls in ambulances or helicopters to transport critically ill or injured patients. The remainder worked in various industries providing emergency services.

Job Outlook

Employment for EMTs and paramedics is expected to grow faster than the average for all occupations through 2016. Job prospects should be good, particularly in cities and private ambulance services.

Employment change. Employment of emergency medical technicians and paramedics is expected to grow by 19 percent between 2006 and 2016, which is faster than the average for all occupations. Full-time paid EMTs and paramedics will be needed to replace unpaid volunteers. It is becoming increasing difficult for emergency medical services to recruit and retain unpaid volunteers because of the amount of training and the large time commitment these positions require. As a result, more paid EMTs and paramedics are needed. Furthermore, as a large segment of the population—aging members of the baby boom generation—becomes more likely to have medical emergencies, demand will increase for EMTs and paramedics. There also will still be demand for part-time, volunteer EMTs and paramedics in rural areas and smaller metropolitan areas.

Job prospects. Job prospects should be favorable. Many job openings will arise from growth and from the need to replace workers who leave the occupation because of the limited potential for advancement, as well as the modest pay and benefits in private-sector jobs.

Job opportunities should be best in private ambulance services. Competition will be greater for jobs in local government, including fire, police, and independent third-service rescue squad departments which tend to have better salaries and benefits. EMTs and paramedics who have advanced education and certifications, such as Paramedic level certification, should enjoy the most favorable job prospects as clients and patients demand higher levels of care before arriving at the hospital.

Earnings

Earnings of EMTs and paramedics depend on the employment setting and geographic location of their jobs, as well as their training and experience. Median annual earnings of EMTs and paramedics were $27,070 in May 2006. The middle 50 percent earned between $21,290 and $35,210. The lowest 10 percent earned less than $17,300, and the highest 10 percent earned more than $45,280. Median annual earnings in the industries employing the largest numbers of EMTs and paramedics in May 2006 were $23,250 in general medical and surgical hospitals and $20,350 in ambulance services.

Those in emergency medical services who are part of fire or police departments typically receive the same benefits as firefighters or police officers. For example, many are covered by pension plans that provide retirement at half pay after 20 or 25 years of service or if the worker is disabled in the line of duty.

Related Occupations

Other workers in occupations that require quick and level-headed reactions to life-or-death situations are air traffic controllers, firefighting occupations, physician assistants, police and detectives, and registered nurses.

Licensed Practical and Licensed Vocational Nurses

(O*NET 29-2061.00)

Significant Points

- Most training programs, lasting about 1 year, are offered by vocational or technical schools or community or junior colleges.
- Overall job prospects are expected to be very good, but job outlook varies by industry.
- Replacement needs will be a major source of job openings, as many workers leave the occupation permanently.

Nature of the Work

Licensed practical nurses (LPNs), or licensed vocational nurses (LVNs), care for people who are sick, injured, convalescent, or disabled under the direction of physicians and registered nurses. (The work of physicians and surgeons and of registered nurses is described elsewhere in the *Handbook.*) The nature of the direction and supervision required varies by state and job setting.

LPNs care for patients in many ways. Often, they provide basic bedside care. Many LPNs measure and record patients' vital signs such as height, weight, temperature, blood pressure, pulse, and respiration. They also prepare and give injections and enemas, monitor catheters, dress wounds, and give alcohol rubs and massages. To help keep patients comfortable, they assist with bathing, dressing, and personal hygiene, moving in bed, standing, and walking. They might also feed patients who need help eating. Experienced LPNs may supervise nursing assistants and aides.

As part of their work, LPNs collect samples for testing, perform routine laboratory tests, and record food and fluid intake and output. They clean and monitor medical equipment. Sometimes, they help physicians and registered nurses perform tests and procedures. Some LPNs help to deliver, care for, and feed infants.

LPNs also monitor their patients and report adverse reactions to medications or treatments. LPNs gather information from patients, including their health history and how they are currently feeling. They may use this information to complete insurance forms, preauthorizations, and referrals, and they share information with registered nurses and doctors to help determine the best course of care for a patient.

Licensed practical nurses care for people who are sick, injured, convalescent, and disabled.

LPNs often teach family members how to care for a relative or teach patients about good health habits.

Most LPNs are generalists and work in all areas of health care. However, some work in a specialized setting, such as a nursing home, a doctor's office, or in home health care. LPNs in nursing care facilities help to evaluate residents' needs, develop care plans, and supervise the care provided by nursing aides. In doctors' offices and clinics, they may be responsible for making appointments, keeping records, and performing other clerical duties. LPNs who work in home health care may prepare meals and teach family members simple nursing tasks.

In some states, LPNs are permitted to administer prescribed medicines, start intravenous fluids, and provide care to ventilator-dependent patients.

Work environment. Most licensed practical nurses in hospitals and nursing care facilities work a 40-hour week, but because patients need round-the-clock care, some work nights, weekends, and holidays. They often stand for long periods and help patients move in bed, stand, or walk.

LPNs may face hazards from caustic chemicals, radiation, and infectious diseases. They are subject to back injuries when moving patients. They often must deal with the stress of heavy workloads. In addition, the patients they care for may be confused, agitated, or uncooperative.

Training, Other Qualifications, and Advancement

Most training programs, lasting about 1 year, are offered by vocational or technical schools or community or junior colleges. LPNs must be licensed to practice. Successful completion of a practical nurse program and passing an examination are required to become licensed.

Education and training. All states and the District of Columbia require LPNs to pass a licensing examination, known as the NCLEX-PN, after completing a state-approved practical nursing program. A high school diploma or its equivalent usually is required for entry, although some programs accept candidates without a diploma, and some programs are part of a high school curriculum.

In 2006, there were more than 1,500 state-approved training programs in practical nursing. Most training programs are available from technical and vocational schools or community and junior colleges. Other programs are available through high schools, hospitals, and colleges and universities.

Most year-long practical nursing programs include both classroom study and supervised clinical practice (patient care). Class-

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-2016	
				Number	Percent
Licensed practical and licensed vocational nurses	29-2061	749,000	854,000	105,000	14

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

room study covers basic nursing concepts and subjects related to patient care, including anatomy, physiology, medical-surgical nursing, pediatrics, obstetrics, psychiatric nursing, the administration of drugs, nutrition, and first aid. Clinical practice usually is in a hospital but sometimes includes other settings.

Licensure. The NCLEX-PN licensing exam is required in order to obtain licensure as an LPN. The exam is developed and administered by the National Council of State Boards of Nursing. The NCLEX-PN is a computer-based exam and varies in length. The exam covers four major categories: safe and effective care environment, health promotion and maintenance, psychosocial integrity, and physiological integrity.

Other qualifications. LPNs should have a caring, sympathetic nature. They should be emotionally stable because working with the sick and injured can be stressful. They also need to be observant, and to have good decision-making and communication skills. As part of a health-care team, they must be able to follow orders and work under close supervision.

Advancement. In some employment settings, such as nursing homes, LPNs can advance to become charge nurses who oversee the work of other LPNs and of nursing aides. Some LPNs also choose to become registered nurses through numerous LPN-to-RN training programs.

Employment

Licensed practical nurses held about 749,000 jobs in 2006. About 26 percent of LPNs worked in hospitals, 26 percent in nursing care facilities, and another 12 percent in offices of physicians. Others worked for home health care services; employment services; residential care facilities; community care facilities for the elderly; outpatient care centers; and federal, state, and local government agencies. About 19 percent worked part time.

Job Outlook

Employment of LPNs is projected to grow faster than average. Overall job prospects are expected to be very good, but job outlook varies by industry. The best job opportunities will occur in nursing care facilities and home health care services, while applicants for jobs in hospitals may face competition.

Employment change. Employment of LPNs is expected to grow 14 percent between 2006 and 2016, faster than the average for all occupations, in response to the long-term care needs of an increasing elderly population and the general increase in demand for health care services.

Many procedures once performed only in hospitals are being performed in physicians' offices and in outpatient care centers such as ambulatory surgical and emergency medical centers, largely because of advances in technology. LPNs care for patients who undergo these and other procedures, so employment of LPNs is projected to decline in traditional hospitals, but is projected to grow faster than average in most settings outside of hospitals. However, some hospitals are assigning a larger share of nursing duties to LPNs, which will temper the employment decline in the industry.

Employment of LPNs is expected to grow much faster than average in home health care services. Home health care agencies will offer a large number of new jobs for LPNs because of an increasing number of older people with functional disabilities, consumer preference for care in the home, and technological advances that make it possible to bring increasingly complex treatments into the home.

Employment of LPNs in nursing care facilities is expected to grow faster than average, and provide the most new jobs for LPNs, because of the growing number of people who are aged and disabled and in need of long-term care. In addition, LPNs in nursing care facilities will be needed to care for the increasing number of patients who have been discharged from the hospital but who have not recovered enough to return home.

Job prospects. Replacement needs will be a major source of job openings, as many workers leave the occupation permanently. Very good job opportunities are expected. Rapid employment growth is projected in most health care industries, with the best job opportunities occurring in nursing care facilities and in home health care services. However, applicants for jobs in hospitals may face competition as the number of hospital jobs for LPNs declines.

Earnings

Median annual earnings of licensed practical nurses were $36,550 in May 2006. The middle 50 percent earned between $31,080 and $43,640. The lowest 10 percent earned less than $26,380, and the highest 10 percent earned more than $50,480. Median annual earnings in the industries employing the largest numbers of licensed practical nurses in May 2006 were:

Employment services	$42,110
Nursing care facilities	38,320
Home health care services	37,880
General medical and surgical hospitals	35,000
Offices of physicians	32,710

Related Occupations

LPNs work closely with people while helping them. So do emergency medical technicians and paramedics; medical assistants; nursing, psychiatric, and home health aides; registered nurses; athletic trainers; social and human service assistants; pharmacy technicians; pharmacy aides; and surgical technologists.

A list of state-approved LPN programs is available from individual state boards of nursing.

Medical Records and Health Information Technicians

(O*NET 29-2071.00)

Significant Points

- Employment is expected to grow faster than average.
- Job prospects should be very good; technicians with a strong background in medical coding will be in particularly high demand.
- Entrants usually have an associate degree.
- This is one of the few health occupations in which there is little or no direct contact with patients.

Nature of the Work

Every time a patient receives health care, a record is maintained of the observations, medical or surgical interventions, and treatment outcomes. This record includes information that the patient provides concerning his or her symptoms and medical history, the results of examinations, reports of X rays and laboratory tests, diagnoses, and treatment plans. Medical records and health information technicians organize and evaluate these records for completeness and accuracy.

Technicians assemble patients' health information, making sure that patients' initial medical charts are complete, that all forms are completed and properly identified and authenticated, and that all necessary information is in the computer. They regularly communicate with physicians and other health care professionals to clarify diagnoses or to obtain additional information. Technicians regularly use computer programs to tabulate and analyze data to improve patient care, better control cost, provide documentation for use in legal actions, or use in research studies.

Medical records and health information technicians' duties vary with the size of the facility where they work. In large to medium-size facilities, technicians might specialize in one aspect of health information or might supervise health information clerks and transcriptionists while a medical records and health information administrator manages the department. (See the statement on medical and health services managers elsewhere in the *Handbook*.) In small facilities, a credentialed medical records and health information technician may have the opportunity to manage the department.

Medical records and health information technicians comprise one of the few health occupations that involve little or no direct contact with patients.

Some medical records and health information technicians specialize in coding patients' medical information for insurance purposes. Technicians who specialize in coding are called *health information coders, medical record coders, coder/abstractors*, or *coding specialists*. These technicians assign a code to each diagnosis and procedure, relying on their knowledge of disease processes. Technicians then use classification systems software to assign the patient to one of several hundred "diagnosis-related groups," or DRGs. The DRG determines the amount for which the hospital will be reimbursed if the patient is covered by Medicare or other insurance programs using the DRG system. In addition to the DRG system, coders use other coding systems, such as those required for ambulatory settings, physician offices, or long-term care.

Medical records and health information technicians also may specialize in cancer registry. *Cancer* (or tumor) *registrars* maintain facility, regional, and national databases of cancer patients. Registrars review patient records and pathology reports, and assign codes for the diagnosis and treatment of different cancers and selected benign tumors. Registrars conduct annual followups on all patients in the registry to track their treatment, survival, and recovery. Physicians and public health organizations then use this information to calculate survivor rates and success rates of various types of treatment, locate geographic areas with high incidences of certain cancers, and identify potential participants for clinical drug trials. Public health officials also use cancer registry data to target areas for the allocation of resources to provide intervention and screening.

Work environment. Medical records and health information technicians work in pleasant and comfortable offices. This is one of the few health-related occupations in which there is little or no direct contact with patients. Because accuracy is essential in their jobs, technicians must pay close attention to detail. Technicians who work at computer monitors for prolonged periods must guard against eyestrain and muscle pain.

Medical records and health information technicians usually work a 40-hour week. Some overtime may be required. In hospitals—where health information departments often are open 24 hours a day, 7 days a week—technicians may work day, evening, and night shifts.

Training, Other Qualifications, and Advancement

Medical records and health information technicians entering the field usually have an associate degree from a community or junior college. Many employers favor technicians who have become Registered Health Information Technicians (RHIT). Advancement opportunities for medical record and health information technicians are typically achieved by specialization or promotion to a management position.

Education and training. Medical records and health information technicians generally obtain an associate degree from a community or junior college. Typically, community and junior colleges offer flexible course scheduling or online distance learning courses. (See the *Sources of Education, Training, and Financial Aid* section of the *Handbook* for more information regarding community and junior colleges.) In addition to general education, coursework includes medical terminology, anatomy and physiology, legal aspects of health information, health data standards, coding and abstraction of

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-2016	
				Number	Percent
Medical records and health information technicians	29-2071	170,000	200,000	30,000	18

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

data, statistics, database management, quality improvement methods, and computer science. Applicants can improve their chances of admission into a program by taking biology, math, chemistry, health, and computer science courses in high school.

Certification and other qualifications. Most employers prefer to hire Registered Health Information Technicians (RHIT), who must pass a written examination offered by the American Health Information Management Association (AHIMA). To take the examination, a person must graduate from a two-year associate degree program accredited by the Commission on Accreditation for Health Informatics and Information Management Education (CAHIIM). Technicians trained in non-CAHIIM-accredited programs or trained on the job are not eligible to take the examination. In 2007, there were about 245 CAHIIM accredited programs in Health Informatics and Information Management Education.

Some employers prefer candidates with experience in a health care setting. Experience is valuable in demonstrating certain skills or desirable qualities. It is beneficial for health information technicians to possess good communication skills, as they often serve as a liaison between health care facilities, insurance companies, and other establishments. Accuracy is also essential to technicians because they must pay close attention to detail. A candidate who exhibits proficiency with computers will become more valuable as health care facilities continue to adopt electronic medical records.

Certification and advancement. Experienced medical records and health information technicians usually advance in one of two ways—by specializing or by moving into a management position. Many senior technicians specialize in coding, in cancer registry, or in privacy and security. Most coding and registry skills are learned on the job. A number of schools offer certificate programs in coding or include coding as part of the associate degree program for health information technicians, although there are no formal degree programs in coding. For cancer registry, there are a few formal two-year certificate programs approved by the National Cancer Registrars Association (NCRA). Some schools and employers offer intensive one- to two-week training programs in either coding or cancer registry.

Certification in coding is available from several organizations. Coding certification within specific medical specialty areas is available from the Board of Medical Specialty Coding and the Professional Association of Healthcare Coding Specialist (PAHCS). The American Academy of Professional Coders (AAPC) offers three distinct certification programs in coding. The AHIMA also offers certification for Certified Healthcare Privacy and Security because of growing concerns for the security of electronic medical records. Certification in cancer registry is available from the NCRA. Continuing education units are typically required to renew credentials.

In large medical records and health information departments, experienced technicians may advance to section supervisor, overseeing the work of the coding, correspondence, or discharge sections, for example. Senior technicians with RHIT credentials may become director or assistant director of a medical records and health information department in a small facility. However, in larger institutions, the director usually is an administrator with a bachelor's degree in medical records and health information administration.

Hospitals sometimes advance promising health information clerks to jobs as medical records and health information technicians, although this practice may be less common in the future. Advancement usually requires 2 to 4 years of job experience and completion of a hospital's in-house training program.

Employment

Medical records and health information technicians held about 170,000 jobs in 2006. About 2 out of 5 jobs were in hospitals. The rest were mostly in offices of physicians, nursing care facilities, outpatient care centers, and home health care services. Insurance firms that deal in health matters employ a small number of health information technicians to tabulate and analyze health information. Public health departments also employ technicians to supervise data collection from health care institutions and to assist in research.

Job Outlook

Employment is expected to grow faster than average. Job prospects should be very good; technicians with a strong background in medical coding will be in particularly high demand.

Employment change. Employment of medical records and health information technicians is expected to increase by 18 percent through 2016—faster than the average for all occupations—because of rapid growth in the number of medical tests, treatments, and procedures that will be increasingly scrutinized by health insurance companies, regulators, courts, and consumers. Also, technicians will be needed to enter patient information into computer databases to comply with federal legislation mandating the use of electronic medical records.

New jobs are expected in offices of physicians as a result of increasing demand for detailed records, especially in large group practices. New jobs also are expected in home health care services, outpatient care centers, and nursing and residential care facilities. Although employment growth in hospitals will not keep pace with growth in other health care industries, many new jobs will, nevertheless, be created.

Cancer registrars should experience job growth. As the population continues to age, the incidence of cancer may increase.

Job prospects. Job prospects should be very good. In addition to job growth, openings will result from the need to replace technicians who retire or leave the occupation permanently.

Technicians with a strong background in medical coding will be in particularly high demand. Changing government regulations and the growth of managed care have increased the amount of paperwork involved in filing insurance claims. Additionally, health care facilities are having some difficulty attracting qualified workers, primarily because employers prefer trained and experienced technicians prepared to work in an increasingly electronic environment with the integration of electronic health records. Job opportunities may be especially good for coders employed through temporary help agencies or by professional services firms.

Earnings

Median annual earnings of medical records and health information technicians were $28,030 in May 2006. The middle 50 percent

earned between $22,420 and $35,990. The lowest 10 percent earned less than $19,060, and the highest 10 percent earned more than $45,260. Median annual earnings in the industries employing the largest numbers of medical records and health information technicians in May 2006 were

General medical and surgical hospitals	$29,400
Nursing care facilities	28,410
Outpatient care centers	26,680
Offices of physicians	24,170

Related Occupations

Medical records and health information technicians need a strong clinical background to analyze the contents of medical records. Medical secretaries and medical transcriptionists also must be knowledgeable about medical terminology, anatomy, and physiology even though they have little or no direct contact with patients.

Nuclear Medicine Technologists

(O*NET 29-2033.00)

Significant Points

- Two-thirds of nuclear medicine technologists work in hospitals.
- Nuclear medicine technology programs range in length from 1 to 4 years and lead to a certificate, an associate degree, or a bachelor's degree.
- Faster-than-average job growth will arise from an increase in the number of middle-aged and elderly persons, who are the primary users of diagnostic and treatment procedures.
- The number of job openings each year will be relatively low because the occupation is small; technologists who also are trained in other diagnostic methods, such as radiologic technology or diagnostic medical sonography, will have the best prospects.

Nature of the Work

Diagnostic imaging embraces several procedures that aid in diagnosing ailments, the most familiar being the X ray. In nuclear medicine, radionuclides—unstable atoms that emit radiation spontaneously—are used to diagnose and treat disease. Radionuclides are purified and compounded to form radiopharmaceuticals. Nuclear medicine technologists administer radiopharmaceuticals to patients and then monitor the characteristics and functions of tissues

Nuclear medicine technologists operate cameras that detect and map the radioactive drugs in a patient's body to create diagnostic images.

or organs in which the drugs localize. Abnormal areas show higher-than-expected or lower-than-expected concentrations of radioactivity. Nuclear medicine differs from other diagnostic imaging technologies because it determines the presence of disease on the basis of metabolic changes rather than changes in organ structure.

Nuclear medicine technologists operate cameras that detect and map the radioactive drug in a patient's body to create diagnostic images. After explaining test procedures to patients, technologists prepare a dosage of the radiopharmaceutical and administer it by mouth, injection, inhalation, or other means. They position patients and start a gamma scintillation camera, or "scanner," which creates images of the distribution of a radiopharmaceutical as it localizes in, and emits signals from, the patient's body. The images are produced on a computer screen or on film for a physician to interpret.

When preparing radiopharmaceuticals, technologists adhere to safety standards that keep the radiation exposure as low as possible to workers and patients. Technologists keep patient records and document the amount and type of radionuclides that they receive, use, and discard.

Work environment. Physical stamina is important because nuclear medicine technologists are on their feet much of the day and may have to lift or turn disabled patients. In addition, technologists must operate complicated equipment that requires mechanical ability and manual dexterity.

Although the potential for radiation exposure exists in this field, it is minimized by the use of shielded syringes, gloves, and other protective devices and by adherence to strict radiation safety guidelines. The amount of radiation in a nuclear medicine procedure is comparable to that received during a diagnostic X-ray procedure. Technologists also wear badges that measure radiation levels. Because of safety programs, badge measurements rarely exceed established safety levels.

Nuclear medicine technologists generally work a 40-hour week, perhaps including evening or weekend hours, in departments that operate on an extended schedule. Opportunities for part-time and shift work also are available. In addition, technologists in hospitals may have on-call duty on a rotational basis, and those employed by mobile imaging services may be required to travel to several locations.

Training, Other Qualifications, and Advancement

Nuclear medicine technology programs range in length from 1 to 4 years and lead to a certificate, an associate degree, or a bachelor's degree. Many employers and an increasing number of states require

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-2016	
				Number	Percent
Nuclear medicine technologists	29-2033	20,000	23,000	2,900	15

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

certification or licensure. Aspiring nuclear medicine technologists should check the requirements of the state in which they plan to work.

Education and training. Completion of a nuclear medicine technology program takes 1 to 4 years and leads to a certificate, an associate degree, or a bachelor's degree. Generally, certificate programs are offered in hospitals, associate degree programs in community colleges, and bachelor's degree programs in four-year colleges and universities. Courses cover the physical sciences, biological effects of radiation exposure, radiation protection and procedures, the use of radiopharmaceuticals, imaging techniques, and computer applications.

One-year certificate programs are for health professionals who already possess an associate degree—especially radiologic technologists and diagnostic medical sonographers—but who wish to specialize in nuclear medicine. The programs also attract medical technologists, registered nurses, and others who wish to change fields or specialize.

The Joint Review Committee on Education Programs in Nuclear Medicine Technology accredits most formal training programs in nuclear medicine technology. In 2006, there were about 100 accredited programs in the continental United States and Puerto Rico.

Licensure and certification. Educational requirements for nuclear medicine technologists vary from state to state, so it is important that aspiring technologists check the requirements of the state in which they plan to work. More than half of all states require certification or licensing of nuclear medicine technicians. Certification is available from the American Registry of Radiologic Technologists (ARRT) and from the Nuclear Medicine Technology Certification Board (NMTCB). Although not required, some workers receive certification from both agencies. Nuclear medicine technologists must meet the minimum federal standards on the administration of radioactive drugs and the operation of radiation detection equipment.

The most common way to become eligible for certification by ARRT or NMTCB is to complete a training program recognized by those organizations. Other ways to become eligible are completing a bachelor's or associate degree in biological science or related health field, such as registered nursing, or acquiring, under supervision, a certain number of hours of experience in nuclear medicine technology. ARRT and NMTCB have different requirements, but in all cases, one must pass a comprehensive exam to become certified.

In addition to the general certification requirements, certified technicians also must complete a certain number of continuing education hours. Continuing education is required primarily because of the frequent technological and innovative changes in the field of nuclear medicine. Typically, technologists must register annually with both the ARRT and the NMTCB.

Other qualifications. Nuclear medicine technologists should have excellent communication skills, be detail-oriented, and have a desire to continue learning. Technologists must effectively interact with patients and their families and should be sensitive to patients' physical and psychological needs. Nuclear medicine technologists must be able to work independently as they usually have little direct supervision. Technologists also must be detailed-oriented and meticulous when performing procedures to assure that all regulations are being followed.

Advancement. Technologists may advance to supervisor, then to chief technologist, and to department administrator or director. Some technologists specialize in a clinical area such as nuclear cardiology or computer analysis or leave patient care to take positions in research laboratories. Some become instructors in, or directors of, nuclear medicine technology programs, a step that usually requires a bachelor's or master's degree in the subject. Others leave the occupation to work as sales or training representatives for medical equipment and radiopharmaceutical manufacturing firms or as radiation safety officers in regulatory agencies or hospitals.

Employment

Nuclear medicine technologists held about 20,000 jobs in 2006. About 67 percent of all nuclear medicine technologists jobs were in hospitals—private and government. Most of the rest were in offices of physicians or in medical and diagnostic laboratories, including diagnostic imaging centers.

Job Outlook

Faster-than-average job growth will arise from an increase in the number of middle-aged and elderly persons, who are the primary users of diagnostic and treatment procedures. However, the number of job openings each year will be relatively low because the occupation is small.

Employment change. Employment of nuclear medicine technologists is expected to increase by 15 percent from 2006 to 2016, faster than the average for all occupations. Growth will arise from technological advancement, the development of new nuclear medicine treatments, and an increase in the number of middle-aged and older persons, who are the primary users of diagnostic procedures, including nuclear medicine tests.

Technological innovations may increase the diagnostic uses of nuclear medicine. New nuclear medical imaging technologies, including positron emission tomography (PET) and single photon emission computed tomography (SPECT), are expected to be used increasingly and to contribute further to employment growth. The wider use of nuclear medical imaging to observe metabolic and biochemical changes during neurology, cardiology, and oncology procedures also will spur demand for nuclear medicine technologists.

Nonetheless, cost considerations will affect the speed with which new applications of nuclear medicine grow. Some promising nuclear medicine procedures, such as positron emission tomography, are extremely costly, and hospitals contemplating these procedures will have to consider equipment costs, reimbursement policies, and the number of potential users.

Job prospects. In spite of fast growth in nuclear medicine, the number of openings into the occupation each year will be relatively low because of the small size of the occupation. Technologists who have additional training in other diagnostic methods, such as radiologic technology or diagnostic medical sonography, will have the best prospects.

Earnings

Median annual earnings of nuclear medicine technologists were $62,300 in May 2006. The middle 50 percent earned between $53,530 and $72,410. The lowest 10 percent earned less than $46,490, and the highest 10 percent earned more than $82,310. Median annual earnings of nuclear medicine technologists in 2006 were $61,230 in general medical and surgical hospitals.

Related Occupations

Nuclear medical technologists operate sophisticated equipment to help physicians and other health practitioners diagnose and treat patients. Cardiovascular technologists and technicians, clinical laboratory technologists and technicians, diagnostic medical sonographers, radiation therapists, radiologic technologists and technicians, and respiratory therapists perform similar functions.

Occupational Health and Safety Specialists and Technicians

(O*NET 29-9011.00 and 29-9012.00)

Significant Points

- About 2 out of 5 specialists and technicians work in federal, state, and local government agencies that enforce rules on safety, health, and the environment.
- Some specialist jobs require a bachelor's degree in occupational health, safety, or a related field.
- Projected average employment growth reflects a balance of continuing public demand for a safe and healthy work environment against the desire for smaller government and fewer regulations.

Nature of the Work

Occupational health and safety specialists and technicians, also known as *safety and health professionals* or *occupational health and safety inspectors*, help prevent harm to workers, property, the environment, and the general public. For example, they might design safe work spaces, inspect machines, or test air quality. In addition to making workers safer, specialists and technicians aim to increase worker productivity by reducing absenteeism and equipment downtime—and to save money by lowering insurance premiums and workers' compensation payments, and preventing government fines. Some specialists and technicians work for governments, conducting safety inspections and imposing fines.

Occupational health and safety specialists analyze work environments and design programs to control, eliminate, and prevent disease or injury. They look for chemical, physical, radiological, and biological hazards, and they work to make more equipment ergonomic—designed to promote proper body positioning, increase worker comfort, and decrease fatigue. Specialists may conduct inspections and inform an organization's management of areas not in compliance with state and federal laws or employer policies. They also advise management on the cost and effectiveness of safety and health programs. Some provide training on new regulations and policies or on how to recognize hazards.

Sometimes, specialists develop methods to predict hazards from historical data and other information sources. They use these methods and their own knowledge and experience to evaluate current equipment, products, facilities, or processes and those planned for use in the future. For example, they might uncover patterns in injury data that show that many injuries are caused by a specific type of system failure, human error, or weakness in procedures. They evaluate the probability and severity of accidents and identify where controls need to be implemented to reduce or eliminate risk. If a new program or practice is required, they propose it to management and monitor results if it is implemented. Specialists also might conduct safety training for management, supervisors, and workers. Training

Occupational health and safety technicians use scientific equipment to measure hazards, such as noise or radiation.

sessions might show how to recognize hazards, for example, or explain new regulations and production processes.

Some specialists, often called *loss prevention specialists*, work for insurance companies, inspecting the facilities that they insure and suggesting and helping to implement improvements.

Occupational health and safety technicians often focus on testing air, water, machines, and other elements of the work environment. They collect data that occupational health and safety specialists then analyze. Usually working under the supervision of specialists, they also help to implement and evaluate safety programs.

To measure hazards, such as noise or radiation, occupational health and safety technicians prepare and calibrate scientific equipment. They must properly collect and handle samples of dust, gases, vapors, and other potentially toxic materials to ensure personal safety and accurate test results. Occupational health and safety specialists also may perform this work, especially if it is complex.

To ensure that machinery and equipment complies with appropriate safety regulations, occupational health and safety specialists and technicians both may examine and test machinery and equipment, such as lifting devices, machine guards, or scaffolding. They may check that personal protective equipment, such as masks, respirators, protective eyewear, or hardhats, is being used according to regulations. They also check that hazardous materials are stored correctly. They test and identify work areas for potential accident and health hazards, such as toxic vapors, mold, mildew, and explosive gas-air mixtures and help implement appropriate control measures, such as adjustments to ventilation systems. Their inspection of the workplace might involve talking with workers and observing their work, as well as inspecting elements in their work environment, such as lighting, tools, and equipment.

If an injury or illness occurs, occupational health and safety specialists and technicians help investigate, studying its causes and recommending remedial action. Some occupational health and safety specialists and technicians help workers to return to work after accidents and injuries.

Occupational health and safety specialists and technicians frequently communicate with management about the status of health and safety programs. They also might consult with engineers or physicians.

Specialists and technicians write reports, including accident reports, and enter information on Occupational Safety and Health Administration recordkeeping forms. They may prepare documents used in legal proceedings and give testimony in court. Those who develop expertise in specific areas may develop occupational health and safety systems, including policies, procedures, and manuals.

The responsibilities of occupational health and safety specialists and technicians vary by industry, workplace, and types of hazards affecting employees. Mine examiners, for example, are technicians who inspect mines for proper air flow and health hazards such as the buildup of methane or other noxious gases. Environmental protection officers evaluate and coordinate the storage and handling of hazardous waste, the cleanup of contaminated soil or water, or other activities that affect the environment. Ergonomists consider the design of industrial, office, and other equipment to maximize worker comfort, safety, and productivity. Health physicists work in places that use radiation and radioactive material, helping to protect people and the environment from hazardous radiation exposure. And industrial hygienists examine the workplace for health hazards, such as exposure to lead, asbestos, pesticides, or communicable diseases.

Work environment. Occupational health and safety specialists and technicians work in a variety of settings from offices and factories to mines. Their jobs often involve considerable fieldwork, and some require frequent travel.

Occupational health and safety specialists and technicians may be exposed to many of the same strenuous, dangerous, or stressful conditions faced by industrial employees. They may find themselves in an adversarial role if an organization disagrees with their recommendations. Many occupational health and safety specialists and technicians work long, and often irregular, hours.

Training, Other Qualifications, and Advancement

All occupational health and safety specialists and technicians are trained in the applicable laws or inspection procedures through some combination of classroom and on-the-job training.

Education and training. Some employers require occupational health and safety specialists to have a bachelor's degree in occupational health, safety, or a related field, such as engineering, biology, or chemistry. For some positions, a master's degree in industrial hygiene or a related subject is required. There also are associate degree and one-year certificate programs, which primarily are intended for technicians.

As of February 2007, the Accreditation Board for Engineering and Technology accredited 45 programs in health physics, industrial hygiene, and safety.

Certification and other qualifications. Although voluntary, many employers encourage certification. Certification is available through several organizations. The Board of Certified Safety Professionals offers the Certified Safety Professional (CSP) credential. The American Board of Industrial Hygiene offers the Certified Industrial Hygienist (CIH) credential. Also, the Council on Certification of Health, Environmental, and Safety Technologists certifies people as Occupational Health and Safety Technologists (OHST), who may be called Certified Loss Control Specialists (CLCS), Construction Health and Safety Technicians (CHST), and Safety Trained Supervisors (STS). The Indoor Air Quality Association awards the Certified Indoor Environmentalist (CIE) credential. The Board of Certification in Professional Ergonomics offers the Certified Professional Ergonomist (CPE) and the Certified Ergonomics Associate (CEA) credentials. The American Board of Health Physicists awards the Certified Health Physicist (CHP) credential.

Requirements for these credentials differ. Usually, they include specific education and experience, passing an examination, and completing periodic continuing education for recertification.

In general, people who want to enter this occupation should be responsible and like detailed work. Occupational health and safety specialists and technicians also should be able to communicate well. Recommended high school courses include English, mathematics, chemistry, biology, and physics. Experience as an occupational health and safety professional is also a prerequisite for many positions.

Advancement. Occupational health and safety specialists and technicians who work for the federal government advance through their career ladder to a specified full-performance level if their work is satisfactory. For positions above this level, usually supervisory positions, advancement is competitive and based on agency needs and individual merit. Advancement opportunities in state and local governments and the private sector are often similar to those in the federal government.

Specialists and technicians with broad education and experience and those who are well versed in numerous business functions usually have the best advancement opportunities. One way to keep up with current professional developments is to join a professional society, such as those that offer the certifications mentioned earlier. These organizations offer journals, continuing education courses, and conferences, which offer learning and networking opportunities and can help workers and students to advance.

With an advanced degree, professionals can become professors or do research. Promotion to senior specialist positions is likely to require an advanced degree and substantial experience in several areas of practice.

Employment

Occupational health and safety specialists and technicians held about 56,000 jobs in 2006. While the majority of jobs were spread throughout the private sector; about 2 out of 5 specialists worked for government agencies. Local governments employed 15 percent, the federal government employed 13 percent, and state governments employed 12 percent.

Within the federal government, most jobs are as Occupational Safety and Health Administration inspectors, who enforce U.S. Department of Labor regulations and impose fines. Within the U.S. Department of Health and Human Services, the National Institute of Occupational Safety and Health hires occupational health and safety specialists to offer companies help in evaluating safety without the risk of fines. Most large government agencies also employ occupational health and safety specialists and technicians who work to protect agency employees.

Most private companies either employ their own occupational health and safety workers or contract with them. Most contract work is done through consulting companies, but some specialists and technicians are self-employed.

In addition to working for governments, occupational health and safety specialists and technicians were employed in manufacturing firms; private general medical and surgical hospitals; private colleges, universities, and professional schools; scientific and technical consulting services; research and development in the physical, engineering, and life sciences; and electric power generation, transmission, and distribution. Insurance companies and technical consulting services also often employed specialists, whereas employment services and testing laboratories often employed technicians.

Job Outlook

Average employment growth is expected; additional opportunities will arise from the need to replace workers who leave the occupation.

Employment change. Employment of occupational health and safety specialists and technicians is expected to increase 9 percent during the 2006–2016 decade, about as fast as the average for all occupations, reflecting a balance of continuing public demand for a safe and healthy work environment against the desire for smaller government and fewer regulations. Emergency preparedness will continue to increase in importance, creating demand for these workers. More specialists will be needed to cope with technological advances in safety equipment and threats, changing regulations, and increasing public expectations. In private industry, employment growth will reflect overall business growth and continuing self-enforcement of government and company regulations and policies.

Over the past two decades, insurance and worker's compensation costs have risen and have become a financial concern for many employers and insurance companies. As a result, job growth should be good for those specializing in loss prevention, especially in construction safety and in ergonomics.

Job prospects. In addition to job openings from growth, job openings will arise from the need to replace workers who transfer to other occupations, retire, or leave for other reasons. An aging population paired with a decline in the number of postsecondary students studying the sciences, especially health physics, will create opportunities for those with technical skill.

Employment of occupational health and safety specialists and technicians in the private sector is somewhat affected by general economic fluctuations. Federal, state, and local governments, which employ about 2 out of 5 of all specialists and technicians, provide considerable job security; workers are less likely to be affected by changes in the economy.

Earnings

Median annual earnings of occupational health and safety specialists and technicians were $54,920 in May 2006. The middle 50 percent earned between $41,800 and $70,230. The lowest 10 percent earned less than $32,230, and the highest 10 percent earned more than $83,720. Median annual earnings in the industries employing the largest numbers of occupational health and safety specialists and technicians in May 2006 were:

Federal government	$68,890
Management, scientific, and technical consulting services	63,130
General medical and surgical hospitals	59,200
Local government	52,110
State government	49,690

Most occupational health and safety specialists and technicians work in large private firms or for federal, state, and local governments, most of which generally offer benefits more generous than those offered by smaller firms.

Related Occupations

Occupational health and safety specialists and technicians help to ensure that laws and regulations are obeyed. Others who enforce laws and regulations include agricultural inspectors, construction and building inspectors, correctional officers, financial examiners, fire inspectors, police and detectives, and transportation inspectors. Occupational health and safety specialists also analyze work environments and processes, topics that industrial engineers also study.

Sources of Additional Information

Information about jobs in federal, state, and local governments and in private industry is available from state employment service offices.

Information on obtaining positions as occupational health and safety specialists and technicians with the federal government is available from the Office of Personnel Management through USAJOBS, the federal government's official employment information system. This resource for locating and applying for job opportunities can be accessed through the Internet at http://www.usajobs.opm.gov or through an interactive voice response telephone system at (703) 724-1850 or TDD (978) 461-8404. These numbers are not toll free, and charges may result.

Opticians, Dispensing

(O*NET 29-2081.00)

Significant Points

- Most dispensing opticians receive training on the job or through apprenticeships lasting 2 or more years, but some employers seek graduates of postsecondary training programs in opticianry.
- A license to practice is required by 22 states.
- Employment growth is projected to be average and reflect the steady demand for corrective lenses and fashionable eyeglass frames.

Nature of the Work

Helping people see better and look good at the same time is the job of a dispensing optician. Dispensing opticians help select and then fit eyeglasses and contact lenses for people with eye problems, following prescriptions written by ophthalmologists or optometrists. (The work of optometrists is described elsewhere in the *Handbook*. See the section on physicians and surgeons for information about ophthalmologists.) Dispensing opticians recommend eyeglass frames, lenses, and lens coatings after considering the prescription and the customer's occupation, habits, and facial features. They measure clients' eyes, including the distance between the centers of the pupils and the distance between the ocular surface and the lens. For customers without prescriptions, dispensing opticians may use a focimeter to record eyeglass measurements in order to duplicate their existing eyeglasses. They also may obtain a customer's previous record to re-make eyeglasses or contact lenses, or they may verify a prescription with the examining optometrist or ophthalmologist.

Opticians take measurements to ensure that eyeglasses fit properly.

Dispensing opticians prepare work orders that give ophthalmic laboratory technicians the information they need to grind and insert lenses into a frame. (See the section on ophthalmic laboratory technicians elsewhere in the *Handbook*.) The work order includes prescriptions for lenses and information on their size, material, color, and style. Some dispensing opticians grind and insert lenses themselves. They may also apply tint to glasses. After the glasses are made, dispensing opticians verify that the lenses have been ground to specifications. Then they may reshape or bend the frame by hand or using pliers so that the eyeglasses fit the customer properly and comfortably.

Many opticians also spend time fixing, adjusting, and refitting broken frames. They instruct clients about adapting to, wearing, or caring for eyeglasses. Additionally, administrative duties have become a major part of their work, including keeping records on customers' prescriptions, work orders, and payments, and tracking inventory and sales.

Some dispensing opticians, after additional education and training, specialize in fitting contacts, artificial eyes, or cosmetic shells to cover blemished eyes. To fit contact lenses, dispensing opticians measure the shape and size of the eye, select the type of contact lens material, and prepare work orders specifying the prescription and lens size. Fitting contact lenses requires considerable skill, care, and patience. Dispensing opticians observe customers' eyes, corneas, lids, and contact lenses with specialized instruments and microscopes. During several follow-up visits, opticians teach proper insertion, removal, and care of contact lenses.

Work environment. Dispensing opticians work indoors mainly in medical offices, optical stores, or in large department or club stores. Opticians spend a fair amount of time on their feet. If they prepare lenses, they need to take precautions against the hazards of glass cutting, chemicals, and machinery. Most dispensing opticians work about 40 hours a week, although a few work longer hours. Those in retail stores may work evenings and weekends. Some work part time.

Training, Other Qualifications, and Advancement

Most workers entering this occupation receive their training on the job, mainly through apprenticeship programs that may last 2 years or longer. Some employers, though, prefer to hire people who have graduated from an opticianry program.

Education and training. A high school diploma is all that is required to get into this occupation, but most workers have completed at least some college courses or a degree. Classes in physics, basic anatomy, algebra, and trigonometry as well as experience with computers are particularly valuable. These prepare dispensing opticians to learn job skills, including optical mathematics, optical physics, and the use of precision measuring instruments and other machinery and tools.

Most applicants for optician positions do not have any background in the field and learn mainly on the job. Large employers usually offer structured apprenticeship programs; small employers provide more informal, on-the-job training. Apprentices receive technical training and also learn office management and sales. Under the supervision of an experienced optician, optometrist, or ophthalmologist, apprentices work directly with patients, fitting eyeglasses and contact lenses.

Formal training in the field is offered in community colleges and in a few four-year colleges and universities. As of 2007, the Commission on Opticianry Accreditation accredited 21 associate degree programs. Graduation from an accredited program in opticianry provides a nationally recognized credential. There also are shorter programs of 1 year or less.

Licensure. Twenty-one states require dispensing opticians to be licensed. States may require individuals to pass one or more of the following for licensure: a state practical examination, a state written examination, and certification examinations offered by the American Board of Opticianry (ABO) and the National Contact Lens Examiners (NCLE). To qualify for the examinations, states often require applicants to complete postsecondary training or work as apprentices for 2 to 4 years.

Some states that license dispensing opticians allow graduates of opticianry programs to take the licensure exam immediately upon graduation; others require a few months to a year of experience. Continuing education is commonly required for licensure renewal. Information about specific licensing requirements is available from the state board of occupational licensing.

Certification and other qualifications. Any optician can apply to the ABO and the NCLE for certification of their skills, whether or not their state requires it. Certification signifies to customers and employers that an optician has a certain level of expertise. All applicants age 18 or older who have a high school diploma or equivalent are eligible for the exam, but some state licensing boards have additional eligibility requirements. Certification must be renewed every 3 years through continuing education. The state of Texas offers voluntary registration for the occupation.

Dispensing opticians deal directly with the public, so they should be tactful, pleasant, and communicate well. Manual dexterity and the ability to do precision work are essential.

Advancement. Many experienced dispensing opticians open their own optical stores. Others become managers of optical stores or sales representatives for wholesalers or manufacturers of eyeglasses or lenses.

Employment

Dispensing opticians held about 66,000 jobs in 2006. About one-third of dispensing opticians worked in offices of optometrists. Nearly one-third worked in health and personal care stores, including optical goods stores. Many of these stores offer one-stop shopping. Customers may have their eyes examined, choose frames, and have glasses made on the spot. Some opticians work in optical departments of department stores or other general merchandise stores, such as warehouse clubs and superstores. Eleven percent worked in offices of physicians, primarily ophthalmologists, who sell glasses directly to patients. Two percent were self-employed and ran their own unincorporated businesses.

Job Outlook

Employment of dispensing opticians is expected to grow about as fast as average for all occupations through 2016, as the population ages and demand for corrective lenses increases. Good job prospects are expected, but the occupation will remain relatively small.

Employment change. Employment in this occupation is expected to rise 9 percent over the 2006–2016 decade. Middle age is a time when many individuals use corrective lenses for the first time, and elderly persons generally require more vision care than others. As the share of the population in these older age groups increases, more opticians will be needed to provide service to them. In addition, awareness is increasing of the importance of regular eye exams across all age groups. A small, but growing number of states require children as young as 5 to get eye exams, which is expected to increase the need for eye care services in those states. Fashion also influences demand. Frames come in a growing variety of styles, colors, and sizes, encouraging people to buy more than one pair.

Moderating the need for optician services is the increasing use of laser surgery to correct vision problems. Although the surgery remains relatively more expensive than eyewear, patients who successfully undergo this surgery may not require glasses or contact lenses for several years. Also, new technology is allowing people with minimal training to make the measurements needed to fit glasses and may allow dispensing opticians to work faster, limiting the need for more workers. There also is proposed legislation that, if passed, may require contact lens manufacturers to make lenses available to nonoptical retail outlets, which may allow them to be sold over the Internet, reducing the need for opticians to provide contact lens services.

Job prospects. Job prospects for entering the profession should be good as there is a regular need to replace those who leave the occupation or retire. Nevertheless, the number of job openings will be limited because the occupation is small. Also, dispensing opticians are vulnerable to changes in the business cycle because eyewear purchases often can be deferred for a time. Job prospects will be best for those who have taken formal opticianry classes and those who master new technology, including new refraction systems, framing materials, and edging techniques.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-2016	
				Number	Percent
Opticians, dispensing	29-2081	66,000	72,000	5,700	9

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Earnings

Median annual earnings of dispensing opticians were $30,300 in May 2006. The middle 50 percent earned between $23,560 and $38,950. The lowest 10 percent earned less than $19,290, and the highest 10 percent earned more than $47,630. Median annual earnings in the industries employing the largest numbers of dispensing opticians in May 2006 were:

Offices of physicians	$32,770
Health and personal care stores	31,850
Offices of health practitioner	29,200
Offices of optometrists	29,190

Benefits for opticians are generally determined by the industries in which they are employed. In general, those who work part-time or in small retail shops generally have fewer benefits than those who may work for large optical chains or department stores. Self-employed opticians must provide their own benefits.

Related Occupations

Other workers who deal with customers and perform delicate work include jewelers and precious stone and metal workers, orthotists and prosthetists, and precision instrument and equipment repairers. Ophthalmic laboratory technicians also perform many of the tasks that opticians perform. And because many opticians work in the retail industry, retail salesworkers also perform some of the same duties.

Pharmacy Technicians

(O*NET 29-2052.00)

Significant Points

- Job opportunities are expected to be good, especially for those with certification or previous work experience.
- Many technicians work evenings, weekends, and holidays.
- About 71 percent of jobs are in retail pharmacies, grocery stores, department stores, or mass retailers.

Nature of the Work

Pharmacy technicians help licensed pharmacists provide medication and other health care products to patients. Technicians usually perform routine tasks to help prepare prescribed medication, such as counting tablets and labeling bottles. They also perform administrative duties, such as answering phones, stocking shelves, and operating cash registers. Technicians refer any questions regarding prescriptions, drug information, or health matters to a *pharmacist*. (See the statement on pharmacists elsewhere in the *Handbook*.)

Pharmacy technicians who work in retail or mail-order pharmacies have varying responsibilities, depending on state rules and regulations. Technicians receive written prescriptions or requests for prescription refills from patients. They also may receive prescriptions sent electronically from the doctor's office. They must verify that information on the prescription is complete and accurate. To prepare the prescription, technicians must retrieve, count, pour, weigh, measure, and sometimes mix the medication. Then, they prepare the prescription labels, select the type of prescription container, and affix the prescription and auxiliary labels to the container. Once the prescription is filled, technicians price and file the prescription, which must be checked by a pharmacist before it is given to the patient. Technicians may establish and maintain patient profiles, prepare insurance claim forms, and stock and take inventory of prescription and over-the-counter medications.

Pharmacy technicians prepare prescription medications for patients.

In hospitals, nursing homes, and assisted-living facilities, technicians have added responsibilities, including reading patients' charts and preparing the appropriate medication. After the pharmacist checks the prescription for accuracy, the pharmacy technician may deliver it to the patient. The technician then copies the information about the prescribed medication onto the patient's profile. Technicians also may assemble a 24-hour supply of medicine for every patient. They package and label each dose separately. The packages are then placed in the medicine cabinets of patients until the supervising pharmacist checks them for accuracy, and only then is the medication given to the patients.

Pharmacy aides work closely with pharmacy technicians. They often are clerks or cashiers who primarily answer telephones, handle money, stock shelves, and perform other clerical duties. (See the statement on pharmacy aides elsewhere in the *Handbook*.) Pharmacy technicians usually perform more complex tasks than pharmacy aides, although in some states their duties and job titles may overlap.

Work environment. Pharmacy technicians work in clean, organized, well-lighted, and well-ventilated areas. Most of their workday is spent on their feet. They may be required to lift heavy boxes or to use stepladders to retrieve supplies from high shelves.

Technicians work the same hours that pharmacists work. These may include evenings, nights, weekends, and holidays, particularly in facilities that are open 24 hours a day such as hospitals and some retail pharmacies. As their seniority increases, technicians often acquire increased control over the hours they work. There are many opportunities for part-time work in both retail and hospital settings.

Training, Other Qualifications, and Advancement

Most pharmacy technicians are trained on-the-job, but employers favor applicants who have formal training, certification, or previous

experience. Strong customer service skills also are important. Pharmacy technicians may become supervisors, may move into specialty positions or into sales, or may become pharmacists.

Education and training. Although most pharmacy technicians receive informal on-the-job training, employers favor those who have completed formal training and certification. However, there are currently few state and no federal requirements for formal training or certification of pharmacy technicians. Employers who have insufficient resources to give on-the-job training often seek formally educated pharmacy technicians. Formal education programs and certification emphasize the technician's interest in and dedication to the work. In addition to the military, some hospitals, proprietary schools, vocational or technical colleges, and community colleges offer formal education programs.

Formal pharmacy technician education programs require classroom and laboratory work in a variety of areas, including medical and pharmaceutical terminology, pharmaceutical calculations, pharmacy recordkeeping, pharmaceutical techniques, and pharmacy law and ethics. Technicians also are required to learn medication names, actions, uses, and doses. Many training programs include internships, in which students gain hands-on experience in actual pharmacies. After completion, students receive a diploma, a certificate, or an associate's degree, depending on the program.

Prospective pharmacy technicians with experience working as an aide in a community pharmacy or volunteering in a hospital may have an advantage. Employers also prefer applicants with experience managing inventories, counting tablets, measuring dosages, and using computers. In addition, a background in chemistry, English, and health education may be beneficial.

Certification and other qualifications. Two organizations, the Pharmacy Technician Certification Board and the Institute for the Certification of Pharmacy Technicians, administer national certification examinations. Certification is voluntary in most states, but is required by some states and employers. Some technicians are hired without formal training, but under the condition that they obtain certification within a specified period of time. To be eligible for either exam, candidates must have a high school diploma or GED, no felony convictions of any kind within 5 years of applying, and no drug or pharmacy related felony convictions at any point. Employers, often pharmacists, know that individuals who pass the exam have a standardized body of knowledge and skills. Many employers also will reimburse the costs of the exam.

Under both programs, technicians must be recertified every 2 years. Recertification requires 20 hours of continuing education within the two-year certification period. At least 1 hour must be in pharmacy law. Continuing education hours can be earned from several different sources, including colleges, pharmacy associations, and pharmacy technician training programs. Up to 10 hours of continuing education can be earned on the job under the direct supervision and instruction of a pharmacist.

Strong customer service and teamwork skills are needed because pharmacy technicians interact with patients, coworkers, and health care professionals. Mathematics, spelling, and reading skills also are important. Successful pharmacy technicians are alert, observant, organized, dedicated, and responsible. They should be willing and able to take directions, but be able to work independently without constant instruction. They must be precise; details are sometimes a matter of life and death. Candidates interested in becoming pharmacy technicians cannot have prior records of drug or substance abuse.

Advancement. In large pharmacies and health-systems, pharmacy technicians with significant training, experience and certification can be promoted to supervisory positions, mentoring and training pharmacy technicians with less experience. Some may advance into specialty positions such as chemo therapy technician and nuclear pharmacy technician. Others move into sales. With a substantial amount of formal training, some pharmacy technicians go on to become pharmacists.

Employment

Pharmacy technicians held about 285,000 jobs in 2006. About 71 percent of jobs were in retail pharmacies, either independently owned or part of a drugstore chain, grocery store, department store, or mass retailer. About 18 percent of jobs were in hospitals and a small proportion was in mail-order and Internet pharmacies, offices of physicians, pharmaceutical wholesalers, and the federal government.

Job Outlook

Employment is expected to increase much faster than the average through 2016, and job opportunities are expected to be good.

Employment change. Employment of pharmacy technicians is expected to increase by 32 percent from 2006 to 2016, which is much faster than the average for all occupations. The increased number of middle-aged and elderly people—who use more prescription drugs than younger people—will spur demand for technicians throughout the projection period. In addition, as scientific advances bring treatments for an increasing number of conditions, more pharmacy technicians will be needed to fill a growing number of prescriptions.

As cost-conscious insurers begin to use pharmacies as patient-care centers, pharmacy technicians will assume responsibility for some of the more routine tasks previously performed by Pharmacists. In addition, they will adopt some of the administrative duties that were previously performed by pharmacy aides, such as answering phones and stocking shelves.

Reducing the need for pharmacy technicians to some degree, however, will be the growing use of drug dispensing machines. These machines increase productivity by completing some of the pharmacy technician's duties, namely counting pills and placing them into prescription containers. These machines are only used for the most common medications, however, and their effect on employment should be minimal.

Almost all states have legislated the maximum number of technicians who can safely work under a pharmacist at one time. Changes in these laws could directly affect employment.

Job prospects. Good job opportunities are expected for full-time and part-time work, especially for technicians with formal training or previous experience. Job openings for pharmacy technicians will result from employment growth, and from the need to replace workers who transfer to other occupations or leave the labor force.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-2016	
				Number	Percent
Pharmacy technicians	29-2052	285,000	376,000	91,000	32

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Earnings

Median hourly earnings of wage-and-salary pharmacy technicians in May 2006 were $12.32. The middle 50 percent earned between $10.10 and $14.92. The lowest 10 percent earned less than $8.56, and the highest 10 percent earned more than $17.65. Median hourly earnings in the industries employing the largest numbers of pharmacy technicians in May 2006 were:

General medical and surgical hospitals	$13.86
Grocery stores	12.78
Pharmacies and drug stores	11.50

Certified technicians may earn more. Shift differentials for working evenings or weekends also can increase earnings. Some technicians belong to unions representing hospital or grocery store workers.

Related Occupations

This occupation is most closely related to pharmacists and pharmacy aides. Workers in other medical support occupations include dental assistants, medical transcriptionists, medical records and health information technicians, occupational therapist assistants and aides, and physical therapist assistants and aides.

Radiologic Technologists and Technicians

(O*NET 29-2034.00, 29-2034.01, and 29-2034.02)

Significant Points

- Employment is projected to grow faster than average, and job opportunities are expected to be favorable.
- Formal training programs in radiography are offered in hospitals, colleges and universities, and less frequently at vocational-technical institutes; range in length from 1 to 4 years; and lead to a certificate, an associate degree, or a bachelor's degree.
- Although hospitals will remain the primary employer, a number of new jobs will be found in physicians' offices and diagnostic imaging centers.

Nature of the Work

Radiologic technologists take X rays and administer nonradioactive materials into patients' bloodstreams for diagnostic purposes.

Radiographers position equipment at the correct angle and height over the appropriate area of a patient's body.

Radiologic technologists also referred to as *radiographers,* produce X-ray films (radiographs) of parts of the human body for use in diagnosing medical problems. They prepare patients for radiologic examinations by explaining the procedure, removing jewelry and other articles through which X rays cannot pass, and positioning patients so that the parts of the body can be appropriately radiographed. To prevent unnecessary exposure to radiation, these workers surround the exposed area with radiation protection devices, such as lead shields, or limit the size of the X-ray beam. Radiographers position radiographic equipment at the correct angle and height over the appropriate area of a patient's body. Using instruments similar to a measuring tape, they may measure the thickness of the section to be radiographed and set controls on the X-ray machine to produce radiographs of the appropriate density, detail, and contrast. They place the X-ray film under the part of the patient's body to be examined and make the exposure. They then remove the film and develop it.

Radiologic technologists must follow physicians' orders precisely and conform to regulations concerning the use of radiation to protect themselves, their patients, and their co-workers from unnecessary exposure.

In addition to preparing patients and operating equipment, radiologic technologists keep patient records and adjust and maintain equipment. They also may prepare work schedules, evaluate purchases of equipment, or manage a radiology department.

Experienced radiographers may perform more complex imaging procedures. When performing fluoroscopies, for example, radiographers prepare a solution of contrast medium for the patient to drink, allowing the radiologist (a physician who interprets radiographs) to see soft tissues in the body.

Some radiographers specialize in computed tomography (CT), and are sometimes referred to as *CT technologists*. CT scans produce a substantial amount of cross-sectional X rays of an area of the body. From those cross-sectional X rays, a three-dimensional image is made. The CT uses ionizing radiation; therefore, it requires the same precautionary measures that radiographers use with other X rays.

Radiographers also can specialize in Magnetic Resonance Imaging as an *MR technologist*. MR, like CT, produces multiple cross-sectional images to create a three-dimensional image. Unlike CT, MR uses non-ionizing radio frequency to generate image contrast.

Another common specialty for radiographers specialize in is mammography. Mammographers use low-dose X-ray systems to produce images of the breast.

In addition to radiologic technologists, others who conduct diagnostic imaging procedures include cardiovascular technologists and technicians, diagnostic medical sonographers, and nuclear medicine technologists. (Each is discussed elsewhere in the *Handbook.*)

Work environment. Physical stamina is important in this occupation because technologists are on their feet for long periods and may lift or turn disabled patients. Technologists work at diagnostic machines but also may perform some procedures at patients' bedsides. Some travel to patients in large vans equipped with sophisticated diagnostic equipment.

Although radiation hazards exist in this occupation, they are minimized by the use of lead aprons, gloves, and other shielding devices, as well as by instruments monitoring exposure to radiation. Technologists wear badges measuring radiation levels in the radiation area, and detailed records are kept on their cumulative lifetime dose.

Most full-time radiologic technologists work about 40 hours a week. They may, however, have evening, weekend, or on-call hours. Opportunities for part-time and shift work also are available.

Training, Other Qualifications, and Advancement

Preparation for this profession is offered in hospitals, colleges and universities, and less frequently at vocational-technical institutes. Hospitals employ most radiologic technologists. Employers prefer to hire technologists with formal training.

Education and training. Formal training programs in radiography range in length from 1 to 4 years and lead to a certificate, an associate degree, or a bachelor's degree. Two-year associate degree programs are most prevalent.

Some one-year certificate programs are available for experienced radiographers or individuals from other health occupations, such as medical technologists and registered nurses, who want to change fields. A bachelor's or master's degree in one of the radiologic technologies is desirable for supervisory, administrative, or teaching positions.

The Joint Review Committee on Education in Radiologic Technology accredits most formal training programs for the field. The committee accredited more than 600 radiography programs in 2007. Admission to radiography programs require, at a minimum, a high school diploma or the equivalent. High school courses in mathematics, physics, chemistry, and biology are helpful. The programs provide both classroom and clinical instruction in anatomy and physiology, patient care procedures, radiation physics, radiation protection, principles of imaging, medical terminology, positioning of patients, medical ethics, radiobiology, and pathology.

Licensure. Federal legislation protects the public from the hazards of unnecessary exposure to medical and dental radiation by ensuring that operators of radiologic equipment are properly trained. Under this legislation, the federal government sets voluntary standards that the states may use for accrediting training programs and licensing individuals who engage in medical or dental radiography. In 2007, 40 states required licensure for practicing radiologic technologists and technicians.

Certification and other qualifications. The American Registry of Radiologic Technologists (ARRT) offers voluntary certification for radiologic technologists. In addition, 35 states use ARRT-administered exams for state licensing purposes. To be eligible for certification, technologists generally must graduate from an accredited program and pass an examination. Many employers prefer to hire certified radiographers. To be recertified, radiographers must complete 24 hours of continuing education every 2 years.

Radiologic technologists should be sensitive to patients' physical and psychological needs. They must pay attention to detail, follow instructions, and work as part of a team. In addition, operating complicated equipment requires mechanical ability and manual dexterity.

Advancement. With experience and additional training, staff technologists may become specialists, performing CT scanning, MR, and angiography, a procedure during which blood vessels are X-rayed to find clots. Technologists also may advance, with additional education and certification, to become a radiologist assistant.

Experienced technologists also may be promoted to supervisor, chief radiologic technologist, and, ultimately, department administrator or director. Depending on the institution, courses or a master's degree in business or health administration may be necessary for the director's position.

Some technologists progress by specializing in the occupation to become instructors or directors in radiologic technology programs; others take jobs as sales representatives or instructors with equipment manufacturers.

Employment

Radiologic technologists held about 196,000 jobs in 2006. More than 60 percent of all jobs were in hospitals. Most other jobs were in offices of physicians; medical and diagnostic laboratories, including diagnostic imaging centers; and outpatient care centers.

Job Outlook

Employment is projected to grow faster than average, and job opportunities are expected to be favorable.

Employment change. Employment of radiologic technologists is expected to increase by about 15 percent from 2006 to 2016, faster than the average for all occupations. As the population grows and ages, there will be an increasing demand for diagnostic imaging. Although health care providers are enthusiastic about the clinical benefits of new technologies, the extent to which they are adopted depends largely on cost and reimbursement considerations. As technology advances many imaging modalities are becoming less expensive and their adoption is becoming more widespread. For example, digital imaging technology can improve the quality of the images and the efficiency of the procedure, but it remains slightly more expensive than analog imaging, a procedure during which the image is put directly on film. Despite this, digital imaging is becom-

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-2016	
				Number	Percent
Radiologic technologists and technicians	29-2034	196,000	226,000	30,000	15

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

ing more widespread in many imaging facilities because of the advantages it provides over analog.

Although hospitals will remain the principal employer of radiologic technologists, a number of new jobs will be found in offices of physicians and diagnostic imaging centers. Health facilities such as these are expected to grow through 2016, because of the shift toward outpatient care, encouraged by third-party payers and made possible by technological advances that permit more procedures to be performed outside the hospital.

Job prospects. In addition to job growth, job openings also will arise from the need to replace technologists who leave the occupation. Radiologic technologists are willing to relocate and who also are experienced in more than one diagnostic imaging procedure—such as CT, MR, and mammography—will have the best employment opportunities as employers seek to control costs by using multi-credentialed employees.

CT is becoming a frontline diagnosis tool. Instead of taking x rays to decide whether a CT is needed, as was the practice before, it is often the first choice for imaging because of its accuracy. MR also is increasing in frequency of use. Technologists with credentialing in either of these specialties will be very marketable to employers.

Earnings

Median annual earnings of radiologic technologists were $48,170 in May 2006. The middle 50 percent earned between $39,840 and $57,940. The lowest 10 percent earned less than $32,750, and the highest 10 percent earned more than $68,920. Median annual earnings in the industries employing the largest numbers of radiologic technologists in 2006 were:

Medical and diagnostic laboratories	$51,280
General medical and surgical hospitals	48,830
Offices of physicians	45,500

Related Occupations

Radiologic technologists operate sophisticated equipment to help physicians, dentists, and other health practitioners diagnose and treat patients. Workers in related occupations include cardiovascular technologists and technicians, clinical laboratory technologists and technicians, diagnostic medical sonographers, nuclear medicine technologists, radiation therapists, and respiratory therapists.

Surgical Technologists

(O*NET 29-2055.00)

Significant Points

- Employment is expected to grow much faster than average.
- Job opportunities will be best for technologists who are certified.
- Training programs last 9 to 24 months and lead to a certificate, diploma, or associate degree.
- Hospitals will continue to be the primary employer, although much faster employment growth is expected in other health care industries.

Nature of the Work

Surgical technologists, also called *scrubs* and *surgical* or *operating room technicians,* assist in surgical operations under the supervision of surgeons, registered nurses, or other surgical personnel. Surgical technologists are members of operating room teams, which most commonly include surgeons, anesthesiologists, and circulating nurses.

Before an operation, surgical technologists help prepare the operating room by setting up surgical instruments and equipment, sterile drapes, and sterile solutions. They assemble both sterile and nonsterile equipment, as well as check and adjust it to ensure it is working properly. Technologists also get patients ready for surgery by washing, shaving, and disinfecting incision sites. They transport patients to the operating room, help position them on the operating table, and cover them with sterile surgical drapes. Technologists also observe patients' vital signs, check charts, and help the surgical team put on sterile gowns and gloves.

During surgery, technologists pass instruments and other sterile supplies to surgeons and surgeon assistants. They may hold retractors, cut sutures, and help count sponges, needles, supplies, and instruments. Surgical technologists help prepare, care for, and dispose of specimens taken for laboratory analysis and help apply dressings. Some operate sterilizers, lights, or suction machines, and help operate diagnostic equipment.

After an operation, surgical technologists may help transfer patients to the recovery room and clean and restock the operating room.

Surgical technologists assemble, check, and adjust both sterile and nonsterile equipment.

Certified surgical technologists with additional specialized education or training also may act in the role of the surgical first assistant or circulator. The surgical first assistant, as defined by the American College of Surgeons (ACS), provides aid in exposure, hemostasis (controlling blood flow and stopping or preventing hemorrhage), and other technical functions under the surgeon's direction that help the surgeon carry out a safe operation. A circulating technologist is the "unsterile" member of the surgical team who interviews the patient before surgery; prepares the patient; helps with anesthesia; obtains and opens packages for the "sterile" people to remove the sterile contents during the procedure; keeps a written account of the surgical procedure; and answers the surgeon's questions about the patient during the surgery.

Work environment. Surgical technologists work in clean, well-lighted, cool environments. They must stand for long periods and remain alert during operations. At times, they may be exposed to communicable diseases and unpleasant sights, odors, and materials.

Most surgical technologists work a regular 40-hour week, although they may be on call or work nights, weekends, and holidays on a rotating basis.

Training, Other Qualifications, and Advancement

Training programs last 9 to 24 months and lead to a certificate, diploma, or associate degree. Professional certification can help in getting jobs and promotions.

Education and training. Surgical technologists receive their training in formal programs offered by community and junior colleges, vocational schools, universities, hospitals, and the military. In 2006, the Commission on Accreditation of Allied Health Education Programs (CAAHEP) recognized more than 400 accredited training programs. Programs last from 9 to 24 months and lead to a certificate, diploma, or associate degree. High school graduation normally is required for admission. Recommended high school courses include health, biology, chemistry, and mathematics.

Programs provide classroom education and supervised clinical experience. Students take courses in anatomy, physiology, microbiology, pharmacology, professional ethics, and medical terminology. Other topics covered include the care and safety of patients during surgery, sterile techniques, and surgical procedures. Students also learn to sterilize instruments; prevent and control infection; and handle special drugs, solutions, supplies, and equipment.

Certification and other qualifications. Most employers prefer to hire certified technologists. Technologists may obtain voluntary professional certification from the Liaison Council on Certification for the Surgical Technologist by graduating from a CAAHEP-accredited program and passing a national certification examination. They may then use the Certified Surgical Technologist (CST) designation. Continuing education or reexamination is required to maintain certification, which must be renewed every 4 years.

Certification also may be obtained from the National Center for Competency Testing (NCCT). To qualify to take the exam, candidates follow one of three paths: complete an accredited training program; undergo a two-year hospital on-the-job training program; or acquire seven years of experience working in the field. After passing the exam, individuals may use the designation Tech in Surgery-Certified, TS-C (NCCT). This certification must be renewed every five years through either continuing education or reexamination.

Surgical technologists need manual dexterity to handle instruments quickly. They also must be conscientious, orderly, and emotionally stable to handle the demands of the operating room environment. Technologists must respond quickly and must be familiar with operating procedures in order to have instruments ready for surgeons without having to be told. They are expected to keep abreast of new developments in the field.

Advancement. Technologists advance by specializing in a particular area of surgery, such as neurosurgery or open heart surgery. They also may work as circulating technologists. With additional training, some technologists advance to first assistant. Some surgical technologists manage central supply departments in hospitals, or take positions with insurance companies, sterile supply services, and operating equipment firms.

Employment

Surgical technologists held about 86,000 jobs in 2006. About 70 percent of jobs for surgical technologists were in hospitals, mainly in operating and delivery rooms. Other jobs were in offices of physicians or dentists who perform outpatient surgery and in outpatient care centers, including ambulatory surgical centers. A few technologists, known as private scrubs, are employed directly by surgeons who have special surgical teams, like those for liver transplants.

Job Outlook

Employment of surgical technologists is expected to grow much faster than the average for all occupations. Job opportunities will be best for technologists who are certified.

Employment change. Employment of surgical technologists is expected to grow 24 percent between 2006 and 2016, much faster than the average for all occupations, as the volume of surgeries increases. The number of surgical procedures is expected to rise as the population grows and ages. Older people, including the baby boom generation, who generally require more surgical procedures, will account for a larger portion of the general population. In addition, technological advances, such as fiber optics and laser technology, will permit an increasing number of new surgical procedures to be performed and also will allow surgical technologists to assist with a greater number of procedures.

Hospitals will continue to be the primary employer of surgical technologists, although much faster employment growth is expected in offices of physicians and in outpatient care centers, including ambulatory surgical centers.

Job prospects. Job opportunities will be best for technologists who are certified.

Earnings

Median annual earnings of wage-and-salary surgical technologists were $36,080 in May 2006. The middle 50 percent earned between $30,300 and $43,560. The lowest 10 percent earned less than $25,490, and the highest 10 percent earned more than $51,140.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-2016	
				Number	Percent
Surgical technologists	29-2055	86,000	107,000	21,000	24

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Median annual earnings in the industries employing the largest numbers of surgical technologists were:

Offices of physicians	$37,300
Outpatient care centers	37,280
General medical and surgical hospitals	35,840
Offices of dentists	34,160

Benefits provided by most employers include paid vacation and sick leave, health, medical, vision, dental insurance and life insurance, and retirement program. A few employers also provide tuition reimbursement and child care benefits.

Related Occupations

Other health occupations requiring approximately 1 year of training after high school include dental assistants, licensed practical and licensed vocational nurses, clinical laboratory technologists and technicians, and medical assistants.

Veterinary Technologists and Technicians

(O*NET 29-2056.00)

Significant Points

- Animal lovers get satisfaction from this occupation, but aspects of the work can be unpleasant, physically and emotionally demanding, and sometimes dangerous.
- Entrants generally complete a two-year or four-year veterinary technology program and must pass a state examination.
- Employment is expected to grow much faster than average.
- Overall job opportunities should be excellent; however, keen competition is expected for jobs in zoos and aquariums.

Nature of the Work

Owners of pets and other animals today expect state-of-the-art veterinary care. To provide this service, veterinarians use the skills of veterinary technologists and technicians, who perform many of the same duties for a veterinarian that a nurse would for a physician, including routine laboratory and clinical procedures. Although specific job duties vary by employer, there often is little difference between the tasks carried out by technicians and by technologists, despite some differences in formal education and training. As a result, most workers in this occupation are called *technicians.*

Many veterinary technologists and technicians assist veterinarians in routine laboratory and clinical procedures.

Veterinary technologists and technicians typically conduct clinical work in a private practice under the supervision of a licensed veterinarian. They often perform various medical tests and treat and diagnose medical conditions and diseases in animals. For example, they may perform laboratory tests such as urinalysis and blood counts, assist with dental prophylaxis, prepare tissue samples, take blood samples, or assist veterinarians in a variety of tests and analyses in which they often use various items of medical equipment, such as test tubes and diagnostic equipment. While most of these duties are performed in a laboratory setting, many are not. For example, some veterinary technicians obtain and record patients' case histories, expose and develop X rays and radiographs, and provide specialized nursing care. In addition, experienced veterinary technicians may discuss a pet's condition with its owners and train new clinic personnel. Veterinary technologists and technicians assisting small-animal practitioners usually care for companion animals, such as cats and dogs, but can perform a variety of duties with mice, rats, sheep, pigs, cattle, monkeys, birds, fish, and frogs. Very few veterinary technologists work in mixed animal practices where they care for both small companion animals and larger, nondomestic animals.

Besides working in private clinics and animal hospitals, veterinary technologists and technicians may work in research facilities, where they administer medications orally or topically, prepare samples for laboratory examinations, and record information on an animal's genealogy, diet, weight, medications, food intake, and clinical signs of pain and distress. Some may sterilize laboratory and surgical equipment and provide routine postoperative care. At research facilities, veterinary technologists typically work under the guidance of veterinarians or physicians. Some veterinary technologists vaccinate newly admitted animals and occasionally may have to euthanize seriously ill, severely injured, or unwanted animals.

While the goal of most veterinary technologists and technicians is to promote animal health, some contribute to human health as well. Veterinary technologists occasionally assist veterinarians in implementing research projects as they work with other scientists in medical-related fields such as gene therapy and cloning. Some find opportunities in biomedical research, wildlife medicine, the military, livestock management, or pharmaceutical sales.

Work environment. People who love animals get satisfaction from working with and helping them. However, some of the work may be unpleasant, physically and emotionally demanding, and sometimes dangerous. At times, veterinary technicians must clean cages and lift, hold, or restrain animals, risking exposure to bites or

scratches. These workers must take precautions when treating animals with germicides or insecticides. The work setting can be noisy.

Veterinary technologists and technicians who witness abused animals or who euthanize unwanted, aged, or hopelessly injured animals may experience emotional stress. Those working for humane societies and animal shelters often deal with the public, some of whom might react with hostility to any implication that the owners are neglecting or abusing their pets. Such workers must maintain a calm and professional demeanor while they enforce the laws regarding animal care.

In some animal hospitals, research facilities, and animal shelters, a veterinary technician is on duty 24 hours a day, which means that some may work night shifts. Most full-time veterinary technologists and technicians work about 40 hours a week, although some work 50 or more hours a week.

Training, Other Qualifications, and Advancement

There are primarily two levels of education and training for entry to this occupation: a two-year program for veterinary technicians and a four-year program for veterinary technologists.

Education and training. Most entry-level veterinary technicians have a two-year associate degree from an American Veterinary Medical Association (AVMA)-accredited community college program in veterinary technology in which courses are taught in clinical and laboratory settings using live animals. About 16 colleges offer veterinary technology programs that are longer and that culminate in a four-year bachelor's degree in veterinary technology. These four-year colleges, in addition to some vocational schools, also offer two-year programs in laboratory animal science. Several schools offer distance learning.

In 2006, 131 veterinary technology programs in 44 states were accredited by the American Veterinary Medical Association (AVMA). Graduation from an AVMA-accredited veterinary technology program allows students to take the credentialing exam in any state in the country.

Persons interested in careers as veterinary technologists and technicians should take as many high school science, biology, and math courses as possible. Science courses taken beyond high school, in an associate or bachelor's degree program, should emphasize practical skills in a clinical or laboratory setting.

Technologists and technicians usually begin work as trainees in routine positions under the direct supervision of a veterinarian. Entry-level workers whose training or educational background encompasses extensive hands-on experience with a variety of laboratory equipment, including diagnostic and medical equipment, usually require a shorter period of on-the-job training.

Licensure and certification. Each state regulates veterinary technicians and technologists differently; however, all states require them to pass a credentialing exam following coursework. Passing the state exam assures the public that the technician or technologist has sufficient knowledge to work in a veterinary clinic or hospital. Candidates are tested for competency through an examination that includes oral, written, and practical portions and that is regulated by the state Board of Veterinary Examiners or the appropriate state agency. Depending on the state, candidates may become registered, licensed, or certified. Most states, however, use the National Veterinary Technician (NVT) exam. Prospects usually can have their passing scores transferred from one state to another, so long as both states use the same exam.

Employers recommend American Association for Laboratory Animal Science (AALAS) certification for those seeking employment in a research facility. AALAS offers certification for three levels of technician competence, with a focus on three principal areas—animal husbandry, facility management, and animal health and welfare. Those who wish to become certified must satisfy a combination of education and experience requirements prior to taking the AALAS examination. Work experience must be directly related to the maintenance, health, and well-being of laboratory animals and must be gained in a laboratory animal facility as defined by AALAS. Candidates who meet the necessary criteria can begin pursuing the desired certification on the basis of their qualifications. The lowest level of certification is Assistant Laboratory Animal Technician (ALAT), the second level is Laboratory Animal Technician (LAT), and the highest level of certification is Laboratory Animal Technologist (LATG). The AALAS examination consists of multiple-choice questions and is longer and more difficult for higher levels of certification, ranging from 2 hours and 120 multiple choice questions for the ALAT to 3 hours and 180 multiple choice questions for the LATG.

Other qualifications. As veterinary technologists and technicians often deal with pet owners, communication skills are very important. In addition, technologists and technicians should be able to work well with others, because teamwork with Veterinarians is common. Organizational ability and the ability to pay attention to detail also are important.

Advancement. As they gain experience, technologists and technicians take on more responsibility and carry out more assignments under only general veterinary supervision. Some eventually may become supervisors.

Employment

Veterinary technologists and technicians held about 71,000 jobs in 2006. About 91 percent worked in veterinary services. The remainder worked in boarding kennels, animal shelters, stables, grooming salons, zoos, state and private educational institutions, and local, state, and federal agencies.

Job Outlook

Excellent job opportunities will stem from the need to replace veterinary technologists and technicians who leave the occupation and from the limited output of qualified veterinary technicians from two-year programs, which are not expected to meet the demand over the 2006–2016 period. Employment is expected to grow much faster than average.

Employment change. Employment of veterinary technologists and technicians is expected to grow 41 percent over the 2006–2016 projection period, which is much faster than the average for all occupations. Pet owners are becoming more affluent and more willing to pay for advanced veterinary care because many of them consider their pet to be part of the family. This growing affluence and

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-2016	
				Number	Percent
Veterinary technologists and technicians	29-2056	71,000	100,000	29,000	41

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

view of pets will continue to increase the demand for veterinary care. The vast majority of veterinary technicians work at private clinical practice under veterinarians. As the number of veterinarians grows to meet the demand for veterinary care, so will the number of veterinary technicians needed to assist them.

The number of pet owners who take advantage of veterinary services for their pets—currently about 6 in 10—is expected to grow over the projection period, increasing employment opportunities. The availability of advanced veterinary services, such as preventive dental care and surgical procedures, also will provide opportunities for workers specializing in those areas as they will be needed to assist licensed veterinarians. The rapidly growing number of cats kept as companion pets is expected to boost the demand for feline medicine and services. Further demand for these workers will stem from the desire to replace veterinary assistants with more highly skilled technicians and technologists in animal clinics and hospitals, shelters, boarding kennels, and humane societies.

Biomedical facilities, diagnostic laboratories, wildlife facilities, humane societies, animal control facilities, drug or food manufacturing companies, and food safety inspection facilities will provide additional jobs for veterinary technologists and technicians. However, keen competition is expected for veterinary technologist and technician jobs in zoos and aquariums, due to expected slow growth in facility capacity, low turnover among workers, the limited number of positions, and the fact that the work in zoos and aquariums attracts many candidates.

Job prospects. Excellent job opportunities are expected because of the relatively few veterinary technology graduates each year. The number of two-year programs has recently grown to 131, but due to small class sizes, fewer than 3,000 graduates are anticipated each year, which is not expected to meet demand. Additionally, many veterinary technicians remain in the field for only seven to eight years, so the need to replace workers who leave the occupation each year also will produce many job opportunities.

Employment of veterinary technicians and technologists is relatively stable during periods of economic recession. Layoffs are less likely to occur among veterinary technologists and technicians than in some other occupations because animals will continue to require medical care.

Earnings

Median hourly earnings of veterinary technologists and technicians were $12.88 in May 2006. The middle 50 percent earned between $10.44 and $15.77. The bottom 10 percent earned less than $8.79, and the top 10 percent earned more than $18.68.

Related Occupations

Others who work extensively with animals include animal care and service workers, and veterinary assistants and laboratory animal caretakers. Like veterinary technologists and technicians, they must have patience and feel comfortable with animals. However, the level of training required for these occupations is less than that needed by veterinary technologists and technicians. Veterinarians, who need much more formal education, also work extensively with animals, preventing, diagnosing, and treating their diseases, disorders, and injuries.

Service Occupations

Healthcare Support Occupations

Dental Assistants

(O*NET 31-9091.00)

Significant Points

- Job prospects should be excellent.
- Dentists are expected to hire more assistants to perform routine tasks so that they may devote their own time to more complex procedures.
- Many assistants learn their skills on the job, although an increasing number are trained in dental-assisting programs; most programs take one year or less to complete.

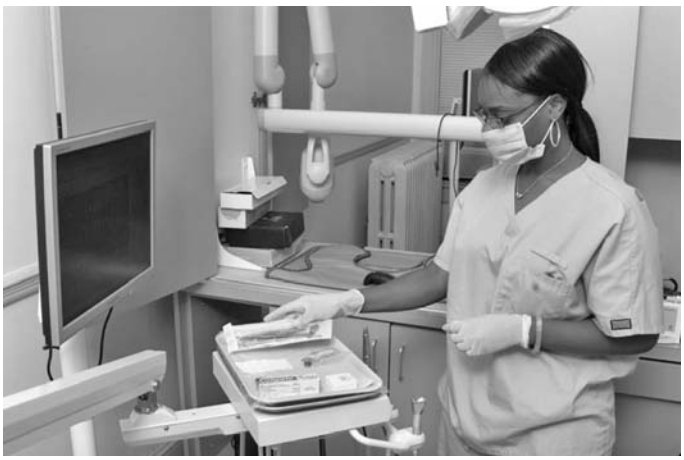
Nature of the Work

Dental assistants work closely with, and under the supervision of, dentists. (See the statement on dentists elsewhere in the *Handbook*.) Assistants perform a variety of patient care, office, and laboratory duties.

Dental assistants should not be confused with dental hygienists, who are licensed to perform different clinical tasks. (See the statement on dental hygienists elsewhere in the *Handbook*.)

Dental assistants sterilize and disinfect instruments and equipment, prepare and lay out the instruments and materials required to treat each patient, and obtain patients' dental records. Assistants make patients as comfortable as possible in the dental chair and prepare them for treatment. During dental procedures, assistants work alongside the dentist to provide assistance. They hand instruments and materials to dentists and keep patients' mouths dry and clear by using suction or other devices. They also instruct patients on postoperative and general oral health care.

Dental assistants may prepare materials for impressions and restorations, take dental X rays, and process X-ray film as directed by a dentist. They also may remove sutures, apply topical anesthetics to gums or cavity-preventive agents to teeth, remove excess cement used in the filling process, and place rubber dams on the teeth to isolate them for individual treatment. Some states are expanding dental assistants' duties to include tasks such as coronal polishing and restorative dentistry functions for those assistants that meet specific training and experience requirements.



Dental assistants prepare and lay out the instruments and materials required to treat each patient.

Dental assistants with laboratory duties make casts of the teeth and mouth from impressions, clean and polish removable appliances, and make temporary crowns. Those with office duties schedule and confirm appointments, receive patients, keep treatment records, send bills, receive payments, and order dental supplies and materials.

Work environment. Dental assistants work in a well-lighted, clean environment. Their work area usually is near the dental chair so that they can arrange instruments, materials, and medication and hand them to the dentist when needed. Dental assistants must wear gloves, masks, eyewear, and protective clothing to protect themselves and their patients from infectious diseases. Assistants also follow safety procedures to minimize the risks associated with the use of X-ray machines.

About half of dental assistants have a 35- to 40-hour workweek. Most of the rest work part-time or have variable schedules. Depending on the hours of the dental office where they work, assistants may have to work on Saturdays or evenings. Some dental assistants hold multiple jobs by working at dental offices that are open on different days or scheduling their work at a second office around the hours they work at their primary office.

Training, Other Qualifications, and Advancement

Many assistants learn their skills on the job, although an increasing number are trained in dental-assisting programs offered by community and junior colleges, trade schools, technical institutes, or the Armed Forces.

Education and training. High school students interested in a career as a dental assistant should take courses in biology, chemistry, health, and office practices. For those wishing to pursue further education, the Commission on Dental Accreditation within the American Dental Association (ADA) approved 269 dental-assisting training programs in 2006. Programs include classroom, laboratory, and preclinical instruction in dental-assisting skills and related theory. In addition, students gain practical experience in dental schools, clinics, or dental offices. Most programs take 1 year or less to complete and lead to a certificate or diploma. Two-year programs offered in community and junior colleges lead to an associate degree. All programs require a high school diploma or its equivalent, and some require science or computer-related courses for admission. A number of private vocational schools offer four- to six-month courses in dental assisting, but the Commission on Dental Accreditation does not accredit these programs.

A large number of dental assistants learn through on-the-job training. In these situations, the employing dentist or other dental assistants in the dental office teach the new assistant dental terminology, the names of the instruments, how to perform daily duties, how to interact with patients, and other things necessary to help keep the dental office running smoothly. While some things can be picked up easily, it may be a few months before new dental assistants are completely knowledgeable about their duties and comfortable doing all of their tasks without assistance.

A period of on-the-job training is often required even for those that have completed a dental-assisting program or have some previ-

ous experience. Different dentists may have their own styles of doing things that need to be learned before an assistant can be comfortable working with them. Office-specific information, such as where files are kept, will need to be learned at each new job. Also, as dental technology changes, dental assistants need to stay familiar with the tools and procedures that they will be using or helping dentists to use. On-the-job training is often sufficient to keep assistants up-to-date on these matters.

Licensure. Most states regulate the duties that dental assistants are allowed to perform. Some states require licensure or registration, which may include passing a written or practical examination. There are a variety of schools offering courses—approximately 10 to 12 months in length—that meet their state's requirements. Other states require dental assistants to complete state-approved education courses of 4 to 12 hours in length. Some states offer registration of other dental assisting credentials with little or no education required. Some states require continuing education to maintain licensure or registration. A few states allow dental assistants to perform any function delegated to them by the dentist.

Individual states have adopted different standards for dental assistants who perform certain advanced duties. In some states, for example, dental assistants who perform radiological procedures must complete additional training. Completion of the Radiation Health and Safety examination offered by Dental Assisting National Board (DANB) meets the standards in more than 30 states. Some states require completion of a state-approved course in radiology as well.

Certification and other qualifications. Certification is available through the Dental Assisting National Board (DANB) and is recognized or required in more than 30 states. Certification is an acknowledgment of an assistant's qualifications and professional competence and may be an asset when one is seeking employment. Candidates may qualify to take the DANB certification examination by graduating from an ADA-accredited dental assisting education program or by having 2 years of full-time, or 4 years of part-time, experience as a dental assistant. In addition, applicants must have current certification in cardiopulmonary resuscitation. For annual recertification, individuals must earn continuing education credits. Other organizations offer registration, most often at the state level.

Dental assistants must be a second pair of hands for a dentist; therefore, dentists look for people who are reliable, work well with others, and have good manual dexterity.

Advancement. Without further education, advancement opportunities are limited. Some dental assistants become office managers, dental-assisting instructors, dental product sales representatives, or insurance claims processors for dental insurance companies. Others go back to school to become dental hygienists. For many, this entry-level occupation provides basic training and experience and serves as a steppingstone to more highly skilled and higher paying jobs.

Employment

Dental assistants held about 280,000 jobs in 2006. Almost all jobs for dental assistants were in offices of dentists. A small number of jobs were in the federal, state, and local governments or in offices of physicians. About 35 percent of dental assistants worked part time, sometimes in more than one dental office.

Job Outlook

Employment is expected to increase much faster than average; job prospects are expected to be excellent.

Employment change. Employment is expected to grow 29 percent from 2006 to 2016, which is much faster than the average for all occupations. In fact, dental assistants are expected to be among the fastest growing occupations over the 2006–2016 projection period.

Population growth, greater retention of natural teeth by middle-aged and older people, and an increased focus on preventative dental care for younger generations will fuel demand for dental services. Older dentists, who have been less likely to employ assistants or have employed fewer, are leaving the occupation and will be replaced by recent graduates, who are more likely to use one or more assistants. In addition, as dentists' workloads increase, they are expected to hire more assistants to perform routine tasks, so that they may devote their own time to more complex procedures.

Job prospects. Job prospects for dental assistants should be excellent. In addition to job openings due to employment growth, numerous job openings will arise out of the need to replace assistants who transfer to other occupations, retire, or leave for other reasons. Many opportunities for entry-level positions offer on-the-job training, but some dentists prefer to hire experienced assistants or those who have completed a dental-assisting program.

Earnings

Median hourly earnings of dental assistants were $14.53 in May 2006. The middle 50 percent earned between $11.94 and $17.44 an hour. The lowest 10 percent earned less than $9.87, and the highest 10 percent earned more than $20.69 an hour.

Benefits vary substantially by practice setting and may be contingent upon full-time employment. According to the American Dental Association, 87 percent of dentists offer reimbursement for continuing education courses taken by their assistants.

Related Occupations

Other workers supporting health practitioners include dental hygienists, medical assistants, surgical technologists, pharmacy aides, pharmacy technicians, occupational therapist assistants and aides, and physical therapist assistants and aides.

Massage Therapists

(O*NET 31-9011.00)

Significant Points

- Employment is expected to grow faster than average over the 2006–2016 period as more people learn about the benefits of massage therapy.
- Many states require formal training and national certification in order to practice massage therapy.
- This occupation includes a large percentage of part-time and self-employed workers.

Nature of the Work

The medical benefits of "friction" were first documented in Western culture by the Greek physician Hippocrates around 400 BC. Today, massage therapy is being used as a means of treating painful ailments, decompressing tired and overworked muscles, reducing stress, rehabilitating sports injuries, and promoting general health. This is done by manipulating the soft tissue muscles of the body in order to improve circulation and remove waste products from the muscles.

Clients may seek massage for medical benefit or for relaxation purposes, and there is a wide range of massage treatment available to meet these distinct needs. Massage therapy that aims to improve physical health typically differs in duration and technique from massage that is intended to simply relax or rejuvenate clients. The training background of those who perform the two types of massage therapy differs as well.

Massage therapists can specialize in over 80 different types of massage, called modalities. Swedish massage, deep tissue massage, reflexology, acupressure, sports massage, and neuromuscular massage are just a few of the many approaches to massage therapy. Most massage therapists specialize in several modalities, which require different techniques. Some use exaggerated strokes ranging the length of a body part, while others use quick, percussion-like strokes with a cupped or closed hand. A massage can be as long as 2 hours or as short as 5 or 10 minutes. Usually, the type of massage given depends on the client's needs and the client's physical condition. For example, therapists may use special techniques for elderly clients that they would not use for athletes, and they would use approaches for clients with injuries that would not be appropriate for clients seeking relaxation. There are also some forms of massage that are given solely to one type of client, for example prenatal massage and infant massage.

Massage therapists work by appointment. Before beginning a massage therapy session, therapists conduct an informal interview with the client to find out about the person's medical history and desired results from the massage. This gives therapists a chance to discuss which techniques could be beneficial to the client and which could be harmful. Because massage therapists tend to specialize in only a few areas of massage, customers will often be referred to or seek a therapist with a certain type of massage in mind. Based on the person's goals, ailments, medical history, and stress- or pain-related problem areas, a massage therapist will conclude whether a massage would be harmful, and if not, move forward with the session. While giving the massage, therapists alter their approach or concentrate on any areas of particular discomfort as necessary.

Seated massage is just one type of therapy used by massage therapists.

Many modalities of massage therapy use massage oils, lotions, or creams to massage and rub the client's muscles. Most massage therapists, particularly those who are self-employed, supply their own table or chair, sheets, pillows, and body lotions or oils. Most modalities of massage require clients to be covered in a sheet or blanket, and require clients to be undressed or to wear loose-fitting clothing. The therapist only exposes the body part being massaged. Some types of massage are done without oils or lotions and are performed with the client fully-clothed.

Massage therapists must develop a rapport with their clients if repeat customers are to be secured. Because those who seek a therapist tend to make regular visits, developing a loyal clientele is an important part of becoming successful.

Work environment. Massage therapists work in an array of settings both private and public: private offices, studios, hospitals, nursing homes, fitness centers, sports medicine facilities, airports, and shopping malls, for example. Some massage therapists also travel to clients' homes or offices to provide a massage. It is not uncommon for full-time massage therapists to divide their time among several different settings, depending on the clients and locations scheduled.

Most massage therapists give massages in dimly lit settings. Using candles and/or incense is not uncommon. Ambient or other calm, soothing music is often played. The dim lighting, smells, and background noise are meant to put clients at ease. On the other hand, when visiting a client's office, a massage therapist may not have those amenities. The working conditions depend heavily on a therapist's location and what the client wants.

Because massage is physically demanding, massage therapists can succumb to injury if the proper technique is not used. Repetitive motion problems and fatigue from standing for extended periods of

time are most common. This risk can be limited by use of good technique, proper spacing between sessions, exercise, and in many cases by the therapists themselves receiving a massage on a regular basis.

Because of the physical nature of the work and time needed in between sessions, massage therapists typically give massages less than 40 hours per week. Most therapists who work 15 to 30 hours per week consider themselves to be full-time workers, because when time for travel, equipment set-up, and business functions, such as billing, are added, a massage therapist's hours per week may very well be more than 40 hours. About 42 percent of all massage therapists worked part time and 20 percent had variable schedules in 2006.

Training, Other Qualifications, and Advancement

In 2007, 38 states and the District of Columbia had laws regulating massage therapy in some way. Most of the boards governing massage therapy in these states require practicing massage therapists to complete a formal education program and pass a national certification examination or a state exam. It is best to check information on licensing, certification, and accreditation on a state-by-state basis.

Education and training. Training standards and requirements for massage therapists vary greatly by state and locality. There are roughly 1,500 massage therapy postsecondary schools, college programs, and training programs throughout the country. Massage therapy programs generally cover subjects such as anatomy; physiology, the study of organs and tissues; kinesiology, the study of motion and body mechanics; business; ethics; as well as hands-on practice of massage techniques. Training programs may concentrate on certain modalities of massage. Several programs also provide alumni services such as post-graduate job placement and continuing educational services. Both full- and part-time programs are available.

These programs vary in accreditation. Massage therapy training programs are generally approved by a state board, and may also be accredited by an independent accrediting agency. In states that regulate massage therapy, graduation from an approved school or training program is usually required in order to practice. Some state regulations require that therapists keep up on their knowledge and technique through continuing education.

Licensure. After completion of a training program, many massage therapists opt to take the National Certification Examination for Therapeutic Massage and Bodywork (NCETMB). Many states require that therapists pass this test in order to practice massage therapy. The exam is administered by the National Certification Board for Therapeutic Massage and Bodywork (NCBTMB), which has several eligibility requirements. In states that require massage therapy program approval, a candidate must graduate from a state-approved training institute or submit a portfolio of training experience for NCBTMB review to qualify for the test. In locations that do not require accredited training programs, this is unnecessary.

When a therapist passes the NCETMB, he or she can use the recognized national credential: Nationally Certified in Therapeutic Massage and Bodywork (NCTMB). The credential must be renewed every 4 years. In order to remain certified, a therapist must perform at least 200 hours of therapeutic massage and complete continuing education requirements during this time. In 2005, the NCBTMB introduced a new national certification test and corresponding professional credential. The new test covers the same topics as the traditional national certification exam, but covers fewer modalities of massage therapy. Recognition of this new national certification varies by state.

Recently, a second multi-state examination program has begun to take shape. The Federation of State Massage Therapy Boards offers a licensure program that is also accepted by many states.

Massage therapy licensure boards decide which certifications and tests to accept on a state-by-state basis. Therefore, those wishing to practice massage therapy should look into legal requirements for the state and locality in which they intend to practice.

Other qualifications. Both strong communication skills and a friendly, empathetic personality are extremely helpful qualities for fostering a trusting relationship with clients and in turn, expanding one's client base. Massage can be a delicate issue for some clients and because of this, making clients feel comfortable is one of the most important abilities for massage therapists.

Advancement. Membership in a professional massage therapy association may help therapists network and in turn, find new clients. Some of these associations require that members graduate from a nationally credentialed training program, have a state license, or be nationally certified by the NCBTMB.

Because of the nature of massage therapy, opportunities for advancement are limited. However, with increased experience and an expanding client base, there are opportunities for therapists to increase client fees and, therefore, income. In addition, those who are well organized and have an entrepreneurial spirit may go into business for themselves. Self-employed massage therapists with a large client base have the highest earnings.

Employment

Massage therapists held about 118,000 jobs in 2006. About 64 percent were self-employed. There are many more people who practice massage therapy as a secondary source of income. As a result, some industry sources estimate that more than 200,000 people practice massage therapy in some capacity.

Of those self-employed, most owned their own business, and the rest worked as independent contractors. Others found employment in salons and spas; the offices of physicians and chiropractors; fitness and recreational sports centers; and hotels. While massage therapists can find jobs throughout the country, employment is concentrated in metropolitan areas, as well as resort and destination locales.

Job Outlook

Employment growth for massage therapists is expected to be faster than average for all occupations with very good job prospects, particularly for those seeking part-time work.

Employment change. Employment for massage therapists is expected to increase 20 percent from 2006 to 2016, faster than average for all occupations. Employment will grow as more people learn about the benefits of massage therapy.

Increased interest in alternative medicine and holistic healing will translate into new openings for those skilled in massage therapy.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Massage therapists	31-9011	118,000	142,000	24,000	20

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Healthcare providers and medical insurance companies are beginning to recognize massage therapy as a legitimate treatment and preventative measure for several types of injuries and illnesses. The health care industry is using massage therapy more often as a supplement to conventional medical techniques for ailments such as muscle problems, some sicknesses and diseases, and stress-related health problems. Massage therapy's growing acceptance as a medical tool, particularly by the medical provider and insurance industries, will have the greatest impact on new job growth for massage therapists.

Massage is an increasingly popular technique for relaxation and reduction of stress. As workplaces try to distinguish themselves as employee-friendly, providing professional in-office, seated massages for employees is becoming a popular on-the-job benefit.

Older citizens in nursing homes or assisted living facilities are also finding benefits from massage, such as increased energy levels and reduced health problems. Demand for massage therapy should grow among older age groups because they increasingly enjoy longer, more active lives and persons age 55 and older are projected to be the most rapidly growing segment of the U.S. population over the next decade. However, demand for massage therapy is presently greatest among young adults, and they are likely to continue to enjoy the benefits of massage therapy as they age.

Job prospects. In states that regulate massage therapy, those who complete formal training programs and pass the national certification exam are likely to have very good opportunities. However, new massage therapists should expect to work only part-time in spas, hotels, hospitals, physical therapy centers, and other businesses until they can build a client base of their own. Because referrals are a very important source of work for massage therapists, networking will increase the number of job opportunities. Joining a state or local chapter of a professional association can also help build strong contacts and further increase the likelihood of steady work.

Female massage therapists will continue to enjoy slightly better job prospects, as some clients—both male and female—are uncomfortable with male physical contact. In 2006, 84 percent of all massage therapists were female.

Earnings

Median wage and salary hourly earnings of massage therapists, including gratuities, were $16.06 in May 2006. The middle 50 percent earned between $10.98 and $24.22. The lowest 10 percent earned less than $7.48, and the highest 10 percent earned more than $33.83. Generally, massage therapists earn 15 to 20 percent of their income as gratuities. For those who work in a hospital or other clinical setting, however, tipping is not common.

As is typical for most workers who are self-employed and work part-time, few benefits are provided.

Related Occupations

Other workers associated with the healthcare industry who provide therapy to clients include athletic trainers, physical therapists, physical therapist assistants and aides, chiropractors, and workers in other occupations that use touch to aid healing or relieve stress.

Sources of Additional Information

General information on becoming a massage therapist is available from state regulatory boards.

Medical Assistants

(O*NET 31-9092.00)

Significant Points

- About 62 percent of medical assistants work in offices of physicians.
- Some medical assistants are trained on the job, but many complete one-year or two-year programs.
- Employment is projected to grow much faster than average, ranking medical assistants among the fastest-growing occupations over the 2006–2016 decade.
- Job prospects should be excellent.

Nature of the Work

Medical assistants perform administrative and clinical tasks to keep the offices of physicians, podiatrists, chiropractors, and other health practitioners running smoothly. They should not be confused with physician assistants, who examine, diagnose, and treat patients under the direct supervision of a physician. (Physician assistants are discussed elsewhere in the *Handbook*.)

The duties of medical assistants vary from office to office, depending on the location and size of the practice and the practitioner's specialty. In small practices, medical assistants usually do many different kinds of tasks, handling both administrative and clinical

Medical assistants who perform clinical tasks often record vital signs of patients.

duties and reporting directly to an office manager, physician, or other health practitioner. Those in large practices tend to specialize in a particular area, under the supervision of department administrators.

Medical assistants who perform administrative tasks have many duties. They update and file patients' medical records, fill out insurance forms, and arrange for hospital admissions and laboratory services. They also perform tasks less specific to medical settings, such as answering telephones, greeting patients, handling correspondence, scheduling appointments, and handling billing and bookkeeping.

For clinical medical assistants, duties vary according to what is allowed by state law. Some common tasks include taking medical histories and recording vital signs, explaining treatment procedures to patients, preparing patients for examinations, and assisting physicians during examinations. Medical assistants collect and prepare laboratory specimens and sometimes perform basic laboratory tests on the premises, dispose of contaminated supplies, and sterilize medical instruments. They might instruct patients about medications and special diets, prepare and administer medications as directed by a physician, authorize drug refills as directed, telephone prescriptions to a pharmacy, draw blood, prepare patients for X rays, take electrocardiograms, remove sutures, and change dressings.

Medical assistants also may arrange examining room instruments and equipment, purchase and maintain supplies and equipment, and keep waiting and examining rooms neat and clean.

Ophthalmic medical assistants, *optometric assistants*, and *podiatric medical assistants* are examples of specialized assistants who have additional duties. Ophthalmic medical assistants help ophthalmologists provide eye care. They conduct diagnostic tests, measure and record vision, and test eye muscle function. They also show patients how to insert, remove, and care for contact lenses, and they apply eye dressings. Under the direction of the physician, ophthalmic medical assistants may administer eye medications. They also maintain optical and surgical instruments and may assist the ophthalmologist in surgery. Optometric assistants also help provide eye care, working with optometrists. They provide chair-side assistance, instruct patients about contact lens use and care, conduct preliminary tests on patients, and otherwise provide assistance while working directly with an optometrist. Podiatric medical assistants make castings of feet, expose and develop X rays, and assist podiatrists in surgery.

Work environment. Medical assistants work in well-lighted, clean environments. They constantly interact with other people and may have to handle several responsibilities at once. Most full-time medical assistants work a regular 40-hour week. However, many medical assistants work part time, evenings, or weekends.

Training, Other Qualifications, and Advancement

Some medical assistants are trained on the job, but many complete one-year or two-year programs.

Education and training. Postsecondary medical assisting programs are offered in vocational-technical high schools, postsecondary vocational schools, and community and junior colleges. Programs usually last either 1 year and result in a certificate or diploma, or 2 years and result in an associate degree. Courses cover anatomy, physiology, and medical terminology, as well as typing, transcription, recordkeeping, accounting, and insurance processing. Students learn laboratory techniques, clinical and diagnostic procedures, pharmaceutical principles, the administration of medications, and first aid. They study office practices, patient relations, medical law, and ethics. There are various organizations that accredit medical assisting programs. Accredited programs often include an internship that provides practical experience in physicians' offices, hospitals, or other health care facilities.

Formal training in medical assisting, while generally preferred, is not always required. Some medical assistants are trained on the job, although this practice is less common than in the past. Applicants usually need a high school diploma or the equivalent. Recommended high school courses include mathematics, health, biology, typing, bookkeeping, computers, and office skills. Volunteer experience in the health care field also is helpful. Medical assistants who are trained on the job usually spend their first few months attending training sessions and working closely with more experienced workers.

Some states allow medical assistants to perform more advanced procedures, such as giving injections, after passing a test or taking a course.

Certification and other qualifications. Employers prefer to hire experienced workers or those who are certified. Although not required, certification indicates that a medical assistant meets certain standards of competence. There are various associations—some listed in the Sources of Additional Information section—that award certification credentials to medical assistants, and the certification process varies. It also is possible to become certified in a specialty, such as podiatry, optometry, or ophthalmology.

Medical assistants deal with the public; therefore, they must be neat and well groomed and have a courteous, pleasant manner and they must be able to put patients at ease and explain physicians' instructions. They must respect the confidential nature of medical information. Clinical duties require a reasonable level of manual dexterity and visual acuity.

Advancement. Medical assistants may advance to other occupations through experience or additional training. For example, some may go on to teach medical assisting, and others pursue additional education to become nurses or other health care workers. Administrative medical assistants may advance to office manager, or qualify for a variety of administrative support occupations.

Employment

Medical assistants held about 417,000 jobs in 2006. About 62 percent worked in offices of physicians; 12 percent worked in public and private hospitals, including inpatient and outpatient facilities; and 11 percent worked in offices of other health practitioners, such as chiropractors, optometrists, and podiatrists. Most of the remainder worked in other health care industries such as outpatient care centers and nursing and residential care facilities.

Job Outlook

Employment is projected to grow much faster than average, ranking medical assistants among the fastest-growing occupations over the

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Medical assistants	31-9092	417,000	565,000	148,000	35

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

2006–2016 decade. Job opportunities should be excellent, particularly for those with formal training or experience, and certification.

Employment change. Employment of medical assistants is expected to grow 35 percent from 2006 to 2016, much faster than the average for all occupations. As the health care industry expands because of technological advances in medicine and the growth and aging of the population, there will be an increased need for all health care workers. Increasing use of medical assistants in the rapidly growing health care industry will further stimulate job growth.

Helping to drive job growth is the increasing number of group practices, clinics, and other health care facilities that need a high proportion of support personnel, particularly medical assistants who can handle both administrative and clinical duties. In addition, medical assistants work primarily in outpatient settings, a rapidly growing sector of the health care industry.

Job prospects. Job seekers who want to work as a medical assistant should find excellent job prospects. Medical assistants are projected to account for a very large number of new jobs, and many other opportunities will come from the need to replace workers leaving the occupation. Those with formal training or experience—particularly those with certification—should have the best job opportunities.

Earnings

The earnings of medical assistants vary, depending on their experience, skill level, and location. Median annual earnings of wage-and-salary medical assistants were $26,290 in May 2006. The middle 50 percent earned between $21,970 and $31,210. The lowest 10 percent earned less than $18,860, and the highest 10 percent earned more than $36,840. Median annual earnings in the industries employing the largest numbers of medical assistants in May 2006 were:

General medical and surgical hospitals	$27,340
Outpatient care centers	26,840
Offices of physicians	26,620
Offices of chiropractors	22,940
Offices of optometrists	22,850

Related Occupations

Medical assistants perform work similar to the tasks completed by other workers in medical support occupations. Administrative medical assistants do work similar to that of medical secretaries, medical transcriptionists, and medical records and health information technicians. Clinical medical assistants perform duties similar to those of dental assistants; dental hygienists; occupational therapist assistants and aides; pharmacy aides; licensed practical and licensed vocational nurses; surgical technologists; physical therapist assistants and aides; and nursing, psychiatric, and home health aides.

Medical Transcriptionists

(O*NET 31-9094.00)

Significant Points

- Job opportunities will be good.
- Employers prefer medical transcriptionists who have completed a postsecondary training program.
- Many medical transcriptionists telecommute from home-based offices.
- About 41 percent work in hospitals, and another 29 percent work in offices of physicians.

Nature of the Work

Medical transcriptionists listen to dictated recordings made by physicians and other health care professionals and transcribe them into medical reports, correspondence, and other administrative material. They generally listen to recordings on a headset, using a foot pedal to pause the recording when necessary, and key the text into a personal computer or word processor, editing as necessary for grammar and clarity. The documents they produce include discharge summaries, medical history and physical examination reports, operative reports, consultation reports, autopsy reports, diagnostic imaging studies, progress notes, and referral letters. Medical transcriptionists return transcribed documents to the physicians or other health care professionals who dictated them for review and signature or correction. These documents eventually become part of patients' permanent files.

To understand and accurately transcribe dictated reports, medical transcriptionists must understand medical terminology, anatomy and physiology, diagnostic procedures, pharmacology, and treatment assessments. They also must be able to translate medical jargon and abbreviations into their expanded forms. To help identify terms appropriately, transcriptionists refer to standard medical reference materials—both printed and electronic; some of these are available over the Internet. Medical transcriptionists must comply with specific standards that apply to the style of medical records and to the legal and ethical requirements for keeping patient information confidential.

Experienced transcriptionists spot mistakes or inconsistencies in a medical report and check to correct the information. Their ability to understand and correctly transcribe patient assessments and treatments reduces the chance of patients receiving ineffective or even harmful treatments and ensures high-quality patient care.

Currently, most health care providers transmit dictation to medical transcriptionists using either digital or analog dictating equip-

Medical transcriptionists listen to recordings on a headset, key the text into a personal computer or word processor, and edit for grammar and clarity.

ment. The Internet has grown to be a popular mode for transmitting documentation. Many transcriptionists receive dictation over the Internet and are able to quickly return transcribed documents to clients for approval. Another increasingly popular method uses speech recognition technology, which electronically translates sound into text and creates drafts of reports. Transcriptionists then format the reports; edit them for mistakes in translation, punctuation, or grammar; and check for consistency and any wording that doesn't make sense medically. Transcriptionists working in specialties, such as radiology or pathology, with standardized terminology are more likely to use speech recognition technology. However, speech recognition technology will become more widespread in all specialties as the technology becomes more sophisticated, that is, better able to recognize and more accurately transcribe diverse modes of speech.

Medical transcriptionists who work in physicians' offices may have other office duties, such as receiving patients, scheduling appointments, answering the telephone, and handling incoming and outgoing mail. Medical secretaries, discussed in the statement on secretaries and administrative assistants elsewhere in the *Handbook*, also may transcribe as part of their jobs.

Work environment. The majority of these workers are employed in comfortable settings, such as hospitals, physicians' offices, transcription service offices, clinics, laboratories, medical libraries, government medical facilities, or their own homes. Many medical transcriptionists telecommute from home-based offices.

Workers usually sit in the same position for long periods. They can suffer wrist, back, neck, or eye problems due to strain and risk repetitive motion injuries such as carpal tunnel syndrome. The constant pressure to be accurate and productive also can be stressful.

Many medical transcriptionists work a standard 40-hour week. Self-employed medical transcriptionists are more likely to work irregular hours—including part time, evenings, weekends, or on call at any time.

Training, Other Qualifications, and Advancement

Postsecondary training in medical transcription is preferred by employers; writing and computer skills also are important.

Education and training. Employers prefer to hire transcriptionists who have completed postsecondary training in medical transcription offered by many vocational schools, community colleges, and distance-learning programs.

Completion of a two-year associate degree or one-year certificate program—including coursework in anatomy, medical terminology, legal issues relating to health care documentation, and English grammar and punctuation—is highly recommended, but not always required. Many of these programs include supervised on-the-job experience. Some transcriptionists, especially those already familiar with medical terminology from previous experience as a nurse or medical secretary, become proficient through refresher courses and training.

Formal accreditation is not required for medical transcription programs. However, the Approval Committee for Certificate Programs (AACP)—established by the Association for Healthcare Documentation Integrity (AHDI) and the American Health Information Management Association—offers voluntary accreditation for medical transcription programs. Although voluntary, completion of an ACCP approved program may be required for transcriptionists seeking certification.

Certification and other qualifications. The AHDI awards two voluntary designations, the Registered Medical Transcriptionist (RMT) and the Certified Medical Transcriptionist (CMT). Medical transcriptionists who are recent graduates of medical transcription educational programs, or have fewer than 2 years experience in acute care, may become a registered RMT. The RMT credential is awarded upon successfully passing the AHDI level 1 registered medical transcription exam. The CMT designation requires at least 2 years of acute care experience working in multiple specialty surgery areas using different format, report, and dictation types. Candidates also must earn a passing score on a certification examination. Because medicine is constantly evolving, medical transcriptionists are encouraged to update their skills regularly. RMTs and CMTs must earn continuing education credits every 3 years to be recertified. As in many other fields, certification is recognized as a sign of competence.

Graduates of an ACCP approved program who earn the RMT credential are eligible to participate in the Registered Apprenticeship Program sponsored by the Medical Transcription Industry Association through the U.S. Department of Labor. The Registered Apprenticeship program offers structured on-the-job learning and related technical instruction for qualified medical transcriptionists entering the profession.

In addition to understanding medical terminology, transcriptionists must have good English grammar and punctuation skills and proficiency with personal computers and word-processing software. Normal hearing acuity and good listening skills also are necessary. Employers usually require applicants to take pre-employment tests.

Advancement. With experience, medical transcriptionists can advance to supervisory positions, home-based work, editing, con-

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Medical transcriptionists	31-9094	98,000	112,000	13,000	14

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

sulting, or teaching. Some become owners of medical transcription businesses. With additional education or training, some become medical records and health information technicians, medical coders, or medical records and health information administrators.

Employment

Medical transcriptionists held about 98,000 jobs in 20006. About 41 percent worked in hospitals and another 29 percent worked in offices of physicians. Others worked for business support services; medical and diagnostic laboratories; outpatient care centers; and offices of physical, occupational, and speech therapists, and audiologists.

Job Outlook

Employment of medical transcriptionists is projected to grow faster than the average; job opportunities should be good, especially for those who are certified.

Employment change. Employment of medical transcriptionists is projected to grow 14 percent from 2006 to 2016, faster than the average for all occupations. Demand for medical transcription services will be spurred by a growing and aging population. Older age groups receive proportionately greater numbers of medical tests, treatments, and procedures that require documentation. A high level of demand for transcription services also will be sustained by the continued need for electronic documentation that can be shared easily among providers, third-party payers, regulators, consumers, and health information systems. Growing numbers of medical transcriptionists will be needed to amend patients' records, edit documents from speech recognition systems, and identify discrepancies in medical reports.

Contracting out transcription work overseas and advancements in speech recognition technology are not expected to significantly reduce the need for well-trained medical transcriptionists. Outsourcing transcription work abroad—to countries such as India, Pakistan, Philippines, and the Caribbean—has grown more popular as transmitting confidential health information over the Internet has become more secure; however, the demand for overseas transcription services is expected only to supplement the demand for well-trained domestic medical transcriptionists. In addition, reports transcribed by overseas medical transcription services usually require editing for accuracy by domestic medical transcriptionists before they meet U.S. quality standards.

Speech-recognition technology allows physicians and other health professionals to dictate medical reports to a computer that immediately creates an electronic document. In spite of the advances in this technology, the software has been slow to grasp and analyze the human voice and the English language, and the medical vernacular with all its diversity. As a result, there will continue to be a need for skilled medical transcriptionists to identify and appropriately edit the inevitable errors created by speech recognition systems, and to create a final document.

Job prospects. Job opportunities will be good, especially for those who are certified. Hospitals will continue to employ a large percentage of medical transcriptionists, but job growth there will not be as fast as in other industries. An increasing demand for standardized records should result in rapid employment growth in physicians' offices, especially in large group practices.

Earnings

Wage-and-salary medical transcriptionists had median hourly earnings of $14.40 in May 2006. The middle 50 percent earned between $12.17 and $17.06. The lowest 10 percent earned less than $10.22, and the highest 10 percent earned more than $20.15. Median hourly earnings in the industries employing the largest numbers of medical transcriptionists were:

Medical and diagnostic laboratories	$15.68
General medical and surgical hospitals	14.62
Business support services	14.34
Outpatient care centers	14.31
Offices of physicians	14.00

Compensation methods for medical transcriptionists vary. Some are paid based on the number of hours they work or on the number of lines they transcribe. Others receive a base pay per hour with incentives for extra production. Employees of transcription services and independent contractors almost always receive production-based pay. Independent contractors earn more than do transcriptionists who work for others, but independent contractors have higher expenses than their corporate counterparts, receive no benefits, and may face higher risk of termination than do wage-and-salary transcriptionists.

Related Occupations

Workers in other occupations also type, record information, and process paperwork. Among these are court reporters; human resources assistants, except payroll and timekeeping; receptionists and information clerks; and secretaries and administrative assistants. Other workers who provide medical support include medical assistants and medical records and health information technicians.

State employment service offices can provide information about job openings for medical transcriptionists.

Nursing, Psychiatric, and Home Health Aides

(O*NET 31-1011.00, 31-1012.00, and 31-1013.00)

Significant Points

- Numerous job openings and excellent job opportunities are expected.
- Most jobs are in nursing and residential care facilities, hospitals, and home health care services.

- This occupation is characterized by modest entry requirements, low pay, high physical and emotional demands, and limited advancement opportunities.

Nature of the Work

Nursing and psychiatric aides help care for physically or mentally ill, injured, disabled, or infirm individuals in hospitals, nursing care facilities, and mental health settings. Home health aides have duties that are similar, but they work in patients' homes or residential care facilities. Nursing aides and home health aides are among the occupations commonly referred to as *direct care workers,* due to their role in working with patients who need long-term care. The specific care they give depends on their specialty.

Nursing aides also known as *nurse aides, nursing assistants, certified nursing assistants, geriatric aides, unlicensed assistive personnel, orderlies,* or *hospital attendants* provide hands-on care and perform routine tasks under the supervision of nursing and medical staff. Specific tasks vary, with aides handling many aspects of a patient's care. They often help patients to eat, dress, and bathe. They also answer calls for help, deliver messages, serve meals, make beds, and tidy up rooms. Aides sometimes are responsible for taking a patient's temperature, pulse rate, respiration rate, or blood pressure. They also may help provide care to patients by helping them get into and out of bed and walk, escorting them to operating and examining rooms, or providing skin care. Some aides help other medical staff by setting up equipment, storing and moving supplies, and assisting with some procedures. Aides also observe patients' physical, mental, and emotional conditions and report any change to the nursing or medical staff.

Nurse aides employed in nursing care facilities often are the principal caregivers, having far more contact with residents than do other members of the staff. Because some residents may stay in a nursing care facility for months or even years, aides develop ongoing relationships with them and interact with them in a positive, caring way.

Aides help care for physically or mentally ill, injured, disabled, or infirm individuals in a variety of settings.

Home health aides help elderly, convalescent, or disabled persons live in their own homes instead of health care facilities. Under the direction of nursing or medical staff, they provide health-related services, such as administering oral medications. (Personal and home care aides, who provide mainly housekeeping and routine personal care services, are discussed elsewhere in the *Handbook*.) Like nursing aides, home health aides may check patients' pulse rate, temperature, and respiration rate; help with simple prescribed exercises; and help patients to get in and out of bed, bathe, dress, and groom. Occasionally, they change nonsterile dressings, give massages and provide skin care, or assist with braces and artificial limbs. Experienced home health aides, with training, also may assist with medical equipment such as ventilators, which help patients breathe.

Most home health aides work with elderly or disabled persons who need more extensive care than family or friends can provide. Some help discharged hospital patients who have relatively short-term needs.

In home health agencies, a registered nurse, physical therapist, or social worker usually assigns specific duties to and supervises home health aides, who keep records of the services they perform and record each patient's condition and progress. The aides report changes in a patient's condition to the supervisor or case manager.

Psychiatric aides, also known as *mental health assistants* or *psychiatric nursing assistants,* care for mentally impaired or emotionally disturbed individuals. They work under a team that may include psychiatrists, psychologists, psychiatric nurses, social workers, and therapists. In addition to helping patients to dress, bathe, groom themselves, and eat, psychiatric aides socialize with them and lead them in educational and recreational activities. Psychiatric aides may play card games or other games with patients, watch television with them, or participate in group activities, such as playing sports or going on field trips. They observe patients and report any physical or behavioral signs that might be important for the professional staff to know. They accompany patients to and from therapy and treatment. Because they have such close contact with patients, psychiatric aides can have a great deal of influence on their outlook and treatment.

Work environment. Work as an aide can be physically demanding. Aides spend many hours standing and walking, and they often face heavy workloads. Aides must guard against back injury because they may have to move patients into and out of bed or help them to stand or walk. It is important for aides to be trained in and to follow the proper procedures for lifting and moving patients. Aides also may face hazards from minor infections and major diseases, such as hepatitis, but can avoid infections by following proper procedures.

Aides also perform tasks that some may consider unpleasant, such as emptying bedpans and changing soiled bed linens. The patients they care for may be disoriented, irritable, or uncooperative. Psychiatric aides must be prepared to care for patients whose illness may cause violent behavior. Although their work can be emotionally demanding, many aides gain satisfaction from assisting those in need.

Home health aides may go to the same patient's home for months or even years. However, most aides work with a number of different patients, each job lasting a few hours, days, or weeks. Home health aides often visit multiple patients on the same day.

Home health aides generally work alone, with periodic visits from their supervisor. They receive detailed instructions explaining when to visit patients and what services to perform. Aides are individually responsible for getting to patients' homes, and they may spend a good portion of the working day traveling from one patient to

another. Because mechanical lifting devices available in institutional settings are not as frequently available in patients' homes, home health aides must take extra care to avoid injuries resulting from overexertion when they assist patients.

Most full-time aides work about 40 hours per week, but because patients need care 24 hours a day, some aides work evenings, nights, weekends, and holidays. In 2006, 23 percent of aides worked part time compared with 15 percent of all workers.

Training, Other Qualifications, and Advancement

In many cases, a high school diploma or equivalent is necessary for a job as a nursing or psychiatric aide. However, a high school diploma generally is not required for jobs as home health aides. Specific qualifications vary by occupation, state laws, and work setting. Advancement opportunities are limited.

Education and training. Nursing and psychiatric aide training is offered in high schools, vocational-technical centers, some nursing care facilities, and some community colleges. Courses cover body mechanics, nutrition, anatomy and physiology, infection control, communication skills, and resident rights. Personal care skills, such as how to help patients to bathe, eat, and groom themselves, also are taught. Hospitals may require previous experience as a nursing aide or home health aide. Some states also require psychiatric aides to complete a formal training program. However, most psychiatric aides learn their skills on the job from experienced workers.

Home health aides are generally not required to have a high school diploma. They usually are trained on the job by registered nurses, licensed practical nurses, or experienced aides. Also, clients may prefer that tasks are done a certain way, and make those suggestions to the home health aide. A competency evaluation may be required to ensure the aide can perform the required tasks.

Some employers provide classroom instruction for newly hired aides, while others rely exclusively on informal on-the-job instruction by a licensed nurse or an experienced aide. Such training may last from several days to a few months. Aides also may attend lectures, workshops, and in-service training.

Licensure and certification. The federal government has guidelines for home health aides whose employers receive reimbursement from Medicare. Federal law requires home health aides to pass a competency test covering a wide range of areas. A home health aide may receive training before taking the competency test. In addition, the National Association for Home Care and Hospice offers voluntary certification for home health aides. Some states also require aides to be licensed.

Similar federal requirements exist for nurse aides who work in nursing care facilities. These aides must complete a minimum of 75 hours of state-approved training and pass a competency evaluation. Aides who complete the program are known as certified nurse assistants (CNAs) and are placed on the state registry of nurse aides.

Other qualifications. Aides must be in good health. A physical examination, including state-regulated tests such as those for tuberculosis, may be required. A criminal background check also is usually required for employment.

Applicants should be tactful, patient, understanding, emotionally stable, and dependable and should have a desire to help people. They also should be able to work as part of a team, have good communication skills, and be willing to perform repetitive, routine tasks. Home health aides should be honest and discreet because they work in private homes. They also will need access to a car or public transportation to reach patients' homes.

Advancement. Opportunities for advancement within these occupations are limited. Aides generally need additional formal training or education to enter other health occupations. The most common health care occupations for former aides are licensed practical nurse, registered nurse, and medical assistant.

For some individuals, these occupations serve as entry-level jobs. For example, some high school and college students gain experience working in these occupations while attending school. In addition, experience as an aide can help individuals decide whether to pursue a career in health care.

Employment

Nursing, psychiatric, and home health aides held about 2.3 million jobs in 2006. Nursing aides held the most jobs—approximately 1.4 million. Home health aides held roughly 787,000 jobs, and psychiatric aides held about 62,000 jobs. About 52 percent of nursing aides worked in nursing and residential care facilities and another 29 percent worked in hospitals. Home health aides were mainly employed by home health care services, nursing and residential care facilities and social assistance agencies. About 47 percent of all psychiatric aides worked in hospitals, primarily in psychiatric and substance abuse hospitals, although some also worked in the psychiatric units of general medical and surgical hospitals. Others were employed in state government agencies; residential mental retardation, mental health, and substance abuse facilities; and nursing and residential care facilities.

Job Outlook

Excellent job opportunities for nursing, psychiatric, and home health aides will arise from a combination of rapid employment growth and the need to replace the many workers who leave the occupation each year.

Employment change. Overall employment of nursing, psychiatric, and home health aides is projected to grow 28 percent between 2006 and 2016, much faster than the average for all occupations. However, growth will vary for the individual occupations. Home health aides are expected to gain jobs faster than other aides as a result of growing demand for home services from an aging population and efforts to contain costs by moving patients out of hospitals and nursing care facilities as quickly as possible. Consumer preference for care in the home and improvements in medical technologies for in-home treatment also will contribute to much-faster-than-average employment growth for home health aides.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Nursing, psychiatric, and home health aides	31-1000	2,296,000	2,944,000	647,000	28
Home health aides	31-1011	787,000	1,171,000	384,000	49
Nursing aides, orderlies, and attendants	31-1012	1,447,000	1,711,000	264,000	18
Psychiatric aides	31-1013	62,000	62,000	0	0

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Nursing aide employment will not grow as fast as home health aide employment, largely because nursing aides are concentrated in relatively slower-growing industries. Employment of nursing aides is expected to grow faster than the average for all occupations through 2016, in response to the long-term care needs of an increasing elderly population. Financial pressures on hospitals to discharge patients as soon as possible should boost admissions to nursing care facilities. As a result, job openings will be more numerous in nursing and residential care facilities than in hospitals. Modern medical technology also will drive demand for nursing aides because as the technology saves and extends more lives, it increases the need for long-term care provided by aides.

Little or no change is expected in employment of psychiatric aides—the smallest of the three occupations. Most psychiatric aides currently work in hospitals, but the industries most likely to see growth will be residential facilities for people with developmental disabilities, mental illness, and substance abuse problems. There is a long-term trend toward treating psychiatric patients outside of hospitals because it is more cost effective and allows patients to live more independent lives. Demand for psychiatric aides in residential facilities will rise in response to the increase in the number of older persons, many of whom will require mental health services. Growing demand for these workers also rests on an increasing number of mentally disabled adults who were formerly cared for by their elderly parents and who will continue to need care. Job growth also could be affected by changes in government funding of programs for the mentally ill.

Job prospects. High replacement needs for nursing, psychiatric, and home health aides reflect modest entry requirements, low pay, high physical and emotional demands, and limited opportunities for advancement within the occupation. For these same reasons, the number of people looking to enter the occupation will be limited. Many aides leave the occupation to attend training programs for other health care occupations. Therefore, people who are interested in, and suited for, this work should have excellent job opportunities.

Earnings

Median hourly earnings of nursing aides, orderlies, and attendants were $10.67 in May 2006. The middle 50 percent earned between $9.09 and $12.80 an hour. The lowest 10 percent earned less than $7.78, and the highest 10 percent earned more than $14.99 an hour. Median hourly earnings in the industries employing the largest numbers of nursing aides, orderlies, and attendants in May 2006 were:

Local government	$12.15
Employment services	11.47
General medical and surgical hospitals	11.06
Nursing care facilities	10.37
Community care facilities for the elderly	10.07

Nursing and psychiatric aides in hospitals generally receive at least 1 week of paid vacation after 1 year of service. Paid holidays and sick leave, hospital and medical benefits, extra pay for late-shift work, and pension plans also are available to many hospital employees and to some nursing care facility employees.

Median hourly earnings of home health aides were $9.34 in May 2006. The middle 50 percent earned between $7.99 and $10.90 an hour. The lowest 10 percent earned less than $7.06, and the highest 10 percent earned more than $13.00 an hour. Median hourly earnings in the industries employing the largest numbers of home health aides in May 2006 were:

Nursing care facilities	$9.76
Residential mental retardation facilities	9.34
Services for the elderly and persons with disabilities	9.26
Home health care services	9.14
Community care facilities for the elderly	8.87

Home health aides receive slight pay increases with experience and added responsibility. Usually, they are paid only for the time worked in the home, not for travel time between jobs, and must pay for their travel costs from their earnings. Most employers hire only on-call hourly workers and provide no benefits.

Median hourly earnings of psychiatric aides were $11.49 in May 2006. The middle 50 percent earned between $9.20 and $14.46 an hour. The lowest 10 percent earned less than $7.75, and the highest 10 percent earned more than $17.32 an hour. Median hourly earnings in the industries employing the largest numbers of psychiatric aides in May 2006 were:

State government	$13.27
General medical and surgical hospitals	12.31
Psychiatric and substance abuse hospitals	11.76
Residential mental health and substance abuse facilities	9.65
Residential mental retardation facilities	8.80

Related Occupations

Nursing, psychiatric, and home health aides help people who need routine care or treatment. So do child care workers, licensed practical and licensed vocational nurses, medical assistants, occupational therapist assistants and aides, personal and home care aides, physical therapist assistants and aides, radiation therapists, and registered nurses. Social and human service assistants, who sometimes work with mental health patients, do work similar to that of psychiatric aides.

Sources of Additional Information

Information about employment opportunities may be obtained from local hospitals, nursing care facilities, home health care agencies, psychiatric facilities, state boards of nursing, and local offices of the state employment service.

Information on licensing requirements for nursing and home health aides and lists of state-approved nursing aide programs are available from state departments of public health, departments of occupational licensing, boards of nursing, and home care associations.

Occupational Therapist Assistants and Aides

(O*NET 31-2011.00 and 31-2012.00)

Significant Points

- Occupational therapist assistants generally must complete an associate degree or a certificate program; in contrast, occupational therapist aides usually receive most of their training on the job.

- Employment is projected to grow much faster than the average as demand for occupational therapy services rises and as occupational therapists increasingly use assistants and aides.
- Job prospects should be very good for occupational therapist assistants; job seekers holding only a high school diploma might face keen competition for occupational therapist aide jobs.

Nature of the Work

Occupational therapist assistants and aides work under the direction of occupational therapists to provide rehabilitative services to persons with mental, physical, emotional, or developmental impairments. The ultimate goal is to improve clients' quality of life and ability to perform daily activities. For example, occupational therapist assistants help injured workers re-enter the labor force by teaching them how to compensate for lost motor skills or help individuals with learning disabilities increase their independence.

Occupational therapist assistants, commonly known as *occupational therapy assistants*, help clients with rehabilitative activities and exercises outlined in a treatment plan developed in collaboration with an occupational therapist. Activities range from teaching the proper method of moving from a bed into a wheelchair to the best way to stretch and limber the muscles of the hand. Assistants monitor an individual's activities to make sure that they are performed correctly and to provide encouragement. They also record their client's progress for the occupational therapist. If the treatment is not having the intended effect, or the client is not improving as expected, the therapist may alter the treatment program in hopes of obtaining better results. In addition, occupational therapist assistants document the billing of the client's health insurance provider.

Occupational therapist aides typically prepare materials and assemble equipment used during treatment. They are responsible for a range of clerical tasks, including scheduling appointments, answering the telephone, restocking or ordering depleted supplies, and filling out insurance forms or other paperwork. Aides are not licensed, so the law does not allow them to perform as wide a range of tasks as occupational therapist assistants.

Work environment. Occupational therapist assistants and aides need to have a moderate degree of strength because of the physical exertion required to assist patients. For example, assistants and aides may need to lift patients. Constant kneeling, stooping, and standing for long periods also are part of the job.

The hours and days that occupational therapist assistants and aides work vary by facility and with whether they are full- or part time. For example, many outpatient therapy offices and clinics have evening and weekend hours to coincide with patients' schedules.

Training, Other Qualifications, and Advancement

An associate degree or a certificate from an accredited community college or technical school is generally required to qualify for occupational therapist assistant jobs. In contrast, occupational therapist aides usually receive most of their training on the job.

Education and training. There were 126 accredited occupational therapist assistant programs in 2007. The first year of study typically involves an introduction to health care, basic medical terminology, anatomy, and physiology. In the second year, courses are more rigorous and usually include occupational therapist courses in areas such as mental health, adult physical disabilities, gerontology, and pediatrics. Students also must complete 16 weeks of supervised fieldwork in a clinic or community setting.

Occupational therapist assistants and aides provide rehabilitative services to persons with mental, physical, emotional, or developmental impairments.

Applicants to occupational therapist assistant programs can improve their chances of admission by taking high school courses in biology and health and by performing volunteer work in nursing care facilities, occupational or physical therapists' offices, or other health care settings.

Occupational therapist aides usually receive most of their training on the job. Qualified applicants must have a high school diploma, strong interpersonal skills, and a desire to help people in need. Applicants may increase their chances of getting a job by volunteering their services, thus displaying initiative and aptitude to the employer.

Licensure. In most states, occupational therapist assistants are regulated and must pass a national certification examination after they graduate. Those who pass the test are awarded the title "Certified Occupational Therapy Assistant."

Other qualifications. Assistants and aides must be responsible, patient, and willing to take directions and work as part of a team. Furthermore, they should be caring and want to help people who are not able to help themselves.

Advancement. Occupational therapist assistants may advance into administration positions. They might organize all the assistants in a large occupational therapy department or act as the director for a specific department such as sports medicine. Some assistants go on to teach classes in accredited occupational therapist assistant academic programs or lead health risk reduction classes for the elderly.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Occupational therapist assistants and aides	31-2010	33,000	41,000	8,200	25
Occupational therapist assistants	31-2011	25,000	31,000	6,400	25
Occupational therapist aides	31-2012	8,200	10,000	1,800	22

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Employment

Occupational therapist assistants and aides held about 33,000 jobs in 2006. Occupational therapist assistants held about 25,000 jobs, and occupational therapist aides held approximately 8,000. About 29 percent of jobs for assistants and aides were in hospitals, 23 percent were in offices of occupational therapists, and 21 percent were in nursing and residential care facilities. The rest were primarily in community care facilities for the elderly, home health care services, individual and family services, and state government agencies.

Job Outlook

Employment is expected to grow much faster than average as demand for occupational therapy services rises and as occupational therapists increasingly use assistants and aides. Job prospects should be very good for occupational therapist assistants. Job seekers holding only a high school diploma might face keen competition for occupational therapist aide jobs.

Employment change. Employment of occupational therapist assistants and aides is expected to grow 25 percent from 2006 to 2016, much faster than the average for all occupations. In the short run, the impact of proposed federal legislation imposing limits on reimbursement for therapy services may adversely affect the job market for occupational therapist assistants and aides. Over the long run, however, demand for occupational therapist assistants and aides will continue to rise because of the increasing number of individuals with disabilities or limited function.

The growing elderly population is particularly vulnerable to chronic and debilitating conditions that require therapeutic services. These patients often need additional assistance in their treatment, making the roles of assistants and aides vital. Also, the large baby-boom generation is entering the prime age for heart attacks and strokes, further increasing the demand for cardiac and physical rehabilitation. In addition, future medical developments should permit an increased percentage of trauma victims to survive, creating added demand for therapy services. An increase of sensory disorders in children will also spur demand for occupational therapy services.

Occupational therapists are expected to increasingly utilize assistants and aides to reduce the cost of occupational therapy services. Once a patient is evaluated and a treatment plan is designed by the therapist, the occupational therapist assistant can provide many aspects of treatment, as prescribed by the therapist.

Job prospects. Opportunities for individuals interested in becoming occupational therapist assistants are expected to be very good. In addition to employment growth, job openings will result from the need to replace occupational therapist assistants and aides who leave the occupation permanently over the 2006–2016 period. Occupational therapist assistants and aides with prior experience working in an occupational therapy office or other health care setting will have the best job opportunities. However, individuals with only a high school diploma may face keen competition for occupational therapist aide jobs.

Earnings

Median annual earnings of occupational therapist assistants were $42,060 in May 2006. The middle 50 percent earned between $34,130 and $50,230. The lowest 10 percent earned less than $26,050, and the highest 10 percent earned more than $58,270. Median annual earnings in the industries employing the largest numbers of occupational therapist assistants in May 2006 were:

Offices of physical, occupational and speech therapists, and audiologists	$45,130
Nursing care facilities	43,280
General medical and surgical hospitals	40,060

Median annual earnings of occupational therapist aides were $25,020 in May 2006. The middle 50 percent earned between $20,460 and $32,160. The lowest 10 percent earned less than $17,060, and the highest 10 percent earned more than $44,130. Median annual earnings in the industries employing the largest numbers of occupational therapist aides in May 2006 were:

Offices of physical, occupational and speech therapists, and audiologists	$26,960
General medical and surgical hospitals	26,360
Nursing care facilities	25,520

Related Occupations

Occupational therapist assistants and aides work under the supervision and direction of occupational therapists. Other workers in the health care field who work under similar supervision include dental assistants; medical assistants; nursing, psychiatric, and home health aides; personal and home care aides; pharmacy aides; pharmacy technicians; and physical therapist assistants and aides.

Pharmacy Aides

(O*NET 31-9095.00)

Significant Points

- Job opportunities are expected to be good for full-time and part-time work, especially for those with related work experience.
- Many pharmacy aides work evenings, weekends, and holidays.
- About 82 percent work in retail pharmacies, grocery stores, department stores, or mass retailers.

Pharmacy aides perform administrative duties in pharmacies, such as answering phones and stocking shelves.

Nature of the Work

Pharmacy aides perform administrative duties in pharmacies. Aides often are clerks or cashiers who primarily answer telephones, handle money, stock shelves, and perform other clerical duties. They work closely with pharmacy technicians. *Pharmacy technicians* usually perform more complex tasks than do aides, although in some states the duties and titles of the jobs overlap. (See the statement on pharmacy technicians elsewhere in the *Handbook*.) Aides refer any questions regarding prescriptions, drug information, or health matters to a pharmacist. (See the statement on pharmacists elsewhere in the *Handbook*.)

Pharmacy aides may establish and maintain patient profiles, prepare insurance claim forms, and stock and take inventory of prescription and over-the-counter medications. Accurate recordkeeping is necessary to help avert dangerous drug interactions. In addition, because many people have medical insurance to help pay for prescriptions, it is essential that pharmacy aides correspond efficiently and correctly with third-party insurance providers to obtain payment. Pharmacy aides also maintain inventory and inform the supervisor of stock needs so that the pharmacy does not run out of vital medications that customers need. Some aides also help with the maintenance of equipment and supplies.

Work environment. Pharmacy aides work in clean, organized, well-lighted, and well-ventilated areas. Most of their workday is spent on their feet. They may be required to lift heavy boxes or to use stepladders to retrieve supplies from high shelves.

Aides work the same hours that pharmacists do. These include evenings, nights, weekends, and some holidays, particularly in facilities that are open 24 hours a day such as hospitals and some retail pharmacies.

Training, Other Qualifications, and Advancement

Most pharmacy aides are trained on the job. Employers prefer applicants with previous experience and strong customer service skills. Many pharmacy aides go on to become pharmacy technicians.

Education and training. Most pharmacy aides receive informal on-the-job training, but employers favor those with at least a high school diploma. Prospective pharmacy aides with experience working as cashiers may have an advantage when applying for jobs. Employers also prefer applicants with experience managing inventories and using computers.

Pharmacy aides begin their training by observing a more experienced worker. After they become familiar with the store's equipment, policies, and procedures, they begin to work on their own. Once they become experienced, aides are not likely to receive additional training, except when new equipment is introduced or when policies or procedures change.

Other qualifications. Strong customer service and communication skills are essential, as pharmacy aides frequently interact with patients, fellow employees, and other health-care professionals. Aides entering the field also need strong spelling, reading, and mathematics skills. Successful pharmacy aides are organized, dedicated, friendly, and responsible. They should be willing and able to take directions. Candidates interested in becoming pharmacy aides cannot have prior records of drug or substance abuse.

Advancement. With experience or certification, many pharmacy aides go on to become pharmacy technicians. Some become pharmacists after completing a substantial amount of formal training.

Employment

Pharmacy aides held about 50,000 jobs in 2006. About 82 percent worked in retail pharmacies, most of which were in drug stores but some of which were in grocery stores, department stores, or mass retailers. About 7 percent of aides worked in hospitals.

Job Outlook

Employment of pharmacy aides is expected to decline rapidly from 2006 to 2016. Job prospects, however, should be good.

Employment change. Employment of pharmacy aides is expected to decline rapidly, decreasing by 11 percent over the 2006 to 2016 period. Demand for pharmacy aides will fall as pharmacy technicians become increasingly responsible for answering phones, stocking shelves, operating cash registers, and performing other administrative tasks. In addition, with increased training, many pharmacy aides will become pharmacy technicians, which will result in further declines in pharmacy aide jobs.

Job prospects. Despite declining employment, job opportunities for full-time and part-time work are expected to be good. The frequent need to replace workers who leave the occupation will create opportunities for interested applicants. Aides with related work experience in pharmacies, or as cashiers or stock clerks in other retail settings, should have the best opportunities.

Earnings

Median hourly earnings of wage-and-salary pharmacy aides were $9.35 in May 2006. The middle 50 percent earned between $7.89 and $11.58; the lowest 10 percent earned less than $6.92, and the highest 10 percent earned more than $14.64. Median hourly earnings in the industries employing the largest numbers of pharmacy aides in May 2006 were:

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Pharmacy aides	31-9095	50,000	45,000	-5,600	-11

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

General medical and surgical hospitals	$11.53
Grocery stores	9.87
Pharmacies and drug stores	8.97

Related Occupations
The work of pharmacy aides is closely related to that of pharmacy technicians, cashiers, and stock clerks and order fillers.

For information on employment opportunities, contact local employers or local offices of the state employment service.

Physical Therapist Assistants and Aides

(O*NET 31-2021.00 and 31-2022.00)

Significant Points
- Employment is projected to increase much faster than average.
- Assistants should have very good job prospects; on the other hand, aides may face keen competition from the large pool of qualified applicants.
- Aides usually learn skills on the job, while assistants generally have an associate degree; some states require licensing for assistants.
- About 71 percent of jobs are in offices of physical therapists or in hospitals.

Nature of the Work
Physical therapist assistants and aides help physical therapists to provide treatment that improves patient mobility, relieves pain, and prevents or lessens physical disabilities of patients. A physical therapist might ask an assistant to help patients exercise or learn to use crutches, for example, or an aide to gather and prepare therapy equipment. Patients include accident victims and individuals with disabling conditions such as lower-back pain, arthritis, heart disease, fractures, head injuries, and cerebral palsy.

Physical therapist assistants perform a variety of tasks. Under the direction and supervision of physical therapists, they provide part of a patient's treatment. This might involve exercises, massages, electrical stimulation, paraffin baths, hot and cold packs, traction, and ultrasound. Physical therapist assistants record the patient's responses to treatment and report the outcome of each treatment to the physical therapist.

Physical therapist aides help make therapy sessions productive, under the direct supervision of a physical therapist or physical therapist assistant. They usually are responsible for keeping the treatment area clean and organized and for preparing for each patient's therapy. When patients need assistance moving to or from a treatment area, aides push them in a wheelchair or provide them with a shoulder to lean on. Because they are not licensed, aides do not perform the clinical tasks of a physical therapist assistant in states where licensure is required.

The duties of aides include some clerical tasks, such as ordering depleted supplies, answering the phone, and filling out insurance forms and other paperwork. The extent to which an aide or an assistant performs clerical tasks depends on the size and location of the facility.

Physical therapist assistants have very good job prospects, but physical therapist aides should experience keen competition for jobs.

Work environment. Physical therapist assistants and aides need a moderate degree of strength because of the physical exertion required in assisting patients with their treatment. In some cases, assistants and aides need to lift patients. Frequent kneeling, stooping, and standing for long periods also are part of the job.

The hours and days that physical therapist assistants and aides work vary with the facility. About 23 percent of all physical therapist assistants and aides work part time. Many outpatient physical therapy offices and clinics have evening and weekend hours, to coincide with patients' personal schedules.

Training, Other Qualifications, and Advancement
Most physical therapist aides are trained on the job, but most physical therapist assistants earn an associate degree from an accredited physical therapist assistant program. Some states require licensing for physical therapist assistants.

Education and training. Employers typically require physical therapist aides to have a high school diploma. They are trained on the job, and most employers provide clinical on-the-job training.

In many states, physical therapist assistants are required by law to hold at least an associate degree. According to the American Physical Therapy Association, there were 233 accredited physical therapist assistant programs in the United States as of 2006. Accredited programs usually last 2 years, or 4 semesters, and culminate in an associate degree.

Programs are divided into academic study and hands-on clinical experience. Academic course work includes algebra, anatomy and physiology, biology, chemistry, and psychology. Clinical work includes certifications in CPR and other first aid and field experience in treatment centers. Both educators and prospective employers view clinical experience as essential to ensuring that students understand the responsibilities of a physical therapist assistant.

Licensure. Licensing is not required to practice as a physical therapist aide. However, some states require licensure or registration in order to work as a physical therapist assistant. states that require licensure stipulate specific educational and examination criteria. Additional requirements may include certification in cardiopulmonary resuscitation (CPR) and other first aid and a minimum number of hours of clinical experience. Complete information on regulations can be obtained from state licensing boards.

Other qualifications. Physical therapist assistants and aides should be well-organized, detail oriented, and caring. They usually have strong interpersonal skills and a desire to help people in need.

Advancement. Some physical therapist aides advance to become therapist assistants after gaining experience and, often, additional education. Sometimes, this education is required by law.

Some physical therapist assistants advance by specializing in a clinical area. They gain expertise in treating a certain type of patient, such as geriatric or pediatric, or a type of ailment, such as sports injuries. Many physical therapist assistants advance to administration positions. These positions might include organizing all the assistants in a large physical therapy organization or acting as the director for a specific department such as sports medicine. Other assistants go on to teach in an accredited physical therapist assistant academic program, lead health risk reduction classes for the elderly, or organize community activities related to fitness and risk reduction.

Employment

Physical therapist assistants and aides held about 107,000 jobs in 2006. Physical therapist assistants held about 60,000 jobs; physical therapist aides, approximately 46,000. Both work with physical therapists in a variety of settings. About 71 percent of jobs were in offices of physical therapists or in hospitals. Others worked primarily in nursing care facilities, offices of physicians, home health care services, and outpatient care centers.

Job Outlook

Employment is expected to grow much faster than average because of increasing consumer demand for physical therapy services. Job prospects for physical therapist assistants are expected to be very good. Aides should experience keen competition for jobs.

Employment change. Employment of physical therapist assistants and aides is expected to grow by 29 percent over the 2006–2016 decade, much faster than the average for all occupations. The impact of federal limits on Medicare and Medicaid reimbursement for therapy services may adversely affect the short-term job outlook for physical therapist assistants and aides. However, long-term demand for physical therapist assistants and aides will continue to rise, as the number of individuals with disabilities or limited function grows.

The increasing number of people who need therapy reflects, in part, the increasing elderly population. The elderly population is particularly vulnerable to chronic and debilitating conditions that require therapeutic services. These patients often need additional assistance in their treatment, making the roles of assistants and aides vital. In addition, the large baby-boom generation is entering the prime age for heart attacks and strokes, further increasing the demand for cardiac and physical rehabilitation. Moreover, future medical developments should permit an increased percentage of trauma victims to survive, creating added demand for therapy services.

Physical therapists are expected to increasingly use assistants to reduce the cost of physical therapy services. Once a patient is evaluated and a treatment plan is designed by the physical therapist, the physical therapist assistant can provide many parts of the treatment, as approved by the therapist.

Job prospects. Opportunities for individuals interested in becoming physical therapist assistants are expected to be very good. Physical therapist aides may face keen competition from the large pool of qualified individuals. In addition to employment growth, job openings will result from the need to replace workers who leave the occupation permanently. Physical therapist assistants and aides with prior experience working in a physical therapy office or other health care setting will have the best job opportunities.

Earnings

Median annual earnings of physical therapist assistants were $41,360 in May 2006. The middle 50 percent earned between $33,840 and $49,010. The lowest 10 percent earned less than $26,190, and the highest 10 percent earned more than $57,220. Median annual earnings in the industries employing the largest numbers of physical therapist assistants in May 2006 were:

Home health care services	$46,390
Nursing care facilities	44,460
Offices of physical, occupational and speech therapists, and audiologists	40,780
General medical and surgical hospitals	40,670
Offices of physicians	39,290

Median annual earnings of physical therapist aides were $22,060 in May 2006. The middle 50 percent earned between $18,550 and $26,860. The lowest 10 percent earned less than $15,850, and the highest 10 percent earned more than $32,600. Median annual earnings in the industries employing the largest numbers of physical therapist aides in May 2006 were:

Nursing care facilities	$24,170
Offices of physicians	22,680
General medical and surgical hospitals	22,680
Offices of physical, occupational and speech therapists, and audiologists	21,230

Related Occupations

Physical therapist assistants and aides work under the supervision of physical therapists. Other workers in the health care field who work under similar supervision include dental assistants; medical assistants; occupational therapist assistants and aides; pharmacy aides; pharmacy technicians; nursing, psychiatric, and home health aides; personal and home care aides; and social and human service assistants.

Protective Service Occupations

Correctional Officers

(O*NET 33-1011.00, 33-3011.00, and 33-3012.00)

Significant Points

- The work can be stressful and hazardous.
- Most correctional officers are employed in state and local government prisons and jails.
- Job opportunities are expected to be excellent.

Nature of the Work

Correctional officers, also known as *detention officers*, are responsible for overseeing individuals who have been arrested and are awaiting trial or who have been convicted of a crime and sentenced to serve time in a jail, reformatory, or penitentiary.

The jail population changes constantly as some are released, some are convicted and transferred to prison, and new offenders are arrested and enter the system. Correctional officers in local jails admit and process about 12 million people a year, with about 700,000 offenders in jail at any given time. Correctional officers in state and federal prisons watch over the approximately 1.5 million offenders who are incarcerated there at any given time.

Correctional officers maintain security and inmate accountability to prevent disturbances, assaults, and escapes. Officers have no law enforcement responsibilities outside the institution where they work. (For more information on related occupations, see the statements on police and detectives and on probation officers and correctional treatment specialists, elsewhere in the *Handbook*.)

Regardless of the setting, correctional officers maintain order within the institution and enforce rules and regulations. To help ensure that inmates are orderly and obey rules, correctional officers monitor the activities and supervise the work assignments of inmates. Sometimes, officers must search inmates and their living quarters for contraband like weapons or drugs, settle disputes between inmates, and enforce discipline. Correctional officers periodically inspect the facilities, checking cells and other areas of the institution for unsanitary conditions, contraband, fire hazards, and any evidence of infractions of rules. In addition, they routinely inspect locks, window bars, grilles, doors, and gates for signs of tampering. Finally, officers inspect mail and visitors for prohibited items.

Correctional officers report orally and in writing on inmate conduct and on the quality and quantity of work done by inmates. Officers also report security breaches, disturbances, violations of rules, and any unusual occurrences. They usually keep a daily log or record of their activities. Correctional officers cannot show favoritism and must report any inmate who violates the rules. If a crime is committed within their institution or an inmate escapes, they help the responsible law enforcement authorities investigate or search for the escapee. In jail and prison facilities with direct supervision of cellblocks, officers work unarmed. They are equipped with communications devices so that they can summon help if necessary. These officers often work in a cellblock alone, or with another officer, among the 50 to 100 inmates who reside there. The officers enforce regulations primarily through their interpersonal communication skills and through the use of progressive sanctions, such as the removal of some privileges.

In the highest security facilities, where the most dangerous inmates are housed, correctional officers often monitor the activities of prisoners from a centralized control center with closed-circuit television cameras and a computer tracking system. In such an environment, the inmates may not see anyone but officers for days or weeks at a time and may leave their cells only for showers, solitary exercise time, or visitors. Depending on the offenders' security classification within the institution, correctional officers may have to restrain inmates in handcuffs and leg irons to safely escort them to and from cells and other areas and to see authorized visitors. Officers also escort prisoners between the institution and courtrooms, medical facilities, and other destinations outside the institution.

Bailiffs, also known as *marshals* or *court officers*, are law enforcement officers who maintain safety and order in courtrooms. Their duties, which vary by location, include enforcing courtroom rules, assisting judges, guarding juries from outside contact, delivering court documents, and providing general security for courthouses.

Work environment. Working in a correctional institution can be stressful and hazardous. Every year, correctional officers are injured in confrontations with inmates. Correctional officers may work indoors or outdoors. Some correctional institutions are well lighted, temperature controlled, and ventilated, but others are old, overcrowded, hot, and noisy. Although both jails and prisons can be dangerous places to work, prison populations are more stable than jail populations, and correctional officers in prisons know the security and custodial requirements of the prisoners with whom they are dealing.

Correctional officers usually work an eight-hour day, five days a week, on rotating shifts. Because prison and jail security must be provided around the clock, officers work all hours of the day and night, weekends, and holidays. In addition, officers may be required to work paid overtime.

Job opportunities for correctional officers should be excellent.

Training, Other Qualifications, and Advancement

Correctional officers learn most of what they need to know for their work through on-the-job training. Qualifications vary by agency, but all agencies require a high school diploma or equivalent, and some also require some college education or full-time work experience.

Education and training. A high school diploma or graduation equivalency degree is required by all employers. The Federal Bureau of Prisons requires entry-level correctional officers to have at least a bachelor's degree; 3 years of full-time experience in a field providing counseling, assistance, or supervision to individuals; or a combination of the two. Some state and local corrections agencies require some college credits, but law enforcement or military experience may be substituted to fulfill this requirement.

Federal, state, and some local departments of corrections provide training for correctional officers based on guidelines established by the American Correctional Association and the American Jail Association. Some states have regional training academies that are available to local agencies. At the conclusion of formal instruction, all state and local correctional agencies provide on-the-job training, including training on legal restrictions and interpersonal relations. Many systems require firearms proficiency and self-defense skills. Officer trainees typically receive several weeks or months of training in an actual job setting under the supervision of an experienced officer. However, on-the-job training varies widely from agency to agency.

Academy trainees generally receive instruction in a number of subjects, including institutional policies, regulations, and operations, as well as custody and security procedures. New federal correctional officers must undergo 200 hours of formal training within the first year of employment. They also must complete 120 hours of specialized training at the U.S. Federal Bureau of Prisons residential training center at Glynco, GA, within 60 days of their appointment. Experienced officers receive annual in-service training to keep abreast of new developments and procedures.

Some correctional officers are members of prison tactical response teams, which are trained to respond to disturbances, riots, hostage situations, forced cell moves, and other potentially dangerous confrontations. Team members practice disarming prisoners wielding weapons, protecting themselves and inmates against the effects of chemical agents, and other tactics.

Other qualifications. All institutions require correctional officers to be at least 18 to 21 years of age, be a U.S. citizen or permanent resident, and have no felony convictions. Some require previous experience in law enforcement or the military, but college credits can be substituted to fulfill this requirement. Others require demonstration of job stability, usually by accumulating 2 years of work experience, which need not be related to corrections or law enforcement.

Correctional officers must be in good health. Candidates for employment generally are required to meet formal standards of physical fitness, eyesight, and hearing. In addition, many jurisdictions use standard tests to determine applicant suitability to work in a correctional environment. Good judgment and the ability to think and act quickly are indispensable. Applicants are typically screened for drug abuse, subject to background checks, and required to pass a written examination.

Advancement. Qualified officers may advance to the position of correctional sergeant. Correctional sergeants supervise correctional officers and usually are responsible for maintaining security and directing the activities of other officers during an assigned shift or in an assigned area. Ambitious and qualified correctional officers can be promoted to supervisory or administrative positions all the way up to warden. Promotion prospects may be enhanced by attending college. Officers sometimes transfer to related jobs, such as probation officer, parole officer, and correctional treatment specialist.

Employment

Correctional officers held about 500,000 jobs in 2006. About 3 of every 5 jobs were in state correctional institutions such as prisons, prison camps, and youth correctional facilities. About 18,000 jobs for correctional officers were in federal correctional institutions, and about 16,000 jobs were in privately owned and managed prisons.

Most of the remaining jobs were in city and county jails or in other institutions run by local governments. Some 300 of these jails, all of them in urban areas, are large, housing over 1,000 inmates. Most correctional officers employed in jails, however, work in institutions located in rural areas with smaller inmate populations.

Other correctional officers oversee individuals being held by the U.S. Immigration and Naturalization Service pending release or deportation or work for correctional institutions that are run by private, for-profit organizations.

Job Outlook

Employment growth is expected to be faster than the average for all occupations, and job opportunities are expected to be excellent.

Employment change. Employment of correctional officers is expected to grow 16 percent between 2006 and 2016, faster than the average for all occupations. Increasing demand for correctional officers will stem from population growth and rising rates of incarceration. Mandatory sentencing guidelines calling for longer sentences and reduced parole for inmates are a primary reason for historically increasing incarceration rates. Some states are reconsidering mandatory sentencing guidelines because of budgetary constraints, court decisions, and doubts about their effectiveness. Additionally, the Supreme Court recently ruled to make federal sentencing guidelines voluntary, rather than mandatory, for judges. It is unclear how many states will change their sentencing policies and how long it will be before any changes affect the prison population. Nevertheless, these developments could moderate future increases in the prison population and cause employment of correctional officers to grow more slowly than they have in the past.

Some employment opportunities also will arise in the private sector, as public authorities contract with private companies to provide

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Correctional officers	—	500,000	582,000	82,000	16
First-line supervisors/managers of correctional officers	33-1011	40,000	45,000	5,000	13
Bailiffs, correctional officers, and jailers	33-3010	460,000	537,000	77,000	17
Bailiffs	33-3011	19,000	21,000	2,100	11
Correctional officers and jailers	33-3012	442,000	516,000	75,000	17

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

and staff corrections facilities. Both state and federal corrections agencies are increasingly using private prisons.

Job prospects. Job opportunities for correctional officers are expected to be excellent. The need to replace correctional officers who transfer to other occupations, retire, or leave the labor force, coupled with rising employment demand, will generate thousands of job openings each year. In the past, some local and state corrections agencies have experienced difficulty in attracting and keeping qualified applicants, largely because of low salaries, shift work, and the concentration of jobs in rural locations. This situation is expected to continue.

Layoffs of correctional officers are rare because of increasing offender populations.

Earnings

Median annual earnings of correctional officers and jailers were $35,760 in May 2006. The middle 50 percent earned between $28,320 and $46,500. The lowest 10 percent earned less than $23,600, and the highest 10 percent earned more than $58,580. Median annual earnings in the public sector were $47,750 in the federal government, $36,140 in state government, and $34,820 in local government. In the facilities support services industry, where the relatively small number of officers employed by privately operated prisons is classified, median annual earnings were $25,050.

Median annual earnings of first-line supervisors/managers of correctional officers were $52,580 in May 2006. The middle 50 percent earned between $38,920 and $67,820. The lowest 10 percent earned less than $33,270, and the highest 10 percent earned more than $81,230. Median annual earnings were $51,500 in state government and $52,940 in local government.

Median annual earnings of bailiffs were $34,210 in May 2006. The middle 50 percent earned between $25,130 and $48,010. The lowest 10 percent earned less than $18,390, and the highest 10 percent earned more than $58,270. Median annual earnings were $30,510 in local government.

According to the Federal Bureau of Prisons, the starting salary for federal correctional officers was $28,862 a year in 2007. Starting federal salaries were slightly higher in areas where prevailing local pay levels were higher.

In addition to typical benefits, correctional officers employed in the public sector usually are provided with uniforms or a clothing allowance to purchase their own uniforms. Civil service systems or merit boards cover officers employed by the federal government and most state governments. Their retirement coverage entitles correctional officers to retire at age 50 after 20 years of service or at any age with 25 years of service.

Related Occupations

A number of options are available to those interested in careers in protective services and security. Security guards and gaming surveillance officers protect people and property against theft, vandalism, illegal entry, and fire. Police and detectives maintain law and order, prevent crime, and arrest offenders. Probation officers and correctional treatment specialists monitor and counsel offenders and evaluate their progress in becoming productive members of society.

➤ American Jail Association, 1135 Professional Ct., Hagerstown, MD 21740. Internet: http://www.corrections.com/aja

➤ Information on entrance requirements, training, and career opportunities for correctional officers at the federal level may be obtained from the Federal Bureau of Prisons. Internet: http://www.bop.gov

Information on obtaining a position as a correctional officer with the federal government is available from the Office of Personnel Management through USAJOBS, the federal government's official employment information system. This resource for locating and applying for job opportunities can be accessed through the Internet at http://www.usajobs.opm.gov or through an interactive voice response telephone system at (703) 724-1850 or TDD (978) 461-8404. These numbers are not toll free, and charges may result.

Fire Fighting Occupations

(O*NET 33-1021.00, 33-1021.01, 33-1021.02, 33-2011.00, 33-2011.01, 33-2011.02, 33-2021.00, 33-2021.01, 33-2021.02, and 33-2022.00)

Significant Points

- Fire fighting involves hazardous conditions and long, irregular hours.
- About 9 out of 10 fire fighting workers are employed by local governments.
- Applicants for city fire fighting jobs generally must pass written, physical, and medical examinations.
- Although employment is expected to grow faster than the average, keen competition for jobs is expected because this occupation attracts many qualified candidates.

Nature of the Work

Every year, fires and other emergencies take thousands of lives and destroy property worth billions of dollars. Fire fighters help protect the public against these dangers by responding to fires and a variety of other emergencies. In addition to putting out fires, they are frequently the first emergency personnel at the scene of a traffic accident or medical emergency and may be called upon to treat injuries or perform other vital functions.

During duty hours, fire fighters must be prepared to respond immediately to a fire or others emergency. Fighting fires is dangerous and complex, therefore requires organization and teamwork. At every emergency scene, fire fighters perform specific duties assigned by a superior officer. At fires, they connect hose lines to hydrants and operate a pump to send water to high-pressure hoses. Some carry hoses, climb ladders, and enter burning buildings—using systematic and careful procedures—to put out fires. At times, they may need to use tools, like an ax, to make their way through doors, walls, and debris, sometimes with the aid of information about a building's floor plan. Some find and rescue occupants who are unable to safely leave the building without assistance. They also provide emergency medical attention, ventilate smoke-filled areas, and attempt to salvage the contents of buildings. Fire fighters' duties may change several times while the company is in action. Sometimes they remain at the site of a disaster for days at a time, rescuing trapped survivors, and assisting with medical treatment.

Fire fighters work in a variety of settings, including metropolitan areas, rural areas with grasslands and forests, airports, chemical plants and other industrial sites. They have also assumed a range of responsibilities, including emergency medical services. In fact, most calls to which fire fighters respond involve medical emergencies. In addition, some fire fighters work in hazardous materials units that are specially trained for the control, prevention, and cleanup of hazardous materials, such as oil spills or accidents involving the trans-

Fire fighters respond to emergencies, such as car accidents and fires.

port of chemicals. (For more information, see the *Handbook* section on hazardous material removal workers.)

Workers specializing forest fires utilize different methods and equipment than other fire fighters. In national forests and parks, *forest fire inspectors and prevention specialists* spot fires from watchtowers and report the fires to headquarters by telephone or radio. Forest rangers also patrol to ensure that travelers and campers comply with fire regulations. When fires break out, crews of fire fighters are brought in to suppress the blaze with heavy equipment and water hoses. Fighting forest fires, like fighting urban fires, is rigorous work. One of the most effective means of fighting a forest fire is creating fire lines—cutting down trees and digging out grass and all other combustible vegetation in the path of the fire—to deprive it of fuel. Elite fire fighters called smoke jumpers parachute from airplanes to reach otherwise inaccessible areas. This tactic, however, can be extremely hazardous.

When they aren't responding to fires and other emergencies, fire fighters clean and maintain equipment, study fire science and fire fighting techniques, conduct practice drills and fire inspections, and participate in physical fitness activities. They also prepare written reports on fire incidents and review fire science literature to stay informed about technological developments and changing administrative practices and policies.

Most fire departments have a fire prevention division, usually headed by a fire marshal and staffed by *fire inspectors*. Workers in this division conduct inspections of structures to prevent fires by ensuring compliance with fire codes. These inspectors also work with developers and planners to check and approve plans for new buildings and inspect buildings under construction.

Some fire fighters become *fire investigators*, who determine the causes of fires. They collect evidence, interview witnesses, and prepare reports on fires in cases where the cause may be arson or criminal negligence. They often are asked to testify in court. In some cities, these investigators work in police departments, and some are employed by insurance companies.

Work environment. Fire fighters spend much of their time at fire stations, which are usually similar to dormitories. When an alarm sounds, fire fighters respond, regardless of the weather or hour. Fire fighting involves the risk of death or injury from floors caving in, walls toppling, traffic accidents, and exposure to flames and smoke. Fire fighters also may come into contact with poisonous, flammable, or explosive gases and chemicals and radioactive materials, which may have immediate or long-term effects on their health. For these reasons, they must wear protective gear that can be very heavy and hot.

Work hours of fire fighters are longer and more varied than the hours of most other workers. Many fire fighters work more than 50 hours a week, and sometimes they may work longer. In some agencies, fire fighters are on duty for 24 hours, then off for 48 hours, and receive an extra day off at intervals. In others, they work a day shift of 10 hours for 3 or 4 days, a night shift of 14 hours for 3 or 4 nights, have 3 or 4 days off, and then repeat the cycle. In addition, fire fighters often work extra hours at fires and other emergencies and are regularly assigned to work on holidays. Fire lieutenants and fire captains often work the same hours as the fire fighters they supervise.

Training, Other Qualifications, and Advancement

Applicants for fire fighting jobs are usually required to have at least a high school diploma, but candidates with some education after high school are increasingly preferred. Most municipal jobs require passing written and physical tests. All fire fighters receive extensive training after being hired.

Education and training. Most fire fighters have a high school diploma, however, the completion of community college courses, or in some cases, an associate degree, in fire science may improve an applicant's chances for a job. A number of colleges and universities offer courses leading to two- or four-year degrees in fire engineering or fire science. In recent years, an increasing proportion of new fire fighters have had some education after high school.

As a rule, entry-level workers in large fire departments are trained for several weeks at the department's training center or academy. Through classroom instruction and practical training, the recruits study fire fighting techniques, fire prevention, hazardous materials control, local building codes, and emergency medical procedures, including first aid and cardiopulmonary resuscitation (CPR). They also learn how to use axes, chain saws, fire extinguishers, ladders, and other fire fighting and rescue equipment. After successfully completing this training, the recruits are assigned to a fire company, where they undergo a period of probation.

Many fire departments have accredited apprenticeship programs lasting up to 4 years. These programs combine formal instruction with on-the-job training under the supervision of experienced fire fighters.

Almost all departments require fire fighters to be certified as emergency medical technicians. (For more information, see the section of the *Handbook* on emergency medical technicians and paramedics.) Although most fire departments require the lowest level of certification, Emergency Medical Technician-Basic (EMT-Basic), larger departments in major metropolitan areas increasingly require paramedic certification. Some departments include this training in the fire academy, whereas others prefer that recruits earn EMT certification on their own but will give them up to 1 year to do it.

In addition to participating in training programs conducted by local fire departments, some fire fighters attend training sessions sponsored by the U.S. National Fire Academy. These training sessions cover topics such as executive development, anti-arson techniques, disaster preparedness, hazardous materials control, and public fire safety and education. Some states also have either voluntary or mandatory fire fighter training and certification programs. Many fire departments offer fire fighters incentives such as tuition reimbursement or higher pay for completing advanced training.

Other qualifications. Applicants for municipal fire fighting jobs usually must pass a written exam; tests of strength, physical stamina, coordination, and agility; and a medical examination that includes a drug screening. Workers may be monitored on a random

basis for drug use after accepting employment. Examinations are generally open to people who are at least 18 years of age and have a high school education or its equivalent. Those who receive the highest scores in all phases of testing have the best chances of being hired.

Among the personal qualities fire fighters need are mental alertness, self-discipline, courage, mechanical aptitude, endurance, strength, and a sense of public service. Initiative and good judgment also are extremely important because fire fighters make quick decisions in emergencies. Members of a crew live and work closely together under conditions of stress and danger for extended periods, so they must be dependable and able to get along well with others. Leadership qualities are necessary for officers, who must establish and maintain discipline and efficiency, as well as direct the activities of the fire fighters in their companies.

Advancement. Most experienced fire fighters continue studying to improve their job performance and prepare for promotion examinations. To progress to higher level positions, they acquire expertise in advanced fire fighting equipment and techniques, building construction, emergency medical technology, writing, public speaking, management and budgeting procedures, and public relations.

Opportunities for promotion depend upon the results of written examinations, as well as job performance, interviews, and seniority. Hands-on tests that simulate real-world job situations are also used by some fire departments.

Usually, fire fighters are first promoted to engineer, then lieutenant, captain, battalion chief, assistant chief, deputy chief, and, finally, chief. For promotion to positions higher than battalion chief, many fire departments now require a bachelor's degree, preferably in fire science, public administration, or a related field. An associate degree is required for executive fire officer certification from the National Fire Academy.

Employment

In 2006, total paid employment in firefighting occupations was about 361,000. Fire fighters held about 293,000 jobs, first-line supervisors/managers of fire fighting and prevention workers held about 52,000, and fire inspectors and investigators held about 14,000 jobs. These employment figures include only paid career fire fighters—they do not cover volunteer fire fighters, who perform the same duties and may constitute the majority of fire fighters in a residential area. According to the U.S. Fire Administration, about 71 percent of fire companies were staffed entirely by volunteer fire fighters in 2005.

About 9 out of 10 fire fighting workers were employed by local government. Some large cities have thousands of career fire fighters, while many small towns have only a few. Most of the remainder worked in fire departments on federal and state installations, including airports. Private fire fighting companies employ a small number of fire fighters.

In response to the expanding role of fire fighters, some municipalities have combined fire prevention, public fire education, safety, and emergency medical services into a single organization commonly referred to as a public safety organization. Some local and regional fire departments are being consolidated into countywide establishments to reduce administrative staffs, cut costs, and establish consistent training standards and work procedures.

Job Outlook

Although employment is expected to grow as fast as the average for all jobs, candidates for these positions are expected to face keen competition as these positions are highly attractive and sought after.

Employment change. Employment of workers in fire fighting occupations is expected to grow by 12 percent over the 2006–2016 decade, which is as fast as the average for all occupations. Most job growth will stem from volunteer fire fighting positions being converted to paid positions. In recent years, it has become more difficult for volunteer fire departments to recruit and retain volunteers. This may be the result of the considerable amount of training and time commitment required. Furthermore, a trend towards more people living in and around cities has increased the demand for fire fighters. When areas develop and become more densely populated, emergencies and fires affect more buildings and more people and therefore require more fire fighters.

Job prospects. Prospective fire fighters are expected to face keen competition for available job openings. Many people are attracted to fire fighting because, it is challenging and provides the opportunity to perform an essential public service; a high school education is usually sufficient for entry; and a pension is usually guaranteed after 25 years work. Consequently, the number of qualified applicants in most areas far exceeds the number of job openings, even though the written examination and physical requirements eliminate many applicants. This situation is expected to persist in coming years. Applicants with the best chances are those who are physically fit and score the highest on physical conditioning and mechanical aptitude exams. Those who have completed some fire fighter education at a community college and have EMT or paramedic certification will have an additional advantage.

Earnings

Median annual earnings of fire fighters were $41,190 in May 2006. The middle 50 percent earned between $29,550 and $54,120. The lowest 10 percent earned less than $20,660, and the highest 10 percent earned more than $66,140. Median annual earnings were $41,600 in local government, $41,070 in the federal government, and $37,000 in state governments.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Fire fighting occupations	—	361,000	404,000	43,000	12
First-line supervisors/managers of fire fighting and prevention workers	33-1021	52,000	58,000	6,000	11
Fire fighting and prevention workers	33-2000	308,000	345,000	37,000	12
Fire fighters	33-2011	293,000	328,000	35,000	12
Fire inspectors	33-2020	16,000	17,000	1,600	10
Fire inspectors and investigators	33-2021	14,000	15,000	1,500	11
Forest fire inspectors and prevention specialists	33-2022	1,800	1,900	0	2

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Median annual earnings of first-line supervisors/managers of fire fighting and prevention workers were $62,900 in May 2006. The middle 50 percent earned between $50,180 and $79,060. The lowest 10 percent earned less than $36,820, and the highest 10 percent earned more than $97,820. First-line supervisors/managers of fire fighting and prevention workers employed in local government earned a median of about $64,070 a year.

Median annual earnings of fire inspectors and investigators were $48,050 in May 2006. The middle 50 percent earned between $36,960 and $61,160 a year. The lowest 10 percent earned less than $29,840, and the highest 10 percent earned more than $74,930. Fire inspectors and investigators employed in local government earned a median of about $49,690 a year.

According to the International City-County Management Association, average salaries in 2006 for sworn full-time positions were as follows:

	Minimum annual base salary	Maximum annual base salary
Fire chief	$73,435	$95,271
Deputy chief	66,420	84,284
Assistant fire chief	61,887	78,914
Battalion chief	62,199	78,611
Fire captain	51,808	62,785
Fire lieutenant	47,469	56,511
Fire prevention/code inspector	45,951	58,349
Engineer	43,232	56,045

Fire fighters who average more than a certain number of work hours per week are required to be paid overtime. The hours threshold is determined by the department. Fire fighters often earn overtime for working extra shifts to maintain minimum staffing levels or during special emergencies.

Fire fighters receive benefits that usually include medical and liability insurance, vacation and sick leave, and some paid holidays. Almost all fire departments provide protective clothing (helmets, boots, and coats) and breathing apparatus, and many also provide dress uniforms. Fire fighters generally are covered by pension plans, often providing retirement at half pay after 25 years of service or if the individual is disabled in the line of duty.

Related Occupations

Like fire fighters, emergency medical technicians and paramedics and police and detectives respond to emergencies and save lives.

Sources of Additional Information

Information about a career as a fire fighter may be obtained from local fire departments and from either of the following organizations

➤ International Association of Fire Fighters, 1750 New York Ave. NW, Washington, DC 20006. Internet: http://www.iaff.org

➤ U.S. Fire Administration, 16825 S. Seton Ave., Emmitsburg, MD 21727. Internet: http://www.usfa.dhs.gov

Information about professional qualifications and a list of colleges and universities offering two- or four-year degree programs in fire science or fire prevention may be obtained from

➤ National Fire Academy, 16825 S. Seton Ave., Emmitsburg, MD 21727. Internet: http://www.usfa.dhs.gov/nfa/index.htm

Police and Detectives

(O*NET 33-1012.00, 33-3021.00, 33-3021.01, 33-3021.02, 33-3021.03, 33-3021.04,33-3021.05, 33-3031.00, 33-3051.00, 33-3051.01, 33-3051.02, 33-3051.03, and 33-3052.00)

Significant Points

- Police work can be dangerous and stressful.
- Education requirements range from a high school diploma to a college degree or higher.
- Job opportunities in most local police departments will be excellent for qualified individuals, while competition is expected for jobs in state and federal agencies.
- Applicants with college training in police science or military police experience will have the best opportunities.

Nature of the Work

People depend on police officers and detectives to protect their lives and property. Law enforcement officers, some of whom are state or federal special agents or inspectors, perform these duties in a variety of ways depending on the size and type of their organization. In most jurisdictions, they are expected to exercise authority when necessary, whether on or off duty.

Police and detectives pursue and apprehend individuals who break the law and then issue citations or give warnings. A large proportion of their time is spent writing reports and maintaining records of incidents they encounter. Most *police officers* patrol their jurisdictions and investigate any suspicious activity they notice. *Detectives,* who are often called *agents* or *special agents,* perform investigative duties such as gathering facts and collecting evidence.

The daily activities of police and detectives differ depending on their occupational specialty—such as police officer, game warden, or detective—and whether they are working for a local, state, or fed-

Job opportunities in most local police departments will be excellent, while competition is expected for jobs in state and federal agencies.

eral agency. Duties also differ substantially among various federal agencies, which enforce different aspects of the law. Regardless of job duties or location, police officers and detectives at all levels must write reports and maintain meticulous records that will be needed if they testify in court.

Uniformed police officers have general law enforcement duties, including maintaining regular patrols and responding to calls for service. Much of their time is spent responding to calls and doing paperwork. They may direct traffic at the scene of an accident, investigate a burglary, or give first aid to an accident victim. In large police departments, officers usually are assigned to a specific type of duty. Many urban police agencies are involved in community policing—a practice in which an officer builds relationships with the citizens of local neighborhoods and mobilizes the public to help fight crime.

Police agencies are usually organized into geographic districts, with uniformed officers assigned to patrol a specific area such as part of the business district or outlying residential neighborhoods. Officers may work alone, but in large agencies, they often patrol with a partner. While on patrol, officers attempt to become thoroughly familiar with their patrol area and remain alert for anything unusual. Suspicious circumstances and hazards to public safety are investigated or noted, and officers are dispatched to individual calls for assistance within their district. During their shift, they may identify, pursue, and arrest suspected criminals; resolve problems within the community; and enforce traffic laws.

Some agencies have special geographic jurisdictions and enforcement responsibilities. Public college and university police forces, public school district police, and agencies serving transportation systems and facilities are examples. Most law enforcement workers in special agencies are uniformed officers; a smaller number are investigators.

Some police officers specialize in a particular field, such as chemical and microscopic analysis, training and firearms instruction, or handwriting and fingerprint identification. Others work with special units, such as horseback, bicycle, motorcycle, or harbor patrol; canine corps; special weapons and tactics (SWAT); or emergency response teams. A few local and special law enforcement officers primarily perform jail-related duties or work in courts. (For information on other officers who work in jails and prisons, see correctional officers elsewhere in the *Handbook*.)

Sheriffs and deputy sheriffs enforce the law on the county level. Sheriffs are usually elected to their posts and perform duties similar to those of a local or county police chief. Sheriffs' departments tend to be relatively small, most having fewer than 50 sworn officers. Deputy sheriffs have law enforcement duties similar to those of officers in urban police departments. Police and sheriffs' deputies who provide security in city and county courts are sometimes called bailiffs.

State police officers, sometimes called *state troopers* or *highway patrol officers*, arrest criminals statewide and patrol highways to enforce motor vehicle laws and regulations. State police officers often issue traffic citations to motorists. At the scene of accidents, they may direct traffic, give first aid, and call for emergency equipment. They also write reports used to determine the cause of the accident. State police officers are frequently called upon to render assistance to other law enforcement agencies, especially those in rural areas or small towns.

State law enforcement agencies operate in every state except Hawaii. Most full-time sworn personnel are uniformed officers who regularly patrol and respond to calls for service. Others work as investigators, perform court-related duties, or carry out administrative or other assignments.

Detectives are plainclothes investigators who gather facts and collect evidence for criminal cases. Some are assigned to interagency task forces to combat specific types of crime. They conduct interviews, examine records, observe the activities of suspects, and participate in raids or arrests. Detectives and state and federal agents and inspectors usually specialize in investigating one type of violation, such as homicide or fraud. They are assigned cases on a rotating basis and work on them until an arrest and conviction is made or until the case is dropped.

Fish and game wardens enforce fishing, hunting, and boating laws. They patrol hunting and fishing areas, conduct search and rescue operations, investigate complaints and accidents, and aid in prosecuting court cases.

The federal government works in many areas of law enforcement. *Federal Bureau of Investigation (FBI) agents* are the government's principal investigators, responsible for investigating violations of more than 200 categories of federal law and conducting sensitive national security investigations. Agents may conduct surveillance, monitor court-authorized wiretaps, examine business records, investigate white-collar crime, or participate in sensitive undercover assignments. The FBI investigates a wide range of criminal activity, including organized crime, public corruption, financial crime, bank robbery, kidnapping, terrorism, espionage, drug trafficking, and cyber crime.

There are many other federal agencies that enforce particular types of laws. *U.S. Drug Enforcement Administration (DEA) agents* enforce laws and regulations relating to illegal drugs. *U.S. marshals and deputy marshals* protect the federal courts and ensure the effective operation of the judicial system. *Bureau of Alcohol, Tobacco, Firearms, and Explosives agents* enforce and investigate violations of federal firearms and explosives laws, as well as federal alcohol and tobacco tax regulations. The U.S. Department of State *Bureau of Diplomatic Security special agents* are engaged in the battle against terrorism.

The *Department of Homeland Security* also employs numerous law enforcement officers within several different agencies, including Customs and Border Protection, Immigration and Customs Enforcement, and the U.S. Secret Service. *U.S. Border Patrol agents* protect more than 8,000 miles of international land and water boundaries. *Immigration inspectors* interview and examine people seeking entrance to the United States and its territories. *Customs inspectors* enforce laws governing imports and exports by inspecting cargo, baggage, and articles worn or carried by people, vessels, vehicles, trains, and aircraft entering or leaving the United States. *Federal Air Marshals* provide air security by guarding against attacks targeting U.S. aircraft, passengers, and crews. *U.S. Secret Service special agents* and U*.S. Secret Service uniformed officers* protect the President, Vice President, their immediate families, and other public officials. Secret Service special agents also investigate counterfeiting, forgery of government checks or bonds, and fraudulent use of credit cards.

Other federal agencies employ police and special agents with sworn arrest powers and the authority to carry firearms. These agencies include the Postal Service, the Bureau of Indian Affairs Office of Law Enforcement, the Forest Service, and the National Park Service.

Work environment. Police and detective work can be very dangerous and stressful. In addition to the obvious dangers of confrontations with criminals, police officers and detectives need to be constantly alert and ready to deal appropriately with a number of other threatening situations. Many law enforcement officers witness death and suffering resulting from accidents and criminal behavior. A career in law enforcement may take a toll on their private lives.

The jobs of some federal agents such as U.S. Secret Service and DEA special agents require extensive travel, often on very short notice. They may relocate a number of times over the course of their careers. Some special agents in agencies such as the U.S. Border Patrol work outdoors in rugged terrain for long periods and in all kinds of weather.

Uniformed officers, detectives, agents, and inspectors are usually scheduled to work 40-hour weeks, but paid overtime is common. Shift work is necessary because protection must be provided around the clock. Junior officers frequently work weekends, holidays, and nights. Police officers and detectives are required to work whenever they are needed and may work long hours during investigations. Officers in most jurisdictions, whether on or off duty, are expected to be armed and to exercise their authority when necessary.

Training, Other Qualifications, and Advancement

Most police and detectives learn much of what they need to know on the job, often in their agency's police academy. Civil service regulations govern the appointment of police and detectives in most states, large municipalities, and special police agencies, as well as in many smaller jurisdictions. Candidates must be U.S. citizens, usually at least 20 years old, and must meet rigorous physical and personal qualifications.

Education and training. Applicants usually must have at least a high school education, and some departments require 1 or 2 years of college coursework or, in some cases, a college degree.

Law enforcement agencies encourage applicants to take courses or training related to law enforcement subjects after high school. Many entry-level applicants for police jobs have completed some formal postsecondary education, and a significant number are college graduates. Many junior colleges, colleges, and universities offer programs in law enforcement or administration of justice.

Physical education classes and participating in sports are also helpful in developing the competitiveness, stamina, and agility needed for many law enforcement positions. Knowledge of a foreign language is an asset in many federal agencies and urban departments.

Many agencies pay all or part of the tuition for officers to work toward degrees in criminal justice, police science, administration of justice, or public administration and pay higher salaries to those who earn such a degree.

Before their first assignments, officers usually go through a period of training. In state and large local police departments, recruits get training in their agency's police academy, often for 12 to 14 weeks. In small agencies, recruits often attend a regional or state academy. Training includes classroom instruction in constitutional law and civil rights, state laws and local ordinances, and accident investigation. Recruits also receive training and supervised experience in patrol, traffic control, the use of firearms, self-defense, first aid, and emergency response. Police departments in some large cities hire high school graduates who are still in their teens as police cadets or trainees. They do clerical work and attend classes, usually for 1 to 2 years, until they reach the minimum age requirement and can be appointed to the regular force.

To be considered for appointment as an FBI agent, an applicant must be a college graduate and have at least 3 years of professional work experience, or have an advanced degree plus 2 years of professional work experience. An applicant who meets these criteria must also have one of the following: a college major in accounting, electrical engineering, information technology, or computer science; fluency in a foreign language; a degree from an accredited law school; or 3 years of related full-time work experience. All new FBI agents undergo 18 weeks of training at the FBI Academy on the U.S. Marine Corps base in Quantico, Virginia.

Most other federal law enforcement agencies require either a bachelor's degree or related work experience or a combination of the two. Federal law enforcement agents undergo extensive training, usually at the U.S. Marine Corps base in Quantico, Virginia, or the Federal Law Enforcement Training Center in Glynco, Georgia. The educational requirements, qualifications, and training information for a particular federal agency can be found on the agency's Web site, most of which are listed in the last section of this statement.

Fish and game wardens also must meet specific requirements. Most states require at least 2 years of college study. Once hired, fish and game wardens attend a training academy lasting from 3 to 12 months, sometimes followed by further training in the field.

Other qualifications. Civil service regulations govern the appointment of police and detectives in most states, large municipalities, and special police agencies, as well as in many smaller jurisdictions. Candidates must be U.S. citizens, usually at least 20 years old, and must meet rigorous physical and personal qualifications. Physical examinations for entrance into law enforcement often include tests of vision, hearing, strength, and agility. Eligibility for appointment usually depends on performance in competitive written examinations and previous education and experience.

Candidates should enjoy working with people and meeting the public. Because personal characteristics such as honesty, sound judgment, integrity, and a sense of responsibility are especially important in law enforcement, candidates are interviewed by senior officers, and their character traits and backgrounds are investigated. In some agencies, candidates are interviewed by a psychiatrist or a psychologist or given a personality test. Most applicants are subjected to lie detector examinations or drug testing. Some agencies subject sworn personnel to random drug testing as a condition of continuing employment.

Advancement. Police officers usually become eligible for promotion after a probationary period ranging from 6 months to 3 years. In large departments, promotion may enable an officer to become a detective or to specialize in one type of police work, such as working with juveniles. Promotions to corporal, sergeant, lieutenant, and captain usually are made according to a candidate's position on a promotion list, as determined by scores on a written examination and on-the-job performance.

Continuing training helps police officers, detectives, and special agents improve their job performance. Through police department academies, regional centers for public safety employees established by the states, and federal agency training centers, instructors provide annual training in self-defense tactics, firearms, use-of-force policies, sensitivity and communications skills, crowd-control techniques, relevant legal developments, and advances in law enforcement equipment.

Employment

Police and detectives held about 861,000 jobs in 2006. Seventy-nine percent were employed by local governments. State police agencies employed about 11 percent, and various federal agencies employed about 7 percent. A small proportion worked for educational services, rail transportation, and contract investigation and security services.

According to the U.S. Bureau of Justice Statistics, police and detectives employed by local governments primarily worked in cities with more than 25,000 inhabitants. Some cities have very large police forces, while thousands of small communities employ fewer than 25 officers each.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16 Number	Change, 2006-16 Percent
Police and detectives	—	861,000	959,000	97,000	11
First-line supervisors/managers of police and detectives	33-1012	93,000	102,000	8,500	9
Detectives and criminal investigators	33-3021	106,000	125,000	18,000	17
Fish and game wardens	33-3031	8,000	8,000	0	0
Police officers	33-3050	654,000	724,000	70,000	11
Police and sheriff's patrol officers	33-3051	648,000	719,000	70,000	11
Transit and railroad police	33-3052	5,600	5,900	400	6

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Job Outlook

Job opportunities in most local police departments will be excellent for qualified individuals, while competition is expected for jobs in state and federal agencies. Average employment growth is expected.

Employment change. Employment of police and detectives is expected to grow 11 percent over the 2006–2016 decade, about as fast as the average for all occupations. A more security-conscious society and population growth will contribute to the increasing demand for police services.

Job prospects. Overall opportunities in local police departments will be excellent for individuals who meet the psychological, personal, and physical qualifications. In addition to openings from employment growth, many openings will be created by the need to replace workers who retire and those who leave local agencies for federal jobs and private sector security jobs. There will be more competition for jobs in federal and state law enforcement agencies than for jobs in local agencies. Less competition for jobs will occur in departments that offer relatively low salaries or those in urban communities where the crime rate is relatively high. Applicants with military experience or college training in police science will have the best opportunities in local and state departments. Applicants with a bachelor's degree and several years of law enforcement or military experience, especially investigative experience, will have the best opportunities in federal agencies.

The level of government spending determines the level of employment for police and detectives. The number of job opportunities, therefore, can vary from year to year and from place to place. Layoffs, on the other hand, are rare because retirements enable most staffing cuts to be handled through attrition. Trained law enforcement officers who lose their jobs because of budget cuts usually have little difficulty finding jobs with other agencies.

Earnings

Police and sheriff's patrol officers had median annual earnings of $47,460 in May 2006. The middle 50 percent earned between $35,600 and $59,880. The lowest 10 percent earned less than $27,310, and the highest 10 percent earned more than $72,450. Median annual earnings were $43,510 in federal government, $52,540 in state government, and $47,190 in local government.

In May 2006, median annual earnings of police and detective supervisors were $69,310. The middle 50 percent earned between $53,900 and $83,940. The lowest 10 percent earned less than $41,260, and the highest 10 percent earned more than $104,410. Median annual earnings were $85,170 in federal government, $68,990 in state government, and $68,670 in local government.

In May 2006, median annual earnings of detectives and criminal investigators were $58,260. The middle 50 percent earned between $43,920 and $76,350. The lowest 10 percent earned less than $34,480, and the highest 10 percent earned more than $92,590. Median annual earnings were $69,510 in federal government, $49,370 in state government, and $52,520 in local government.

Federal law provides special salary rates to federal employees who serve in law enforcement. Additionally, federal special agents and inspectors receive law enforcement availability pay (LEAP)—equal to 25 percent of the agent's grade and step—awarded because of the large amount of overtime that these agents are expected to work. For example, in 2007, FBI agents entered federal service as GS-10 employees on the pay scale at a base salary of $48,159, yet they earned about $60,199 a year with availability pay. They could advance to the GS-13 grade level in field nonsupervisory assignments at a base salary of $75,414, which was worth $94,268 with availability pay. FBI supervisory, management, and executive positions in grades GS-14 and GS-15 paid a base salary of about $89,115 and $104,826 a year, respectively, which amounted to $111,394 or $131,033 per year including availability pay. Salaries were slightly higher in selected areas where the prevailing local pay level was higher. Because federal agents may be eligible for a special law enforcement benefits package, applicants should ask their recruiter for more information.

Total earnings for local, state, and special police and detectives frequently exceed the stated salary because of payments for overtime, which can be significant.

According to the International City-County Management Association's annual Police and Fire Personnel, Salaries, and Expenditures Survey, average salaries for sworn full-time positions in 2006 were:

	Minimum annual base salary	Maximum annual base salary
Police chief	$78,547	$99,698
Deputy chief	68,797	87,564
Police captain	65,408	81,466
Police lieutenant	59,940	72,454
Police sergeant	53,734	63,564
Police corporal	44,160	55,183

In addition to the common benefits—paid vacation, sick leave, and medical and life insurance—most police and sheriffs' departments provide officers with special allowances for uniforms. Because police officers usually are covered by liberal pension plans, many retire at half-pay after 25 or 30 years of service.

Related Occupations

Police and detectives maintain law and order, collect evidence and information, and conduct investigations and surveillance. Workers in related occupations include correctional officers, private detectives and investigators, probation officers and correctional treatment specialists, and security guards and gaming surveillance officers. Like police and detectives, firefighters and emergency medical tech-

nicians and paramedics provide public safety services and respond to emergencies.

Sources of Additional Information

Information about entrance requirements may be obtained from federal, state, and local law enforcement agencies.

Private Detectives and Investigators

(O*NET 33-9021.00)

Significant Points

- Work hours are often irregular, and the work can be dangerous.
- About 30 percent are self-employed.
- Applicants typically have related experience in areas such as law enforcement, insurance, the military, or government investigative or intelligence jobs.
- Keen competition is expected for most jobs despite faster-than-average employment growth.

Nature of the Work

Private detectives and investigators assist individuals, businesses, and attorneys by finding and analyzing information. They connect small clues to solve mysteries or to uncover facts about legal, financial, or personal matters. Private detectives and investigators offer many services, including executive, corporate, and celebrity protection; pre-employment verification; and individual background profiles. Some investigate computer crimes, such as identity theft, harassing e-mails, and illegal downloading of copyrighted material. They also provide assistance in criminal and civil liability cases, insurance claims and fraud, child custody and protection cases, missing persons cases, and premarital screening. They are sometimes hired to investigate individuals to prove or disprove infidelity.

Despite rapid employment growth, keen competition is expected for private detective jobs.

Private detectives and investigators have many methods to choose from when determining the facts in a case. Much of their work is done using a computer, recovering deleted e-mails and documents, for example. They may also perform computer database searches or work with someone who does. Computers allow investigators to quickly obtain huge amounts of information such as a subject's prior arrests, convictions, and civil legal judgments; telephone numbers; motor vehicle registrations; association and club memberships; and even photographs.

Detectives and investigators also perform various other types of surveillance or searches. To verify facts, such as an individual's income or place of employment, they may make phone calls or visit a subject's workplace. In other cases, especially those involving missing persons and background checks, investigators interview people to gather as much information as possible about an individual. Sometimes investigators go undercover, pretending to be someone else to get information or to observe a subject inconspicuously.

Most detectives and investigators are trained to perform physical surveillance, which may be high-tech or low-tech. They may observe a site, such as the home of a subject, from an inconspicuous location or a vehicle. Using photographic and video cameras, binoculars, and cell phones, detectives often use surveillance to gather information on an individual; this can be quite time consuming.

The duties of private detectives and investigators depend on the needs of their clients. In cases that involve fraudulent workers' compensation claims, for example, investigators may carry out long-term covert observation of a person suspected of fraud. If an investigator observes him or her performing an activity that contradicts injuries stated in a worker's compensation claim, the investigator would take video or still photographs to document the activity and report it to the client.

Detectives and investigators must be mindful of the law when conducting investigations. They keep up with federal, state, and local legislation, such as privacy laws and other legal issues affect-

ing their work. The legality of certain methods may be unclear, and investigators and detectives must make judgment calls when deciding how to pursue a case. They must also know how to collect evidence properly so that they do not compromise its admissibility in court.

Private detectives and investigators often specialize. Those who focus on intellectual property theft, for example, investigate and document acts of piracy, help clients stop illegal activity, and provide intelligence for prosecution and civil action. Other investigators specialize in developing financial profiles and asset searches. Their reports reflect information gathered through interviews, investigation and surveillance, and research, including review of public documents.

Computer forensic investigators specialize in recovering, analyzing, and presenting data from computers for use in investigations or as evidence. They determine the details of intrusions into computer systems, recover data from encrypted or erased files, and recover e-mails and deleted passwords.

Legal investigators assist in preparing criminal defenses, locating witnesses, serving legal documents, interviewing police and prospective witnesses, and gathering and reviewing evidence. Legal investigators also may collect information on the parties to the litigation, take photographs, testify in court, and assemble evidence and reports for trials. They often work for law firms or lawyers.

Corporate investigators conduct internal and external investigations for corporations. In internal investigations, they may investigate drug use in the workplace, ensure that expense accounts are not abused, or determine whether employees are stealing merchandise or information. External investigations attempt to thwart criminal schemes from outside the corporation, such as fraudulent billing by a supplier.

Financial investigators may be hired to develop confidential financial profiles of individuals or companies that are prospective parties to large financial transactions. These investigators often are certified public accountants (CPAs) who work closely with investment bankers and other accountants. They might also search for assets in order to recover damages awarded by a court in fraud or theft cases.

Detectives who work for retail stores or hotels are responsible for controlling losses and protecting assets. *Store detectives*, also known as *loss prevention agents*, safeguard the assets of retail stores by apprehending anyone attempting to steal merchandise or destroy store property. They prevent theft by shoplifters, vendor representatives, delivery personnel and even store employees. Store detectives also conduct periodic inspections of stock areas, dressing rooms, and restrooms, and sometimes assist in opening and closing the store. They may prepare loss prevention and security reports for management and testify in court against people they apprehend. *Hotel detectives* protect guests of the establishment from theft of their belongings and preserve order in hotel restaurants and bars. They also may keep undesirable individuals, such as known thieves, off the premises.

Work environment. Many detectives and investigators spend time away from their offices conducting interviews or doing surveillance, but some work in their office most of the day conducting computer searches and making phone calls. When the investigator is working on a case, the environment might range from plush boardrooms to seedy bars. Store and hotel detectives work in the businesses that they protect.

Investigators generally work alone, but they sometimes work with others during surveillance or when following a subject in order to avoid detection by the subject. Some of the work involves confrontation, so the job can be stressful and dangerous. Some situations call for the investigator to be armed, such as certain bodyguard assignments for corporate or celebrity clients. In most cases, however, a weapon is not necessary because the purpose of the work is gathering information and not law enforcement or criminal apprehension. Owners of investigative agencies have the added stress of having to deal with demanding and sometimes distraught clients.

Private detectives and investigators often work irregular hours because of the need to conduct surveillance and contact people who are not available during normal working hours. Early morning, evening, weekend, and holiday work is common.

Training, Other Qualifications, and Advancement

Most private detectives and investigators have some college education and previous experience in investigative work. In most states, they are required to be licensed.

Education and training. There are no formal education requirements for most private detective and investigator jobs, although many have college degrees. Courses in criminal justice and police science are helpful to aspiring private detectives and investigators. Although related experience is usually required, some people enter the occupation directly after graduation from college, generally with an associate or bachelor's degree in criminal justice or police science. The 2006 educational attainment for private detectives and investigators, in percent, was as follows:

High school graduate or equivalent	18%
Some college, no degree	26
Associate degree	8
Bachelor's degree	34
Master's degree	13
Professional degree or PhD	3

Most corporate investigators must have a bachelor's degree, preferably in a business-related field. Some corporate investigators have a master's degree in business administration or a law degree; others are CPAs.

For computer forensics work, a computer science or accounting degree is more helpful than a criminal justice degree. An accounting degree provides good background knowledge for investigating fraud through computer forensics. Either of these two degrees provides a good starting point after which investigative techniques can be learned on the job. Alternatively, many colleges and universities now offer certificate programs, requiring from 15 to 21 credits, in computer forensics. These programs are most beneficial to law enforcement officers, paralegals, or others who are already involved in investigative work. A few colleges and universities now offer bachelor's or master's degrees in computer forensics, and others are planning to begin offering such degrees.

Most of the work of private detectives and investigators is learned on the job. New investigators will usually start by learning how to use databases to gather information. The training they receive depends on the type of firm. At an insurance company, a new investigator will learn to recognize insurance fraud. At a firm that specializes in domestic cases, a new worker might observe a senior investigator performing surveillance. Learning by doing, in which new investigators are put on cases and gain skills as they go, is a common approach. Corporate investigators hired by large companies, however, may receive formal training in business practices, management structure, and various finance-related topics.

Because they work with changing technologies, computer forensic investigators never stop training. They learn the latest methods of fraud detection and new software programs and operating systems by attending conferences and courses offered by software vendors and professional associations.

Licensure. The majority of states and the District of Columbia require private detectives and investigators to be licensed. Licensing requirements vary, however. Seven states—Alabama, Alaska, Colorado, Idaho, Mississippi, Missouri, and South Dakota—have no statewide licensing requirements, some states have few requirements, and many others have stringent regulations. For example, the Bureau of Security and Investigative Services of the California Department of Consumer Affairs requires private investigators to be 18 years of age or older; have a combination of education in police science, criminal law, or justice and experience equaling 3 years (6,000 hours); pass a criminal history background check by the California Department of Justice and the FBI (in most states, convicted felons cannot be issued a license); and receive a qualifying score on a two-hour written examination covering laws and regulations. Detectives and investigators in all states who carry handguns must meet additional requirements for a firearms permit.

There are no licenses specifically for computer forensic investigators, but some states require them to be licensed private investigators. Even where licensure is not required, a private investigator license is useful to some because it allows them to perform follow-up or complementary tasks.

Other qualifications. Private detectives and investigators typically have previous experience in other occupations. Some have worked in other occupations for insurance or collections companies, in the private security industry, or as paralegals. Many investigators enter the field after serving in law enforcement, the military, government auditing and investigative positions, or federal intelligence jobs. Former law enforcement officers, military investigators, and government agents, who are frequently able to retire after 25 years of service, often become private detectives or investigators in a second career.

Others enter from jobs in finance, accounting, commercial credit, investigative reporting, insurance, and law. These individuals often can apply their prior work experience in a related investigative specialty.

Most computer forensic investigators learn their trade while working for a law enforcement agency, either as a sworn officer or a civilian computer forensic analyst. They are trained at their agency's computer forensics training program. Many people enter law enforcement specifically to get this training and establish a reputation before moving to the private sector.

For private detective and investigator jobs, most employers look for individuals with ingenuity, persistence, and assertiveness. A candidate must not be afraid of confrontation, should communicate well, and should be able to think on his or her feet. Good interviewing and interrogation skills also are important and usually are acquired in earlier careers in law enforcement or other fields. Because the courts often are the judge of a properly conducted investigation, the investigator must be able to present the facts in a manner that a jury will believe. The screening process for potential employees typically includes a background check for a criminal history.

Certification and advancement. Some investigators receive certification from a professional organization to demonstrate competency in a field. For example, the National Association of Legal Investigators confers the Certified Legal Investigator designation to licensed investigators who devote a majority of their practice to negligence or criminal defense investigations. To receive the designation, applicants must satisfy experience, educational, and continuing-training requirements and must pass written and oral exams.

ASIS, a trade organization for the security industry, offers the Professional Certified Investigator certification. To qualify, applicants must have a high school diploma or equivalent; have 5 years of investigations experience, including 2 years managing investigations; and must pass an exam.

Most private-detective agencies are small, with little room for advancement. Usually, there are no defined ranks or steps, so advancement takes the form of increases in salary and assignment status. Many detectives and investigators start their own firms after gaining a few years of experience. Corporate and legal investigators may rise to supervisor or manager of the security or investigations department.

Employment

Private detectives and investigators held about 52,000 jobs in 2006. About 30 percent were self-employed, including many for whom investigative work was a second job. Around 34 percent of detective and investigator jobs were in investigation and security services, including private detective agencies, while another 9 percent were in department or other general merchandise stores. The rest worked mostly in state and local government, legal services firms, employment services companies, insurance agencies, and credit mediation establishments, including banks and other depository institutions.

Job Outlook

Keen competition is expected for most jobs despite faster-than-average employment growth.

Employment change. Employment of private detectives and investigators is expected to grow 18 percent over the 2006–2016 decade, faster than the average for all occupations. Increased demand for private detectives and investigators will result from heightened security concerns, increased litigation, and the need to protect confidential information and property of all kinds. The proliferation of criminal activity on the Internet, such as identity theft, spamming, e-mail harassment, and illegal downloading of copyrighted materials, will also increase the demand for private investigators. Employee background checks, conducted by private investigators, will become standard for an increasing number of jobs. Growing financial activity worldwide will increase the demand for investigators to control internal and external financial losses, to monitor competitors, and to prevent industrial spying.

Job prospects. Keen competition is expected for most jobs because private detective and investigator careers attract many qualified people, including relatively young retirees from law enforcement and military careers. The best opportunities for new jobseekers will be in entry-level jobs in detective agencies or stores, particularly large chain and discount stores that hire detectives on a part-time basis. Opportunities are expected to be excellent for qualified computer forensic investigators.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Private detectives and investigators	33-9021	52,000	61,000	9,400	18

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Earnings

Median annual earnings of salaried private detectives and investigators were $33,750 in May 2006. The middle 50 percent earned between $24,180 and $47,740. The lowest 10 percent earned less than $19,720, and the highest 10 percent earned more than $64,380. Earnings of private detectives and investigators vary greatly by employer, specialty, and geographic area.

Related Occupations

Private detectives and investigators often collect information and protect the property and other assets of companies and individuals. Others with related duties include bill and account collectors; claims adjusters, appraisers, examiners, and investigators; police and detectives; and security guards and gaming surveillance officers. Investigators who specialize in conducting financial profiles and asset searches perform work closely related to that of accountants and auditors, as well as financial analysts and personal financial advisors.

Sources of Additional Information

Security Guards and Gaming Surveillance Officers

(O*NET 33-9031.00 and 33-9032.00)

Significant Points

- Jobs should be plentiful, but competition is expected for higher-paying positions at facilities requiring longer periods of training and a high level of security, such as nuclear power plants and weapons installations.
- Because of limited formal training requirements and flexible hours, this occupation attracts many individuals seeking a second or part-time job.
- Some positions, such as those of armored car guards, are hazardous.

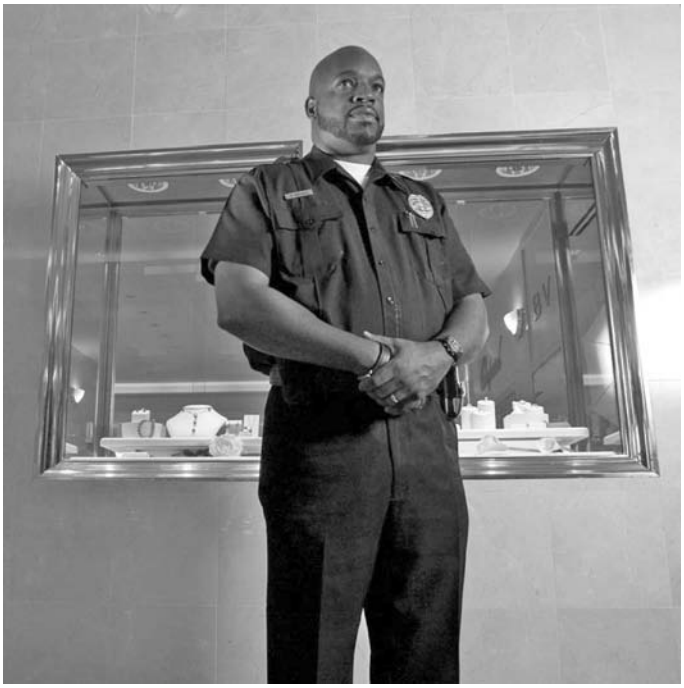
Nature of the Work

Security guards, also called *security officers*, patrol and inspect property to protect against fire, theft, vandalism, terrorism, and illegal activity. These workers protect their employer's investment, enforce laws on the property, and deter criminal activity and other problems. They use radio and telephone communications to call for assistance from police, fire, or emergency medical services as the situation dictates. Security guards write comprehensive reports outlining their observations and activities during their assigned shift. They also may interview witnesses or victims, prepare case reports, and testify in court.

Although all security guards perform many of the same duties, their specific tasks depend on whether they work in a "static" security position or on a mobile patrol. Guards assigned to static security positions usually stay at one location for a specified length of time. These guards must become closely acquainted with the property and people associated with their station and must often monitor alarms and closed-circuit TV cameras. In contrast, guards assigned to mobile patrol drive or walk from one location to another and conduct security checks within an assigned geographical zone. They may detain or arrest criminal violators, answer service calls concerning criminal activity or problems, and issue traffic violation warnings.

The security guard's job responsibilities also vary with the size, type, and location of the employer. In department stores, guards protect people, records, merchandise, money, and equipment. They often work with undercover store detectives to prevent theft by customers or employees, and help apprehend shoplifting suspects prior to the arrival of the police. Some shopping centers and theaters have officers who patrol their parking lots to deter car thefts and robberies. In office buildings, banks, and hospitals, guards maintain order and protect the institution's customers, staff and property. At air, sea, and rail terminals and other transportation facilities, guards protect people, freight, property, and equipment. Using metal detectors and high-tech equipment, they may screen passengers and visitors for weapons and explosives, ensure that nothing is stolen while a vehicle is being loaded or unloaded, and watch for fires and criminals.

Guards who work in public buildings such as museums or art galleries protect paintings and exhibits by inspecting people and packages entering and leaving the building. In factories, laboratories, government buildings, data processing centers, and military bases, security officers protect information, products, computer codes, and defense secrets and check the credentials of people and vehicles entering and leaving the premises. Guards working at universities, parks, and sports stadiums perform crowd control, supervise parking and seating, and direct traffic. Security guards stationed at the entrance to bars and nightclubs, prevent access by minors, collect



Security guards patrol property and buildings to deter crime.

cover charges at the door, maintain order among customers, and protect patrons and property.

Armored car guards protect money and valuables during transit. In addition, they protect individuals responsible for making commercial bank deposits from theft or injury. They pick up money or other valuables from businesses to transport to another location. Carrying money between the truck and the business can be extremely hazardous. As a result, armored car guards usually wear bulletproof vests.

Gaming surveillance officers, also known as *surveillance agents*, and *gaming investigators* act as security agents for casino managers and patrons. Using primarily audio and video equipment in an observation room, they observe casino operations for irregular activities, such as cheating or theft, and monitor compliance to rules, regulations and laws. They maintain and organize recordings from security cameras as they are sometimes used as evidence in police investigations. Some casinos use a catwalk over one-way mirrors located above the casino floor to augment electronic surveillance equipment. Surveillance agents occasionally leave the surveillance room and walk the casino floor.

All security officers must show good judgment and common sense, follow directions, testify accurately in court, and follow company policy and guidelines. In an emergency, they must be able to take charge and direct others to safety. In larger organizations, a security manager might oversee a group of security officers. In smaller organizations, however, a single worker may be solely responsible for all security.

Work environment. Most security guards and gaming surveillance officers spend considerable time on their feet, either assigned to a specific post or patrolling buildings and grounds. Guards may be stationed at a guard desk inside a building to monitor electronic security and surveillance devices or to check the credentials of people entering or leaving the premises. They also may be stationed at a guardhouse outside the entrance to a gated facility or community and may use a portable radio or cellular telephone to be in constant contact with a central station. The work usually is routine, but guards must be constantly alert for threats to themselves and the property they are protecting. Guards who work during the day may have a great deal of contact with other employees and the public. Gaming surveillance officers often work behind a bank of monitors controlling numerous cameras in a casino and thus can develop eyestrain.

Guards usually work shifts of 8 hours or longer for 40 hours per week and are often on call in case of an emergency. Some employers offer three shifts, and guards rotate to divide daytime, weekend, and holiday work equally. Guards usually eat on the job instead of taking a regular break away from the site. In 2006, about 15 percent of guards worked part time, and some held a second job as a guard to supplement their primary earnings.

Training, Other Qualifications, and Advancement

Generally, there are no specific education requirements for security guards, but employers usually prefer to fill armed guard positions with people who have at least a high school diploma. Gaming surveillance officers often need some education beyond high school. In most states, guards must be licensed.

Education and training. Many employers of unarmed guards do not have any specific educational requirements. For armed guards, employers usually prefer individuals who are high school graduates or who hold an equivalent certification.

Many employers give newly hired guards instruction before they start the job and provide on-the-job training. The amount of training guards receive varies. Training is more rigorous for armed guards because their employers are legally responsible for any use of force. Armed guards receive formal training in areas such as weapons retention and laws covering the use of force. They may be periodically tested in the use of firearms.

An increasing number of states are making ongoing training a legal requirement for retention of licensure. Guards may receive training in protection, public relations, report writing, crisis deterrence, first aid, and specialized training relevant to their particular assignment.

The American Society for Industrial Security International has written voluntary training guidelines that are intended to provide regulating bodies consistent minimum standards for the quality of security services. These guidelines recommend that security guards receive at least 48 hours of training within the first 100 days of employment. The guidelines also suggest that security guards be required to pass a written or performance examination covering topics such as sharing information with law enforcement, crime prevention, handling evidence, the use of force, court testimony, report writing, interpersonal and communication skills, and emergency response procedures. In addition, they recommend annual retraining and additional firearms training for armed officers.

Guards who are employed at establishments that place a heavy emphasis on security usually receive extensive formal training. For example, guards at nuclear power plants undergo several months of training before going on duty—and even then, they perform their tasks under close supervision for a significant period of time. They are taught to use firearms, administer first aid, operate alarm systems and electronic security equipment, and spot and deal with security problems.

Gaming surveillance officers and investigators usually need some training beyond high school but not usually a bachelor's degree. Several educational institutes offer certification programs. Classroom training usually is conducted in a casino-like atmosphere and includes the use of surveillance camera equipment. Previous security experience is a plus. Employers prefer either individuals with casino experience and significant knowledge of casino operations or those with law enforcement and investigation experience.

Licensure. Most states require that guards be licensed. To be licensed as a guard, individuals must usually be at least 18 years old, pass a background check, and complete classroom training in such subjects as property rights, emergency procedures, and detention of suspected criminals. Drug testing often is required and may be random and ongoing.

Guards who carry weapons must be licensed by the appropriate government authority, and some receive further certification as special police officers, allowing them to make limited types of arrests while on duty. Armed guard positions have more stringent background checks and entry requirements than those of unarmed guards.

Other qualifications. Most jobs require a driver's license. For positions as armed guards, employers often seek people who have had responsible experience in other occupations.

Rigorous hiring and screening programs consisting of background, criminal record, and fingerprint checks are becoming the norm in the occupation. Applicants are expected to have good character references, no serious police record, and good health. They should be mentally alert, emotionally stable, and physically fit to cope with emergencies. Guards who have frequent contact with the public should communicate well.

Like security guards, gaming surveillance officers and gaming investigators must have keen observation skills and excellent verbal and writing abilities to document violations or suspicious behavior. They also need to be physically fit and have quick reflexes because they sometimes must detain individuals until local law enforcement officials arrive.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Security guards and gaming surveillance officers	33-9030	1,049,000	1,227,000	178,000	17
Gaming surveillance officers and gaming investigators	33-9031	8,700	12,000	2,900	34
Security guards	33-9032	1,040,000	1,216,000	175,000	17

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Advancement. Compared with unarmed security guards, armed guards and special police usually enjoy higher earnings and benefits, greater job security, and more potential for advancement. Because many people do not stay long in this occupation, opportunities for advancement are good for those who make a career in security. Most large organizations use a military type of ranking that offers the possibility of advancement in both position and salary. Some guards may advance to supervisor or security manager positions. Guards with management skills may open their own contract security guard agencies. Guards can also move to an organization with more stringent security and higher pay.

Employment

Security guards and gaming surveillance officers held over 1 million jobs in 2006. More than half of all jobs for security guards were in investigation and security services, including guard and armored car services. These organizations provide security on a contract basis, assigning their guards to buildings and other sites as needed. Most other security officers were employed directly by educational services, hospitals, food services and drinking places, traveler accommodation (hotels), department stores, manufacturing firms, lessors of real estate (residential and nonresidential buildings), and governments. Guard jobs are found throughout the country, most commonly in metropolitan areas.

Gaming surveillance officers work primarily in gambling industries; traveler accommodation, which includes casino hotels; and local government. They are employed only in those states and on those Indian reservations where gambling is legal.

A significant number of law enforcement officers work as security guards when they are off duty, in order to supplement their incomes. Often working in uniform and with the official cars assigned to them, they add a high-profile security presence to the establishment with which they have contracted. At construction sites and apartment complexes, for example, their presence often deters crime. (Police and detectives are discussed elsewhere in the *Handbook*.)

Job Outlook

Opportunities for security guards and gaming surveillance officers should be favorable. Numerous job openings will stem from employment growth, driven by the demand for increased security, and from the need to replace those who leave this large occupation each year.

Employment change. Employment of security guards is expected to grow by 17 percent between 2006 and 2016, which is faster than the average for all occupations. This occupation will have a very large number of new jobs arise, about 175,000 over the projections decade. Concern about crime, vandalism, and terrorism continues to increase the need for security. Demand for guards also will grow as private security firms increasingly perform duties—such as providing security at public events and in residential neighborhoods—that were formerly handled by police officers.

Employment of gaming surveillance officers is expected to grow by 34 percent between 2006 and 2016, which is much faster than the average for all occupations. Casinos will continue to hire more surveillance officers as more states legalize gambling and as the number of casinos increases in states where gambling is already legal. In addition, casino security forces will employ more technically trained personnel as technology becomes increasingly important in thwarting casino cheating and theft.

Job prospects. Job prospects for security guards should be excellent because of growing demand for these workers and the need to replace experienced workers who leave the occupation. In addition to full-time job opportunities, the limited training requirements and flexible hours attract many people seeking part-time or second jobs. However, competition is expected for higher paying positions that require longer periods of training; these positions usually are found at facilities that require a high level of security, such as nuclear power plants or weapons installations. Job prospects for gaming surveillance officers should be good, but they will be better for those with experience in the gaming industry.

Earnings

Median annual wage-and-salary earnings of security guards were $21,530 in May 2006. The middle 50 percent earned between $17,620 and $27,430. The lowest 10 percent earned less than $15,030, and the highest 10 percent earned more than $35,840. Median annual earnings in the industries employing the largest numbers of security guards were:

General medical and surgical hospitals	$26,610
Elementary and secondary schools	26,290
Local government	24,950
Investigation, guard and armored car services	20,280

Gaming surveillance officers and gaming investigators had median annual wage-and-salary earnings of $27,130 in May 2006. The middle 50 percent earned between $21,600 and $35,970. The lowest 10 percent earned less than $18,720, and the highest 10 percent earned more than $45,940.

Related Occupations

Guards protect property, maintain security, and enforce regulations and standards of conduct in the establishments at which they work. Related security and protective service occupations include correctional officers, police and detectives, private detectives and investigators, and gaming services occupations.

Sources of Additional Information

Further information about work opportunities for guards is available from local security and guard firms and state employment service offices. Information about licensing requirements for guards may be obtained from the state licensing commission or the state police department. In states where local jurisdictions establish licensing requirements, contact a local government authority such as the sheriff, county executive, or city manager.

Food Preparation and Serving Related Occupations

Chefs, Cooks, and Food Preparation Workers

(O*NET 35-1011.00, 35-2011.00, 35-2012.00, 35-2013.00, 35-2014.00, 35-2015.00, 35-2019.99, and 35-2021.00)

Significant Points

- Many cooks and food preparation workers are young—37 percent are below the age of 24.
- One-third of these workers are employed part time.
- Job openings are expected to be plentiful because many of these workers will leave the occupation for full-time employment or better wages.

Nature of the Work

Chefs, cooks, and food preparation workers prepare, season, and cook a wide range of foods—from soups, snacks, and salads to entrees, side dishes, and desserts. They work in a variety of restaurants and other food services establishments. Chefs and cooks create recipes and prepare meals, while food preparation workers peel and cut vegetables, trim meat, prepare poultry, and perform other duties, such as keeping work areas clean and monitoring temperatures of ovens and stovetops.

Specifically, *chefs* and *cooks* measure, mix, and cook ingredients according to recipes, using a variety of equipment, including pots, pans, cutlery, ovens, broilers, grills, slicers, grinders, and blenders. Chefs and head cooks also are responsible for directing the work of other kitchen workers, estimating food requirements, and ordering food supplies.

Food preparation workers perform routine, repetitive tasks under the direction of chefs and cooks. These workers ready the ingredients for complex dishes by slicing and dicing vegetables, and composing salads and cold items. They weigh and measure ingredients, go after pots and pans, and stir and strain soups and sauces. Food preparation workers may cut and grind meats, poultry, and seafood in preparation for cooking. They also clean work areas, equipment, utensils, dishes, and silverware.

Larger restaurants and food services establishments tend to have varied menus and larger kitchen staffs. Staffs often include several chefs and cooks, sometimes called assistant or line cooks. Each chef or cook works an assigned station that is equipped with the types of stoves, grills, pans, and ingredients needed for the foods prepared at that station. Job titles often reflect the principal ingredient prepared or the type of cooking performed—vegetable cook, fry cook, or grill cook, for example. These cooks also may direct or work with other food preparation workers.

Executive chefs and *head cooks* coordinate the work of the kitchen staff and direct the preparation of meals. They determine serving sizes, plan menus, order food supplies, and oversee kitchen operations to ensure uniform quality and presentation of meals. An executive chef, for example, is in charge of all food service operations and also may supervise the many kitchens of a hotel, restaurant group, or corporate dining operation. A *chef de cuisine* reports to an executive chef and is responsible for the daily operations of a single kitchen. A *sous chef*, or sub chef, is the second-in-command and runs the kitchen in the absence of the chef. Many chefs earn fame both for themselves and for their kitchens because of the quality and distinctive nature of the food they serve.

Responsibilities depend on where cooks work. *Institution and cafeteria cooks*, for example, work in the kitchens of schools, cafeterias, businesses, hospitals, and other institutions. For each meal, they prepare a large quantity of a limited number of entrees, vegetables, and desserts according to preset menus. Meals generally are prepared in advance so diners seldom get the opportunity to special order a meal. *Restaurant cooks* usually prepare a wider selection of dishes, cooking most orders individually. *Short-order cooks* prepare foods in restaurants and coffee shops that emphasize fast service and quick food preparation. They grill and garnish hamburgers, prepare sandwiches, fry eggs, and cook French fries, often working on several orders at the same time. *Fast-food cooks* prepare a limited selection of menu items in fast-food restaurants. They cook and package batches of food, such as hamburgers and fried chicken, to be kept warm until served. (Combined food preparation and service workers, who both prepare and serve items in fast-food restaurants, are included with the material on food and beverage serving and related workers elsewhere in the *Handbook*.)

Chefs, cooks, and food preparation workers often prepare ingredients ahead of time so that they can be cooked quickly when ordered.

The number and types of workers employed in kitchens also depends on the type of establishment. Small, full-service restaurants offering casual dining often feature a limited number of easy-to-prepare items supplemented by short-order specialties and ready-made desserts. Typically, one cook prepares all the food with the help of a short-order cook and one or two other kitchen workers.

Grocery and specialty food stores employ chefs, cooks, and food preparation workers to develop recipes and prepare meals for customers to carry out. Typically, entrees, side dishes, salads, or other items are prepared in large quantities and stored at an appropriate temperature. Counter assistants portion and package items according to customer orders for serving at home.

Some cooks, called research chefs, combine culinary skills with knowledge of food science to develop recipes for chain restaurants and food processors and manufacturers. They test new formulas and flavors for prepared foods and determine the most efficient and safest way to prepare new foods.

Some cooks work for individuals rather than for restaurants, cafeterias, or food manufacturers. These *private household cooks* plan and prepare meals in private homes according to the client's tastes or dietary needs. They order groceries and supplies, clean the kitchen, and wash dishes and utensils. They also may serve meals. Private chefs are employed directly by a single individual or family or sometimes by corporations or institutions, such as universities and embassies, to perform cooking and entertaining tasks. These chefs usually live in and may travel with their employer. Because of the sensitive nature of their employment, they are usually required to sign confidentiality agreements. As part of the job, private chefs often perform additional services, such as paying bills, coordinating schedules, and planning events.

Another type of private household cooks, called *personal chefs,* usually prepare a week's worth of meals in the client's home for the client to heat and serve according to directions throughout the week. Personal chefs are self-employed or employed by a company that provides this service.

Work environment. Many restaurant and institutional kitchens have modern equipment, convenient work areas, and air conditioning, but kitchens in older and smaller eating places are often not as well designed. Kitchen staffs invariably work in small quarters against hot stoves and ovens. They are under constant pressure to prepare meals quickly, while ensuring quality is maintained and safety and sanitation guidelines are observed. Because the pace can be hectic during peak dining times, workers must be able to communicate clearly so that food orders are completed correctly.

Working conditions vary with the type and quantity of food prepared and the local laws governing food service operations. Workers usually must stand for hours at a time, lifting heavy pots and kettles, and working near hot ovens and grills. Job hazards include slips and falls, cuts, and burns, but injuries are seldom serious.

Work hours in restaurants may include early mornings, late evenings, holidays, and weekends. Work schedules of chefs, cooks and other kitchen workers in factory and school cafeterias may be more regular. In 2006, about 29 percent of cooks and 44 percent of food preparation workers had part-time schedules, compared to 15 percent of workers throughout the economy. Work schedules in fine-dining restaurants, however, tend to be longer because of the time required to prepare ingredients in advance. Many executive chefs regularly work 12-hour days because they oversee the delivery of foodstuffs early in the day, plan the menu, and prepare those menu items that take the most skill.

The wide range in dining hours and the need for fully-staffed kitchens during all open hours creates work opportunities for students, youth, and other individuals seeking supplemental income, flexible work hours, or variable schedules. Eighteen percent of cooks and food preparation workers were 16 to 19 years old in 2006; nineteen percent were age 20 to 24. Ten percent had variable schedules. Kitchen workers employed by schools may work during the school year only, usually for 9 or 10 months. Similarly, resort establishments usually only offer seasonal employment.

Training, Other Qualifications, and Advancement

On-the-job training is most common for fast-food cooks, short-order cooks, and food preparation workers. Chefs and others with more advanced cooking duties often attend cooking school. Vocational training programs are available to many high school students, but advanced positions usually require training after high school. Experience, an ability to develop and enhance cooking skills, and a strong desire to cook are the most common requirements for advancement.

Education and training. A high school diploma is not required for beginning jobs, but it is recommended for those planning a career as a cook or chef. Most fast-food or short-order cooks and food preparation workers require little education or training to start because most skills are learned on the job. Training generally starts with basic sanitation and workplace safety and continues with instruction on food handling, preparation, and cooking procedures. Training in food handling, sanitation, and health and safety procedures are mandatory in most jurisdictions for all workers. Those who become proficient and who show an interest in learning complicated cooking techniques may advance to more demanding cooking positions or into supervisory positions.

Some high school or vocational school programs offer courses in basic food safety and handling procedures, cooking, and general business and computer classes that can be helpful for those who might someday want to be a chef or to open their own restaurant. Many school districts, in cooperation with state departments of education, provide on-the-job training and summer workshops for cafeteria kitchen workers who aspire to become cooks. Food service management companies or hotel and restaurant chains, also offer paid internships and summer jobs to those starting out in the field. Internships provide valuable experience and can lead to placement in more formal chef training programs.

When hiring chefs and others in advanced cooking positions, however, employers usually prefer applicants who have training after high school. These training programs range from a few months to 2 years or more. Vocational or trade-school programs typically offer basic training in food handling and sanitation procedures, nutrition, slicing and dicing methods for various kinds of meats and vegetables, and basic cooking methods, such as baking, broiling, and grilling. Longer programs leading to a certificate or a two- or four-year degree train chefs for fine-dining or upscale restaurants. They offer a wider array of training specialties, such as advanced cooking techniques; cooking for banquets, buffets, or parties; and cuisines and cooking styles from around the world.

A growing number of chefs participate in these longer training programs through independent cooking schools, professional culinary institutes, two- or four-year college degree programs in hospitality or culinary arts, or in the armed forces. Some large hotels and restaurants also operate their own training and job-placement programs for chefs and cooks. Executive chefs and head cooks who work in fine-dining restaurants require many years of training and experience and an intense desire to cook.

Although curricula may vary, students in culinary training programs spend most of their time in kitchens learning to prepare meals by practicing cooking skills. They learn good knife techniques and proper use and care of kitchen equipment. Training programs also

include courses in nutrition, menu planning, portion control, purchasing and inventory methods, proper food storage procedures, and use of leftover food to minimize waste. Students also learn sanitation and public health rules for handling food. Training in food service management, computer accounting and inventory software, and banquet service are featured in some training programs. Most formal training programs also require students to get experience in a commercial kitchen through an internship, apprenticeship, or outplacement program.

Many chefs are trained on the job, receiving real work experience and training from chef-mentors in the restaurants where they work. Professional culinary institutes, industry associations, and trade unions sponsor formal apprenticeship programs in coordination with the U.S. Department of Labor.

The American Culinary Federation accredits more than 200 formal academic training programs and sponsors apprenticeship programs around the country. Typical apprenticeships last 2 years and combine classroom training and work experience. Accreditation is an indication that a culinary program meets recognized standards regarding course content, facilities, and quality of instruction.

Other qualifications. Chefs, cooks, and food preparation workers must be efficient, quick, and work well as part of a team. Manual dexterity is helpful for cutting, chopping, and plating. These workers also need creativity and a keen sense of taste and smell. Personal cleanliness is essential because most states require health certificates indicating that workers are free from communicable diseases. Knowledge of a foreign language can be an asset because it may improve communication with other restaurant staff, vendors, and the restaurant's clientele.

Certification and advancement. The American Culinary Federation certifies pastry professionals, personal chefs, and culinary educators in addition to various levels of chefs. Certification standards are based primarily on experience and formal training. Although certification is not required, it can help to prove accomplishment and lead to advancement and higher-paying positions.

Advancement opportunities for chefs, cooks, and food preparation workers depend on their training, work experience, and ability to perform more responsible and sophisticated tasks. Many food preparation workers, for example, may move into assistant or line cook positions. Chefs and cooks who demonstrate an eagerness to learn new cooking skills and to accept greater responsibility may also move up and be asked to train or supervise lesser skilled kitchen staff. Others may move to larger or more prestigious kitchens and restaurants.

Some chefs and cooks go into business as caterers or personal chefs or open their own restaurant. Others become instructors in culinary training programs. A number of cooks and chefs advance to executive chef positions or food service management positions, particularly in hotels, clubs, or larger, more elegant restaurants. (See the section on food service managers elsewhere in the *Handbook*.)

Employment

Chefs, cooks, and food preparation workers held 3.1 million jobs in 2006. The distribution of jobs among the various types of chefs, cooks, and food preparation workers was as follows:

Food preparation workers	902,000
Cooks, restaurant	850,000
Cooks, fast food	629,000
Cooks, institution and cafeteria	401,000
Cooks, short order	195,000
Chefs and head cooks	115,000
Cooks, private household	4,900
Cooks, all other	16,000

Two-thirds of all chefs, cooks, and food preparation workers were employed in restaurants and other food services and drinking places. About 15 percent worked in institutions such as schools, universities, hospitals, and nursing care facilities. Grocery stores, hotels, and gasoline stations with convenience stores employed most of the remainder.

Job Outlook

Job opportunities for chefs, cooks, and food preparation workers are expected to be plentiful because of the continued growth and expansion of food services outlets, resulting in average employment growth, and because of the large numbers of workers who leave these occupations and need to be replaced. However, those seeking the highest-paying positions will face keen competition.

Employment change. Employment of chefs, cooks, and food preparation workers is expected to increase by 11 percent over the 2006–2016 decade, which is about as fast as the average for all occupations. This occupation will have among the largest numbers of new jobs arise, about 351,000 over the period. Growth will be spurred by increases in population, household income, and demand for convenience that will lead to more people dining out and taking vacations that include hotel stays and restaurant visits. In addition, employment of chefs, cooks, and food preparation workers who prepare meals-to-go, such as those who work in the prepared foods sections of grocery or specialty food stores, should grow faster than average as these stores compete with restaurants for people's food dollars. Also, there is a growing consumer desire for convenient, healthier, made-from-scratch meals.

Projected employment growth varies by detailed occupation. The number of higher-skilled chefs and cooks working in full-service restaurants—those that offer table service and more varied menus—is expected to increase about as fast as the average for all occupations. Much of this increase will come from job growth in more casual dining settings, rather than in up-scale full-service restaurants. Dining trends suggest that an increasing number of meals are eaten away from home, which creates growth in family dining restaurants, but greater limits on expense-account meals is expected to generate slower growth for up-scale restaurants.

Employment of food preparation workers is expected to grow faster than the average for all occupations, reflecting diners' desires for convenience as they shop for carryout meals in a greater variety of places, including full-service restaurants, limited-service eating places, and grocery stores.

Employment of fast-food cooks is expected to grow about as fast as the average for all occupations. Duties of cooks in fast-food restaurants are limited; most workers are likely to be combined food preparation and serving workers, rather than fast-food cooks. Employment of short-order cooks is expected to increase more slowly than average.

Employment of institution and cafeteria chefs and cooks will show growth about as fast as the average. Their employment will not keep pace with the rapid growth in the educational and health services industries—where their employment is concentrated. Offices, schools, and hospitals increasingly contract out their food services in an effort to make "institutional food" more attractive to office workers, students, staff, visitors, and patients. Much of the growth of these workers will be in contract food service establishments that provide catering services or food management and staff for employee dining rooms, sports complexes, convention centers, and educational or health care facilities.

Employment of private household cooks is projected to grow by 9 percent, about as fast as the average. While the employment of personal chefs is expected to increase—reflecting the growing pop-

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Chefs, cooks, and food preparation workers	—	3,113,000	3,464,000	351,000	11
Chefs and head cooks	35-1011	115,000	124,000	8,700	8
Cooks and food preparation workers	35-2000	2,998,000	3,340,000	342,000	11
Cooks	35-2010	2,097,000	2,301,000	204,000	10
Cooks, fast food	35-2011	629,000	681,000	52,000	8
Cooks, institution and cafeteria	35-2012	401,000	445,000	43,000	11
Cooks, private household	35-2013	4,900	5,400	400	9
Cooks, restaurant	35-2014	850,000	948,000	98,000	12
Cooks, short order	35-2015	195,000	205,000	9,500	5
Cooks, all other	35-2019	16,000	16,000	500	3
Food preparation workers	35-2021	902,000	1,040,000	138,000	15

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

ularity and convenience of eating restaurant-quality meals at home—the number of private chefs will not grow as fast, reflecting slower growth in private household service employment.

Job prospects. Job openings for chefs, cooks, and food preparation workers are expected to be plentiful through 2016; however, competition should be keen for jobs in the top kitchens of higher end restaurants. Although job growth will create many new positions, the overwhelming majority of job openings will stem from the need to replace workers who leave this large occupational group. Many chef, cook, and food preparation worker jobs are attractive to people seeking first-time or short-term employment, additional income, or a flexible schedule. Employers typically hire a large number of part-time workers, but many of these workers soon transfer to other occupations or stop working, creating numerous openings for those entering the field. At higher end restaurants, the fast pace, long hours, and high energy levels required to succeed also cause some top chefs and cooks to leave for other jobs, creating job openings.

Earnings

Earnings of chefs, cooks, and food preparation workers vary greatly by region and the type of employer. Earnings usually are highest in elegant restaurants and hotels, where many executive chefs are employed, and in major metropolitan and resort areas.

Median annual wage-and-salary earnings of chefs and head cooks were $34,370 in May 2006. The middle 50 percent earned between $25,910 and $46,040. The lowest 10 percent earned less than $20,160, and the highest 10 percent earned more than $60,730. Median annual earnings in the industries employing the largest number of chefs and head cooks were:

Other amusement and recreations industries	$46,460
Traveler accommodation	40,020
Special food services	36,450
Full-service restaurants	32,360
Limited-service eating places	27,560

Median annual wage-and-salary earnings of cooks, private household were $22,870 in May 2006. The middle 50 percent earned between $17,960 and $31,050. The lowest 10 percent earned less than $14,690, and the highest 10 percent earned more than $55,040.

Median annual wage-and-and salary earnings of institution and cafeteria cooks were $20,410 in May 2006. The middle 50 percent earned between $16,280 and $25,280. The lowest 10 percent earned less than $13,450, and the highest 10 percent earned more than $30,770. Median annual earnings in the industries employing the largest numbers of institution and cafeteria cooks were:

General medical and surgical hospitals	$22,980
Special food services	21,650
Community care facilities for the elderly	20,910
Nursing care facilities	20,470
Elementary and secondary schools	18,770

Median annual wage-and-salary earnings of restaurant cooks were $20,340 in May 2006. The middle 50 percent earned between $16,860 and $24,260. The lowest 10 percent earned less than $14,370, and the highest 10 percent earned more than $28,850. Median annual earnings in the industries employing the largest numbers of restaurant cooks were:

Traveler accommodations	$23,400
Full-service restaurants	20,100
Limited-service eating places	18,200

Median annual wage-and-salary earnings of short-order cooks were $17,880 in May 2006. The middle 50 percent earned between $14,960 and $21,820. The lowest 10 percent earned less than $12,930, and the highest 10 percent earned more than $26,110. Median annual earnings in full-service restaurants were $18,340.

Median annual wage-and-salary earnings of food preparation workers were $17,410 in May 2006. The middle 50 percent earned between $14,920 and $21,230. The lowest 10 percent earned less than $13,190, and the highest 10 percent earned more than $25,940. Median annual earnings in the industries employing the largest number of food preparation workers were:

Grocery stores	$18,920
Full-service restaurants	17,390
Limited-service eating places	15,550

Median annual wage-and-salary earnings of fast-food cooks were $15,410 in May 2006. The middle 50 percent earned between $13,730 and $17,700. The lowest 10 percent earned less than $12,170, and the highest 10 percent earned more than $20,770. Median annual earnings were $15,360 in full-service restaurants and $15,350 in limited-service eating places.

Some employers provide employees with uniforms and free meals, but federal law permits employers to deduct from their employees' wages the cost or fair value of any meals or lodging provided, and some employers do so. Chefs, cooks, and food preparation workers who work full time often receive typical benefits, but part-time and hourly workers usually do not.

In some large hotels and restaurants, kitchen workers belong to unions. The principal unions are the Hotel Employees and Restau-

rant Employees International Union and the Service Employees International Union.

Related Occupations

People who perform tasks similar to those of chefs, cooks, and food preparation workers include those in food processing occupations, such as butchers and meat cutters, and bakers. Others who work closely with these workers include food service managers and food and beverage serving and related workers.

Sources of Additional Information

Information about job opportunities may be obtained from local employers and local offices of the state employment service.

Career information about chefs, cooks, and other kitchen workers, including a directory of two- and four-year colleges that offer courses or training programs is available from

Food and Beverage Serving and Related Workers

(O*NET 35-3011.00, 35-3021.00, 35-3022.00, 35-3031.00, 35-3041.00, 35-9011.00, 35-9021.00, 35-9031.00, and 35-9099.99)

Significant Points

- Most jobs are part time and have few educational requirements, attracting many young people to the occupation—more than one-fifth of these workers were 16 to 19 years old, about five times the proportion for all workers.
- Job openings are expected to be abundant through 2016, which will create excellent opportunities for jobseekers.
- Tips comprise a major portion of earnings, so keen competition is expected for jobs in fine dining and more popular restaurants where potential tips are greatest.

Nature of the Work

Food and beverage serving and related workers are the front line of customer service in restaurants, coffee shops, and other food service establishments. These workers greet customers, escort them to seats and hand them menus, take food and drink orders, and serve food and beverages. They also answer questions, explain menu items and specials, and keep tables and dining areas clean and set for new diners. Most work as part of a team, helping coworkers to improve workflow and customer service.

Waiters and waitresses, the largest group of these workers, take customers' orders, serve food and beverages, prepare itemized checks, and sometimes accept payment. Their specific duties vary considerably, depending on the establishment. In coffee shops serving routine, straightforward fare, such as salads, soups, and sandwiches, servers are expected to provide fast, efficient, and courteous service. In fine dining restaurants, where more complicated meals are prepared and often served over several courses, waiters and waitresses provide more formal service emphasizing personal, attentive treatment and a more leisurely pace. They may recommend certain dishes and identify ingredients or explain how various items on the menu are prepared. Some prepare salads, desserts, or other menu items tableside. Additionally, servers may meet with managers and chefs, before each shift to discuss the menu and any new items or specials, review ingredients for any potential food allergies, or talk about any food safety concerns, coordination between the kitchen and the dining room, and any customer service issues from the previous day or shift. Servers usually also check the identification of patrons to ensure they meet the minimum age requirement for the purchase of alcohol and tobacco products wherever those items are sold.

Food and beverage serving and related workers need good interpersonal skills to deal with customers.

Waiters and waitresses sometimes perform the duties of other food and beverage service workers. These tasks may include escorting guests to tables, serving customers seated at counters, clearing and setting up tables, or operating a cash register. However, full-service restaurants frequently hire other staff, such as hosts and hostesses, cashiers, or dining room attendants, to perform these duties.

Bartenders fill drink orders either taken directly from patrons at the bar or through waiters and waitresses who place drink orders for dining room customers. Bartenders check the identification of customers seated at the bar to ensure they meet the minimum age requirement for the purchase of alcohol and tobacco products. They prepare mixed drinks, serve bottled or draught beer, and pour wine or other beverages. Bartenders must know a wide range of drink recipes and be able to mix drinks accurately, quickly, and without waste. Besides mixing and serving drinks, bartenders stock and prepare garnishes for drinks; maintain an adequate supply of ice, glasses, and other bar supplies; and keep the bar area clean for customers. They also may collect payment, operate the cash register, wash glassware and utensils, and serve food to customers who dine at the bar. Bartenders usually are responsible for ordering and maintaining an inventory of liquor, mixes, and other bar supplies.

Most bartenders directly serve and interact with patrons. Bartenders should be friendly and at ease talking with customers. Bartenders at service bars, on the other hand, have less contact with

customers. They work in small bars often located off the kitchen in restaurants, hotels, and clubs where only waiters and waitresses place drink orders. Some establishments, especially larger, higher volume ones, use equipment that automatically measures, pours, and mixes drinks at the push of a button. Bartenders who use this equipment, however, still must work quickly to handle a large volume of drink orders and be familiar with the ingredients for special drink requests. Much of a bartender's work still must be done by hand.

Hosts and hostesses welcome guests and maintain reservation or waiting lists. They may direct patrons to coatrooms, restrooms, or to a place to wait until their table is ready. Hosts and hostesses assign guests to tables suitable for the size of their group, escort patrons to their seats, and provide menus. They also schedule dining reservations, arrange parties, and organize any special services that are required. In some restaurants, they act as cashiers.

Dining room and cafeteria attendants and bartender helpers assist waiters, waitresses, and bartenders by cleaning tables, removing dirty dishes, and keeping serving areas stocked with supplies. Sometimes called backwaiters or runners, they bring meals out of the kitchen and assist waiters and waitresses by distributing dishes to individual diners. They also replenish the supply of clean linens, dishes, silverware, and glasses in the dining room and keep the bar stocked with glasses, liquor, ice, and drink garnishes. Dining room attendants set tables with clean tablecloths, napkins, silverware, glasses, and dishes and serve ice water, rolls, and butter. At the conclusion of meals, they remove dirty dishes and soiled linens from tables. *Cafeteria attendants* stock serving tables with food, trays, dishes, and silverware and may carry trays to dining tables for patrons. Bartender helpers keep bar equipment clean and glasses washed. *Dishwashers* clean dishes, cutlery, and kitchen utensils and equipment.

Counter attendants take orders and serve food in cafeterias, coffee shops, and carryout eateries. In cafeterias, they serve food displayed on steam tables, carve meat, dish out vegetables, ladle sauces and soups, and fill beverage glasses. In lunchrooms and coffee shops, counter attendants take orders from customers seated at the counter, transmit orders to the kitchen, and pick up and serve food. They also fill cups with coffee, soda, and other beverages and prepare fountain specialties, such as milkshakes and ice cream sundaes. Counter attendants also take carryout orders from diners and wrap or place items in containers. They clean counters, write itemized bills, and sometimes accept payment. Some counter attendants may prepare short-order items, such as sandwiches and salads.

Some food and beverage serving workers take orders from customers at counters or drive-through windows at fast-food restaurants. They assemble orders, hand them to customers, and accept payment. Many of these are *combined food preparation and serving workers* who also cook and package food, make coffee, and fill beverage cups using drink-dispensing machines.

Other workers serve food to patrons outside of a restaurant environment. They might deliver room service meals in hotels or meals to hospital rooms or act as carhops, bringing orders to parked cars.

Work environment. Food and beverage service workers are on their feet most of the time and often carry heavy trays of food, dishes, and glassware. During busy dining periods, they are under pressure to serve customers quickly and efficiently. The work is relatively safe, but care must be taken to avoid slips, falls, and burns.

Part-time work is more common among food and beverage serving and related workers than among workers in almost any other occupation. In 2006, those on part-time schedules included half of all waiters and waitresses and 39 percent of all bartenders.

Food service and drinking establishments typically maintain long dining hours and offer flexible and varied work opportunities. Many food and beverage serving and related workers work evenings, weekends, and holidays. Many students and teenagers seek part time or seasonal work as food and beverage serving and related workers as a first job to gain work experience or to earn spending money. More than one-fifth of all food and beverage serving and related workers were 16 to 19 years old—about five times the proportion for all workers.

Training, Other Qualifications, and Advancement

Most food and beverage service jobs require little or no previous experience and provide training on the job.

Education and training. There are no specific educational requirements for most food and beverage service jobs. Many employers prefer to hire high school graduates for waiter and waitress, bartender, and host and hostess positions, but completion of high school usually is not required for fast-food workers, counter attendants, dishwashers, and dining room attendants and bartender helpers. For many people, a job as a food and beverage service worker serves as a source of immediate income, rather than a career. Many entrants to these jobs are in their late teens or early twenties and have a high school education or less. Usually, they have little or no work experience. Many are full-time students or homemakers. Food and beverage service jobs are a major source of part-time employment for high school and college students.

All new employees receive some training from their employer. They learn safe food handling procedures and sanitation practices, for example. Some employers, particularly those in fast-food restaurants, teach new workers using self-study programs, on-line programs, audiovisual presentations, and instructional booklets that explain food preparation and service skills. But most food and beverage serving and related workers pick up their skills by observing and working with more experienced workers. Some full-service restaurants also provide new dining room employees with some form of classroom training that alternates with periods of on-the-job work experience. These training programs communicate the operating philosophy of the restaurant, help establish a personal rapport with other staff, teach formal serving techniques, and instill a desire to work as a team. They also provide an opportunity to discuss customer service situations and the proper ways of handling unpleasant circumstances or unruly patrons.

Some food serving workers can acquire more skills by attending relevant classes offered by public or private vocational schools, restaurant associations, or large restaurant chains. Some bartenders also acquire their skills by attending a bartending or vocational and technical school. These programs often include instruction on state and local laws and regulations, cocktail recipes, proper attire and conduct, and stocking a bar. Some of these schools help their graduates find jobs. Although few employers require any minimum level of educational attainment, some specialized training is usually needed in food handling and legal issues surrounding serving alcoholic beverages. Employers are more likely to hire and promote based on people skills and personal qualities rather than education.

Other qualifications. Restaurants rely on good food and quality customer service to retain loyal customers and succeed in a competitive industry. Food and beverage serving and related workers who exhibit excellent personal qualities—such as a neat clean appearance, a well-spoken manner, an ability to work as a part of a team, and a pleasant way with patrons—will be highly sought after. All workers who serve alcoholic beverages must be at least 21 years of age in most jurisdictions and should be familiar with state and local

laws concerning the sale of alcoholic beverages. For bartender jobs, many employers prefer to hire people who are 25 or older.

Waiters and waitresses need a good memory to avoid confusing customers' orders and to recall faces, names, and preferences of frequent patrons. These workers also should be comfortable using computers to place orders and generate customers' bills. Some may need to be quick at arithmetic so they can total bills manually. Knowledge of a foreign language is helpful to communicate with a diverse clientele and staff. Prior experience waiting on tables is preferred by restaurants and hotels that have rigid table service standards. Jobs at these establishments often offer higher wages and have greater income potential from tips, but they may also have stiffer employment requirements, such as prior table service experience or higher education than other establishments.

Advancement. Due to the relatively small size of most food-serving establishments, opportunities for promotion are limited. After gaining experience, some dining room and cafeteria attendants and bartender helpers advance to waiter, waitress, or bartender jobs. For waiters, waitresses, and bartenders, advancement usually is limited to finding a job in a busier or more expensive restaurant or bar where prospects for tip earnings are better. Some bartenders, hosts and hostesses, and waiters and waitresses advance to supervisory jobs, such as dining room supervisor, *maitre d'hotel*, assistant manager, or restaurant general manager. A few bartenders open their own businesses. In larger restaurant chains, food and beverage service workers who excel often are invited to enter the company's formal management training program. (For more information, see the section on food service managers elsewhere in the *Handbook*.)

Employment

Food and beverage serving and related workers held 7.4 million jobs in 2006. The distribution of jobs among the various food and beverage serving occupations was as follows:

Combined food preparation and serving workers, including fast food	2,503,000
Waiters and waitresses	2,361,000
Counter attendants, cafeteria, food concession, and coffee shop	533,000
Dishwashers	517,000
Bartenders	495,000
Dining room and cafeteria attendants and bartender helpers	416,000
Hosts and hostesses, restaurant, lounge, and coffee shop	351,000
Food servers, non restaurant	189,000
All other food preparation and serving related workers	56,000

The overwhelming majority of jobs for food and beverage serving and related workers were found in food services and drinking places, such as restaurants, sandwich shops, and catering or contract food service operators. Other jobs were in hotels, motels, and other traveler accommodation establishments; amusement, gambling, and recreation establishments; educational services; grocery stores; nursing care facilities; civic and social organizations; and hospitals.

Jobs are located throughout the country but are typically plentiful in large cities and tourist areas. Vacation resorts offer seasonal employment, and some workers alternate between summer and winter resorts.

Job Outlook

Average employment growth is expected, and job opportunities should be excellent for food and beverage serving and related workers, but job competition is often keen at upscale restaurants.

Employment change. Overall employment of these workers is expected to increase by 13 percent over the 2006–2016 decade, which is about as fast as the average for all occupations. Food and beverage serving and related workers are projected to have one of the largest numbers of new jobs arise, about 993,000, over this period. The popularity of eating out is expected to increase as the population expands and as customers seek the convenience of restaurants and other dining options. Projected employment growth varies somewhat by job type. Employment of combined food preparation and serving workers, which includes fast-food workers, is expected to increase faster than the average in response to the continuing fast-paced lifestyle of many Americans and the addition of healthier foods at many fast-food restaurants. Average employment growth is expected for waiters and waitresses, hosts and hostesses, and bartenders. Restaurants that offer table service, more varied menus, and an active bar scene are growing in number in response to consumer demands for convenience and to increases in disposable income, especially among families who frequent casual family-

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16 Number	Change, 2006-16 Percent
Food and beverage serving and related workers	—	7,422,000	8,415,000	993,000	13
Food and beverage serving workers	35-3000	6,081,000	6,927,000	846,000	14
Bartenders	35-3011	495,000	551,000	56,000	11
Fast food and counter workers	35-3020	3,036,000	3,542,000	506,000	17
Combined food preparation and serving workers, including fast food	35-3021	2,503,000	2,955,000	452,000	18
Counter attendants, cafeteria, food concession, and coffee shop	35-3022	533,000	587,000	54,000	10
Waiters and waitresses	35-3031	2,361,000	2,615,000	255,000	11
Food servers, nonrestaurant	35-3041	189,000	219,000	30,000	16
Other food preparation and serving related workers	35-9000	1,341,000	1,488,000	147,000	11
Dining room and cafeteria attendants and bartender helpers	35-9011	416,000	466,000	49,000	12
Dishwashers	35-9021	517,000	571,000	54,000	10
Hosts and hostesses, restaurant, lounge, and coffee shop	35-9031	351,000	388,000	37,000	10
Food preparation and serving related workers, all other	35-9099	56,000	64,000	7,300	13

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

oriented restaurants; affluent young professionals, who patronize trendier, more upscale establishments; and retirees and others who dine out as a way to socialize. Employment of dishwashers, dining room and cafeteria attendants, and bartender helpers also will grow about as fast as average.

Job prospects. Job opportunities at most eating and drinking places will be excellent because many people in service sector occupations change jobs frequently and the number of food service outlets needing food service workers will continue to grow. Many of these workers, such as teens, those seeking part-time employment, or multiple jobholders, do so to satisfy short-term income needs before moving on to jobs in other occupations or leaving the workforce. Keen competition is expected, however, for jobs in popular restaurants and fine dining establishments, where potential earnings from tips are greatest.

Earnings

Food and beverage serving and related workers derive their earnings from a combination of hourly wages and customer tips. Earnings vary greatly, depending on the type of job and establishment. For example, fast-food workers and hosts and hostesses usually do not receive tips, so their wage rates may be higher than those of waiters and waitresses and bartenders in full-service restaurants but their overall earnings might be lower. In many full-service restaurants, tips are higher than wages. In some restaurants, workers contribute all or a portion of their tips to a tip pool, which is distributed among qualifying workers. Tip pools allow workers who don't usually receive tips directly from customers, such as dining room attendants, to feel a part of a team and to share in the rewards of good service.

In May 2006, median hourly wage-and-salary earnings (including tips) of waiters and waitresses were $7.14. The middle 50 percent earned between $6.42 and $9.14. The lowest 10 percent earned less than $5.78, and the highest 10 percent earned more than $12.46 an hour. For most waiters and waitresses, higher earnings are primarily the result of receiving more in tips rather than higher hourly wages. Tips usually average between 10 and 20 percent of guests' checks; waiters and waitresses working in busy, expensive restaurants earn the most.

Bartenders had median hourly wage-and-salary earnings (including tips) of $7.86. The middle 50 percent earned between $6.77 and $10.10. The lowest 10 percent earned less than $6.00, and the highest 10 percent earned more than $13.56 an hour. Like waiters and waitresses, bartenders employed in public bars may receive more than half of their earnings as tips. Service bartenders often are paid higher hourly wages to offset their lower tip earnings.

Median hourly wage-and-salary earnings (including tips) of dining room and cafeteria attendants and bartender helpers were $7.36. The middle 50 percent earned between $6.62 and $8.59. The lowest 10 percent earned less than $5.91, and the highest 10 percent earned more than $10.60 an hour. Most received over half of their earnings as wages; the rest of their income was a share of the proceeds from tip pools.

Median hourly wage-and-salary earnings of hosts and hostesses were $7.78. The middle 50 percent earned between $6.79 and $8.97. The lowest 10 percent earned less than $5.99, and the highest 10 percent earned more than $10.80 an hour. Wages comprised the majority of their earnings. In some cases, wages were supplemented by proceeds from tip pools.

Median hourly wage-and-salary earnings of combined food preparation and serving workers, including fast food, were $7.24. The middle 50 percent earned between $6.47 and $8.46. The lowest 10 percent earned less than $5.79, and the highest 10 percent earned more than $10.16 an hour. Although some combined food preparation and serving workers receive a part of their earnings as tips, fast-food workers usually do not.

Median hourly wage-and-salary earnings of counter attendants in cafeterias, food concessions, and coffee shops (including tips) were $7.76. The middle 50 percent earned between $6.85 and $9.00 an hour. The lowest 10 percent earned less than $6.11, and the highest 10 percent earned more than $10.86 an hour.

Median hourly wage-and-salary earnings of dishwashers were $7.57. The middle 50 percent earned between $6.78 and $8.62. The lowest 10 percent earned less than $6.01, and the highest 10 percent earned more than $10.00 an hour.

Median hourly wage-and-salary earnings of food servers outside of restaurants were $8.70. The middle 50 percent earned between $7.27 and $10.87. The lowest 10 percent earned less than $6.36, and the highest 10 percent earned more than $13.81 an hour.

Many beginning or inexperienced workers earn the federal minimum wage of $5.85 an hour. However, a few states set minimum wages higher than the federal minimum. Under federal law, this wage will increase to $6.55 in the summer of 2008 and to $7.25 in the summer of 2009. Also, various minimum wage exceptions apply under specific circumstances to disabled workers, full-time students, youth under age 20 in their first 90 days of employment, tipped employees, and student-learners. Tipped employees are those who customarily and regularly receive more than $30 a month in tips. The employer may consider tips as part of wages, but the employer must pay at least $2.13 an hour in direct wages.

Many employers provide free meals and furnish uniforms, but some may deduct from wages the cost, or fair value, of any meals or lodging provided. Food and beverage service workers who work full time often receive typical benefits, but part-time workers usually do not. In some large restaurants and hotels, food and beverage serving and related workers belong to unions—principally the Unite HERE and the Service Employees International Union.

Related Occupations

Other workers who prepare food for diners include chefs, cooks, and food preparation workers. Those whose job involves serving customers and handling money include cashiers, flight attendants, gaming services workers, and retail salespersons.

Sources of Additional Information

Information about job opportunities may be obtained from local employers and local offices of state employment services agencies.

Building and Grounds Cleaning and Maintenance Occupations

Building Cleaning Workers

(O*NET 37-1011.00, 37-2011.00, 37-2012.00, and 37-2019.99)

Significant Points

- This very large occupation requires few skills to enter and each year has one of the largest numbers of job openings of any occupation.
- Most job openings result from the need to replace the many workers who leave these jobs because they provide low pay and few benefits, limited opportunities for training or advancement, and often only part-time or temporary work.
- Most new jobs will occur in businesses providing janitorial and cleaning services on a contract basis.

Nature of the Work

Building cleaning workers—including janitors, maids, housekeeping cleaners, window washers, and rug shampooers—keep office buildings, hospitals, stores, apartment houses, hotels, and residences clean, sanitary, and in good condition. Some do only cleaning, while others have a wide range of duties.

Janitors and cleaners perform a variety of heavy cleaning duties, such as cleaning floors, shampooing rugs, washing walls and glass, and removing rubbish. They may fix leaky faucets, empty trash cans, do painting and carpentry, replenish bathroom supplies, mow lawns, and see that heating and air-conditioning equipment works properly. On a typical day, janitors may wet- or dry-mop floors, clean bathrooms, vacuum carpets, dust furniture, make minor repairs, and exterminate insects and rodents. They may also clean snow or debris from sidewalks in front of buildings and notify management of the need for major repairs. While janitors typically perform most of the duties mentioned, cleaners tend to work for companies that specialize in one type of cleaning activity, such as washing windows.

Maids and housekeeping cleaners perform any combination of light cleaning duties to keep private households or commercial establishments, such as hotels, restaurants, hospitals, and nursing homes, clean and orderly. In hotels, aside from cleaning and maintaining the premises, maids and housekeeping cleaners may deliver ironing boards, cribs, and rollaway beds to guests' rooms. In hospitals, they also may wash bed frames, make beds, and disinfect and sanitize equipment and supplies with germicides. Janitors, maids, and cleaners use many kinds of equipment, tools, and cleaning materials. For one job they may need standard cleaning implements; another may require an electric floor polishing machine and a special cleaning solution. Improved building materials, chemical cleaners, and power equipment have made many tasks easier and less time consuming, but cleaning workers must learn the proper use of equipment and cleaners to avoid harming floors, fixtures, building occupants, and themselves.

Building cleaning workers often work indoors and use specialized equipment.

Cleaning supervisors coordinate, schedule, and supervise the activities of janitors and cleaners. They assign tasks and inspect building areas to see that work has been done properly; they also issue supplies and equipment and inventory stocks to ensure that supplies on hand are adequate. They may be expected to screen and hire job applicants; train new and experienced employees; and recommend promotions, transfers, or dismissals. Supervisors may prepare reports concerning the occupancy of rooms, hours worked, and department expenses. Some also perform cleaning duties.

Cleaners and servants in private households dust and polish furniture; sweep, mop, and wax floors; vacuum; and clean ovens, refrigerators, and bathrooms. They also may wash dishes, polish silver, and change and make beds. Some wash, fold, and iron clothes; a few wash windows. General houseworkers also may take clothes and laundry to the cleaners, buy groceries, and perform many other errands.

Building cleaning workers in large office and residential buildings, and more recently in large hotels, often work in teams consisting of workers who specialize in vacuuming, picking up trash, and cleaning restrooms, among other things. Supervisors conduct inspections to ensure that the building is cleaned properly and the team is functioning efficiently. In hotels, one member of the team is responsible for reporting electronically to the supervisor when rooms are cleaned.

Work environment. Because most office buildings are cleaned while they are empty, many cleaning workers work evening hours. Some, however, such as school and hospital custodians, work in the daytime. When there is a need for 24-hour maintenance, janitors may be assigned to shifts. Most full-time building cleaners work about 40 hours a week. Part-time cleaners usually work in the evenings and on weekends.

Most building cleaning workers work indoors, but some work outdoors part of the time, sweeping walkways, mowing lawns, or shoveling snow. Working with machines can be noisy, and some tasks, such as cleaning bathrooms and trash rooms, can be dirty and unpleasant. Janitors may suffer cuts, bruises, and burns from machines, hand tools, and chemicals. They spend most of their time on their feet, sometimes lifting or pushing heavy furniture or equipment. Many tasks, such as dusting or sweeping, require constant bending, stooping, and stretching. Lifting the increasingly heavier mattresses at nicer hotels in order to change the linens can cause back injuries and sprains.

Training, Other Qualifications, and Advancement

Most building cleaning workers, except supervisors, have a high school degree or less and mainly learn their skills on the job or in informal training sessions sponsored by their employers. Supervi-

sors, though, generally have at least a high school diploma and often some college.

Education and training. No special education is required for most entry-level janitorial or cleaning jobs, but workers should be able to perform simple arithmetic and follow instructions. High school shop courses are helpful for jobs involving repair work. Most building cleaners learn their skills on the job. Beginners usually work with an experienced cleaner, doing routine cleaning. As they gain more experience, they are assigned more complicated tasks. In some cities, programs run by unions, government agencies, or employers teach janitorial skills. Students learn how to clean buildings thoroughly and efficiently; how to select and safely use various cleansing agents; and how to operate and maintain machines, such as wet and dry vacuums, buffers, and polishers. Students learn to plan their work, to follow safety and health regulations, to interact positively with people in the buildings they clean, and to work without supervision. Instruction in minor electrical, plumbing, and other repairs also may be given.

Supervisors of building cleaning workers usually need at least a high school diploma, but many have some college or more, especially those who work at places where clean rooms and well-functioning buildings are a necessity, such as in hospitals and hotels.

Other qualifications. Those who come in contact with the public should have good communication skills. Employers usually look for dependable, hard-working individuals who are in good health, follow directions well, and get along with other people.

Certification and advancement. A small number of cleaning supervisors and managers are members of the International Executive Housekeepers Association, which offers two kinds of certification programs for cleaning supervisors and managers: Certified Executive Housekeeper (CEH) and Registered Executive Housekeeper (REH). The CEH designation is offered to those with a high school education, while the REH designation is offered to those who have a four-year college degree. Both designations are earned by attending courses and passing exams and both must be renewed every 3 years to ensure that workers keep abreast of new cleaning methods. Those with the REH designation usually oversee the cleaning services of hotels, hospitals, casinos, and other large institutions that rely on well-trained experts for their cleaning needs.

Advancement opportunities for workers usually are limited in organizations where they are the only maintenance worker. Where there is a large maintenance staff, however, cleaning workers can be promoted to supervisor or to area supervisor or manager. In many establishments, they are required to take some in-service training to improve their housekeeping techniques and procedures and to enhance their supervisory skills. A high school diploma improves the chances for advancement. Some janitors set up their own maintenance or cleaning businesses.

Employment

Building cleaning workers held about 4.2 million jobs in 2006. More than 7 percent were self-employed.

Janitors and cleaners worked in nearly every type of establishment and held about 2.4 million jobs. They accounted for more than 57 percent of all building cleaning workers. More than 31 percent worked for firms supplying building maintenance services on a contract basis, about 20 percent were employed in public or private educational services, and 2 percent worked in hotels or motels. Other employers included hospitals; restaurants; religious institutions; manufacturing firms; government agencies; and operators of apartment buildings, office buildings, and other types of real estate.

First-line supervisors of housekeeping and janitorial workers held more than 282,000 jobs. Approximately 20 percent worked in firms supplying building maintenance services on a contract basis, while approximately 11 percent were employed in hotels or motels. About 4 percent worked for state and local governments, primarily at schools and colleges. Others worked for hospitals, nursing homes and other residential care facilities.

Maids and housekeepers held about 1.5 million jobs. Private households employed the most maids and housekeepers—almost 29 percent—while hotels, motels, and other traveler accommodations employed about the same percentage, almost 29 percent. Hospitals, nursing homes, and other residential care facilities employed large numbers, also. Although cleaning jobs can be found in all cities and towns, most are located in highly populated areas where there are many office buildings, schools, apartment houses, nursing homes, and hospitals.

Job Outlook

Overall employment of building cleaning workers is expected to grow faster than average for all occupations through 2016, as more office complexes, apartment houses, schools, factories, hospitals, and other buildings requiring cleaning are built to accommodate a growing population and economy.

Employment change. The number of building cleaning workers is expected to grow 14 percent between 2006 and 2016, which is faster than the average for all occupations. This occupation will have, in fact, one of the largest numbers of new jobs arise, about 570,000 over the 2006–2016 period.

Much of the growth in these occupations will come from cleaning residential properties. As families become more pressed for time, they increasingly hire cleaning and handyman services to perform a variety of tasks in their homes. Also, as the population ages, older people will need to hire cleaners to help maintain their houses. In addition, housekeeping cleaners will be needed to clean the growing number of residential care facilities for the elderly. These facilities, including assisted-living residences, generally provide housekeep-

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Building cleaning workers	—	4,154,000	4,723,000	569,000	14
First-line supervisors/managers of housekeeping and janitorial workers	37-1011	282,000	318,000	36,000	13
Building cleaning workers	37-2010	3,872,000	4,405,000	533,000	14
Janitors and cleaners, except maids and housekeeping cleaners	37-2011	2,387,000	2,732,000	345,000	14
Maids and housekeeping cleaners	37-2012	1,470,000	1,656,000	186,000	13
Building cleaning workers, all other	37-2019	16,000	18,000	2,400	15

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

ing services as part of the rent. Although there have been some improvements in productivity in the way buildings are cleaned and maintained—using teams of cleaners, for example, and better cleaning supplies—cleaning still is very much a labor-intensive job.

As many firms reduce costs by contracting out the cleaning and maintenance of buildings, businesses providing janitorial and cleaning services on a contract basis are expected to have the greatest number of new jobs in this field.

Job prospects. In addition to job openings arising due to growth, numerous openings should result from the need to replace those who leave this very large occupation each year. Limited promotion potential, low pay, and the fact that many jobs are part-time and temporary, induce many to leave the occupation, thereby contributing to the number of job openings and the need to replace these workers.

Building cleaners usually find work by answering newspaper advertisements, applying directly to organizations where they would like to work, contacting local labor unions, or contacting state employment service offices.

Earnings

Median annual earnings of janitors and cleaners, except maids and housekeeping cleaners, were $19,930 in May 2006. The middle 50 percent earned between $16,220 and $25,640. The lowest 10 percent earned less than $14,010 and the highest 10 percent earned more than $33,060. Median annual earnings in 2006 in the industries employing the largest numbers of janitors and cleaners, except maids and housekeeping cleaners, were as follows:

Elementary and secondary schools	$24,010
Local government	23,930
Colleges, universities, and professional schools	23,170
General medical and surgical hospitals	21,670
Services to buildings and dwellings	17,870

Median annual earnings of maids and housekeepers were $17,580 in May 2006. The middle 50 percent earned between $15,060 and $21,440. The lowest 10 percent earned less than $13,140, and the highest 10 percent earned more than $26,390. Median annual earnings in 2006 in the industries employing the largest numbers of maids and housekeepers were as follows:

General medical and surgical hospitals	$20,080
Community care facilities for the elderly	17,900
Nursing care facilities	17,690
Services to buildings and dwellings	17,540
Traveler accommodation	16,790

Median annual earnings of first-line supervisors and managers of housekeeping and janitorial workers were $31,290 in May 2006. The middle 50 percent earned between $24,230 and $40,670. The lowest 10 percent earned less than $19,620, and the highest 10 percent earned more than $51,490. Median annual earnings in May 2006 in the industries employing the largest numbers of first-line supervisors and managers of housekeeping and janitorial workers were as follows:

Local government	$38,170
Elementary and secondary schools	35,660
Nursing care facilities	30,570
Services to buildings and dwellings	29,730
Traveler accommodation	26,730

Related Occupations

Workers who specialize in one of the many job functions of janitors and cleaners include pest control workers; general maintenance and repair workers; and grounds maintenance workers.

Sources of Additional Information

Information about janitorial jobs may be obtained from state employment service offices.

Grounds Maintenance Workers

(O*NET 37-1012.00, 37-3011.00, 37-3012.00, 37-3013.00, and 37-3019.99)

Significant Points

- Opportunities should be very good, especially for workers willing to work seasonal or variable schedules, because of significant job turnover and increased demand for landscaping.
- Many beginning jobs have low earnings and are physically demanding.
- Most workers learn through short-term on-the-job training.

Nature of the Work

Attractively designed, healthy, and well-maintained lawns, gardens, and grounds create a positive impression, establish a peaceful mood, and increase property values. Grounds maintenance workers perform the variety of tasks necessary to achieve a pleasant and functional outdoor environment. They also care for indoor gardens and plantings in commercial and public facilities, such as malls, hotels, and botanical gardens.

These workers use hand tools such as shovels, rakes, pruning and handsaws, hedge and brush trimmers, and axes, as well as power lawnmowers, chain saws, snowblowers, and electric clippers. Some use equipment such as tractors and twin-axle vehicles. Landscaping and groundskeeping workers at parks, schools, cemeteries, and golf courses may lay sod after preparing the ground. Workers at sod farms use sod cutters to harvest sod that will be replanted elsewhere.

Grounds maintenance workers can be divided into landscaping workers and groundskeeping workers, depending on whether they mainly install new landscape elements or maintain existing ones, but their duties often overlap. Other grounds maintenance workers are pesticide handlers and tree trimmers.

Landscaping workers install plants and other elements into landscaped areas and often maintain them. They might mow, edge, trim, fertilize, dethatch, water, and mulch lawns and grounds many times during the growing season. They grade property by creating or smoothing hills and inclines, install lighting or sprinkler systems, and build walkways, terraces, patios, decks, and fountains. They also transport and plant new vegetation, and transplant, mulch, fertilize, and water existing plants, trees, and shrubs. A growing number of residential and commercial clients, such as managers of office buildings, shopping malls, multiunit residential buildings, and hotels and motels, favor full-service landscape maintenance.

Groundskeeping workers, also called *groundskeepers*, usually focus on maintaining existing grounds. They might work on athletic fields, golf courses, cemeteries, university campuses, and parks. In

Grounds maintenance workers often use power equipment.

addition to caring for sod, plants, and trees, they rake and mulch leaves, clear snow from walkways and parking lots, and use irrigation methods to adjust the amount of water consumption and prevent waste. They see to the proper upkeep and repair of sidewalks, parking lots, groundskeeping equipment, pools, fountains, fences, planters, and benches.

Groundskeeping workers who care for athletic fields keep natural and artificial turf in top condition, mark out boundaries, and paint turf with team logos and names before events. They must make sure that the underlying soil on fields with natural turf has the required composition to allow proper drainage and to support the grasses used on the field. Groundskeeping workers mow, water, fertilize, and aerate the fields regularly. In sports venues, they vacuum and disinfect synthetic turf after its use to prevent the growth of harmful bacteria, and they remove the turf and replace the cushioning pad periodically.

Groundskeepers in parks and recreation facilities care for lawns, trees, and shrubs; maintain playgrounds; clean buildings; and keep parking lots, picnic areas, and other public spaces free of litter. They also may erect and dismantle snow fences, and maintain swimming pools. These workers inspect buildings and equipment, make needed repairs, and keep everything freshly painted.

Workers who maintain golf courses are called *greenskeepers*. Greenskeepers do many of the same things as other groundskeepers, but they also periodically relocate the holes on putting greens to prevent uneven wear of the turf and to add interest and challenge to the game. Greenskeepers also keep canopies, benches, ball washers, and tee markers repaired and freshly painted.

Some groundskeepers specialize in caring for cemeteries and memorial gardens. They dig graves to specified depths, generally using a backhoe. They mow grass regularly, apply fertilizers and other chemicals, prune shrubs and trees, plant flowers, and remove debris from graves.

Pesticide handlers, sprayers, and applicators, vegetation mix herbicides, fungicides, or insecticides and apply them through sprays, dusts, or vapors into the soil or onto plants. Those working for chemical lawn service firms are more specialized, inspecting lawns for problems and applying fertilizers, pesticides, and other chemicals to stimulate growth and prevent or control weeds, diseases, or insect infestation. Many practice integrated pest-management techniques.

Tree trimmers and pruners cut away dead or excess branches from trees or shrubs to clear roads, sidewalks, or utilities' equipment or to improve the appearance, health, and value of trees. Some of these workers also specialize in pruning, trimming and shaping ornamental trees and shrubs for private residences, golf courses, or other institutional grounds. Tree trimmers and pruners use handsaws, pole saws, shears, and clippers. When trimming near power lines, they usually work on truck-mounted lifts and use power pruners.

Supervisors of landscaping and groundskeeping workers oversee grounds maintenance work. They prepare cost estimates, schedule work for crews on the basis of weather conditions or the availability of equipment, perform spot checks to ensure the quality of the service, and suggest changes in work procedures. In addition, supervisors train workers in their tasks; keep employees' time records and record work performed; and even assist workers when deadlines are near. Supervisors who own their own business are also known as *landscape contractors*. They also often call themselves *landscape designers* if they create landscape design plans. Landscape designers also design exterior floral displays by planting annual or perennial flowers. Some work with landscape architects. (Landscape architects, discussed elsewhere in the *Handbook*, create more technical architectural plans and usually work on larger projects.) Supervisors of workers on golf courses are known as s*uperintendents*.

Supervisors of tree trimmers and pruners are called *arborists*. Arborists specialize in the care of individual trees, diagnosing and treating tree diseases and recommending preventative health measures. Some arborists plant trees. Most can recommend types of trees that are appropriate for a specific location, as the wrong tree in the wrong location could lead to future problems with crowding, insects, diseases, or poor growth.

Arborists are employed by cities to improve urban green space, utilities to maintain power distribution networks, companies to care for residential and commercial properties, as well as many other settings.

Work environment. Many grounds maintenance jobs are seasonal, available mainly in the spring, summer, and fall, when most planting, mowing, trimming, and cleanup are necessary. Most of the work is performed outdoors in all kinds of weather. It can be physically demanding and repetitive, involving much bending, lifting, and shoveling. Workers in landscaping and groundskeeping may be under pressure to get the job completed, especially when they are preparing for scheduled events such as athletic competitions.

Those who work with pesticides, fertilizers, and other chemicals, as well as dangerous equipment and tools such as power lawnmowers, chain saws, and power clippers, must exercise safety precautions. Workers who use motorized equipment must take care to protect their hearing.

Training, Other Qualifications, and Advancement

Most grounds maintenance workers learn on-the-job. However, some occupations may require formal training in areas such as landscape design, horticulture, or business management.

Education and training. There usually are no minimum educational requirements for entry-level positions in grounds maintenance. In 2006, most workers had a high school education or less. Short-term on-the-job training generally is sufficient to teach new hires how to operate and repair equipment such as mowers, trimmers, leaf blowers, and small tractors and to follow correct safety procedures. They must also learn proper planting and maintenance procedures for their localities. Large institutional employers such as golf courses or municipalities may supplement on-the-job training with coursework in subjects like horticulture or small engine repair for those employees showing ability and willingness to learn.

Landscaping supervisors or contractors who own their own business, arborists, and landscape designers usually need formal training in landscape design, horticulture, arboriculture, or business. A bachelor's degree may be needed for those who want to become specialists or own their own business.

Licensure. Most states require licensure or certification for workers who apply pesticides. Requirements vary but usually include passing a test on the proper use and disposal of insecticides, herbicides, and fungicides. Some states require that landscape contractors be licensed.

Other qualifications. Employers look for responsible, self-motivated individuals because grounds maintenance workers often work with little supervision. Employers want people who can learn quickly and follow instructions accurately so that time is not wasted and plants are not damaged. Workers who deal directly with customers must get along well with people.

Driving a vehicle is often needed for these jobs. If driving is required, preference is given to applicants with a driver's license, a good driving record, and experience driving a truck.

Certification and advancement. The Professional Grounds Management Society offers voluntary certification to grounds managers who have a bachelor's degree in a relevant major with at least 4 years of experience, including 2 years as a supervisor; an associate degree in a relevant major with 6 years of experience, including 3 years as a supervisor; or 8 years of experience including 4 years as a supervisor, and no degree. Additionally, candidates for certification must pass an examination covering subjects such as equipment management, personnel management, environmental issues, turf care, ornamentals, and circulatory systems. Certification as a grounds technician is also offered by this organization.

The Professional Landcare Network offers six certifications to those who seek to demonstrate specific knowledge in an area of landscaping and grounds maintenance. Obtaining certification may be an asset for career advancement. The Tree Care Industry Association offers four levels of credentials. Currently available credentials include Tree Care Apprentice, Ground Operations Specialist, Tree Climber Specialist, and Tree Care Specialist, as well as a certification program in safety.

Laborers who demonstrate a willingness to work hard and quickly, have good communication skills, and take an interest in the business may advance to crew leader or other supervisory positions. Becoming a grounds manager or landscape contractor usually requires some formal education beyond high school and several years of progressively more responsible experience. Some workers with groundskeeping backgrounds may start their own businesses after several years of experience.

Employment

Grounds maintenance workers held about 1.5 million jobs in 2006. Employment was distributed as follows:

Landscaping and groundskeeping workers	1,220,000
First-line supervisors/managers of landscaping, lawn service, and groundskeeping workers	202,000
Tree trimmers and pruners	41,000
Pesticide handlers, sprayers, and applicators, vegetation	31,000
Grounds maintenance workers, all other	28,000

More than one-third of the workers in grounds maintenance were employed in companies providing landscaping services to buildings and dwellings. Others worked for amusement and recreation facilities, such as golf courses and racetracks; educational institutions, both public, and private; and property management and real-estate development firms. Some were employed by local governments, installing and maintaining landscaping for parks, hospitals, and other public facilities. Almost 24 percent of grounds maintenance workers were self-employed, providing landscape maintenance directly to customers on a contract basis.

About 14 percent of grounds maintenance workers worked part time; about 9 percent were younger than age twenty.

Job Outlook

Those interested in grounds maintenance occupations should find very good job opportunities in the future. Employment of grounds maintenance workers is expected to grow faster than average for all occupations through the year 2016.

Employment change. Employment of grounds maintenance workers is expected to grow about 18 percent during the 2006–2016 decade. Grounds maintenance workers will have among the largest numbers of new jobs arise, around 270,000 over the 2006–2016 period.

More workers will be needed to keep up with increasing demand by lawn care and landscaping companies. Increased construction of office buildings, shopping malls, and residential housing and of highways and parks is expected to increase demand for grounds maintenance workers. In addition, the upkeep and renovation of existing landscaping and grounds are continuing sources of demand for grounds maintenance workers. Major institutions, such as universities and corporate headquarters, recognize the importance of good landscape design in attracting personnel and clients and are expected to use grounds maintenance services more extensively to maintain and upgrade their properties. Grounds maintenance workers working for state and local governments, however, may face budget cuts, which may affect hiring.

Homeowners are a growing source of demand for grounds maintenance workers. Many two-income households lack the time to

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Grounds maintenance workers and related first-line supervisors/managers	—	1,521,000	1,791,000	270,000	18
First-line supervisors/managers of landscaping, lawn service, and groundskeeping workers	37-1012	202,000	237,000	36,000	18
Grounds maintenance workers	37-3000	1,319,000	1,554,000	235,000	18
Landscaping and groundskeeping workers	37-3011	1,220,000	1,441,000	221,000	18
Pesticide handlers, sprayers, and applicators, vegetation	37-3012	31,000	35,000	4,300	14
Tree trimmers and pruners	37-3013	41,000	45,000	4,500	11
Grounds maintenance workers, all other	37-3019	28,000	33,000	4,600	17

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

take care of their lawns so they increasingly hire people to maintain them. Also, as the population ages, more elderly homeowners will require lawn care services to help maintain their yards. In addition, there is a growing interest by homeowners in their backyards and a desire to make yards more attractive for outdoor entertaining. With many newer homes having more and bigger windows overlooking the property, it is becoming more important to maintain and beautify the grounds.

Job opportunities for tree trimmers and pruners should also increase as utility companies step up pruning of trees around electric lines to prevent power outages. Additionally, tree trimmers and pruners will be needed to help combat infestations caused by new species of insects from other countries. For example, ash trees from Chicago to Washington, D.C. are under threat by a pest from China, and preventative eradication may be employed to control the pest.

Job prospects. Jobs for grounds maintenance workers are increasing, and because wages for beginners are low and the work is physically demanding, many employers have difficulty attracting enough workers to fill all openings, creating very good job opportunities.

Job opportunities for nonseasonal work are more numerous in regions with temperate climates, where landscaping and lawn services are required all year. Opportunities may vary with local economic conditions.

Earnings

Median hourly earnings in May 2006 of grounds maintenance workers were as follows:

First-line supervisors/managers of landscaping, lawn service, and groundskeeping workers	$17.93
Tree trimmers and pruners	13.58
Pesticide handlers, sprayers, and applicators, vegetation	12.84
Landscaping and groundskeeping workers	10.22
Grounds maintenance workers, all others	9.82

Median hourly earnings in the industries employing the largest numbers of landscaping and groundskeeping workers were as follows:

Local government	$11.64
Services to buildings and dwellings	10.17
Landscaping services	10.17
Other amusement and recreation industries	9.47
Employment services	9.09

Related Occupations

Grounds maintenance workers perform most of their work outdoors and have some knowledge of plants and soils. Others whose jobs may require that they work outdoors are agricultural workers; farmers, ranchers, and agricultural managers; forest, conservation, and logging workers; landscape architects; and biological scientists.

Pest Control Workers

(O*NET 37-2021.00)

Significant Points

- A high school diploma is the minimum educational requirement; however, about 4 in 10 workers have either attended college or earned a degree.
- Laws require pest control workers to be certified through training and examination.
- Job prospects should be favorable, especially in warmer climates.

Nature of the Work

Unwanted creatures that infest households, buildings, or surrounding areas are pests that can pose serious risks to health and safety. The most common pests are roaches, rats, mice, spiders, termites, fleas, ants, and bees. It is a pest control worker's job to remove them.

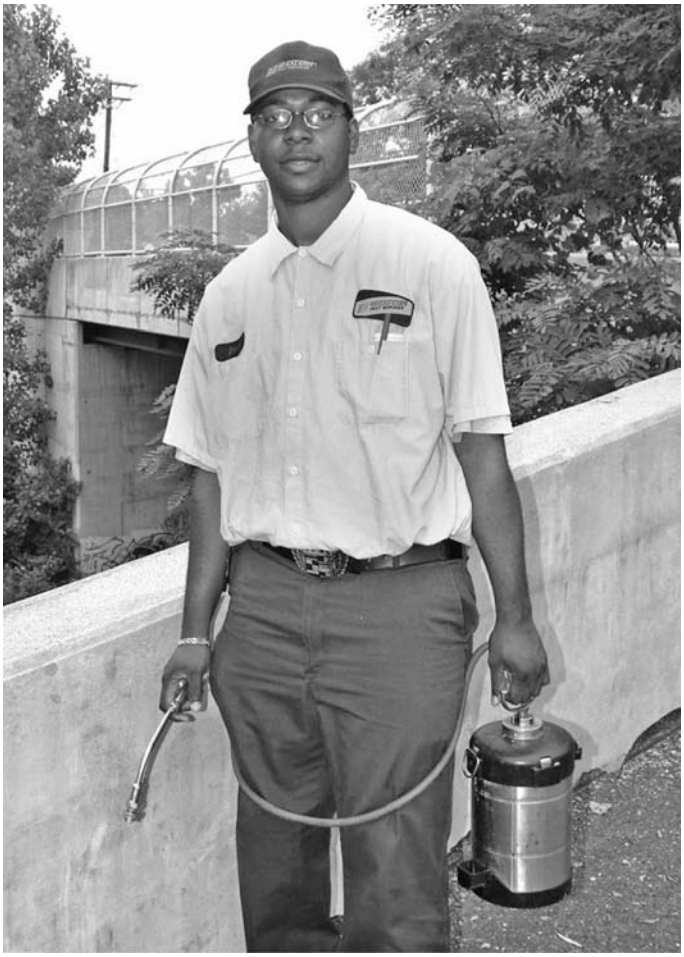
Pest control workers locate, identify, destroy, control, and repel pests. They use their knowledge of pests' biology and habits, along with an arsenal of pest management techniques such as applying chemicals, setting traps, operating equipment, and even modifying structures to alleviate pest problems. The final choice of which type of pest management is used often is decided by the consumer.

After a pest management plan is agreed upon, action needs to be taken. Some pests need to be eliminated and require pesticide application. Pest control workers use two different types of pesticides—general use and restricted use. General use pesticides are the most widely used and are readily available. They are available to the public in diluted concentrations. Restricted use pesticides are available only to certified professionals for controlling the most severe infestations. Their registration, labeling, and application are regulated by federal law and interpreted by the U.S. Environmental Protection Agency (EPA), because of their potential harm to pest control workers, customers, and the environment.

Pesticides are not pest control workers' only tool. Pest control workers increasingly use a combination of pest management techniques, known as integrated pest management. One method involves using proper sanitation and creating physical barriers. Pests cannot survive without food and will not infest a building if they cannot enter it. Another method involves using baits, some of which destroy the pests and others that prevent them from reproducing. Yet another method involves using mechanical devices, such as traps, that remove pests from the immediate environment.

Integrated pest management is popular for several reasons. Pesticides can pose environmental and health risks and some states heavily restrict the application of pesticides. Some pests are becoming more resistant to pesticides in certain situations. Finally, an integrated pest management plan is more effective in the long term than use of a pesticide alone.

New technology has been introduced that allows pest control workers to conduct home inspections, mainly of termites, in much less time. The technology works by implanting microchips in baiting stations, which emit signals that can tell pest control workers if



Laws require pest control workers to be certified through training and examination.

there is termite activity at one of the baiting stations. Workers pick up the signals using a device similar to a metal detector and it allows them to more quickly assess the presence of termites.

Most pest control workers are employed as pest control technicians, applicators, or supervisors. Position titles vary by state, but the hierarchy—based on the training and responsibility required—remains consistent.

Pest control technicians identify potential pest problems, conduct inspections, and design control strategies. They work directly with the customer. Some technicians require a higher level of training depending on their task. If certain products are used, the technician may be required to become a certified *applicator*.

Applicators that specialize in controlling termites are called *termite control technicians*. They use chemicals and modify structures to eliminate termites and prevent future infestation. To treat infested areas, termite control technicians drill holes and cut openings into buildings to access infestations and install physical barriers or bait systems around the structure. Some termite control technicians even repair structural damage caused by termites.

Fumigators are applicators who control pests using poisonous gases called fumigants. Fumigators pretreat infested buildings by examining, measuring, and sealing the buildings. Then, using cylinders, hoses, and valves, they fill structures with the proper amount and concentration of fumigant. They also monitor the premises during treatment for leaking gas. To prevent accidental fumigant exposure, fumigators padlock doors and post warning signs.

Pest control supervisors, also known as operators, direct service technicians and certified applicators. Supervisors are licensed to apply pesticides, but they usually are more involved in running the business. Supervisors are responsible for ensuring that employees obey rules regarding pesticide use, and they must resolve any problems that arise with regulatory officials or customers. Most states require each pest control establishment to have a supervisor. Self-employed business owners usually are supervisors.

Work environment. Pest control workers travel to visit clients. Pest control workers must kneel, bend, reach, and crawl to inspect, modify, and treat structures. They work both indoors and out, in all weather conditions. During warm weather, applicators may be uncomfortable wearing the heavy protective gear; such as respirators, gloves, and goggles that are required for working with pesticides.

There are health risks associated with pesticide use. Various pest control chemicals are toxic and could be harmful if not used properly. Health risks are minimized, however, by the extensive training required for certification and the use of recommended protective equipment, resulting in fewer reported cases of lost work.

About 47 percent of all pest control workers work a 40-hour week, but 26 percent work more hours. Pest control workers often work evenings and weekends, but many work consistent shifts.

Training, Other Qualifications, and Advancement

Both federal and state laws require pest control workers to be certified. Although a high school diploma is generally the minimum educational requirement, about 4 in 10 pest control workers have either attended college or earned a degree. Most pest control workers begin their careers as apprentice technicians.

Education and training. A high school diploma or equivalent is the minimum qualification for most pest control jobs. Pest control workers must have the basic knowledge needed to pass certification tests. In many states, training usually involves spending 10 hours in the classroom and 60 hours on the job for each category of work that the pest control worker would like to perform. Categories may include general pest control, rodent control, termite control, fumigation, and ornamental and turf control. In addition, technicians must attend general training in pesticide safety and use. After completing the required training, workers can provide supervised pest control services.

Pest control workers usually begin their careers as apprentice technicians. They receive both formal classroom and on-the-job training provided by the employer, but they also must study on their own. Because pest control methods change, workers must attend continuing education classes to maintain their certification, often provided by product manufacturers.

Licensure and certification. Both federal and state laws regulate pest control workers. These laws require them to be certified through training and examination. Most pest control firms provide training and help their employees prepare for the examination. Requirements for pest control workers vary by state. To be eligible to become applicators, technicians must have a combination of experience and education and pass a test. This requirement is sometimes waived for individuals who have either a college degree in biological sciences or extensive related work experience. To become certified as applicators, technicians must pass an additional set of category exams. Depending on the state, applicators must attend additional classes every 1 to 6 years to be recertified. The amount of time allowed to pass the basic certification depends on the state.

Other qualifications. Because of the extensive interaction that pest control workers have with their customers, employers prefer to

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Pest control workers	37-2021	70,000	81,000	11,000	15

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

hire people who have good communication and interpersonal skills. In addition, most pest control companies require their employees to have a good driving record. Some states require a background check for workers prior to certification. Pest control workers must be in good health because of the physical demands of the job, and they also must be able to withstand extreme conditions—such as the heat of climbing into an attic in the summertime or the chill of sliding into a crawlspace during winter.

Advancement. Applicators with several years of experience often become supervisors. To qualify as a pest control supervisor, applicators may have to pass state-administered exams and have relevant experience, usually a minimum of 2 years. Others may choose to take the knowledge and experience that they have gained, and start their own pest management company.

Employment

Pest control workers held about 70,000 jobs in 2006; about 85 percent of workers were employed in the services to buildings and dwellings industry, which includes pest control firms. About 9 percent of workers were self employed. Jobs are concentrated in states with warmer climates and larger cities, due to the greater number of pests in these areas that thrive year round.

Job Outlook

With faster-than-average growth and a limited supply of workers, job prospects should be favorable, especially in warmer climates.

Employment change. Employment of pest control workers is expected to grow 15 percent between 2006 and 2016, which is faster than the average for all occupations. One factor limiting job growth, however, is the lack of sufficient numbers of workers willing to go into this field. Demand for pest control workers is projected to increase for a number of reasons. Growth in the population will generate new residential and commercial buildings that will require inspections by pest control workers. Also, more people are expected to use pest control services as environmental and health concerns, greater numbers of dual-income households, and improvements in the standard of living convince more people to hire professionals rather than attempt pest control work themselves. In addition, tougher regulations limiting pesticide use will demand more complex integrated pest management strategies.

Concerns about the effects of pesticide use in schools have increasingly prompted more school districts to investigate alternative means of pest control, such as integrated pest management. Furthermore, use of some newer materials for insulation around foundations has made many homes more susceptible to pest infestation. Finally, continuing population shifts to the more pest-prone Sunbelt states should increase the number of households in need of pest control.

Job prospects. Job prospects should be favorable for qualified applicants because of relatively fast job growth and because the nature of pest control work is not appealing to many people. In addition to job openings arising from employment growth, opportunities will result from the need to replace workers who leave the occupation.

Earnings

Median hourly earnings of full-time wage and salary pest control workers were $13.41 in May 2006. The middle 50 percent earned between $10.79 and $16.76. The lowest 10 percent earned less than $8.88, and the top 10 percent earned over $20.85. Pest control supervisors usually earn the most and technicians the least, with earnings of certified applicators falling somewhere in between. Some pest control workers earn commissions based on the number of contracts for pest control services they sell. Others may earn bonuses for exceeding performance goals.

Related Occupations

Pest control workers visit homes and places of business to provide building services. Other workers who provide services to buildings include building cleaning workers; grounds maintenance workers; various construction trades workers, such as carpenters and hazardous materials removal workers; and heating, air-conditioning, and refrigeration mechanics and installers. Similar to pest control workers, pesticide handlers, sprayers, and applicators, vegetation also apply pesticides in a safe manner to lawns, trees, and other plants.

Sources of Additional Information

Private employment agencies and state employment services offices have information about available job opportunities for pest control workers.

For information about the training and certification required in your state, contact your local office of the U.S. Department of Agriculture or your state's Environmental Protection (or Conservation) Agency.

For more information about pest control careers and training, contact

Personal Care and Service Occupations

Animal Care and Service Workers

(O*NET 39-2011.00 and 39-2021.00)

Significant Points

- Animal lovers get satisfaction in this occupation, but the work can be unpleasant, physically and emotionally demanding, and sometimes dangerous.
- Most workers are trained on the job, but employers generally prefer to hire people who have experience with animals; some jobs require a bachelor's degree in biology, animal science, or a related field.
- Most positions will present good employment opportunities; however, keen competition is expected for jobs as zookeepers and marine mammal trainers.
- Earnings are relatively low.

Nature of the Work

Many people like animals. But, as pet owners can attest, taking care of them is hard work. Animal care and service workers—who include animal caretakers and animal trainers—train, feed, water, groom, bathe, and exercise animals and clean, disinfect, and repair their cages. They also play with the animals, provide companionship, and observe behavioral changes that could indicate illness or injury. Boarding kennels, pet stores, animal shelters, veterinary hospitals and clinics, stables, laboratories, aquariums and natural aquatic habitats, and zoological parks all house animals and employ animal care and service workers. Job titles and duties vary by employment setting.

Most pet groomers work in kennels, veterinary clinics, or pet supply stores, but an increasing number operate their own salon or make house calls.

Kennel attendants care for pets while their owners are working or traveling out of town. Beginning attendants perform basic tasks, such as cleaning cages and dog runs, filling food and water dishes, and exercising animals. Experienced attendants may provide basic animal healthcare, as well as bathe animals, trim nails, and attend to other grooming needs. Attendants who work in kennels also may sell pet food and supplies, assist in obedience training, help with breeding, or prepare animals for shipping.

Groomers are animal caretakers who specialize in grooming or maintaining a pet's appearance. Most groom dogs and a few groom cats. Some groomers work in kennels, veterinary clinics, animal shelters, or pet-supply stores. Others operate their own grooming business, typically at a salon, or increasingly, by making house calls. Such mobile services are growing rapidly as they offer convenience for pet owners, flexibility of schedules for groomers, and minimal trauma for pets resulting from their being in unfamiliar surroundings. Groomers clean and sanitize equipment to prevent the spread of disease, maintain grooming equipment, and maintain a clean and safe environment for the animals. Groomers also schedule appointments, discuss pets' grooming needs with clients, and collect information on the pet's disposition and its veterinarian. Groomers often are the first to notice a medical problem, such as an ear or skin infection that requires veterinary care.

Grooming the pet involves several steps: an initial brush-out is followed by a first clipping of hair or fur using electric clippers, combs, and grooming shears; the groomer then cuts the nails, cleans the ears, bathes, and blow-dries the animal, and ends with a final clipping and styling.

Animal caretakers in animal shelters perform a variety of duties and work with a wide variety of animals. In addition to attending to the basic needs of the animals, caretakers at shelters also must keep records of the animals received and discharged and any tests or treatments done. Some vaccinate newly admitted animals under the direction of a veterinarian or veterinary technician, and euthanize (painlessly put to death) seriously ill, severely injured, or unwanted animals. Animal caretakers in animal shelters also interact with the public, answering telephone inquiries, screening applicants for animal adoption, or educating visitors on neutering and other animal health issues.

Grooms, or caretakers, care for horses in stables. They saddle and unsaddle horses, give them rubdowns, and walk them to cool them off after a ride. They also feed, groom, and exercise the horses; clean out stalls and replenish bedding; polish saddles; clean and organize the tack (harness, saddle, and bridle) room; and store supplies and feed. Experienced grooms may help train horses.

In zoos, animal care and service workers, called *keepers*, prepare the diets and clean the enclosures of animals, and sometimes assist in raising them when they are very young. They watch for any signs of illness or injury, monitor eating patterns or any changes in behavior, and record their observations. Keepers also may answer questions and ensure that the visiting public behaves responsibly toward the exhibited animals. Depending on the zoo, keepers may be assigned to work with a broad group of animals such as mammals, birds, or reptiles, or they may work with a limited collection of animals such as primates, large cats, or small mammals.

Animal trainers train animals for riding, security, performance, obedience, or assisting people with disabilities. Animal trainers do this by accustoming the animal to human voice and contact and conditioning the animal to respond to commands. The three most commonly trained animals are dogs, horses, and marine mammals,

including dolphins. Trainers use several techniques to help them train animals. One technique, known as a bridge, is a stimulus that a trainer uses to communicate the precise moment an animal does something correctly. When the animal responds correctly, the trainer gives positive reinforcement in a variety of ways: food, toys, play, rubdowns, or speaking the word "good." Animal training takes place in small steps and often takes months and even years of repetition. During the conditioning process, trainers provide animals with mental stimulation, physical exercise, and husbandry care. A relatively new form of training teaches animals to cooperate with workers giving medical care. Animals learn "veterinary" behaviors, such as allowing and even cooperating with the collection of blood samples; physical, X-ray, ultrasonic, and dental exams; physical therapy; and the administration of medicines and replacement fluids.

Training also can be a good tool for facilitating the relocation of animals from one habitat to another, easing, for example, the process of loading horses on trailers. Trainers often work in competitions or shows, such as circuses or marine parks, aquariums, animal shelters, dog kennels and salons, or horse farms. Trainers in shows work to display the talent and ability of an animal, such as a dolphin, through interactive programs to educate and entertain the public.

In addition to their hands-on work with the animals, trainers often oversee other aspects of animals' care, such as preparing their diet and providing a safe and clean environment and habitat.

Work environment. People who love animals get satisfaction from working with and helping them. However, some of the work may be unpleasant, physically and emotionally demanding, and sometimes dangerous. Most animal caretakers and service workers have to clean animal cages and lift, hold, or restrain animals, risking exposure to bites or scratches. Their work often involves kneeling, crawling, repeated bending, and lifting heavy supplies like bales of hay or bags of feed. Animal caretakers must take precautions when treating animals with germicides or insecticides. They may work outdoors in all kinds of weather, and the work setting can be noisy. Caretakers of show and sports animals travel to competitions.

Animal caretaker and service workers who witness abused animals or who assist in euthanizing unwanted, aged, or hopelessly injured animals may experience emotional distress. Those working for private humane societies and municipal animal shelters often deal with the public, some of whom might react with hostility to the implication that they are neglecting or abusing their pets. Such workers must maintain a calm and professional demeanor while helping to enforce the laws regarding animal care.

Animal care and service workers often work irregular hours. Most animals are fed every day, so caretakers often work weekend and holiday shifts. Some zoo animals skip one meal a week to mimic their lives in the wild. In some animal hospitals, research facilities, and animal shelters, an attendant is on duty 24 hours a day, which means night shifts.

Training, Other Qualifications, and Advancement

On-the-job training is the most common way animal caretakers and service workers learn their work; however, employers generally prefer to hire people who have experience with animals. Some preparatory programs are available for specific types of caretakers, such as groomers.

Education and training. Animal trainers often need a high school diploma or GED equivalent. Some animal training jobs may require a bachelor's degree and additional skills. For example, marine mammal trainers usually need a bachelor's degree in biology, marine biology, animal science, psychology, or a related field. An animal health technician degree also may qualify trainers for some jobs.

Most equine trainers learn their trade by working as a groom at a stable. Some study at an accredited private training school. Because large animals are involved, most horse-training jobs have minimum weight requirements for candidates.

Many dog trainers attend workshops and courses at community colleges and vocational schools. Topics include basic study of canines, learning theory of animals, teaching obedience cues, problem solving methods, and safety. Many also offer business training.

Many zoos require their caretakers to have a bachelor's degree in biology, animal science, or a related field. Most require experience with animals, preferably as a volunteer or paid keeper in a zoo.

Most pet groomers learn their trade by completing an informal apprenticeship, usually lasting 6 to 10 weeks, under the guidance of an experienced groomer. Prospective groomers also may attend one of the 52 state-licensed grooming schools throughout the country, with programs varying in length from 2 to 18 weeks. Beginning groomers often start by taking on one duty, such as bathing and drying the pet. They eventually assume responsibility for the entire grooming process, from the initial brush-out to the final clipping.

Animal caretakers in animal shelters are not required to have any specialized training, but training programs and workshops are available through the Humane Society of the United States, the American Humane Association, and the National Animal Control Association. Workshop topics include cruelty investigations, appropriate methods of euthanasia for shelter animals, proper guidelines for capturing animals, techniques for preventing problems with wildlife, and dealing with the public.

Beginning animal caretakers in kennels learn on the job and usually start by cleaning cages and feeding and watering animals.

Certification and other qualifications. Certifications are available in many animal service occupations. For dog trainers, certification by a professional association or one of the hundreds of private vocational or state-approved trade schools can be advantageous. The National Dog Groomers Association of America offers certification for master status as a groomer. The American Boarding Kennels Association offers a three-stage, home-study program for individuals interested in pet care. Those who complete the third stage and pass oral and written examinations become Certified Kennel Operators (CKO).

All animal caretakers and service workers need patience, sensitivity, and problem solving ability. They also need tact and communication skills. This is particularly true for those in shelters, who often deal with individuals who abandon their pets. The ability to handle emotional people is vital for workers at shelters.

Animal trainers especially need problem-solving skills and experience in animal obedience. Successful marine mammal trainers should also have good public speaking skills as seminars and presentations are a large part of the job. Usually 4 to 5 trainers work with a group of animals at one time, therefore, each trainer should be able to work as part of a team. Marine mammal trainers must also be good swimmers; certification in SCUBA is a plus.

Advancement. With experience and additional training, caretakers in animal shelters may become adoption coordinators, animal control officers, emergency rescue drivers, assistant shelter managers, or shelter directors. Pet groomers who work in large retail establishments or kennels may, with experience, move into supervisory or managerial positions. Experienced groomers often choose to open their own salons. Advancement for kennel caretakers takes the form of promotion to kennel supervisor, assistant manager, and manager; those with enough capital and experience may open up their own kennels. Zookeepers may advance to senior keeper, assistant head keeper, head keeper, and assistant curator, but very few openings occur, especially for the higher-level positions.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Animal care and service workers	39-2000	200,000	238,000	39,000	19
Animal trainers	39-2011	43,000	53,000	9,800	23
Nonfarm animal caretakers	39-2021	157,000	185,000	29,000	18

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Employment

Animal caretakers and service workers held 200,000 jobs in 2006. Over 3 out of 4 worked as nonfarm animal caretakers; the remainder worked as animal trainers. Nonfarm animal caretakers often worked in boarding kennels, animal shelters, stables, grooming shops, pet stores, animal hospitals, and veterinary offices. A significant number of caretakers worked for animal humane societies, racing stables, dog and horse racetrack operators, zoos, theme parks, circuses, and other amusement and recreations services.

Employment of animal trainers is concentrated in animal services that specialize in training and in commercial sports, where they train racehorses and dogs. About 57 percent of animal trainers were self-employed.

Job Outlook

Because many workers leave this occupation each year, there will be good job opportunities for most positions. Faster-than-average employment growth also will add to job openings, in addition to replacement needs.

Employment change. Employment of animal care and service workers is expected to grow 19 percent over the 2006–2016 decade, faster than the average for all occupations. The companion pet population, which drives employment of animal caretakers in kennels, grooming shops, animal shelters, and veterinary clinics and hospitals, is expected to increase. Pet owners—including a large number of baby boomers, whose disposable income is expected to increase as they age—are expected to increasingly purchase grooming services, daily and overnight boarding services, training services, and veterinary services, resulting in more jobs for animal care and service workers. As more pet owners consider their pets part of the family, demand for luxury animal services and the willingness to spend greater amounts of money on pets should continue to grow. Demand for marine mammal trainers, on the other hand, should grow slowly.

Demand for animal care and service workers in animal shelters is expected to grow as communities increasingly recognize the connection between animal abuse and abuse toward humans, and continue to commit private funds to animal shelters, many of which are working hand-in-hand with social service agencies and law enforcement teams.

Job prospects. Due to employment growth and the need to replace workers who leave the occupation, job opportunities for most positions should be good. The need to replace workers leaving the field will create the overwhelming majority of job openings. Many animal caretaker jobs require little or no training and have flexible work schedules, making them suitable for people seeking a first job or for temporary or part-time work. The outlook for caretakers in zoos and aquariums, however, is not favorable due to slow job growth and keen competition for the few positions.

Prospective mammal trainers will face keen competition as the number of applicants greatly exceeds the number of available positions. Prospective horse trainers should anticipate an equally challenging labor market as the number of entry-level positions is limited. Dog trainers, however, should experience conditions that are more favorable. Opportunities for dog trainers should be best in large metropolitan areas.

Job opportunities for animal care and service workers may vary from year to year because the strength of the economy affects demand for these workers. Pet owners tend to spend more on animal services when the economy is strong.

Earnings

Earnings are relatively low. Median hourly earnings of nonfarm animal caretakers were $8.72 in May 2006. The middle 50 percent earned between $7.50 and $10.95. The bottom 10 percent earned less than $6.56, and the top 10 percent earned more than $14.64. Median hourly earnings in the industries employing the largest numbers of nonfarm animal caretakers in May 2006 were:

Spectator sports	$9.38
Other personal services	8.78
Social advocacy organizations	8.31
Other professional, scientific, and technical services	8.23
Veterinary services	8.23
Other miscellaneous store retailers	8.22

Median hourly earnings of animal trainers were $12.65 in May 2006. The middle 50 percent earned between $9.11 and $17.39. The lowest 10 percent earned less than $7.66, and the top 10 percent earned more than $22.42.

Related Occupations

Others who work extensively with animals include farmers, ranchers, and agricultural managers; agricultural workers; veterinarians; veterinary technologists and technicians; veterinary assistants; and biological scientists.

Barbers, Cosmetologists, and Other Personal Appearance Workers

(O*NET 39-5011.00, 39-5012.00, 39-5091.00, 39-5092.00, 39-5093.00, and 39-5094.00)

Significant Points

- A state license is required for barbers, cosmetologists, and most other personal appearance workers, although qualifications vary by state.
- About 46 percent of workers are self-employed; many also work flexible schedules.

Nature of the Work

Barbers and cosmetologists focus on providing hair care services to enhance the appearance of consumers. Other personal appearance workers, such as manicurists and pedicurists, shampooers, theatrical and performance makeup artists, and skin care specialists provide specialized beauty services that help clients look and feel their best.

Barbers cut, trim, shampoo, and style hair mostly for male clients. They also may fit hairpieces and offer scalp treatments and facial shaving. In many states, barbers are licensed to color, bleach, or highlight hair and to offer permanent-wave services. Barbers also may provide skin care and nail treatments.

Hairdressers, hairstylists, and cosmetologists offer a wide range of beauty services, such as shampooing, cutting, coloring, and styling of hair. They may advise clients on how to care for their hair at home. In addition, cosmetologists may be trained to give manicures, pedicures, and scalp and facial treatments; provide makeup analysis; and clean and style wigs and hairpieces.

A number of workers offer specialized services. *Manicurists and pedicurists,* called *nail technicians* in some states, work exclusively on nails and provide manicures, pedicures, polishing, and nail extensions to clients. Another group of specialists is *skin care specialists*, or *estheticians*, who cleanse and beautify the skin by giving facials, full-body treatments, and head and neck massages as well as apply makeup. They also may remove hair through waxing or, if properly trained, laser treatments. *Theatrical and performance makeup artists*, apply makeup to enhance performing artists' appearance for movie, television, or stage performances. Finally, in larger salons, *shampooers* specialize in shampooing and conditioning hair.

Manicurists and pedicurists rank among the fastest growing occupations.

In addition to working with clients, personal appearance workers may keep records of hair color or skin care regimens used by their regular clients. A growing number actively sell hair, skin, and nail care products. Barbers, cosmetologists, and other personal appearance workers who operate their own salons have managerial duties that may include hiring, supervising, and firing workers, as well as keeping business and inventory records, ordering supplies, and arranging for advertising.

Work environment. Most full-time barbers, cosmetologists, and other personal appearance workers put in a 40-hour week, but longer hours are common, especially among self-employed workers. Work schedules may include evenings and weekends, the times when beauty salons and barbershops are busiest. In 2006, about 31 percent of cosmetologists and 19 percent of barbers worked part time, and 16 percent of cosmetologists and 11 percent of barbers had variable schedules.

Barbers, cosmetologists, and other personal appearance workers usually work in clean, pleasant surroundings with good lighting and ventilation. Good health and stamina are important, because these workers are on their feet for most of their shift. Prolonged exposure to some hair and nail chemicals may cause irritation, so protective clothing, such as plastic gloves or aprons, may be worn.

Training, Other Qualifications, and Advancement

All states require barbers, cosmetologists, and other personal appearance workers to be licensed, with the exceptions of shampooers and makeup artists. To qualify for a license, most job seekers are required to graduate from a state-licensed barber or cosmetology school.

Education and training. A high school diploma or GED is required for some personal appearance workers in some states. In addition, most states require that barbers and cosmetologists complete a program in a state-licensed barber or cosmetology school. Programs in hairstyling, skin care, and other personal appearance services can be found in both high schools and in public or private postsecondary vocational schools.

Full-time programs in barbering and cosmetology usually last 9 months and may lead to an associate degree, but training for manicurists and pedicurists and skin care specialists requires significantly less time. Makeup artists can attend schools that specialize in this subject, but it is not required. Shampooers generally do not need formal training. Most professionals take advanced courses in hairstyling or other personal appearance services to keep up with the latest trends. They also may take courses in sales and marketing.

During their first weeks on the job, new workers may be given relatively simple tasks. Once they have demonstrated their skills, they are gradually permitted to perform more complicated procedures, such as coloring hair. As they continue to work in the field, more training usually is required to help workers learn the techniques particular to each salon and to build on the basics learned in cosmetology school. Personal appearance workers attend training at salons, cosmetology schools, or industry trade shows throughout their careers.

Licensure. All states require barbers, cosmetologists, and other personal appearance workers to be licensed, with the exceptions of shampooers and makeup artists. Qualifications for a license vary by state, but generally a person must have a high school diploma or GED, be at least 16 years old, and have graduated from a state-licensed barber or cosmetology school. After graduating from a state approved training program, students take a state licensing examination. The exam consists of a written test and, in some cases, a practical test of styling skills or an oral examination. In many states, cosmetology training may be credited toward a barbering license,

and vice versa, and a few states combine the two licenses. Most states require separate licensing examinations for manicurists, pedicurists, and skin care specialists.

Some states have reciprocity agreements that allow licensed barbers and cosmetologists to obtain a license in a different state without additional formal training, but such agreements are uncommon. Consequently, persons who wish to work in a particular state should review the laws of that state before entering a training program.

Other qualifications. Successful personal appearance workers should have an understanding of fashion, art, and technical design. They also must keep a neat personal appearance and a clean work area. Interpersonal skills, image, and attitude play an important role in career success. As client retention and retail sales become an increasingly important part of salons' revenue, the ability to be an effective salesperson becomes ever more vital for salon workers. Some cosmetology schools consider "people skills" to be such an integral part of the job that they require coursework in that area. Business skills are important for those who plan to operate their own salons.

Advancement. Advancement usually takes the form of higher earnings as barbers and cosmetologists gain experience and build a steady clientele. Some barbers and cosmetologists manage salons, lease booth space in salons, or open their own salons after several years of experience. Others teach in barber or cosmetology schools or provide training through vocational schools. Still others advance to become sales representatives, image or fashion consultants, or examiners for state licensing boards.

Employment

Barbers, cosmetologists, and other personal appearance workers held about 825,000 jobs in 2006. Of these, barbers and cosmetologists held 677,000 jobs, manicurists and pedicurists 78,000, skin care specialists 38,000, and shampooers 29,000. Theatrical and performance makeup artists held 2,100 jobs.

Most of these workers are employed in beauty salons or barber shops, but they also are found in nail salons, day and resort spas, and nursing and other residential care homes. Nearly every town has a barbershop or beauty salon, but employment in this occupation is concentrated in the most populous cities and states. Theatrical and performance makeup artists work for movie and television studios, performing arts companies, and event promoters. Some apply makeup in retail stores.

About 46 percent of all barbers, cosmetologists, and other personal appearance workers are self-employed. Many of these workers own their own salon, but a growing number of the self-employed lease booth space or a chair from the salon's owner.

Job Outlook

Overall employment of barbers, cosmetologists, and other personal appearance workers is projected to grow slightly faster than the average for all occupations. Opportunities for entry-level workers should be favorable, while job candidates at high-end establishments will face keen competition.

Employment change. Personal appearance workers will grow by 14 percent from 2006 to 2016, which is faster than the average for all occupations. This growth primarily will be a result of an increasing population and from the growing demand for personal appearance services, particularly skin care services.

Employment trends are expected to vary among the different occupational specialties. Employment of hairdressers, hairstylists, and cosmetologists should increase by 12 percent because many now cut and style both men's and women's hair and because the demand for hair treatment by teens and aging baby boomers is expected to remain steady or even grow. As a result, fewer people are expected to go to barber shops and employment of barbers is expected to see relatively little change in employment.

Continued growth in the number of nail salons and full-service day spas will generate numerous job openings for manicurists, pedicurists, and skin care specialists. Employment of manicurists and pedicurists will grow by 28 percent, while employment of shampooers will increase by 13 percent. Estheticians and other skin care specialists will see large gains in employment, and are expected to grow 34 percent as more facial procedures to improve one's complexion become available and become more popular in spas and some medical settings. Makeup artists are expected to grow by 40 percent, but because of its relatively small size, the occupation will only add a few hundred jobs over the decade.

Job prospects. Job opportunities generally should be good. However, competition is expected for jobs and clients at higher paying salons as applicants compete with a large pool of licensed and experienced cosmetologists for these positions. More numerous than those arising from job growth, an abundance of job openings will come about from the need to replace workers who transfer to other occupations, retire, or leave the labor force for other reasons. Opportunities will be best for those with previous experience and for those licensed to provide a broad range of services.

Earnings

Median hourly earnings in May 2006 for salaried hairdressers, hairstylists, and cosmetologists, including tips and commission, were $10.25. The middle 50 percent earned between $7.92 and $13.75. The lowest 10 percent earned less than $6.68, and the highest 10 percent earned more than $18.78.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Personal appearance workers	39-5000	825,000	942,000	117,000	14
Barbers and cosmetologists	39-5010	677,000	755,000	77,000	11
Barbers	39-5011	60,000	61,000	600	1
Hairdressers, hairstylists, and cosmetologists	39-5012	617,000	694,000	77,000	12
Miscellaneous personal appearance workers	39-5090	148,000	187,000	39,000	27
Makeup artists, theatrical and performance	39-5091	2,100	3,000	900	40
Manicurists and pedicurists	39-5092	78,000	100,000	22,000	28
Shampooers	39-5093	29,000	33,000	3,900	13
Skin care specialists	39-5094	38,000	51,000	13,000	34

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Median hourly earnings in May 2006 for salaried barbers, including tips, were $11.13. The middle 50 percent earned between $8.71 and $14.25. The lowest 10 percent earned less than $7.12, and the highest 10 percent earned more than $20.56.

Among skin care specialists, median hourly earnings, including tips, were $12.58, for manicurists and pedicurists $9.23, and for shampooers $7.78.

While earnings for entry-level workers usually are low, earnings can be considerably higher for those with experience. A number of factors, such as the size and location of the salon, determine the total income of personal appearance workers. They may receive commissions based on the price of the service or a salary based on the number of hours worked, and many receive commissions on the products they sell. In addition, some salons pay bonuses to employees who bring in new business. For many personal appearance workers, the ability to attract and hold regular clients are key factors in determining earnings.

Although some salons offer paid vacations and medical benefits, many self-employed and part-time workers in this occupation do not enjoy such benefits. Some personal appearance workers receive free trial products from manufacturers in the hope that they will recommend the products to clients.

Related Occupations

Other workers who provide a personal service to clients and are usually professionally licensed or certified include massage therapists and fitness workers.

Child Care Workers

(O*NET 39-9011.00 and 39-9011.01)

Significant Points

- About 35 percent of child care workers are self-employed, most of whom provided child care in their homes.
- Training requirements range from a high school diploma to a college degree, although a high school diploma and a little experience are adequate for many jobs.
- Many workers leave these jobs every year, creating good job opportunities.

Nature of the Work

Child care workers nurture and care for children who have not yet entered formal schooling. They also supervise older children before and after school. These workers play an important role in children's development by caring for them when parents are at work or away for other reasons. In addition to attending to children's basic needs, child care workers organize activities and implement curricula that stimulate children's physical, emotional, intellectual, and social growth. They help children explore individual interests, develop talents and independence, build self-esteem, and learn how to get along with others.

Child care workers generally are classified into three different groups based on where they work: private household workers, who care for children at the children's home; family child care providers, who care for children in the provider's own home; and child care workers who work at separate child care centers.

Private household workers who are employed on an hourly basis usually are called *babysitters*. These child care workers bathe, dress, and feed children; supervise their play; wash their clothes; and clean their rooms. Babysitters also may put children to bed and wake them, read to them, involve them in educational games, take them for doctors' visits, and discipline them. Those who are in charge of infants, sometimes called *infant nurses*, also prepare bottles and change diapers. *Nannies* for a single family. They generally take care of children from birth to age 12, tending to the child's early education, nutrition, health, and other needs. They also may perform the duties of a housekeeper, including cleaning and laundry.

Family child care providers often work alone with a small group of children, though some work in larger settings with multiple adults. Child care centers generally have more than one adult per group of children; in groups of older children, a child care worker may assist a more experienced preschool teacher.

Most child care workers perform a combination of basic care and teaching duties, but the majority of their time is spent on caregiving activities. Workers whose primary responsibility is teaching are classified as preschool teachers. (Teachers—preschool, kindergarten, elementary, middle, and secondary are covered elsewhere in the *Handbook*.) However, many basic care activities also are opportunities for children to learn. For example, a worker who shows a child how to tie a shoelace teaches the child while also providing for that child's basic needs.

Child care workers spend most of their day working with children. However, they do maintain contact with parents or guardians through informal meetings or scheduled conferences to discuss each child's progress and needs. Many child care workers keep records of

Child care workers nurture and care for young children.

each child's progress and suggest ways in which parents can stimulate their child's learning and development at home. Some child care centers and before- and after-school programs actively recruit parent volunteers to work with the children and participate in administrative decisions and program planning.

Young children learn mainly through play. Child care workers recognize this and capitalize on children's play to further language development (storytelling and acting games), improve social skills (working together to build a neighborhood in a sandbox), and introduce scientific and mathematical concepts (balancing and counting blocks when building a bridge or mixing colors when painting). Often a less structured approach is used to teach young children, including small-group lessons; one-on-one instruction; and creative activities such as art, dance, and music. Child care workers play a vital role in preparing children to build the skills they will need in school.

Child care workers in child care centers or family child care homes greet young children as they arrive, help them with their jackets, and select an activity of interest. When caring for infants, they feed and change them. To ensure a well-balanced program, child care workers prepare daily and long-term schedules of activities. Each day's activities balance individual and group play, as well as quiet and active time. Children are given some freedom to participate in activities in which they are interested. As children age, child care workers may provide more guided learning opportunities, particularly in the areas of math and reading.

Concern over school-aged children being home alone before and after school has spurred many parents to seek alternative ways for their children to constructively spend their time. The purpose of before- and after-school programs is to watch over school-aged children during the gap between school hours and the end of their parents' daily work hours. These programs also may operate during the summer and on weekends. Workers in before- and after-school programs may help students with their homework or engage them in other extracurricular activities. These activities may include field trips, sports, or learning about computers, painting, photography, or other fun subjects. Some child care workers are responsible for taking children to school in the morning and picking them up from school in the afternoon. Before- and after-school programs may be operated by public school systems, local community centers, or other private organizations.

Helping to keep children healthy is another important part of the job. Child care workers serve nutritious meals and snacks and teach good eating habits and personal hygiene. They ensure that children have proper rest periods. They identify children who may not feel well and, in some cases, may help parents locate programs that will provide basic health services. Child care workers also watch for children who show signs of emotional or developmental problems and discuss these matters with their supervisor and the child's parents. Early identification of children with special needs—such as those with behavioral, emotional, physical, or learning disabilities—is important to improve their future learning ability. Special education teachers often work with preschool children to provide the individual attention they need. (Special education teachers are discussed elsewhere in the *Handbook*.)

Work environment. Helping children grow, learn, and gain new skills can be very rewarding. The work is sometimes routine but new activities and challenges mark each day. Child care can be physically and emotionally taxing, as workers constantly stand, walk, bend, stoop, and lift to attend to each child's interests and problems.

States regulate child care facilities, the number of children per child care worker, staff qualifications, and the health and safety of the children. State regulations in all of these areas vary. To ensure that children in child care centers receive proper supervision, state or local regulations may require a certain ratio of workers to children. The ratio varies with the age of the children. Child development experts generally recommend that a single caregiver be responsible for no more than 3 or 4 infants (less than 1 year old) and toddler's (1 to 2 years old) or 6 or 7 preschool-aged children (between 2 and 5 years old). In before- and after-school programs, workers may be responsible for many school-aged children at a time.

Family child care providers work out of their own homes. While this arrangement provides convenience, it also requires that their homes be accommodating to young children. Private household workers usually work in the homes or apartments of their employers. Most live in their own homes and travel to work, though some live in the home of their employer and generally are provided with their own room and bath. They often come to feel like part of their employer's family.

The work hours of child care workers vary widely. Child care centers usually are open year round, with long hours so that parents can drop off and pick up their children before and after work. Some centers employ full-time and part-time staff with staggered shifts to cover the entire day. Some workers are unable to take regular breaks during the day due to limited staffing. Public and many private preschool programs operate during the typical nine- or ten-month school year, employing both full-time and part-time workers. Family child care providers have flexible hours and daily routines, but they may work long or unusual hours to fit parents' work schedules. Live-in nannies usually work longer hours than do those who have their own homes. However, although nannies may work evenings or weekends, they usually get other time off.

Training, Other Qualifications, and Advancement

Licensure and training requirements vary greatly by state, but many jobs require little more than a high school diploma.

Education and training. The training and qualifications required of child care workers vary widely. Each state has its own licensing requirements that regulate caregiver training. These requirements range from a high school diploma, a national Child Development Associate (CDA) credential to community college courses or a college degree in child development or early childhood education. State requirements are generally higher for workers at child care centers than for family child care providers. Child care workers in private settings who care for only a few children often are not regulated by states at all. Child care workers generally can obtain some form of employment with a high school diploma and little or no experience, but certain private firms and publicly funded programs have more demanding training and education requirements. Some employers may prefer workers who have taken secondary or postsecondary courses in child development and early childhood education or who have work experience in a child care setting. Other employers require their own specialized training. An increasing number of employers require an associate degree in early childhood education.

Licensure. Many states require child care centers, including those in private homes, to be licensed if they care for more than a few children. In order to obtain their license, child care centers may require child care workers to pass a background check and get immunizations. Furthermore, child care workers may need to be trained in first aid and CPR and receive continuous training on topics of health and safety.

Other qualifications. Child care workers must anticipate and prevent problems, deal with disruptive children, provide fair but firm

discipline, and be enthusiastic and constantly alert. They must communicate effectively with the children and their parents, as well as with teachers and other child care workers. Workers should be mature, patient, understanding, and articulate and have energy and physical stamina. Skills in music, art, drama, and storytelling also are important. Self-employed child care workers must have business sense and management abilities.

Certification and advancement. Some employers prefer to hire child care workers who have earned a nationally recognized Child Development Associate (CDA) credential or the Certified Childcare Professional (CCP) designation from the Council for Professional Recognition and the National Child Care Association, respectively. Requirements include child care experience and coursework, such as college courses or employer-provided seminars.

Opportunities for advancement are limited. However, as child care workers gain experience, some may advance to supervisory or administrative positions in large child care centers or preschools. Often, these positions require additional training, such as a bachelor's or master's degree. Other workers move on to work in resource and referral agencies, consulting with parents on available child services. A few workers become involved in policy or advocacy work related to child care and early childhood education. With a bachelor's degree, workers may become preschool teachers or become certified to teach in public or private schools. Some workers set up their own child care businesses.

Employment

Child care workers held about 1.4 million jobs in 2006. Many worked part time. About 35 percent of child care workers were self-employed; most of these were family child care providers.

Child day care services employed about 18 percent of all child care workers and about 20 percent work for private households. The remainder worked primarily in educational services; nursing and residential care facilities; religious organizations; amusement and recreation industries; civic and social organizations; individual and family services; and local government, excluding education and hospitals. Some child care programs are for-profit centers, which may be affiliated with a local or national company. Religious institutions, community agencies, school systems, and state and local governments operate nonprofit programs. A very small percentage of private industry establishments operate on-site child care centers for the children of their employees.

Job Outlook

Child care workers are expected to experience job growth that is faster than the average for all occupations. Job prospects will be excellent because of the many workers who leave and need to be replaced.

Employment change. Employment of child care workers is projected to increase by 18 percent between 2006 and 2016, which is faster than the average for all occupations. Child care workers will have a very large number of new jobs arise, almost 248,000 over the projections decade. The proportion of children being cared for exclusively by parents or other relatives is likely to continue to decline, spurring demand for additional child care workers. Concern about the safety and supervision of school-aged children during nonschool hours also should increase demand for before- and after-school programs and the child care workers who staff them.

The growth in demand for child care workers will be moderated, however, by an increasing emphasis on early childhood education programs, which hire mostly preschool workers instead of child care workers. While only a few states currently provide targeted or universal preschool programs, many more are considering or starting such programs. A rise in enrollment in private preschools is likely as the value of formal education before kindergarten becomes more widely accepted. Since the majority of workers in these programs are classified as preschool teachers, this growth in preschool enrollment will mean less growth among child care workers.

Job prospects. High replacement needs should create good job opportunities for child care workers. Qualified persons who are interested in this work should have little trouble finding and keeping a job. Many child care workers must be replaced each year as they leave the occupation to fulfill family responsibilities, to study, or for other reasons. Others leave because they are interested in pursuing other occupations or because of low wages.

Earnings

Pay depends on the educational attainment of the worker and the type of establishment. Although the pay generally is very low, more education usually means higher earnings. Median annual earnings of wage-and-salary child care workers were $17,630 in May 2006. The middle 50 percent earned between $14,790 and $21,930. The lowest 10 percent earned less than $12,910, and the highest 10 percent earned more than $27,050. Median annual earnings in the industries employing the largest numbers of child care workers in 2006 were as follows:

Other residential care facilities	$20,770
Elementary and secondary schools	20,220
Civic and social organizations	16,460
Child day care services	16,320
Other amusement and recreation industries	16,300

Earnings of self-employed child care workers vary depending on the number of hours worked, the number and ages of the children, and the location.

Benefits vary but are minimal for most child care workers. Many employers offer free or discounted child care to employees. Some offer a full benefits package, including health insurance and paid vacations, but others offer no benefits at all. Some employers offer seminars and workshops to help workers learn new skills. A few are willing to cover the cost of courses taken at community colleges or technical schools. Live-in nannies receive free room and board.

Related Occupations

Child care work requires patience; creativity; an ability to nurture, motivate, teach, and influence children; and leadership, organizational, and administrative skills. Others who work with children and need these qualities and skills include teacher assistants; teachers—preschool, kindergarten, elementary, middle, and secondary; and teachers—special education.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Child care workers	39-9011	1,388,000	1,636,000	248,000	18

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Fitness Workers

(O*NET 39-9031.00)

Significant Points

- Many fitness and personal training jobs are part time, but many workers increase their hours by working at several different facilities or at clients' homes.
- Night and weekend hours are common.
- Most fitness workers need to be certified.
- Job prospects are expected to be good.

Nature of the Work

Fitness workers lead, instruct, and motivate individuals or groups in exercise activities, including cardiovascular exercise, strength training, and stretching. They work in health clubs, country clubs, hospitals, universities, yoga and Pilates studios, resorts, and clients' homes. Increasingly, fitness workers also are found in workplaces, where they organize and direct health and fitness programs for employees of all ages. Although gyms and health clubs offer a variety of exercise activities such as weightlifting, yoga, cardiovascular training, and karate, fitness workers typically specialize in only a few areas.

Personal trainers work one-on-one with clients either in a gym or in the client's home. They help clients assess their level of physical fitness and set and reach fitness goals. Trainers also demonstrate various exercises and help clients improve their exercise techniques. They may keep records of their clients' exercise sessions to monitor clients' progress toward physical fitness. They may also advise their clients on how to modify their lifestyle outside of the gym to improve their fitness.

Group exercise instructors conduct group exercise sessions that usually include aerobic exercise, stretching, and muscle conditioning. Cardiovascular conditioning classes are often set to music. Instructors choose and mix the music and choreograph a corresponding exercise sequence. Two increasingly popular conditioning methods taught in exercise classes are Pilates and yoga. In these classes, instructors demonstrate the different moves and positions of the particular method; they also observe students and correct those who are doing the exercises improperly. Group exercise instructors are responsible for ensuring that their classes are motivating, safe, and challenging, yet not too difficult for the participants.

Personal trainers usually must have certification to begin working with clients.

Fitness directors oversee the fitness-related aspects of a health club or fitness center. They create and oversee programs that meet the needs of the club's members, including new member orientations, fitness assessments, and workout incentive programs. They also select fitness equipment; coordinate personal training and group exercise programs; hire, train, and supervise fitness staff; and carry out administrative duties.

Fitness workers in smaller facilities with few employees may perform a variety of functions in addition to their fitness duties, such as tending the front desk, signing up new members, giving tours of the fitness center, writing newsletter articles, creating posters and flyers, and supervising the weight training and cardiovascular equipment areas. In larger commercial facilities, personal trainers are often required to sell their services to members and to make a specified number of sales. Some fitness workers may combine the duties of group exercise instructors and personal trainers, and in smaller facilities, the fitness director may teach classes and do personal training.

Work environment. Most fitness workers spend their time indoors at fitness centers and health clubs. Fitness directors and supervisors, however, typically spend most of their time in an office. Those in smaller fitness centers may split their time among office work, personal training, and teaching classes. Directors and supervisors generally engage in less physical activity than do lower-level fitness workers. Nevertheless, workers at all levels risk suffering injuries during physical activities.

Since most fitness centers are open long hours, fitness workers often work nights and weekends and even occasional holidays. Some may travel from place to place throughout the day, to different gyms or to clients' homes, to maintain a full work schedule.

Fitness workers generally enjoy a lot of autonomy. Group exercise instructors choreograph or plan their own classes, and personal trainers have the freedom to design and implement their clients' workout routines.

Training, Other Qualifications, and Advancement

For most fitness workers, certification is critical. Personal trainers usually must have certification to begin working with clients or with members of a fitness facility. Group fitness instructors may begin without a certification, but they are often encouraged or required by their employers to become certified.

Education and training. Fitness workers usually do not receive much on-the-job training; they are expected to know how to do their jobs when they are hired. Workers may receive some organizational training to learn about the operations of their new employer. They occasionally receive specialized training if they are expected to teach or lead a specific method of exercise or focus on a particular age or ability group. Because the requirements vary from employer to employer, it may be helpful to contact your local fitness centers or other potential employers to find out what background they prefer before pursuing training.

The education and training required depends on the specific type of fitness work: personal training, group fitness, or a specialization such as Pilates or yoga each need different preparation. Personal trainers often start out by taking classes to become certified. They then may begin by working alongside an experienced trainer before being allowed to train clients alone. Group fitness instructors often get started by participating in exercise classes until they are ready to successfully audition as instructors and begin teaching class. They also may improve their skills by taking training courses or attending fitness conventions. Most employers require instructors to work toward becoming certified.

Training for Pilates and yoga instructors is changing. Because interest in these forms of exercise has exploded in recent years, the demand for teachers has grown faster than the ability to train them properly. However, because inexperienced teachers have contributed to student injuries, there has been a push toward more standardized, rigorous requirements for teacher training.

Pilates and yoga teachers need specialized training in their particular method of exercise. For Pilates, training options range from weekend-long workshops to year-long programs, but the trend is toward requiring more training. The Pilates Method Alliance has established training standards that recommend at least 200 hours of training; the group also has standards for training schools and maintains a list of training schools that meet the requirements. However, some Pilates teachers are certified group exercise instructors who attend short Pilates workshops; currently, many fitness centers hire people with minimal Pilates training if the applicants have a fitness certification and group fitness experience.

Training requirements for yoga teachers are similar to those for Pilates teachers. Training programs range from a few days to more than 2 years. Many people get their start by taking yoga; eventually, their teachers may consider them ready to assist or to substitute teach. Some students may begin teaching their own classes when their yoga teachers think they are ready; the teachers may even provide letters of recommendation. Those who wish to pursue teaching more seriously usually pursue formal teacher training.

Currently, there are many training programs through the yoga community as well as programs through the fitness industry. The Yoga Alliance has established training standards requiring at least 200 training hours, with a specified number of hours in areas including techniques, teaching methodology, anatomy, physiology, and philosophy. The Yoga Alliance also registers schools that train students to its standards. Because some schools may meet the standards but not be registered, prospective students should check the requirements and decide if particular schools meet them.

An increasing number of employers require fitness workers to have a bachelor's degree in a field related to health or fitness, such as exercise science or physical education. Some employers allow workers to substitute a college degree for certification, but most employers who require a bachelor's degree also require certification.

Certification and other qualifications. Most personal trainers must obtain certification in the fitness field to gain employment. Group fitness instructors do not necessarily need certification to begin working. The most important characteristic that an employer looks for in a new fitness instructor is the ability to plan and lead a class that is motivating and safe. However, most organizations encourage their group instructors to become certified over time, and many require it.

In the fitness field, there are many organizations—some of which are listed in the last section of this statement—that offer certification. Becoming certified by one of the top certification organizations is increasingly important, especially for personal trainers. One way to ensure that a certifying organization is reputable is to see that it is accredited by the National Commission for Certifying Agencies.

Most certifying organizations require candidates to have a high school diploma, be certified in cardiopulmonary resuscitation (CPR), and pass an exam. All certification exams have a written component, and some also have a practical component. The exams measure knowledge of human physiology, proper exercise techniques, assessment of client fitness levels, and development of appropriate exercise programs. There is no particular training program required for certifications; candidates may prepare however they prefer. Certifying organizations do offer study materials, including books, CD-ROMs, other audio and visual materials, and exam preparation workshops and seminars, but exam candidates are not required to purchase materials to take exams.

Certification generally is good for 2 years, after which workers must become recertified by attending continuing education classes or conferences, writing articles, or giving presentations. Some organizations offer more advanced certification, requiring an associate or bachelor's degree in an exercise-related subject for individuals interested in training athletes, working with people who are injured or ill, or advising clients on general health.

Pilates and yoga instructors usually do not need group exercise certifications to maintain employment. It is more important that they have specialized training in their particular method of exercise. However, the Pilates Method Alliance does offer certification.

People planning fitness careers should be outgoing, excellent communicators, good at motivating people, and sensitive to the needs of others. Excellent health and physical fitness are important due to the physical nature of the job. Those who wish to be personal trainers in a large commercial fitness center should have strong sales skills. All personal trainers should have the personality and motivation to attract and retain clients.

Advancement. A bachelor's degree in exercise science, physical education, kinesiology (the study of muscles, especially the mechanics of human motion), or a related area, along with experience, usually is required to advance to management positions in a health club or fitness center. Some organizations require a master's degree. As in other occupations, managerial skills are also needed to advance to supervisory or managerial positions. College courses in management, business administration, accounting, and personnel management may be helpful, but many fitness companies have corporate universities in which they train employees for management positions.

Personal trainers may advance to head trainer, with responsibility for hiring and overseeing the personal training staff and for bringing in new personal training clients. Group fitness instructors may be promoted to group exercise director, responsible for hiring instructors and coordinating exercise classes. Later, a worker might become the fitness director, who manages the fitness budget and staff. Workers might also become the general manager, whose main focus is the financial aspects of an organization, particularly setting and achieving sales goals; in a small fitness center, however, the general manager is usually involved with all aspects of running the

facility. Some workers go into business for themselves and open their own fitness centers.

Employment

Fitness workers held about 235,000 jobs in 2006. Almost all personal trainers and group exercise instructors worked in physical fitness facilities, health clubs, and fitness centers, mainly in the amusement and recreation industry or in civic and social organizations. About 8 percent of fitness workers were self-employed; many of these were personal trainers, while others were group fitness instructors working on a contract basis with fitness centers. Many fitness jobs are part time, and many workers hold multiple jobs, teaching or doing personal training at several different fitness centers and at clients' homes.

Job Outlook

Jobs for fitness workers are expected to increase much faster than the average for all occupations. Fitness workers should have good opportunities due to rapid job growth in health clubs, fitness facilities, and other settings where fitness workers are concentrated.

Employment change. Employment of fitness workers is expected to increase 27 percent over the 2006–2016 decade, much faster than the average for all occupations. These workers are expected to gain jobs because an increasing number of people are spending time and money on fitness, and more businesses are recognizing the benefits of health and fitness programs for their employees.

Aging baby boomers are concerned with staying healthy, physically fit, and independent. Moreover, the reduction of physical education programs in schools, combined with parents' growing concern about childhood obesity, has resulted in rapid increases in children's health club membership. Increasingly, parents are also hiring personal trainers for their children, and the number of weight-training gyms for children is expected to continue to grow. Health club membership among young adults also has grown steadily, driven by concern with physical fitness and by rising incomes.

As health clubs strive to provide more personalized service to keep their members motivated, they will continue to offer personal training and a wide variety of group exercise classes. Participation in yoga and Pilates is expected to continue to increase, driven partly by the aging population that demands low-impact forms of exercise and seeks relief from arthritis and other ailments.

Job prospects. Opportunities are expected to be good for fitness workers because of rapid job growth in health clubs, fitness facilities, and other settings where fitness workers are concentrated. In addition, many job openings will stem from the need to replace the large numbers of workers who leave these occupations each year. Part-time jobs will be easier to find than full-time jobs.

Earnings

Median annual earnings of fitness trainers and aerobics instructors in May 2006 were $25,910. The middle 50 percent earned between $18,010 and $41,040. The bottom 10 percent earned less than $14,880, while the top 10 percent earned $56,750 or more. These figures do not include the earnings of the self-employed. Earnings of successful self-employed personal trainers can be much higher. Median annual earnings in the industries employing the largest numbers of fitness workers in 2006 were as follows:

General medical and surgical hospitals	$29,640
Local government	27,720
Fitness and recreational sports centers	27,200
Other schools and instruction	22,770
Civic and social organizations	22,630

Because many fitness workers work part time, they often do not receive benefits such as health insurance or retirement plans from their employers. They are able to use fitness facilities at no cost, however.

Related Occupations

Other occupations that focus on physical fitness include athletes, coaches, umpires, and related workers. Physical therapists also do related work when they create exercise plans to improve their patients' flexibility, strength, and endurance. Dietitians and nutritionists advise individuals on improving and maintaining their health, like fitness workers do. Also like fitness workers, many recreation workers lead groups in physical activities.

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Flight Attendants

(O*NET 39-6031.00)

Significant Points

- Competition for positions is expected to remain keen because the opportunity for travel attracts more applicants than there are jobs.
- Job duties are learned through formal on-the-job training at a flight training center.
- A high school diploma is the minimum educational requirement; however, applicants with a college degree and with experience in dealing with the public are likely to have the best job opportunities.

Nature of the Work

Major airlines are required by law to provide flight attendants for the safety and security of the traveling public. Although the primary job of the flight attendants is to ensure that security and safety regulations are followed, attendants also try to make flights comfortable and enjoyable for passengers.

At least 1 hour before each flight, attendants are briefed by the captain—the pilot in command—on such things as emergency evacuation procedures, coordination of the crew, the length of the flight, expected weather conditions, and special issues having to do with passengers. Flight attendants make sure that first-aid kits and other emergency equipment are aboard and in working order and that the passenger cabin is in order, with adequate supplies of food, beverages, and any other provided amenities. As passengers board the plane, flight attendants greet them, check their tickets, and tell them where to store carry-on items.

Before the plane takes off, flight attendants instruct all passengers in the use of emergency equipment and check to see that seatbelts are fastened, seat backs are in upright positions, and all carry-on items are properly stowed. In the air, helping passengers in the event of an emergency is the most important responsibility of a flight attendant. Safety-related actions may range from reassuring passengers during rough weather to directing passengers who must evacuate a plane following an emergency landing. Flight attendants also answer questions about the flight; distribute reading material, pillows, and blankets; and help small children, elderly or disabled persons, and any others needing assistance. They may administer first aid to passengers who become ill. Flight attendants generally serve beverages and other refreshments and, on many flights, especially international, heat and distribute precooked meals or snacks. Prior to landing, flight attendants take inventory of headsets, alcoholic beverages, and moneys collected. They also report any medical problems passengers may have had, the condition of cabin equipment, and lost and found articles.

In addition to flying, flight attendants also work on the ground preparing planes for flights, writing reports following completed flights, and waiting for planes to arrive.

Lead, or *first, flight attendants,* sometimes known as *pursers,* oversee the work of the other attendants aboard the aircraft, while performing most of the same duties.

Work environment. Because airlines operate around the clock and year round, flight attendants may work nights, holidays, and weekends. In most cases, agreements between the airline and the employees' union determine the total daily and monthly working time. Scheduled on-duty time usually is limited to 12 hours per day although some contracts provide daily actual maximums of 14 hours, with somewhat greater maximums for international flying.

Attendants usually fly 65 to 90 hours a month and generally spend another 50 hours a month on the ground preparing planes for flights, writing reports following completed flights, and waiting for planes to arrive. Most airlines guarantee a minimum of 65 to 85 flight hours per month, with the option to work additional hours. Flight attendants receive extra compensation for increased hours.

Flight attendants may be away from their home base at least one-third of the time. During this period, the airlines provide hotel accommodations and an allowance for meal expenses.

Flight attendants must be flexible and willing to relocate. However, many flight attendants elect to live in one place and commute to their assigned home base. Home bases and routes worked are bid for on a seniority basis. The longer the flight attendant has been employed, the more likely he or she is to work on chosen flights. Almost all flight attendants start out working on reserve status or on call. On small corporate airlines, flight attendants often work on an as-needed basis and must adapt to varying environments and passengers.

The combination of free time and discount airfares provides flight attendants the opportunity to travel and see new places. However, the work can be strenuous and trying. Flight attendants stand during much of the flight and must remain pleasant and efficient, regardless of how tired they are or how demanding passengers may be. Occasionally, flight attendants must deal with disruptive passengers. Also, turbulent flights can add to possible difficulties regarding service, including potential injuries to passengers.

Working in a moving aircraft leaves flight attendants susceptible to injuries. For example, back injuries and mishaps can occur when opening overhead compartments or while pushing heavy service carts. In addition, medical problems can arise from irregular sleeping and eating patterns, dealing with stressful passengers, working in a pressurized environment, and breathing recycled air.

Training, Other Qualifications, and Advancement

Flight attendants must be certified by the Federal Aviation Administration (FAA). A high school diploma is the minimum educational requirement, but airlines increasingly prefer applicants who have a

college degree. Experience in dealing with the public is important because flight attendants must be able to interact comfortably with strangers and remain calm under duress.

Education and training. A high school diploma is the minimum educational requirement. However, airlines increasingly prefer applicants with a college degree and with experience in dealing with the public. Applicants who attend schools and colleges that offer flight attendant training may have an advantage over other applicants. Highly desirable areas of concentration include people-oriented disciplines such as psychology, communications, sociology, nursing, anthropology, police or fire science, travel and tourism, hospitality and education. Flight attendants for international airlines generally must speak a foreign language fluently. For their international flights, some of the major airlines prefer candidates who can speak two major foreign languages.

Once hired, all candidates must undergo a period of formal training. The length of training, ranging from 3 to 8 weeks, depends on the size and type of carrier and takes place at the airline's flight training center. Airlines that do not operate training centers generally send new employees to the center of another airline. Some airlines may provide transportation to the training centers and an allowance for room, board, and school supplies, while other airlines charge individuals for training. New trainees are not considered employees of the airline until they successfully complete the training program. Trainees learn emergency procedures such as evacuating an airplane, operating emergency systems and equipment, administering first aid, and surviving in the water. In addition, trainees are taught how to deal with disruptive passengers and with hijacking and terrorist situations. New hires learn flight regulations and duties, gain knowledge of company operations and policies, and receive instruction on personal grooming and weight control. Trainees for the international routes get additional instruction in passport and customs regulations. Trainees must perform many drills and duties unaided, in front of the training staff. Throughout training, they also take tests designed to eliminate unsuccessful trainees. Toward the end of their training, students go on practice flights. Upon successful completion of training, flight attendants receive the FAA's Certificate of Demonstrated Proficiency. Flight attendants also are required to go through periodic retraining and pass an FAA safety examination to continue flying.

Licensure and certification. All flight attendants must be certified by the FAA. In order to be certified, flight attendants are required to successfully complete training requirements, such as evacuation, fire fighting, medical emergency, and security procedures established by the FAA and the Transportation Security Administration. They also must perform the assigned duties of a cabin crew member and complete an approved proficiency check. Flight attendants are certified for specific types of aircraft, regardless of the carrier. Therefore, only one-day or two-day recurrent training, with the new carrier, is needed for those flight attendants who change airlines, as long as the type of aircraft remains the same.

Other qualifications. Airlines prefer to hire poised, tactful, and resourceful people who can interact comfortably with strangers and remain calm under duress. Flight attendants must be in excellent health, and have the ability to speak clearly. Airlines usually have age, physical, and appearance requirements. Applicants usually must be at least 18 to 21 years old, although some carriers may have higher minimum-age requirements. Applicants must meet height requirements for reaching overhead bins, which often contain emergency equipment, and most airlines want candidates with weight proportionate to height. Vision is required to be correctable to 20/30 or better with glasses or contact lenses (uncorrected no worse than 20/200). Men must have their hair cut above the collar and be clean shaven. Airlines prefer applicants with no visible tattoos, body piercing, or unusual hairstyles or makeup.

In addition to education and training, airlines conduct a thorough background check as required by the FAA, which goes back as many as 10 years. Everything about an applicant is investigated, including date of birth, employment history, criminal record, school records, and gaps in employment. Employment is contingent on a successful background check. An applicant will not be offered a job or will be immediately dismissed if his or her background check shows any discrepancies. All U.S. airlines require that applicants be citizens of the United States or registered aliens with legal rights to obtain employment in the United States.

Advancement. After completing initial training, flight attendants are assigned to one of their airline's bases. New flight attendants are placed on reserve status and are called either to staff extra flights or to fill in for crewmembers who are sick, on vacation, or rerouted. When they are not on duty, reserve flight attendants must be available to report for flights on short notice. They usually remain on reserve for at least 1 year but, in some cities, it may take 5 to 10 years or longer to advance from reserve status. Flight attendants who no longer are on reserve bid monthly for regular assignments. Because assignments are based on seniority, usually only the most experienced attendants get their choice of assignments. Advancement takes longer today than in the past because experienced flight attendants are remaining in this career longer than in the past.

Some flight attendants become supervisors, moving from senior or lead flight attendant, to check flight attendant, to flight attendant supervisor, then on to base manager, and finally to manager or vice president of in-flight operations. They may take on additional duties such as recruiting, instructing, or developing in-flight products. Their experience also may qualify them for numerous airline-related jobs involving contact with the public, such as reservation ticket agent or public relations specialist. Flight attendants who do not want to travel often for various reasons may move to a position as an administrative assistant. With additional education, some flight attendants may decide to transfer to other areas of the airline for which they work, such as risk management or human resources.

Employment

Flight attendants held about 97,000 jobs in 2006. Commercial airlines employed the vast majority of flight attendants, most of whom lived in their employer's home-base city. A small number of flight attendants worked for large companies that operated aircraft for business purposes.

Job Outlook

Competition for jobs is expected to remain keen because the opportunity for travel attracts more applicants than there are jobs.

Employment change. Employment of flight attendants is expected to grow 11 percent, about as fast as the average for all occupations over the 2006–2016 projection period. Population growth and an improving economy are expected to boost the number of airline passengers. As airlines expand their capacity to meet rising demand by increasing the number and size of planes in operation, more flight attendants will be needed.

Job prospects. Despite growing demand for flight attendants, competition is expected to be keen because this job usually attracts more applicants than there are jobs, with only the most qualified eventually being hired. College graduates who have experience dealing with the public should have the best chance of being hired. Job opportunities may be better with the faster growing regional and commuter, low-cost, and charter airlines. There also are job oppor-

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Flight attendants	39-6031	97,000	107,000	10,000	11

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

tunities for professionally trained flight attendants to work for companies operating private aircraft for their executives.

The majority of job opportunities through the year 2016 will arise from the need to replace flight attendants who leave the labor force or transfer to other occupations, often for higher earnings or a more stable lifestyle. With the job now viewed increasingly as a profession, however, fewer flight attendants leave their jobs, and job turnover is not as high as in the past. The average job tenure of attendants is currently more than 14 years and is increasing.

In the long run, opportunities for persons seeking flight attendant jobs should improve as the airline industry expands. Over the next decade, however, demand for flight attendants will fluctuate with the demand for air travel, which is highly sensitive to swings in the economy. During downturns, as air traffic declines, the hiring of flight attendants declines, and some experienced attendants may be laid off until traffic recovers.

Earnings

Median annual earnings of flight attendants were $53,780 in May 2006. The middle 50 percent earned between $33,320 and $77,410. The lowest 10 percent earned less than $24,250, and the highest 10 percent earned more than $99,300.

According to data from the Association of Flight Attendants, beginning attendants had median earnings of $15,849 a year in 2006. Beginning pay scales for flight attendants vary by carrier, however. New hires usually begin at the same pay scale regardless of experience, and all flight attendants receive the same future pay increases based on an established pay scale.

Some airlines offer incentive pay for working holidays, night and international flights, or taking positions that require additional responsibility or paperwork.

Flight attendants and their immediate families are entitled to free or discounted fares on their own airline and reduced fares on most other airlines. Some airlines require that the flight attendant be with an airline for 3 to 6 months before taking advantage of this benefit. Other benefits may include medical, dental, and life insurance; 401K or other retirement plan; sick leave; paid holidays; stock options; paid vacations; and tuition reimbursement. Flight attendants also receive a "per diem" allowance for meal expenses while on duty away from home. Flight attendants are required to purchase uniforms and wear them while on duty. The airlines usually pay for uniform replacement items, and may provide a small allowance to cover cleaning and upkeep of the uniforms.

The majority of flight attendants hold union membership, primarily with the Association of Flight Attendants. Other unions that represent flight attendants include the Transport Workers Union of America and the International Brotherhood of Teamsters.

Related Occupations

Other jobs that involve helping people as a safety professional, while requiring the ability to be calm even under trying circumstances, include emergency medical technicians and paramedics as well as firefighting occupations.

Sources of Additional Information

Information about job opportunities and qualifications required for work at a particular airline may be obtained by writing to the airline's human resources office.

Gaming Services Occupations

(O*NET 11-9071.00, 39-1011.00, 39-1012.00, 39-3011.00, and 39-3012.00)

Significant Points

- Job opportunities are available nationwide and are no longer limited to Nevada and New Jersey.
- Workers need a license issued by a regulatory agency, such as a state casino control board or commission.
- Employment is projected to grow much faster than average.
- Job prospects will be best for those with a degree or certification in gaming or a hospitality-related field, previous training or experience in casino gaming, and strong interpersonal and customer service skills.

Nature of the Work

Legalized gambling in the United States today includes casino gaming, state lotteries, pari-mutuel wagering on contests such as horse or dog racing, and charitable gaming. Gaming, the playing of games of chance, is a multibillion-dollar industry that is responsible for the creation of a number of unique service occupations.

The majority of all gaming services workers are employed in casinos. Their duties and titles may vary from one establishment to another. Some positions are associated with oversight and direction—supervision, surveillance, and investigation—while others

Gaming service workers are required to have a license.

involve working with the games or patrons themselves by tending slot machines, dealing cards or running games, handling money, writing and running tickets, and other activities. In nearly any gaming job, workers interact directly with patrons, and part of their responsibility is to make those interactions enjoyable.

Like nearly every business establishment, casinos have workers who direct and oversee day-to-day operations. *Gaming supervisors* and *gaming managers* oversee the gaming operations and personnel in an assigned area. They circulate among the tables and observe the operations to ensure that all of the stations and games are covered for each shift and workers and gamblers adhere to the rules of the games. Gaming supervisors and gaming managers often explain and interpret the operating rules of the house to patrons who may have difficulty understanding the rules. They also may plan and organize activities to create a friendly atmosphere for the guests staying in casino hotels. Periodically, they address complaints about service.

Gaming managers also have additional responsibilities beyond those of supervisors. For example, gaming managers prepare work schedules and station assignments for their subordinates. They are responsible for interviewing, hiring, training, and evaluating new workers.

Managers supervise a variety of other workers. Some of these workers need specialized skills—dealing blackjack, for example—that are unique to casino work. Others require skills common to most business workers, such as the ability to conduct financial transactions.

Slot key persons coordinate and supervise the slot machine department and its workers. Their duties include verifying and handling payoff winnings to patrons, resetting slot machines after completing the payoff, and refilling machines with money. Slot key persons must be familiar with a variety of slot machines and be able to make minor repairs and adjustments to the machines as needed. If major repairs are required, slot key persons determine whether the slot machine should be removed from the floor. Working the floor as frontline personnel, they enforce safety rules and report hazards.

Gaming and sportsbook writers and runners assist in the operations of games such as bingo and keno, in addition to taking bets on sporting events. They scan tickets presented by patrons and calculate and distribute winnings. Some writers and runners operate the equipment that randomly selects the numbers. Others may announce numbers selected, pick up tickets from patrons, collect bets, or receive, verify, and record patrons' cash wagers.

Gaming dealers operate table games such as craps, blackjack, and roulette. Standing or sitting behind the table, dealers provide dice, dispense cards to players, or run the equipment. Some dealers also monitor the patrons for infractions of casino rules. Gaming dealers must be skilled in customer service and in executing their game. Dealers determine winners, calculate and pay winning bets, and collect losing bets. Because of the fast-paced work environment, most gaming dealers are competent in at least two games, usually blackjack and craps.

Work environment. Most casinos are open 24 hours a day, 7 days a week and offer 3 staggered shifts. Employees can be expected to work weekends and holidays. The atmosphere in casinos is generally filled with fun and often considered glamorous. However, casino work can also be physically demanding. Most occupations require that workers stand for long periods; some require the lifting of heavy items. The atmosphere in casinos exposes workers to certain hazards, such as cigarette, cigar, and pipe smoke. Noise from slot machines, gaming tables, and talking workers and patrons may be distracting to some, although workers wear protective headgear in areas where loud machinery is used to count money.

Training, Other Qualifications, and Advancement

Each casino establishes its own education, training, and experience requirements, but all gaming service workers must obtain a license from a regulatory agency, such as a state casino control board or commission.

Education and training. There usually are no minimum educational requirements for entry-level gaming jobs, although most employers prefer workers with at least a high school diploma or GED.

Each casino establishes its own requirements for education, training, and experience. Some of the major casinos and slot manufacturers run their own training schools, and almost all provide some form of in-house training in addition to requiring certification. The type and quantity of classes needed may vary. Many institutions of higher learning give training toward certificates in gaming, as well as offering an associate, bachelor's, or master's degree in a hospitality-related field such as hospitality management, hospitality administration, or hotel management. Some schools offer training in games, gaming supervision, slot attendant and slot repair technician work, slot department management, and surveillance and security.

Slot key persons do not need to meet formal educational requirements to enter the occupation, but completion of slot attendant or slot technician training is helpful. As with most other gaming workers, slot key persons receive on-the-job training during the first several weeks of employment.

Gaming and sports book writers and runners must have at least a high school diploma or GED. Most of these workers receive on-the-job training. Because gaming and sportsbook writers and runners work closely with patrons, they need excellent customer service skills.

Most gaming dealers acquire their skills by attending a dealer school or vocational and technical school. They teach the rules and procedures of the games as well as state and local laws and regulations. Graduation from one of these schools does not guarantee a job at a casino, however, as most casinos also require prospective dealers to audition for open positions. During the audition, personal qualities are assessed along with knowledge of the games.

For most gaming supervisor and gaming manager positions, an associate or bachelor's degree is beneficial, but it is not required. Most employees in these occupations have experience in other gaming occupations, typically as dealers, and have a broad knowledge of casino rules, regulations, procedures, and games.

Licensure. Gaming services workers are required to be licensed by a regulatory agency, such as a state casino control board or commission. Applicants for a license must provide photo identification and pay a fee. Some states may require gaming service workers to be residents of that state. Age requirements vary by state. The licensing application process also includes a background investigation and drug test.

Other qualifications. In addition to possessing a license, gaming services workers need superior customer service skills. Casino gaming workers provide entertainment and hospitality to patrons, and the quality of their service contributes to an establishment's success or failure. Therefore, gaming workers need good communication skills, an outgoing personality, and the ability to maintain their composure even when dealing with angry or demanding patrons. Personal integrity also is important because workers handle large amounts of money.

Gaming services workers who manage money should have some experience handling cash or using calculators or computers. For such positions, most casinos administer a math test to assess an applicant's level of competency.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Gaming services occupations	—	174,000	214,000	40,000	23
Gaming managers	11-9071	4,000	5,000	1,000	24
First-line supervisors/managers of gaming workers	39-1010	54,000	64,000	10,000	19
Gaming supervisors	39-1011	34,000	42,000	7,900	23
Slot key persons	39-1012	20,000	22,000	2,200	11
Gaming dealers	39-3011	84,000	104,000	20,000	24
Gaming and sports book writers and runners	39-3012	18,000	24,000	5,200	28

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Gaming supervisors and gaming managers must have strong leadership, organizational, and communication skills. Excellent customer service and employee relations skills also are necessary.

Advancement. Advancement opportunities in casino gaming depend less on workers' previous casino duties and titles than on their ability and eagerness to learn new jobs. For example, an entry-level gaming worker eventually might advance to become a dealer or card room manager or to assume some other supervisory position.

Employment

Gaming services occupations provided 174,000 jobs in 2006. Employment among occupational specialties was distributed as follows:

Gaming dealers	84,000
Gaming supervisors	34,000
Slot key persons	20,000
Gaming and sports book writers and runners	18,000
Gaming managers	4,000

Gaming services workers are found mainly in the traveler accommodation and gaming industries. Most are employed in commercial casinos, including riverboat casinos, casino hotels, and pari-mutuel racetracks—known as "racinos"—that in 20 states offer casino games. The largest number work in casinos in Nevada. Mississippi, which boasts the greatest number of riverboat casinos in operation, employs the most workers in that venue. In addition, there are 28 states with Indian casinos. Legal lotteries are held in 41 states and the District of Columbia, and pari-mutuel wagering is legal in 43 states. Forty-seven states and the District of Columbia also allow charitable gaming. Other states are considering legislation to permit gambling, but no casinos have been opened as of yet.

For most workers, gaming licensure requires proof of residency in the state in which gaming workers are employed. But some gaming services workers do not limit themselves to one state or even one country, finding jobs on the small number of casinos located on luxury cruise liners that travel the world. These individuals live and work aboard the vessel.

Job Outlook

Employment of gaming service workers is expected to grow much faster than the average for all occupations. Opportunities will be best for those with previous casino gaming experience, a degree or technical or vocational training in gaming or a hospitality-related field, and strong customer service skills.

Employment change. With demand for gaming showing no sign of waning, employment in gaming services occupations is projected to grow by 23 percent between 2006 and 2016, which is much faster than the average for all occupations. The increasing popularity and prevalence of Indian casinos and racinos will provide substantial new job openings. With many states benefiting from casino gambling in the form of tax revenue or agreements with Indian tribes, additional states are reconsidering their opposition to legalized gambling and will likely approve the construction of more casinos and other gaming establishments during the next decade. Additional job growth will occur in established gaming areas in Nevada and Atlantic City, New Jersey, as they solidify their positions as tourist destinations.

The increase in gaming reflects growth in the population and in its disposable income, both of which are expected to continue. Higher expectations for customer service among gaming patrons also should result in more jobs for gaming services workers. Because of increasing demand in gaming establishments for additional table games, particularly poker, the largest growth is expected among gaming dealers. Conversely, advancements in slot machine technology, such as coinless slot machines—known as "Ticket-in, Ticket-out machines"—will limit job growth for slot key persons relative to other gaming service occupations. Ticket-in, Ticket-out technology reduces the need for slot key persons to pay out jackpots, fill hoppers, and reset machines. Additionally, slot machines linked to a network allow adjustments to be made from a central computer server rather than from the floor by a slot key person. However, there will still be some new jobs for slot key persons because of the casino industry's focus on customer service and the rising popularity of racinos and slot machines in states that have recently legalized gambling or are expected to do so in the future.

Job prospects. Job prospects in gaming services occupations will be best for those with previous casino gaming experience, a degree or technical or vocational training in gaming or a hospitality-related field, and strong interpersonal and customer service skills.

In addition to job openings arising from employment growth, opportunities will result from the need to replace workers transferring to other occupations or leaving the labor force. Despite this, keen competition for jobs as gaming dealers is expected. There are generally more applicants than jobs. Experienced dealers who are able to attract new or return business will have the best job prospects.

Earnings

Wage earnings for gaming services workers vary according to occupation, level of experience, training, location, and size of the gaming establishment. The following were median earnings for various gaming services occupations in May 2006:

Gaming managers	$62,820
Gaming supervisors	41,160
Slot key persons	22,720
Gaming and sports book writers and runners	18,800
Gaming dealers	14,730

Gaming dealers generally receive a large portion of their earnings from tokes, which are tips in the form of tokens received from players. Earnings from tokes vary depending on the table games the dealer operates, the personal traits of the dealer, and the pooling policies of the casino.

Related Occupations

Many other occupations provide hospitality and customer service. Some examples of related occupations are security guards and gaming surveillance officers, sales worker supervisors, cashiers, gaming change persons and booth cashiers, retail salespersons, gaming cage workers, and tellers.

Personal and Home Care Aides

(O*NET 39-9021.00)

Significant Points

- Job opportunities are expected to be excellent because of rapid growth in home health care and high replacement needs.
- Skill requirements are low, as is the pay.
- About 1 out of 3 personal and home care aides work part time; most aides work with a number of different clients, each job lasting a few hours, days, or weeks.

Personal and home care aides assist elderly and disabled clients with daily tasks, like housekeeping and personal hygiene.

Nature of the Work

Personal and home care aides help people who are elderly, disabled, ill, and/or mentally disabled to live in their own homes or in residential care facilities instead of in health facilities or institutions. Most personal and home care aides work with elderly or physically or mentally disabled clients who need more extensive personal and home care than family or friends can provide. Some aides work with families in which a parent is incapacitated and small children need care. Others help discharged hospital patients who have relatively short-term needs. (Home health aides—who provide health-related services—are discussed in the section on nursing, psychiatric, and home health aides, elsewhere in the *Handbook*.)

Personal and home care aides—also called *homemakers, caregivers, companions*, and *personal attendants*—provide housekeeping and routine personal care services. They clean clients' houses, do laundry, and change bed linens. Aides may plan meals (including special diets), shop for food, and cook. Aides also may help clients get out of bed, bathe, dress, and groom. Some accompany clients to doctors' appointments or on other errands.

Personal and home care aides provide instruction and psychological support to their patients. They may advise families and patients on nutrition, cleanliness, and household tasks. Aides also may assist in toilet training a severely mentally handicapped child, or they may just listen to clients talk.

In home health care agencies, a registered nurse, physical therapist, or social worker assigns specific duties and supervises personal and home care aides. Aides keep records of services performed and of clients' condition and progress. They report changes in the client's condition to the supervisor or case manager. In carrying out their work, aides cooperate with health care professionals, including registered nurses, therapists, and other medical staff.

The personal and home care aide's daily routine may vary. Aides may go to the same home every day for months or even years. Aides often visit four or five clients on the same day. However, some aides may work solely with one client who is in need of more care and attention. In some situations, this may involve working with other aides in shifts so the client has an aide throughout the day and night.

Personal and home care aides generally work on their own, with periodic visits by their supervisor. They receive detailed instructions explaining when to visit clients and what services to perform for them.

Aides are individually responsible for getting to the client's home. They may spend a good portion of the work day traveling from one client to another. Aides must be careful to avoid over-exertion or injury when they assist clients.

Work environment. Surroundings differ from case to case. Some homes are neat and pleasant, whereas others are untidy and depressing. Some clients are pleasant and cooperative; others are angry, abusive, depressed, or otherwise difficult. Aides may spend a large portion of each day traveling between clients' homes.

About 33 percent of aides work part time, and some work weekends or evenings to suit the needs of their clients.

Training, Other Qualifications, and Advancement

In some states, the only requirement for employment is on-the-job training, which generally is provided by employers. Other states may require formal training, which is available from community colleges, vocational schools, elder care programs, and home health care agencies.

Education and training. Most personal and home care aides receive short term on-the-job training in a range of job functions. Aides are instructed on how to properly cook for a client, which includes information on nutrition and special diets. Furthermore, they may be trained on basic housekeeping tasks, such as making a bed and keeping the home sanitary and safe for the client. Generally, they are taught how to respond to an emergency situation, learning basic safety techniques. Employers may also train aides to conduct themselves in a professional and courteous manner while in a clients' home.

Other qualifications. Personal and home care aides should have a desire to help people and not mind hard work. They should be responsible, compassionate, patient, emotionally stable, and cheerful. In addition, aides should be tactful, honest, and discreet because they work in private homes. Aides also must be in good health. A physical examination, including state-mandated tests for tuberculosis and other diseases, may be required. A criminal background check, credit check, and good driving record may also be required for employment. Additionally, personal and home care aides are responsible for their own transportation to reach patients' homes.

Certification and advancement. The National Association for Home Care and Hospice (NAHC) offers national certification for personal and home care aides. Certification is a voluntary demonstration that the individual has met industry standards. Certification requires the completion of a 75-hour course, observation and documentation of 17 skills for competency assessed by a registered nurse and passing a written exam developed by NAHC.

Advancement for personal and home care aides is limited. In some agencies, workers start out performing homemaker duties, such as cleaning. With experience and training, they may take on more personal care duties. Some aides choose to receive additional training to become nursing and home health aides, licensed practical nurses, or registered nurses. Some experienced personal and home care aides may start their own home care agency or work as a self-employed aide. Self-employed aides have no agency affiliation or supervision and accept clients, set fees, and arrange work schedules on their own.

Employment

Personal and home care aides held about 767,000 jobs in 2006. The majority of jobs were in home health care services; individual and family services; residential care facilities; and private households. In 2006, about 8 percent of personal and home care aides were self-employed.

Job Outlook

Excellent job opportunities are expected for this occupation because rapid employment growth and high replacement needs are projected to produce a large number of job openings.

Employment change. Employment of personal and home care aides is projected to grow by 51 percent between 2006 and 2016, which is much faster than the average for all occupations. This occupation will be amongst the occupations adding the most new jobs, growing by about 389,000 jobs. The expected growth is due, in large part, to the projected rise in the number of elderly people, an age group that often has mounting health problems and that needs some assistance with daily activities. The elderly and other patients, such as the mentally disabled, increasingly rely on home care.

This trend reflects several developments. Inpatient care in hospitals and nursing homes can be extremely expensive, so more patients return to their homes from these facilities as quickly as possible to contain costs. Patients who need assistance with everyday tasks and household chores rather than medical care can reduce medical expenses by returning to their homes. Furthermore, most patients—particularly the elderly—increasingly prefer care in their homes rather than in nursing homes or other in-patient facilities. This trend is aided by the realization that treatment can be more effective in familiar surroundings. Finally, home care has become easier and more feasible with the development of better medical technologies for in-home treatment.

Job prospects. In addition to job openings created by the increased demand for these workers, replacement needs are expected to lead to many openings. The relatively low skill requirements, low pay, and high emotional demands of the work result in high replacement needs. For these same reasons, many people are reluctant to seek jobs in the occupation. Therefore, persons who are interested in and suited for this work—particularly those with experience or training as personal care, home health, or nursing aides—should have excellent job prospects.

Earnings

Median hourly earnings of wage-and-salary personal and home care aides were $8.54 in May 2006. The middle 50 percent earned between $7.09 and $10.19 an hour. The lowest 10 percent earned less than $6.05, and the highest 10 percent earned more than $11.60 an hour. Median hourly earnings in the industries employing the largest numbers of personal and home care aides were as follows:

Residential mental retardation facilities	$9.54
Services for the elderly and persons with disabilities	9.18
Home health care services	7.19

Most employers give slight pay increases with experience and added responsibility. Aides usually are paid only for the time they work in the home, not for travel time between jobs. Employers often hire on-call hourly workers and provide no benefits.

Related Occupations

Personal and home care aides combine the duties of caregivers and social service workers. Workers in related occupations that involve personal contact to help others include child care workers; nursing, psychiatric, and home health aides; occupational therapist assistants and aides; physical therapist assistants and aides; and social and human service assistants.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Personal and home care aides	39-9021	767,000	1,156,000	389,000	51

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Sources of Additional Information

Information about employment opportunities may be obtained from local hospitals, nursing care facilities, home health care agencies, psychiatric facilities, residential mental health facilities, social assistance agencies, and local offices of the state employment service.

For information about voluntary credentials for personal and home care aides, contact

➤ National Association for Homecare and Hospice, 228 Seventh St. SE, Washington, DC 20003. Internet: http://www.nahc.org

Recreation Workers

(O*NET 39-9032.00)

Significant Points

- The recreation field offers an unusually large number of part-time and seasonal job opportunities.
- Educational requirements range from a high school diploma to a graduate degree.
- Opportunities for part-time, seasonal, and temporary recreation jobs will be good, but competition will remain keen for full-time career positions.

Nature of the Work

People spend much of their leisure time participating in a wide variety of organized recreational activities, such as arts and crafts, the performing arts, camping, and sports. Recreation workers plan, organize, and direct these activities in local playgrounds and recreation areas, parks, community centers, religious organizations, camps, theme parks, and tourist attractions. Increasingly, recreation workers also are found in businesses where they organize and direct leisure activities for employees.

Recreation workers hold a variety of positions at different levels of responsibility. Workers who provide instruction and coaching in art, music, drama, swimming, tennis, or other activities may be called *activity specialists.*

Many recreation workers are only seasonally employed.

Camp counselors lead and instruct children and teenagers in outdoor recreation, such as swimming, hiking, horseback riding, and camping. In addition, counselors teach campers special subjects such as archery, boating, music, drama, gymnastics, tennis, and computers. In residential camps, counselors also provide guidance and supervise daily living and socialization. *Camp directors* typically supervise camp counselors, plan camp activities or programs, and perform the various administrative functions of a camp.

Recreation leaders, who are responsible for a recreation program's daily operation, primarily organize and direct participants. They may lead and give instruction in dance, drama, crafts, games, and sports; schedule the use of facilities; keep records of equipment use; and ensure that recreation facilities and equipment are used properly.

Recreation supervisors oversee recreation leaders and plan, organize, and manage recreational activities to meet the needs of a variety of populations. These workers often serve as liaisons between the director of the park or recreation center and the recreation leaders. Recreation supervisors with more specialized responsibilities also may direct special activities or events or oversee a major activity, such as aquatics, gymnastics, or performing arts.

Directors of recreation and parks develop and manage comprehensive recreation programs in parks, playgrounds, and other settings. Directors usually serve as technical advisors to state and local recreation and park commissions and may be responsible for recreation and park budgets. (Workers in a related occupation, recreational therapists, help individuals to recover from or adjust to illness, disability, or specific social problems; this occupation is described elsewhere in the *Handbook*.)

Work environment. Recreation workers may work in a variety of settings—for example, a cruise ship, a woodland recreational park, a summer camp, or a playground in the center of a large urban community. Regardless of the setting, most recreation workers spend much of their time outdoors and may work in a variety of weather conditions. Recreation directors and supervisors, however, typically spend most of their time in an office, planning programs and special events. Directors and supervisors generally engage in less physical activity than do lower level recreation workers. Nevertheless, recreation workers at all levels risk suffering injuries during physical activities.

Some recreation workers work about 40 hours a week. However, many people entering this field, such as camp counselors, may have some night and weekend work, irregular hours, and seasonal employment.

Training, Other Qualifications, and Advancement

The educational and training requirements for recreation workers vary widely depending on the type of job. Full-time career positions usually require a college degree. Many jobs, however, can be learned with only a short period of on-the-job training.

Education and training. Educational requirements for recreation workers range from a high school diploma—or sometimes less for those seeking summer jobs—to graduate degrees for some administrative positions in large public recreation systems. Full-time career professional positions usually require a college degree with a major in parks and recreation or leisure studies, but a bachelor's degree in any liberal arts field may be sufficient for some jobs in the private sector. In industrial recreation, or "employee services" as it is more commonly called, companies prefer to hire those with a bachelor's degree in recreation or leisure studies and a background in business

administration. Some college students work part time as recreation workers while earning degrees.

Employers seeking candidates for some administrative positions favor those with at least a master's degree in parks and recreation, business administration, or public administration. Most required at least an associate degree in recreation studies or a related field.

An associate or bachelor's degree in a recreation-related discipline and experience are preferred for most recreation supervisor jobs and are required for most higher level administrative jobs. Graduates of associate degree programs in parks and recreation, social work, and other human services disciplines also enter some career recreation positions. High school graduates occasionally enter career positions, but this is not common.

Programs leading to an associate or bachelor's degree in parks and recreation, leisure studies, or related fields are offered at several hundred colleges and universities. Many also offer master's or doctoral degrees in the field. In 2006, about 100 bachelor's degree programs in parks and recreation were accredited by the National Recreation and Park Association (NRPA). Accredited programs provide broad exposure to the history, theory, and practice of park and recreation management. Courses offered include community organization; supervision and administration; recreational needs of special populations, such as the elderly or disabled; and supervised fieldwork. Students may specialize in areas such as therapeutic recreation, park management, outdoor recreation, industrial or commercial recreation, or camp management.

Specialized training or experience in a particular field, such as art, music, drama, or athletics, is an asset for many jobs. Some jobs also require certification. For example, a lifesaving certificate is a prerequisite for teaching or coaching water-related activities.

The large number of seasonal and part-time workers learn through on-the-job training.

Licensure and certification. The NRPA certifies individuals for professional and technical jobs. Certified Park and Recreation Professionals must pass an exam; earn a bachelor's degree with a major in recreation, park resources, or leisure services from a program accredited by the NRPA or earn a bachelor's degree and have at least 5 years of relevant full-time work experience. Continuing education is necessary to remain certified.

Many areas require lifeguards to be certified. Training and certification details vary from state to state and county to county. Information on lifeguards is available from your local Parks and Recreation Department.

Other qualifications. People planning recreation careers should be outgoing, good at motivating people, and sensitive to the needs of others. Excellent health and physical fitness are often required, due to the physical nature of some jobs. Volunteer experience, part-time work during school, or a summer job can lead to a full-time career as a recreation worker.

Advancement. Recreation workers with experience and managerial skills may advance to supervisory or managerial positions.

Employment

Recreation workers held about 320,000 jobs in 2006, and many additional workers held summer jobs in the occupation. About 32 percent of recreation workers worked for local governments, primarily in park and recreation departments. About 16 percent of recreation workers were employed by nursing and residential care facilities and another 10 percent were employed in civic and social organizations, such as the Boy Scouts or Girl Scouts or the Red Cross.

Job Outlook

Jobs opportunities for part-time, seasonal, and temporary recreation workers will be good, but competition will remain keen for career positions as recreation workers. Average growth is expected.

Employment change. Overall employment of recreation workers is projected to increase by 13 percent between 2006 and 2016, which is about as fast as the average for all occupations. Although people will spend more time and money on recreation, budget restrictions in state and local government will moderate the number of jobs added. Many of the new jobs will be in social assistance organizations and in nursing and residential care facilities.

Growth will be driven by retiring baby boomers who, with more leisure time, high disposable income, and concern for health and fitness, are expected to increase the demand for recreation services.

Job prospects. Applicants for part-time, seasonal, and temporary recreation jobs should have good opportunities, but competition will remain keen for career positions because the recreation field attracts many applicants and because the number of career positions is limited compared with the number of lower-level seasonal jobs. Opportunities for staff positions should be best for people with formal training and experience in part-time or seasonal recreation jobs. Those with graduate degrees should have the best opportunities for supervisory or administrative positions. Job openings will stem from growth and the need to replace the large numbers of workers who leave the occupation each year.

Earnings

In May 2006, median annual earnings of recreation workers who worked full time were $20,470. The middle 50 percent earned between $16,360 and $27,050. The lowest paid 10 percent earned less than $14,150, while the highest paid 10 percent earned $35,780 or more. However, earnings of recreation directors and others in supervisory or managerial positions can be substantially higher. Most public and private recreation agencies provide full-time recreation workers with typical benefits; part-time workers receive few, if any, benefits. In May 2006, median annual earnings in the industries employing the largest numbers of recreation workers were as follows:

Nursing care facilities	$21,510
Individual and family services	20,410
Local government	20,100
Other amusement and recreation industries	18,810
Civic and social organizations	17,920

The large numbers of temporary, seasonal jobs in the recreation field typically are filled by high school or college students, generally do not have formal education requirements, and are open to anyone with the desired personal qualities. Employers compete for

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Recreation workers	39-9032	320,000	360,000	41,000	13

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

a share of the vacationing student labor force, and although salaries in recreation often are lower than those in other fields, the nature of the work and the opportunity to work outdoors are attractive to many.

Part-time, seasonal, and volunteer jobs in recreation include summer camp counselors, craft specialists, and after-school and weekend recreation program leaders. In addition, many teachers and college students accept jobs as recreation workers when school is not in session. The vast majority of volunteers serve as activity leaders at local day camp programs, or in youth organizations, camps, nursing homes, hospitals, senior centers, and other settings.

Related Occupations

Recreation workers must exhibit leadership and sensitivity when dealing with people. Other occupations that require similar personal qualities include counselors; probation officers and correctional treatment specialists; psychologists; recreational therapists; teachers—self enrichment education; athletes, coaches, umpires, and related workers; and social workers.

Advertising Sales Agents

(O*NET 41-3011.00)

Significant Points

- Overall earnings are higher than average but vary considerably because they usually are based on a salary plus performance-based commissions and bonuses.
- Pressure to meet monthly sales quotas can be stressful.

Nature of the Work

Advertising sales agents—often referred to as *account executives* or *advertising sales representatives*—sell or solicit advertising primarily for newspapers and periodicals, television and radio, websites, telephone directories, and direct mail and outdoor advertisers. Because such a large share of revenue for many of these media outlets is generated from advertising, advertising sales agents play an important role in their success.

More than half of all advertising sales agents work in the information sector, mostly for media firms including television and radio broadcasters, print and Internet publishers, and cable program distributors. Firms that are regionally based often need the help of two types of advertising sales agents, one to handle local clients and one to solicit advertising from national advertisers. Print publications and radio and television stations employ local sales agents who are responsible for sales in an immediate territory, while separate companies known as media representative firms sell advertising space or time for media owners at the national level with their own teams of advertising sales agents. Sales agents employed in media representation work exclusively through executives at advertising agencies, called media buyers, who purchase advertising space for their clients that want to initiate national advertising campaigns. When a local television broadcaster, radio station, print, or online publisher is working with a media representative firm, the media company normally employs a national sales manager to coordinate efforts with the media representative.

Many advertising sales agents work long and irregular hours to meet sales goals.

Local sales agents are often referred to as outside sales agents or inside sales agents. *Outside sales agents* call on clients and prospects at their places of business. They may have an appointment, or they may practice cold calling—arriving without an appointment. For these sales agents, obtaining new accounts is an important part of the job, and they may spend much of their time traveling to and visiting prospective advertisers and current clients. *Inside sales agents* work on their employer's premises and handle sales for customers who walk in or telephone the firm to inquire about advertising. Some may also make telephone sales calls—calling prospects, attempting to sell the media firm's advertising space or time, and arranging follow-up appointments between interested prospects and outside sales agents.

A critical part of building a relationship with a client is to find out as much as possible about the client. Before the first meeting with a client, sales agents gather background information on the client's products, current customers, prospective customers, and the geographic area of the target market. They then meet with the clients to explain how specific types of advertising will help promote the client's products or services most effectively. If a client wishes to proceed, the advertising sales agent prepares an advertising proposal to present to the client. This entails determining the advertising medium to be used, preparing sample advertisements, and providing clients with cost estimates for the proposal. Because consolidation among media industries has brought the sales of different types of advertising under one roof, advertising sales are increasingly in the form of integrated packages. This means that advertising sales agents may sell packages that include print and online ad space and time slots with a broadcast subsidiary.

After a contract has been established, advertising sales agents serve as the main contact between the advertiser or ad agency and the media firm. They handle communication between the parties and assist in developing sample artwork or radio and television spots, if needed. For radio and television advertisements, they may also arrange for commercial taping sessions and accompany clients to these sessions.

In addition to maintaining sales and overseeing clients' accounts, advertising sales agents' other duties include analyzing sales statistics and audience demographics, preparing reports on client's accounts, and scheduling and keeping their appointments and work hours. They read about new and existing products and monitor the sales, prices, and products of their competitors. In many firms, the advertising sales agent handles the drafting of contracts specifying the advertising work to be performed and its cost, and may undertake customer service responsibilities such as answering questions or addressing any problems the client may have with the proposal. Sales agents are also responsible for developing sales tools, promotional plans, and media kits, which they use to help make the sale.

Work environment. Selling can be stressful work because income and job security depend directly on the agent's ability to maintain and expand clientele. Companies generally set monthly sales quotas and place considerable pressure on advertising sales agents to meet those quotas. The added stress of rejection places more pressure on the agent.

Although agents work long and often irregular hours, most have the freedom to determine their own schedule. The Internet and other electronic tools allow agents to do more work from home or while on the road, enabling them to send messages and documents to clients and coworkers, keep up with industry news, and access databases that help them target potential customers. Advertising sales agents use e-mail to conduct much of the business with their clients.

Many advertising sales agents work more than 40 hours per week. This frequently involves irregular hours and may also include working on weekends and holidays. However, most advertising sales agents are able to set their own schedule. Eleven percent of advertising sales agents were employed part time in 2006.

Training, Other Qualifications, and Advancement

For sales positions that require meeting with clients, large employers prefer applicants with a college degree. Smaller companies generally are more willing to hire individuals with a high school degree. Successful sales experience and the ability to communicate effectively become more important than educational attainment once hired. Most training for advertising sales agents takes place informally on the job.

Education and training. Some employers, large companies in particular, prefer applicants with a college degree, particularly for sales positions that require meeting with clients. Courses in marketing, leadership, communication, business, and advertising are helpful. For those who sell over the telephone or who have a proven record of successfully selling other products, a high school degree may be sufficient. In 2006, the highest level of educational attainment for advertising sales agents was as follows:

High school graduate or less	20%
Some college, no degree	19
Associate degree	10
Bachelor's degree or higher	52

Most training, however, takes place on the job, and can be formal or informal in nature. In most cases, an experienced sales manager instructs a newly hired advertising sales agent who lacks sales experience. In this one-on-one environment, supervisors typically coach new hires and observe as they make sales calls and contact clients. Supervisors then advise new hires on ways to improve their interaction with clients. Employers may bring in consultants to lead formal training sessions when agents sell to a specialized market segment. This practice is common when advertising sales agents sell space to automotive dealers and real estate professionals.

Other qualifications. Employers look for applicants who are honest and possess a pleasant personality and neat professional appearance. After gaining entry into the occupation, successful sales experience and the ability to communicate effectively become more important than educational attainment. In fact, when selling or soliciting ad space, personality traits are equally, if not more, important than academic background. In general, smaller companies are more willing to hire unproven individuals.

Because they represent their employers to the executives of client organizations, advertising sales agents must have excellent interpersonal and written communication skills. Being multi-lingual, particularly in English and Spanish, is another trait that will benefit prospective advertising agents as media increasingly seek to market to Hispanics and other foreign-born persons. Self-motivation, organization, persistence, independence, and the ability to multitask are required because advertising sales agents set their own schedules and perform their duties without much supervision.

Advancement. Advancement in the occupation means taking on bigger, more important clients. Agents with proven leadership ability and a strong sales record may advance to supervisory and managerial positions such as sales supervisor, sales manager, or vice president of sales. Frequent contact with managers of other departments and people in other firms provides sales agents with leads about job openings, enhancing advancement opportunities. In small firms, where the number of supervisory and management positions is limited, advancement may come slowly. Promotion may occur more quickly in larger media firms and in media representative firms.

Employment

Advertising sales agents held over 170,000 jobs in 2006. Workers were concentrated in three industries: More than 3 in 10 jobs were in newspaper, periodical, book, and directory publishers; 3 in 10 in advertising and related services; and nearly 2 in 10 in radio and television broadcasting. Media representative firms are in the advertising and related services industry. A relatively small number of jobs were found in specialized design services, including industrial and graphic designers; printing and related support activities; computer systems design and related services; business support services; and cable and other program distribution.

Employment is spread around the country, but jobs in radio and television stations and large, well-known publications are concentrated in big metropolitan areas. Media representative firms are also concentrated in large cities with many advertising agencies, such as New York City.

Job Outlook

Employment growth of advertising sales agents is expected to grow faster than average for all occupations for the 2006–2016 period. Because of growth in new media outlets, such as the Internet, advertising agents with an ability to sell, should see good job opportunities.

Employment change. Employment of advertising sales agents is expected to increase by 20 percent from 2006 to 2016, which is faster than the average for all occupations. Fast growth in the number of cable channels, online advertisers, and other advertising mediums will create many new opportunities for advertisers. These opportunities, along with increased efforts by media outlets to market to the growing Hispanic population, will lead to the growth of advertising sales agents.

The industries employing advertising sales agents, particularly the newspaper, periodical, radio, and television industries, have experienced considerable consolidation in recent years, which created efficiencies in the sale of advertising and reduced the need for more sales agents. While this trend is expected to continue over the next decade, it should do so at a slower pace and not affect employment of advertising sales agents significantly.

While advances in technology have made advertising sales agents more productive, allowing agents to take on additional duties and improve the quality of the services they provide, technological advances have not substantially decreased overall demand for these workers. Productivity gains have had the largest effect on miscellaneous services that workers provide, such as accounting, proposal creation, and customer service responsibilities, allowing them to provide faster, improved services to their clients. For example, the use of e-mail has considerably shortened the time it takes to negotiate a sale and place an ad. Sales agents may accomplish more in less time, but many work more hours than in the past, spending additional time on follow-up and service calls. Thus, while productivity gains will temper the growth of advertising sales agents, who can now manage more accounts, the increasing growth in advertising across all industries will ensure that new advertising sales agents will continue to be needed in the future.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Advertising sales agents	41-3011	170,000	205,000	35,000	20

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Job prospects. Those interested in ad sales positions can expect good job opportunities. This is particularly true for sales people with experience and those with a college degree. For those with a proven sales record in advertising sales, opportunities should be excellent. In addition to the job openings generated by employment growth, openings will occur each year because of the need to replace sales representatives who transfer to other occupations or leave the labor force. Each year, many advertising sales agents discover they are unable to earn enough money and leave the occupation.

Advertising revenues are sensitive to economic downturns, which cause the industries and companies that advertise to reduce both the frequency of campaigns and the overall level of spending on advertising. Advertising sales agents must work hard to get the most out of every dollar spent on advertising under these conditions. Therefore, the number of opportunities for advertising sales agents fluctuates with the business cycle. So while advertising sales candidates can expect good opportunities, applicants can expect keen competition for job openings during downturns in advertising spending.

Earnings

Including commissions, median annual earnings for all advertising sales agents were $42,750 in May 2006. The middle 50 percent earned between $29,450 and $63,120 a year. The lowest 10 percent earned less than $21,460, and the highest 10 percent earned more than $91,280 a year. Median annual earnings for sales agents in the industries in which they were concentrated were:

Motion picture and video industries	$55,340
Cable and other subscription programming	50,260
Advertising and related services	47,640
Radio and television broadcasting	41,110
Newspaper, periodical, book, and directory publishers	36,880

Performance-based pay, including bonuses and commissions, can make up a large portion of advertising sales agents' earnings. Most employers pay some combination of salaries, commissions, and bonuses. Commissions are usually based on individual sales numbers, whereas bonuses may depend on individual performance, on the performance of all sales workers in a group or district, or on the performance of the entire company. For agents covering multiple areas or regions, commissions also may be based on the difficulty in making a sale in that particular area. Sales revenue is affected by the economic conditions and business expectations facing the industries that tend to advertise. Earnings from commissions are likely to be high when these industries are doing well and low when companies decide not to advertise as frequently.

In addition to their earnings, advertising sales agents are usually reimbursed for entertaining clients and for other business expenses such as transportation costs, meals, and hotel stays. They often receive benefits such as health and life insurance, pension plans, vacation and sick leave, personal use of a company car, and frequent flier mileage. Some companies offer incentives such as free vacation trips or gifts for outstanding sales workers.

Related Occupations

Advertising sales agents must have sales ability and knowledge of their clients' business and personal needs. Workers in other occupations requiring these skills include telemarketers; advertising, marketing, promotions, public relations, and sales managers; insurance sales agents; purchasing managers, buyers, and purchasing agents; real estate brokers and sales agents; sales engineers; sales representatives, wholesale and manufacturing; and securities, commodities, and financial services sales agents.

Sources of Additional Information

To learn about opportunities for employment as an advertising sales agent, contact local broadcasters, radio stations, and publishers for advertising sales representative positions or look for media representative firms in your area.

Cashiers

(O*NET 41-2011.00 and 41-2012.00)

Significant Points

- Cashiers need little or no work experience and are trained on the job.
- Overall employment is projected to decline; however, job growth will be strong for gaming cashiers.
- Opportunities for full-time and part-time jobs are expected to be good because of the need to replace the large number of workers who leave cashier jobs.
- Many cashiers start at minimum wage.

Nature of the Work

Supermarkets, department stores, gasoline service stations, movie theaters, restaurants, and many other businesses employ cashiers to register the sale of their merchandise. Almost all cashiers total bills on a cash register, receive money, make change, fill out charge forms, and give receipts. A few still use pencil and paper or an adding machine.

Although specific job duties vary by employer, cashiers usually are assigned to a register at the beginning of their shifts and are given a drawer containing a specific amount of money with which to start—their "till." They must count their till to ensure that it contains the correct amount of money and adequate supplies of change. Cashiers also handle returns and exchanges. They must ensure that returned merchandise is in good condition, and determine where and when it was purchased and what type of payment was used.

After entering charges for all items and subtracting the value of any coupons or special discounts, cashiers total the customer's bill

Cashiers total bills on a cash register, handle money, and interact with customers.

and take payment. Forms of payment include cash, personal checks, credit cards, and debit cards. Cashiers must know the store's policies and procedures for each type of payment the store accepts. For checks and credit and debit card charges, they may request additional identification from the customer or call in for an authorization. They must verify the age of customers purchasing alcohol or tobacco. When the sale is complete, cashiers issue a receipt to the customer and return the appropriate change. They may also wrap or bag the purchase.

At the end of their shifts, cashiers once again count the drawers' contents and compare the totals with sales data. An occasional shortage of small amounts may be overlooked but, in many establishments, repeated shortages are grounds for dismissal. In addition to counting the contents of their drawers at the end of their shifts, cashiers usually separate and total charge forms, return slips, coupons, and any other noncash items.

Most cashiers use scanners and computers, but some establishments still require price and product information to be entered manually. In a store with scanners, a cashier passes a product's Universal Product Code over the scanning device, which transmits the code number to a computer. The computer identifies the item and its price. In other establishments, cashiers manually enter codes into computers and then descriptions of the items and their prices appear on the screen.

Depending on the type of establishment, cashiers may have other duties as well. In many supermarkets, for example, cashiers weigh produce and bulk food, as well as return unwanted items to the shelves. In convenience stores, cashiers may be required to know how to use a variety of machines other than cash registers, and how to furnish money orders and sell lottery tickets. Operating ticket-dispensing machines and answering customers' questions are common duties for cashiers who work at movie theaters and ticket agencies. In casinos, *gaming change persons* and *booth cashiers* exchange coins and tokens and may issue payoffs. They also may operate a booth in the slot-machine area and furnish change to people or count and audit money in drawers.

Work environment. Most cashiers work indoors, usually standing in booths or behind counters. Often, they are not allowed to leave their workstations without supervisory approval because they are responsible for large sums of money. The work of cashiers can be very repetitious, but improvements in workstation design in many stores are alleviating problems caused by repetitive motion. In addition, the work can sometimes be dangerous; the risk from robberies and homicides is much higher for cashiers than for other workers, although more safety precautions are being taken to help deter robbers.

Gaming change persons and booth cashiers can expect a safer work environment than cashiers in other industries. However, casinos are not without their hazards such as exposure to fumes from cigarettes, cigars, and pipes and noise from slot machines.

About 46 percent of all cashiers work part time. Hours of work often vary depending on the needs of the employer. Generally, cashiers are expected to work weekends, evenings, and holidays to accommodate customers' needs. However, many employers offer flexible schedules. Because the holiday season is the busiest time for most retailers, many employers restrict the use of vacation time from Thanksgiving through the beginning of January.

Training, Other Qualifications, and Advancement

Cashier jobs usually are entry-level positions requiring little or no previous work experience. They require good customer service skills.

Education and training. Although there are no specific educational requirements, employers filling full-time jobs often prefer applicants with high school diplomas.

Nearly all cashiers are trained on the job. In small businesses, an experienced worker often trains beginners. The trainee spends the first day observing the operation and becoming familiar with the store's equipment, policies, and procedures. After this, trainees are assigned to a register—frequently under the supervision of an experienced worker. In larger businesses, trainees spend several days in classes before being placed at cash registers. Topics typically covered in class include a description of the industry and the company, store policies and procedures, equipment operation, and security.

Training for experienced workers is not common, except when new equipment is introduced or when procedures change. In these cases, the employer or a representative of the equipment manufacturer trains workers on the job.

Licensure. Gaming change persons and booth cashiers are required to obtain a license and background check from their state's gaming board and must meet an age requirement, usually set at 21 years old.

Other qualifications. People who want to become cashiers should be able to do repetitious work accurately. They also need basic mathematics skills and good manual dexterity. Because cashiers deal constantly with the public, they should be neat in appearance and able to deal tactfully and pleasantly with customers. In addition, some businesses prefer to hire workers who can operate specialized equipment or who have business experience, such as typing, selling, or handling money.

Advancement. Advancement opportunities for cashiers vary. For those working part time, promotion may be to a full-time position. Others advance to head cashier or cash-office clerk. In addition, this job offers a good opportunity to learn about an employer's business and can serve as a steppingstone to a more responsible position.

Employment

Cashiers held about 3.5 million jobs in 2006. Of these, 27,000 were employed as gaming change persons and booth cashiers. Although cashiers are employed in almost every industry, 26 percent of all jobs were in food and beverage stores. Gasoline stations, department stores, other retail establishments, and restaurants also employed large numbers of these workers. Outside of retail establishments, many cashiers worked in amusement, gambling, and recreation industries, local government, and personal and laundry services.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Cashiers	41-2010	3,527,000	3,411,000	-116,000	-3
Cashiers, except gaming	41-2011	3,500,000	3,382,000	-118,000	-3
Gaming change persons and booth cashiers	41-2012	27,000	29,000	1,800	7

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Job Outlook

Overall cashier employment is expected to decline, but job growth will be strong for gaming cashiers. Opportunities for full-time and part-time jobs are expected to be good because of the need to replace the large number of workers who leave this occupation.

Employment change. Employment of cashiers is expected to decline 3 percent between 2006 and 2016. The rising popularity of purchasing goods online will negatively affect the employment growth of cashiers, although many customers still prefer the traditional method of purchasing goods at stores. Also, the growing use of self-service check-out systems in retail trade, especially at grocery stores, should have an adverse effect on employment of cashiers. These self-checkout systems may outnumber checkouts with cashiers in the future in many establishments. The impact on job growth for cashiers will largely depend on the public's acceptance of this self-service technology.

Job growth will be strong for gaming cashiers as more states legalize casinos and gaming becomes more popular. An increasing number of gaming venues will generate new jobs. However, many casinos are finding ways to use less cash in their operations, particularly the slot machines, which now generate tickets that can be accepted by other slot machines.

Job prospects. Opportunities for full-time and part-time cashier jobs should continue to be good because of the need to replace the large number of workers who transfer to other occupations or leave the labor force. There is substantial movement into and out of the occupation because education and training requirements are minimal and the predominance of part-time jobs is attractive to people seeking a short-term source of income rather than a full-time career. Historically, workers under the age of 25 have filled many of the openings in this occupation. In 2006, almost half of all cashiers were 24 years of age or younger.

Because cashiers are needed in businesses and organizations of all types and sizes, job opportunities are found throughout the country. But job opportunities may vary from year to year because the strength of the economy affects demand for cashiers. Companies tend to hire more cashiers when the economy is strong. Seasonal demand for cashiers also causes fluctuations in employment.

Earnings

Many cashiers start at the federal minimum wage, which was $5.85 an hour in 2007. Some state laws set the minimum wage higher, and establishments must pay at least that amount. Wages tend to be higher in areas where there is intense competition for workers.

Median hourly earnings of cashiers, except gaming in May 2006 were $8.08. The middle 50 percent earned between $6.99 and $9.44 an hour. The lowest 10 percent earned less than $6.18, and the highest 10 percent earned more than $11.64 an hour. Median hourly earnings in the industries employing the largest numbers of cashiers in May 2006 were:

Grocery stores	$8.20
Health and personal care stores	8.15
Department stores	8.10
Other general merchandise stores	8.09
Gasoline stations	7.82

Median hourly earnings for gaming cashiers in May 2006 were $9.94. The middle 50 percent earned between $8.16 and $12.22 an hour. The lowest 10 percent earned less than $6.98, and the highest 10 percent earned more than $14.50 an hour. Median hourly earnings in the industries employing the largest numbers of gaming cashiers in May 2006 were:

Casino hotels	$11.64
Traveler accommodation	11.61
Local government	9.50
Gambling industries	9.45

Benefits for full-time cashiers tend to be better than those for cashiers working part time. In addition to typical benefits, those working in retail establishments often receive discounts on purchases, and cashiers in restaurants may receive free or low-cost meals. Some employers also offer employee stock option plans and education reimbursement plans.

Related Occupations

Cashiers accept payment for the purchase of goods and services. Other workers with similar duties include tellers, counter and rental clerks, food and beverage serving and related workers, gaming cage workers, Postal Service workers, and retail salespersons.

Counter and Rental Clerks

(O*NET 41-2021.00)

Significant Points

- Jobs usually require little or no experience or formal education.
- Employment is projected to grow much faster than average as businesses strive to improve customer service.
- Many full-time and part-time job opportunities should be available, primarily because of the need to replace workers who leave this occupation.

In video rental stores, counter clerks advise customers about the use of video and game players and the length of a rental, restock shelves, and handle money.

Nature of the Work

Counter and rental clerks take orders for rentals and services. Many rent cars or home improvement equipment, for example. Regardless of where they work, counter and rental clerks must be knowledgeable about the company's goods and services, policies, and procedures. Depending on the type of establishment, counter and rental clerks use their knowledge to give advice on a wide variety of products and services, ranging from hydraulic tools to shoe repair. For example, in the car rental industry, these workers tell customers about the features of different types of automobiles and about daily and weekly rental costs. They also ensure that customers meet age and other requirements for renting cars, and they indicate when and in what condition the cars must be returned. Those in the equipment rental industry have similar duties but also must know how to operate and care for the machinery rented. In drycleaning establishments, counter clerks inform customers when items will be ready and about the effects, if any, of the chemicals used on certain garments. In video rental stores, counter clerks advise customers about the use of video and game players and the length of the rental period. They scan returned movies and games, restock shelves, handle money, and log daily reports.

When taking orders, counter and rental clerks use various types of equipment. In some establishments, they write out tickets and order forms, although most use computers or barcode scanners. Most of these computer systems are user friendly, require very little data entry, and are customized for each firm. Scanners read the product code and display a description of the item on a computer screen. However, clerks must ensure that the information on the screen matches the product.

Work environment. Firms employing counter and rental clerks usually operate nights and weekends for the convenience of their customers. As a result, many employers offer flexible schedules. Some counter and rental clerks work 40-hour weeks, but many are on part-time schedules—usually during rush periods, such as weekends, evenings, and holidays.

Working conditions usually are pleasant; most stores and service establishments are clean, well lighted, and temperature controlled. However, clerks are on their feet much of the time and may be confined behind a small counter area. Some may need to move, lift, or carry heavy machinery or other equipment. The job requires constant interaction with the public and can be stressful, especially during busy periods.

Training, Other Qualifications, and Advancement

Most counter and rental clerk jobs are entry-level positions that require little or no experience and minimal formal education.

Education and training. Many employers prefer workers with at least a high school diploma. In most companies, counter and rental clerks are trained on the job, sometimes through the use of videos, brochures, and pamphlets.

Clerks usually learn the firm's policies and procedures and how to operate a firm's equipment from more experienced workers. However, some employers have formal classroom training programs lasting between a few hours and a few weeks. Topics covered in this training include the nature of the industry, the company and its policies and procedures, operation of equipment, sales techniques, and customer service. Counter and rental clerks also must become familiar with the different products and services rented or provided by their company to give customers the best possible service.

Other qualifications. Counter and rental clerks should enjoy working with people and should be tactful and polite, even with difficult customers. They also should be able to handle several tasks at once, while continuing to provide friendly service. In addition, good oral and written communication skills are essential.

Advancement. Advancement opportunities depend on the size and type of company. Many establishments that employ counter or rental clerks tend to be small businesses, making advancement difficult. In larger establishments, however, jobs such as counter and rental clerks offer good opportunities for workers to learn about their company's products and business practices. That can lead to more responsible positions. Some counter and rental clerks are promoted to event planner, assistant manager, or salesperson. Some pursue related positions. A clerk that fixes rented equipment might become a mechanic, for example.

In certain industries, such as equipment repair, counter and rental jobs may be an additional or alternative source of income for workers with multiple jobs or for those who are semiretired. For example, retired mechanics could prove invaluable at tool rental centers because of their knowledge of, and familiarity with, tools.

Employment

Counter and rental clerks held about 477,000 jobs in 2006. About 22 percent of clerks worked in consumer goods rental, which includes video rental stores. Other large employers included drycleaning and laundry services; automotive equipment rental and leasing services; automobile dealers; amusement, gambling, and recreation industries; and grocery stores.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Counter and rental clerks	41-2021	477,000	586,000	109,000	23

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Counter and rental clerks are employed throughout the country but are concentrated in metropolitan areas, where personal services and renting and leasing services are in greater demand.

Job Outlook

Much faster than average employment growth coupled with the need to replace workers who leave this occupation should result in many full-time and part-time job opportunities.

Employment change. Employment of counter and rental clerks is expected to increase by 23 percent during the 2006–2016 decade, much faster than the average for all occupations. Because all types of businesses strive to improve customer service by hiring more clerks, fast employment growth is expected in most industries; growth in amusement and recreation industries is expected to be especially fast.

Job prospects. Many full-time and part-time job opportunities should be available, primarily because of the need to replace experienced workers who transfer to other occupations or leave the labor force.

Earnings

Counter and rental clerks typically start at the minimum wage, which, in establishments covered by federal law, was $5.85 an hour in 2007. In some states, the law sets the minimum wage higher, and establishments must pay at least that amount. Wages also tend to be higher in areas where there is intense competition for workers. In addition to wages, some counter and rental clerks receive commissions based on the number of contracts they complete or services they sell.

Median hourly earnings of counter and rental clerks in May 2006 were $9.41. The middle 50 percent earned between $7.58 and $13.05 an hour. The lowest 10 percent earned less than $6.56 an hour, and the highest 10 percent earned more than $18.17 an hour. Median hourly earnings in the industries employing the largest number of counter and rental clerks in May 2006 were:

Automobile dealers	$19.15
Automotive equipment rental and leasing	10.79
Lessors of real estate	10.31
Consumer goods rental	8.07
Drycleaning and laundry services	7.95

Full-time workers typically receive health and life insurance, paid vacation, and sick leave. Benefits for counter and rental clerks who work part time or work for independent stores tend to be significantly less than for those who work full time. Many companies offer discounts to full-time and part-time employees on the goods or services they provide.

Related Occupations

Counter and rental clerks take orders and receive payment for services rendered. Other workers with similar duties include tellers, cashiers, food and beverage serving and related workers, gaming cage workers, Postal Service workers, and retail salespersons.

Demonstrators, Product Promoters, and Models

(O*NET 41-9011.00 and 41-9012.00)

Significant Points

- Job openings should be plentiful for demonstrators and product promoters, but keen competition is expected for modeling jobs.
- Most jobs are part time or have variable work schedules, and many jobs require frequent travel.
- Formal training is limited and education beyond high school usually is not required.

Nature of the Work

Demonstrators, product promoters, and models create public interest in buying products such as clothing, cosmetics, food, and housewares. The information they provide helps consumers make choices among the wide variety of products and services they can buy.

Demonstrators and product promoters encourage people and stores to buy a product by demonstrating it to prospective customers and answering their questions. They may sell the demonstrated merchandise or gather names of prospects to contact later or pass on to sales staff. *Demonstrators* promote sales of a product to consumers, while *product promoters* encourage sales to retail stores and help them market products effectively.

Demonstrators and product promoters generate sales of both sophisticated and simple products, ranging from computer software to mops. They attract an audience by offering samples, administering contests, distributing prizes and coupons, and using direct-mail advertising. They must greet and catch the attention of possible customers and quickly identify those who are interested and able to buy. They inform and educate customers about the features of products and demonstrate their use with apparent ease to inspire confidence in the product and its manufacturer. They also distribute information, such as brochures and order forms. Some demonstrations are intended to generate immediate sales through impulse buying, whereas others increase the likelihood of future sales by increasing brand awareness.

Demonstrations and product promotions are conducted in retail and grocery stores, shopping malls, trade shows, and outdoor fairs.

Demonstrators and product promoters often provide customers with free samples to encourage them to buy a product.

Locations are selected based on the nature of the product and the type of audience. Demonstrations at large events may require teams of demonstrators to efficiently handle large crowds. Some demonstrators promote products on videotape or on television programs, such as "infomercials" or home shopping programs.

Demonstrators and product promoters may prepare the content of a presentation and alter it to target a specific audience or to keep it current. They may participate in the design of an exhibit or customize it for particular audiences. Results obtained by demonstrators and product promoters are analyzed, and presentations are adjusted to make them more effective. Demonstrators and product promoters also may be involved in transporting, assembling, and disassembling materials used in demonstrations.

A demonstrator's presentation may include visuals, models, case studies, testimonials, test results, and surveys. The equipment used for a demonstration varies with the product being demonstrated. A food product demonstration might require the use of cooking utensils, while a software demonstration could require the use of a multimedia computer. Demonstrators must be familiar with the product to be able to relate detailed information to customers and to answer any questions that arise before, during, or after a demonstration. Therefore, they may research the product presented, the products of competitors, and the interests and concerns of the target audience before conducting a demonstration. Demonstrations of complex products often need practice.

Models pose for photos, paintings, or sculptures. They display clothing, such as dresses, coats, underclothing, swimwear, and suits, for a variety of audiences and in various types of media. They model accessories, such as handbags, shoes, and jewelry, and promote beauty products, including fragrances and cosmetics. The most successful models, called supermodels, hold celebrity status and often use their image to sell books, calendars, fitness videos, and other products. In addition to modeling, they may appear in movies and television shows.

Models appear in printed publications, live modeling events, and television to advertise and promote products and services. Most modeling jobs are for printed publications, and models usually do a combination of editorial, commercial, and catalog work. Editorial print modeling uses still photographs of models for fashion magazine covers and to accompany feature articles. Commercial print modeling includes work for advertisements in magazines, newspapers, and billboards. Catalog models appear in department store and mail order catalogs.

During a photo shoot, a model poses to demonstrate the features of clothing and products. Models make small changes in posture and facial expression to capture the look desired by the client. As they shoot film, photographers instruct models to pose in certain positions and to interact with their physical surroundings. Models work closely with photographers, hair and clothing stylists, makeup artists, and clients to produce the desired look and to finish the photo shoot on schedule. Stylists and makeup artists prepare the model for the photo shoot, provide touchups, and change the look of models throughout the day. If stylists are not provided, models must apply their own makeup and bring their own clothing. Because the client spends time and money planning for and preparing an advertising campaign, the client usually is present to ensure that the work is satisfactory.

Editorial printwork generally pays less than other types of modeling but provides exposure for a model and can lead to commercial modeling opportunities. Often, beginning fashion models work in foreign countries where fashion magazines are more plentiful.

Live modeling is done in a variety of locations. Live models stand, turn, and walk to demonstrate clothing to a variety of audiences. At fashion shows and in showrooms, garment buyers are the primary audience. Runway models display clothes that either are intended for direct sale to consumers or are the artistic expressions of the designer. High fashion, or haute couture, runway models walk a runway before an audience of photographers, journalists, designers, and garment buyers. Live modeling also is done in apparel marts, department stores, and fitting rooms of clothing designers. In retail establishments, models display clothing directly for shoppers and may be required to describe the features and price of the clothing. Other models pose for sketch artists, painters, and sculptors.

Models may compete with actors and actresses for work in television and may even receive speaking parts. Television work includes commercials, cable television programs, and even game shows. However, competition for television work is intense because of the potential for high earnings and extensive exposure.

Because advertisers need to target very specific segments of the population, models may specialize in a certain area. Petite and plus-size fashions are modeled by women whose dress size is smaller or larger than that worn by the typical model. Models who are disabled may be used to model fashions or products for disabled consumers. "Parts" models have a body part, such as a hand or foot, which is particularly well-suited to model products such as fingernail polish or shoes.

Almost all models work through agents. Agents provide a link between models and clients. Clients pay models, while the agency receives a portion of the model's earnings for its services. Agents scout for new faces, advise and train new models, and promote them to clients. A typical modeling job lasts only 1 day, so modeling agencies differ from other employment agencies in that they maintain an ongoing relationship with the model. Agents find and nurture relationships with clients, arrange auditions called "go-sees," and book shoots if a model is hired. They also provide bookkeeping and billing services to models and may offer them financial planning services. Relatively short careers and variable incomes make financial planning an important issue for many models.

With the help of agents, models spend a considerable amount of time promoting and developing themselves. Models assemble and maintain portfolios, print composite cards, and travel to go-sees. A portfolio is a collection of a model's previous work that is carried to all go-sees and bookings. A composite card contains the best photographs from a model's portfolio, along with his or her measurements. Increasingly, composite cards are being sent electronically to clients and printed portfolios are being replaced with digital portfolios.

Models must gather information before a job. From an agent, they learn the pay, date, time, and length of the shoot. Also, models need to ask if hair, makeup, and clothing stylists will be provided. It is helpful to know what product is being promoted and what image they should project. Some models research the client and the product being modeled to prepare for a shoot. Models use a document called a voucher to record the rate of pay and the actual duration of the job. The voucher is used for billing purposes after both the client and model sign it. Once a job is completed, models must check in with their agency and plan for the next appointment.

Work environment. More than half of all demonstrators, product promoters, and models work part time and about 1 in 4 have variable work schedules. Many positions last 6 months or less.

Demonstrators and product promoters may work long hours while standing or walking, with little opportunity to rest. Some of them travel frequently, and night and weekend work often is required. The atmosphere of a crowded trade show or state fair is often hectic, and demonstrators and product promoters may feel pressure to influence the greatest number of consumers possible in a very limited amount of time. However, many enjoy the opportunity to interact with a variety of people.

Models work under a variety of conditions, which can often be both difficult and glamorous. The coming season's fashions may be modeled in a comfortable, climate-controlled studio or in a cold, damp outdoor location. Schedules can be demanding, and models must keep in constant touch with an agent so that they do not miss an opportunity for work. Being away from friends and family, and needing to focus on the photographer's instructions despite constant interruption for touchups, clothing, and set changes can be stressful. Yet, successful models interact with a variety of people and enjoy frequent travel. They may meet potential clients at several go-sees in one day and often travel to work in distant cities, foreign countries, and exotic locations.

Training, Other Qualifications, and Advancement

Postsecondary education, while helpful, usually is not required for demonstrators, product promoters, and models.

Education and training. Demonstrators and product promoters usually receive on-the-job training. Training is primarily product oriented because a demonstrator must be familiar with the product to demonstrate it properly. The length of training varies with the complexity of the product. Experience with the product or familiarity with similar products may be required for demonstration of complex products, such as computers. During the training process, demonstrators may be introduced to the manufacturer's corporate philosophy and preferred methods for dealing with customers.

Some aspiring models opt to attend modeling schools. Modeling schools provide training in posing, walking, makeup application, and other basic tasks, but attending such schools does not necessarily lead to job opportunities. In fact, many agents prefer beginning models with little or no previous experience and discourage models from attending modeling schools and purchasing professional photographs. Agents continually scout for new faces, and many of the top models are discovered in this way. Most agencies review snapshots or have "open calls", during which models are seen in person; this service usually is provided free of charge. Some agencies sponsor modeling contests and searches. Very few people who send in snapshots or attend open calls are offered contracts.

Agencies advise models on how to dress, wear makeup, and conduct themselves properly during go-sees and bookings. Because models' advancement depends on their previous work, development of a good portfolio is key to getting assignments. The higher the quality and currency of the photos in the portfolio, the more likely it is that the model will find work.

Other qualifications. Employers look for demonstrators and product promoters with good communication skills and a pleasant appearance and personality. Demonstrators and product promoters must be comfortable with public speaking. They should be able to entertain an audience and use humor, spontaneity, and personal interest in the product as promotional tools. Foreign language skills are helpful.

Models should be photogenic and have a basic knowledge of hair styling, makeup, and clothing. Some local governments require models under the age of 18 to hold a work permit. An attractive physical appearance is necessary to become a successful model. A model should have flawless skin, healthy hair, and attractive facial features. Specific requirements depend on the client, but most models must be within certain ranges for height, weight, and clothing size in order to meet the practical needs of fashion designers, photographers, and advertisers. Requirements may change slightly from time to time as our society's perceptions of physical beauty change. However, most fashion designers feel that their clothing looks best on tall, thin models. Although physical requirements may be relaxed for some types of modeling jobs, opportunities are limited for those who do not meet these basic requirements.

A model's career depends on preservation of his or her physical characteristics, so models must control their diet, exercise regularly, and get enough sleep in order to stay healthy. Haircuts, pedicures, and manicures are necessary work-related expenses for models.

In addition to being attractive, models must be photogenic. The ability to relate to the camera in order to capture the desired look on film is essential and agents test prospective models using snapshots or professional photographs. For photographic and runway work, models must be able to move gracefully and confidently. Training in acting, voice, and dance is useful and allows a model to be considered for television work. Foreign language skills are useful because successful models travel frequently to foreign countries.

Models must interact with a large number of people and personality plays an important role in success. They must be professional, polite, and prompt as every contact could lead to future employment. Organizational skills are necessary to manage personal lives, financial matters, and work and travel schedules. Competition for jobs is keen and clients' needs are very specific so patience and persistence are essential.

Advancement. Demonstrators and product promoters who perform well and show leadership abilities may advance to other marketing and sales occupations or open their own business.

Models advance by working more regularly and being selected for assignments that have higher pay. They may begin to appear in magazine, print campaigns, commercials, or runway shows with a higher profile. They may begin to work with clients who will provide them with more national exposure. A model's selection of an agency is an important factor for advancement in the occupation. The better the reputation and skill of the agency, the more assignments a model is likely to get. Prospective clients prefer to work with agents, making it very difficult for a model to pursue a freelance career. Modeling careers are relatively short and most models eventually transfer to other occupations.

Employment

Demonstrators, product promoters, and models held about 107,000 jobs in 2006. Of these, models held only about 2,000 jobs in 2006. About 22 percent of all salaried jobs for demonstrators, product promoters, and models were in retail trade, especially general merchandise stores, and 14 percent were in administrative and support

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Models, demonstrators, and product promoters	41-9010	107,000	126,000	19,000	18
Demonstrators and product promoters	41-9011	105,000	124,000	19,000	18
Models	41-9012	2,000	2,200	200	10

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

services—which includes employment services. Other jobs were found in advertising and related services.

Job Outlook

Employment of demonstrators, product promoters, and models is expected to grow faster than the average for all occupations through 2016. Job openings for demonstrators and product promoters should be plentiful over the next decade but models should face keen competition for the small number of openings.

Employment change. Demonstrators and product promoters are expected to experience 18 percent growth between 2006 and 2016, which is faster than the average for all occupations. Job growth should be driven by increases in the number and size of trade shows and greater use of these workers in department stores and various retail shops for in-store promotions. Product demonstration is considered a very effective marketing tool. New jobs should arise as firms devote a greater percentage of marketing budgets to product demonstration. However, it is also an expensive method of marketing, which will somewhat limit growth.

Employment of models is expected to grow by 10 percent between 2006 and 2016, which is as fast as the average for all occupations. Growth in the employment of models will be driven by their continued use in advertising products. Advertisers will continue to use models in fashion shows, catalogs, and print campaigns as a method to increase awareness of their product.

Job prospects. Job openings should be plentiful for demonstrators and product promoters. Employers may have difficulty finding qualified demonstrators who are willing to fill part-time, short-term positions. On the other hand, modeling is considered a glamorous occupation, with limited formal entry requirements. Consequently, those who wish to pursue a modeling career can expect keen competition for jobs. The modeling profession typically attracts many more jobseekers than there are job openings available. Only models who closely meet the unique requirements of the occupation will achieve regular employment. The increasing diversification of the general population should boost demand for models more representative of diverse racial and ethnic groups. Work for male models also should increase as society becomes more receptive to the marketing of men's fashions. Because fashions change frequently, demand for a model's look may fluctuate. Most models experience periods of unemployment.

Employment of demonstrators, product promoters, and models is affected by downturns in the business cycle. Many firms tend to reduce advertising budgets during recessions.

Earnings

Demonstrators and product promoters had median hourly earnings of $10.65 in May 2006. The middle 50 percent earned between $8.77 and $13.91. The lowest 10 percent earned less than $7.70, and the highest 10 percent earned more than $19.27. Employers of demonstrators, product promoters, and models generally pay for job-related travel expenses.

Median hourly earnings of models were $11.22 in May 2006. The middle 50 percent earned between $9.52 and $14.42. The lowest 10 percent earned less than $7.67, and the highest 10 percent earned more than $18.68. Earnings vary for different types of modeling, and depend on the experience and reputation of the model. Female models typically earn more than male models for similar work. Hourly earnings can be relatively high, particularly for supermodels and others in high demand, but models may not have work every day, and jobs may last only a few hours. Models occasionally receive clothing or clothing discounts instead of, or in addition to, regular earnings. Almost all models work with agents, and pay 15 to 20 percent of their earnings in return for an agent's services. Models who do not find immediate work may receive payments, called advances, from agents to cover promotional and living expenses. Models must provide their own health and retirement benefits.

Related Occupations

Demonstrators, product promoters, and models create public interest in buying clothing, products, and services. Others who create interest in a product or service include actors, producers, and directors; insurance sales agents; real estate brokers; retail salespersons; sales representatives, wholesale and manufacturing; and reservation and transportation ticket agents and travel clerks.

Sources of Additional Information

For information about modeling schools and agencies in your area, contact a local consumer affairs organization such as the Better Business Bureau.

Insurance Sales Agents

(O*NET 41-3021.00)

Significant Points

- In addition to offering insurance policies, agents increasingly sell mutual funds, annuities, and securities and offer comprehensive financial planning services, including retirement and estate planning.
- Agents must obtain a license in the states where they sell.
- Job opportunities should be good for college graduates who have sales ability, excellent interpersonal skills, and expertise in a wide range of insurance and financial services.

Nature of the Work

Most people have their first contact with an insurance company through an insurance sales agent. These workers help individuals, families, and businesses select insurance policies that provide the best protection for their lives, health, and property.

Insurance sales agents, commonly referred to as *producers* in the insurance industry, sell one or more types of insurance, such as

Insurance sales agents carefully review the terms of a new policy with their clients.

property and casualty, life, health, disability, and long-term care. Property and casualty insurance agents sell policies that protect individuals and businesses from financial loss resulting from automobile accidents, fire, theft, storms, and other events that can damage property. For businesses, property and casualty insurance can also cover injured workers' compensation, product liability claims, or medical malpractice claims.

Life insurance agents specialize in selling policies that pay beneficiaries when a policyholder dies. Depending on the policyholder's circumstances, a cash-value policy can be designed to provide retirement income, funds for the education of children, or other benefits. Life insurance agents also sell annuities that promise a retirement income. Health insurance agents sell health insurance policies that cover the costs of medical care and loss of income due to illness or injury. They also may sell dental insurance and short-term- and long-term-disability insurance policies. Agents may specialize in any one of these product areas, or function as generalists, providing multiple products to a single customer.

An increasing number of insurance sales agents are offering comprehensive financial planning services to their clients. These services include retirement planning, estate planning, and assistance in setting up pension plans for businesses. As a result, many insurance agents are involved in "cross-selling" or "total account development". Besides offering insurance, these agents may become licensed to sell mutual funds, variable annuities, and other securities. This practice is most common with life insurance agents who already sell annuities, but many property and casualty agents also sell financial products. (See the statement on securities, commodities, and financial services sales agents elsewhere in the *Handbook*.)

Insurance sales agents also prepare reports, maintain records, and seek out new clients. In the event that policy holders experience a loss, agents help them settle their insurance claims. Increasingly, some agents are also offering their clients financial analysis or advice on how to minimize risk.

Insurance sales agents working exclusively for one insurance company are referred to as *captive agents*. Independent insurance agents, or *brokers*, represent several companies and match insurance policies for their clients with the company that offers the best rate and coverage.

Technology has greatly affected the insurance business, making it much more efficient and giving the agent the ability to take on more clients. Agents' computers are now linked directly to insurance carriers via the Internet, making the tasks of obtaining price quotes and processing applications and service requests faster and easier. Computers also allow agents to be better informed about new products that the insurance carriers may be offering.

The growing use of the Internet in the insurance industry has altered the relationship between agent and client. Agents formerly used to devote much of their time to marketing and selling products to new clients. Now, clients are increasingly obtaining insurance quotes from a company's Web site and then contacting the company directly to purchase policies. This interaction gives the client a more active role in selecting their policy, while reducing the amount of time agents spend actively seeking new clients. Insurance sales agents also obtain many new accounts through referrals, so it is important that they maintain regular contact with their clients to ensure that the clients' financial needs are being met. Developing a satisfied clientele that will recommend an agent's services to other potential customers is a key to success for agents.

Increasing competition in the insurance industry has spurred carriers and agents to find new ways to keep their clients satisfied. One solution is to increase the use of call centers, which usually are accessible to clients 24 hours a day, 7 days a week. Insurance carriers and sales agents also are hiring customer service representatives to handle routine tasks such as answering questions, making changes in policies, processing claims, and selling more products to clients. The opportunity to cross-sell new products to clients will help agents' businesses grow. The use of call centers also allows agents to concentrate their efforts on seeking out new clients and maintaining relationships with old ones. (See elsewhere in the *Handbook* the statements on customer service representatives and claims adjusters, appraisers, examiners, and investigators.)

Work environment. Insurance sales agents working as captive agents are usually based in small offices, from which they contact clients and provide information on the policies they sell. Independent insurance agents, or brokers, may work in offices of varying sizes, depending on the size of the agency. However, much of their time may be spent outside their offices, traveling locally to meet with clients, close sales, or investigate claims. Agents usually determine their own hours of work and often schedule evening and weekend appointments for the convenience of clients. Some sales agents may meet with clients during business hours and then spend evenings doing paperwork and preparing presentations to prospective clients. Although most agents work a 40-hour week, some work 60 hours a week or longer.

Training, Other Qualifications, and Advancement

Every sales agent involved in the solicitation, selling, or negotiation of insurance must have a state issued license. Licensure requirements vary by state but typically require some insurance-related coursework and the passing of several exams. Although some agents are hired right out of college, many are hired by insurance companies as customer service representatives and are later promoted to sales agent.

Education and training. For insurance sales agent jobs, many companies and independent agencies prefer to hire college graduates—especially those who have majored in business or economics.

High school graduates may be hired if they have proven sales ability or have been successful in other types of work.

College training can help agents grasp the technical aspects of insurance policies as well as the industry fundamentals and operational procedures of selling insurance. Many colleges and universities offer courses in insurance, and a few schools offer a bachelor's degree in the field. College courses in finance, mathematics, accounting, economics, business law, marketing, and business administration enable insurance sales agents to understand how social and economic conditions relate to the insurance industry. Courses in psychology, sociology, and public speaking can prove useful in improving sales techniques. In addition, familiarity with computers and popular software packages has become very important because computers provide instantaneous information on a wide variety of financial products and greatly improve agents' efficiency.

Agents learn many of their job duties on the job from other agents. Many employers have their new agents shadow an experienced agent for a period of time. This allows the agent to learn how to conduct their business, how the agency interacts with clients, and how to write policies.

Employers also are placing greater emphasis on continuing professional education as the diversity of financial products sold by insurance agents increases. It is important for insurance agents to keep up to date on issues concerning clients. Changes in tax laws, government benefits programs, and other state and federal regulations can affect the insurance needs of clients and the way in which agents conduct business. Agents can enhance their selling skills and broaden their knowledge of insurance and other financial services by taking courses at colleges and universities and by attending institutes, conferences, and seminars sponsored by insurance organizations.

Licensure. Insurance sales agents must obtain a license in the states where they plan to work. Separate licenses are required for agents to sell life and health insurance and property and casualty insurance. In most states, licenses are issued only to applicants who complete specified prelicensing courses and who pass state examinations covering insurance fundamentals and state insurance laws. The insurance industry is increasingly moving toward uniform state licensing standards and reciprocal licensing, allowing agents who earn a license in one state to become licensed in other states more easily. Most state licensing authorities also have mandatory continuing education requirements focusing on insurance laws, consumer protection, ethics, and the technical details of various insurance policies.

As the demand for financial products and financial planning increases, many insurance agents, especially those involved in life insurance, are choosing to gain the proper licensing and certification to sell securities and other financial products. Doing so, however, requires substantial study and passing an additional examination—either the Series 6 or Series 7 licensing exam, both of which are administered by the National Association of Securities Dealers (NASD). The Series 6 exam is for individuals who wish to sell only mutual funds and variable annuities, whereas the Series 7 exam is the main NASD series license that qualifies agents as general securities sales representatives.

Other qualifications. Previous experience in sales or insurance jobs can be very useful in becoming an insurance sales agent. In fact, many entrants to insurance sales agent jobs transfer from other sales related occupations, such as customer service representative positions. In selling commercial insurance, technical experience in a particular field can help sell policies to those in the same profession. As a result, new agents tend to be older than entrants in many other occupations.

Insurance sales agents should be flexible, enthusiastic, confident, disciplined, hard working, and willing to solve problems. They should communicate effectively and inspire customer confidence. Because they usually work without supervision, sales agents must be able to plan their time well and have the initiative to locate new clients.

Certification and advancement. A number of organizations offer professional designation programs that certify agents' expertise in specialties such as life, health, and property and casualty insurance, as well as financial consulting. For example, The National Alliance for Education and Research offers a wide variety of courses in health, life and property, and casualty insurance for independent insurance agents. Although voluntary, such programs assure clients and employers that an agent has a thorough understanding of the relevant specialty. Agents are usually required to complete a specified number of hours of continuing education to retain their designation.

In the area of financial planning, many agents find it worthwhile to demonstrate competency by earning the certified financial planner or chartered financial consultant designation. The Certified Financial Planner credential, issued by the Certified Financial Planner Board of Standards, requires relevant experience, completion of education requirements, passing a comprehensive examination, and adherence to an enforceable code of ethics. The exam tests the candidate's knowledge of the financial planning process, insurance and risk management, employee benefits planning, taxes and retirement planning, and investment and estate planning.

The Chartered Financial Consultant (ChFC) and the Chartered Life Underwriter (CLU) designations, issued by the American College in Bryn Mawr, Pennsylvania, typically require professional experience and the completion of an eight-course program of study. Many property and casualty insurance agents obtain the Chartered Property Casualty Underwriter (CPCU) designation, offered by the American Institute for Chartered Property Casualty Underwriter. The majority of professional designations in insurance have continuing education requirements.

An insurance sales agent who shows ability and leadership may become a sales manager in a local office. A few advance to agency managerial or executive positions. However, many who have built up a good clientele prefer to remain in sales work. Some—particularly in the property and casualty field—establish their own independent agencies or brokerage firms.

Employment

Insurance sales agents held about 436,000 jobs in 2006. Almost 50 percent of insurance sales agents work for insurance agencies and brokerages. About 23 percent work directly for insurance carriers. Although most insurance agents specialize in life and health insurance or property and casualty insurance, a growing number of "multiline" agents sell all lines of insurance. A small number of agents work for banks and securities brokerages as a result of the increasing integration of the finance and insurance industries. Approximately 26 percent of insurance sales agents are self employed.

Insurance sales agents are employed throughout the country, but most work in or near large urban centers. Some are employed in the headquarters of insurance companies, but the majority work out of local offices or independent agencies.

Job Outlook

Employment of insurance sales agents is expected to grow about average for all occupations through 2016, and opportunities will be favorable for persons who are college graduates and who have sales

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Insurance sales agents	41-3021	436,000	492,000	56,000	13

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

ability, excellent interpersonal skills, and expertise in a wide range of insurance and financial services.

Employment change. Employment of insurance sales agents is expected to increase by 13 percent over the 2006–2016 period, which is about as fast as average for all occupations. Future demand for insurance sales agents depends largely on the volume of sales of insurance and other financial products. Sales of health insurance and long-term-care insurance are expected to rise sharply as the population ages. In addition, a growing population will increase demand for insurance for automobiles, homes, and high-priced valuables and equipment. As new businesses emerge and existing firms expand their insurance coverage, sales of commercial insurance also should increase, including coverage such as product liability, workers' compensation, employee benefits, and pollution liability insurance.

Employment of agents will not keep up with the rising level of insurance sales, however. Many insurance carriers are trying to contain costs and are shedding their captive agents—those agents working directly for insurance carriers. Instead carriers are relying more on independent agents or direct marketing through the mail, by phone, or on the Internet.

In many ways, the Internet should not greatly threaten agents' jobs as was widely thought. The automation of policy and claims processing is allowing insurance agents to take on more clients. Most clients value their relationship with their agent and still prefer discussing their policies directly with their agents, rather than through a computer.

Insurance and investments are becoming more complex, and many people and businesses lack the time and expertise to buy insurance without the advice of an agent.

Job prospects. Multilingual agents should have good job prospects because they can serve a wider range of customers. Additionally, insurance language tends to be quite technical, so agents who have a firm understanding of relevant technical and legal terms will also be desirable to employers. Many beginning agents fail to earn enough from commissions to meet their income goals and eventually transfer to other careers. Many job openings are likely to result from the need to replace agents who leave the occupation or retire, as a large number of agents are expected to retire over the next decade.

Agents may face increased competition from traditional securities brokers and bankers as they begin to sell insurance policies. Insurance sales agents will need to expand the products and services they offer as consolidation increases among insurance companies, banks, and brokerage firms and as demands increase from clients for more comprehensive financial planning.

Independent agents who incorporate new technology into their existing businesses will remain competitive. Agents who use the Internet to market their products will reach a broader client base and expand their business. Agents who offer better customer service also will remain competitive. Carriers and agencies are increasingly using call centers in an effort to offer better service to customers because they provide greater access to clients' policies and more prompt services.

Most individuals and businesses consider insurance a necessity, regardless of economic conditions, so agents are not likely to face unemployment because of a recession.

Earnings

The median annual earnings of wage and salary insurance sales agents were $43,870 in May 2006. The middle 50 percent earned between $31,640 and $69,180. The lowest 10 percent had earnings of $24,600 or less, while the highest 10 percent earned more than $115,090. Median annual earnings in May 2006 in the two industries employing the largest number of insurance sales agents were $46,210 for insurance carriers, and $42,950 for agencies, brokerages, and other insurance related activities.

Many independent agents are paid by commission only, whereas sales workers who are employees of an agency or an insurance carrier may be paid in one of three ways: salary only, salary plus commission, or salary plus bonus. In general, commissions are the most common form of compensation, especially for experienced agents. The amount of the commission depends on the type and amount of insurance sold and on whether the transaction is a new policy or a renewal. Bonuses usually are awarded when agents meet their sales goals or when an agency meets its profit goals. Some agents involved with financial planning receive a fee for their services, rather than a commission.

Company-paid benefits to insurance sales agents usually include continuing education, training to qualify for licensing, group insurance plans, office space, and clerical support services. Some companies also may pay for automobile and transportation expenses, attendance at conventions and meetings, promotion and marketing expenses, and retirement plans. Independent agents working for insurance agencies receive fewer benefits, but their commissions may be higher to help them pay for marketing and other expenses.

Related Occupations

Other workers who provide or sell financial products or services include real estate brokers and sales agents; securities, commodities, and financial services sales agents; financial analysts and personal financial advisors; and financial managers. Occupations with similar sales duties include sales representatives, wholesale and manufacturing; customer service representatives, and advertising sales agents. Other occupations in the insurance industry include insurance underwriters and claims adjusters, examiners, and investigators.

Sources of Additional Information

Occupational information about insurance sales agents is available from the home office of many insurance companies. Information on state licensing requirements may be obtained from the department of insurance at any state capital.

Real Estate Brokers and Sales Agents

(O*NET 41-9021.00 and 41-9022.00)

Significant Points

- Real estate brokers and sales agents often work evenings and weekends and usually are on call to suit the needs of clients.
- A license is required in every state and the District of Columbia.
- Although gaining a job may be relatively easy, beginning workers face competition from well-established, more experienced agents and brokers.
- Employment is sensitive to swings in the economy, especially interest rates; during periods of declining economic activity and rising interest rates, the volume of sales and the resulting demand for sales workers fall.

Nature of the Work

One of the most complex and significant financial events in peoples' lives is the purchase or sale of a home or investment property. Because of this complexity and significance, people typically seek the help of real estate brokers and sales agents when buying or selling real estate.

Real estate brokers and sales agents have a thorough knowledge of the real estate market in their communities. They know which neighborhoods will best fit clients' needs and budgets. They are familiar with local zoning and tax laws and know where to obtain financing. Agents and brokers also act as intermediaries in price negotiations between buyers and sellers.

When selling property, brokers and agents arrange for title searches to verify ownership and for meetings between buyers and sellers during which they agree to the details of the transactions and in a final meeting, the new owners take possession of the property. They also may help to arrange favorable financing from a lender for the prospective buyer; often, this makes the difference between success and failure in closing a sale. In some cases, brokers and agents assume primary responsibility for closing sales; in others, lawyers or lenders do.

Agents and brokers spend a significant amount of time looking for properties to sell. They obtain listings—agreements by owners to place properties for sale with the firm. When listing a property for sale, agents and brokers compare the listed property with similar properties that recently sold, in order to determine a competitive market price for the property. Following the sale of the property, both the agent who sold it and the agent who obtained the listing receive a portion of the commission. Thus, agents who sell a property that they themselves have listed can increase their commission.

Before showing residential properties to potential buyers, agents meet with them to get an idea of the type of home the buyers would like. In this prequalifying phase, the agent determines how much the buyers can afford to spend. In addition, the agent and the buyer usually sign a loyalty contract, which states that the agent will be the only one to show houses to the buyer. An agent or broker then generates lists of properties for sale, their location and description, and available sources of financing. In some cases, agents and brokers use computers to give buyers a virtual tour of properties that interest them.

Agents may meet several times with prospective buyers to discuss and visit available properties. Agents identify and emphasize the most pertinent selling points. To a young family looking for a house, for example, they may emphasize the convenient floor plan, the area's low crime rate, and the proximity to schools and shopping. To a potential investor, they may point out the tax advantages of owning a rental property and the ease of finding a renter. If bargaining over price becomes necessary, agents must follow their client's instructions carefully and may have to present counteroffers to get the best possible price.

Once the buyer and seller have signed a contract, the real estate broker or agent must make sure that all special terms of the contract are met before the closing date. The agent must make sure that any legally mandated or agreed-upon inspections, such as termite and radon inspections, take place. In addition, if the seller agrees to any repairs, the broker or agent ensures they are made. Increasingly, brokers and agents are handling environmental problems as well, by making sure that the properties they sell meet environmental regulations. For example, they may be responsible for dealing with lead paint on the walls. Loan officers, attorneys, or other people handle many details, but the agent must ensure that they are carried out.

Most real estate brokers and sales agents sell residential property. A small number—usually employed in large or specialized firms—sell commercial, industrial, agricultural, or other types of real estate. Every specialty requires knowledge of that particular type of property and clientele. Selling or leasing business property requires an understanding of leasing practices, business trends, and the location of the property. Agents who sell or lease industrial properties must know about the region's transportation, utilities, and labor supply.

Real estate brokers and sales agents have knowledge of the real estate market and are on call to suit the needs of clients.

Whatever the type of property, the agent or broker must know how to meet the client's particular requirements.

Brokers and agents do the same type of work, but brokers are licensed to manage their own real estate businesses. Agents must work with a broker. They usually provide their services to a licensed real estate broker on a contract basis. In return, the broker pays the agent a portion of the commission earned from the agent's sale of the property. Brokers, as independent businesspeople, often sell real estate owned by others; they also may rent or manage properties for a fee.

Work environment. Advances in telecommunications and the ability to retrieve data about properties over the Internet allow many real estate brokers and sales agents to work out of their homes instead of real estate offices. Even with this convenience, workers spend much of their time away from their desks—showing properties to customers, analyzing properties for sale, meeting with prospective clients, or researching the real estate market.

Agents and brokers often work more than a standard 40-hour week. They usually work evenings and weekends and are usually on call to respond to the needs of clients. Although the hours are long and frequently irregular, most agents and brokers have the freedom to determine their own schedule. They can arrange their work so that they have time off when they want it. Business usually is slower during the winter season.

Training, Other Qualifications, and Advancement

In every state and the District of Columbia, real estate brokers and sales agents must be licensed. Prospective agents must be high school graduates, be at least 18 years old, and pass a written test.

Education and training. Agents and brokers must be high school graduates. In fact, as real estate transactions have become more legally complex, many firms have turned to college graduates to fill positions. A large number of agents and brokers have some college training. College courses in real estate, finance, business administration, statistics, economics, law, and English are helpful. For those who intend to start their own company, business courses such as marketing and accounting are as important as courses in real estate or finance.

More than 1,000 universities, colleges, and community colleges offer courses in real estate. Most offer an associate or bachelor's degree in real estate; some offer graduate degrees. Many local real estate associations that are members of the National Association of Realtors sponsor courses covering the fundamentals and legal aspects of the field. Advanced courses in mortgage financing, property development and management, and other subjects also are available.

Many firms offer formal training programs for both beginners and experienced agents. Larger firms usually offer more extensive programs than smaller firms do.

Licensure. In every state and the District of Columbia, real estate brokers and sales agents must be licensed. Prospective brokers and agents must pass a written examination. The examination—more comprehensive for brokers than for agents—includes questions on basic real estate transactions and laws affecting the sale of property. Most states require candidates for the general sales license to complete between 30 and 90 hours of classroom instruction. To get a broker's license an individual needs between 60 and 90 hours of formal training and a specific amount of experience selling real estate, usually 1 to 3 years. Some states waive the experience requirements for the broker's license for applicants who have a bachelor's degree in real estate.

State licenses typically must be renewed every 1 or 2 years; usually, no examination is needed. However, many states require continuing education for license renewals. Prospective agents and brokers should contact the real estate licensing commission of the state in which they wish to work to verify the exact licensing requirements.

Other qualifications. Personality traits are as important as academic background. Brokers look for agents who have a pleasant personality, honesty, and a neat appearance. Maturity, good judgment, trustworthiness, and enthusiasm for the job are required to attract prospective customers in this highly competitive field. Agents should be well organized, be detail oriented, and have a good memory for names, faces, and business particulars. They must be at least 18 years old.

Those interested in jobs as real estate agents often begin in their own communities. Their knowledge of local neighborhoods is a clear advantage. Under the direction of an experienced agent, beginners learn the practical aspects of the job, including the use of computers to locate or list available properties and identify sources of financing.

Advancement. As agents gain knowledge and expertise, they become more efficient in closing a greater number of transactions and increase their earnings. In many large firms, experienced agents can advance to sales manager or general manager. People who earn their broker's license may open their own offices. Others with experience and training in estimating property value may become real estate appraisers, and people familiar with operating and maintaining rental properties may become property managers. (See the *Handbook* statements on property, real estate, and community association managers; and appraisers and assessors of real estate.) Experienced agents and brokers with a thorough knowledge of business conditions and property values in their localities may enter mortgage financing or real estate investment counseling.

Employment

In 2006, real estate brokers and sales agents held about 564,000 jobs; real estate sales agents held approximately 77 percent of these jobs.

Many real estate brokers and sales agents worked part time, combining their real estate activities with other careers. About 61 percent real estate brokers and sales agents were self-employed. Real estate is sold in all areas, but employment is concentrated in large urban areas and in rapidly growing communities.

Most real estate firms are relatively small; indeed, some are one-person businesses. By contrast, some large real estate firms have several hundred agents operating out of numerous branch offices. Many brokers have franchise agreements with national or regional real estate organizations. Under this type of arrangement, the broker pays a fee in exchange for the privilege of using the more widely known name of the parent organization. Although franchised brokers often receive help in training sales staff and running their offices, they bear the ultimate responsibility for the success or failure of their firms.

Job Outlook

Average employment growth is expected because of the increasing housing needs of a growing population, as well as the perception that real estate is a good investment. Beginning agents and brokers face competition from their well-established, more experienced counterparts.

Employment change. Employment of real estate brokers and sales agents is expected to grow 11 percent during the 2006–2016

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Real estate brokers and sales agents	41-9020	564,000	624,000	60,000	11
Real estate brokers	41-9021	131,000	146,000	15,000	11
Real estate sales agents	41-9022	432,000	478,000	46,000	11

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

projection decade—about as fast as the average for all occupations. Relatively low interest rates and the perception that real estate usually is a good investment may continue to stimulate sales of real estate, resulting in the need for more agents and brokers. However, job growth will be somewhat limited by the increasing use of technology, which is improving the productivity of agents and brokers. For example, prospective customers often can perform their own searches for properties that meet their criteria by accessing real estate information on the Internet. The increasing use of technology is likely to be more detrimental to part-time or temporary real estate agents than to full-time agents because part-time agents generally are not able to compete with full-time agents who have invested in new technology. Changing legal requirements, such as disclosure laws, also may dissuade some who are not serious about practicing full time from continuing to work part time.

Job prospects. In addition to job growth, a large number of job openings will arise from the need to replace workers who transfer to other occupations or leave the labor force. Real estate brokers and sales agents are older, on average, than are most other workers. Historically, many homemakers and retired people were attracted to real estate sales by the flexible and part-time work schedules characteristic of the field. These individuals could enter, leave, and later return to the occupation, depending on the strength of the real estate market, their family responsibilities, or other personal circumstances. Recently, however, the attractiveness of part-time real estate work has declined, as increasingly complex legal and technological requirements are raising startup costs associated with becoming an agent.

Employment of real estate brokers and sales agents often is sensitive to swings in the economy, especially interest rates. During periods of declining economic activity and rising interest rates, the volume of sales and the resulting demand for sales workers falls. As a result, the earnings of agents and brokers decline, and many work fewer hours or leave the occupation altogether.

This occupation is relatively easy to enter and is attractive because of its flexible working conditions; the high interest in, and familiarity with, local real estate markets that entrants often have; and the potential for high earnings. Therefore, although gaining a job as a real estate agent or broker may be relatively easy, beginning agents and brokers face competition from their well-established, more experienced counterparts in obtaining listings and in closing an adequate number of sales.

Well-trained, ambitious people who enjoy selling—particularly those with extensive social and business connections in their communities—should have the best chance for success.

Earnings

The median annual earnings, including commissions, of salaried real estate sales agents were $39,760 in May 2006. The middle 50 percent earned between $26,790 and $65,270 a year. The lowest 10 percent earned less than $20,170, and the highest 10 percent earned more than $111,500. Median annual earnings in the industries employing the largest number of real estate sales agents in May 2006 were:

Residential building construction	$53,390
Land subdivision	49,230
Offices of real estate agents and brokers	39,930
Activities related to real estate	36,510
Lessors of real estate	32,580

Median annual earnings, including commissions, of salaried real estate brokers were $60,790 in May 2006. The middle 50 percent earned between $37,800 and $102,180 a year. Median annual earnings in the industries employing the largest number of real estate brokers in May 2006 were:

Offices of real estate agents and brokers	$64,350
Lessors of real estate	61,030
Activities related to real estate	48,250

Commissions on sales are the main source of earnings of real estate agents and brokers. The rate of commission varies according to whatever the agent and broker agree on, the type of property, and its value. The percentage paid on the sale of farm and commercial properties or unimproved land is typically higher than the percentage paid for selling a home.

Commissions may be divided among several agents and brokers. The broker or agent who obtains a listing usually shares the commission with the broker or agent who sells the property and with the firms that employ each of them. Although an agent's share varies greatly from one firm to another, often it is about half of the total amount received by the firm. Agents who both list and sell a property maximize their commission.

Income usually increases as an agent gains experience, but individual motivation, economic conditions, and the type and location of the property affect earnings, too. Sales workers who are active in community organizations and in local real estate associations can broaden their contacts and increase their earnings. A beginner's earnings often are irregular because a few weeks or even months may go by without a sale. Although some brokers allow an agent to draw against future earnings from a special account, the practice is not common with new employees. The beginner, therefore, should have enough money to live for about 6 months or until commissions increase.

Related Occupations

Selling expensive items such as homes requires maturity, tact, and a sense of responsibility. Other sales workers who find these character traits important in their work include insurance sales agents; retail salespersons; sales representatives, wholesale and manufacturing; and securities, commodities, and financial services sales agents. Although not involving sales, others who need an understanding of real estate include property, real estate, and community association managers, as well as appraisers and assessors of real estate.

Sources of Additional Information

Information on licensing requirements for real estate brokers and sales agents is available from most local real estate organizations or from the state real estate commission or board.

More information about opportunities in real estate is available on the Internet site of the following organization:

➤ National Association of Realtors. Internet: http://www.realtor.org

Retail Salespersons

(O*NET 41-2031.00)

Significant Points

- Good employment opportunities are expected because of the need to replace the large number of workers who leave the occupation each year.
- Most salespersons work evenings and weekends, particularly during sales and other peak retail periods.
- Employers look for people who enjoy working with others and who have tact, patience, an interest in sales work, a neat appearance, and the ability to communicate clearly.

Nature of the Work

Consumers spend millions of dollars every day on merchandise and often rely on a store's sales force for help. Whether selling shoes, computer equipment, or automobiles, retail salespersons assist customers in finding what they are looking for and try to interest them in buying the merchandise. Most are able to describe a product's features, demonstrate its use, or show various models and colors.

In addition to selling, most retail salespersons—especially those who work in department and apparel stores—make out sales checks; receive cash, checks, debit, and charge payments; bag or package purchases; and give change and receipts. Depending on the hours they work, retail salespersons may have to open or close cash registers. This work may include counting the money in the register; separating charge slips, coupons, and exchange vouchers; and making deposits at the cash office. Salespersons often are held responsible for the contents of their registers, and repeated shortages are cause for dismissal in many organizations. (Cashiers, who have similar duties, are discussed elsewhere in the *Handbook*.)

Retail salespersons must know about the products they are selling, and answer questions from customers.

Retailers stress the importance of providing courteous and efficient service to remain competitive. For example, when a customer wants an item that is not on the sales floor, the salesperson may check the stockroom, place a special order, or call another store to locate the item.

For some sales jobs, particularly those involving expensive and complex items, retail salespersons need special knowledge or skills. For example, salespersons who sell automobiles must be able to explain the features of various models, the manufacturers' specifications, the types of options and financing available, and the warranty.

Salespersons also may handle returns and exchanges of merchandise, wrap gifts, and keep their work areas neat. In addition, they may help stock shelves or racks, arrange for mailing or delivery of purchases, mark price tags, take inventory, and prepare displays.

Frequently, salespersons must be aware of special sales and promotions. They also must recognize security risks and thefts and know how to handle or prevent such situations.

Work environment. Most salespersons in retail trade work in clean, comfortable, well-lit stores. However, they often stand for long periods and may need supervisory approval to leave the sales floor. They also may work outdoors if they sell items such as cars, plants, or lumber yard materials.

The Monday-through-Friday, 9-to-5 workweek is the exception rather than the rule in retail trade. Most salespersons work evenings and weekends, particularly during sales and other peak retail periods. The end-of-year holiday season is the busiest time for most retailers. As a result, many employers limit the use of vacation time between Thanksgiving and the beginning of January.

This occupation offers many opportunities for part-time work and is especially appealing to students, retirees, and others seeking to supplement their income. More than 32 percent of retail salespersons worked part-time in 2006. However, most of those selling big-ticket items work full time and have substantial experience.

Training, Other Qualifications, and Advancement

Retail salespeople typically learn their skills through on-the-job training. Although advancement opportunities are limited, having a college degree or a great deal of experience may help retail salespersons move into management positions.

Education and training. There usually are no formal education requirements for this type of work, although a high school diploma or the equivalent is often preferred. A college degree may be required for management trainee positions, especially in larger retail establishments.

In most small stores, an experienced employee or the store owner instructs newly hired sales personnel in making out sales checks and operating cash registers. In large stores, training programs are more formal and are usually conducted over several days. Topics discussed often include customer service, security, the store's policies and procedures, and how to work a cash register. Depending on the type of product they are selling, employees may be given additional specialized training by sales representatives. For example, those working in cosmetics receive instruction on the types of products the store offers and for whom the cosmetics would be most beneficial. Likewise, salespersons employed by motor vehicle dealers may be instructed on the technical details of standard and optional equipment available on new vehicle models. Since providing the best possible service to customers is a high priority for many employers, employees often are given periodic training to update and refine their skills.

Other qualifications. Employers look for people who enjoy working with others and who have the tact and patience to deal with difficult customers. Among other desirable characteristics are an

interest in sales work, a neat appearance, and the ability to communicate clearly and effectively. The ability to speak more than one language may be helpful for employment in communities where people from various cultures live and shop. Before hiring a salesperson, some employers may conduct a background check, especially for a job selling high-priced items.

Advancement. Opportunities for advancement vary. In some small establishments, advancement is limited because one person—often the owner—does most of the managerial work. In others, some salespersons are promoted to assistant manager. Large retail businesses usually prefer to hire college graduates as management trainees, making a college education increasingly important. However, motivated and capable employees without college degrees still may advance to administrative or supervisory positions in large establishments.

As salespersons gain experience and seniority, they usually move to positions of greater responsibility and may be given their choice of departments in which to work. This often means moving to areas with higher potential earnings and commissions. The highest earnings potential usually lies in selling "big-ticket" items—such as cars, jewelry, furniture, and electronic equipment—although doing so often requires extensive knowledge of the product and an extraordinary talent for persuasion.

Retail selling experience may be an asset when applying for sales positions with larger retailers or in nonretail industries, such as financial services, wholesale trade, or manufacturing.

Employment

Retail salespersons held about 4.5 million jobs in 2006. They worked in stores ranging from small specialty shops employing a few workers to giant department stores with hundreds of salespersons. In addition, some were self-employed representatives of direct-sales companies and mail-order houses. The largest employers of retail salespersons are department stores, clothing and clothing accessories stores, building material and garden equipment and supplies dealers, other general merchandise stores, and motor vehicle and parts dealers.

Because retail stores are found in every city and town, employment is distributed geographically in much the same way as the population.

Job Outlook

Due to the high level of turnover in this occupation, opportunities are expected to be good. The average projected employment growth in this occupation reflects the expansion of the economy and consumer spending.

Employment change. Employment is expected to grow by 12 percent over the 2006–2016 decade, which is about as fast as the average for all occupations. In fact, due to the size of this occupation, retail salespersons will have one of the largest numbers of new jobs arise, about 557,000 over the projections decade. This growth reflects rising retail sales stemming from a growing population. Many retail establishments will continue to expand in size and number, leading to new retail sales positions. Since retail salespeople must be available to assist customers in person, this is not an occupation that will suffer negative effects from advancements in technology. To the contrary, software that integrates purchase transactions, inventory management, and purchasing has greatly changed retailing, but retail salespersons continue to be essential in dealing with customers. There will also be an increased demand for retail salespersons in warehouse clubs and supercenters, which sell a wide assortment of goods at low prices, since they continue to grow as many consumers prefer these stores.

Despite the growing popularity of electronic commerce, the impact of electronic commerce on employment of retail salespersons is expected to be minimal. Internet sales have not decreased the need for retail salespersons. Retail stores commonly use an online presence to complement their in-store sales; there are a limited number of Internet-only apparel and specialty stores. Retail salespersons will remain important in assuring customers, providing specialized service, and increasing customer satisfaction. Most shoppers continue to prefer to make their purchases in stores, and growth of retail sales will continue to generate employment growth in various retail establishments.

Job prospects. As in the past, employment opportunities for retail salespersons are expected to be good because of the need to replace the large number of workers who transfer to other occupations or leave the labor force each year. Warehouse clubs and supercenters are expected to have excellent job prospects as they continue to grow in popularity with consumers. In addition, many new jobs will be created for retail salespersons as businesses seek to expand operations and enhance customer service.

Opportunities for part-time work should be abundant, and demand will be strong for temporary workers during peak selling periods, such as the end-of-year holiday season. The availability of part-time and temporary work attracts many people seeking to supplement their income.

During economic downturns, sales volumes and the resulting demand for sales workers usually decline. Purchases of costly items, such as cars, appliances, and furniture, tend to be postponed during difficult economic times. In areas of high unemployment, sales of many types of goods decline. However, because many retail salespersons constantly transfer to other occupations in search of better pay or career opportunities, employers often can adjust employment levels simply by not replacing all those who leave.

Earnings

Median hourly earnings of retail salespersons, including commissions, were $9.50 in May 2006. The middle 50 percent earned between $7.81 and $12.83 an hour. The lowest 10 percent earned less than $6.79, and the highest 10 percent earned more than $18.48 an hour. Median hourly earnings in the industries employing the largest numbers of retail salespersons in May 2006 were as follows:

Automobile dealers	$18.70
Building material and supplies dealers	11.37
Other general merchandise stores	8.79
Department stores	8.70
Clothing stores	8.53

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Retail salespersons	41-2031	4,477,000	5,034,000	557,000	12

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Many beginning or inexperienced workers earn the federal minimum wage of $5.85 an hour, but many states set minimum wages higher than the federal minimum. Under federal law, this wage will increase to $6.55 in the summer of 2008 and to $7.25 in the summer of 2009. In areas where employers have difficulty attracting and retaining workers, wages tend to be higher than the legislated minimum.

Compensation systems can vary by type of establishment and merchandise sold. Salespersons receive hourly wages, commissions, or a combination thereof. Under a commission system, salespersons receive a percentage of the sales they make. This system offers sales workers the opportunity to increase their earnings considerably, but they may find that their earnings strongly depend on their ability to sell their product and on the ups and downs of the economy.

Benefits may be limited in smaller stores, but benefits in large establishments usually are comparable to those offered by other employers. In addition, nearly all salespersons are able to buy their store's merchandise at a discount, with the savings depending on the type of merchandise. Also, to bolster revenue, employers may use incentive programs such as awards, banquets, bonuses, and profit-sharing plans to promote teamwork among the sales staff.

Related Occupations

Salespersons use sales techniques, coupled with their knowledge of merchandise, to assist customers and encourage purchases. Workers in other occupations who use these same skills include sales representatives, wholesale and manufacturing; securities, commodities, and financial services sales agents; counter and rental clerks; real estate brokers and sales agents; purchasing managers, buyers, and purchasing agents; insurance sales agents; sales engineers; and cashiers.

Sources of Additional Information

Information on careers in retail sales may be obtained from the personnel offices of local stores or from state merchants' associations.

Sales Engineers

(O*NET 41-9031.00)

Significant Points

- A bachelor's degree in engineering usually is required; many sales engineers have previous work experience in an engineering specialty.
- Projected employment growth will stem from the increasing numbers of technical products and services for sale.
- More job opportunities are expected in independent sales agencies.
- Earnings are typically based on a combination of salary and commission.

Most sales engineers have a bachelor's degree in engineering.

Nature of the Work

Many products and services, especially those purchased by large companies and institutions, are highly complex. Sales engineers—who also may be called *manufacturers' agents, sales representatives*, or *technical sales support workers*—work with the production, engineering, or research and development departments of their companies, or with independent sales firms, to determine how products and services could be designed or modified to suit customers' needs. They also may advise customers on how best to use the products or services provided.

Sales engineers sell and consult on technologically and scientifically advanced products. They should possess extensive knowledge of these products, including their components and processes. Sales engineers then use their technical skills to demonstrate to potential customers how and why the products or services they are selling would suit the customer better than competitors' products. Often, there may not be a directly competitive product. In these cases, the job of the sales engineer is to demonstrate to the customer the usefulness of the product or service—for example, how much money new production machinery would save.

Engineers apply the theories and principles of science and mathematics to technical problems. Their work is the link between scientific discoveries and commercial applications. Many sales engineers specialize in products that are related to their engineering specialty. For example, sales engineers selling chemical products may have chemical engineering backgrounds, while those selling business software or information systems may have degrees in computer engineering. (Information on engineers, including 17 engineering specialties, appears elsewhere in the *Handbook*.)

Many of the duties of sales engineers are similar to those of other salespersons. They must interest the client in purchasing their products, many of which are durable manufactured products such as turbines. Sales engineers often are teamed with other salespersons who concentrate on the marketing and sales, enabling the sales engineer to concentrate on the technical aspects of the job. By working on a sales team, each member is able to focus on his or her strengths and expertise. (Information on other sales occupations, including sales representatives, wholesale and manufacturing, appears elsewhere in the *Handbook*.)

Sales engineers tend to employ selling techniques that are different from those used by most other sales workers. They generally use a "consultative" style; that is, they focus on the client's problem and show how it could be solved or mitigated with their product or service. This selling style differs from the "benefits and features"

method, whereby the salesperson describes the product and leaves the customer to decide how it would be useful.

In addition to maintaining current clients and attracting new ones, sales engineers help clients solve any problems that arise when the product is installed. Afterward, they may continue to serve as a liaison between the client and their company. Increasingly, sales engineers are asked to undertake tasks related to sales, such as market research, because of their familiarity with clients' purchasing needs. Drawing on this same familiarity, sales engineers may help identify and develop new products.

Work environment. Sales engineers may work directly for manufacturers or service providers, or they may work in small independent sales firms. In an independent firm, they may sell complementary products from several different suppliers.

Workers in this occupation can encounter pressure and stress because their income and job security often depend directly on their success in sales and customer service. Many sales engineers work more than 40 hours per week to meet sales goals and client needs. Although the hours may be long and often irregular, many sales engineers have the freedom to determine their own schedules. Consequently, they often can arrange their appointments so that they can have time off when they want it.

Some sales engineers have large territories and travel extensively. Because sales regions may cover several states, sales engineers may be away from home for several days or even weeks at a time. Others work near their home base and travel mostly by car. International travel to secure contracts with foreign clients is becoming more common.

Training, Other Qualifications, and Advancement

Most sales engineers have a bachelor's degree in engineering, and many have previous work experience in an engineering specialty. New sales engineers may need some on-the-job training in sales or may work closely with a sales mentor familiar with company policies and practices before they can work on their own.

Education and training. A bachelor's degree in engineering usually is required to become a sales engineer. However, some workers with previous experience in sales combined with technical experience or training sometimes hold the title of sales engineer. Also, workers who have a degree in a science, such as chemistry, or even a degree in business with little or no previous sales experience, may be termed sales engineers.

Admissions requirements for undergraduate engineering schools include a solid background in mathematics (algebra, geometry, trigonometry, and calculus) and the physical sciences (biology, chemistry, and physics), as well as basic courses in English, social studies, humanities, and computer science. University programs vary in content, though all require the development of computer skills. Once a university has been selected, a student must choose an area of engineering in which to specialize. Some programs offer a general engineering curriculum; students then specialize on the job or in graduate school. Most engineering degrees are granted in electrical, mechanical, or civil engineering. However, engineers trained in one branch may work in related branches.

New graduates with engineering degrees may need sales experience and training before they can work independently as sales engineers. Training may involve teaming with a sales mentor who is familiar with the employer's business practices, customers, procedures, and company culture. After the training period has been completed, sales engineers may continue to partner with someone who lacks technical skills, yet excels in the art of sales.

It is important for sales engineers to continue their engineering and sales education throughout their careers. Much of their value to their employers depends on their knowledge of and ability to sell the latest technologies. Sales engineers in high-technology fields, such as information technology or advanced electronics, may find that technical knowledge rapidly becomes obsolete.

Other qualifications. Many sales engineers first work as engineers. For some, engineering experience is necessary to obtain the technical background needed to sell their employers' products or services effectively. Others move into the occupation because it offers better earnings and advancement potential than engineering or because they are looking for a new challenge.

Advancement. Promotion may include a higher commission rate, larger sales territory, or elevation to the position of supervisor or marketing manager. Alternatively, sales engineers may leave their companies and form independent firms. Independent firms tend to be small, and relatively few sales engineers are self-employed.

Employment

Sales engineers held about 76,000 jobs in 2006. About 37 percent were employed in wholesale trade and another 26 percent were employed in the manufacturing industries. Smaller numbers of sales engineers worked in information industries, such as software publishing and telecommunications; professional, scientific, and technical services, such as computer systems design and related services; architectural, engineering, and related services; and other industries. Unlike workers in many other sales occupations, very few sales engineers are self-employed.

Job Outlook

Job growth for sales engineers is projected to be about average through 2016, and opportunities will be good in independent sales agencies because of the increase in outsourcing of sales departments by manufacturers.

Employment change. Employment of sales engineers is expected to grow by 9 percent between 2006 and 2016, which is about as fast as the average for all occupations. Projected employment growth stems from the increasing variety and technical nature of goods and services to be sold. Competitive pressures and advancing technology will force companies to improve and update product designs more frequently and to optimize their manufacturing and sales processes, and thus require the services of a sales engineer.

In wholesale trade, both outsourcing to independent sales agencies and the use of information technology are expected to create some job growth for sales engineers. Although outsourcing should lead to more jobs in independent agencies, employment growth for sales engineers in wholesale trade likely will be dampened by the

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Sales engineers	41-9031	76,000	82,000	6,500	9

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

increasing ability of businesses to find, order, and track shipments directly from wholesalers through the Internet, without assistance from sales engineers. However, since direct purchases from wholesalers are more likely to be non-scientific or non-technical products, their impact on sales engineers should remain somewhat limited.

Job prospects. Manufacturers, especially foreign manufacturers that sell their products in the United States, are expected to continue outsourcing more of their sales functions to independent sales agencies in an attempt to control costs. Additionally, since independent agencies can carry multiple lines of products, a single sales engineer can handle more products than the single product line they would have handled under a manufacturer. This should result in more job opportunities for sales engineers in independent agencies.

Employment opportunities may fluctuate from year to year because sales are affected by changing economic conditions, legislative issues, and consumer preferences. Prospects will be best for those with the appropriate knowledge or technical expertise, as well as the personal traits necessary for successful sales work. In addition to new positions created as companies expand their sales forces, some openings will arise each year from the need to replace sales engineers who transfer to other occupations or leave the labor force.

Earnings

Median annual earnings, including commissions, of wage and salary sales engineers were $77,720 in May 2006. The middle 50 percent earned between $59,490 and $100,280 a year. The lowest 10 percent earned less than $47,010, and the highest 10 percent earned more than $127,680 a year. Median annual earnings of those employed by firms in the computer systems design and related services industry were $90,950.

Compensation varies significantly by the type of firm and the product sold. Most employers offer a combination of salary and commission payments or a salary plus a bonus. Those working in independent sales companies may solely earn commissions. Commissions usually are based on the amount of sales, whereas bonuses may depend on individual performance, on the performance of all workers in the group or district, or on the company's performance. Earnings from commissions and bonuses may vary greatly from year to year, depending on sales ability, the demand for the company's products or services, and the overall economy.

In addition to their earnings, sales engineers who work for manufacturers usually are reimbursed for expenses such as transportation, meals, hotels, and customer entertainment. In addition to typical benefits, sales engineers may get personal use of a company car and frequent-flyer mileage. Some companies offer incentives such as free vacation trips or gifts for outstanding performance. Sales engineers who work in independent firms may have higher but less stable earnings and, often, relatively few benefits. Most independent sales engineers do not earn any income while on vacation.

Related Occupations

Sales engineers must have sales ability and knowledge of the products and services they sell, as well as technical and analytical skills. Other occupations that require similar skills include advertising, marketing, promotions, public relations, and sales managers; engineers; insurance sales agents; purchasing managers, buyers and purchasing agents; real estate brokers and sales agents; sales representatives, wholesale and manufacturing; and securities, commodities, and financial services sales agents.

Sources of Additional Information

Information on careers for manufacturers' representatives and agents is available from

➤ Manufacturers' Agents National Association, P.O. Box 3467, Laguna Hills, CA 92654. Internet: http://www.manaonline.org

➤ Manufacturers' Representatives Educational Research Foundation, 8329 Cole St., Arvada, CO 80005. Internet: http://www.mrerf.org

Sales Representatives, Wholesale and Manufacturing

(O*NET 41-4011.00 and 41-4012.00)

Significant Points

- Competition for jobs is expected, but opportunities will be best for those with a college degree, the appropriate technical expertise, and the personal traits necessary for successful selling.
- Job prospects for sales representatives will be better for those working with essential goods, since the demand for these products do not fluctuate with the economy.
- Earnings of sales representatives are relatively high and usually are based on a combination of salary and commission.

Nature of the Work

Sales representatives are an important part of manufacturers' and wholesalers' success. Regardless of the type of product they sell, sales representatives' primary duties are to make wholesale and retail buyers and purchasing agents interested in their merchandise and to address any of their clients' questions and concerns. Sales representatives demonstrate their products and explain how using those products can reduce costs and increase sales.

Sales representatives may represent one or several manufacturers or wholesale distributors by selling one product or a complementary line of products. The clients of sales representatives span almost every industry and include other manufacturers, wholesale and retail establishments, construction contractors, and government agencies. (Retail salespersons, who sell directly to consumers, and sales engineers, who specialize in sales of technical products and services, are discussed elsewhere in the *Handbook*.)

The process of promoting and selling products can take up to several months. Sales representatives present their products to a customer and negotiate the sale. Whether in person or over the phone, they can make a persuasive sales pitch and often will immediately answer technical and non-technical questions about the products. They may also record any interactions with clients and their respective sales to better match their future needs and sales potential.

There are two major categories of products that sales representatives work with: technical and scientific products and all products except technical and scientific products. Technical and scientific products may include anything from agricultural and mechanical equipment to electrical and pharmaceutical goods. Products included in the later category are more everyday items, including goods such as food, office supplies, and apparel.

Sales representatives stay abreast of new products and the changing needs of their customers in a variety of ways. They attend trade shows at which new products and technologies are showcased. They also attend conferences and conventions to meet other sales representatives and clients and discuss new product developments. In addition, the entire sales force may participate in company-sponsored meetings to review sales performance, product development, sales goals, and profitability.

Sales representatives may travel to meet with prospective clients to discuss products and their uses.

Frequently, sales representatives who lack the necessary expertise about a given product may team with a technical expert. In this arrangement, the technical expert—sometimes a sales engineer—attends the sales presentation to explain the product and answer questions or concerns. The sales representative makes the preliminary contact with customers, introduces the company's product, and closes the sale. The representative is then able to spend more time maintaining and soliciting accounts and less time acquiring technical knowledge. After the sale, representatives may make follow-up visits to ensure that the equipment is functioning properly and may even help train customers' employees to operate and maintain new equipment. Those selling technical goods may also help set up the installation. Those selling consumer goods often suggest how and where merchandise should be displayed. When working with retailers, they may help arrange promotional programs, store displays, and advertising.

Obtaining new accounts is an important part of the job for all sales representatives. Sales representatives follow leads from other clients, track advertisements in trade journals, participate in trade shows and conferences, and may visit potential clients unannounced. In addition, they may spend time meeting with and entertaining prospective clients during evenings and weekends.

Sales representatives have several duties beyond selling products. They analyze sales statistics; prepare reports; and handle administrative duties, such as filing expense accounts, scheduling appointments, and making travel plans. They also read about new and existing products and monitor the sales, prices, and products of their competitors.

Sales representatives, regardless of where they are employed, may work in either inside sales or outside "field" sales. *Inside sales representatives* may spend a lot of their time on the phone, taking orders and resolving any problems or complaints about the merchandise. These sales representatives typically do not leave the office. *Outside sales representatives* spend much of their time traveling to and visiting with current clients and prospective buyers. During a sales call, they discuss the client's needs and suggest how their merchandise or services can meet those needs. They may show samples or catalogs that describe items their company stocks and inform customers about prices, availability, and ways in which their products can save money and boost productivity. Given that a number of manufacturers and wholesalers sell similar products, sales representatives must emphasize any unique qualities of their products and services. Since many sales representatives sell several complementary products made by different manufacturers, they may take a broad approach to their customers' business. For example, sales representatives may help install new equipment and train employees in its use.

Sales representatives working at an independent sales agency usually sell several products from multiple manufacturers. Additionally, these firms may only cover a certain territory, ranging from local areas to several states. These independent firms are called "manufacturers' representative companies" because their selling is on behalf of the manufacturers.

Depending on where they work, sales representatives may have different job titles. *Manufacturers' agents* or *manufacturers' representatives*, for example, are self-employed sales workers who own independent firms which contract their services to all types of manufacturing companies.

Work environment. Some sales representatives have large territories and travel considerably. Because a sales region may cover several states, representatives may be away from home for several days or weeks at a time. Others work near their home base and travel mostly by car. Sales representatives often are on their feet for long periods and may carry heavy sample products, necessitating some physical stamina.

Sales representatives may work more than 40 hours per week because of the nature of the work and the amount of travel. Since sales calls take place during regular working hours, most of the planning and paperwork involved with sales must be completed during the evening and on the weekends. Although the hours are long and often irregular, many sales representatives working for independent sales companies have the freedom to determine their own schedules.

Dealing with different types of people can be stimulating but demanding. Sales representatives often face competition from representatives of other companies. Companies usually set goals or quotas that representatives are expected to meet. Because their earnings depend on commissions, manufacturers' representatives are also under the added pressure to maintain and expand their clientele.

Training, Other Qualifications, and Advancement

Many employers hire individuals with previous sales experience who lack a college degree, but hiring candidates with a college degree is becoming increasingly common. Regardless of educational background, factors such as personality, the ability to sell, and familiarity with brands are essential to being a successful sales representative.

Education and training. Since there is no formal educational requirement for sales representative, their levels of education varies. Having a bachelor's degree can be highly desirable, especially for sales representatives who work with technical and scientific products. This is because technological advances result in new and more complex products. Additionally, manufacturers' representatives who start their own independent sales company might have an MBA. As shown in the tabulation below, in 2006 many sales representatives had a bachelor's degree, and many others had some college classes. Some, however, had no degree or formal training, but these workers often had sales experience or potential.

High school graduate or less	27%
Some college, no degree	19
Associate degree	9
Bachelor's degree	38
Graduate degree	6

Many sales representatives attend seminars in sales techniques or take courses in marketing, economics, communication, or even a foreign language to provide the extra edge needed to make sales. Often, companies have formal training programs for beginning sales representatives lasting up to 2 years. However, most businesses accelerate these programs to reduce costs and expedite the returns from training. In some programs, trainees rotate among jobs in plants and offices to learn all phases of production, installation, and distribution of the product. In others, trainees take formal classroom instruction at the plant, followed by on-the-job training under the supervision of a field sales manager.

Regardless of where they work, new employees may get training by accompanying experienced workers on their sales calls. As they gain familiarity with the firm's products and clients, the new workers are given increasing responsibility until they are eventually assigned their own territory. As businesses experience greater competition, representatives face more pressure to produce sales.

Other qualifications. For sales representative jobs, companies seek the best and brightest individuals who have the personality and desire to sell. Those who want to become sales representatives should be goal oriented, persuasive, and able to work well both independently and as part of a team. A pleasant personality and appearance, the ability to communicate well with people, and problem-solving skills are highly valued. Patience and perseverance are also keys to completing a sale, which can take up to several months. Sales representatives also need to be able to work with computers since computers are increasingly used to place and track orders and to monitor inventory levels.

Manufacturers' representatives who operate a sales agency must also manage their business. This requires organizational and general business skills, as well as knowledge of accounting, marketing, and administration. Usually, however, sales representatives gain experience and recognition with a manufacturer or wholesaler before becoming self-employed.

Certification and advancement. Certifications are available that provide formal recognition of the skills of sales representatives, wholesale and manufacturing. Many obtaining certification in this profession have either the Certified Professional Manufacturers' Representative (CPMR) or the Certified Sales Professional (CSP), offered by the Manufacturers' Representatives Education Research Foundation. Certification typically involves completion of formal training and passing an examination.

Frequently, promotion takes the form of an assignment to a larger account or territory where commissions are likely to be greater. Those who have good sales records and leadership ability may advance to higher level positions such as sales supervisor, district manager, or vice president of sales. Others find opportunities in purchasing, advertising, or marketing research.

Advancement opportunities typically depend on whether the sales representatives are working directly for a manufacturer or wholesaler or if they are working with an independent sales agency. Experienced sales representatives working directly for a manufacturer or wholesaler may move into jobs as sales trainers and instruct new employees on selling techniques and company policies and procedures. Some leave the manufacturer or wholesaler and start their own independent sales company. Those working for an independent sales company can also advance by going into business for themselves or by receiving higher pay.

Employment

Manufacturers' and wholesale sales representatives held about 2 million jobs in 2006. About 21 percent worked with technical and scientific products. Almost 60 percent of all representatives worked in wholesale trade. Others were employed in manufacturing, retail trade, information, and construction. Because of the diversity of products and services sold, employment opportunities are available throughout the country in a wide range of industries. In addition to those working directly for a firm, some sales representatives are self-employed manufacturers' agents. They often form small sales firms that may start with just themselves and gradually grow to employ a small staff.

Job Outlook

Job growth of sales representatives, wholesale and manufacturing, is expected to be average, but keen competition is expected for these highly paid sales jobs.

Employment change. Employment of sales representatives, wholesale and manufacturing, is expected to grow by 9 percent between 2006 and 2016, which is about as fast as the average for all occupations. Given the size of this occupation, a large number of new jobs, about 182,000 will arise over the projections decade. This is primarily because of continued growth in the variety and number of goods sold throughout the economy. Technological progress will also have an impact on job growth. Sales representatives can help ensure that retailers offer the latest technology available to their customers or that businesses acquire the right technical products that will increase their efficiency in operations. Advances in technology will therefore lead to more products being demanded and sold, and thus growth in the sales representative profession.

At the same time, however, computers and other information technology are also making sales representatives more effective and productive, allowing sales representatives to handle more clients, and thus hindering job growth somewhat.

Employment growth will be greatest in independent sales companies as manufacturers and wholesalers continue to outsource sales activities to independent agents rather than using in-house or direct sales workers. Independent agent companies are paid only if they

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Sales representatives, wholesale and manufacturing	41-4000	1,973,000	2,155,000	182,000	9
Sales representatives, wholesale and manufacturing, technical and scientific products	41-4011	411,000	462,000	51,000	12
Sales representatives, wholesale and manufacturing, except technical and scientific products	41-4012	1,562,000	1,693,000	131,000	8

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

sell, a practice that reduces the overhead cost to their clients. Also, by using agents who usually contract their services to more than one company, companies can share costs of the agents with each other. As the customers of independent agents continue to merge with other companies, independent agent companies and other wholesale trade firms will also merge with each other in response to better serve their clients.

Job prospects. Earnings of sales representatives, wholesale and manufacturing are relatively high, especially for those selling technical and scientific products, so keen competition is likely for jobs. Prospects will be best for those with a solid technical background and the personal traits necessary for successful selling. Opportunities will be better for sales representatives working for an independent sales company as opposed to working directly for a manufacturer because manufacturers are expected to continue contracting out field sales duties.

Opportunities for sales representatives in manufacturing are likely to be best for those selling products for which there is strong demand. Jobs will be most plentiful in small wholesale and manufacturing firms because a growing number of these companies will rely on agents to market their products as a way to control their costs and expand their customer base.

Employment opportunities and earnings may fluctuate from year to year because sales are affected by changing economic conditions, legislative issues, and consumer preferences. Also, many job openings will result from the need to replace workers who transfer to other occupations or leave the labor force.

Earnings

Median annual earnings of wage and salary sales representatives, wholesale and manufacturing, technical and scientific products, were $64,440, including commissions, in May 2006. The middle 50 percent earned between $45,630 and $91,090 a year. The lowest 10 percent earned less than $33,410, and the highest 10 percent earned more than $121,850 a year. Median annual earnings in the industries employing the largest numbers of sales representatives, technical and scientific products, were as follows:

Computer systems design and related services	$75,240
Wholesale electronic markets and agents and brokers	69,510
Professional and commercial equipment and supplies merchant wholesalers	67,700
Drugs and druggists' sundries merchant wholesalers	66,210
Electrical and electronic goods merchant wholesalers	61,000

Median annual earnings of wage and salary sales representatives, wholesale and manufacturing, except technical and scientific products, were $49,610, including commission, in May 2006. The middle 50 percent earned between $35,460 and $71,650 a year. The lowest 10 percent earned less than $26,030, and the highest 10 percent earned more than $101,030 a year. Median annual earnings in the industries employing the largest numbers of sales representatives, except technical and scientific products, were as follows:

Wholesale electronic markets and agents and brokers	$54,900
Professional and commercial equipment and supplies merchant wholesalers	49,730
Machinery, equipment, and supplies merchant wholesalers	48,620
Grocery and related product wholesalers	46,150
Miscellaneous nondurable goods merchant wholesalers	42,530

Compensation methods for those representatives working for an independent sales company vary significantly by the type of firm and the product sold. Most employers use a combination of salary and commissions or salary plus bonus. Commissions usually are based on the amount of sales, whereas bonuses may depend on individual performance, on the performance of all sales workers in the group or district, or on the company's performance. Unlike those working directly for a manufacturer or wholesaler, sales representatives working for an independent sales company usually are not reimbursed for expenses. Depending on the type of product or products they are selling, their experience in the field, and the number of clients they have, they can earn significantly more or less than those working in direct sales for a manufacturer or wholesaler.

In addition to their earnings, sales representatives working directly for a manufacturer or wholesaler usually are reimbursed for expenses such as transportation costs, meals, hotels, and entertaining customers. They often receive benefits such as health and life insurance, pension plans, vacation and sick leave, personal use of a company car, and frequent flyer mileage. Some companies offer incentives such as free vacation trips or gifts for outstanding sales workers.

Related Occupations

Sales representatives, wholesale and manufacturing, must have sales ability and knowledge of the products they sell. Other occupations that require similar skills include advertising, marketing, promotions, public relations, and sales managers; insurance sales agents; purchasing managers, buyers, and purchasing agents; real estate brokers and sales agents; retail salespersons; sales engineers; and securities, commodities, and financial services sales agents.

Sources of Additional Information

Information on careers for manufacturers' representatives and sales agents is available from

➤ Manufacturers' Agents National Association, One Spectrum Pointe, Suite 150, Lake Forest, CA 92630. Internet: http://www.manaonline.org

➤ Manufacturers' Representatives Educational Research Foundation, 8329 Cole St., Arvada, CO 80005. Internet: http://www.mrerf.org

Sales Worker Supervisors

(O*NET 41-1011.00 and 41-1012.00)

Significant Points

- Overall employment is projected to grow more slowly than average.
- Applicants with retail experience should have the best job opportunities.
- Long, irregular hours, including evenings and weekends, are common.

Nature of the Work

Sales worker supervisors oversee the work of sales and related workers, such as retail salespersons, cashiers, customer service representatives, stock clerks and order fillers, sales engineers, and wholesale sales representatives. Sales worker supervisors are responsible for interviewing, hiring, and training employees. They also may prepare work schedules and assign workers to specific duties. Many of these supervisors hold job titles such as *sales manager* or *department manager*. Under the occupational classification system used in the *Handbook*, however, workers who mainly supervise workers and who do not focus on broader managerial issues of planning and strategy are classified as *supervisors*.

Sales worker supervisors monitor their staff to ensure high quality service to customers.

In retail establishments, sales worker supervisors ensure that customers receive satisfactory service and quality goods. They also answer customers' inquiries, deal with complaints, and sometimes handle purchasing, budgeting, and accounting.

Responsibilities vary with the size and type of establishment. As the size of retail stores and the types of goods and services increase, supervisors tend to specialize in one department or one aspect of merchandising. Sales worker supervisors in large retail establishments are often referred to as department supervisors or managers. They provide day-to-day oversight of individual departments, such as shoes, cosmetics, or housewares in department stores; produce or meat in grocery stores; and car sales in automotive dealerships. Department supervisors establish and implement policies, goals, and procedures for their specific departments; coordinate activities with other department heads; and strive for smooth operations within their departments. They supervise employees who price and ticket goods and place them on display; clean and organize shelves, displays, and inventories in stockrooms; and inspect merchandise to ensure that nothing is outdated. Sales worker supervisors also review inventory and sales records, develop merchandising techniques, and coordinate sales promotions. In addition, they may greet and assist customers and promote sales and good public relations.

Sales worker supervisors in non-retail establishments oversee and coordinate the activities of sales workers who sell industrial products, insurance policies, or services such as advertising, financial, or Internet services. They may prepare budgets, make personnel decisions, devise sales-incentive programs, and approve sales contracts.

In small or independent companies and retail stores, sales worker supervisors not only directly supervise sales associates, but they also are responsible for the operation of the entire company or store. Some are self-employed business or store owners.

Work environment. Most sales worker supervisors have offices. In retail trade, their offices are within the stores, usually close to the areas they oversee. Although they spend some time in the office completing merchandise orders or arranging work schedules, a large portion of their workday is spent on the sales floor, supervising employees or selling.

Work hours of supervisors vary greatly among establishments because work schedules usually depend on customers' needs. Supervisors generally work at least 40 hours a week. Long, irregular hours are common, particularly during sales, holidays, and busy shopping seasons and at times when inventory is taken. Supervisors are expected to work some evenings and weekends but usually are given a day off during the week. Hours can change weekly, and supervisors sometimes must report to work on short notice, especially when employees are absent. Independent owners often can set their own schedules, but hours must be convenient to customers.

Training, Other Qualifications, and Advancement

Sales worker supervisors usually gain knowledge of management principles and practices through work experience. Many supervisors begin their careers on the sales floor as salespersons, cashiers, or customer service representatives. These workers should be patient, decisive, and sales-oriented.

Education and training. The educational backgrounds of sales worker supervisors vary widely. Supervisors who have postsecondary education often hold associate or bachelor's degrees in liberal arts, social sciences, business, or management. Recommended high school or college courses include those related to business, such as accounting, marketing, management, and sales, and those related to social science, such as psychology, sociology, and communication. Supervisors also must know how to use computers because almost all cash registers, inventory control systems, and sales quotes and contracts are computerized. To gain experience, many college students participate in internship programs that usually are developed jointly by schools and businesses.

Having previous sales experience is usually a requirement for becoming a sales worker supervisor. Most sales worker supervisors have retail sales experience or experience as a customer service representative. In these positions, they learn merchandising, customer service, and the basic policies and procedures of the company.

The type and amount of training available to supervisors varies by company. Many national retail chains and companies have formal training programs for management trainees that include both classroom and on-site training. Training time may be as brief as 1 week or may last more than 1 year, giving trainees experience during all sales seasons.

Ordinarily, classroom training includes topics such as interviewing, customer service skills, inventory management, employee relations, and scheduling. Management trainees may work in one specific department while training on the job, or they may rotate through several departments to gain a well-rounded knowledge of the company's operation. Training programs for retail franchises are generally extensive, covering all functions of the company's operation, including budgeting, marketing, management, finance, purchasing, product preparation, human resource management, and compensation. College graduates usually can enter management training programs directly, without much experience.

Other qualifications. Sales worker supervisors must get along with all types of people. They need initiative, self-discipline, good

judgment, and decisiveness. Patience and a conciliatory temperament are necessary when dealing with demanding customers. Supervisors also must be able to motivate, organize, and direct the work of subordinates and communicate clearly and persuasively with customers and other supervisors.

Advancement. Supervisors who display leadership and team-building skills, self-confidence, motivation, and decisiveness become candidates for promotion to assistant manager or manager. A postsecondary degree may speed their advancement into management because employers view it as a sign of motivation and maturity—qualities deemed important for promotion to more responsible positions. In many retail establishments, managers are promoted from within the company. In small retail establishments, where the number of positions is limited, advancement to a higher management position may come slowly. Large establishments often have extensive career ladder programs and may offer supervisors the opportunity to transfer to another store in the chain or to the central office. Although promotions may occur more quickly in large establishments, some managers may need to relocate every several years in order to advance.

Supervisors also can become advertising, marketing, promotions, public relations, and sales managers—workers who coordinate marketing plans, monitor sales, and propose advertisements and promotions—or purchasing managers, buyers, or purchasing agents—workers who purchase goods and supplies for their organization or for resale. (These occupations are covered elsewhere in the *Handbook*.)

Some supervisors who have worked in their industry for a long time open their own stores or sales firms. However, retail trade and sales occupations are highly competitive, and although many independent owners succeed, some fail to cover expenses and eventually go out of business. To prosper, owners usually need good business sense and strong customer service and public relations skills.

Employment

Sales worker supervisors held about 2.2 million jobs in 2006. Approximately 37 percent were self-employed, most of whom were store owners. About 44 percent of sales worker supervisors were wage-and-salary workers employed in the retail sector; some of the largest employers were grocery stores, department stores, motor vehicle and parts dealers, and clothing and clothing accessory stores. The remaining sales worker supervisors worked in non-retail establishments.

Job Outlook

Despite slower than average growth, retail sales worker supervisors with previous experience in sales are expected to have good job prospects because of the large size of the occupation and the need to replace workers who leave their positions.

Employment change. Employment of sales worker supervisors is expected to grow by 4 percent between 2006 and 2016, which is more slowly than the average for all occupations. Growth in the occupation will be limited as retail companies increase the responsibilities of retail salespersons and existing sales worker supervisors.

The Internet and electronic commerce are creating new opportunities to reach and communicate with potential customers. Some firms are hiring Internet sales supervisors, who are in charge of maintaining an Internet site and answering inquiries relating to the product, to prices, and to the terms of delivery. However, Internet sales and electronic commerce may reduce the number of additional sales workers needed in stores, thus reducing the total number of additional supervisors required. Overall, the impact of electronic commerce on employment of sales worker supervisors should be minimal.

Projected employment growth of sales worker supervisors will mirror, in part, the patterns of employment growth in the industries in which they work. For example, faster-than-average employment growth is expected in many of the rapidly growing service-providing industries. In contrast, the number of self-employed sales worker supervisors is expected to grow slowly as independent retailers face increasing competition from national chains.

Unlike mid-level and top-level managers, retail store managers generally will not be affected by the restructuring and consolidation taking place at the corporate headquarters of many retail chains.

Job prospects. Candidates who have retail experience—as a salesperson, cashier, or customer service representative, for example—will have the best opportunities for jobs as supervisors, especially in retail establishments. Stronger competition for supervisory jobs is expected in non-retail establishments, particularly those with the most attractive earnings and work environment.

Some of the job openings over the next decade will occur as experienced supervisors move into higher levels of management, transfer to other occupations, or leave the labor force. However, these job openings will not be great in number since, as with other supervisory and managerial occupations, the separation rate is low. This is the case especially for non-retail sales worker supervisors.

Earnings

Salaries of sales worker supervisors vary substantially, depending on a worker's level of responsibility and length of service and the type, size, and location of the firm.

Salaried supervisors of retail sales workers had median annual earnings of $33,960, including commissions, in May 2006. The middle 50 percent earned between $26,490 and $44,570 a year. The lowest 10 percent earned less than $21,420, and the highest 10 percent earned more than $59,710 a year. Median annual earnings in the industries employing the largest numbers of salaried supervisors of retail sales workers were as follows:

Building material and supplies dealers	$35,820
Grocery stores	33,390
Clothing stores	33,140
Gasoline stations	29,270
Other general merchandise stores	28,870

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Supervisors, sales workers	41-1000	2,206,000	2,296,000	91,000	4
First-line supervisors/managers of retail sales workers	41-1011	1,676,000	1,747,000	71,000	4
First-line supervisors/managers of non-retail sales workers	41-1012	530,000	549,000	19,000	4

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Salaried supervisors of nonretail sales workers had median annual earnings of, $65,510, including commissions, in May 2006. The middle 50 percent earned between $48,900 and $94,670 a year. The lowest 10 percent earned less than $34,840, and the highest 10 percent earned more than $135,270 a year. Median annual earnings in the industries employing the largest numbers of salaried supervisors of nonretail sales workers were as follows:

Professional and commercial equipment and supplies merchant wholesalers	$80,650
Wholesale electronic markets and agents and brokers	78,260
Machinery, equipment, and supplies merchant wholesalers	65,660
Postal service	58,640
Business support services	45,490

Compensation systems vary by type of establishment and by merchandise sold. Many supervisors receive a commission or a combination of salary and commission. Under a commission system, supervisors receive a percentage of department or store sales. Thus, these supervisors' earnings depend on their ability to sell their product and the condition of the economy. Those who sell large amounts of merchandise or exceed sales goals often receive bonuses or other awards.

Related Occupations

Sales worker supervisors serve customers, supervise workers, and direct and coordinate the operations of an establishment. Workers with similar responsibilities include financial managers, food service managers, lodging managers, office and administrative support worker supervisors and managers, and medical and health services managers.

Sources of Additional Information

Information on employment opportunities for sales worker supervisors may be obtained from the employment offices of various retail establishments or from state employment service offices.

Securities, Commodities, and Financial Services Sales Agents

(O*NET 41-3031.00, 41-3031.01, and 41-3031.02)

Significant Points

- A college degree, sales ability, good interpersonal and communication skills, and a strong desire to succeed are important qualifications.
- Competition for entry-level jobs usually is keen, especially in investment banks; opportunities should be better in smaller firms.
- Many people leave the occupation because of underperformance, but those who are successful have a very strong attachment to their occupation because of high earnings and considerable investment in training.

Nature of the Work

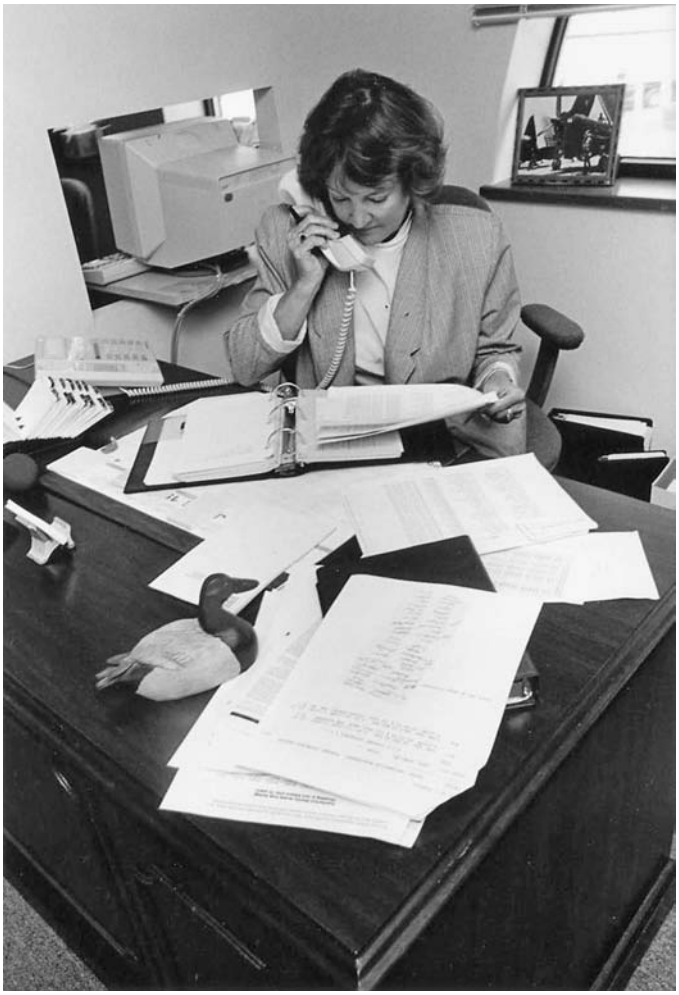
Each day, hundreds of billions of dollars change hands on the major United States securities exchanges. This money is used to purchase stocks, bonds, mutual funds, and other financial instruments, called securities. Securities are bought and sold by large institutional investors, wealthy individuals, mutual funds and pension plans, and the general public. In fact, about half of American households own stock. Most securities trades are arranged through securities, commodities, and financial services sales agents, whether they are between individuals with a few hundred dollars to invest or between large institutions having millions of dollars. The duties of sales agents vary greatly depending on occupational specialty.

The most common type of securities sales agent is called a *broker* or *stock broker*. These are the people who sell securities to everyday people, also known as retail investors. Although only about 2 out of every 10 equities are held by small investors, most investors fall into this category. Because there are so many retail investors, they must work through a broker rather than trading directly on an exchange. First, the investor speaks with the broker, discussing the terms of the trade. Then, the broker relays this information to a *trader* at the company's headquarters. Because most securities companies are very large, they can often find other company clients who are willing to buy or sell the same security. Otherwise, the stock trader places an order with a floor broker at an exchange, or trades the stock on an electronic network. The broker charges a fee for this service, and may also make money by finding a lower price for the security than was arranged with the investor.

The most important part of a broker's job is finding clients and building a customer base. Thus, beginning securities and commodities sales agents spend much of their time searching for customers, often relying heavily on telephone solicitation. They also may meet clients through business and social contacts. Agents also join civic organizations and other social groups to expand their networks of possible clients. Many find it useful to contact potential clients by teaching adult education investment courses or by giving lectures at libraries or social clubs. Brokerage firms may give sales agents lists of people with whom the firm has done business in the past. Some agents inherit the clients of agents who have retired. After an agent is established, referrals from satisfied clients are an important source of new business.

Investment bankers are sales agents who connect businesses that need money to finance their operations or expansion plans with investors who are interested in providing that funding in exchange for debt (in the form of bonds) or equity (in the form of stock). This process is called underwriting, and it is the main function of the investment bank. Investment bankers have to sell twice: first, they sell their advisory services to help companies set up issuing new stock or bonds, and second, they then sell the securities they issue to investors.

Perhaps the most important advisory service provided by investment banks is to help companies new to the public investment arena issue stock for the first time. This process, known as an initial public offering, or IPO, can take a great deal of effort because private companies must meet stringent requirements to become public or be allowed to issue stocks and bonds. Corporate finance departments also help private companies sell stock to institutional investors or



Securities, commodities, and financial services sales agents spend much of their time on the telephone with clients.

wealthy individuals. They also advise companies that are interested in funding their operations by taking on debt. This debt can be issued in the form of bonds. Unlike a stock, which entitles its holder to partial ownership of a company, a bond entitles its holder to be repaid with a pre-determined rate of interest.

Another important advisory service is provided by the mergers and acquisitions department. Bankers in this area advise companies that are interested in merging with or purchasing other companies. They also help companies that would like to be acquired. Once a potential seller or buyer is found, bankers advise their client on how to execute the agreement. Generally both buyers and sellers have investment banks working for them to make sure that the transaction goes smoothly.

Investment banking sales agents and *traders* sell stocks and bonds to investors. Instead of selling their services to companies for fees, salespeople and traders sell securities to customers for commissions. These sales agents generally work by telephone, calling customers and their agents to discuss new stock and bond issues. When an investor decides to make a purchase, the order goes to the trading floor. Traders execute buy and sell orders from clients and make trades on behalf of the bank itself. Because markets fluctuate so much, trading is a split-second decision making process. If a trader cannot secure the promised price on an exchange, millions of dollars could potentially be lost. On the other hand, if a trader finds a better deal, the bank could make millions more.

A small but powerful group of sales agents work directly on the floor of a stock or commodities exchange. When a firm or investor wishes to buy or sell a security or commodity, sales agents relay the order through their firm's computers to the floor of the exchange. There, *floor brokers* negotiate the price with other floor brokers, make the sale, and forward the purchase price to the sales agents. In addition to floor brokers, who work for individual securities dealers, there are also *independent brokers*. These are similar to floor brokers, except that they are not buyers for specific firms. Instead, they can buy and sell stocks for their own accounts, or corporate accounts that they manage,, or they can sell their services to floor brokers who are too busy to execute all of the trades they are responsible for making. *Specialists* or *market makers* also work directly on the exchange floor, and there is generally one for each security or commodity being traded. They facilitate the trading process by quoting prices and by buying or selling shares when there are too many or too few available.

Financial services sales agents sell a wide variety of banking, accounting, securities, insurance, tax preparation, and other related services. They contact potential customers to explain their services and to ascertain customers' banking and other financial needs. They also may solicit businesses to participate in consumer credit card programs.

Work environment. Most securities and commodities sales agents work in offices under fairly stressful conditions. The pace of work is very fast, and managers tend to be very demanding of their workers since both commissions and advancement are tied to sales.

Stock brokers and investment advisors generally work somewhat more than 40 hours a week, but they may not work at traditional times. Evening and weekend work is often necessary, as many of their clients work during the day. A growing number of securities sales agents, employed mostly by discount or online brokerage firms, work in call-center environments. In these centers, hundreds of agents spend much of the day on the telephone taking orders from clients or offering advice and information on different securities. Often, such call centers operate 24 hours a day, requiring agents to work in shifts.

Investment bankers in corporate finance or mergers and acquisitions typically work long hours and endure extreme stress, especially at the junior levels. Evening and weekend work is common. Because banks work with companies all over the world, extensive travel is often part of the job. With some experience, the workload becomes more manageable, but since higher-level workers generally have more contact with clients, they also tend to travel more.

Sales and trading departments typically work somewhat more than 40 hours a week, but not nearly as much as their counterparts in investment banking. They also travel less, and many only travel a few times a year for conferences or training. On the other hand, their jobs are incredibly stressful. For sales agents, every minute of the day that is wasted means they might have made another sale. Since both commissions and advancement are tied to sales, this can be very stressful. Traders have perhaps the most stressful jobs of all, as split second decisions can lead to millions of dollars being won or lost. Trading floors are very busy and often very loud. Exchange workers, much like traders, have highly stressful jobs because the bulk of their work takes place on the floor of the exchanges. However, exchange traders and workers typically work shorter hours than many other agents since most of their work is done while the market is open.

Exchange workers, much like traders, have highly stressful jobs, but the bulk of their work takes place on the floor of the exchanges, so hours are not very long. Trading floors of exchanges are even busier and louder than those inside of investment banks. Stress is

very high, as millions of dollars are on the line for almost every trade, but workers who have made it to this level are generally up to the task.

Financial services sales agents normally work 40 hours a week in a comfortable, less stressful office environment. They may spend considerable time outside the office, meeting with current and prospective clients, attending civic functions, and participating in trade association meetings. Some financial services sales agents work exclusively inside banks, providing service to walk-in customers.

Training, Other Qualifications, and Advancement

Most positions require a bachelor's degree, although few require a specific major. An MBA or professional certification can also be very helpful. Advancement is often very difficult, but those who are successful can have extremely lucrative careers.

Education and training. A college education is important for securities and commodities sales agents, especially in larger firms, because they must be knowledgeable about economic conditions and trends. Most workers have a bachelor's degree in business, finance, accounting, or economics, although this is not necessarily a requirement. Many firms hire summer interns before their last year of college and those who are most successful are offered full-time jobs after they graduate.

After working for a few years, many agents get Master's degrees in Business Administration (MBA). This degree is a requirement for many of the high-level positions in the securities industry. Because the MBA is a professional degree designed to expose students to real-world business practices, it is considered to be a major asset for jobseekers. Employers often reward MBA-holders with higher-level positions, better compensation, and even large signing bonuses.

Most employers provide intensive on-the-job training, especially for entry-level employees. While college coursework is helpful, most firms have a specialized business model which employees must learn. New employees must also come to know the large number of products and services offered by most firms. Trainees in large firms may receive classroom instruction in securities analysis, effective speaking, and the finer points of selling. Firms often rotate their trainees among various departments, to give them a broad perspective of the securities business. In small firms, sales agents often receive training in outside institutions and on the job.

Securities and commodities sales agents must keep up with new products and services and other developments. Because of this, brokers regularly attend conferences and training seminars.

Licensure. Brokers and investment advisors must register as representatives of their firm with the Financial Industry Regulatory Authority (FINRA). Before beginners can qualify as registered representatives, they must be an employee of a registered firm for at least 4 months and pass the General Securities Registered Representative Examination—known as the Series 7 Exam—administered by FINRA. The exam takes 6 hours and contains 250 multiple-choice questions; a passing score is above 70 percent.

Most states require a second examination—the Uniform Securities Agents state Law Examination (Series 63 or 66). This test measures the prospective representative's knowledge of the securities business in general, customer protection requirements, and record-keeping procedures. Most firms offer training to help their employees pass these exams.

There are many other licenses available, each of which gives the holder the right to sell different products and services. Most experienced representatives have several. Traders and some other workers also need licenses, although these vary greatly by firm and specialization. Financial services sales agents may also need to be licensed, especially if they sell securities or insurance.

Registered representatives must attend periodic continuing education classes to maintain their licenses. Courses consist of computer-based training in regulatory matters and company training on new products and services.

Other qualifications. Many employers consider personal qualities and skills more important than academic training. Employers seek applicants who have excellent interpersonal and communication skills, a strong work ethic, the ability to work in a team, and a desire to succeed. The ability to understand and analyze numbers is also especially important. Because securities, commodities, and financial services sales agents are entrusted with large sums of money and personal information, employers also make sure that applicants have a good credit history and a clean record. Self-confidence and an ability to handle frequent rejection are important ingredients for success.

Maturity and the ability to work independently are important so many employers prefer to hire those who have achieved success in other jobs. Most firms prefer candidates with sales experience, particularly those who have worked on commission in areas such as real estate or insurance. Other firms prefer to hire workers right out of college, with the intention of molding them to their corporate image.

Advancement. The principal form of advancement for brokers, investment advisors, and financial services sales agents is an increase in the number and size of the accounts they handle. Although beginners usually service the accounts of individual investors, they may eventually handle very large institutional accounts, such as those of banks and pension funds. After taking a series of tests, some brokers become portfolio managers and have greater authority to make investment decisions regarding an account. Some experienced sales agents become branch office managers and supervise other sales agents while continuing to provide services for their own customers. A few agents advance to top management positions or become partners in their firms.

Investment bankers who enter the occupation directly after college generally start as analysts. At this level, employees have some contact with clients but spend most of their time producing "pitchbooks," information booklets used to sell products. They also receive intensive training. After 2 to 3 years, top analysts may be promoted to an associate position or asked to leave. Recent graduates from MBA programs can start as associates, which is similar to the analyst position, but with more responsibilities. Associate may lead a group of analysts and tend to have more contact with clients. After 2 to 3 years, associates are promoted or terminated. Successful associates can become vice presidents, who manage the work of analysts and associates and have a great deal of contact with clients. Vice presidents may advance to become directors, sometimes called executive directors.

Employment

Securities, commodities, and financial services sales agents held about 320,000 jobs in 2006. More than half of jobs were in the securities, commodity contracts, and other financial investments and related activities industry. One in 5 worked in the depository and nondepository credit intermediation industries, which include commercial banks, savings institutions, and credit unions. About 1 out of 6 securities, commodities, and financial services sales agents were self-employed.

Although securities and commodities sales agents are employed by firms in all parts of the country, about 1 in 10 jobs were located in New York City, including the majority of those in investment

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Securities, commodities, and financial services sales agents.....	41-3031	320,000	399,000	79,000	25

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

banking. Because of their close relationship to stock exchanges and large banking operations, most of the major investment banks in the United States are based in New York City. Smaller investment banks can be found in many major American cities and some major investment banks have operations in other cities, although most of their business remains in New York.

Job Outlook

Securities, commodities, and financial services sales agent jobs are projected to grow rapidly over the next decade, especially in the banking industry. However, the number of applicants will continue to far exceed the number of job openings in this high-paying occupation.

Employment change. Employment of securities, commodities, and financial services sales agents is expected to grow 25 percent during the 2006–2016 decade, which is much faster than the average for all occupations. The replacement of traditional pension plans with self-directed retirement accounts has led more Americans to hold stock in recent years. This change means that where companies were making investments to secure their employees' retirements in the past, individuals now save money for their own retirements. About half of American households now own stock, and the number of new investors grows daily. While these individual investors are still only a small part of the total, the nationwide interest in owning securities will greatly increase the number of brokers and investment advisors.

Members of the baby boomer generation, in their peak savings years, will fuel much of this increase in investment. As they begin to retire, the number of transactions they make will go up, fueling the need for more investment advisors and brokers. The growing demand for brokers will also stem from the increasing number and complexity of investment products, as well as the effects of globalization. As the public and businesses become more sophisticated about investing, they are venturing into the options and futures markets. Also, markets for investment are expanding with the increase in global trading of stocks and bonds.

The deregulation of financial markets has broken down the barriers between investment activities and banking. The result is that banks now compete with securities companies on all levels. Many of the major investment banks are now owned by large banks and most major banks also have brokerages, which allow their customers to quickly and easily transfer money between their personal banking and investment accounts. This will lead to increased employment of financial services sales agents in banks as they expand their product offerings in order to compete directly with other investment firms.

Job prospects. Despite job growth, competition for jobs in this occupation usually is keen with more applicants than jobs, especially in larger companies. Jobs in brokerages are competitive but are accessible to graduates who have first-rate résumés, strong interpersonal skills, and good grades. Opportunities for beginning sales agents should be better in smaller firms. Investment banking is especially known for its competitive hiring process. Having a degree from a prestigious undergraduate institution is very helpful, as are excellent grades in finance, economics, accounting, and business courses. Competition is even greater for positions working in exchanges.

Employment in the securities industry is closely connected with market conditions and the state of the overall economy and is highly volatile during recessionary periods. Turnover is high for newcomers, who face difficult prospects no matter when they join the industry. Once established, however, securities and commodities sales agents have a very strong attachment to their profession because of their high earnings and considerable investment in training.

Earnings

The median annual wage-and-salary earnings of securities, commodities, and financial services sales agents were $68,500 in May 2006. The middle half earned between $42,630 and $126,290. The lowest 10 percent earned less than $31,170, and the highest 10 percent made more than $145,600.

Median annual earnings in the industries employing the largest numbers of securities, commodities, and financial services sales agents were:

Other financial investment activities	$103,640
Security and commodity contracts intermediation and brokerage	81,050
Activities related to credit intermediation	67,080
Other nondepository credit intermediation	53,750
Nondepository credit intermediation	52,100

Because this is a sales occupation, many workers are paid a commission based on the amount of stocks, bonds, mutual funds, insurance, and other products they sell. Earnings from commissions are likely to be high when there is much buying and selling, and low when there is a slump in market activity. Most firms provide sales agents with a steady income by paying a "draw against commission"—a minimum salary based on commissions they can be expected to earn. Trainee brokers usually are paid a salary until they develop a client base. The salary gradually decreases in favor of commissions as the broker gains clients.

Investment bankers in corporate finance and mergers and acquisitions are generally paid a base salary with the opportunity to earn a substantial bonus. At the higher levels, bonuses far exceed base salary. This arrangement works similarly to commissions but gives banks greater flexibility to reward members of the team who were more effective. Since investment bankers in sales and trading departments generally work alone, they generally work on commissions.

Brokers who work for discount brokerage firms that promote the use of telephone and online trading services usually are paid a salary, sometimes boosted by bonuses that reflect the profitability of the office. Financial services sales agents usually are paid a salary also, although bonuses or commissions from sales are starting to account for a larger share of their income.

Benefits in the securities industry are generally very good. They normally include health care, retirement, and life insurance. Securities firms may also give discounts to employees on financial services that they sell to customers. Other benefits may include paid

lunches with clients, paid dinners for employees who work late, and often extensive travel opportunities.

Related Occupations

Other jobs requiring knowledge of finance and an ability to sell include insurance sales agents, real estate brokers and sales agents, financial analysts and personal financial advisors, and loan officers.

Travel Agents

(O*NET 41-3041.00)

Significant Points

- Travel benefits, such as reduced rates for transportation and lodging, attract people to this occupation.
- Training at a postsecondary vocational school, college, or university is increasingly important.
- Travel agents increasingly specialize in specific destinations or by type of travel or traveler.

Nature of the Work

Travel agents help travelers sort through vast amounts of information to help them make the best possible travel arrangements. They offer advice on destinations and make arrangements for transportation, hotel accommodations, car rentals, and tours for their clients. They are also the primary source of bookings for most of the major cruise lines. In addition, resorts and specialty travel groups use travel agents to promote travel packages to their clients.

Travel agents are also increasingly expected to know about and be able to advise travelers about their destinations, such as the weather conditions, local ordinances and customs, attractions, and exhibitions. For those traveling internationally, agents also provide information on customs regulations, required papers (passports, visas, and certificates of vaccination), travel advisories, and currency exchange rates. In the event of changes in itinerary in the middle of a trip, travel agents intercede on the traveler's behalf to make alternate booking arrangements.

Travel agents use a variety of published and computer-based sources for information on departure and arrival times, fares, quality of hotel accommodations, and group discounts. They may also visit hotels, resorts, and restaurants themselves to evaluate the comfort, cleanliness, and the quality of specific hotels and restaurants so that they can base recommendations on their own experiences or those of colleagues or clients.

Travel agents who primarily work for tour operators and other travel arrangers may help develop, arrange, and sell the company's own package tours and travel services. They may promote these services, using telemarketing, direct mail, and the Internet. They make presentations to social and special-interest groups, arrange advertising displays, and suggest company-sponsored trips to business managers.

Travel agents collect information from clients concerning travel dates and destinations before researching fares and routes on computers.

Agents face increasing competition from travel and airline websites for low-cost fares, but travelers still prefer using travel agents who can provide customized service and planning for complex itineraries to remote or multiple destinations. To attract these travelers, many travel agents specialize in specific interest destinations, travel to certain regions, or in selling to particular demographic groups.

Work environment. Travel agents spend most of their time behind a desk conferring with clients, completing paperwork, contacting airlines and hotels to make travel arrangements, and promoting tours. Most of their time is spent either on the telephone or on the computer researching travel itineraries or updating reservations and travel documents. Agents may be under a great deal of pressure during travel emergencies or when they need to reschedule missed reservations. Peak vacation times, such as summer and holiday travel periods, also tend to be hectic.

Many agents, especially those who are self-employed, frequently work long hours. Advanced computer systems and telecommunications networks make it possible for a growing number of travel agents to work at home; however, some agents feel a need to have an office presence to attract walk-in business.

Training, Other Qualifications, and Advancement

A love of travel and knowledge and enthusiasm for advising people about travel destinations and itineraries are important traits for a

travel agent to have. Superb communication and computer skills are essential for talking with clients and making travel reservations.

Education and training. The minimum requirement for those interested in becoming a travel agent is a high school diploma or equivalent; although many travel agencies prefer applicants who have a college degree and business or travel experience. Much of the training is provided on the job, a significant part of which consists of instruction on how to use reservation systems.

Training specific to becoming a travel agent is available at the many vocational schools that offer full-time travel agent programs leading to a postsecondary vocational award. Travel agent courses also are offered in public adult education programs, online, and in community colleges. These programs teach students about cruise lines and sales techniques and how to use the reservations systems. They also provide general information about travel destinations. A few colleges offer bachelor's or master's degrees in travel and tourism. Some employers prefer agents who have backgrounds in computer science, geography, communication, foreign languages, or world history, because these backgrounds suggest an existing interest in travel and culture and help agents develop a rapport with clients. Courses in accounting and business management also are important, especially for those who expect to manage or start their own travel agencies. Continuing education is critical because the abundance of travel information readily available through the Internet and other sources has resulted in a more informed consumer who wants to deal with an expert when choosing a travel agent.

Other qualifications. Travel agents must be well-organized, accurate, and detail-oriented in order to compile information from various sources and to plan and organize their clients' travel itineraries. Agents also must be professional and courteous when dealing with travel representatives and clients. Other desirable qualifications include good writing and interpersonal skills and sales abilities.

Personal travel experience is an asset because knowledge about a city or foreign country often helps influence a client's travel plans. Business experience or training increasingly is important because agents need to know how to run a business profitably. As the Internet has become an important tool for making travel arrangements, more travel agencies use websites to provide their services to clients. This trend has increased the importance of computer skills in this occupation.

Certification and advancement. Some employees start as reservation clerks or receptionists in travel agencies. With experience and some formal training, they can take on greater responsibilities and eventually assume travel agent duties. In agencies with many offices, travel agents may advance to busier offices or to office manager or other managerial position.

Those who start their own agencies generally have experience in an established agency. These agents must gain formal approval from suppliers or corporations, such as airlines, ship lines, or rail lines to extend credit on reservations and ensure payment. The Airlines Reporting Corporation and the International Airlines Travel Agency Network, for example, are the approving bodies for airlines. To gain approval, an agency must be financially sound and employ at least one experienced manager or travel agent.

The National Business Travel Association offers three types of designations for corporate travel professionals—Corporate Travel Expert, Certified Corporate Travel Executive, and Global Leadership Professional.

Experienced travel agents can take advanced self-study or group-study courses from the Travel Institute, leading to the Certified Travel Counselor designation. The Travel Institute also offers marketing and sales skills development programs and destination specialist programs, which provide detailed knowledge of regions such as North America, Western Europe, the Caribbean, and the Pacific Rim. With the trend toward more specialization, these and other destination specialist courses are increasingly important.

Employment

Travel agents held about 101,000 jobs in May 2006 and are found in every part of the country. Nearly two-thirds worked for travel agencies. Another 13 percent were self-employed. The remainder worked for tour operators, visitor's bureaus, reservation offices, and other travel arrangers.

Job Outlook

Employment of travel agents is expected to change little through 2016. Travel agents who specialize in a travel destination, type of traveler, or mode of transportation will have the best chances for success.

Employment change. Employment of travel agents is expected to increase by 1 percent, which is considered little or no growth. As spending on travel and tourism rebound from recent recessionary periods and as more travelers begin taking more exotic and customized trips, the demands for the specialized services offered by travel agents will offset the service lost to Internet bookings for simpler itineraries. The ease of Internet use and the ready availability of travel and airline websites that allow people to research and plan their own trips, make their own reservations, and purchase their own tickets will result in less demand for travel agents for routine travel arrangements. There will be, however, many consumers who still prefer to use a professional travel agent to plan a complete trip; to deal with more complex transactions; to ensure reliability; to suggest excursions or destinations that might otherwise be missed; to save time; or, in some cases, to save money. In addition, higher projected levels of travel, especially from businesses and retiring baby boomers will offset the loss of routine transactions. Furthermore, luxury and specialty travel is expected to increase among the growing number of Americans who are seeking out exotic and unique vacations and a growing part of travel agents' business is organizing and selling tours for the growing number of international visitors.

Job prospects. Applicants for travel agent jobs should face fair to good job opportunities, depending on one's qualifications and experience. Opportunities should be better for agents who specialize in specific destinations, luxury travel, or particular types of travelers such as ethnic groups or groups with a special interest or hobby.

The demand for travel is sensitive to economic downturns and international political crises, when travel plans are likely to be deferred. Thus job opportunities for travel agents will fluctuate with

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Travel agents	41-3041	101,000	102,000	1,000	1

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

changing economic and political times. Many openings, though, are expected to occur as agents leave for other occupations or retire.

Earnings

Experience, sales ability, and the size and location of the agency determine the salary of a travel agent. Median annual earnings of travel agents were $29,210 in May 2006. The middle 50 percent earned between $23,020 and $36,920. The lowest 10 percent earned less than $18,100, while the top 10 percent earned more than $46,270. Median earnings in May 2006 for travel agents employed in the travel arrangement and reservation services industry were $29,160.

Salaried agents usually enjoy standard employer-paid benefits that self-employed agents must provide for themselves. When traveling for personal reasons, agents usually get reduced rates for transportation and accommodations. In addition, agents sometimes take "familiarization" trips, at lower cost or no cost to themselves, to learn about various vacation sites. These benefits often attract people to this occupation.

Earnings of travel agents who own their agencies depend mainly on commissions from travel-related bookings and service fees they charge clients. Often it takes time to acquire a sufficient number of clients to have adequate earnings, so it is not unusual for new self-employed agents to have low earnings. Established agents may have lower earnings during economic downturns.

Related Occupations

Travel agents organize and schedule business, educational, or recreational travel or activities. Other workers with similar responsibilities include tour guides and escorts, travel guides, reservation and transportation ticket agents and travel clerks, retail salespersons, and hotel, motel, and resort desk clerks.

Office and Administrative Support Occupations

Financial Clerks

Bill and Account Collectors

(O*NET 43-3011.00)

Significant Points

- Almost 1 in 4 collectors work for a collection agency; others work in banks, retail stores, government, physicians' offices, hospitals, and other institutions that lend money and extend credit.
- Most jobs in this occupation require only a high school diploma, though many employers prefer workers with some postsecondary training.
- Much-faster-than-average employment growth is expected as companies focus more efforts on collecting unpaid debts.

Nature of the Work

Bill and account collectors, often called simply *collectors*, keep track of accounts that are overdue and attempt to collect payment on them. Some are employed by third-party collection agencies, while others—known as "in-house collectors"—work directly for the original creditors, such as department stores, hospitals, or banks.

The duties of bill and account collectors are similar across the many different organizations in which they work. First, collectors are called upon to locate and notify customers of delinquent accounts, usually over the telephone, but sometimes by letter. When customers move without leaving a forwarding address, collectors may check with the post office, telephone companies, credit bureaus, or former neighbors to obtain the new address. The attempt to find the new address is called "skip tracing." New computer systems assist in tracing by automatically tracking when customers change their address or contact information on any of their open accounts.

Once collectors find the debtor, they inform him or her of the overdue account and solicit payment. If necessary, they review the terms of the sale, service, or credit contract with the customer. Collectors also may attempt to learn the cause of the delay in payment. Where feasible, they offer the customer advice on how to pay off the debts, such as taking out a bill consolidation loan. However, the collector's prime objective is always to ensure that the customer pays the debt in question.

Bill and account collectors call customers to ask for payment on late or delinquent bills.

If a customer agrees to pay, collectors record this commitment and check later to verify that the payment was made. Collectors may have authority to grant an extension of time if customers ask for one. If a customer fails to pay, collectors prepare a statement indicating the customer's action for the credit department of the establishment. In more extreme cases, collectors may initiate repossession proceedings, disconnect the customer's service, or hand the account over to an attorney for legal action. Most collectors handle other administrative functions for the accounts assigned to them, including recording changes of address and purging the records of the deceased.

Collectors use computers and a variety of automated systems to keep track of overdue accounts. In sophisticated predictive dialer systems, a computer dials the telephone automatically, and the collector speaks only when a connection has been made. Such systems eliminate time spent calling busy or nonanswering numbers. Many collectors use regular telephones, but others wear headsets like those used by telephone operators.

Work environment. In-house bill and account collectors typically are employed in an office environment, and those who work for third-party collection agencies may work in a call-center environment. Workers spend most of their time on the phone tracking down and contacting people with debts. The work can be stressful as some customers are confrontational when pressed about their debts. Still, some appreciate assistance in resolving their outstanding debt. Collectors may also feel pressured to meet targets for debt recovered in a certain period.

Bill and account collectors often have to work evenings and weekends, when it is easier to reach people. Many collectors work part time or on flexible work schedules, though the majority work 40 hours per week.

Training, Other Qualifications, and Advancement

Most employers require collectors to have at a least a high school diploma and prefer some customer service experience. Employers usually provide on-the-job training to new employees.

Education and training. Most bill and account collectors are required to have at least a high school diploma. However, employers prefer workers who have completed some college or who have experience in other occupations that involve contact with the public.

Once hired, workers usually receive on-the-job training. Under the guidance of a supervisor or some other senior worker, new employees learn company procedures. Some formal classroom training also may be necessary, such as training in specific computer software. Additional training topics usually include telephone techniques and negotiation skills. Workers are also instructed in the laws governing the collection of debt as mandated by the Fair Debt Collection Practices Act, which applies to all third party and some in-house collectors.

Other qualifications. Workers should have good communication and people skills because they need to speak to customers daily, some of whom may be in stressful financial situations. In addition,

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Bill and account collectors	43-3011	434,000	534,000	99,000	23

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

collectors should be computer literate, and experience with advanced telecommunications equipment is also useful.

Advancement. Collectors most often advance by taking on more complex cases. Some might become team leaders or supervisors. Workers who acquire additional skills, experience, and training improve their advancement opportunities.

Employment

Bill and account collectors held about 434,000 jobs in 2006. About 24 percent of collectors work in the business support services industries, which includes collection agencies. Many others work in banks, retail stores, government, physician's offices, hospitals, and other institutions that lend money and extend credit.

Job Outlook

Employment of bill and account collectors is expected to grow much faster than the average for all occupations through 2016. Job prospects are expected to be favorable because growth in the occupation and the many people who leave the occupation are expected to create plentiful openings.

Employment change. Over the 2006–2016 decade, employment of bill and account collectors is expected to grow by 23 percent, which is much faster than the average for all occupations. Cash flow is becoming increasingly important to companies, which are now placing greater emphasis on collecting unpaid debts sooner. Thus, the workload for collectors is expected to continue to increase as they seek to collect not only debts that are relatively old, but also ones that are more recent. In addition, as more companies in a wide range of industries get involved in lending money and issuing credit cards, they will need to hire collectors because debt levels will likely continue to rise.

Hospitals and physicians' offices are two of the fastest growing industries requiring collectors. With insurance reimbursements not keeping up with cost increases, the health care industry is seeking to recover more money from patients. Government agencies also are making more use of collectors to collect on everything from parking tickets to child-support payments and past-due taxes. In addition, the Internal Revenue Service (IRS) has begun outsourcing the collection of overdue federal taxes to third-party collection agencies, adding to the need for workers in this occupation.

Despite the increasing demand for bill collectors, employment growth may be somewhat constrained by the increased use of third-party debt collectors, who are generally more efficient than in-house collectors. Also, some firms are beginning to use offshore collection agencies, whose lower cost structures allow them to collect debts that are too small for domestic collection agencies.

Job prospects. Job openings will not be created from employment growth alone. A significant number of openings will result from the many people who leave the occupation and must be replaced. As a result, job opportunities should be favorable.

Contrary to the pattern in most occupations, employment of bill and account collectors tends to rise during recessions, reflecting the difficulty that many people have in meeting their financial obligations. However, collectors usually have more success at getting people to repay their debts when the economy is good.

Earnings

Median hourly earnings of bill and account collectors were $13.97 in May 2006. The middle 50 percent earned between $11.49 and $17.14. The lowest 10 percent earned less than $9.61, and the highest 10 percent earned more than $21.12. Many bill and account collectors earn commissions based on the amount of debt they recover.

Related Occupations

Bill and account collectors review and collect information on accounts. Other occupations with similar responsibilities include credit authorizers, checkers, and clerks; loan officers; and interviewers.

Sources of Additional Information

Career information on bill and account collectors is available from

Billing and Posting Clerks and Machine Operators

(O*NET 43-3021.00, 43-3021.01, 43-3021.02, and 43-3021.03)

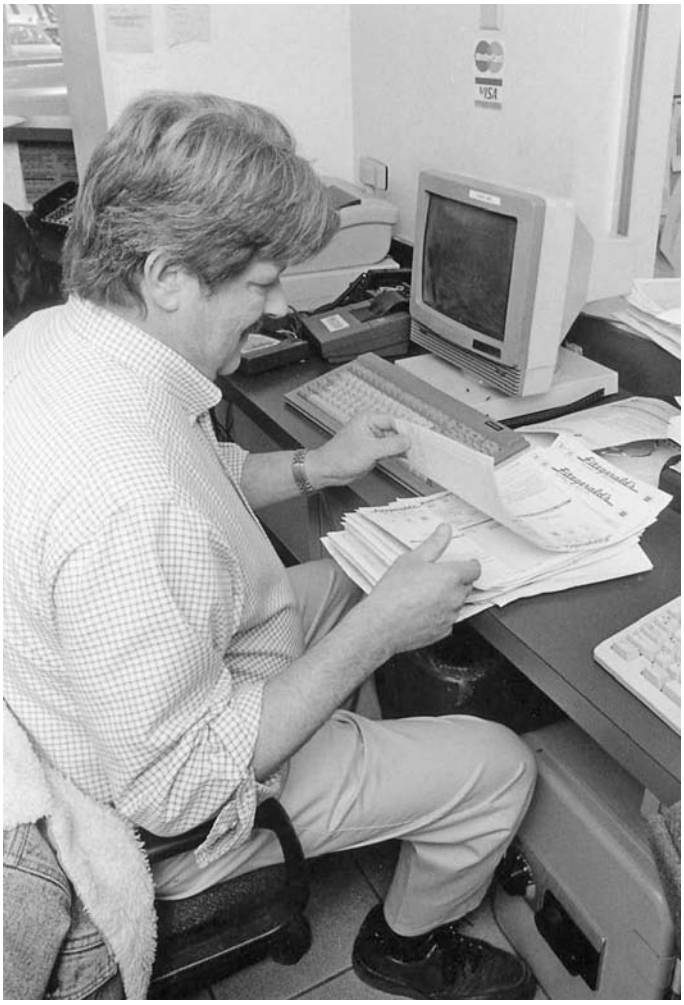
Significant Points

- About 35 percent of these workers are employed in the health care industry.
- Most jobs in this occupation require only a high school diploma; however, many employers prefer to hire workers who have completed some college courses or a degree.
- Slower-than-average employment growth is expected as increased automation of billing services reduces the need for billing clerks.

Nature of the Work

Billing and posting clerks and machine operators, commonly called *billing clerks,* calculate charges, develop bills, and prepare them to be mailed to customers. By reviewing purchasing records and making or verifying calculations, they ensure that even the most complicated bills are accurate.

Billing clerks review hospital records, purchase orders, sales tickets, or charge slips to calculate the total amount due from a customer. They must take into account any discounts, special rates, or credit terms. A billing clerk for a trucking company, for example, often needs to consult a rate book to determine shipping costs. A hospital's billing clerk may need to contact an insurance company to determine what items will be reimbursed. In accounting, law, consulting, and similar firms, billing clerks calculate client fees based on the time required to perform the service being purchased. They keep track of the accumulated hours spent on a job, the fees to charge, the type of job performed for a customer, and the percentage of work completed.



Billing and posting clerks prepare statements to be sent to customers.

After billing clerks review all necessary information, they compute the charges, using calculators or computers. They then prepare itemized statements, bills, or invoices used for billing and record-keeping purposes. In some organizations, the clerk might prepare a bill containing the amount due and the date and type of service; in others, the clerk might produce a more detailed invoice with codes for all goods and services provided. They might also list the items sold, the terms of credit, the date of shipment or of service, and a salesperson's or doctor's identification.

Computers and specialized billing software allow many clerks to calculate charges and prepare bills in one step. Computer packages prompt clerks to enter data from handwritten forms and to manipulate the necessary information on quantities, labor, and rates to be charged. Billing clerks verify the entry of information and check for errors before the computer prints the bill. After the bills are printed, billing clerks review them again for accuracy. Computer software also allows bills to be sent electronically if both the biller and the customer prefer not to use paper copies; this, coupled with the prevalence of electronic payment options, allows a completely paperless billing process. In offices that are not automated, *billing machine operators* produce the bill on a billing machine to send to the customer.

In addition to producing invoices, billing clerks may be asked to handle follow-up questions from customers and resolve any discrepancies or errors. Finally, all changes must be entered in the accounting records.

Work environment. Billing clerks typically are employed in an office environment, although a growing number—particularly medical billers—work at home. Most billing clerks work 40 hours per week during regular business hours, though about 16 percent work part time. Billing clerks use computers on a daily basis, so workers may have to sit for extended periods and also may experience eye and muscle strain, backaches, headaches, and repetitive motion injuries.

Training, Other Qualifications, and Advancement

Billing clerks generally need at least a high school diploma, but many employers prefer workers who have completed some college courses.

Education and training. Most billing clerks need at least a high school diploma. However, many employers prefer to hire workers who have completed some college courses or a degree. Workers with an associate or bachelor's degree are likely to start at higher salaries and advance more easily than those without degrees. Employers also seek workers who are comfortable using computers, especially billing software programs.

Billing clerks usually receive on-the-job training from their supervisor or some other senior worker. Some formal classroom training also may be necessary, such as training in the specific computer software used by the company. A number of community and career colleges offer certificate programs in medical billing. Courses typically cover basic biology, anatomy, and physiology in addition to training on coding and computer billing software.

Other qualifications. Workers must be careful, orderly, and detail oriented. They must be good at working with numbers to avoid making errors and to recognize errors made by others. Workers also should be discreet and trustworthy because they frequently come in contact with confidential material. Medical billers in particular need to understand and follow the regulations of the Health Insurance Portability and Accountability Act (HIPAA), which were enacted to maintain the confidentiality of patient medical records.

Advancement. Billing clerks usually advance by taking on more duties for higher pay or by transferring to a closely related occupation. Some become supervisors because most companies fill supervisory and managerial positions by promoting individuals from within the organization. Workers who acquire additional skills, experience, and training improve their advancement opportunities. With appropriate experience and education, some billing clerks may become accountants, human resource specialists, or buyers.

Employment

In 2006, billing and posting clerks and machine operators held about 542,000 jobs. Although all industries employ billing clerks, the

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Billing and posting clerks and machine operators	43-3021	542,000	566,000	24,000	4

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

health care industry employs the most, with over a third of all billing clerks. The wholesale and retail trade industries also employ a large number. Third-party billing companies—companies that provide billing services for other companies—are employing a growing number. Industries that provide this service are the accounting, tax preparation, bookkeeping, and payroll services industry and administrative and support services industry. These industries currently employ around 11 percent of this occupation, although a portion of these clerks do billing for their employers rather than for an outside client. Another 2 percent—mostly medical billers—were self-employed.

Job Outlook

Employment of billing and posting clerks and machine operators is expected to grow more slowly than the average for all occupations through 2016. Despite slow growth, job prospects should be good as workers leave the occupation creating many job openings.

Employment change. Employment of billing and posting clerks and machine operators is expected to grow by about 4 percent from 2006 to 2016, which is slower than the average for all occupations. Automated and electronic billing processes have greatly simplified billing and allow companies to send bills out faster without hiring additional workers. In addition, as the billing process becomes simplified, other workers, particularly accounting and bookkeeping clerks, are taking on the billing function. More billing clerks will be needed in medical billing, however, because medical bills are complicated and health care services are growing.

Employment growth for billing clerks will occur in most health care related industries, but growth will be limited as more hospitals and physicians' offices use contract billing companies. Contract billing companies generally have much more sophisticated technology and software, enabling each clerk to produce more bills, limiting the need for more clerks. In all industries, including health care, the billing function is becoming increasingly automated and invoices and statements are automatically generated upon delivery of the service or shipment of goods. Bills also are increasingly delivered electronically over the Internet, eliminating the production and mailing of paper bills.

Job prospects. Although growth will be limited, many job openings will occur as workers transfer to other occupations or leave the labor force. A relatively large number of workers leave jobs in this occupation and must be replaced, as is common among entry-level occupations that usually require only a high school diploma.

Earnings

Median hourly earnings of billing and posting clerks and machine operators were $28,850 in May 2006. The middle 50 percent earned between $24,080 and $34,970. The lowest 10 percent earned less than $20,140, and the highest 10 percent earned more than $41,750.

Related Occupations

Billing clerks create and process financial records; other occupations with similar responsibilities include payroll and timekeeping clerks; bookkeeping, accounting, and auditing clerks; tellers; and order clerks.

Sources of Additional Information

Information on employment opportunities for billing clerks is available from local offices of the state employment service.

Bookkeeping, Accounting, and Auditing Clerks

(O*NET 43-3031.00)

Significant Points

- Bookkeeping, accounting, and auditing clerks held more than 2.1 million jobs in 2006 and are employed in every industry.
- Employment is projected to grow as fast as the average due to a growing economy.
- The large size of this occupation ensures plentiful job openings, including many opportunities for temporary and part-time work.

Nature of the Work

Bookkeeping, accounting, and auditing clerks are financial recordkeepers. They update and maintain accounting records, including those which calculate expenditures, receipts, accounts payable and receivable, and profit and loss. These workers have a wide range of skills from full-charge bookkeepers who can maintain an entire company's books to accounting clerks who handle specific tasks. All of these clerks make numerous computations each day and increasingly must be comfortable using computers to calculate and record data.

In small businesses, *bookkeepers and bookkeeping clerks* often have responsibility for some or all of the accounts, known as the general ledger. They record all transactions and post debits (costs) and credits (income). They also produce financial statements and prepare reports and summaries for supervisors and managers. Bookkeepers also prepare bank deposits by compiling data from cashiers, verifying and balancing receipts, and sending cash, checks, or other forms of payment to the bank. They also may handle payroll, make purchases, prepare invoices, and keep track of overdue accounts.

In large-companies' accounting departments, *accounting clerks* have more specialized tasks. Their titles, such as accounts payable clerk or accounts receivable clerk, often reflect the type of accounting they do. In addition, their responsibilities vary by level of experience. Entry-level accounting clerks post details of transactions, total accounts, and compute interest charges. They also may monitor loans and accounts to ensure that payments are up to date. More advanced accounting clerks may total, balance, and reconcile billing vouchers; ensure the completeness and accuracy of data on accounts; and code documents according to company procedures.

Accounting clerks post transactions in journals and on computer files and update the files when needed. Senior clerks also review computer printouts against regularly maintained journals and make necessary corrections. They may review invoices and statements to ensure that all the information appearing on them is accurate and complete, and they may reconcile computer reports with operating reports.

Auditing clerks verify records of transactions posted by other workers. They check figures, postings, and documents to ensure that they are correct, mathematically accurate, and properly coded. They also correct or note errors for accountants or other workers to fix.

As organizations continue to computerize their financial records, many bookkeeping, accounting, and auditing clerks use specialized accounting software, spreadsheets, and databases. Most clerks now enter information from receipts or bills into computers, and the information is then stored either electronically or as computer print-

Bookkeeping, accounting, and auditing clerks keep records of business and financial documents.

outs, or both. The widespread use of computers also has enabled bookkeeping, accounting, and auditing clerks to take on additional responsibilities, such as payroll, procurement, and billing. Many of these functions require these clerks to write letters and make phone calls to customers or clients.

Work environment. Bookkeeping, accounting, and auditing clerks work in an office environment. They may experience eye and muscle strain, backaches, headaches, and repetitive motion injuries from using computers on a daily basis. Clerks may have to sit for extended periods while reviewing detailed data.

Many bookkeeping, accounting, and auditing clerks work regular business hours and a standard 40-hour week, although some may work occasional evenings and weekends. About 24 percent of these clerks worked part time in 2006.

Bookkeeping, accounting, and auditing clerks may work longer hours to meet deadlines at the end of the fiscal year, during tax time, or when monthly or yearly accounting audits are performed. Additionally, those who work in hotels, restaurants, and stores may put in overtime during peak holiday and vacation seasons.

Training, Other Qualifications, and Advancement

Employers usually prefer bookkeeping, accounting, and auditing clerks to have at least a high school diploma and some accounting coursework or relevant work experience. Clerks should also have good communication skills, be detail-oriented, and trustworthy.

Education and training. Most bookkeeping, accounting, and auditing clerks are required to have a high school degree at a minimum. However, having some college is increasingly important and an associate degree in business or accounting is required for some positions. Although a bachelor's degree is rarely required, graduates may accept bookkeeping, accounting, and auditing clerk positions to get into a particular company or to enter the accounting or finance field with the hope of eventually being promoted.

Once hired, bookkeeping, accounting, and auditing clerks usually receive on-the-job training. Under the guidance of a supervisor or another more experienced employee, new clerks learn company procedures. Some formal classroom training also may be necessary, such as training in specialized computer software.

Other qualifications. Experience in a related job and working in an office environment also is recommended. Employers prefer workers who can use computers; knowledge of word-processing and spreadsheet software is especially valuable.

Bookkeeping, accounting, and auditing clerks must be careful, orderly, and detail-oriented in order to avoid making errors and to recognize errors made by others. These workers also should be discreet and trustworthy because they frequently come in contact with confidential material. They should also have good communication skills because they increasingly work with customers. In addition, all bookkeeping, accounting, and auditing clerks should have a strong aptitude for numbers.

Certification and advancement. Bookkeeping, accounting, and auditing clerks, particularly those who handle all the recordkeeping for a company, may find it beneficial to become certified. The Certified Bookkeeper (CB) designation, awarded by the American Institute of Professional Bookkeepers, demonstrates that individuals have the skills and knowledge needed to carry out all bookkeeping functions, including overseeing payroll and balancing accounts according to accepted accounting procedures. For certification, candidates must have at least 2 years of bookkeeping experience, pass a four-part examination, and adhere to a code of ethics. Several colleges and universities offer a preparatory course for certification; some offer courses online.

Bookkeeping, accounting, and auditing clerks usually advance by taking on more duties for higher pay or by transferring to a closely related occupation. Most companies fill office and administrative support supervisory and managerial positions by promoting individuals from within their organizations, so clerks who acquire additional skills, experience, and training improve their advancement opportunities. With appropriate experience and education, some bookkeeping, accounting, and auditing clerks may become accountants or auditors.

Employment

Bookkeeping, accounting, and auditing clerks held more than 2.1 million jobs in 2006. They work in all industries and at all levels of government. Local government and the accounting, tax preparation, bookkeeping, and payroll services industry are among the individual industries employing the largest numbers of these clerks.

Job Outlook

Job growth is projected to be average through 2016, and job prospects should be good as a large number of bookkeeping, accounting, and auditing clerks are expected to retire or transfer to other occupations.

Employment change. Employment of bookkeeping, accounting, and auditing clerks is projected to grow by 12 percent during the 2006–2016 decade, which is as fast as the average for all occupations. Due its size, this occupation will have among the largest numbers of new jobs arise, about 264,000 over the projections decade.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Bookkeeping, accounting, and auditing clerks	43-3031	2,114,000	2,377,000	264,000	12

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

A growing economy will result in more financial transactions and other activities that require recordkeeping by these workers. Additionally, the Sarbanes-Oxley Act of 2002 calls for more accuracy and transparency in the reporting of financial data for public companies, which will increase the demand for these workers. Moreover, companies will continue to outsource their bookkeeping and accounting departments to independent accounting, tax preparation, bookkeeping, and payroll services firms. However, at the same time, the increasing use of tax preparation software in place of the services of tax professionals will hinder growth somewhat.

Clerks who can carry out a wider range of bookkeeping and accounting activities will be in greater demand than specialized clerks. Demand for full-charge bookkeepers is expected to increase, for example, because they do much of the work of accountants and perform a wider variety of financial transactions, from payroll to billing. Technological advances will continue to change the way these workers perform their daily tasks, such as using computer software programs to maintain records, but will not decrease the demand for these workers, especially in smaller establishments.

Job prospects. Some job openings are expected to result from job growth, but even more openings will stem from the need to replace existing workers who leave. Each year, numerous jobs will become available as clerks transfer to other occupations or leave the labor force. The large size of this occupation ensures plentiful job openings, including many opportunities for temporary and part-time work. Certified Bookkeepers (CBs) and those with several years of accounting or bookkeeping experience will have the best job prospects.

Earnings

In May 2006, the median wage and salary earnings of bookkeeping, accounting, and auditing clerks were $30,560. The middle half of the occupation earned between $24,540 and $37,780. The top 10 percent of bookkeeping, accounting, and auditing clerks more than $46,020, and the bottom 10 percent earned less than $19,760.

Benefits offered by employers may vary by the type and size of establishment, but health insurance and paid leave are common.

Related Occupations

Bookkeeping, accounting, and auditing clerks work with financial records. Other workers who perform similar duties include accountants and auditors; bill and account collectors; billing and posting clerks and machine operators; brokerage clerks; credit authorizers, checkers, and clerks; payroll and timekeeping clerks; procurement clerks; and tellers.

Gaming Cage Workers

(O*NET 43-3041.00)

Significant Points

- Job opportunities are available nationwide and are no longer limited to Nevada and New Jersey.
- Most employers prefer applicants who have at least a high school diploma as well as experience in handling money or previous casino employment.

Gaming cage workers must be careful, orderly, and detail-oriented to avoid making errors.

- Workers need a license issued by a regulatory agency, such as a state casino control board or commission; licensure requires a background investigation.

Nature of the Work

Gaming cage workers, more commonly called *cage cashiers*, work in casinos and other gaming establishments. The "cage" where these workers can be found is the central depository for money, gaming chips, and paperwork necessary to support casino play.

Cage workers carry out a wide range of financial transactions and handle any paperwork that may be required. They perform credit checks and verify credit references for people who want to open a house credit account. They cash checks according to rules established by the casino. Cage workers sell gambling chips, tokens, or tickets to patrons or to other workers for resale to patrons and exchange chips and tokens for cash. They may use cash registers, adding machines, or computers to calculate and record transactions. At the end of their shift, cage cashiers must balance the books.

Because gaming establishments are closely scrutinized, cage workers must follow a number of rules and regulations related to their handling of money. For example, they monitor large cash transactions and report these transactions to the Internal Revenue Service to help enforce tax regulations and prevent money laundering. Also, in determining when to extend credit or cash a check, cage workers must follow detailed procedures.

Work environment. The atmosphere in casinos is often considered glamorous. However, casino work can also be physically demanding. This occupation requires workers to stand for long periods with constant reaching and grabbing. Sometimes cage workers may be expected to lift and carry relatively heavy items. The casino atmosphere exposes workers to certain hazards, such as cigarette, cigar, and pipe smoke. Noise from slot machines, gaming tables, and talking workers and patrons may be distracting to some, although workers wear protective headgear in areas where loud machinery is used to count money.

Most casinos are open 24 hours a day, 7 days a week and offer 3 staggered shifts. Casinos typically require cage workers to work on nights, weekends, and holidays.

Training, Other Qualifications, and Advancement

While there are no mandatory education requirements, gaming cage workers typically receive on-the-job training and are licensed by a regulatory agency, such as a state casino control board or commission.

Education and training. There usually are no minimum educational requirements, although most employers prefer at least a high school diploma or the equivalent.

Once hired, gaming cage workers usually receive on-the-job training. Under the guidance of a supervisor or other senior worker, new employees learn company procedures. Some formal classroom training also may be necessary, such as training in specific gaming regulations and procedures.

Licensure. All gaming workers are required to have a license issued by a regulatory agency, such as a state casino control board or commission. Applicants for a license must provide photo identification and pay a fee. Some states may require gaming cage workers to be residents of that state. Age requirements vary by state. The licensing application process also includes a background investigation and drug test.

Other qualifications. Experience in handling money or previous casino employment is preferred. Prospective gaming cage workers are sometimes required to pass a basic math test, and they must be careful, orderly, and detail-oriented to avoid making errors and to recognize errors made by others. These workers also should be discreet and trustworthy because they frequently come in contact with confidential material. Good customer service skills and computer proficiency are also necessary for this occupation. Each casino establishes its own requirements for education, training, and experience.

Advancement. Advancement opportunities in casino gaming depend less on workers' previous casino duties and titles than on their ability and eagerness to learn new jobs. For example, in addition to advancement opportunities available in the cage, such as head cage cashier or supervisor, cage workers may advance onto the floor and become dealers or supervisors.

Employment

Gaming cage workers held about 18,000 jobs in 2006. All of these individuals work in establishments that offer gaming; employment is concentrated in Nevada, Louisiana, Mississippi, and Atlantic City, New Jersey. However, a growing number of states and Indian reservations have legalized gambling, and gaming establishments can now be found in many parts of the country.

Job Outlook

Employment of gaming cage workers is expected to grow about as fast as the average for all occupations through 2016. Job seekers should have favorable prospects due primarily to the spread of legalized gambling.

Employment change. Employment of gaming cage workers is expected to increase by 11 percent between 2006 and 2016, which is about as fast as the average for all occupations. The outlook for gaming cage workers depends on the demand for gaming, which is expected to remain strong. No longer confined to Nevada and New Jersey, gaming is becoming legalized in more states that consider gaming an effective way to increase revenues. A substantial portion of this growth will come from the construction of new Indian casinos and of "racinos," which are pari-mutuel racetracks that offer casino games.

Gaming cage workers, however, will experience slower growth than others in gaming establishments, as casinos find ways to reduce the amount of cash handled by employees. For example, self-serve cash-out and change machines are common along with automated teller machines. In addition, slot machines are now able to make payouts in tickets, instead of coins. Tickets can be read by other slot machines and the amount on the ticket transferred to the new machine. Known as Ticket-in, Ticket-out game play, these technologies reduce the number of cash transactions needed to play and speed up the exchange process, which means fewer workers are needed to handle the cage than in the past.

Job prospects. In addition to job openings arising from employment growth, a fair number of openings will result from high turnover in this occupation caused by the high level of scrutiny workers receive and the need to be accurate. People with good mathematics abilities, previous casino experience, some background in accounting or bookkeeping, and good customer service skills should have the best opportunities.

Earnings

Earnings for gaming cage workers vary according to level of experience, training, location, and size of the gaming establishment. Median hourly earnings of gaming cage workers were $11.13 in May 2006. The middle 50 percent earned between $9.49 and $13.52 an hour. The lowest 10 percent earned less than $8.19, and the highest 10 percent earned more than $15.92 an hour.

Related Occupations

Many other occupations provide hospitality and customer service. Some examples of related occupations are credit authorizers, checkers, and clerks; gaming services occupations; sales worker supervisors; cashiers; retail salespersons; and tellers.

Sources of Additional Information

Information on employment opportunities for gaming cage workers is available from local offices of the state employment service.

Information on careers in gaming also is available from

Payroll and Timekeeping Clerks

(O*NET 43-3051.00)

Significant Points

- Payroll and timekeeping clerks are found in every industry.
- Workers train on the job; employers prefer high school graduates who have computer skills.
- Those who have completed a certification program will have an advantage in the job market.

Nature of the Work

Payroll and timekeeping clerks perform a vital function: ensuring that employees are paid on time and that their paychecks are accurate. If inaccuracies occur, such as monetary errors or incorrect amounts of vacation time, these clerks research and correct the records. In addition, they may perform other clerical tasks. Automated timekeeping systems that allow employees to enter the number of hours they have worked directly into a computer have eliminated much of the data entry and review by timekeepers and have elevated the job of payroll clerks, allowing them to perform more complex tasks. In offices that have not automated this function, however, payroll and timekeeping clerks still perform many of the traditional job functions.

The fundamental task of *timekeeping clerks* is distributing and collecting timecards each pay period. These workers review employee work charts, timesheets, and timecards to ensure that information is properly recorded and that records have the signatures of authorizing officials. In companies that bill clients for the time worked by staff—law or accounting firms, for example—timekeeping clerks make sure that the hours recorded are charged to the correct job so that clients can be properly billed. These clerks also review computer reports listing timecards that cannot be processed because of errors, and they contact the employee or the employee's supervisor to resolve the problem. In addition, timekeeping clerks are responsible for informing managers and other employees about procedural changes in payroll policies.

Payroll clerks, also called *payroll technicians,* screen timecards for calculating, coding, or other errors. They compute pay by subtracting allotments, including federal and state taxes and contributions to retirement, insurance, and savings plans, from gross earnings. Increasingly, computers perform these calculations and alert payroll clerks to problems or errors in the data. In small organizations or for new employees whose records are not yet entered into a computer system, clerks may perform the necessary calculations manually. In some small offices, clerks or other employees in the accounting department process payrolls.

Payroll and timekeeping clerks review work charts and timesheets to ensure that employees are paid on time.

Payroll clerks record changes in employees' addresses; close out files when workers retire, resign, or transfer; and advise employees on income tax withholding and other mandatory deductions. These workers also issue and record adjustments to workers' pay because of previous errors or retroactive increases. Periodically, they prepare and mail earnings and tax-withholding statements for employees' use in preparing income tax returns. Payroll clerks need to be aware of changes in tax and deduction laws, so that they can implement them.

In small offices, payroll and timekeeping duties are likely to be included in the duties of a general office clerk, a secretary, or an accounting clerk. However, large organizations employ specialized payroll and timekeeping clerks to perform these functions. In offices that have automated timekeeping systems, payroll clerks perform more analysis of the data, examining trends and working with computer systems. They also spend more time answering employees' questions and processing unique data.

Work environment. Payroll and timekeeping clerks usually work in clean, pleasant, and comfortable office settings, but they also may face pressure to meet deadlines. Clerks usually work a standard 35- to 40-hour week; however, longer hours might be necessary during busy periods.

Training, Other Qualifications, and Advancement

Payroll and timekeeping clerks train on the job. Employers prefer high school graduates who have computer skills.

Education and training. Most employers prefer applicants with a high school diploma or GED. Payroll and timekeeping clerks train on the job, gaining skills by watching and learning from other workers. New workers receive training in payroll, timekeeping, personnel issues, workplace practices, and company policies. Some also complete training programs in high schools, business schools, or community colleges.

Other qualifications. Computer skills are very desirable. In addition, payroll and timekeeping clerks must be able to interact and communicate with individuals at all levels of the organization. Clerks need poise, tactfulness, and diplomacy, and the interpersonal skills to handle sensitive and confidential situations.

Certification and advancement. Many professional organizations for payroll and timekeeping offer classes to enhance the skills of their members. Some organizations offer certification programs; completion of a certification program can show competence and can enhance advancement opportunities. For example, the American Payroll Association offers two levels of certification, the Fundamental Payroll Certification and the Certified Payroll Professional. The first is open to all individuals who wish to demonstrate basic payroll competency. The second and more advanced credential is available to those who have been employed in the practice of payroll for at least 3 years, among other requirements. Both certifications require experience and a passing score on an exam.

Employment

Payroll and timekeeping clerks held about 214,000 jobs in 2006. They can be found in every industry, but a growing number work for employment services companies as temporary employees. Many also work for accounting, tax preparation, bookkeeping, and payroll services firms, which increasingly perform the payroll function as a

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Payroll and timekeeping clerks	43-3051	214,000	220,000	6,600	3

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

service to other companies. Approximately 16 percent of all payroll and timekeeping clerks worked part time in 2006.

Job Outlook

Slower-than-average job growth is expected. Those who have completed a certification program will have an advantage in the job market.

Employment change. Employment of payroll and timekeeping clerks is expected to grow 3 percent during the 2006–2016 decade, slower than the average for all occupations. The increasing use of computers will limit employment growth of payroll and timekeeping clerks. For example, automated time clocks, which calculate employee hours, allow large organizations to centralize their timekeeping duties in one location. At individual sites, employee hours increasingly are tracked by computer and verified by managers. This information is compiled and sent to a central office to be processed by payroll clerks. In addition, the growing use of direct deposit will reduce the need to draft paychecks because pay is transferred automatically each pay period. Also, more organizations are allowing employees to update their payroll records electronically. In smaller organizations, payroll and timekeeping duties are being assigned to secretaries, general office clerks, or accounting clerks.

As entering and recording payroll and timekeeping information becomes more simplified, the job itself is becoming more varied and complex. For example, companies now offer a greater variety of pension, 401(k), and other investment plans to their employees. Also, the growing use of wage garnishment for child support is adding to the complexity. These developments will contribute to job growth for payroll and timekeeping clerks, who will be needed to record and monitor such information.

As firms increasingly outsource the payroll function, most job growth is expected to be in companies that specialize in payroll—including companies in the employment services industry and the accounting, tax preparation, bookkeeping, and payroll services industry. Many of these companies are data processing facilities, but accounting firms also are taking on the payroll function to supplement their accounting work.

Job prospects. In addition to job growth, numerous job openings will arise each year as payroll and timekeeping clerks leave the labor force or transfer to other occupations. Those who have completed a certification program, indicating that they can handle more complex payroll issues, will have an advantage in the job market.

Earnings

Salaries of payroll and timekeeping clerks may vary considerably. The region of the country, size of city, and type and size of establishment all influence salary levels. Also, the level of expertise required and the complexity and uniqueness of a clerk's responsibilities may affect earnings.

Median annual earnings of payroll and timekeeping clerks in May 2006 were $32,400. The middle 50 percent earned between $26,190 and $39,420. The lowest 10 percent earned less than $21,150, and the highest 10 percent earned more than $46,500. Median annual earnings in the industries employing the largest numbers of payroll and timekeeping clerks in May 2006 were:

Management of companies and enterprises	$33,880
Accounting, tax preparation, bookkeeping, and payroll services	33,700
Elementary and secondary schools	33,600
Local government	33,490
Employment services	30,290

Some employers offer educational assistance to payroll and timekeeping clerks.

Related Occupations

Payroll and timekeeping clerks perform a vital financial function—ensuring that employees are paid on time and that their paychecks are accurate. In addition, they may perform various other office and administrative support duties. Other financial clerks include bill and account collectors; billing and posting clerks and machine operators; bookkeeping, accounting, and auditing clerks; gaming cage workers; procurement clerks; and tellers.

Procurement Clerks

(O*NET 43-3061.00)

Significant Points

- About 23 percent of procurement clerks work for federal, state, and local governments.
- Overall employment is expected to experience little or no change as a result of increasing automation, offshoring, and restructuring of business.
- High school graduates with good communication and computer skills should have the best job opportunities.

Nature of the Work

Procurement clerks compile requests for materials, prepare purchase orders, keep track of purchases and supplies, and handle inquiries about orders. Usually called *purchasing clerks* or *purchasing technicians*, they perform a variety of tasks related to ordering goods and supplies for an organization. They make sure that what was purchased arrives on schedule and meets the purchaser's specifications.

Automation is having a profound effect on this occupation. Orders for goods now can be placed electronically when supplies are low. However, automation is still years away for many firms,

Procurement clerks prepare purchase orders and make sure that the shipment and the bills agree with the order.

and the role of the procurement clerk is unchanged in many organizations.

Procurement clerks perform a wide range of tasks. Some clerks perform strictly clerical functions, but others, particularly at small or medium-sized companies, do more complex tasks. In general, procurement clerks process requests for purchases. They first determine whether there is any of the requested product left in inventory and may go through catalogs or to the Internet to find suppliers. They may prepare invitation-to-bid forms and mail them to suppliers or distribute them for public posting. Procurement clerks may interview potential suppliers by telephone or face-to-face to check on prices and specifications and then put together spreadsheets with price comparisons and other facts about each supplier. Upon the organization's approval, clerks prepare and mail purchase orders and enter them into computers.

Procurement clerks keep track of orders and determine the causes of any delays. If the supplier has questions, clerks try to answer them and resolve any problems. When the shipment arrives, procurement clerks may reconcile the purchase order with the shipment, making sure that they match; notify the vendors when invoices are not received; and verify that the bills match the purchase orders.

Some purchasing departments, particularly in small companies, are responsible for overseeing the organization's inventory control system. At these organizations, procurement clerks monitor in-house inventory movement and complete inventory transfer forms for bookkeeping purposes. They may keep inventory spreadsheets and place orders when materials on hand are insufficient.

Work environment. Procurement clerks usually work a standard 40-hour week. Most procurement clerks work in areas that are clean, well lit, and relatively quiet. These workers sit for long periods of time in front of computer terminals, which many cause eyestrain and headaches. Workers in this occupation may sometimes work overtime or on varied shifts.

Training, Other Qualifications, and Advancement

Most employers prefer applicants with a high school diploma or its equivalent. To advance to purchasing agent jobs, a bachelor's degree is usually required and certification is helpful.

Education and training. Most employers prefer applicants who have a high school diploma or its equivalent or a mix of education and related experience. Most procurement clerks are trained on the job under close supervision of more experienced employees. Training usually lasts less than a few months.

Other qualifications. Employers prefer workers who are computer-literate and have a working knowledge of word-processing and spreadsheet software. Proficiency with computer software is important because most tasks, such as preparing purchase orders, are performed electronically.

Certification and advancement. Some procurement clerks who obtain a bachelor's degree and show a greater understanding of contracts and purchasing may be promoted to the position of purchasing agent or buyer. Useful fields of study include business, supply management, engineering, and economics.

Getting a certification may help procurement clerks demonstrate that they have the knowledge and skills necessary to take on more advanced purchasing tasks. There are several recognized credentials for purchasing agents and purchasing managers. The Certified Purchasing Manager (CPM) designation is conferred by the Institute for Supply Management. In 2008, this certification will be replaced by the Certified Professional in Supply Management (CPSM) credential, covering the wider scope of duties now performed by purchasing professionals. The Certified Purchasing Professional (CPP) and Certified Professional Purchasing Manager (CPPM) designations are conferred by the American Purchasing Society. The Certified Supply Chain Professional (CSCP) and Certified in Production and Inventory Management (CPIM) credentials are conferred by APICS, also known as the Association for Operations Management. In federal, state, and local government, the indications of professional competence are Certified Professional Public Buyer (CPPB) and Certified Public Purchasing Officer (CPPO), conferred by the National Institute of Governmental Purchasing. Most of these certifications are awarded only after experience and education requirements are met and written or oral exams are successfully completed.

Employment

In 2006, procurement clerks held about 78,000 jobs in every industry, including manufacturing, retail and wholesale trade, health care, and government. About 23 percent of procurement clerks work for federal, state, and local governments; most of these work for the federal government.

Job Outlook

Employment in the occupation is expected to experience little or no change. High school graduates with good communication and computer skills should have the best job opportunities.

Employment change. Employment of procurement clerks is expected to decline by 2 percent during the 2006–2016 decade, which is considered little or no change, as a result of increasing automation, offshoring, and business restructuring. The need for

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Procurement clerks	43-3061	78,000	76,000	-1,600	-2

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

procurement clerks will be reduced as the use of computers to place orders directly with suppliers—called electronic data interchange—and as ordering over the Internet—known as "e-procurement"—become more commonplace. In addition, procurement authority for some purchases is now being given to employees in the departments originating the purchase. These departments may be issued procurement cards, which are similar to credit cards that enable a department to charge purchases up to a specified amount.

Job prospects. Despite the expected little or no change in employment, job openings will arise out of the need to replace workers who transfer to other occupations or leave the labor force. High school graduates with good communication and computer skills should have the best job opportunities.

Earnings

Median hourly earnings of procurement clerks in May 2006 were $15.91. The middle 50 percent earned between $12.65 and $19.41. The lowest 10 percent earned less than $10.16 and the highest 10 percent earned more than $22.68. Procurement clerks working for the federal government had an average annual income of $41,716 in 2007.

Related Occupations

Procurement clerks compile information and records to draw up purchase orders for materials and services. Other workers who perform similar duties are purchasing agents and buyers, stock clerks and order fillers, and order clerks. Procurement clerks provide office support services for businesses and other organizations. Other workers who perform similar duties are file clerks; secretaries and administrative assistants; receptionists and information clerks; bookkeeping, accounting, and auditing clerks; and payroll and timekeeping clerks.

Sources of Additional Information

Information on obtaining positions as procurement clerks or procurement technicians with the federal government is available from the Office of Personnel Management through USAJOBS, the federal government's official employment information system. This resource for locating and applying for job opportunities can be accessed through the Internet at http://www.usajobs.opm.gov or through an interactive voice response telephone system at (703) 724-1850 or TDD (978) 461-8404. These numbers are not toll free, and charges may result.

State or local government personnel offices and their Web sites can provide information about procurement clerk jobs at those levels of government.

Information on employment opportunities for procurement clerks in the public or private sector is available from local offices of the state employment service.

Tellers

(O*NET 43-3071.00)

Significant Points

- Tellers should enjoy working with the public, feel comfortable handling large amounts of money, and be discreet and trustworthy.
- About 1 out of 4 tellers work part time.
- Many job openings will arise from replacement needs because many tellers eventually leave for jobs in other occupations that offer higher pay or more responsibility.
- Employment of tellers is projected to grow as fast as the average; good job prospects are expected.

Nature of the Work

The teller is the worker most people associate with their bank. Among the responsibilities of tellers are cashing checks, accepting deposits and loan payments, and processing withdrawals. Tellers make up approximately one-fourth of bank employees and conduct most of a bank's routine transactions.

Prior to starting their shifts, tellers receive and count an amount of working cash for their drawers. A supervisor—usually the head teller—verifies this amount. Tellers disburse this cash during the day and are responsible for its safe and accurate handling. Before leaving, tellers count their cash on hand, list the currency received

Tellers must have good customer service skills.

on a balance sheet making sure that the accounts balance, and sort checks and deposit slips. Over the course of a workday, tellers also may process numerous mail transactions. They also may sell savings bonds, accept payment for customers' utility bills and charge cards, process necessary paperwork for certificates of deposit, and sell travelers' checks. Some tellers specialize in handling foreign currencies or commercial or business accounts. Other tellers corroborate deposits and payments to automated teller machines (ATMs).

Being a teller requires a great deal of attention to detail. Before cashing a check, a teller must verify the date, the name of the bank, the identity of the person who is to receive payment, and the legality of the document. A teller also must make sure that the written and numerical amounts agree and that the account has sufficient funds to cover the check. The teller then must carefully count cash to avoid errors. Sometimes a customer withdraws money in the form of a cashier's check, which the teller prepares and verifies. When accepting a deposit, tellers must check the accuracy of the deposit slip before processing the transaction.

As banks begin to offer more and increasingly complex financial services, tellers are being trained to identify customers who might want to buy these services. This task requires them to learn about the various financial products and services the bank offers so that they can explain them to customers and refer interested customers to appropriate specialized sales personnel. In addition, tellers in many banks are being cross-trained to perform some of the functions of customer service representatives. (Customer service representatives are discussed separately in the *Handbook*.)

Technology continues to play a large role in the job duties of all tellers. In most banks, for example, tellers use computer terminals to record deposits and withdrawals. These terminals often give them quick access to detailed information on customer accounts. Tellers can use this information to tailor the bank's services to fit a customer's needs or to recommend an appropriate bank product or service.

In most banks, head tellers manage teller operations. They set work schedules, ensure that the proper procedures are adhered to, and act as mentors to less experienced tellers. In addition, head tellers may perform the typical duties of a front-line teller, as needed, and may deal with the more difficult customer problems. They may access the vault, ensure that the correct cash balance is in the vault, and oversee large cash transactions.

Work environment. Tellers work in an office environment. They may experience eye and muscle strain, backaches, headaches, and repetitive motion injuries as a result of using computers every day. Tellers may have to sit for extended periods while reviewing detailed data.

Many tellers work regular business hours and a standard 40-hour week. Sometimes, they work evenings and weekends to accommodate extended bank hours. About 1 in 4 tellers worked part time.

Training, Other Qualifications, and Advancement

Most teller jobs require a high school diploma or higher degree. Tellers are usually trained on the job.

Education and training. Most tellers are required to have at least a high school diploma, but some have completed some college training or even a bachelor's degree in business, accounting, or liberal arts. Although a college degree is rarely required, graduates sometimes accept teller positions to get started in banking or in a particular company with the hope of eventually being promoted to managerial or other positions.

Once hired, tellers usually receive on-the-job training. Under the guidance of a supervisor or other senior worker, new employees learn company procedures. Some formal classroom training also may be necessary, such as training in specific computer software.

Other qualifications. Experience working in an office environment or in customer service, and particularly in cash-handling can be important for tellers. Regardless of experience, employers prefer workers who have good communication and customer service skills. Knowledge of word-processing and spreadsheet software is also valuable.

Tellers should enjoy contact with the public. They must have a strong aptitude for numbers and feel comfortable handling large amounts of money. They should be discreet and trustworthy because they frequently come in contact with confidential material. Tellers also must be careful, orderly, and detail-oriented to avoid making errors and to recognize errors made by others.

Advancement. Tellers usually advance by taking on more duties and being promoted to head teller or to another supervisory job. Many banks and other employers fill supervisory and managerial positions by promoting individuals from within their organizations, so outstanding tellers who acquire additional skills, experience, and training improve their advancement opportunities. Tellers can prepare for jobs with better pay or more responsibility by taking courses offered by banking and financial institutes, colleges and universities, and private training institutions.

Employment

Tellers held about 608,000 jobs in 2006. The overwhelming majority of tellers worked in commercial banks, savings institutions, or credit unions. The remainder worked in a variety of other finance and other industries.

Job Outlook

Employment of tellers is expected to grow about as fast as the average for all occupations. Overall job prospects should be favorable due to the need to replace workers who retire or otherwise leave the occupation.

Employment change. Employment is projected to grow by 13 percent between 2006 and 2016, which is about as fast as the average for all occupations. To attract customers, banks are opening new branch offices in a variety of locations, such as grocery stores and shopping malls. Banks are also keeping their branches open longer during the day and on weekends. Both of these trends are expected to increase job opportunities for tellers, particularly those who work part time.

Despite the improved outlook, automation and technology will continue to reduce the need for tellers who perform only routine transactions. For example, increased use of ATMs, debit cards, credit cards, and the direct deposit of pay and benefit checks have reduced the need for bank customers to interact with tellers for rou-

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Tellers	43-3071	608,000	689,000	82,000	13

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

tine transactions. Electronic banking—conducted over the telephone or the Internet—also is spreading rapidly throughout the banking industry and will reduce the need for tellers in the long run.

Employment of tellers also is being affected by the increasing use of 24-hour telephone centers by many large banks. These centers allow a customer to interact with a bank representative at a distant location, either by telephone or by video terminal. Such centers usually are staffed by customer service representatives.

Job prospects. Job prospects for tellers are expected to be favorable. In addition to job openings expected from growth, most openings will arise from the need to replace the many tellers who transfer to other occupations—which is common for large occupations that normally require little formal education and offer relatively low pay. Prospects will be best for tellers with excellent customer service skills, knowledge about a variety of financial services, and the ability to sell those services.

Earnings

Salaries of tellers vary with experience, region of the country, size of city, and type and size of establishment. Median annual earnings of tellers were $22,140 in May 2006. The middle 50 percent earned between $19,300 and $25,880 a year. The lowest 10 percent earned less than $16,770, and the highest 10 percent earned more than $30,020 a year in May 2006.

Related Occupations

Tellers enter data into a computer, handle cash, and keep track of financial transactions. Other clerks who perform similar duties include bill and account collectors; billing and posting clerks and machine operators; bookkeeping, accounting, and auditing clerks; gaming cage workers; brokerage clerks; and credit authorizers, checkers, and clerks.

Sources of Additional Information

Information on employment opportunities for tellers is available from banks and other employers, local offices of the state employment service, and

Information and Record Clerks

Brokerage Clerks

(O*NET 43-4011.00)

Significant Points

- More than 9 out of 10 brokerage clerks work for securities and commodities firms, banks, and other establishments in the financial services industry.
- High school graduates qualify for many of these positions, but many workers now hold associate or bachelor's degrees.
- Good prospects are expected for qualified jobseekers as employment grows and as existing brokerage clerks advance to other occupations.

Nature of the Work

For a typical investor, buying and selling stock is a simple process. Often, it is as easy as calling a broker on the phone or entering the trade into a computer. Behind the scenes, however, buying and selling stock is more complicated, involving trade execution and a fair amount of paperwork. While brokers do some of this work themselves, much of it is delegated to brokerage clerks.

Brokerage clerks perform a number of different tasks with a wide range of responsibilities. Most involve computing and recording data pertaining to securities transactions. Brokerage clerks may also contact customers, take orders, and inform clients of changes to their accounts. Brokerage clerks work in the operations departments of securities firms, on trading floors, and in branch offices. Technology has had a major impact on these positions over the last several years. A significant and growing number of brokerage clerks use custom-designed software programs to process transactions more quickly. Only a few customized accounts are still handled manually.

A *broker's assistant*, also called a *sales assistant*, is the most common type of brokerage clerk. These clerks typically assist a small number of brokers, for whom they take client calls, write up order tickets, process the paperwork for opening and closing accounts, record a client's purchases and sales, and inform clients of changes to their accounts. All broker's assistants must be knowledgeable about investment products so that they can communicate clearly with clients. Those who are licensed by the Financial Industry Regulatory Authority (FINRA) can make recommendations to clients at the instruction of the broker. (Securities, commodities, and financial services sales agents are discussed elsewhere in the *Handbook*.)

Brokerage clerks in the operations areas of securities firms perform many duties to help the sale and purchase of stocks, bonds, commodities, and other kinds of investments. They also produce the necessary records of all transactions that occur in their area of the business. *Purchase-and-sale clerks* match orders to buy with orders to sell. They balance and verify trades of stock by comparing the records of the selling firm with those of the buying firm. *Dividend clerks* ensure timely payments of stock or cash dividends to clients

Brokerage clerks assist with tasks such as executing trades and filing paperwork.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Brokerage clerks	43-4011	73,000	88,000	15,000	20

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

of a particular brokerage firm. *Transfer clerks* execute customer requests for changes to security registration and examine stock certificates to make sure that they adhere to banking regulations. *Receive-and-deliver clerks* handle the receipt and delivery of securities among firms and institutions. *Margin clerks* record and monitor activity in customers' accounts to ensure that clients make payments and stay within legal boundaries concerning their purchases of stock.

Work environment. Brokerage clerks work in offices and on trading floors, areas that are clean and well lit but which may be noisy at times. The workload is generally manageable but can become very heavy when the market fluctuates rapidly. Brokerage clerks generally work a standard 40-hour week, but they may work overtime during particularly busy periods.

Training, Other Qualifications, and Advancement

Most brokerage clerks learn their jobs through a few months of on-the-job training and experience. Once they have worked in the firm for a few years, many clerks advance to sales representative or broker positions.

Education and training. Some brokerage clerk positions require only a high school diploma, but graduates from two- and four-year college degree programs are increasingly preferred. Positions dealing with the public, such as broker's or sales assistant, and those dealing with more complicated financial records are especially likely to require a college degree.

Most new employees are trained on the job, working under the close supervision of more experienced employees. Some firms offer formal training that may include courses in telephone etiquette, computer use, and customer service skills. They may also offer training programs to help clerks study for the broker licensing exams.

Licensure. Licenses are not strictly required for most brokerage clerk positions, but a Series 7 brokerage license can make a clerk more valuable to the broker. This license gives the holder the ability to act as a registered representative of the firm. A registered representative has the right to answer more of a client's questions and to pass along securities recommendations from the broker. In order to receive this license, a clerk must pass the General Securities Registered Representative Examination (Series 7 exam), administered by FINRA, and be an employee of a registered firm for at least 4 months.

Other qualifications. Brokerage clerk jobs require good organizational and communication skills, as well as attention to detail. Computer skills are extremely important, as most of the work is done by computer. An aptitude for working with numbers is also very helpful, as is a basic knowledge of accounting.

Advancement. Clerks may be promoted to sales representative positions or other professional positions within the securities industry. Employment as a brokerage clerk may also be a stepping-stone into a position as a broker.

Employment

Brokerage clerks held about 73,000 jobs in 2006. More than 9 out of 10 worked for securities and commodities, banking, and other financial industries.

Job Outlook

The job outlook for prospective brokerage clerks is good. As the securities industry grows, the number of clerks will increase. Opportunities will be abundant relative to other securities industry occupations, due to advancement of other clerks and job growth.

Employment change. Employment of brokerage clerks is expected to grow by 20 percent during the 2006–2016 decade, which is faster than the average for all occupations. With more people investing in securities, brokerage clerks will be required to process larger volumes of transactions. Moreover, regulatory changes have resulted in more legal documentation and recordkeeping requirements. Demand will be tempered, however, by continually improving technologies that allow increased automation of many tasks. Further, clerks are often seen as reducing profits, since they do not bring in customers, making them particularly prone to layoffs. Because of intense competition, especially among discount brokerages, companies must continually focus on cutting costs, meaning that many responsibilities formerly handled by clerks are now handled by the brokers themselves.

Job prospects. Because brokerage clerks are often entry-level workers, many opportunities will result from the advancement of other clerks. Prospects will be good for qualified workers. New entrants who have strong sales skills and an aptitude for understanding numbers will have the best opportunities. While not required, a four-year degree can also be very helpful.

Earnings

Median annual earnings of brokerage clerks were $36,390 in May 2006. The middle 50 percent earned between $29,480 and $46,030. The lowest 10 percent earned less than $24,590 and the highest 10 percent earned more than $57,600.

Related Occupations

Brokerage clerks compute and record data. Other workers who perform calculations and record data include bill and account collectors; billing and posting clerks and machine operators; bookkeeping, accounting, and auditing clerks; and tellers.

Credit Authorizers, Checkers, and Clerks

(O*NET 43-4041.00, 43-4041.01, and 43-4041.02)

Significant Points

- Most jobs require only a high school diploma.
- Employment is expected to decline.

Nature of the Work

Credit authorizers, checkers, and clerks review credit history and obtain the information needed to determine the creditworthiness of individuals or businesses applying for credit. They spend much of their day on the telephone or on the Internet obtaining information from credit bureaus, employers, banks, credit institutions, and other sources to determine applicants' credit history and ability to repay what they borrow or charge.

Credit authorizers, checkers, and clerks process and authorize applications for credit, including applications for credit cards. Although the distinctions among the three job titles are disappearing, some general differences remain. *Credit clerks* typically handle the processing of credit applications by verifying the information on the application, calling applicants if additional data are needed, contacting credit bureaus for a credit rating, and obtaining any other information necessary to determine applicants' creditworthiness. If clerks work in a department store or other establishment that offers instant credit, they enter the applicant's information into a computer at the point of sale. A credit rating is then transmitted from a central office within seconds to indicate whether the application should be rejected or approved.

Credit checkers investigate the credit history and current credit standing of a person or business prior to the issuance of a loan or line of credit. Credit checkers also may contact credit departments of businesses and service companies to obtain information about an applicant's credit standing. Credit reporting agencies and bureaus hire checkers to secure, update, and verify information for credit reports. These workers often are called *credit investigators* or *credit reporters*.

Credit authorizers approve charges against customers' existing accounts. Most charges are approved automatically by computer. However, when accounts are past due, overextended, or invalid, or when they show a change of address, salespersons refer the associated transactions to credit authorizers located in a central office. These authorizers evaluate customers' computerized credit records and payment histories and quickly decide whether to approve new charges.

Work environment. Credit authorizers, checkers, and clerks usually work a standard 40-hour week. However, they may work overtime during particularly busy periods, such as holiday shopping seasons and store sales. Most credit authorizers, checkers, and clerks work in areas that are clean, well lit, and relatively quiet. These workers sit for long periods of time in front of computer screens, which may cause eyestrain and headaches. Part-time work is available, and temporary workers are often hired during peak workloads.

Training, Other Qualifications, and Advancement

Employers generally prefer workers with a least a high school diploma or its equivalent and usually provide on-the-job training.

Credit authorizers review a customer's credit history.

Education and training. A high school diploma or its equivalent is usually the minimum requirement for these workers. Most new employees are trained on the job, working under close supervision of more experienced employees. Some firms offer formal training that may include courses in telephone etiquette, computer use, and customer service skills. Some credit authorizers, checkers, and clerks also take courses in credit offered by banking and credit associations, public and private vocational schools, and colleges and universities.

Experience and other qualifications. Other requirements of the job include good telephone and organizational skills and the ability to pay close attention to details and meet tight deadlines. Computer skills also are important in order to enter and retrieve data quickly.

Advancement. These workers typically can advance to supervisory positions. They may become loan or credit department supervisor or team leader of a small group of clerks.

Employment

Credit authorizers, checkers, and clerks held about 69,000 jobs in 2006. Nearly half of these workers were employed by finance and insurance industries, mainly firms in credit intermediation and related activities, such as commercial and savings banks; credit unions; and mortgage, finance, and loan companies. Credit bureaus, collection agencies, and wholesale and retail trade establishments also employ these clerks.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Credit authorizers, checkers, and clerks	43-4041	69,000	63,000	-5,800	-8

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Job Outlook

Employment for this occupation is expected to decline moderately through the year 2016. However, job openings will still arise from the need to replace workers leaving the occupation.

Employment change. Employment of credit authorizers, checkers, and clerks is expected to decline moderately by about 8 percent between 2006 and 2016. Despite a projected increase in the number of credit applications, technology will allow these applications to be processed, checked, and authorized by fewer workers than were required in the past.

Credit scoring is a major development that has improved the productivity of credit authorizers, checkers, and clerks, thus limiting employment growth in the occupation. Companies and credit bureaus now can purchase software that quickly analyzes an applicant's creditworthiness and summarizes it with a "score." Credit issuers then can easily decide whether to accept or reject an application on the basis of its score, speeding up the authorization of loans or credit. Obtaining credit ratings also has become much easier for credit checkers and authorizers because businesses now have computer systems directly linked to credit bureaus that provide immediate access to a person's credit history.

Job prospects. Despite an expected decline in employment, job prospects for credit authorizers, checkers, and clerks will remain good. Openings will arise from the need to replace workers who leave the occupation for various reasons. However, the job outlook is sensitive to overall economic activity. However, the job outlook is sensitive to overall economic activity. A downturn in the economy or a rise in interest rates usually leads to a decline in demand for credit.

Earnings

Median hourly earnings of credit authorizers, checkers, and clerks in May 2006 were $14.41. The middle 50 percent earned between $11.25 and $18.10. The lowest 10 percent earned less than $8.72, and the highest 10 percent earned more than $22.30. Median hourly earnings in nondepository credit intermediation were $15.21 in 2006, while median earnings in depository credit intermediation were $15.01.

Related Occupations

Credit authorizers, checkers, and clerks obtain and analyze credit histories. Other workers who review account information include bill and account collectors, loan officers, and insurance underwriters.

Sources of Additional Information

State employment service offices and agencies can provide information about job openings for credit authorizers, checkers, and clerks.

Customer Service Representatives

(O*NET 43-4051.00, 43-4051.01, and 43-4051.02)

Significant Points

- Job prospects are expected to be excellent.
- Most jobs require only a high school diploma but educational requirements are rising.
- Strong verbal communication and listening skills are important.

Nature of the Work

Customer service representatives are employed by many different types of companies to serve as a direct point of contact for customers. They are responsible for ensuring that their company's customers receive an adequate level of service or help with their questions and concerns. These customers may be individual consumers or other companies, and their service needs can vary considerably.

All customer service representatives interact with customers to provide information in response to inquiries about products or services and to handle and resolve complaints. They communicate with customers through a variety of means—by telephone; by e-mail, fax, regular mail; or in person. Some customer service representatives handle general questions and complaints, whereas others specialize in a particular area.

Many customer inquiries involve routine questions and requests. For example, customer service representatives may be asked to provide a customer with their credit card balance, or to check on the status of an order. However, other questions are more involved, and may require additional research or further explanation on the part of the customer service representative. In handling customers' complaints, they must attempt to resolve the problem according to guidelines established by the company. These procedures may involve asking questions to determine the validity of a complaint; offering possible solutions; or providing customers with refunds, exchanges, or other offers, like discounts or coupons. In some cases, customer service representatives are required to follow up with an individual customer until a question is answered or an issue is resolved.

Some customer service representatives help people decide what types of products or services would best suit their needs. They may even aid customers in completing purchases or transactions. Although the primary function of customer service representatives is not sales, some may spend time encouraging customers to purchase additional products or services. (For information on workers whose primary function is sales, see the statements on sales and related occupations elsewhere in the *Handbook*.) Customer service representatives also may make changes or updates to a customer's profile or account information. They may keep records of transactions and update and maintain databases of information.

Customer service representatives answer questions and assist customers over the phone.

Most customer service representatives use computers and telephones extensively in their work. Customer service representatives frequently enter information into a computer as they are speaking to customers. Often, companies have large amounts of data, such as account information, that is pulled up on a computer screen while the representative is talking to a customer so he or she can answer specific questions. Customer service representatives also usually have answers to the most common customer questions, or guidelines for dealing with complaints. In the event that they encounter a question or situation to which they do not know how to respond, workers consult with a supervisor to determine the best course of action. They generally use multiline telephone systems, which may route calls directly to the most appropriate representative. However, at times, they must transfer calls to someone who may be better able to respond to the customer's needs.

In some organizations, customer service representatives spend their entire day on the telephone. In others, they may spend part of their day answering e-mails and the remainder of the day taking calls. For some, most of their contact with the customer is face to face. Customer service representatives need to remain aware of the amount of time spent with each customer so that they can fairly distribute their time among the people who require their assistance. This is particularly important for those whose primary activities are answering telephone calls and whose conversations are required to be kept within a set time limit. For those working in call centers, there is usually very little time between telephone calls. When working in call centers, customer service representatives are likely to be under close supervision. Telephone calls may be taped and reviewed by supervisors to ensure that company policies and procedures are being followed.

Job responsibilities also can differ, depending on the industry in which a customer service representative is employed. For example, those working in the branch office of a bank may assume the responsibilities of other workers, such as teller or new account clerk, as needed. In insurance agencies, a customer service representative interacts with agents, insurance companies, and policyholders. These workers handle much of the paperwork related to insurance policies, such as policy applications and changes and renewals to existing policies. They answer questions regarding policy coverage, help with reporting claims, and do anything else that may need to be done. Although they must have similar credentials and knowledge of insurance products as insurance agents, the duties of a customer service representative differ from those of an agent as they are not responsible for seeking potential customers. Customer service representatives employed by utilities and communications companies assist individuals interested in opening accounts for various utilities such as electricity and gas, or for communication services such as cable television and telephone. They explain various options and receive orders for services to be installed, turned on, turned off, or changed. They also may look into and resolve complaints about billing and other service.

Work environment. Although customer service representatives work in a variety of settings, most work in areas that are clean and well lit. Many work in call or customer contact centers where workers generally have their own workstation or cubicle space equipped with a telephone, headset, and computer. Because many call centers are open extended hours, beyond the traditional work day, or are staffed around the clock, these positions may require workers to take on early morning, evening, or late night shifts. Weekend or holiday work also may be necessary. As a result, the occupation is well suited to flexible work schedules. About 17 percent of customer service representatives work part time. The occupation also offers the opportunity for seasonal work in certain industries, often through temporary help agencies.

Call centers may be crowded and noisy, and work may be repetitious and stressful, with little time between calls. Workers usually must attempt to minimize the length of each call, while still providing excellent service. To ensure that these procedures are followed, conversations may be monitored by supervisors, which be stressful. Also, long periods spent sitting, typing, or looking at a computer screen may cause eye and muscle strain, backaches, headaches, and repetitive motion injuries.

Customer service representatives working outside of a call center environment may interact with customers through several different means. For example, workers employed by an insurance agency or in a grocery store may have customers approach them in person or contact them by telephone, computer, mail, or fax. Many of these customer service representatives work a standard 40-hour week; however, their hours generally depend on their employer's hours of operation. Work environments outside of a call center also vary accordingly. Most customer service representatives work either in an office or at a service or help desk.

Customer service representatives may have to deal with difficult or irate customers, which can be challenging. However, the ability to resolve customers' problems has the potential to be very rewarding.

Training, Other Qualifications, and Advancement

Most jobs require at least a high school diploma. However, employers are increasingly seeking candidates with some college education. Most employers provide training to workers before they begin serving customers.

Education and training. Most customer service representative jobs require only a high school diploma. However, because employers are demanding a higher skilled workforce, many customer service jobs now require an associate or bachelor's degree. High school and college level courses in computers, English, or business are helpful in preparing for a job in customer service.

Training requirements vary by industry. Almost all customer service representatives are provided with some training prior to beginning work. This training generally includes customer service and phone skills; information on products and services; information about common customer problems; the use of the telephone and computer systems; and company policies and regulations. Length of training varies, but usually lasts at least several weeks. Because of a constant need to update skills and knowledge, most customer service representatives continue to receive training throughout their career. This is particularly true of workers in industries such as banking, in which regulations and products are continually changing.

Other qualifications. Because customer service representatives constantly interact with the public, good communication and problem-solving skills are a must. Verbal communication and listening skills are especially important. For workers who communicate through e-mail, good typing, spelling, and writing skills are necessary. Basic to intermediate computer knowledge and good interpersonal skills also are important qualities for people who wish to be successful in the field.

Customer service representatives play a critical role in providing an interface between customers and companies. As a result, employers seek out people who are friendly and possess a professional manner. The ability to deal patiently with problems and complaints and to remain courteous when faced with difficult or angry people is very important. Also, a customer service representative needs to be able to work independently within specified time constraints. Workers should have a clear and pleasant speaking voice and be fluent in English. However, the ability to speak a foreign language is becoming increasingly necessary.

Although some positions may require previous industry, office, or customer service experience, many customer service jobs are entry level. However, within insurance agencies and brokerages, these jobs usually are not entry-level positions. Workers must have previous experience in insurance and often are required by state regulations to be licensed like insurance sales agents. A variety of designations are available to demonstrate that a candidate has sufficient knowledge and skill, and continuing education courses and training often are offered through the employer.

Advancement. Customer service jobs are often good introductory positions into a company or an industry. In some cases, experienced workers can move up within the company into supervisory or managerial positions or they may move into areas such as product development, in which they can use their knowledge to improve products and services. As they gain more knowledge of industry products and services, customer service representatives in insurance may advance to other, higher level positions, such as insurance sales agent.

Employment

Customer service representatives held about 2.2 million jobs in 2006. Although they were found in a variety of industries, about 23 percent of customer service representatives worked in finance and insurance. The largest numbers were employed by insurance carriers, insurance agencies and brokerages, and banks and credit unions.

About 14 percent of customer service representatives were employed in administrative and support services. These workers were concentrated in the business support services industry (which includes telephone call centers) and employment services (which includes temporary help services and employment placement agencies). Another 11 percent of customer service representatives were employed in retail trade establishments such as general merchandise stores and food and beverage stores. Other industries that employ significant numbers of customer service representatives include information, particularly the telecommunications industry; manufacturing, such as printing and related support activities; and wholesale trade.

Job Outlook

Customer service representatives are expected to experience growth that is much faster than the average for all occupations through the projection period. Furthermore, job prospects should excellent as workers who leave the occupation will need to be replaced.

Employment Change. Employment of customer service representatives is expected to increase 25 percent from 2006 to 2016, which is much faster than the average for all occupations. This occupation will have one of the largest numbers of new jobs arise, about 545,000 over the 2006–2016 projection period. Beyond growth stemming from expansion of the industries in which customer service representatives are employed, a need for additional customer service representatives is likely to result from heightened reliance on these workers. Customer service is very important to the success of any organization that deals with customers, and strong customer service can build sales, visibility, and loyalty as companies try to distinguish themselves from competitors. In many industries, gaining a competitive edge and retaining customers will be increasingly important over the next decade. This is particularly true in industries such as financial services, communications, and utilities, which already employ numerous customer service representatives. As the trend towards consolidation in industries continues, centralized call centers will provide an effective method for delivering a high level of customer service. As a result, employment of customer service representatives may grow at a faster rate in call centers than in other areas. However, this growth may be tempered by a variety of factors such as technological improvements that make it increasingly feasible and cost-effective for call centers to be built or relocated outside of the United States.

Technology is affecting the occupation in many ways. The Internet and automated teller machines have provided customers with means of obtaining information and conducting transactions that do not entail interacting with another person. Technology also allows

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Customer service representatives	43-4051	2,202,000	2,747,000	545,000	25

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

for greater streamlining of processes, while at the same time increasing the productivity of workers. The use of computer software to filter e-mails, generating automatic responses or directing messages to the appropriate representative, and the use of similar systems to answer or route telephone inquiries are likely to become more prevalent in the future. Also, with rapidly improving telecommunications, some organizations have begun to position their call centers overseas.

Despite such developments, the need for customer service representatives is expected to remain strong. In many ways, technology has heightened consumers' expectations for information and services, and the availability of information online seems to have generated more need for customer service representatives, particularly to respond to e-mail. Also, technology cannot replace human skills. As more sophisticated technologies are able to resolve many customers' questions and concerns, the nature of the inquiries handled by customer service representatives is likely to become increasingly complex.

Furthermore, the job responsibilities of customer service representatives are expanding. As companies downsize or take other measures to increase profitability, workers are being trained to perform additional duties such as opening bank accounts or cross-selling products. As a result, employers increasingly may prefer customer service representatives who have education beyond high school, such as some college or even a college degree.

While jobs in some industries—such as retail trade—may be affected by economic downturns, the customer service occupation generally is resistant to major fluctuations in employment.

Job prospects. Prospects for obtaining a job in this field are expected to be excellent, with more job openings than jobseekers. Bilingual jobseekers, in particular, may enjoy favorable job prospects. In addition, numerous job openings will result from the need to replace experienced customer service representatives who transfer to other occupations or leave the labor force. Replacement needs are expected to be significant in this large occupation because many young people work as customer service representatives before switching to other jobs.

This occupation is well suited to flexible work schedules, and many opportunities for part-time work will continue to be available, particularly as organizations attempt to cut labor costs by hiring more temporary workers.

Earnings

In May 2006, median hourly earnings for wage and salary customer service representatives were $13.62. The middle 50 percent earned between $10.73 and $17.40. The lowest 10 percent earned less than $8.71 and the highest 10 percent earned more than $22.11.

Earnings for customer service representatives vary according to level of skill required, experience, training, location, and size of firm. Median hourly earnings in the industries employing the largest numbers of these workers in May 2006 were:

Insurance carriers	$15.00
Agencies, brokerages, and other insurance related activities	14.51
Depository Credit Intermediation	13.68
Employment services	11.74
Telephone call centers	10.29

In addition to receiving an hourly wage, full-time customer service representatives who work evenings, nights, weekends, or holidays may receive shift differential pay. Also, because call centers are often open during extended hours, or even 24 hours a day, some customer service representatives have the benefit of being able to work a schedule that does not conform to the traditional workweek. Other benefits can include life and health insurance, pensions, bonuses, employer-provided training, and discounts on the products and services the company offers.

Related Occupations

Customer service representatives interact with customers to provide information in response to inquiries about products and services and to handle and resolve complaints. Other occupations in which workers have similar dealings with customers and the public are information and record clerks; financial clerks such as tellers and new account clerks; insurance sales agents; securities, commodities, and financial services sales agents; retail salespersons; computer support specialists; and gaming services workers.

Sources of Additional Information

State employment service offices can provide information about employment opportunities for customer service representatives.

File Clerks

(O*NET 43-4071.00)

Significant Points

- About 1 out of 4 file clerks work part time.
- A high school diploma or its equivalent is the most common educational requirement.
- Employment is expected to decline through the year 2016.

Nature of the Work

The amount of information generated by organizations continues to grow rapidly. File clerks classify, store, retrieve, and update this information. In many small offices, they often have additional responsibilities, such as entering data, performing word processing, sorting mail, and operating copying or fax machines.

File clerks, also called *record, information,* or *record center clerks,* examine incoming material and code it numerically, alphabetically, or by subject matter. Paper forms, letters, receipts, or reports are stored in files while necessary information may be entered, often electronically, into other storage devices. Some clerks operate mechanized files that rotate to bring the needed records to them; others convert documents to film that is then stored on micro-

File clerks are responsible for sorting, storing, and retrieving an organization's records.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
File clerks	43-4071	234,000	137,000	-97,000	-41

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

film or microfiche. A growing number of file clerks use imaging systems that scan paper files or film and store the material on computers.

In order for records to be useful, they must be up to date and accurate and readily available. File clerks ensure that new information is added to files in a timely manner and discard outdated materials or transfer them to inactive storage. Clerks also check files at regular intervals to make sure that all items are correctly sequenced and placed. When records cannot be found, file clerks attempt to locate them. As an organization's needs for information change, file clerks implement changes to the filing system.

When records are requested, file clerks locate them and give them to the person requesting them. A record may be a sheet of paper stored in a file cabinet or an image on microform. In the former case, the clerk retrieves the document manually. In the latter case, the clerk retrieves the microform and displays it on a microform reader. If necessary, file clerks make copies of records and distribute them. In addition, they keep track of materials removed from the files to ensure that borrowed files are returned.

Increasingly, file clerks use computerized filing and retrieval systems that have a variety of storage devices, such as a mainframe computer, CD-ROM, or DVD-ROM. To retrieve a document in these systems, the clerk enters the document's identification code, obtains the location of the document, and gets the document. Accessing files in a computer database is much quicker than locating and physically retrieving paper files. Still, even when files are stored electronically, backup paper or electronic copies usually are also kept.

Work environment. File clerks usually work in areas that are clean, well lit, and relatively quiet. The work is not overly strenuous but may involve a lot of standing, walking, reaching, pulling, and bending, depending on the method used to retrieve files. Prolonged exposure to computer screens may lead to eyestrain for the many file clerks who work with computers.

Training, Other Qualifications, and Advancement

File clerks must be alert, accurate, and able to work with others. Most train on the job.

Education and training. Most employers prefer applicants with a high school diploma or a GED or a mix of education and related experience. Most new employees are trained on the job under close supervision of more experienced employees.

Other qualifications. File clerks must be able to work with others since part of the job is helping fellow workers. Clerks must be alert, accurate, and attentive while performing repetitive tasks. Willingness to do routine and detailed work is also important. Proficiency with desktop computer software is becoming increasingly important as more files are being stored electronically.

Advancement. File clerks can advance to more senior clerical office positions such as receptionist or bookkeeping clerk.

Employment

File clerks held about 234,000 jobs in 2006. Although file clerk jobs are found in nearly every sector of the economy, more than 90 percent of these workers are employed in service-providing industries, including government. Health care establishments employed around 3 out of every 10 file clerks. About 1 out of every 4 file clerks worked part time in 2006.

Job Outlook

Rapid declines in employment are expected through 2016. Job prospects should be best for jobseekers who have general office skills and who are familiar with personal computers and other office machines.

Employment change. Employment of file clerks is expected to decline rapidly by 41 percent between 2006 and 2016, largely due to productivity gains from office automation and the consolidation of clerical jobs. Most files are stored digitally and can be retrieved electronically, reducing the demand for file clerks.

Job prospects. There will be job openings for file clerks because a large number of workers will be needed to replace the workers who leave the occupation each year. The high number of separations from file clerk jobs reflects the lack of formal training requirements, limited advancement potential, and relatively low pay. Organizations across the economy will continue to need to hire file clerks to record and retrieve information. File clerks should find opportunities for temporary or part-time work, especially during peak business periods.

Jobseekers who have typing and other secretarial skills and who are familiar with a wide range of office machines, especially personal computers, should have the best job opportunities.

Earnings

Median hourly earnings of file clerks were $10.62 in May 2006. The middle 50 percent earned between $8.64 and $13.31. The lowest 10 percent earned less than $7.27, and the highest 10 percent earned more than $16.71. Median hourly earnings in the industries employing the largest number of file clerks in May 2006 are shown below:

Local government	$12.18
Legal services	11.08
General medical and surgical hospitals	11.02
Employment services	10.19
Offices of physicians	9.50

Related Occupations

File clerks classify and retrieve files. Other workers who perform similar duties include receptionists and information clerks and stock clerks and order fillers.

Sources of Additional Information

State employment service offices and agencies can provide information about job openings for file clerks.

Hotel, Motel, and Resort Desk Clerks

(O*NET 43-4081.00)

Significant Points

- Job opportunities should be good, because of industry growth and substantial replacement needs.
- Evening, weekend, and part-time work hours create the potential for flexible schedules.
- Professional appearance and personality are more important than formal academic training in getting a job.

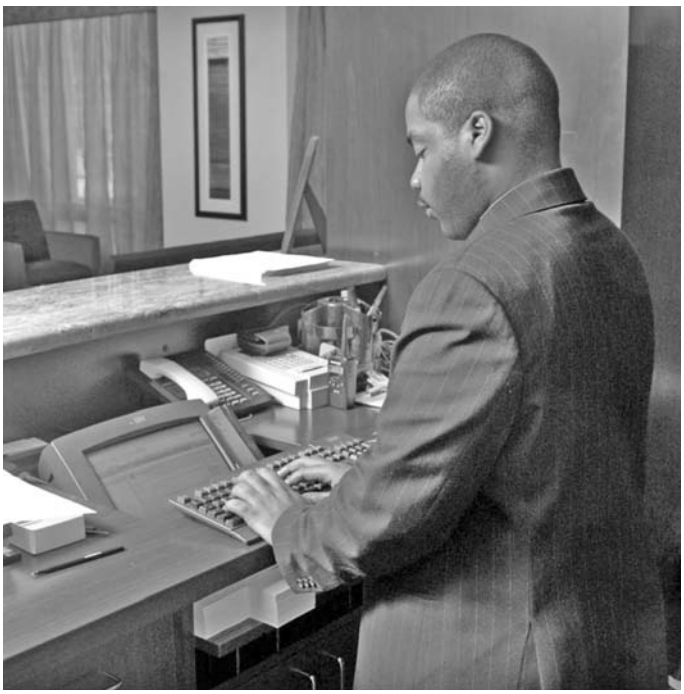
Nature of the Work

Hotel, motel, and resort desk clerks are always in the public eye and are usually the first line of customer service for a lodging property. Their attitude and behavior greatly influence the public's impressions of the establishment.

Front-desk clerks perform a variety of services for guests of hotels, motels, and other lodging establishments. Regardless of the type of accommodation, most desk clerks have similar responsibilities. They register arriving guests, assign rooms, and check out guests at the end of their stay. They also keep records of room assignments and other registration-related information on computers. When guests check out, desk clerks prepare and explain the charges and process payments.

Desk clerks answer questions about services, checkout times, the local community, or other matters of public interest. They report problems with guest rooms or public facilities to members of the housekeeping or maintenance staff. In larger hotels or in larger cities, desk clerks may refer queries about area attractions to a concierge and may direct more complicated questions to the appropriate manager.

In some smaller hotels and motels where smaller staffs are employed, clerks may take on a variety of additional responsibilities, such as bringing fresh linens to rooms, and they are often responsible for all front-office operations, information, and services. For example, they may perform the work of a bookkeeper, advance reservation agent, cashier, laundry attendant, and telephone switchboard operator.



Hotel, motel, and resort desk clerks regularly use computers to store and retrieve guest reservation information.

Work environment. Hotels are open around the clock, creating the need for night and weekend work. About half of all desk clerks work a 40-hour week. Nearly one in five work part-time. Others work full-time, but with varying schedules. Most clerks work in areas that are clean, well lit, and relatively quiet, although lobbies can become crowded and noisy when busy. Many hotels have stringent dress guidelines for desk clerks.

Desk clerks may experience particularly hectic times during check-in and check-out times or when convention guests or large groups arrive at once. Moreover, dealing with irate guests can be stressful. Computer failures can further complicate an already busy time and add to stress levels. Hotel desk clerks may be on their feet most of the time and may occasionally be asked to lift heavy guest luggage.

Training, Other Qualifications, and Advancement

Employers look for clerks who are friendly and customer-service oriented, well groomed, and display maturity, self confidence, and good judgment.

Education and training. Most hotel, motel, and resort desk clerks receive orientation and training on the job. Orientation may include an explanation of the job duties and information about the establishment, such as the arrangement of guest rooms, availability of additional services, such as a business or fitness center, and location of guest services, such as ice and vending machines, restaurants, and nearby retail stores and attractions. New employees learn job tasks under the guidance of a supervisor or an experienced desk clerk. They often receive additional training on interpersonal or customer service skills and on how to use the computerized reservation, room assignment, and billing systems and equipment. Desk clerks often learn new procedures and company policies after their initial training ends. While postsecondary education is not usually required for this job, formal training in a hospitality management degree or certificate program may be an advantage for getting positions in larger or more upscale properties.

Other qualifications. Desk clerks, especially in high-volume and higher-end properties, should be quick-thinking, energetic, and able to work as a member of a team. Hotel managers typically look for these personal characteristics when hiring desk clerks, because personality traits are difficult to teach. A clear speaking voice and fluency in English are essential when talking with guests and using the telephone or public-address systems. Good spelling and computer literacy are also needed because most of the work involves a computer. In addition, speaking a foreign language fluently is increasingly helpful because of the growing international clientele of many properties.

Advancement. Large hotel and motel chains may offer better opportunities for advancement than small, independently owned establishments. Large chains have more extensive career ladder programs and may offer desk clerks an opportunity to participate in management training programs. Also, the Educational Institute of the American Hotel and Lodging Association offers home-study or group-study courses in lodging management, which may help some desk clerks obtain promotions more rapidly.

Employment

Hotel, motel, and resort desk clerks held about 219,000 jobs in 2006. Almost all were in hotels, motels, and other establishments in the accommodation industry.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Hotel, motel, and resort desk clerks	43-4081	219,000	257,000	38,000	17

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Job Outlook

Hotel, motel, and resort desk clerks will experience faster-than-average job growth through the 2006–2016 decade because additional hotel properties continue to be built and more people are expected to travel for business and leisure. Good job opportunities are expected.

Employment change. Employment of hotel, motel, and resort desk clerks is expected to grow 17 percent between 2006 and 2016, which is faster than the average for all occupations. As more lodging establishments open and as people and companies have more money and travel more, occupancy rates will increase and create demand for desk clerks.

Employment of hotel and motel desk clerks should benefit from steady or increasing business and leisure travel. Shifts in preferences away from long vacations and toward long weekends and other, more frequent, shorter trips also should boost demand for these workers. While many lower budget and extended-stay establishments are being built to cater to families and the leisure traveler, many new luxury and resort accommodations also are opening to serve the upscale client. With the increased number of units requiring staff, employment opportunities for desk clerks should be good.

Growth of hotel, motel, and resort desk clerk jobs will be moderated somewhat by technology. Automated check-in and check-out procedures and on-line reservations networks free up staff time for other tasks and reduce the amount of time spent with each guest.

Job prospects. In addition to job growth, job opportunities for hotel and motel desk clerks are expected to be good because of the need to replace the many clerks who either transfer to other occupations that offer better pay and advancement opportunities or who leave the workforce altogether. Opportunities for those willing to work a variable schedule should continue to be plentiful.

Employment of desk clerks is sensitive to cyclical swings in the economy. During recessions, vacation and business travel declines, and hotels and motels need fewer desk clerks. Similarly, employment is affected by special events, convention business, and seasonal fluctuations.

Earnings

Median annual earnings of hotel, motel and resort desk clerks were $18,460 in May 2006. The middle 50 percent earned between $15,930 and $22,220. The lowest 10 percent earned less than $13,690, and the highest 10 percent earned more than $27,030.

Earnings of hotel, motel, and resort desk clerks vary by worker characteristics, season, and geographic factors, such as whether the establishment is in a major metropolitan area or a resort community. Earnings also vary according to the size of the hotel and the level of service offered. For example, luxury hotels that offer guests more personal attention and a greater number of services typically have stricter and more demanding requirements for their desk staff and often provide higher earnings.

Related Occupations

Lodging managers, particularly at smaller hotels and lodging establishments, may perform some of the same duties as desk clerks. Other occupations that require workers to assist the public include counter and rental clerks, customer service representatives, receptionists and information clerks, and retail salespersons.

Human Resources Assistants, Except Payroll and Timekeeping

(O*NET 43-4161.00)

Significant Points

- About 17 percent work for federal, state, and local governments.
- Employment will grow as human resources assistants assume more responsibilities.
- Job opportunities should be best for those with excellent communication and computer skills and a broad-based knowledge of general office functions, as assistants assume more responsibilities.

Nature of the Work

Human resources assistants maintain the human resource records of an organization's employees. These records include information such as name, address, job title, and earnings; benefits such as health and life insurance; and tax withholding. They also undertake a variety of other personnel and general office related tasks.

On a daily basis, these assistants record information and answer questions about and for employees. They might look up information about absences or job performance, for instance. When an employee receives a promotion or switches health insurance plans, the human resources assistant updates the appropriate form. Human resources assistants also may prepare reports for managers. For example, they might compile a list of employees eligible for an award.

In small organizations, some human resources assistants perform a variety of other clerical duties, including answering telephone calls or letters, sending out announcements of job openings or job examinations, signing for packages, ordering office supplies, and issuing application forms. When credit bureaus and finance companies request confirmation of a person's employment, the human resources assistant provides authorized information from the employee's personnel records. Assistants also may contact payroll departments and insurance companies to verify changes to records.

Human resources assistants explain the organization's employment policies, screen job applicants, and request references.

Some human resources assistants are involved in hiring. They screen job applicants to obtain information such as their education and work experience; administer aptitude, personality, and interest tests; explain the organization's employment policies and refer qualified applicants to the employing official; and request references from present or past employers. Also, human resources assistants inform job applicants, by telephone, letter, or e-mail, of their acceptance for or denial of employment.

In some job settings, human resources assistants have more specific job titles. For example, *assignment clerks* notify a firm's existing employees of upcoming vacancies, identify applicants who qualify for the vacancies, and assign those who are qualified to various positions. They also keep track of vacancies that arise throughout the organization, and they complete and distribute forms advertising vacancies. When completed applications are returned, these clerks review and verify the information in them, using personnel records. After a selection for a position is made, they notify all of the applicants of their acceptance or rejection.

As another example, *identification clerks* are responsible for security matters at defense installations. They compile and record personal data about vendors, contractors, and civilian and military personnel and their dependents. The identification clerk's job duties include interviewing applicants; corresponding with law enforcement authorities; and preparing badges, passes, and identification cards.

Work environment. Human resources assistants usually work in clean, pleasant, and comfortable office settings, but prolonged exposure to video display terminals may lead to eyestrain for assistants who work with computers. They usually work a standard 35- to 40-hour week.

Training, Other Qualifications, and Advancement

Employers prefer to hire people who have a high school diploma. Computer, communication, and interpersonal skills are important.

Education and training. A high school diploma or GED usually is preferred for these jobs. Generally, training beyond high school is not required. However, training in computers, in filing and maintaining filing systems, in organizing, and in human resources practices is helpful. Proficiency using Microsoft Word, Excel, and other computer applications also is very desirable. Many of these skills can be learned in a vocational high school program aimed at office careers, and the remainder can be learned on the job.

Formal training is also available at a small number of colleges, most of which offer diploma programs in office automation. Many proprietary schools also offer such programs.

Other qualifications. Human resources assistants must be able to interact and communicate with individuals at all levels of the organization. In addition, assistants should demonstrate poise, tactfulness, diplomacy, and good interpersonal skills in order to handle sensitive and confidential situations.

Employment

Human resources assistants held about 168,000 jobs in 2006. About 17 percent work for federal, state, and local governments. Other jobs for human resources assistants were in various industries such as health care and social assistance; educational services, public and private; management of companies and enterprises; administrative and support services; and finance and insurance.

Job Outlook

Employment of human resources assistants is expected to grow as fast as the average for all occupations. Job opportunities should be best for those with excellent communication and computer skills and a broad-based knowledge of general office functions, as assistants assume more responsibilities.

Employment change. The number of jobs for human resources assistants is expected to grow by 11 percent between 2006 and 2016, as fast as the average for all occupations. In a favorable job market, more emphasis is placed on human resources departments, thus increasing the demand for assistants. However, even in economic downturns there is demand for assistants, as human resources departments in all industries try to make their organizations more efficient by determining what type of employees to fire or hire, and strategically filling job openings. Human resources assistants may play an instrumental role in their organization's human resources policies. For example, they may talk to staffing firms and consulting firms, conduct other research, and then offer their ideas on issues such as whether to hire temporary contract workers or full-time staff.

As with other office and administrative support occupations, the growing use of computers in human resources departments means that much of the data entry that is done by human resources assistants can be eliminated, as employees themselves enter the data and send the electronic file to the human resources office. Such an arrangement, which is most feasible in large organizations with multiple human resources offices, could limit job growth among human resources assistants.

Job prospects. Job opportunities should be best for those with excellent communication and computer skills and a broad based knowledge of general office functions, as assistants assume more responsibilities. For example, workers conduct Internet research to

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Human resources assistants, except payroll and timekeeping	43-4161	168,000	187,000	19,000	11

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

locate resumes, they must be able to scan resumes of job candidates quickly and efficiently, and they must be increasingly sensitive to confidential information such as salaries and Social Security numbers.

In addition to positions arising from job growth, replacement needs will account for many job openings for human resources assistants as they advance within the human resources department, take jobs unrelated to human resources administration, or leave the labor force.

Earnings

Median annual earnings of human resources assistants in May 2006 were $33,750. The middle 50 percent earned between $27,430 and $41,080. The lowest 10 percent earned less than $22,700 and the highest 10 percent earned more than $48,670. Median annual earnings in the industries employing the largest number of human resources assistants in 2006 were:

Federal executive branch	$37,000
Local government	35,440
Management of companies and enterprises	34,260
Colleges, universities, and professional schools	33,870
Employment services	29,330

In 2007, the federal government typically paid salaries ranging from $33,336 to $42,236 a year. Beginning human resources assistants with a high school diploma or 6 months of experience were paid an average annual salary of $26,685. The average salary for all human resources assistants employed by the federal government was $37,835 in 2007.

Some employers offer educational assistance to human resources assistants.

Related Occupations

Human resources assistants maintain the personnel records of an organization's employees. On a daily basis, these assistants record information and answer questions about employee absences and supervisory reports on employees' job performance. Other workers with similar skills and expertise in interpersonal relations include bookkeeping, accounting, and auditing clerks; communications equipment operators; customer service representatives; data entry and information processing workers; order clerks; receptionists and information clerks; secretaries and administrative assistants; stock clerks and order fillers; and tellers.

Interviewers

(O*NET 43-4061.00, 43-4111.00, and 43-4131.00)

Significant Points

- A high school diploma or its equivalent is the most common educational requirement.
- Familiarity with computers and strong interpersonal skills are very important.

Nature of the Work

Interviewers obtain information from individuals and business representatives who are opening bank accounts, trying to obtain loans, seeking admission to medical facilities, participating in consumer surveys, applying to receive aid from government programs, or providing data for various other purposes. By mail, by telephone, or in person, these workers solicit and verify information, create files, and perform a number of other related tasks.

The specific duties and job titles of interviewers depend upon the type of employer. In doctors' offices and other health care facilities, for example, *interviewing clerks* also are known as *admitting interviewers* or *patient representatives*. These workers obtain all preliminary information required for a patient's record or for his or her admission to a hospital, such as the patient's name, address, age, medical history, present medications, previous hospitalizations, religion, people to notify in case of emergency, attending physician, and party responsible for payment. In some cases, interviewing clerks may be required to verify that an individual is eligible for health benefits or to work out financing options for those who might need them.

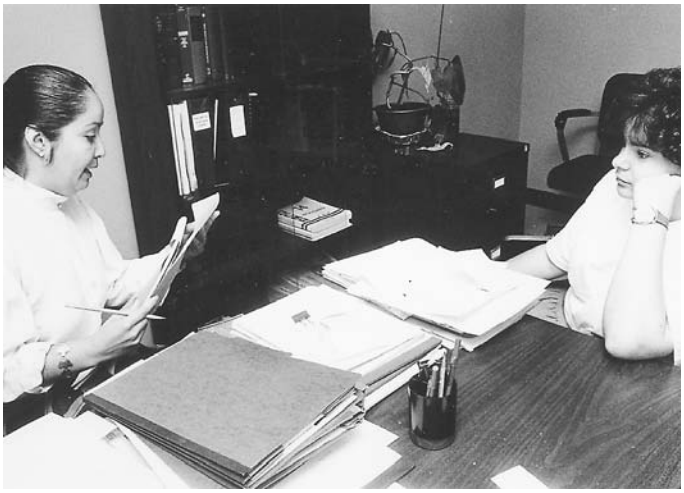
Other duties of interviewers in health care include assigning patients to rooms and summoning escorts to take patients to their rooms; sometimes, interviewers may escort patients themselves. Using the facility's computer system, interviewers schedule laboratory work, x rays, and surgeries; prepare admission and discharge records; and route these medical records to appropriate departments. They also may bill patients, receive payments, and answer the telephone. In an outpatient or office setting, interviewers schedule appointments, keep track of cancellations, and provide general information about care. In addition, the role of the admissions staff, particularly in hospitals, is expanding to include a wide range of patient services, from assisting patients with financial and medical questions to helping family members find hotel rooms.

Interviewing clerks who conduct market research surveys and polls for research firms have somewhat different responsibilities. These interviewers ask a series of prepared questions, record the responses, and forward the results to management. They may ask individuals questions about their occupation and earnings, political preferences, buying habits, satisfaction with certain goods or services sold to them, or other aspects of their lives. Although most interviews are conducted over the telephone, some are conducted in focus groups or by randomly polling people in a public place. More recently, the Internet is being used to elicit people's opinions. Almost all interviewers use computers or similar devices to enter the responses to questions.

Eligibility interviewers, government programs, determine the eligibility of individuals applying to receive government assistance, such as welfare, unemployment benefits, Social Security benefits, and public housing. These interviewers gather the relevant personal and financial information about an applicant and, on the basis of the rules and regulations of the particular government program, grant, modify, deny, or terminate an individual's eligibility for the program. They also help to detect fraud committed by people who try to obtain benefits that they are not eligible to receive.

Loan interviewers and clerks review individuals' credit history and obtain the information needed to determine the creditworthiness of applicants for loans and credit cards. These workers spend much of their day on the telephone, obtaining information from credit bureaus, employers, banks, credit institutions, and other sources to determine an applicant's credit history and ability to pay back a loan or charge.

Loan interviewers interview potential borrowers; help them fill out applications for loans; investigate the applicant's background and references; verify the information on the application; and forward any findings, reports, or documents to the company's appraisal



Interviewers may ask questions over the phone or face-to-face.

department. Finally, interviewers inform the applicant as to whether the loan has been accepted or denied.

Loan clerks, also called *loan processing clerks, loan closers*, or *loan service clerks*, assemble documents pertaining to a loan, process the paperwork associated with the loan, and ensure that all information is complete and verified. Mortgage loans are the primary type of loan handled by loan clerks, who also may have to order appraisals of the property, set up accounts, and secure any additional information required to transfer the property.

The specific duties of loan clerks vary by specialty. Loan closers, for example, complete the loan process by gathering the proper documents for signature at the closing, including deeds of trust, property insurance papers, and title commitments. They set the time and place for the closing, make sure that all parties are present, and ensure that all conditions for settlement have been met. After the settlement, the loan closer records all of the documents involved and submits the final package to the owner of the loan. Loan service clerks maintain the payment records on a loan once it is issued. These clerical workers process the paperwork for payment of fees to insurance companies and tax authorities, and also may record changes in clients' addresses and ownership of a loan. When necessary, they answer calls from customers with routine inquiries.

Work environment. Working conditions vary for different types of interviewers, but most of these workers work in areas that are clean, well lit, and relatively quiet. Most of these workers work a standard 35 to 40 hour week, but evening and weekend work may be required in some establishments. Some interviewers may conduct surveys on the street or in shopping malls, or they may go door to door.

Training, Other Qualifications, and Advancement

There are minimal formal educational requirements for interviewers, and most new employees receive on-the-job training. Employers seek applicants with strong interpersonal skills, including a pleasant personality, clear voice, and the ability to communicate with others.

Education and training. Most employers prefer applicants with a high school diploma or its equivalent or a mix of education and related experience.

New employees generally train on the job, working under the close supervision of more experienced employees, although some firms offer formal training. Some loan interviewers also take courses about credit that are offered by banking and credit associations, public and private vocational schools, and colleges and universities.

Other qualifications. Because interviewers deal with the public, they must have a pleasant personality, clear speaking voice, and professional appearance. Familiarity with computers and strong interpersonal skills are very important. Fluency in a foreign language also can be beneficial.

Advancement. Experienced interviewers may advance to positions with added responsibilities or supervisory duties. Many organizations fill open supervisory positions by promoting qualified individuals from within the company. Interviewers who obtain additional skills or training will have the best opportunities. For some managerial positions, a college degree may be required.

Employment

Interviewers held about 589,000 jobs in 2006. Approximately 221,000 were interviewers, except eligibility and loan; 256,000 were loan interviewers and clerks; and 112,000 were eligibility interviewers, government programs. About half of all interviewers, except eligibility and loan, worked in health care and social assistance industries, and about 23 percent of these interviewers worked part time. Most loan interviewers and clerks worked in financial institutions. About 7 out of every 10 eligibility interviewers for government programs, worked in state and local government.

Job Outlook

Slower-than-average growth is expected for interviewers during the projection period, but levels of employment change vary significantly with occupational specialty. Prospects will be best for applicants with a broad range of job skills, including good customer service, math, and telephone skills.

Employment change. Employment of interviewers is expected to grow by 4 percent from 2006 to 2016, which is slower than the average for all occupations. However, the projected change in employment varies by specialty.

The number of interviewers, except eligibility and loan, is projected to grow about as fast as average, with the most growth in the health care and social assistance sector. This sector will hire more admissions interviewers as health care facilities consolidate staff and expand the role of the admissions staff and as an aging and growing population requires more visits to health care practitioners. However increases in the use of online surveys and questionnaires, which are often cheaper than other data collection methods, should reduce the demand for interviewers who conduct market research interviews over the phone relative to other jobs involved in marketing.

Employment of eligibility interviewers for government programs is projected to grow slower than the average for all occupations. The increase in the number of retiring baby boomers becoming eligible for Social Security and other government entitlement programs will be the main cause of growth in this occupation. Automation should have an effect on some eligibility interviewers because, as with credit and loan ratings, eligibility for government aid programs can be determined instantaneously by entering information into a computer.

Little or no change in employment is projected for loan interviewers and clerks due to advances in technology that are making these workers more productive. Despite a projected increase in the number of applications for loans, automation will increase productivity so that fewer workers will be required to process, check, and authorize applications than in the past. The effects of automation on employment will be moderated, however, by the many interpersonal aspects of the job. Mortgage loans, for example, require loan

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16 Number	Change, 2006-16 Percent
Interviewers	—	589,000	612,000	22,000	4
Eligibility interviewers, government programs	43-4061	112,000	116,000	3,500	3
Interviewers, except eligibility and loan	43-4111	221,000	242,000	21,000	10
Loan interviewers and clerks	43-4131	256,000	254,000	-2,300	-1

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

processors to personally verify financial data on the application, and loan closers are needed to assemble documents and prepare them for settlement.

Moreover, employment will be adversely affected by changes in the financial services industry. For example, significant consolidation has occurred among mortgage loan servicing companies. As a result, fewer mortgage banking companies are involved in servicing loans, making the function more efficient and reducing the need for loan service clerks.

Job prospects. Some job openings will come from employment growth, but most job openings should arise from the need to replace the numerous interviewers who leave the occupation each year. Prospects for filling these openings will be best for applicants with a broad range of job skills, including good customer service, math, and telephone skills. In addition to openings for full-time jobs, opportunities also should be available for part-time and temporary jobs.

The job outlook for loan interviewers and clerks is sensitive to overall economic activity. A downturn in the economy or a rise in interest rates usually leads to a decline in the demand for loans, particularly mortgage loans and can result in layoffs. Even in slow economic times, however, job openings will arise from the need to replace workers who leave the occupation for various reasons.

The job outlook for eligibility interviewers also is sensitive to overall economic activity; a severe slowdown in the economy will cause more people to apply for government aid programs, increasing demand for eligibility interviewers.

Earnings

Median hourly wage and salary earnings of eligibility interviewers, government programs, in May 2006 were $18.05. The middle 50 percent earned between $14.40 and $21.92. The lowest 10 percent earned less than $12.18, and the highest 10 percent earned more than $24.30. Median hourly earnings in the industries employing the largest number eligibility interviewers, government programs were:

Federal government	$21.20
Local government	17.52
State government	16.35

Median hourly wage and salary earnings of loan interviewers and clerks in May 2006 were $14.89. The middle 50 percent earned between $12.07 and $18.69. The lowest 10 percent earned less than $9.88, and the highest 10 percent earned more than $22.66. Median hourly earnings of loan interviewers and clerks in depository credit intermediation was $15.22, while median hourly earnings in nondepository credit intermediation was $14.35.

Median hourly wage and salary earnings of interviewers, except eligibility and loan, in May 2006 were $12.64. The middle 50 percent earned between $10.12 and $15.31. The lowest 10 percent earned less than $8.35, and the highest 10 percent earned more than $18.57. Median hourly earnings in the industries employing the largest number of interviewers, except eligibility and loan, were:

State government	$15.27
Colleges, universities, and professional schools	15.05
General medical and surgical hospitals	12.69
Offices of physicians	12.55
Other professional, scientific, and technical services	10.10

Related Occupations

Interviewers obtain information from individuals. Other workers who perform similar duties include procurement clerks, customer service representatives, and bill and account collectors.

Sources of Additional Information

State employment service offices can provide information about employment opportunities for interviewers.

For specific information on a career as a loan processor or loan closer, contact

Library Assistants, Clerical

(O*NET 43-4121.00)

Significant Points

- Flexible schedules and ample opportunities for part-time work characterize this occupation.
- Library assistants train on the job; most libraries use electronic cataloging systems so computers skills are essential.
- Job prospects should be good.

Nature of the Work

Library assistants, clerical—sometimes referred to as *library media assistants, library aides*, or *circulation assistants*—help librarians and library technicians organize library resources and make them available to users. (Librarians and library technicians are discussed elsewhere in the *Handbook*.)

At the circulation desk, library assistants lend and collect books, periodicals, videotapes, and other materials. When an item is borrowed, assistants scan it and the patron's library card to record the transaction in the library database; they then stamp the due date on the item or print a receipt with the due date. When an item is returned, assistants inspect it for damage and scan it to record its return. Electronic circulation systems automatically generate notices reminding patrons that their materials are overdue, but library assistants may review the record for accuracy before sending out the notice. Library

Library assistants reshelve books after they are returned.

assistants also register new patrons and issue them library cards. They answer patrons' questions or refer them to a librarian.

Throughout the library, assistants sort returned books, periodicals, and other items and put them on their designated shelves, in the appropriate files, or in storage areas. Before reshelving returned materials, they look for any damage and try to make repairs. For example, they may use tape or paste to repair torn pages or book covers and use other specialized processes to repair more valuable materials.

Assistants also locate materials being lent to a patron or another library. Because nearly all library catalogs are computerized, library assistants must be familiar with computers. They sometimes help patrons with computer searches.

Some library assistants specialize in helping patrons who have vision problems. Sometimes referred to as *Braille-and-talking-books clerks*, these assistants review the borrower's list of desired reading materials, and locate those materials or close substitutes from the library collection of large-type or Braille volumes and books on tape. Then, they give or mail the materials to the borrower.

Work environment. Library assistants who prepare library materials may sit at desks or computer terminals for long periods and can develop headaches or eyestrain. Some duties can be repetitive and boring, such as shelving new or returned materials. Others can be rewarding, such as assisting patrons who are performing computer searches with the use of local and regional library networks. Library assistants may lift and carry books, climb ladders to reach high stacks, and bend low to shelve books on bottom shelves.

Library assistants in school libraries work regular school hours. Those in public libraries and college and university libraries also work weekends, evenings, and some holidays. About 60 percent of library assistants work part time, making the job appealing to retirees, students, and others interested in flexible schedules.

Training, Other Qualifications, and Advancement

Library assistants receive most of their training on the job. No formal education is required, although familiarity with computers is helpful.

Education and training. Training requirements for library assistants are generally minimal; most libraries prefer to hire workers with a high school diploma or GED, although libraries also hire high school students for these positions. No formal postsecondary training is expected. Some employers hire individuals with experience in other clerical jobs; others train inexperienced workers on the job.

Other qualifications. Given the extensive use of electronic resources in libraries, computer skills are needed for most jobs; knowledge of databases and other library automation systems is especially useful. Library assistants should be able to pay close attention to detail, as the proper shelving or storage of materials is essential.

Advancement. Library assistants usually advance by assuming added responsibilities. Many begin by performing simple jobs such as shelving books or adding new books and periodicals to the database when they arrive. After gaining experience, they may move into positions that allow them to interact with patrons, such as staffing the circulation desk. Experienced assistants may be able to advance to library technician positions, which involve more responsibility. Eventually they may advance to supervise a public service or technical service area. Advancement opportunities are greater in large libraries.

Employment

Library assistants held about 116,000 jobs in 2006. More than half of these workers were employed by local governments in public libraries; most of the remaining employees worked in school, college, and university libraries. Many of these jobs are part time.

Job Outlook

Employment of library assistants is expected to grow about as fast as average. Prospects should be good because many workers leave these jobs and need to be replaced.

Employment change. The number of library assistants is expected to increase by 8 percent between 2006 and 2016, about as fast as the average for all occupations. Efforts to contain costs in local governments and academic institutions of all types will slow overall growth in library services, but may result in the hiring of more library support staff, who are paid less than librarians and who take on more responsibility. Because library assistants work for public institutions, they are not directly affected by the ups and downs of the business cycle, but they may be affected by changes in the level of government funding for libraries.

Job prospects. Each year, many people leave this relatively low-paying occupation for other occupations that offer higher pay or full-time work. This creates good job opportunities for those who want to become library assistants.

Earnings

Median hourly earnings of library assistants were $10.40 in May 2006. The middle 50 percent earned between $8.07 and $13.45. The lowest 10 percent earned less than $6.77, and the highest 10 percent earned more than $16.73.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Library assistants, clerical	43-4121	116,000	125,000	9,100	8

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Related Occupations

Library assistants, store materials and help customers retrieve it. File clerks have similar duties. Library assistants also work closely with library technicians in providing library services to patrons.

Sources of Additional Information

Information about a career as a library assistant can be obtained from either of the following organizations:

➤ Council on Library/Media Technology, P.O. Box 42048, Mesa, AZ 85274-2048. Internet: http://colt.ucr.edu

➤ American Library Association, 50 E. Huron St., Chicago, IL 60611. Internet: http://www.ala.org/ala/education/educationcareers.htm

Public libraries and libraries in academic institutions also can provide information about job openings for library assistants.

Order Clerks

(O*NET 43-4151.00)

Significant Points

- Employment is expected to decline through 2016 due to growth in online retailing and in business-to-business electronic commerce, and because of the increasing use of automated systems that make placing orders easy and convenient.
- A high school diploma or GED is the most common educational requirement.

Nature of the Work

Order clerks receive and process orders for a variety of goods or services, such as spare parts, consumer appliances, gas and electric power connections, film rentals, and articles of clothing. They sometimes are called *order-entry clerks, order processors,* or *order takers.*

Orders for materials, merchandise, or services can come from inside or from outside of an organization. Inside order clerks receive orders from other workers employed by the same company or from salespersons in the field. In large companies with many worksites, such as automobile manufacturers, clerks order parts and equipment from the company's warehouses.

Many other order clerks, called outside order clerks, receive orders from outside companies or directly from consumers. Order clerks in wholesale businesses, for instance, receive orders from retail establishments for merchandise that the retailer, in turn, sells to the public. An increasing number of order clerks work for catalog companies and online retailers, receiving orders from individual customers by telephone, fax, regular mail, or e-mail.

Order clerks work in areas that are clean, well lit, and relatively quiet.

Computers provide order clerks with ready access to information such as stock numbers, prices, and inventory. The successful filling of an order frequently depends on having the right products in stock and being able to determine which products are most appropriate for the customer's needs. Some order clerks—especially those in industrial settings—must be able to give price estimates for entire jobs, not just single parts. Others must be able to take special orders, give expected arrival dates, prepare contracts, and handle complaints.

Many order clerks receive orders directly by telephone, recording the required information as the customer places the order. However, a rapidly increasing number of orders now are received through computer systems, the Internet, faxes, and e-mail. In some cases, these orders are sent directly from the customer's terminal to the order clerk's terminal. Orders received by regular mail are sometimes scanned into a database that is instantly accessible to clerks.

Clerks review orders for completeness and clarity. They may fill in missing information or contact the customer for the information. Clerks also contact customers if the customers need additional information, such as prices or shipping dates, or if delays in filling the order are anticipated. For orders received by regular mail, clerks remove checks or money orders, sort them, and send them for processing.

After an order has been verified and entered, the customer's final cost is calculated. The clerk then routes the order to the proper department—such as the warehouse—which actually sends out or delivers the item in question.

In organizations with sophisticated computer systems, inventory records are adjusted automatically, as sales are made. In less automated organizations, order clerks may adjust or verify inventory records. Clerks also may notify other departments when inventories are low or when filling certain orders would deplete supplies.

Some order clerks must establish priorities in filling orders. For example, an order clerk in a blood bank may receive a request from a hospital for a certain type of blood. The clerk must first find out whether the request is routine or an emergency and then take appropriate action.

Work environment. Most order clerks work in areas that are clean, well lit, and relatively quiet. These workers sit for long periods of time in front of computer terminals, which may cause eyestrain and headaches.

Order clerks usually work a standard 40-hour workweek. Clerks in retail establishments typically work overtime during peak holiday seasons, when sales volume is high. Some firms may have shifts round-the-clock to accommodate customers' time zones.

Training, Other Qualifications, and Advancement

Most order clerks are trained on the job. Employers prefer workers who are computer literate and proficient in word-processing and spreadsheet software.

Education and training. Employers prefer applicants with a high school diploma or GED or a mix of education and related experience. Most order clerks are trained on the job under the close supervision of more experienced employees.

Other qualifications. It is helpful for clerks to be comfortable using computers and to have a working knowledge of word-processing and spreadsheet software. Proficiency with computer software is increasingly important because most orders are being filled and filed electronically.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Order clerks	43-4151	271,000	205,000	-66,000	-24

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Advancement. By taking on more duties, ambitious order clerks can receive higher pay or become eligible for advancement opportunities. Some use their experience as an order clerk to move into sales positions.

Employment

Order clerks held about 271,000 jobs in 2006. Over half of all order clerks were employed in wholesale and retail trade establishments, and another 15 percent were employed in manufacturing firms. Approximately 1 out every 10 order clerks worked in the electronic shopping and mail order houses sector of retail trade. Other order clerk jobs were in industries such as information, warehousing and storage, couriers, and business support services.

Job Outlook

Overall employment of order clerks is expected to decline rapidly through the year 2016 due to improvements in technology and office automation. However, numerous job openings are expected because some of the clerks who leave the occupation will need to be replaced.

Employment change. Employment of order clerks is expected to decline rapidly by 24 percent from 2006 to 2016 as improvements in technology and office automation continue to increase worker productivity.

Growth in electronic commerce, and the use of automated systems that make placing orders easy and convenient, will decrease demand for order clerks. The spread of electronic data interchange, which enables computers to communicate directly with each other, allows orders within establishments to be placed with little human interaction. In addition, internal systems allowing a firm's employees to place orders directly are becoming increasingly common. Outside orders placed over the Internet often are entered directly into the computer by the customer; the order clerk is not involved in placing the order. Some companies also use automated phone menus to receive orders. Others use answering machines. Developments in voice recognition technology may further reduce the demand for order clerks.

Furthermore, increased automation will allow current order clerks to be more productive, with each clerk able to handle an increasingly higher volume of orders. Sophisticated inventory control and automatic billing systems permit companies to track inventory and accounts with much less help from order clerks than in the past.

Job prospects. While overall employment of order clerks is expected to decline through the year 2016, numerous openings will occur each year to replace order clerks who transfer to other occupations or leave the labor force. Many of these openings will be for seasonal work, especially in catalog companies or online retailers catering to holiday gift buyers.

Earnings

Median hourly earnings of order clerks in May 2006 were $12.66. The middle 50 percent earned between $9.91 and $16.22. The lowest 10 percent earned less than $8.18, and the highest 10 percent earned more than $20.69. Median hourly earnings in electronic shopping and mail-order houses were $10.50.

Related Occupations

Order clerks receive and process orders. Other workers who perform similar duties include stock clerks and order fillers and hotel, motel, and resort desk clerks.

Sources of Additional Information

State employment service offices and agencies can provide information about job openings for order clerks.

Receptionists and Information Clerks

(O*NET 43-4171.00)

Significant Points

- Good interpersonal skills are critical.
- A high school diploma or its equivalent is the most common educational requirement.
- Employment is expected to grow faster than average for all occupations.

Nature of the Work

Receptionists and information clerks are charged with a responsibility that may affect the success of an organization: making a good first impression. Receptionists and information clerks answer telephones, route and screen calls, greet visitors, respond to inquiries from the public, and provide information about the organization. Some are responsible for the coordination of all mail into and out of the office. In addition, they contribute to the security of an organization by helping to monitor the access of visitors—a function that has become increasingly important.

Whereas some tasks are common to most receptionists and information clerks, their specific responsibilities vary with the type of establishment in which they work. For example, receptionists and information clerks in hospitals and in doctors' offices may gather patients' personal and insurance information and direct them to the proper waiting rooms. In corporate headquarters, they may greet visitors and manage the scheduling of the board room or common conference area. In beauty or hair salons, they arrange appointments, direct customers to the hairstylist, and may serve as cashiers. In factories, large corporations, and government offices, receptionists and information clerks may provide identification cards and arrange for escorts to take visitors to the proper office. Those working for bus and train companies respond to inquiries about departures, arrivals, stops, and other related matters.

Increasingly, receptionists and information clerks use multiline telephone systems, personal computers, and fax machines. Despite the widespread use of automated answering systems or voice mail, many receptionists and clerks still take messages and inform other employees of visitors' arrivals or cancellation of an appointment. When they are not busy with callers, most workers are expected to perform a variety of office duties, including opening and sorting mail, collecting and distributing parcels, and transmitting and deliv-

Receptionists and information clerks must be courteous, professional, and helpful when greeting people.

ering facsimiles. Other duties include updating appointment calendars, preparing travel vouchers, and performing basic bookkeeping, word processing, and filing.

Work environment. Receptionists and information clerks who greet customers and visitors usually work in areas that are highly visible and designed and furnished to make a good impression. Most work stations are clean, well lighted, and relatively quiet. The work performed by some receptionists and information clerks may be tiring, repetitious, and stressful as they may spend all day answering continuously ringing telephones and sometimes encounter difficult or irate callers. The work environment, however, may be very friendly and motivating for individuals who enjoy greeting customers face to face and making them feel comfortable.

Training, Other Qualifications, and Advancement

A high school diploma or its equivalent is the most common educational requirement, although hiring requirements for receptionists and information clerks vary by industry. Good interpersonal skills and being technologically proficient also are important to employers.

Education and training. Receptionists and information clerks generally need a high school diploma or equivalent as most of their training is received on the job. However, employers often look for applicants who already possess certain skills, such as prior computer experience or answering telephones. Some employers also may prefer some formal office education or training. On the job, they learn how to operate the telephone system and computers. They also learn the proper procedures for greeting visitors and for distributing mail, fax messages, and parcels. While many of these skills can be learned quickly, those who are charged with relaying information to visitors or customers may need several months to learn details about the organization.

Other qualifications. Good interpersonal and customer service skills—being courteous, professional, and helpful—are critical for this job. Being an active listener often is a key quality needed by receptionists and information clerks that requires the ability to listen patiently to the points being made, to wait to speak until others have finished, and to ask appropriate questions when necessary. In addition, the ability to relay information accurately to others is important.

The ability to operate a wide range of office technology also is helpful, as receptionists and information clerks are often asked to work on other assignments during the day.

Advancement. Advancement for receptionists generally comes about either by transferring to an occupation with more responsibility or by being promoted to a supervisory position. Receptionists with especially strong computer skills may advance to a better paying job as a secretary or an administrative assistant.

Employment

Receptionists and information clerks held about 1.2 million jobs in 2006. The health care and social assistance industries—including offices of physicians, hospitals, nursing homes, and outpatient care facilities—employed about 33 percent of all receptionists and information clerks. Manufacturing, wholesale and retail trade, government, and real estate industries also employed large numbers of receptionists and information clerks. More than 3 of every 10 receptionists and information clerks work part time.

Job Outlook

Employment of receptionists and information clerks is expected to grow faster than average for all occupations. Receptionists and information clerks will have a very large number of new jobs arise, more than 200,000 over the 2006–2016 period. Additional job opportunities will result from the need to replace workers who transfer to other occupations or leave the labor force.

Employment change. Receptionists and information clerks are expected to increase by 17 percent from 2006 to 2016, which is faster than the average for all occupations. Employment growth will result from rapid growth in the following industries: offices of physicians, legal services, employment services, and management and technical consulting.

Technology will have conflicting effects on employment growth for receptionists and information clerks. The increasing use of voice mail and other telephone automation reduces the need for receptionists by allowing one receptionist to perform work that formerly required several. At the same time, however, the increasing use of other technology has caused a consolidation of clerical responsibilities and growing demand for workers with diverse clerical and technical skills. Because receptionists and information clerks may perform a wide variety of clerical tasks, they should continue to be in demand. Further, they perform many tasks that are interpersonal in nature and are not easily automated, ensuring continued demand for their services in a variety of establishments.

Job prospects. In addition to job growth, numerous job opportunities will be created as receptionists and information clerks transfer to other occupations or leave the labor force altogether. Opportunities should be best for persons with a wide range of clerical and technical skills, particularly those with related work experience.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Receptionists and information clerks	43-4171	1,173,000	1,375,000	202,000	17

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Earnings

Median hourly earnings of receptionists and information clerks in May 2006 were $11.01. The middle 50 percent earned between $9.06 and $13.51. The lowest 10 percent earned less than $7.54, and the highest 10 percent earned more than $16.23. Median hourly earnings in the industries employing the largest number of receptionists and information clerks in May 2006 were:

Offices of dentists	$12.89
General medical and surgical hospitals	11.74
Offices of physicians	11.44
Employment services	10.72
Personal care services	8.57

Related Occupations

Receptionists deal with the public and often direct people to others who can assist them. Other workers who perform similar duties include dispatchers, secretaries and administrative assistants, and customer service representatives.

Sources of Additional Information

State employment offices can provide information on job openings for receptionists.

Reservation and Transportation Ticket Agents and Travel Clerks

(O*NET 43-4181.00, 43-4181.01, and 43-4181.02)

Significant Points

- Most jobs are found in large metropolitan airports, reservation call centers, and train or bus stations.
- A high school diploma or its equivalent is the most common educational requirement.
- Employment is expected to show little or no growth because of the significant impact of technology on worker productivity.

Nature of the Work

Each year, millions of people travel by plane, train, ship, bus, and automobile. Many of these travelers rely on the services of reservation and transportation ticket agents and travel clerks. Agents and clerks perform functions as varied as selling tickets, confirming reservations, checking baggage, and providing useful travel information.

Most *reservation agents* work for airlines or large hotel chains, helping people plan trips and make reservations. They usually work in reservation call centers, answering telephone or e-mail inquiries and offering travel arrangement suggestions and information such as routes, schedules, fares, and types of accommodations. They also change or confirm transportation and lodging reservations. Most agents use their own company's reservation system to obtain information needed to make, change, or cancel traveler reservations.

Transportation ticket agents are sometimes known as passenger service agents, passenger booking clerks, reservation clerks, airport service agents, ticket clerks, or ticket sellers. They work in airports, train stations, and bus stations, selling tickets, assigning seats to passengers, and checking baggage. In addition, they may answer inquiries and give directions, examine passports and visas, or check in pets. They may be required to assist customers who have trouble operating self-service ticketing machines or kiosks. Other ticket agents, more commonly known as *gate* or *station agents*, work in airport terminals, assisting passengers boarding airplanes. These workers direct passengers to the correct boarding area, check tickets and seat assignments, make boarding announcements, and provide special assistance to young, elderly, or disabled passengers.

Reservation and transportation ticket agents and travel clerks verify schedules before printing tickets.

Travel clerks provide travelers information on points of interest, restaurants, overnight accommodations, and availability of emergency services. In some cases, they make rental car, hotel, and restaurant reservations. Clerks also may provide assistance in filling out travel documents and answer other travel-related questions.

Work environment. Most reservation and transportation ticket agents and travel clerks work in airports, call centers, and train and bus terminals that generally are clean and safe. Reservation and ticket agents who work in large, centralized reservation centers spend much of their day talking with customers on the telephone and using a computer to plan itineraries and to make reservations. The call center environment is often hectic and noisy. Ticket agents, who work at transportation sites may stand on their feet for long periods of time, and may have to lift heavy baggage.

Although most reservation and transportation ticket agents and travel clerks work a standard 40-hour week, about 14 percent work part time. Some agents work evenings, late nights, weekends, and holidays. In general, employees with the most seniority tend to be assigned the more desirable shifts.

The work performed by reservation and transportation ticket agents and travel clerks may be repetitive and stressful. They often work under stringent time constraints. Agents and clerks must work quickly and accurately to avoid mistakes and angering customers. Difficult or angry customers also can create stressful situations as agents usually bear the brunt of customers' dissatisfaction. In addition, prolonged computer use, which is common in this occupation, may lead to eyestrain.

Training, Other Qualifications, and Advancement

Most reservation and transportation ticket agents spend several weeks in company-sponsored training programs learning the reservation system and other travel-related information. Good customer service skills and the ability to work quickly are important.

Education and training. A high school diploma or its equivalent is the most common educational requirement for reservation and transportation ticket agents and travel clerks. Most airline reservation and ticket agents learn their skills through formal company training programs that can last several weeks. They learn company

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Reservation and transportation ticket agents and travel clerks	43-4181	165,000	167,000	1,800	1

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

and industry policies as well as ticketing procedures. Trainees also learn to use the airline's computer system to obtain information on schedules, fares, and the availability of seats; to make reservations for passengers; and to prepare passenger itineraries. In addition, they must become familiar with train, airport, and airline code designations, security regulations, and safety procedures. After completing classroom instruction, new agents work under the direct guidance of a supervisor or experienced agent. During this time the supervisors may monitor telephone conversations to improve the quality of customer service so that agents learn to provide customer service in a courteous manner, while limiting the time spent on each call.

In contrast to those who work for airlines, reservation and transportation ticket agents and travel clerks who work for bus lines and railroads are trained on the job through short in-house classes that last several days.

Other qualifications. Applicants usually must be 18 years of age and older and a valid driver's license may be required. Also, experience with computers and good typing skills usually are required. Agents who handle passenger luggage must be able to lift heavy objects.

Many reservation and transportation ticket agents and travel clerks deal directly with the public, so a professional appearance and a pleasant personality are important. A clear speaking voice and fluency in English also are essential, because these employees frequently use the telephone or public-address systems. In addition, fluency in a foreign language is becoming increasingly helpful for those who deal with the public, because of the growing number of international and non-English speaking travelers.

Advancement. Reservation and transportation ticket agents and travel clerks may advance by being transferred to a position with more responsibilities or by being promoted to a supervisory position. Many travel companies fill supervisory and managerial positions by promoting individuals within their organization, so those who acquire additional skills, experience, and training improve their opportunities for advancement. Some companies require that candidates for supervisory positions have an associate degree in a business-related field, such as management, business administration, or marketing. Within the airline industry, a ticket agent may advance to lead worker on the shift.

Employment

Reservation and transportation ticket agents and travel clerks held about 165,000 jobs in 2006. About six out of ten agents and clerks are employed by airlines. Others work for tour operators and reservation services, hotels and other lodging places, and other companies that provide transportation services.

Although agents and clerks are found throughout the country, most work in large metropolitan airports, reservation call centers, and train or bus stations. The remainder work in small, regional airports, or in small communities served only by intercity bus or railroad lines.

Job Outlook

Employment of reservation and transportation ticket agents and travel clerks is expected to show little or no growth during the projection period. Additionally, applicants for these jobs are likely to encounter keen competition.

Employment change. Employment of reservation and transportation ticket agents is expected grow only 1 percent from 2006 to 2016, reflecting little or no change to employment. Despite a growing and more mobile population who will likely travel more frequently, newer automated reservations and ticketing operations will speed transaction time and reduce the need for more workers to handle the expected higher volume of business. Most train stations and airports now have self-service ticket printing machines, or kiosks, which enable passengers to make reservations, purchase tickets, and check-in for train rides and flights themselves. Many passengers also are able to check travel times and fares, make reservations, purchase tickets, and check-in for most domestic flights on the Internet. Nevertheless, not all travel-related passenger services can be fully automated, primarily for safety and security reasons, and not all passengers use these automated services. As a result, job openings will continue to become available as increasing numbers of people travel more frequently. Additional growth will result to meet the travel needs of the growing retirement population, particularly in less traditional transportation centers, such as with boat or cruise operators or with companies who rent recreational vehicles.

Job prospects. Job applicants often face competition for these jobs, because entry requirements are relatively low and benefits for those who like to travel, particularly on the airlines, are high. Applicants who have previous experience in the travel industry, in sales, or in customer service should have the best job prospects. Those who possess a pleasant personality and strong customer service skills also should have good job opportunities. Additional job opportunities will result from the need to replace workers who transfer to other occupations, retire, or leave the labor force altogether.

Employment in these occupations may fluctuate with the economy. During recessions, discretionary passenger travel often declines, and transportation service companies are less likely to hire new workers and may institute layoffs.

Earnings

Median annual earnings of reservation and transportation ticket agents and travel clerks in May 2006 were $28,540. The middle 50 percent earned between $21,640 and $38,540. The lowest 10 percent earned less than $17,670, and the highest 10 percent earned more than $45,400. Many employers offer discounts on travel services to their employees. In May 2006, median annual earnings in the industries employing the largest number of agents were:

Scheduled air transportation	$32,850
Traveler accommodation	23,630
Travel arrangement and reservation services	22,630

Related Occupations

Other occupations that provide travel-related services include hotel, motel, and resort desk clerks; travel agents; and flight attendants. Other occupations that make sales and provide information to customers include counter and rental clerks, order clerks, customer service representatives, and receptionists and information clerks.

Sources of Additional Information

For information about job opportunities as reservation and transportation ticket agents and travel clerks, write to the personnel manager of individual transportation companies. Addresses of airlines are available from

➤ Air Transport Association of America, 1301 Pennsylvania Ave. NW, Suite 1100, Washington, DC 20004. Internet: http://www.airlines.org

Material Recording, Scheduling, Dispatching, and Distributing Occupations

Cargo and Freight Agents

(O*NET 43-5011.00)

Significant Points

- Cargo and freight agents need no more than a high school diploma and learn their duties informally on the job.
- Faster-than-average employment growth is expected.

Nature of the Work

Cargo and freight agents arrange for and track incoming and outgoing shipments in airline, train, or trucking terminals or on shipping docks. They expedite shipments by determining the route that shipments will take and by preparing all necessary documents. Agents take orders from customers and arrange for the pickup of freight or cargo and its delivery to loading platforms. Cargo and freight agents may keep records of the cargo, including its amount, type, weight, dimensions, destination, and time of shipment. They keep a tally of missing items and record the condition of damaged items.

Cargo and freight agents determine the route that shipments will take and prepare all necessary documents.

Cargo and freight agents arrange cargo according to its destination. They also determine any shipping rates and other charges that usually apply to freight. For imported or exported freight, they verify that the proper customs paperwork is in order. Cargo and freight agents often track shipments electronically, using bar codes, and answer customers' questions about the status of their shipments.

Work environment. Cargo and freight agents work in a wide variety of businesses, institutions, and industries. Some work in warehouses, stockrooms, or shipping and receiving rooms that may not be temperature controlled. Others may spend time in cold storage rooms or outside on loading platforms, where they are exposed to the weather.

Most jobs for cargo and freight agents involve frequent standing, bending, walking, and stretching. Some lifting and carrying of small items may be involved. Although automated devices have lessened the physical demands of this occupation, not every employer has these devices. The work still can be strenuous, even though mechanical material-handling equipment is used to move heavy items.

The typical workweek is Monday through Friday. However, evening and weekend hours are common in jobs involving large shipments.

Training, Other Qualifications, and Advancement

Cargo and freight agents need no more than a high school diploma and learn their duties informally on the job.

Education and training. Many jobs are entry level and require only a high school diploma. Cargo and freight agents undergo informal on-the-job training. They start out by checking items to be shipped, attaching labels to them, and making sure that addresses are correct. As this occupation becomes more automated, workers may need longer periods of training to master the use of equipment.

Other qualifications. Employers prefer to hire people who can use computers. Typing, filing, recordkeeping, and other clerical skills also are important.

Advancement. Advancement opportunities for cargo and freight agents are usually limited, but some agents may become team leaders or use their hands-on experience to switch to other clerical occupations in the businesses where they work.

Employment

Cargo and freight agents held about 86,000 jobs in 2006. Most agents were employed in transportation. Approximately 44 percent worked for firms engaged in support activities for the transportation industry, 23 percent were in the air transportation industry, 9 percent worked for courier businesses, and 7 percent were in the truck transportation industry.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Cargo and freight agents	43-5011	86,000	100,000	14,000	16

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Job Outlook

Employment is expected to grow faster than average.

Employment change. Employment of cargo and freight agents is expected to increase by 16 percent during the 2006–2016 decade, faster than the average for all occupations. A growing number of agents will be needed to handle the increasing number of shipments resulting from increases in cargo traffic. Additional demand will stem from the growing popularity of online shopping and same-day delivery.

Job prospects. In addition to new job growth, openings will be created by the need to replace cargo and freight agents who leave the occupation.

Earnings

Median annual earnings of cargo and freight agents in May 2006 were $37,110. The middle 50 percent earned between $27,750 and $46,440. The lowest 10 percent earned less than $22,470, and the highest 10 percent earned more than $57,440. Median annual earnings in the industries employing the largest numbers of cargo and freight agents in May 2006 were:

Scheduled air transportation	$38,340
Freight transportation arrangement	37,130
Couriers	36,750
General freight trucking	34,010
Support activities for air transportation	23,770

These workers usually receive the same benefits as most other workers. If uniforms are required, employers generally provide them or offer an allowance to purchase them.

Related Occupations

Cargo and freight agents plan and coordinate shipments of cargo by airlines, trains, and trucks. They also arrange freight pickup with customers. Others who do similar work are couriers and messengers; shipping, receiving, and traffic clerks; weighers, measurers, checkers, and samplers, recordkeeping; truck drivers and driver/sales workers; and Postal Service workers.

Sources of Additional Information

Information about job opportunities may be obtained from local employers and local offices of the state employment service.

Couriers and Messengers

(O*NET 43-5021.00)

Significant Points

- Most jobs do not require more than a high school diploma.
- Employment is expected to have little to no change, reflecting the more widespread use of electronic information-handling technologies such as e-mail and fax.

Nature of the Work

Couriers and messengers move and distribute information, documents, and small packages for businesses, institutions, and government agencies. They pick up and deliver letters, important business documents, or packages that need to be sent or received quickly within a local area. Couriers and messengers use trucks and vans for larger deliveries, such as legal caseloads and conference materials. By sending an item by courier or messenger, the sender ensures that it reaches its destination the same day or even within the hour. Couriers and messengers also deliver items that the sender is unwilling to entrust to other means of delivery, such as important legal or financial documents, passports, airline tickets, or medical samples to be tested.

Couriers and messengers receive their instructions either in person—by reporting to their office—or by telephone, two-way radio, or wireless data service. Then they pick up the item and carry it to its destination. After each pickup or delivery, they check in with their dispatcher to receive instructions. Sometimes the dispatcher will contact them while they are between stops and reroute them to pick up a new delivery. Consequently, most couriers and messengers spend much of their time outdoors or in their vehicle. They usually maintain records of deliveries and often obtain signatures from the people receiving the items.

Most couriers and messengers deliver items within a limited geographic area, such as a city or metropolitan area. Mail or overnight delivery service is the preferred delivery method for items that need to go longer distances. Some couriers and messengers carry items

Couriers and messengers spend most of their time making deliveries and usually are not closely supervised.

only for their employer, often a law firm, bank, medical laboratory, or financial institution. Others may act as part of an organization's internal mail system and carry items mainly within the organization's buildings or entirely within one building. Many couriers and messengers work for messenger or courier services; for a fee, they pick up items from anyone and deliver them to specified destinations within a local area. Most are paid on a commission basis.

Couriers and messengers reach their destination by several methods. Many drive vans or cars or ride motorcycles. A few travel by foot, especially in urban areas or when making deliveries nearby. In congested urban areas, messengers often use bicycles to make deliveries. Messenger or courier services usually employ the bicycle messengers.

Work environment. Couriers and messengers spend most of their time alone, making deliveries, and usually are not closely supervised. Those who deliver by bicycle must be physically fit and must cope with all weather conditions and the hazards of heavy traffic. Car, van, and truck couriers must sometimes carry heavy loads, either manually or with the aid of a hand truck. They also have to deal with difficult parking situations, traffic jams, and road construction. The pressure of making as many deliveries as possible to increase one's earnings can be stressful and may lead to unsafe driving or bicycling practices. The typical workweek is Monday through Friday; however, evening and weekend hours are common.

Training, Other Qualifications, and Advancement

Most couriers and messengers train on the job. Communication skills, a good driving record, and good sense of direction are helpful.

Education and training. Most courier and messenger jobs do not require workers to have more than a high school diploma. Couriers and messengers usually learn as they work, training with an experienced worker for a short time.

Other qualifications. Couriers and messengers need a good knowledge of the area in which they travel and a good sense of direction. Employers also prefer to hire people who are familiar with computers and other electronic office and business equipment. In addition, good oral and written communication skills are important because communicating with customers and dispatchers is an integral part of some courier and messenger jobs.

Those who work as independent contractors for a messenger or delivery service may be required to have a valid driver's license, a registered and inspected vehicle, a good driving record, and insurance coverage. Many couriers and messengers, who are employees rather than independent contractors, also are required to provide and maintain their own vehicle. Although some companies have spare bicycles or mopeds that their riders may rent for a short period, almost all two-wheeled couriers own their own bicycle, moped, or motorcycle.

Advancement. Couriers and messengers have limited advancement opportunities. However, one avenue for advancement is to learn dispatching or to take service requests by phone.

Some independent contractors become master contractors. Master contractors organize routes for multiple independent contractors through courier agencies.

Employment

Couriers and messengers together held about 134,000 jobs in 2006. About 25 percent were employed in the couriers and messengers industry; 15 percent worked in health care; and 9 percent worked in legal services. About 19 percent were self-employed independent contractors; they provide their own vehicles and, to a certain extent, set their own schedules. However, they are like employees in some respects, because they often contract with one company.

Job Outlook

Employment of couriers and messengers should have little to no change through 2016, despite an increasing volume of parcels, business documents, and other materials to be delivered. The need to replace workers who leave the occupation will create some job openings.

Employment change. Employment in this occupation is expected to remain unchanged during the 2006–2016 decade. Employment will be unchanged because of the more widespread use of electronic information-handling technologies such as e-mail and fax. Electronic transmission of many documents, forms, and other materials is replacing items that had been hand delivered. Many legal and financial documents, which formerly were delivered by hand because they required a handwritten signature, can now be delivered electronically with online signatures. However, for items that are unable to be sent electronically—such as blueprints and other oversized materials, securities, and passports—couriers and messengers will still be needed. They still will also be required by medical and dental laboratories to pick up and deliver medical samples, specimens, and other materials.

Job prospects. Despite the lack of job growth, some job opportunities will arise out of the need to replace couriers and messengers who leave the occupation. Demand for couriers and messengers may be particularly strong in certain activities, like transporting donor organs for hospitals.

Earnings

Median annual earnings of couriers and messengers in May 2006 were $21,540. The middle 50 percent earned between $17,430 and $27,080. The lowest 10 percent earned less than $14,870, and the highest 10 percent earned more than $34,510. Median annual earnings in the industries employing the largest numbers of couriers and messengers in May 2006 were:

Medical and diagnostic laboratories	$23,020
Depository credit intermediation	20,680
Couriers	20,650
Legal services	20,610
Local messengers and local delivery	19,560

Couriers employed by a courier service usually receive the same benefits as most other workers. If uniforms are required, employers generally provide them or offer an allowance to purchase them. Most independent contractors do not receive benefits, but usually have higher earnings.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Couriers and messengers	43-5021	134,000	134,000	-200	0

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Related Occupations

Messengers and couriers deliver letters, parcels, and other items. They also keep accurate records of their work. Others who do similar work are Postal Service workers; truck drivers and driver/sales workers; shipping, receiving, and traffic clerks; and cargo and freight agents.

Sources of Additional Information

Local employers and local offices of the state employment service can provide additional information about job opportunities. People interested in courier and messenger jobs also may contact messenger and courier services, mail-order firms, banks, printing and publishing firms, utility companies, retail stores, or other large companies.

Information on careers as couriers and messengers is available from

➤ Messengers and Couriers Association of the Americas, 1156 15th St. NW, Suite 900, Washington, DC 20005.

Dispatchers

(O*NET 43-5031.00 and 43-5032.00)

Significant Points

- Alternative work schedules are necessary to accommodate evening, weekend, and holiday work and 24-hour-per-day, 7-day-per-week operations.
- Dispatchers generally are entry-level workers who are trained on the job and need no more than a high school diploma.
- Many states require specific types of training or certification.

Many dispatchers use computer-aided systems.

Nature of the Work

Dispatchers schedule and dispatch workers, equipment, or service vehicles to carry materials or passengers. Some dispatchers take calls for taxi companies, for example, or for police or ambulance assistance. They keep records, logs, and schedules of the calls that they receive and of the transportation vehicles that they monitor and control. In fact, they usually prepare a detailed report on all activities occurring during their shifts. Many dispatchers employ computer-aided dispatch systems to accomplish these tasks.

All dispatchers are assigned a specific territory and have responsibility for all communications within that area. Many work in teams, especially dispatchers in large communications centers or companies. The work of dispatchers varies greatly, depending on the industry in which they work.

Police, fire, and ambulance dispatchers, also called *public safety dispatchers* or *911 operators,* monitor the location of emergency services personnel from one or all of the jurisdiction's emergency services departments. These workers dispatch the appropriate type and number of units in response to calls for assistance. Dispatchers, or call takers, often are the first people the public contacts when emergency assistance is required. If certified for emergency medical services, the dispatcher may provide medical instruction to those on the scene of the emergency until the medical staff arrives.

Police, fire, and ambulance dispatchers work in a variety of settings—a police station, a fire station, a hospital, or, increasingly, a centralized communications center. In some areas, one of the major departments serves as the communications center. In these situations, all emergency calls go to that department, where a dispatcher handles their calls and screens the others before transferring them to the appropriate service.

When handling calls, dispatchers question each caller carefully to determine the type, seriousness, and location of the emergency. The information obtained is posted either electronically by computer or, with decreasing frequency, by hand. The dispatcher then quickly decides the priority of the incident, the kind and number of units needed, and the location of the closest and most suitable units available. When appropriate, dispatchers stay in close contact with other service providers—for example, a police dispatcher would monitor the response of the fire department when there is a major fire. In a medical emergency, dispatchers keep in close touch not only with the dispatched units, but also with the caller. They may give extensive first-aid instructions before the emergency personnel arrive, while the caller is waiting for the ambulance. Dispatchers continuously give updates on the patient's condition to the ambulance personnel and often serve as a link between the medical staff in a hospital and the emergency medical technicians in the ambulance. (A separate statement on emergency medical technicians and paramedics appears elsewhere in the *Handbook.*)

Other dispatchers coordinate deliveries, service calls, and related activities for a variety of firms. *Truck dispatchers*, who work for local and long-distance trucking companies, coordinate the movement of trucks and freight between cities. These dispatchers direct the pickup and delivery activities of drivers, receive customers' requests for the pickup and delivery of freight, consolidate freight

orders into truckloads for specific destinations, assign drivers and trucks, and draw up routes and pickup and delivery schedules. *Bus dispatchers* make sure that local and long-distance buses stay on schedule. They handle all problems that may disrupt service, and they dispatch other buses or arrange for repairs in order to restore service and schedules. *Train dispatchers* ensure the timely and efficient movement of trains according to orders and schedules. They must be aware of track switch positions, track maintenance areas, and the location of other trains running on the track. *Taxicab dispatchers*, or starters, dispatch taxis in response to requests for service and keep logs on all road service calls. *Tow-truck dispatchers* take calls for emergency road service. They relay the nature of the problem to a nearby service station or a tow-truck service and see to it that the road service is completed. *Gas and water service dispatchers* monitor gas lines and water mains, and send out service trucks and crews to take care of emergencies.

Work environment. The work of dispatchers can be very hectic when many calls come in at the same time. The job of public safety dispatchers is particularly stressful because a slow or an improper response to a call can result in serious injury or further harm. Also, callers who are anxious or afraid may become excited and be unable to provide needed information; some may even become abusive. Despite provocations, dispatchers must remain calm, objective, and in control of the situation.

Dispatchers sit for long periods, using telephones, computers, and two-way radios. Much of their time is spent at video display terminals, viewing monitors and observing traffic patterns. As a result of working for long stretches with computers and other electronic equipment, dispatchers can experience significant eyestrain and back discomfort. Generally, dispatchers work a 40-hour week; however, rotating shifts and compressed work schedules are common. Alternative work schedules are necessary to accommodate evening, weekend, and holiday work and 24-hour-per-day, 7-day-per-week operations.

Training, Other Qualifications, and Advancement

Dispatchers generally are entry-level workers who are trained on the job and need no more than a high school diploma. Many states require specific types of training or certification.

Education and training. Workers usually develop the necessary skills on the job. This informal training lasts from several days to a few months, depending on the complexity of the job. While working with an experienced dispatcher, new employees monitor calls and learn how to operate a variety of communications equipment, including telephones, radios, and various wireless devices. As trainees gain confidence, they begin to handle calls themselves. In smaller operations, dispatchers sometimes act as customer service representatives, processing orders. Many public safety dispatchers also participate in structured training programs sponsored by their employer. Increasingly, public safety dispatchers receive training in stress and crisis management as well as in family counseling. This training helps them to provide effective services to others; and, at the same time, it helps them manage the stress involved in their work.

Licensure. Many states require specific types of training or certification from a professional association. Certification often requires several months in a classroom for instruction in computer-assisted dispatching and other emerging technologies as well as radio dispatching and stress management.

Other qualifications. State or local government civil service regulations usually govern police, fire, and emergency medical dispatching jobs. Candidates for these positions may have to pass written, oral, and performance tests. Also, they may be asked to attend training classes in order to qualify for advancement.

Communication skills and the ability to work under pressure are important personal qualities for dispatchers. Residency in the city or county of employment frequently is required for public safety dispatchers. Dispatchers in transportation industries must be able to deal with sudden influxes of shipments and disruptions of shipping schedules caused by bad weather, road construction, or accidents.

Certification and advancement. Although there are no mandatory licensing requirements, some states require that public safety dispatchers possess a certificate to work on a state network, such as the Police Information Network. Many dispatchers participate in these programs in order to improve their prospects for career advancement.

Dispatchers who work for private firms, which usually are small, will find few opportunities for advancement. In contrast, public safety dispatchers may become a shift or divisional supervisor or chief of communications, or they may move to higher paying administrative jobs. Some become police officers or fire fighters.

Employment

Dispatchers held 289,000 jobs in May of 2006. About 34 percent were police, fire, and ambulance dispatchers, almost all of whom worked for state and local governments—primarily local police and fire departments. About 28 percent of all dispatchers worked in the transportation and warehousing industry, and the rest worked in a wide variety of mainly service-providing industries.

Although dispatching jobs are found throughout the country, most dispatchers work in urban areas, where large communications centers and businesses are located.

Job Outlook

Employment of dispatchers is expected to grow more slowly than average. In addition to those positions resulting from job growth, many openings will arise from the need to replace workers who transfer to other occupations or leave the labor force.

Employment change. Employment of dispatchers is expected to increase 6 percent over the 2006–2016 decade, more slowly than the average for all occupations. Population growth and economic expansion are expected to spur employment growth for all types of dispatchers. The growing and aging population will increase demand for emergency services and stimulate employment growth of police, fire, and ambulance dispatchers.

Job prospects. In addition to openings due to growth, job openings will result from the need to replace workers who transfer to

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Dispatchers	43-5030	289,000	306,000	16,000	6
Police, fire, and ambulance dispatchers	43-5031	99,000	113,000	13,000	14
Dispatchers, except police, fire, and ambulance	43-5032	190,000	193,000	2,900	2

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

other occupations or leave the labor force. Many districts are consolidating their communications centers into a shared area-wide facility. As the equipment becomes more complex, individuals with computer skills and experience will have a greater opportunity for employment as public safety dispatchers.

Employment of some dispatchers is more adversely affected by economic downturns than employment of other dispatchers. For example, when economic activity falls, demand for transportation services declines. As a result, taxicab, train, and truck dispatchers may experience layoffs or a shortened workweek, and jobseekers may have some difficulty finding entry-level jobs. Employment of tow-truck dispatchers, by contrast, is seldom affected by general economic conditions, because of the emergency nature of their business. Likewise, public safety dispatchers are unlikely to be affected by economic downturns.

Earnings

Median annual wage-and-salary earnings of dispatchers, except police, fire, and ambulance in May 2006 were $32,190. The middle 50 percent earned between $24,860 and $42,030. The lowest 10 percent earned less than $19,780, and the highest 10 percent earned more than $53,250.

Median annual wage-and-salary earnings of police, fire, and ambulance dispatchers in 2006 were $31,470. The middle 50 percent earned between $25,200 and $39,040. The lowest 10 percent earned less than $20,010, and the highest 10 percent earned more than $47,190.

Related Occupations

Other occupations that involve directing and controlling the movement of vehicles, freight, and personnel, as well as distributing information and messages, include air traffic controllers, communications equipment operators, customer service representatives, and reservation and transportation ticket agents and travel clerks.

Information on job opportunities for police, fire, and emergency dispatchers is available from personnel offices of state and local governments or police departments. Information about work opportunities for other types of dispatchers is available from local employers and state employment service offices.

Meter Readers, Utilities

(O*NET 43-5041.00)

Significant Points

- Meter reading is one of the fastest-declining occupations, as a result of automated meter reading (AMR) systems that allow meters to be monitored and billed from a central point.
- Most meter readers are employed by electric, gas, or water utilities or by local governments.
- Many workers begin working as meter readers and advance to lineman, power plant operator, or dispatcher jobs.

Most modern meters are electronic and can be read using a remote device.

Nature of the Work

Meter readers read electric, gas, water, or steam consumption meters and record the volume used. They serve both residential and commercial consumers. The basic duty of a meter reader is to walk or drive along a route and read customers' consumption from a tracking device. Accuracy is the most important part of the job, as companies rely on readers to provide the information they need to bill their customers.

Other duties include inspecting the meters and their connections for any defects or damage, supplying repair and maintenance workers with the necessary information to fix damaged meters. They keep track of customers' average usage and record reasons for any extreme fluctuations in volume. Meter readers are constantly aware of any abnormal behavior or consumption that might indicate an unauthorized connection. They may turn on service for new occupants and turn off service for questionable behavior or nonpayment of charges.

Work environment. Meter readers work outdoors in all types of weather as they travel through communities and neighborhoods taking readings. Those traveling on foot may have to walk several miles a day. Dogs can pose a difficulty for meter readers, although they are generally given precautionary devices to help them avoid encounters. Meter readers generally work 40-hour weeks, although part-time positions are available. The typical workweek is Monday through Friday.

Training, Other Qualifications, and Advancement

Meter readers are entry-level utility employees. Many people start utility careers in this occupation with the goal of advancing to more responsible positions.

Education and training. Most employers prefer to hire workers who have a high school diploma. Until they demonstrate an ability to work alone, inexperienced meter readers usually work with more experienced ones. They learn how to read meters and determine consumption rates on the job and they must also learn the route that they need to travel.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Meter readers, utilities	43-5041	47,000	42,000	-4,800	-10

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Other qualifications. No experience is required for this position, but employers prefer to hire those familiar with computers and other electronic office and business equipment. Because routes may change, it is important for readers to be able to understand maps. Typing, recordkeeping and other clerical skills are also useful.

Advancement. Meter reading is generally considered an entry-level occupation. Many people start working as meter readers and move up to higher positions in the metering department. Others move on to other positions within the utility, such as dispatcher or distributor. They may also become apprentices to more skilled positions, such as lineman or electrician.

Employment

Meter readers held about 47,000 jobs in 2006. About 42 percent were employed by electric, gas, and water utilities. Most of the rest were employed in local government, reading water meters or meters for other government-owned utilities.

Job Outlook

Despite declining employment, some job openings are expected during the 2006–2016 decade.

Employment change. Employment of meter readers is expected to decline by 10 percent through 2016. New AMR systems allow meters to be monitored and billed from a central point, reducing the need for meter readers.

Job prospects. It will be many years before AMR systems can be implemented in all locations, so there still will be some openings for meter readers, mainly to replace workers leaving the occupation. The utilities industry is expecting a large number of retirements from its aging workforce, which should create many job opportunities.

Earnings

Median annual earnings of utility meter readers in May 2006 were $30,330. The middle 50 percent earned between $23,580 and $39,320. The lowest 10 percent earned less than $18,970, and the highest 10 percent earned more than $49,150. Employee benefits vary greatly between companies and may not be offered for part-time workers. If uniforms are required, employers generally provide them or offer an allowance to purchase them.

Related Occupations

Other workers responsible for the distribution and control of utilities include line installers and repairers, and power plant operators, distributors, and dispatchers.

Sources of Additional Information

Information about job opportunities may be obtained from local utilities and offices of state employment services and from

➤ International Brotherhood of Electrical Workers, 1125 15th St. NW, Washington, DC 20005. Internet: http://www.ibew.org

Postal Service Workers

(O*NET 43-5051.00, 43-5052.00, and 43-5053.00)

Significant Points

- Employment of Postal Service workers is expected to experience little or no change overall because of greater efficiencies in the processing and sorting of mail.
- Keen competition is expected as the number of qualified applicants usually exceeds the number of job openings.
- Qualification is based on an examination.
- Applicants customarily wait 1 to 2 years or more after passing the examination before being hired.

Nature of the Work

Each week, the U.S. Postal Service delivers billions of pieces of mail, including letters, bills, advertisements, and packages through heat, snow, or rain. To do this in an efficient and timely manner, the Postal Service employs about 615,000 individuals who process, sort, and deliver mail and packages as well as provide customer services and supplies in post offices. Most Postal Service workers are clerks, mail carriers, or mail sorters, processors, and processing machine operators. Postal clerks wait on customers at post offices, whereas mail sorters, processors, and processing machine operators sort incoming and outgoing mail at post offices and mail processing centers. Mail carriers deliver mail to urban and rural residences and businesses throughout the United States.

Postal Service clerks, also known as *window clerks,* sell stamps, money orders, postal stationery, and mailing envelopes and boxes in post offices throughout the country. They also weigh packages to determine postage and check that packages are in satisfactory condition for mailing. These clerks register, certify, and insure mail and answer questions about postage rates, post office boxes, mailing restrictions, and other postal matters. Window clerks also help customers file claims for damaged packages.

Postal Service mail sorters, processors, and processing machine operators prepare incoming and outgoing mail for distribution at post offices and at mail processing centers. These workers are commonly referred to as mail handlers, distribution clerks, mail processors, or mail processing clerks. They load and unload postal trucks and move mail around a mail processing center with forklifts, small electric tractors, or hand-pushed carts. They also load and operate mail processing, sorting, and canceling machinery.

Postal Service mail carriers deliver mail, once it has been processed and sorted, to residences and businesses in cities, towns, and rural areas. Although carriers are classified by their type of route—either city or rural—duties of city and rural carriers are similar. Most travel established routes, delivering and collecting mail. Mail carriers start work at the post office early in the morning, when they arrange the mail in delivery sequence. Automated equipment has reduced the time that carriers need to sort the mail, causing them to spend more of their time delivering it.

Postal Service workers examine addresses to ensure that mail gets delivered to the correct location.

Mail carriers cover their routes on foot, by vehicle, or a combination of both. On foot, they carry a heavy load of mail in a satchel or push it on a cart. In most urban and rural areas, they use a car or small truck. Although the Postal Service provides vehicles to city carriers, most rural carriers must use their own automobiles for whose use they are reimbursed. Deliveries are made house-to-house, to roadside mailboxes, and to large buildings such as offices or apartments, which generally have all of their tenants' mailboxes in one location.

Besides delivering and collecting mail, carriers collect money for postage-due and COD (cash-on-delivery) fees and obtain signed receipts for registered, certified, and insured mail. If a customer is not home, the carrier leaves a notice that tells where special mail is being held. After completing their routes, carriers return to the post office with mail gathered from homes, businesses, and sometimes street collection boxes, and turn in the mail, receipts, and money collected during the day.

Some city carriers may have specialized duties such as delivering only parcels or picking up mail from mail collection boxes. In contrast to city carriers, rural carriers provide a wider range of postal services, in addition to delivering and picking up mail. For example, rural carriers may sell stamps and money orders and register, certify, and insure parcels and letters. All carriers, however, must be able to answer customers' questions about postal regulations and services and provide change-of-address cards and other postal forms when requested.

Work environment. Window clerks usually work in the public portion of post offices. They have a variety of duties and frequent contact with the public, but they rarely work at night. However, they may have to deal with upset customers, stand for long periods, and be held accountable for an assigned stock of stamps and funds. Depending on the size of the post office in which they work, they also may be required to sort mail.

Despite the use of automated equipment, the work of mail sorters, processors, and processing machine operators can be physically demanding. Workers may have to move heavy sacks of mail around a mail processing center. These workers usually are on their feet, reaching for sacks and trays of mail or placing packages and bundles into sacks and trays. Processing mail can be tiring and tedious. Many sorters, processors, and machine operators work at night or on weekends, because most large post offices process mail around the clock, and the largest volume of mail is sorted during the evening and night shifts. Workers can experience stress as they process mail under tight production deadlines and quotas.

Most carriers begin work early in the morning—those with routes in a business district can start as early as 4 a.m. Overtime hours are frequently required for urban carriers. Carriers spend most of their time outdoors, delivering mail in all kinds of weather. Though carriers face many natural hazards, such as extreme temperatures, wet and icy roads and sidewalks, and even dog bites, serious injuries are often due to the nature of the work, which requires repetitive movements, as well as constant lifting and bending. These types of repetitive injuries occur as various kinds of injuries to joints and muscles, as well as carpal tunnel syndrome.

Training, Other Qualifications, and Advancement

All applicants for Postal Service jobs are required to take a postal service examination. After passing the exam, it may take 1 to 2 years or longer before being hired as the number of applicants is generally much greater than the number of jobs that open up.

Education and training. There are no specific education requirements to become a Postal Service worker; however, all applicants must have a good command of the English language. Upon being hired, new Postal Service workers are trained on the job by experienced workers. Many post offices offer classroom instruction on safety and defensive driving. Workers receive additional instruction when new equipment or procedures are introduced. In these cases, workers usually are trained by another postal employee or a training specialist.

Other qualifications. Postal Service workers must be at least 18 years old. They must be U.S. citizens or have been granted permanent resident-alien status in the United States, and males must have registered with the Selective Service upon reaching age 18.

All applicants must pass a written examination that measures speed and accuracy at checking names and numbers and the ability to memorize mail distribution procedures. Jobseekers should contact the post office or mail processing center where they wish to work to determine when an exam will be given. Applicants' names are listed in order of their examination scores. Five points are added to the score of an honorably discharged veteran and 10 points are added to the score of a veteran who was wounded in combat or is disabled. When a vacancy occurs, the appointing officer chooses one of the top three applicants; the rest of the names remain on the list to be considered for future openings until their eligibility expires—usually 2 years after the examination date.

When accepted, applicants must pass a physical examination and drug test, and may be asked to show that they can lift and handle mail sacks weighing 70 pounds. Applicants for mail carrier positions must have a driver's license and a good driving record, and must receive a passing grade on a road test.

Postal clerks and mail carriers should be courteous and tactful when dealing with the public, especially when answering questions or receiving complaints. A good memory and the ability to read rapidly and accurately are important. Good interpersonal skills are important, particularly for mail clerks and mail carriers who deal closely with the public.

Advancement. Postal Service workers often begin on a part-time, flexible basis and become regular or full time in order of seniority, as vacancies occur. Full-time workers may bid for preferred assignments, such as the day shift or a high-level nonsupervisory position. Carriers can look forward to obtaining preferred routes as their seniority increases. Postal Service workers can advance to supervisory positions on a competitive basis.

Employment

The U.S. Postal Service employed 80,000 clerks; 338,000 mail carriers; and 198,000 mail sorters, processors, and processing machine operators in 2006. Most of them worked full time. Most postal clerks provide window service at post office branches. Many mail sorters, processors, and processing machine operators sort mail at major metropolitan post offices; others work at mail processing centers. The majority of mail carriers work in cities and suburbs, while the rest work in rural areas.

Postal Service workers are classified as casual, part-time flexible, part-time regular, or full time. Casuals are hired for 90 days at a time to help process and deliver mail during peak mailing or vacation periods. Part-time flexible workers do not have a regular work schedule or weekly guarantee of hours but are called as the need arises. Part-time regulars have a set work schedule of fewer than 40 hours per week, often replacing regular full-time workers on their scheduled day off. Full-time postal employees work a 40-hour week over a five-day period.

Job Outlook

Employment of Postal Service workers is expected to experience little or no change through 2016. Still, many jobs will become available for mail clerks and carriers, which are expected to add workers, and because of the need to replace those who retire or leave the occupation.

Employment change. The stable employment overall of Postal Service mail carriers and Postal Service clerks will be offset by declines in Postal Service mail sorters, processors, and processing machine operators, which will cause overall employment of Postal Service workers to decline 2 percent over the 2006–2016 period. An increasing population, the greater use of third class, or bulk, mail by businesses, and more electronic shopping will generate more business for the Postal Service. However, demand will be moderated by the fact that people are sending out fewer pieces of first class mail because of the growing use of electronic communication.

These changes will affect Postal Service occupations in different ways. Efforts by the Postal Service to provide better service and meet the needs of a growing population will increase the demand for Postal Service clerks. However, the declining use of first class mail as the use of electronic communication grows will hold growth in this occupation to a minimum.

Employment of mail sorters, processors, and processing machine operators is expected to decline moderately because of the increasing use of automated materials handling equipment and optical character readers, barcode sorters, and other automated sorting equipment. In addition, companies that mail in bulk have an economic incentive to presort the mail before it arrives at the Post Office to qualify for a reduction in the price.

Employment of mail carriers is expected to grow, but only about 1 percent through 2016. As the population continues to rise, the need for mail carriers will grow. In addition, businesses are using the mail more to deliver advertising, which is making up for the reduced use of first class mail. Also, the Postal Service is moving toward more centralized mail delivery, such as the use of cluster mailboxes, to cut down on the number of door-to-door deliveries. The best employment opportunities for mail carriers are expected to be in less urbanized areas as the number of addresses to which mail must be delivered continues to grow, especially in fast growing rural areas. However, increased use of the "delivery point sequencing" system, which allows machines to sort mail directly by the order of delivery, should reduce the amount of time that carriers spend sorting their mail, allowing them to spend more time on the streets delivering mail. This will mitigate the demand for more mail carriers.

Job prospects. Those seeking jobs as Postal Service workers can expect to encounter keen competition. The number of applicants usually exceeds the number of job openings because of the occupation's low entry requirements and attractive wages and benefits.

The role of the Postal Service as a government-approved monopoly continues to be a topic of debate. However, in 2003 the Presidential Commission on Postal Services and in 2006 the Congress both rejected the idea of privatizing the United States Postal Service. Employment and schedules in the Postal Service fluctuate with the demand for its services. When mail volume is high, full-time employees work overtime, part-time workers get additional hours, and casual workers may be hired. When mail volume is low, overtime is curtailed, part-timers work fewer hours, and casual workers are discharged.

Earnings

Median annual earnings of Postal Service mail carriers were $44,350 in May 2006. The middle 50 percent earned between $40,290 and $48,400. The lowest 10 percent had earnings of less than $34,810, while the top 10 percent earned more than $50,830. Rural mail carriers are reimbursed for mileage put on their own vehicles while delivering mail.

Median annual earnings of Postal Service clerks were $44,800 in 2006. The middle 50 percent earned between $41,720 and $47,890.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Postal service workers	43-5050	615,000	603,000	-12,000	-2
Postal service clerks	43-5051	80,000	80,000	900	1
Postal service mail carriers	43-5052	338,000	341,000	3,500	1
Postal service mail sorters, processors, and processing machine operators	43-5053	198,000	181,000	-17,000	-8

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

The lowest 10 percent had earnings of less than $38,980, while the top 10 percent earned more than $49,750.

Median annual earnings of Postal Service mail sorters, processors, and processing machine operators were $43,900 in 2006. The middle 50 percent earned between $40,350 and $47,440. The lowest 10 percent had earnings of less than $25,770, while the top 10 percent earned more than $49,570.

Postal Service workers enjoy a variety of employer-provided benefits similar to those enjoyed by federal government workers. The American Postal Workers Union, the National Association of Letter Carriers, the National Postal Mail Handlers Union, and the National Rural Letter Carriers Association together represent most of these workers.

Related Occupations

Other occupations with duties similar to those of Postal Service clerks include cashiers; counter and rental clerks; file clerks; and shipping, receiving, and traffic clerks. Others with duties related to those of Postal Service mail carriers include couriers and messengers, and truck drivers and driver/sales workers. Occupations whose duties are related to those of Postal Service mail sorters, processors, and processing machine operators include inspectors, testers, sorters, samplers, and weighers, and material moving occupations.

Sources of Additional Information

Local post offices and state employment service offices can supply details about entrance examinations and specific employment opportunities for Postal Service workers.

Production, Planning, and Expediting Clerks

(O*NET 43-5061.00)

Significant Points

- Production, planning, and expediting clerks work closely with supervisors who must approve production and work schedules.
- Many production, planning, and expediting jobs are at the entry level and do not require more than a high school diploma.
- Manufacturing firms and wholesale and retail trade establishments are the primary employers.
- Slower-than-average employment growth is projected.

Nature of the Work

Production, planning, and expediting clerks coordinate and facilitate the flow of information, work, and materials within or among offices. Most of their work is done according to production, work, or shipment schedules that are developed by supervisors who determine work progress and completion dates. Clerks compile reports on the progress of work and on production problems, and also may set worker schedules, estimate costs, schedule the shipment of parts, keep an inventory of materials, inspect and assemble materials, and write special orders for services and merchandise. In addition, they may route and deliver parts to ensure that production quotas are met and that merchandise is delivered on the date promised.

Production and planning clerks compile records and reports on various aspects of production, such as materials and parts used, products produced, machine and instrument readings, and frequency of defects. These workers prepare work tickets or other production guides and distribute them to other workers. Production and planning clerks coordinate, schedule, monitor, and chart production and its progress, either manually or electronically. They also gather information from customers' orders or other specifications and use the information to prepare a detailed production sheet that serves as a guide in assembling or manufacturing the product.

Production, planning, and expediting clerks monitor reports to ensure a steady flow of materials.

Expediting clerks contact vendors and shippers to ensure that merchandise, supplies, and equipment are forwarded on the specified shipping dates. They communicate with transportation companies to prevent delays in transit, and they may arrange for the distribution of materials upon their arrival. They may even visit work areas of vendors and shippers to check the status of orders. Expediting clerks locate materials and distribute them to specified production areas. They may inspect products for quality and quantity to ensure their adherence to specifications. They also keep a chronological list of due dates and may move work that does not meet the production schedule to the top of the list.

Work environment. Although their offices or desks may be near a production plant or warehouse, production, planning, and expediting clerks generally work in clean and environmentally-controlled conditions. They spend most of their day either on the phone or on the computer while working closely with supervisors who must approve production and work schedules. The typical workweek is Monday through Friday.

Training, Other Qualifications, and Advancement

Training requirements for production, planning, and expediting clerks are limited. Usually a high school diploma is sufficient, although computer skills also are essential.

Education and training. Many production, planning, and expediting jobs are at the entry level and do not require more than a high school diploma. However, applicants who have taken business courses or have specific job-related experience may be preferred. Production, planning, and expediting clerks usually learn the job by doing routine tasks under close supervision. They learn how to count and mark stock, and then they start keeping records and taking inventory. Production, planning, and expediting clerks must learn both how their company operates and the company's priorities before they can begin to write production and work schedules efficiently.

Other qualifications. Employers prefer to hire those familiar with computers and other electronic office and business equipment.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Production, planning, and expediting clerks	43-5061	293,000	305,000	12,000	4

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Because communication with other people is an integral part of some jobs in the occupation, good oral and written communication skills are essential. Typing, filing, recordkeeping, and other clerical skills also are important. Strength, stamina, good eyesight, and an ability to work at repetitive tasks, sometimes under pressure, are other important characteristics that employers look for in prospective workers.

Advancement. Advancement opportunities for production, planning, and expediting clerks vary with the place of employment, but often require additional education.

Employment

Clerks engaged in production, planning, and expediting activities work in almost every sector of the economy, overseeing inventory control and assuring that schedules and deadlines are met. In 2006, production, planning, and expediting clerks held 293,000 jobs. Jobs in manufacturing made up 41 percent. Another 15 percent were in wholesale and retail trade establishments. Others worked in advertising firms and for telecommunications companies, among other places.

Job Outlook

Employment of production, planning, and expediting clerks is expected to increase more slowly than average.

Employment change. The number of production, planning, and expediting clerks is expected to grow by 4 percent from 2016 to 2016, slower than the average for all occupations. As a greater emphasis is placed on the timely delivery of goods and services throughout the economy, there will be increasing need for production, planning, and expediting clerks at all levels of the supply chain. However, the expected employment decline in manufacturing will limit the overall growth of this occupation. The work of production, planning, and expediting clerks is less likely to be automated than the work of many other administrative support occupations.

Job prospects. In addition to openings due to employment growth, job openings will arise from the need to replace production, planning, and expediting clerks who leave the labor force or transfer to other occupations. Opportunities will be better in fields that are experiencing faster growth, such as wholesale trade and warehousing.

Earnings

Median annual earnings of production, planning, and expediting clerks in May 2006 were $38,620. The middle 50 percent earned between $29,560 and $48,900. The lowest 10 percent earned less than $23,470, and the highest 10 percent earned more than $59,080.

These workers usually receive the same benefits as most other workers.

Related Occupations

Other workers who coordinate the flow of information to assist the production process include cargo and freight agents; shipping, receiving, and traffic clerks; stock clerks and order fillers; and weighers, measurers, checkers, and samplers, recordkeeping.

Sources of Additional Information

Information about job opportunities may be obtained from local employers and from local offices of the state employment service.

Shipping, Receiving, and Traffic Clerks

(O*NET 43-5071.00)

Significant Points

- Shipping, receiving, and traffic clerks generally are entry-level workers who need no more than a high school diploma.
- Slower-than-average employment growth is expected as a result of increasing automation; many additional job openings will result from the need to replace workers who leave the occupation.
- Because of increasing automation, employers prefer to hire those familiar with computers and other electronic office and business equipment.

Nature of the Work

Shipping, receiving, and traffic clerks keep records of all goods shipped and received. Their duties depend on the size of the establishment they work for and the level of automation used. Larger companies typically are better able to finance the purchase of computers, scanners, and other equipment to handle some or all of a clerk's responsibilities. In smaller companies, a clerk maintains records, prepares shipments, sorts packages, and accepts deliveries. In both environments, shipping, receiving, and traffic clerks may lift cartons of various sizes.

Shipping, receiving, and traffic clerks maintain records of all goods shipped and received.

Shipping clerks keep records of all outgoing shipments. They prepare shipping documents and mailing labels and make sure that orders have been filled correctly. Also, they record items taken from inventory and note when orders were filled. Sometimes they fill the order themselves, taking merchandise from the stockroom, noting when inventories run low, and wrapping or packing the goods in shipping containers. They also address and label packages, look up and compute freight or postal rates, and record the weight and cost of each shipment. In addition, shipping clerks may prepare invoices and furnish information about shipments to other parts of the company, such as the accounting department. Once a shipment is checked and ready to go, shipping clerks may sort and move the goods from the warehouse—sometimes by forklift—to the shipping dock or truck terminal and direct their loading.

Receiving clerks perform tasks similar to those of shipping clerks. They determine whether orders have been filled correctly by verifying incoming shipments against the original order and the accompanying bill of lading or invoice. They make a record of the shipment and the condition of its contents. In many firms, receiving clerks either use hand-held scanners to record barcodes on incoming products or manually enter the information into a computer. These data then can be transferred to the appropriate departments. An increasing number of clerks at larger, more automated companies use radio-frequency identification (RFID) scanners, which store and remotely retrieve data using tags or transponders. Clerks then check the shipment for any discrepancies in quantity, price, and discounts. Receiving clerks may route or move shipments to the proper department, warehouse section, or stockroom. They also may arrange for adjustments with shippers if merchandise is lost or damaged. Receiving clerks in small businesses may perform some duties similar to those of stock clerks. In larger establishments, receiving clerks may control all receiving platform operations, such as scheduling of trucks, recording of shipments, and handling of damaged goods.

Traffic clerks maintain records on the destination, weight, and charges on all incoming and outgoing freight. They verify rate charges by comparing the classification of materials with rate charts. In many companies, this work may be automated. Information either is scanned or is entered by hand into a computer for use by the accounting department or other departments within the company. Traffic clerks also keep a file of claims for overcharges and for damage to goods in transit.

Work environment. Most jobs for shipping, receiving, and traffic clerks involve frequent standing, bending, walking, and stretching. Lifting and carrying smaller items also may be involved, especially at small companies with less automation. Although automated devices have lessened the physical demands of this occupation, their use remains somewhat limited. The work still can be strenuous, even though mechanical material handling equipment, such as computerized conveyor systems, is used to move heavy items at a rapid pace.

The typical workweek is Monday through Friday; however, evening and weekend hours are common in some jobs and may be required when large shipments are involved or during major holiday periods.

Training, Other Qualifications, and Advancement

Shipping, receiving, and traffic clerks generally are entry-level workers who need no more than a high school diploma. Because of increasing automation, however, employers prefer to hire those familiar with computers and other electronic office and business equipment.

Education and training. Shipping, receiving, and traffic clerks usually learn the job by doing routine tasks under close supervision. They first learn how to count and mark stock, and then they start keeping records and taking inventory.

Training in the use of automated equipment usually is done informally, on the job. As these occupations become more automated, however, workers may need longer periods of training to master the use of the equipment and technology. Because of increasing automation, employers prefer to hire those familiar with computers and other electronic office and business equipment.

Other qualifications. Strength, stamina, good eyesight, and an ability to work at repetitive tasks, sometimes under pressure, are important characteristics. Shipping, receiving, and traffic clerks who handle jewelry, liquor, or drugs may need to be bonded.

Advancement. Shipping, receiving, and traffic clerks are commonly promoted to head clerk, and those with a broad understanding of shipping and receiving may sometimes become purchasing agents or enter a related field, such as industrial traffic management. The Warehousing Education and Research Council offers online courses in distribution and logistics, which may enhance a clerk's potential for advancement.

Employment

Shipping, receiving, and traffic clerks held about 769,000 jobs in 2006. About 71 percent were employed in manufacturing or by wholesale and retail establishments. Although jobs for shipping, receiving, and traffic clerks are found throughout the country, most clerks work in urban areas, where shipping depots in factories and wholesale establishments usually are located.

Job Outlook

Slower-than-average employment growth is expected as a result of increasing automation. However, many additional job openings will result from the need to replace shipping, receiving, and traffic clerks who leave the occupation.

Employment change. Employment of shipping, receiving, and traffic clerks is expected to grow 4 percent between 2006 and 2016, more slowly than the average for all occupations. Job growth will continue to be limited by automation as all but the smallest firms move to reduce labor costs by using computers and high-technology scanners to store and retrieve shipping and receiving records.

Methods of handling materials have changed significantly in recent years. Large warehouses are increasingly becoming automated, with equipment such as automatic sorting systems, robots, computer-directed trucks, and programmed data storage and retrieval systems. This automation, coupled with the growing use of hand-held barcode and RFID scanners in shipping and receiving departments, has increased the productivity of shipping, receiving, and traffic clerks.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Shipping, receiving, and traffic clerks	43-5071	769,000	797,000	28,000	4

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Job prospects. In addition to some openings from employment growth, many job openings will occur because of the need to replace shipping, receiving, and traffic clerks who leave the occupation. This is a large entry-level occupation, and many vacancies are created each year as workers leave as part of their normal career progression. Because smaller warehouses, distribution centers, and trucking terminals will continue to rely on sorting and moving goods by hand, job opportunities at those facilities may be better than at larger, more automated centers.

Earnings

Median annual earnings of wage-and-salary shipping, receiving, and traffic clerks in May 2006 were $26,070. The middle 50 percent earned between $20,670 and $32,840. The lowest 10 percent earned less than $16,970, and the highest 10 percent earned more than $40,590.

These workers usually receive the same benefits as most other workers. If uniforms are required, employers generally provide them or offer an allowance to purchase them.

Related Occupations

Shipping, receiving, and traffic clerks record, check, and often store materials that a company receives. They also process and pack goods for shipment. Other workers who perform similar duties are stock clerks and order fillers; production, planning, and expediting clerks; cargo and freight agents; and Postal Service workers.

Sources of Additional Information

For information about career opportunities and online courses in distribution, warehousing, and storage systems, contact

➤ Warehousing Education and Research Council, 1100 Jorie Blvd., Suite 170, Oak Brook, IL 60523. Internet: http://www.werc.org

Additional information about job opportunities may be obtained from local employers and local offices of the state employment service.

Stock Clerks and Order Fillers

(O*NET 43-5081.00, 43-5081.01, 43-5081.02, 43-5081.03, and 43-5081.04)

Significant Points

- Stock clerks and order fillers generally are entry-level workers who learn through short-term on-the-job training.
- Despite the projected decline in employment due to the use of automation in factories, warehouses, and stores, numerous job openings are expected due to replacement needs.
- Because of automation, applicants who are familiar with computers and other electronic office and business equipment will have the best job prospects.

Nature of the Work

Stock clerks and order fillers receive, unpack, check, store, track merchandise or materials, and pick up customer orders. They keep records of items entering or leaving the stockroom and inspect damaged or spoiled goods. Stock clerks and order fillers sort, organize, and mark items with identifying codes, such as price, stock, or inventory control codes, so that inventories can be located quickly and easily. They also may be required to lift cartons of various sizes. In larger establishments, where they may be responsible for only one task, they may be called *stock-control clerks, merchandise distributors*, or *property custodians*. In smaller firms, they also may perform tasks such as packing and mailing items, usually handled by shipping and receiving clerks. (A separate statement on shipping, receiving, and traffic clerks appears elsewhere in the *Handbook*.)

Numerous job openings for stock clerks and order fillers are expected due to replacement needs.

In many firms, stock clerks and order fillers use hand-held scanners connected to computers to keep inventories up to date. In retail stores, stock clerks bring merchandise to the sales floor and stock shelves and racks. In stockrooms and warehouses, stock clerks store materials in bins, on floors, or on shelves. Instead of putting the merchandise on the sales floor or on shelves, order fillers take customers' orders and either hold the merchandise until the customers can pick it up or send it to them.

Work environment. Working conditions vary considerably by employment setting. Most jobs for stock clerks and order fillers involve frequent standing, bending, walking, and stretching. Some lifting and carrying of smaller items also may be involved. Although automated devices have lessened the physical demands of this occupation, their use remains somewhat limited. Even though mechanical material handling equipment is employed to move heavy items, the work still can be strenuous.

Evening and weekend hours are common and may be required when large shipments are involved or when inventory is taken.

Training, Other Qualifications, and Advancement

Stock clerk and order fillers generally are entry-level workers who do not need more than a high school diploma or GED. Short-term on-the-job training is usually adequate for this occupation.

Education and training. Stock clerks and order fillers usually learn the job by doing routine tasks under close supervision. They learn how to count and mark stock and later to keep records and take inventory. Training in the use of automated equipment usually is done informally, on the job. As this occupation becomes more automated, however, workers may need longer periods of training to master the use of the equipment.

Other qualifications. Strength, stamina, good eyesight, and an ability to work at repetitive tasks, sometimes under pressure, are important characteristics. Stock clerks and order fillers who handle

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Stock clerks and order fillers	43-5081	1,705,000	1,574,000	-131,000	-8

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

jewelry, liquor, or drugs may be bonded. Employers prefer to hire those familiar with computers and other electronic office and business equipment. Typing, filing, recordkeeping, and other clerical skills also are important in some jobs.

Advancement. Advancement opportunities for stock clerks and order fillers vary with the place of employment. With additional training, some workers advance to jobs as warehouse leads or supervisors, purchasing agents or other jobs within the facility such as inventory control.

Employment

Stock clerks and order fillers held about 1.7 million jobs in 2006. About 78 percent work in wholesale and retail trade. The greatest numbers are found in department stores, followed by grocery stores. Jobs for stock clerks are found in all parts of the country, but most work in large urban areas that have many large suburban shopping centers, warehouses, and factories.

Job Outlook

Employment of stock clerks and order fillers is projected to decline as a result of automation in factories, warehouses, and stores. However, numerous job openings will occur each year due to the need to replace workers who leave the occupation, which is a characteristic of very large occupations with limited training requirements. Because of automation, applicants who are familiar with computers and other electronic office and business equipment will have the best job prospects.

Employment change. Employment of stock clerks and order fillers is expected to decline moderately by 8 percent over the 2006 to 2016 period. The growing use of computers for inventory control and the installation of new, automated equipment are expected to inhibit growth in demand for stock clerks and order fillers, especially in manufacturing and wholesale trade industries, where operations are most easily automated. In addition to using computerized inventory control systems to sort goods more efficiently, firms in these industries are relying more on sophisticated conveyor belts and automatic high stackers to store and retrieve goods. Also, expanded use of battery-powered, driverless, automatically guided vehicles can be expected.

The increasing role of large retail outlets and warehouses, as well as catalog, mail, telephone, and Internet shopping services, however, should bolster employment of stock clerks and order fillers in these sectors of retail trade.

Job prospects. Despite declining employment, numerous job openings will occur each year due to replacement needs. Because of automation, applicants who are familiar with computers and other electronic office and business equipment will have the best job prospects. Since much of the work of stock clerks and order fillers who work in grocery, general merchandise, apparel, accessory, and department stores is done manually and is difficult to automate, workers in these industries should be less affected by automation than workers in manufacturing.

Earnings

In May 2006, median annual wage-and-salary earnings of stock clerks and order fillers in were $20,440. The middle 50 percent earned between $16,670 and $26,440. The lowest 10 percent earned less than $14,490, and the highest 10 percent earned more than $34,200.

These workers usually receive the same benefits as most other workers. If uniforms are required, employers generally provide them or offer an allowance to purchase them.

Related Occupations

Workers who also handle, move, organize, store, and keep records of materials include shipping, receiving, and traffic clerks; production, planning, and expediting clerks; cargo and freight agents; and procurement clerks.

Sources of Additional Information

State employment service offices can provide information about job openings for stock clerks and order fillers.

Weighers, Measurers, Checkers, and Samplers, Recordkeeping

(O*NET 43-5111.00)

Significant Points

- Many jobs are at the entry level and do not require more than a high school diploma.
- Employment of weighers, measurers, checkers, and samplers is expected to decline because of the increased use of automated equipment that performs the function of these workers.

Information obtained by these workers needs to be accurate.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Weighers, measurers, checkers, and samplers, recordkeeping.....	43-5111	79,000	70,000	-9,000	-11

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Nature of the Work

Weighers, measurers, checkers, and samplers weigh, measure, and check materials, supplies, and equipment in order to keep accurate records. Most of their duties are clerical. Using either manual or automated data-processing systems, they verify the quantity, quality, and overall value of the items they are responsible for and check the condition of items purchased, sold, or produced against records, bills, invoices, or receipts. They check the items to ensure the accuracy of the recorded data. They prepare reports on warehouse inventory levels and on the use of parts. Weighers, measurers, checkers, and samplers also check for any defects in the items and record the severity of the defects they find.

These workers use weight scales, counting devices, tally sheets, and calculators to get and record information about products. They usually move objects to and from the scales with a handtruck or forklift. They issue receipts for products when needed or requested.

Work environment. Weighers, measurers, checkers, and samplers work in a wide variety of businesses, institutions, and industries. Some work in warehouses, stockrooms, or shipping and receiving rooms that may not be temperature controlled. Others may spend time in cold storage rooms or on loading platforms that are exposed to the weather.

Training, Other Qualifications, and Advancement

Most jobs do not require more than a high school diploma. However preference is given to applicants familiar with computers.

Education and training. Many weigher, measurer, checker, and sampler jobs are entry level and do not require more than a high school diploma or a GED, its equivalent.

Other qualifications. Employers prefer to hire individuals familiar with computers. Applicants who have specific job-related experience may also be preferred. Typing, filing, recordkeeping, and other clerical skills are important.

Advancement. Advancement opportunities vary with the place of employment.

Employment

Weighers, measurers, checkers, and samplers held about 79,000 jobs in 2006. Their employment is spread across many industries. Retail trade accounted for 14 percent of those jobs, manufacturing accounted for about 22 percent, and wholesale trade employed another 18 percent.

Job Outlook

Despite rapid declines in overall employment due primarily to automation, job opportunities should arise from the need to replace workers who leave the labor force or transfer to other occupations.

Employment change. Employment of weighers, measurers, checkers, and samplers is expected to decline rapidly by 11 percent from 2006 through 2016 because of the increased use of automated equipment that now performs the function of these workers.

Job prospects. Despite employment declines, job opportunities should arise from the need to replace workers who leave the labor force or transfer to other occupations.

Earnings

Median wage-and-salary earnings of weighers, measurers, checkers, and samplers in May 2006 were $12.20. The middle 50 percent earned between $9.66 and $15.83. The lowest 10 percent earned less than $8.03, and the highest 10 percent earned more than $19.78.

These workers usually receive the same benefits as most other workers. If uniforms are required, employers generally provide them or offer an allowance to purchase them.

Related Occupations

Other workers who determine and document characteristics of materials or equipment include cargo and freight agents; production, planning, and expediting clerks; shipping, receiving, and traffic clerks; stock clerks and order fillers; and procurement clerks.

Sources of Additional Information

Information about job opportunities may be obtained from local employers and local offices of the state employment service.

Other Office and Administrative Support Occupations

Communications Equipment Operators

(O*NET 43-2011.00, 43-2021.00, and 43-2099.99)

Significant Points

- Switchboard operators hold 7 out of 8 jobs.
- Workers train on the job.
- Employment is expected to decline rapidly, but job prospects should be good.

Nature of the Work

Most communications equipment operators work as *switchboard operators* for a wide variety of businesses, such as hospitals, hotels, telephone call centers, and government agencies. Switchboard operators use private branch exchange (PBX) or voice over Internet protocol (VoIP) systems to relay incoming, outgoing, and interoffice calls. They also may frequently handle other clerical duties, such as supplying information, taking messages, and greeting and announcing visitors.

Technological improvements have automated many of the tasks handled by switchboard operators. New systems automatically connect outside calls to the correct destination or to automated directo-

Switchboard operators direct calls within a business.

ries, and voice-mail systems take messages without the assistance of an operator. Despite the increasing automation of telephone call routing, however, some callers still require the assistance of an operator. Many callers have general requests, but do not know the person or department with whom they wish to speak. Switchboard operators use their knowledge of the duties and responsibilities of different departments to correctly direct calls.

Telephone operators assist customers in making telephone calls. Some telephone operators are *central office operators* who help customers to complete local and long-distance calls, usually under special circumstances. Other telephone operators are *directory assistance operators* who provide customers with information such as telephone numbers or area codes.

When callers dial "0," they usually reach a central office operator. Most of these operators work for telephone companies, and many of their responsibilities have been automated. For example, callers can make international, collect, and credit card calls without the assistance of a central office operator. Even so, callers still need a central office operator for a limited number of tasks, including placing person-to-person calls or interrupting busy lines if an emergency warrants the disruption. When natural disasters such as storms or earthquakes occur, central office operators provide callers with emergency phone contacts. They also assist callers who are having difficulty with automated phone systems. For example, an operator monitoring an automated system that aids a caller in placing collect calls may intervene if a caller needs assistance with the system.

When callers dial information, they usually reach a directory assistance operator who provides callers with information such as telephone numbers, addresses, and business listings. Most directory assistance operators work for telephone companies; increasingly, they also work for companies that provide business services. Automated systems now handle many of the functions once performed by directory assistance operators. The systems prompt callers for a listing and may even connect the call after providing the telephone number. Directory assistance operators, however, are still needed to monitor many of the calls received by automated systems. The operators listen to recordings of the customer's request and then key information into electronic directories to access the correct telephone numbers. Directory assistance operators also provide personal assistance to customers having difficulty using the automated system.

Other communications equipment operators include workers who operate satellite communications equipment, telegraph equipment, and a wide variety of other communications equipment.

Work environment. Most communications equipment operators work in pleasant, well-lighted surroundings. Because communications equipment operators spend much time seated at keyboards and video monitors, employers often provide workstations designed to decrease glare and other physical discomforts. Such improvements reduce the incidence of eyestrain, back discomfort, and injury due to repetitive motion.

An operator's work may be quite repetitive and the pace hectic during peak calling periods. To maintain operators' efficiency, supervisors at telephone companies often monitor their performance, including the amount of time they spend on each call. The rapid pace of the job—handling up to 1000 calls in a day—and frequent monitoring may cause stress.

Switchboard operators generally work the same hours as other clerical employees at their company. In most organizations, full-time operators work regular business hours over a five-day workweek. Work schedules are more irregular in hotels, hospitals, and other organizations that require round-the-clock operator services. In these companies, switchboard operators may work in the evenings and on holidays and weekends.

Telephone operators must be accessible to customers 24 hours a day; therefore, they work a variety of shifts. Some operators work split shifts, coming on duty during peak calling periods in the late morning and early evening and going off duty during the intervening hours. Telephone companies normally assign shifts by seniority, allowing the most experienced operators the first choice of schedules. As a result, entry-level operators may have less desirable schedules, including late evening, split-shift, and weekend work. However, companies may allow operators the flexibility to swap shifts with other operators. Telephone company operators may work overtime.

Approximately 1 in 5 communications equipment operators work part time. Because of the irregular nature of telephone operator schedules, many employers seek part-time workers for those shifts that are difficult to fill.

Training, Other Qualifications, and Advancement

Training for communications equipment operators is normally a mix of on-the-job training and classes lasting a few hours to a few weeks.

Education and training. Communications equipment operators generally receive their training on the job, so a high school diploma is usually sufficient for most operators. Switchboard operators usually receive informal on-the-job training, lasting only a few days or weeks. Because they are often the first contact with the public or client, switchboard operators often receive some training in customer service. Training may vary by place of employment—a switchboard operator in a hospital would learn how to handle different emergencies, for example. Since switchboard operators' duties may include clerical work, training in basic computer and writing skills may also be required.

Entry-level telephone operators at telecommunications companies may receive both classroom and on-the-job instruction that can last a couple of weeks. These operators may be paired with experienced personnel who provide hands-on instruction.

New employees in both specialties are trained in the operation of their equipment and in procedures designed to maximize efficiency. They are familiarized with company policies, and instructors monitor both the time and quality of trainees' responses to customer requests. Supervisors may continue to monitor new employees closely after they complete their initial training session.

Other qualifications. Applicants should have clear speech, good hearing, and strong reading, spelling, and numerical skills. Com-

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Communications equipment operators	43-2000	209,000	183,000	-25,000	-12
Switchboard operators, including answering service	43-2011	177,000	163,000	-15,000	-8
Telephone operators	43-2021	27,000	16,000	-11,000	-40
Communications equipment operators, all other	43-2099	4,300	4,700	300	7

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

puter literacy and typing skills also are important, and familiarity with a foreign language is helpful for some positions. Candidates for positions may be required to take an examination covering basic language, computer, data entry, and math skills. Employers emphasize customer service and seek operators who will remain courteous to customers while working quickly and handling difficult customers.

Advancement. After 1 or 2 years on the job, communications equipment operators may advance to other positions within a company. Many switchboard and telephone operators enter clerical occupations, such as customer service representative, dispatcher, and receptionist, in which their operator experience is valuable. (See the *Handbook* sections on these occupations.) Telephone operators interested in more technical work may train for positions in installing and repairing equipment. (See the sections of the *Handbook* on radio and telecommunications equipment installers and repairers, and line installers and repairers.) Promotion to supervisory positions is also possible.

Employment

Communications equipment operators held about 209,000 jobs in 2006. About 7 out of 8 worked as switchboard operators. Employment was distributed as follows:

Switchboard operators, including answering service	177,000
Telephone operators	27,000
All other communications equipment operators	4,300

Switchboard operators work in almost all industries, but they are concentrated in telephone call centers, hospitals, hotels, and the federal government. Many work as temporary employees in the employment services industry. Telephone operators are concentrated in the telecommunications industry.

Job Outlook

Employment of communications equipment operators is projected to decline rapidly. Virtually all job openings will result from the need to replace communications equipment operators who transfer to other occupations or leave the labor force, but job prospects are expected to be good.

Employment change. Employment of communications equipment operators is projected to decline rapidly by 12 percent between 2006 and 2016. Switchboard operators are projected to decline moderately by 8 percent. Telephone operators are expected to decline rapidly by 40 percent. Declining employment will be due largely to new labor-saving communications technologies, the movement of jobs to foreign countries, and consolidation of telephone operator jobs into fewer locations.

Developments in communications technologies—in particular, voice recognition systems—will continue to significantly reduce demand for communications equipment operators. Voice recognition technology allows automated telephone systems to recognize human speech. Callers speak directly to the system, which interprets the speech and then connects the call. Voice recognition systems do not require callers to input data through a telephone keypad so they are easier to use than touch-tone systems. Voice recognition systems are increasingly able to understand sophisticated vocabulary and grammatical structures; however, many companies will continue to employ operators so that those callers who do have problems can access a live employee if they desire.

The proliferation of cell phones has negatively affected employment of both telephone operators and switchboard operators. Cell phones have reduced the demand for directory assistance and collect calls, and have resulted in decreasing use of pay phones that often required operators to assist with the call. The increasing use of cell phones also have reduced demand for switchboard operators in hotels because hotel guests now use in-room phones less frequently.

Internet directory assistance services are reducing the need for directory assistance operators. With Internet access increasingly available on cell phones, the decline in demand for directory assistance services will continue.

As communications technologies have improved and the price of long-distance service has fallen, companies are finding other ways to reduce costs by consolidating operator jobs in low cost locations. Increasingly this has included the movement of telephone operator jobs to other countries with lower prevailing wage rates.

Job prospects. Despite declining employment, job prospects should be good. There are frequent job openings due to turnover. Many communications equipment operator leave the occupation each year, and some must be replaced.

Earnings

Median hourly earnings of wage-and-salary switchboard operators, including answering service, were $10.88 in May 2006. The middle 50 percent earned between $9.14 and $13.29. The lowest 10 percent earned less than $7.71, and the highest 10 percent earned more than $15.93. Median hourly earnings in the industries employing the largest numbers of switchboard operators are:

Offices of physicians	$11.40
General medical and surgical hospitals	11.07
Automobile dealers	10.04
Business support services	9.60
Telephone call centers	9.55

Median hourly earnings of wage-and-salary telephone operators in May 2006 were $16.41. The middle 50 percent earned between $10.67 and $20.59. The lowest 10 percent earned less than $8.44, and the highest 10 percent earned more than $22.44.

Some telephone operators working at telephone companies are members of the Communications Workers of America or the International Brotherhood of Electrical Workers. For these operators, union contracts govern wage rates, wage increases, and the time required to advance from one pay step to the next.

Median hourly earnings of all other wage-and-salary communications equipment operators in May 2006 were $15.23. The middle 50

percent earned between $10.04 and $19.91. The lowest 10 percent earned less than $7.91, and the highest 10 percent earned more than $24.58.

Related Occupations

Other workers who provide information to the general public include dispatchers; hotel, motel, and resort desk clerks; customer service representatives; and receptionists and information clerks.

Sources of Additional Information

For more details about employment opportunities, contact companies in the industries that employ communications equipment operators.

Computer Operators

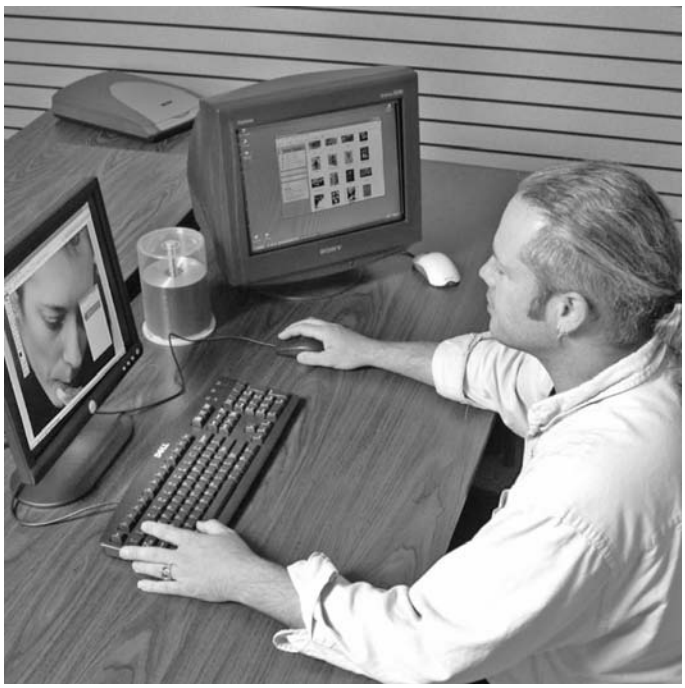
(O*NET 43-9011.00)

Significant Points

- Computer operators are projected to be among the most rapidly declining occupations over the 2006–2016 decade because advances in technology are making the duties traditionally performed by computer operators obsolete.
- Computer operators usually receive on-the-job training; the length of training varies with the job and the experience of the worker.
- Opportunities will be best for operators who have formal computer education, are familiar with a variety of operating systems, and keep up with the latest technology.

Nature of the Work

Computer operators oversee the operation of computer hardware systems, ensuring that these machines are used as efficiently and securely as possible. They may work with mainframes, minicomputers, or networks of personal computers. Computer operators must anticipate problems and take preventive action, as well as solve problems that occur during operations.



Computer operators monitor computer systems and watch for potential problems.

The duties of computer operators vary with the size of the installation, the type of equipment used, and the policies of the employer. Generally, operators control the console of either a mainframe digital computer or a group of minicomputers. Working from operating instructions prepared by programmers, users, or operations managers, computer operators set controls on the computer and on peripheral devices required to run a particular job.

Computer operators load equipment with tapes, disks, and paper, as needed. While the computer is running—which may be 24 hours a day—computer operators monitor the control console and respond to operating and computer messages. Messages indicate the individual specifications of each job being run. If an error message occurs, operators must locate and solve the problem or terminate the program. Operators also maintain logbooks or operating records that list each job run and events that occur during their shift, such as machine malfunctions. Other computer operators perform and monitor routine tasks, such as tape backup, virus checking, software upgrading, and basic maintenance. In addition, computer operators may help programmers and systems analysts test and debug new programs.

A greater number of computer operators are working on personal computers (PCs) and minicomputers, as the number and complexity of computer networks continues to grow. In many offices, factories, and other work settings, PCs and minicomputers are connected in networks, often referred to as local area networks (LANs) or multiuser systems. While users in the area operate some of these computers, many require the services of full-time operators. The tasks they perform on PCs and minicomputers are very similar to those performed on large computers and include trying to keep the computer networks secure.

As organizations continue to look for opportunities to increase productivity, many tasks formerly performed by computer operators are now being automated. New software enables computers to perform many routine tasks, formerly done by computer operators, without human interaction. Scheduling, loading, and downloading programs, mounting tapes, rerouting messages, and running periodic reports can be done without the intervention of an operator. As technology advances, the responsibilities of many computer operators are shifting to areas such as network operations, user support, and database maintenance.

Work environment. Computer operators generally work in well-lit, ventilated, comfortable rooms. Because many organizations use their computers 24 hours a day, 7 days a week, computer operators may be required to work evening or night shifts and weekends. Shift assignments usually are made based on seniority. However, increasingly automated operations will lessen the need for shift work because many companies can let the computer take over operations during less desirable working hours. In addition, telecommuting technologies, such as faxes, modems, and e-mail, and data center automation, such as automated tape libraries, enable some operators to monitor batch processes, check systems performance, and record problems for the next shift.

Because computer operators generally spend a lot of time in front of a computer monitor and perform repetitive tasks such as loading and unloading printers, they may be susceptible to eyestrain, back discomfort, and hand and wrist problems.

Training, Other Qualifications, and Advancement

Computer operators generally require a high school degree and are trained by employers on the job. Most computer operators expect to

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Computer operators	43-9011	130,000	98,000	-32,000	-25

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

advance to other positions in the information technology field within a few years.

Education and training. Computer operators usually receive on-the-job training to become acquainted with their employer's equipment and routines. The length of training varies with the job and the experience of the worker. However, previous work experience is key to obtaining an operator job in many large establishments. Employers generally look for specific, hands-on experience with the type of equipment and related operating systems they use. Additionally, formal computer training, perhaps through a community college or technical school, can be useful. Related training also can be obtained through the U.S. Armed Forces and from some computer manufacturers. As computer technology changes and data processing centers become more automated, employers will increasingly require candidates for operator jobs to have formal training and related experience.

Other qualifications. Computer technology changes so rapidly that operators must be adaptable and willing to learn. Operators who work in automated data centers also need analytical and technical expertise to deal with unique or high-level problems that a computer is not programmed to handle. Operators must be able to communicate well and to work effectively with programmers, users, and other operators. Computer operators also must be able to work independently because they may have little or no direct supervision.

Advancement. Some computer operators may advance to supervisory jobs, although most management positions within data processing or computer operations centers require advanced formal education, such as a bachelor's or graduate degree. Computer operators may advance to jobs in areas such as network operations or support through on-the-job experience and additional formal education. As they gain experience in programming, some operators may advance to jobs as programmers or analysts, but a move into these types of jobs is becoming much more difficult because employers increasingly require at least a bachelor's degree for more skilled computer jobs.

Employment

Computer operators held about 130,000 jobs in 2006. Jobs are found in various industries such as government, health care, manufacturing, data processing services and other information industries, and finance and insurance. They are also employed by some firms in computer systems design and related services as more companies contract out their data processing operations.

Job Outlook

Computer operators continue to be one of the occupations with the most rapidly declining employment. Although computers are increasingly prevalent in the workplace, improved software and automation of many systems are quickly reducing the need for this occupation. Some job openings may, nevertheless, be available to replace workers who leave the occupation.

Employment change. Employment of computer operators is projected to decline by 25 percent because advances in technology are making obsolete many of the duties traditionally performed by these workers. Technological advances have reduced both the size and cost of computer equipment while increasing the capacity for data storage and processing automation. Sophisticated computer hardware and software are now used in practically every industry in such areas as factory and office automation, telecommunications, health care, education, and government. The expanding use of software that automates computer operations gives companies the option of making systems more efficient, but greatly reduces the need for operators. Such improvements require operators to monitor a greater number of operations at the same time and solve a broader range of problems that may arise. The result is that fewer operators will be needed to perform more highly skilled work.

Computer operators who are displaced by automation may be reassigned to support staffs that maintain personal computer networks or assist other members of the organization. Operators who keep up with changing technology by updating their skills through additional training should have the best prospects of moving into other areas such as network administration and technical support. Others may be retrained to perform different job duties, such as supervising an operations center, maintaining automation packages, or analyzing computer operations to recommend ways to increase productivity. In the future, operators who wish to take advantage of changing job opportunities in the computer field will need to know more about programming, automation software, graphics interface, client-server environments, and open systems.

Job prospects. Experienced operators are expected to face competition for the few job openings that will arise each year to replace workers who transfer to other occupations or leave the labor force. Opportunities will be best for operators who have formal computer education, familiarity with a variety of operating systems, and knowledge of the latest technology.

Earnings

Median annual earnings of computer operators were $33,560 in May 2006. The middle 50 percent earned between $25,990 and $43,060 per year. The highest 10 percent earned more than $51,970, and the lowest 10 percent earned less than $20,510.

Related Occupations

Other occupations involving work with computers include computer software engineers; computer programmers; computer support specialists and systems administrators; computer systems analysts, and computer scientists and database administrators. Other occupations in which workers operate electronic office equipment include data entry and information processing workers and secretaries and administrative assistants.

Sources of Additional Information

For information about work opportunities in computer operations, contact establishments with large computer centers, such as banks, manufacturing firms, insurance companies, colleges and universities, and data processing service organizations. The local office of the state employment service can supply information about employment and training opportunities.

Data Entry and Information Processing Workers

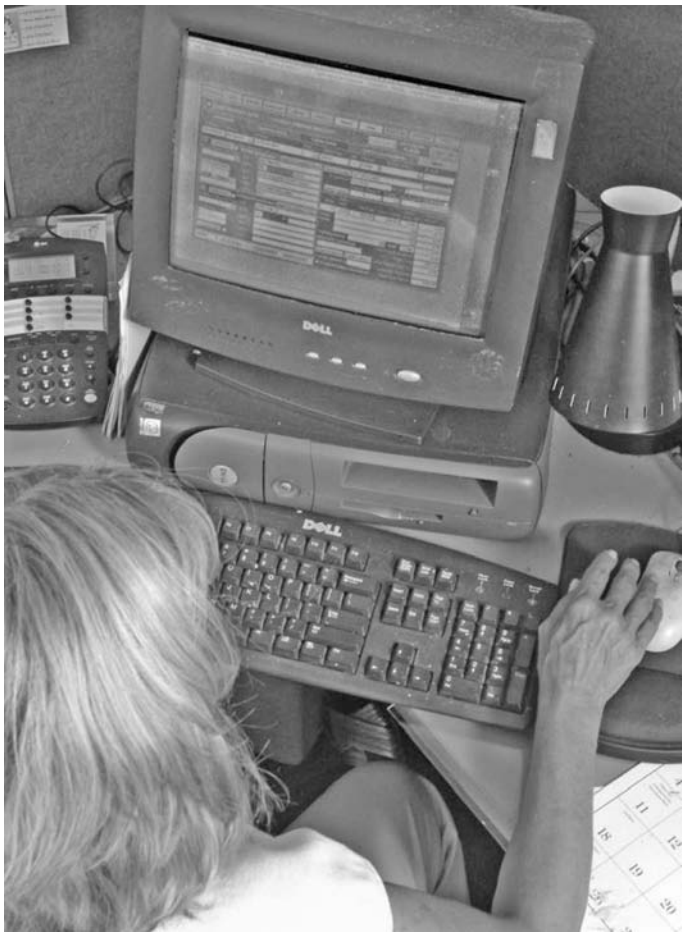
(O*NET 43-9021.00 and 43-9022.00)

Significant Points

- For many people, a job as a data entry and information processing worker is their first job after high school.
- Although overall employment is projected to decline, the need to replace workers who leave this large occupation each year should produce job openings.
- Job prospects should be best for those with expertise in appropriate computer software applications and who meet company requirements for keyboarding speed.

Nature of the Work

Organizations need to process a rapidly growing amount of information. Data entry and information processing workers help ensure the smooth and efficient handling of information. By keying in text, entering data into a computer, operating a variety of office machines, and performing other clerical duties, these workers help organizations keep up with the rapid changes that are characteristic of today's "Information Age." Data entry and information processing workers are known by various other titles, including word processors, typists, and data entry keyers, and less commonly, electronic data processors, keypunch technicians, and transcribers.



Data entry and information processing workers rely on computers to do their work.

Word processors and typists usually set up and prepare reports, letters, mailing labels, and other text material. As entry-level workers, word processors may begin by keying headings on form letters, addressing envelopes, or preparing standard forms on computers. As they gain experience, they often are assigned tasks requiring a higher degree of accuracy and independent judgment. Senior word processors may work with highly technical material, plan and key complicated statistical tables, combine and rearrange materials from different sources, or prepare master copies.

Most keyboarding is now done on computers that normally are connected to a monitor, keyboard, and printer and may have "add-on" capabilities, such as optical character recognition readers. Word processors use this equipment to record, edit, store, and revise letters, memos, reports, statistical tables, forms, and other printed materials. Although it is becoming less common, some word-processing workers are employed on centralized word-processing teams that handle transcription and keying for several departments.

In addition to fulfilling the duties mentioned above, word processors often perform other office tasks, such as answering telephones, filing, and operating copiers or other office machines. Job titles of these workers frequently vary to reflect these duties. For example, administrative clerks combine word processing with filing, sorting mail, answering telephones, and other general office work. Note readers transcribe stenotyped notes of court proceedings into standard formats.

Data entry keyers usually input lists of items, numbers, or other data into computers or complete forms that appear on a computer screen. They also may manipulate existing data, edit current information, or proofread new entries into a database for accuracy. Some examples of data sources include customers' personal information, medical records, and membership lists. Usually, this information is used internally by a company and may be reformatted before other departments or customers use it.

Keyers use various types of equipment to enter data. Many use a machine that converts the information they type to magnetic impulses on tapes or disks for entry into a computer system. Others prepare materials for printing or publication by using data entry composing software. Some keyers operate online terminals or personal computers. Increasingly, data entry keyers work with non-keyboard forms of data entry, such as scanners and electronically transmitted files. When using the new character recognition systems, data entry keyers often enter only those data which cannot be recognized by machines. In some offices, keyers also operate computer peripheral equipment such as printers and tape readers, act as tape librarians, and perform other clerical duties.

Work environment. Data entry and information processing workers usually work a standard 40-hour week in clean offices. They sit for long periods and sometimes must contend with high noise levels caused by various office machines. These workers are susceptible to repetitive strain injuries such as carpal tunnel syndrome, neck and back injuries, and eyestrain. To help prevent these conditions, many offices have adopted regularly scheduled breaks, ergonomically designed keyboards, and workstations that allow workers to stand or sit as they wish.

Some workers in this occupation telecommute, working from their homes on personal computers linked by telephone lines to those in the main office. This arrangement enables them to key in material at home while still being able to produce printed copy in their offices.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Data entry and information processing workers	43-9020	492,000	457,000	-35,000	-7
Data entry keyers	43-9021	313,000	299,000	-15,000	-5
Word processors and typists	43-9022	179,000	158,000	-21,000	-12

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Training, Other Qualifications, and Advancement

Many data entry and information processing workers are hired right out of high school. Most training occurs on the job, and can be learned in a short period of time.

Education and training. Employers generally hire high school graduates who meet their requirements for accuracy and keyboarding speed. Increasingly, employers also expect applicants to have training or experience in word-processing or data entry tasks. Spelling, punctuation, and grammar skills are important, as is familiarity with standard office equipment and procedures.

Students acquire skills in keyboarding and in the use of word-processing, spreadsheet, and database management computer software in high schools, community colleges, business schools, temporary help agencies, or self-teaching aids such as books, tapes, and Internet tutorials.

Advancement. For many people, a job as a data entry and information processing worker is their first job after high school or after a period of full-time family responsibilities. This work frequently serves as a steppingstone to higher paying jobs with increased responsibilities. Large companies and government agencies usually have training programs to help administrative employees upgrade their skills and advance to higher level positions. It is common for data entry and information processing workers to transfer to other administrative jobs, such as secretary, administrative assistant, or statistical clerk, or to be promoted to a supervisory job in a word-processing or data entry center.

Employment

Data entry and information processing workers held about 492,000 jobs in 2006 and were employed in virtually every sector of the economy. Of the data entry and information processing workers, 313,000 were data entry keyers and 179,000 were word processors and typists.

About 1 out of 5 data entry and information processing workers held jobs in firms providing administrative and support services, including temporary help and word-processing agencies, and another 15 percent worked for state or local government.

Job Outlook

Although employment of data entry and information processing workers is expected to decline, job prospects will be favorable for those who have good technical skills, familiarity with office equipment, and keyboarding speed and accuracy.

Employment change. Overall employment of data entry and information processing workers is projected to moderately decline by 7 percent through the year 2016. Although data entry and information processing workers are affected by productivity gains stemming from organizational restructuring and the implementation of new technologies, projected employment change differs among these workers. Employment of word processors and typists is expected to decline because of the proliferation of personal computers, which allows other workers to perform duties formerly assigned to word processors and typists. Most professionals and managers, for example, now use desktop personal computers to do their own word processing. However, because technologies affecting data entry keyers tend to be costlier to implement, employment of these workers will decline less than word processors and typists.

Employment growth of data entry keyers will be dampened by productivity gains as various data-capturing technologies, such as barcode scanners, voice recognition technologies, and sophisticated character recognition readers, become more prevalent. These technologies can be applied to a variety of business transactions, such as inventory tracking, invoicing, and placing orders. Moreover, as telecommunications technology improves, many organizations will increasingly take advantage of computer networks that allow data to be transmitted electronically. These networks will permit more data to be entered automatically into computers, reducing the demand for data entry keyers.

In addition to being affected by technology, employment of data entry and information processing workers will be adversely affected by businesses that are increasingly contracting out their work. Many organizations have reduced or even eliminated permanent in-house staff—for example, in favor of temporary employment and staffing services firms. Some large data entry and information processing firms increasingly employ workers in nations with relatively lower wages. As international trade barriers continue to fall and telecommunications technology improves, this transfer of jobs will mean reduced demand for data entry keyers in the United States.

Job prospects. The need to replace workers who transfer to other occupations or leave this large occupation for other reasons will produce numerous job openings each year. Job prospects will be most favorable for those with the best technical skills—in particular, expertise in appropriate computer software applications. Data entry and information processing workers must be willing to upgrade their skills continuously in order to remain marketable.

Earnings

Median annual earnings of word processors and typists in May 2006 were $29,430. The middle 50 percent earned between $24,180 and $35,950. The lowest 10 percent earned less than $20,200, while the highest 10 percent earned more than $43,330. The salaries of these workers vary by industry and by region. In May 2006, median annual earnings in the industries employing the largest numbers of word processors and typists were as follows:

Local government	$31,210
Elementary and secondary schools	29,960
Federal government	29,420
State government	28,520
Employment services	25,220

Median annual earnings of data entry keyers in May 2006 were $24,690. The middle 50 percent earned between $20,460 and $29,700. The lowest 10 percent earned less than $17,050, and the highest 10 percent earned more than $35,970. The following are

median annual earnings for May 2006 in the industries employing the largest numbers of data entry keyers:

Management, scientific, and technical consulting services	$25,860
Insurance carriers	25,760
Accounting, tax preparation, bookkeeping, and payroll services	23,600
Data processing, hosting, and related services	22,680
Employment services	22,650

Related Occupations

Data entry and information processing workers must transcribe information quickly. Other workers who deliver information in a timely manner are dispatchers, interpreters and translators, and communications equipment operators. Data entry and information processing workers also must be comfortable working with office technology, and in this regard they are similar to court reporters, medical records and health information technicians, secretaries and administrative assistants, and computer operators.

➤ American Management Association, 1601 Broadway, New York, NY 10019. Internet: http://www.amanet.org

Desktop Publishers

(O*NET 43-9031.00)

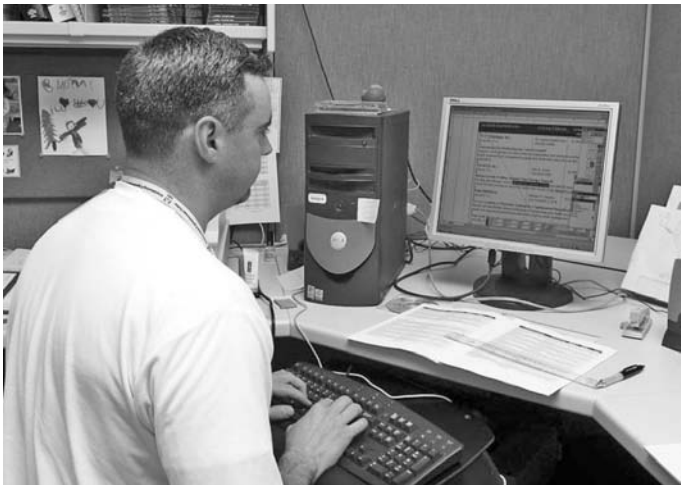
Significant Points

- About 35 percent work for newspaper, periodical, book, and directory publishers, while almost 25 percent work in the printing industry.
- Overall employment is expected to experience little or no change over the 2006–2016 decade.
- Most employers prefer to hire experienced desktop publishers; among persons without experience, opportunities should be best for those with certificates or degrees in desktop publishing or graphic design.

Nature of the Work

Desktop publishers use computer software to format and combine text, data, photographs, charts, and other graphic art or illustrations into prototypes of pages and other documents that are to be printed. They then may print the document using a high resolution printer or they may send the materials, either in print form or electronically, to a commercial printer. Examples of materials produced by desktop publishers include books, brochures, calendars, magazines, newsletters and newspapers, packaging, and forms.

Desktop publishers typically design and create the graphics that accompany text, convert photographs and illustrations into digital images, and manipulate the text and images to display information



Desktop publishers format and design photographs, art, and data with text for electronic page layouts.

in an attractive and readable format. They design page layouts, develop presentations and advertising campaigns, and do color separation of pictures and graphics material. Some desktop publishers may write some of the text or headlines used in newsletters or brochures. They also may translate electronic information onto film or other traditional media if the final product will be sent to an offset printer. As companies bring the production of marketing, promotional, and other kinds of materials in-house, they increasingly employ desktop publishers to produce such materials in house.

Desktop publishers use a computer and appropriate software to enter and select formatting properties, such as the size and style of type, column width, and spacing. Print formats are stored in the computer and displayed on a computer monitor. Images and text can be rearranged, column widths altered, or material enlarged or reduced. New information, such as charts, pictures, or additional text can be added. Scanners are used to capture photographs, images, or art as digital data that can be either incorporated directly into electronic page layouts or further manipulated with the use of computer software. The desktop publisher can make adjustments or compensate for deficiencies in the original color print or transparency. An entire newspaper, catalog, or book page, complete with artwork and graphics, can be created on the screen exactly as it will appear in print. Digital files are then used to produce printing plates. Like photographers and multimedia artists and animators, desktop publishers also can create special effects or other visual images using film, video, computers, or other electronic media. (Separate statements on photographers and on artists and related workers appear elsewhere in the *Handbook*.)

Desktop publishing encompasses a number of different kinds of jobs. Personal computers enable desktop publishers to more easily perform many of the design and layout tasks that would otherwise require large and complicated equipment and extensive human effort. Advances in computer software and printing technology continue to enhance desktop publishing work, making desktop publishing more economical and efficient than before. For example, desktop publishers get the material as computer files delivered over the Internet or on a portable disk drive instead of receiving simple typed text and instructions from customers. Other innovations in the occupation include digital color page makeup systems, electronic page layout systems, and off-press color proofing systems. In addition, most materials are reproduced on the Internet as well as printed; therefore, desktop publishers may need to know electronic publishing software, such as Hypertext Markup Language (HTML)

and may be responsible for converting text and graphics to an Internet-ready format.

Some desktop publishers may write and edit as well as lay out and design pages. For example, in addition to laying out articles for a newsletter, desktop publishers may be responsible for copyediting content or for writing original content themselves. Desktop publisher's writing and editing responsibilities may vary widely from project to project and employer to employer. Smaller firms typically use desktop publishers to perform a wide range of tasks, while desktop publishers at larger firms may specialize in a certain part of the publishing process. (Writers and editors are discussed elsewhere in the *Handbook*.)

Desktop publishers also may be called publications specialists, electronic publishers, DTP operators, desktop publishing editors, electronic prepress technicians, electronic publishing specialists, image designers, typographers, compositors, layout artists, and Web publications designers. The exact name may vary by the specific tasks performed or simply by personal preference.

Work environment. Desktop publishers usually work in clean, air-conditioned office areas with little noise. They generally work a standard workweek; however, some may work night shifts, weekends, or holidays depending upon the production schedule for the project or to meet deadlines.

These workers often are subject to stress and the pressures of short deadlines and tight work schedules. Like other workers who spend long hours working in front of a computer monitor, desktop publishers may be susceptible to eyestrain, back discomfort, and hand and wrist problems.

Training, Other Qualifications, and Advancement

Most desktop publishers learn their skills by taking classes, completing a certificate program offered on line or through an accredited academic program, or through experience on the job. Experience is the best training and many desktop publishers get started just by experimenting with the software and developing a knack for designing and laying out material for publication.

Education and training. There is generally no educational requirement for the job of desktop publisher. Most people learn on the job or by taking classes on line or through local learning centers that teach the latest software. For those who are interested in pursuing a career in desktop publishing, an associate degree or a bachelor's degree in graphic arts, graphic communications, or graphic design is preferred. Graphic arts programs are a good way to learn about the desktop publishing software used to format pages; assign type characteristics; and import text and graphics into electronic page layouts. The programs teach print and graphic design fundamentals and provide an extensive background in imaging, prepress operations, print reproduction, and emerging media. Courses in other aspects of printing also are available at vocational-technical institutes, industry-sponsored update and retraining programs, and private trade and technical schools.

Other qualifications. Although formal training is not always required, those with certificates or degrees will have the best job opportunities. Most employers prefer to hire people who have at least a high school diploma and who possess good communication skills, basic computer skills, and a strong work ethic. Desktop publishers should be able to deal courteously with people, because they have to interact with customers and clients and be able to express design concepts and layout options with them. They also may have to do simple math calculations and compute ratios to scale graphics and artwork and estimate job costs. A basic understanding and facility with computers, printers, scanners, and other office equipment and technologies also is needed to work as a desktop publisher.

Desktop publishers need good manual dexterity, and they must be able to pay attention to detail and work independently. Good eyesight, including visual acuity, depth perception, a wide field of view, color vision, and the ability to focus quickly also are assets. Artistic ability often is a plus. Employers also seek persons who are even tempered and adaptable—important qualities for workers who often must meet deadlines and learn how to operate new equipment.

Advancement. Workers with limited training and experience assist more experienced staff on projects while they learn the software and gain practical experience. They advance on the basis of their demonstrated mastery of skills. Desktop publishing software continues to evolve and gain in technological sophistication. As a result, desktop publishers need to keep abreast of the latest developments and how to use new software and equipment. As they gain experience, they may advance to positions with greater responsibility. Some may move into supervisory or management positions. Other desktop publishers may start their own companies or work as independent consultants, while those with more artistic talent and further education may find job opportunities in graphic design or commercial art positions.

Employment

Desktop publishers held about 32,000 jobs in 2006. About 35 percent worked for newspaper, periodical, book, and directory publishers, while 24 percent worked in the printing and related support activities industry. Other desktop publishers work for professional, scientific, and technical services firms and in many other industries that produce printed or published materials.

The printing and publishing industries are two of the most geographically dispersed industries in the United States, and desktop publishing jobs are found throughout the country. Although most jobs are in large metropolitan cities, electronic communication networks and the Internet allow some desktop publishers to work from other locations.

Job Outlook

Employment of desktop publishers is expected to experience little or no change over the 2006–2016 decade because more people are learning basic desktop publishing skills as a part of their regular job functions in other occupations and because more organizations are formatting materials for display on the web rather than designing pages for print publication.

Employment change. Employment of desktop publishers is expected to grow 1 percent between 2006 and 2016, which is considered little or no change in employment. Desktop publishing has become a frequently used and common tool for designing and laying out printed matter, such as advertisements, brochures, newslet-

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Desktop publishers	43-9031	32,000	32,000	300	1

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

ters, and forms. However, increased computer processing capacity and widespread availability of more elaborate desktop publishing software will make it easier and more affordable to use for people who are not printing professionals. As a result, the need for people who specialize in desktop publishing will slow, as more people are able to do this work.

In addition, organizations are increasingly moving their published material to the Internet to save the cost of printing and distributing materials. This change will slow the growth of desktop publishers, especially in smaller membership and trade organizations, which publish newsletters and small reports. Companies that produce large reports and rely on high quality and high resolution color and graphics within their publications, however, will continue to use desktop publishers to lay out publications for offset printing.

Job prospects. Despite the little to no change in projected employment, job opportunities for desktop publishers are expected to be good because of the need to replace workers who move into managerial positions, transfer to other occupations, or leave the labor force. However, job prospects will be better for those with experience as many employers prefer to hire experienced desktop publishers because of the long time it takes to become good at this work. Among individuals with little or no experience, opportunities should be best for those with computer backgrounds, certification in desktop publishing, or who have completed a postsecondary program in desktop publishing, graphic design, or web design.

Earnings

Earnings for desktop publishers vary according to level of experience, training, geographic location, and company size. Median annual earnings of desktop publishers were $34,130 in May 2006. The middle 50 percent earned between $26,270 and $44,360. The lowest 10 percent earned less than $20,550, and the highest 10 percent earned more than $55,040 a year. Median annual earnings of desktop publishers in May 2006 were $36,460 in printing and related support services and $31,450 in newspaper, periodical, book, and directory publishers.

Related Occupations

Desktop publishers use artistic and editorial skills in their work. These skills also are essential for artists and related workers; commercial and industrial designers; prepress technicians and workers; public relations specialists; and writers and editors.

Sources of Additional Information

Details about training programs may be obtained from local employers such as newspapers and printing shops or from local offices of the state employment service.

Office and Administrative Support Worker Supervisors and Managers

(O*NET 43-1011.00, 43-1011.01, and 43-1011.02)

Significant Points

- Most jobs are filled by promoting office or administrative support workers from within the organization.
- Office automation will cause employment in some office and administrative support occupations to grow slowly or even decline, resulting in slower-than-average growth among supervisors and managers.
- Applicants are likely to encounter keen competition because their numbers should greatly exceed the number of job openings.

Nature of the Work

All organizations need timely and effective office and administrative support to operate efficiently. Office and administrative support supervisors and managers coordinate this support. These workers are employed in virtually every sector of the economy, working in positions as varied as teller supervisor, customer services manager, or shipping and receiving supervisor.

Although specific functions of office and administrative support supervisors and managers vary significantly, they share many common duties. For example, supervisors perform administrative tasks to ensure that their staffs can work efficiently. Equipment and machinery used in their departments must be in good working order. If the computer system goes down or a fax machine malfunctions, the supervisors must try to correct the problem or alert repair personnel. They also request new equipment or supplies for their department when necessary.

Planning work and supervising staff are key functions of this job. To do these effectively, the supervisor must know the strengths and weaknesses of each member of the staff, as well as the results required and time allotted to each job. Supervisors must make allowances for unexpected staff absences and other disruptions by adjusting assignments or performing the work themselves if the situation requires it.

After allocating work assignments and issuing deadlines, office and administrative support supervisors and managers oversee the work to ensure that it is proceeding on schedule and meeting established quality standards. This may involve reviewing each person's work on a computer—as in the case of accounting clerks—or listening to how a worker deals with customers—as in the case of customer services representatives. When supervising long-term projects, the supervisor may meet regularly with staff members to discuss their progress.

Office and administrative support supervisors and managers also evaluate each worker's performance. If a worker has done a good job, the supervisor indicates that in the employee's personnel file and may recommend a promotion or other award. Alternatively, if a worker is performing inadequately, the supervisor discusses the problem with the employee to determine the cause and helps the worker to improve his or her performance. This might require sending the employee to a training course or arranging personal counseling. If the situation does not improve, the supervisor may recommend a transfer, demotion, or dismissal.

Office and administrative support supervisors and managers usually interview and evaluate prospective employees. When new workers arrive on the job, supervisors greet them and provide orientation to acquaint them with their organization and its operating routines. Some supervisors may be actively involved in recruiting new workers—for example, by making presentations at high schools and business colleges. They also may serve as the primary liaisons between their offices and the general public through direct contact and by preparing promotional information.

Supervisors help train new employees in organization and office procedures. They may teach new employees how to use the telephone system and operate office equipment. Because most adminis-

Office and administrative support worker supervisors and managers must ensure that offices operate efficiently.

trative support work is computerized, they also must teach new employees to use the organization's computer system. When new office equipment or updated computer software is introduced, supervisors train experienced employees to use it efficiently or, if this is not possible, arrange for their employees to receive special outside training.

Office and administrative support supervisors and managers often act as liaisons between the administrative support staff and the professional, technical, and managerial staff. This may involve implementing new company policies or restructuring the workflow in their departments. They also must keep their superiors informed of their progress and any potential problems. Often, this communication takes the form of research projects and progress reports. Because supervisors and managers have access to information such as their department's performance records, they may compile and present these data for use in planning or designing new policies.

Office and administrative support supervisors and managers also may have to resolve interpersonal conflicts among the staff. In organizations covered by union contracts, supervisors must know the provisions of labor-management agreements and run their departments accordingly. They also may meet with union representatives to discuss work problems or grievances.

Work environment. Office and administrative support supervisors and managers are employed in a wide variety of work settings, but most work in clean and well-lit offices that usually are comfortable.

Most office and administrative support supervisors and managers work a standard 40-hour week. However, some organizations operate around the clock, so some supervisors may have to work nights, weekends, and holidays. Sometimes, supervisors rotate among the three eight-hour shifts in a workday; in other cases, shifts are assigned on the basis of seniority.

Training, Other Qualifications, and Advancement

Most firms fill office and administrative support supervisory and managerial positions by promoting office or administrative support workers from within their organizations. To become eligible for promotion to a supervisory position, administrative support workers must prove they are capable of handling additional responsibilities.

Education and training. Many employers require office and administrative support supervisors and managers to have postsecondary training—and in some cases, an associate or even a bachelor's degree. Good working knowledge of the organization's computer system is also an advantage. In addition, supervisors must pay close attention to detail in order to identify and correct errors made by the staff they oversee.

Most office and administrative support worker supervisors and managers are promoted from within the company. Several years of on-the-job experience are usually the best preparation to become a supervisor or manager. After acquiring some experience, the employee should have a thorough knowledge of other personnel and company operations.

Administrative support workers with potential supervisory abilities may be given occasional supervisory assignments. To prepare for full-time supervisory duties, workers may attend in-house training or take courses in time management, project management, or interpersonal relations.

Other qualifications. When evaluating candidates, supervisors look for strong teamwork, problem-solving, leadership, and communication skills, as well as determination, loyalty, poise, and confidence. They also look for more specific supervisory attributes, such as the ability to organize and coordinate work efficiently, to set priorities, and to motivate others. Increasingly, supervisors need a broad base of office skills coupled with personal flexibility to adapt to changes in organizational structure and move among departments when necessary.

Advancement. For office and administrative supervisors and managers promoted from within, advancement opportunities may be limited without a postsecondary degree, depending on the company. The knowledge required to move into more business and financial related occupations may not necessarily be learned through working in an office or administrative occupation.

In some managerial positions, office and administrative support supervisor positions are filled with people from outside the organization. These positions may serve as entry-level training for potential higher level managers. New college graduates may rotate through departments of an organization at this level to learn the work of the organization before moving on to a higher level position.

Employment

Office and administrative support supervisors and managers held 1.4 million jobs in 2006. Although jobs for office and administrative support supervisors and managers are found in practically every industry, the largest number are found in organizations with a large administrative support workforce, such as banks, wholesalers, government agencies, retail establishments, business service firms, health care facilities, schools, and insurance companies. Because of most organizations' need for continuity of supervision, few office

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16 Number	Change, 2006-16 Percent
First-line supervisors/managers of office and administrative support workers	43-1011	1,418,000	1,500,000	82,000	6

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

and administrative support supervisors and managers work on a temporary or part-time basis.

Job Outlook

Employment of office and administrative support supervisors and managers is expected to grow more slowly than the average for all occupations through the year 2016. Keen competition is expected for prospective job applicants.

Employment change. Employment is expected to grow by 6 percent during the 2006–2016 period, which is more slowly than the average for all occupations. Employment of office and administrative support supervisors and managers is determined largely by the demand for administrative support workers. New technology should increase office and administrative support workers' productivity and allow a wider variety of tasks to be performed by people in professional positions. These trends will cause employment in some administrative support occupations to grow slowly or even decline. As a result, supervisors will direct smaller permanent staffs—supplemented by increased use of temporary administrative support staff—and perform more professional tasks. Office and administrative support managers will coordinate the increasing amount of administrative work and make sure that the technology is applied and running properly. However, organizational restructuring should continue to reduce employment in some managerial positions, distributing more responsibility to office and administrative support supervisors.

Job prospects. Like those seeking other supervisory and managerial occupations, applicants for jobs as office and administrative support worker supervisors and managers are likely to encounter keen competition because the number of applicants should greatly exceed the number of job openings. Besides the job openings arising from growth, a large number of openings will stem from the need to replace workers who transfer to other occupations or leave this large occupation for other reasons.

Earnings

Median annual earnings of office and administrative support supervisors and managers were $43,510 in May 2006; the middle 50 percent earned between $33,730 and $56,130. The lowest paid 10 percent earned less than $26,530, while the highest paid 10 percent earned more than $71,340. In May 2006, median annual earnings in the industries employing the largest numbers of office and administrative support supervisors and managers were:

Management of companies and enterprises	$49,160
Local government	45,520
General medical and surgical hospitals	44,250
Offices of physicians	42,110
Depository credit intermediation	40,900

In addition to typical benefits, some office and administrative support supervisors and managers, particularly in the private sector, may receive additional compensation in the form of bonuses and stock options.

Related Occupations

Office and administrative support supervisors and managers must understand and sometimes perform the work of those whom they oversee, including bookkeeping, accounting, and auditing clerks; secretaries and administrative assistants; communications equipment operators; customer service representatives; data entry and information processing workers; general office clerks; receptionists and information clerks; stock clerks and order fillers; and order clerks. Their supervisory and administrative duties are similar to those of other supervisors and managers, such as education administrators and administrative services managers.

Office Clerks, General

(O*NET 43-9061.00)

Significant Points

- Employment growth and high replacement needs in this large occupation will result in numerous job openings.
- Prospects should be best for those with knowledge of basic computer applications and office machinery as well as good communication skills.
- Part-time and temporary positions are common.

Nature of the Work

Rather than performing a single specialized task, general office clerks have responsibilities that often change daily with the needs of the specific job and the employer. Some clerks spend their days filing or keyboarding. Others enter data at a computer terminal. They also operate photocopiers, fax machines, and other office equipment; prepare mailings; proofread documents; and answer telephones and deliver messages.

The specific duties assigned to a clerk vary significantly, depending on the type of office in which he or she works. An office clerk in a doctor's office, for example, would not perform the same tasks that a clerk in a large financial institution or in the office of an auto parts wholesaler would. Although all clerks may sort checks, keep payroll records, take inventory, and access information, they also perform duties unique to their employer, such as organizing medica-

General office clerks may send faxes and make photocopies as part of their administrative tasks.

tions in a doctor's office, preparing materials for presentations in a corporate office, or filling orders received by fax machine for a wholesaler.

Clerks' duties also vary by level of experience. Whereas inexperienced employees make photocopies, stuff envelopes, or record inquiries, experienced clerks usually are given additional responsibilities. For example, they may maintain financial or other records, set up spreadsheets, verify statistical reports for accuracy and completeness, handle and adjust customer complaints, work with vendors, make travel arrangements, take inventory of equipment and supplies, answer questions on departmental services and functions, or help prepare invoices or budgetary requests. Senior office clerks may be expected to monitor and direct the work of lower level clerks.

Work environment. For the most part, general office clerks work in comfortable office settings. Those on full-time schedules usually work a standard 40-hour week; however, some work shifts or overtime during busy periods. About 26 percent of clerks work part time in 2006. Many clerks also work in temporary positions.

Training, Other Qualifications, and Advancement

Office clerks often need to know how to use word-processing and other business software and office equipment. Experience working in an office is helpful, but office clerks also learn skills on the job.

Education and training. Although most office clerk jobs are entry-level positions, employers may prefer or require previous office or business experience. Employers usually require a high school diploma or equivalent, and some require basic computer skills, including familiarity with word-processing software, as well as other general office skills.

Training for this occupation is available through business education programs offered in high schools, community and junior colleges, and postsecondary vocational schools. Courses in office practices, word-processing, and other computer applications are particularly helpful.

Other qualifications. Because general office clerks usually work with other office staff, they should be cooperative and able to work as part of a team. Employers prefer individuals who can perform a variety of tasks and satisfy the needs of the many departments within a company. In addition, applicants should have good communication skills, be detail oriented, and adaptable.

Advancement. General office clerks who exhibit strong communication, interpersonal, and analytical skills may be promoted to supervisory positions. Others may move into different, more senior administrative jobs, such as receptionist, secretary, or administrative assistant. After gaining some work experience or specialized skills, many workers transfer to jobs with higher pay or greater advancement potential. Advancement to professional occupations within an organization normally requires additional formal education, such as a college degree.

Employment

General office clerks held about 3.2 million jobs in 2006. Most are employed in relatively small businesses. Although they work in every sector of the economy, about 43 percent worked in local government, health care and social assistance, administrative and support services, finance and insurance, or professional, scientific, and technical services industries.

Job Outlook

Employment growth and high replacement needs in this large occupation is expected to result in numerous job openings for general office clerks.

Employment change. Employment of general office clerks is expected to grow 13 percent between 2006 and 2016, which is about as fast as the average for all occupations. The employment outlook for these workers will continue to be affected by the increasing use of technology, expanding office automation, and the consolidation of administrative support tasks. These factors have led to a consolidation of administrative support staffs and a diversification of job responsibilities. However, this consolidation will increase the demand for general office clerks because they perform a variety of administrative support tasks, as opposed to clerks with very specific functions. It will become increasingly common within businesses,

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Office clerks, general	43-9061	3,200,000	3,604,000	404,000	13

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

especially those smaller in size, to find only general office clerks in charge of all administrative support work.

Job prospects. Many job openings for general office clerks are expected to be for full-time jobs; there will also be a demand for part-time and temporary positions. Prospects should be best for those who have good writing and communication skills and knowledge of basic computer applications and office machinery—such as fax machines, telephone systems, and scanners. As general administrative support duties continue to be consolidated, employers will increasingly seek well-rounded individuals with highly developed communication skills and the ability to perform multiple tasks.

Job opportunities may vary from year to year because the strength of the economy affects demand for general office clerks. Companies tend to employ more workers when the economy is strong. Industries least likely to be affected by economic fluctuations tend to be the most stable places for employment.

Earnings

Median annual earnings of general office clerks were $23,710 in May 2006; the middle 50 percent earned between $18,640 and $30,240 annually. The lowest 10 percent earned less than $14,850, and the highest 10 percent earned more than $37,600. Median annual salaries in the industries employing the largest numbers of general office clerks in May 2006 were:

Local government	$26,590
General medical and surgical hospitals	26,050
Elementary and secondary schools	24,230
Colleges, universities, and professional schools	23,980
Employment services	21,890

Related Occupations

The duties of general office clerks can include a combination of bookkeeping, keyboarding, office machine operation, and filing. Other office and administrative support workers who perform similar duties include bookkeeping, accounting, and auditing clerks; communications equipment operators; customer service representatives; data entry and information processing workers; order clerks; receptionists and information clerks; secretaries and administrative assistants; stock clerks and order fillers; and tellers. Nonclerical entry-level workers include cashiers; counter and rental clerks; and food and beverage serving and related workers.

Sources of Additional Information

State employment service offices and agencies can provide information about job openings for general office clerks.

For information related to administrative occupations, including educational programs and certified designations, contact

➤ International Association of Administrative Professionals, 10502 NW Ambassador Dr., P.O. Box 20404, Kansas City, MO 64195-0404. Internet: http://www.iaap-hq.org

Secretaries and Administrative Assistants

(O*NET 43-6011.00, 43-6012.00, 43-6013.00, and 43-6014.00)

Significant Points

- This occupation is expected to be among those with the largest number of new jobs.
- Opportunities should be best for applicants with extensive knowledge of software applications.
- Secretaries and administrative assistants today perform fewer clerical tasks and are increasingly taking on the roles of information and communication managers.

Nature of the Work

As the reliance on technology continues to expand in offices, the role of the office professional has greatly evolved. Office automation and organizational restructuring have led secretaries and administrative assistants to assume responsibilities once reserved for managerial and professional staff. In spite of these changes, however, the core responsibilities for secretaries and administrative assistants have remained much the same: Performing and coordinating an office's administrative activities and storing, retrieving, and integrating information for dissemination to staff and clients.

Secretaries and administrative assistants perform a variety of administrative and clerical duties necessary to run an organization efficiently. They serve as information and communication managers for an office; plan and schedule meetings and appointments; organize and maintain paper and electronic files; manage projects; conduct research; and disseminate information by using the telephone, mail services, Web sites, and e-mail. They also may handle travel and guest arrangements.

Secretaries and administrative assistants use a variety of office equipment, such as fax machines, photocopiers, scanners, and videoconferencing and telephone systems. In addition, secretaries and administrative assistants often use computers to do tasks previously handled by managers and professionals, such as: create spreadsheets; compose correspondence; manage databases; and create presentations, reports, and documents using desktop publishing software and digital graphics. They also may negotiate with vendors, maintain and examine leased equipment, purchase supplies, manage areas such as stockrooms or corporate libraries, and retrieve data from various sources. At the same time, managers and professionals have assumed many tasks traditionally assigned to secretaries and administrative assistants, such as keyboarding and answering the telephone. Because secretaries and administrative assistants do less dictation and word processing, they now have time to support more members of the executive staff. In a number of organizations, secretaries and administrative assistants work in teams to work flexibly and share their expertise.

Many secretaries and administrative assistants now provide training and orientation for new staff, conduct research on the Internet, and operate and troubleshoot new office technologies.

Specific job duties vary with experience and titles. *Executive secretaries and administrative assistants* provide high-level administrative support for an office and for top executives of an organization. Generally, they perform fewer clerical tasks than do secretaries and more information management. In addition to arranging conference calls and supervising other clerical staff, they may handle more complex responsibilities such as reviewing incoming memos, submissions, and reports in order to determine their significance and to plan for their distribution. They also prepare agendas and make arrangements for meetings of committees and executive boards. They also may conduct research and prepare statistical reports.

Some secretaries and administrative assistants, such as legal and medical secretaries, perform highly specialized work requiring knowledge of technical terminology and procedures. For instance, *legal secretaries* prepare correspondence and legal papers such as summonses, complaints, motions, responses, and subpoenas under the supervision of an attorney or a paralegal. They also may review

Secretaries and administrative assistants use computers to perform clerical and administrative tasks.

legal journals and assist with legal research—for example, by verifying quotes and citations in legal briefs. Additionally, legal secretaries often teach newly minted lawyers how to prepare documents for submission to the courts. *Medical secretaries* transcribe dictation, prepare correspondence, and assist physicians or medical scientists with reports, speeches, articles, and conference proceedings. They also record simple medical histories, arrange for patients to be hospitalized, and order supplies. Most medical secretaries need to be familiar with insurance rules, billing practices, and hospital or laboratory procedures. Other technical secretaries who assist engineers or scientists may prepare correspondence, maintain their organization's technical library, and gather and edit materials for scientific papers.

Secretaries employed in elementary schools and high schools perform important administrative functions for the school. They are responsible for handling most of the communications between parents, the community, and teachers and administrators who work at the school. As such, they are required to know details about registering students, immunizations, and bus schedules, for example. They schedule appointments, keep track of students' academic records, and make room assignments for classes. Those who work directly for principals screen inquiries from parents and handle those matters not needing a principal's attention. They also may set a principal's calendar to help set her or his priorities for the day.

Work environment. Secretaries and administrative assistants usually work in schools, hospitals, corporate settings, government agencies, or legal and medical offices. Their jobs often involve sitting for long periods. If they spend a lot of time keyboarding, particularly at a computer monitor, they may encounter problems of eyestrain, stress, and repetitive motion ailments such as carpal tunnel syndrome.

Almost one-fifth of secretaries work part time and many others work in temporary positions. A few participate in job-sharing arrangements, in which two people divide responsibility for a single job. The majority of secretaries and administrative assistants, however, are full-time employees who work a standard 40-hour week.

Training, Other Qualifications, and Advancement

Word-processing, writing, and communication skills are essential for all secretaries and administrative assistants. However, employers increasingly require extensive knowledge of software applications, such as desktop publishing, project management, spreadsheets, and database management.

Education and training. High school graduates who have basic office skills may qualify for entry-level secretarial positions. They can acquire these skills in various ways. Training ranges from high school vocational education programs that teach office skills and typing to one- and two-year programs in office administration offered by business and vocational-technical schools, and community colleges. Many temporary placement agencies also provide formal training in computer and office skills. Most medical and legal secretaries must go through specialized training programs that teach them the language of the industry.

Employers of executive secretaries increasingly are seeking candidates with a college degree, as these secretaries work closely with top executives. A degree related to the business or industry in which a person is seeking employment may provide the job seeker with an advantage in the application process.

Most secretaries and administrative assistants, once hired, tend to acquire more advanced skills through on-the-job instruction by other employees or by equipment and software vendors. Others may attend classes or participate in online education to learn how to operate new office technologies, such as information storage systems, scanners, or new updated software packages. As office automation continues to evolve, retraining and continuing education will remain integral parts of secretarial jobs.

Other qualifications. Secretaries and administrative assistants should be proficient in typing and good at spelling, punctuation, grammar, and oral communication. Employers also look for good customer service and interpersonal skills because secretaries and administrative assistants must be tactful in their dealings with people. Discretion, good judgment, organizational or management ability, initiative, and the ability to work independently are especially important for higher-level administrative positions. Changes in the office environment have increased the demand for secretaries and administrative assistants who are adaptable and versatile.

Certification and advancement. Testing and certification for proficiency in office skills are available through organizations such as the International Association of Administrative Professionals; National Association of Legal Secretaries (NALS), Inc.; and Legal Secretaries International, Inc. As secretaries and administrative assistants gain experience, they can earn several different designations. Prominent designations include the Certified Professional Secretary (CPS) and the Certified Administrative Professional (CAP), which can be earned by meeting certain experience or educational requirements and passing an examination. Similarly, those with 1 year of experience in the legal field, or who have concluded an approved training course and who want to be certified as a legal support professional, can acquire the Accredited Legal Secretary (ALS) designation through a testing process administered by NALS.

NALS offers two additional designations: Professional Legal Secretary (PLS), considered an advanced certification for legal support professionals, and a designation for proficiency as a paralegal. Legal Secretaries International confers the Certified Legal Secretary Specialist (CLSS) designation in areas such as intellectual property, criminal law, civil litigation, probate, and business law to those who have 5 years of legal experience and pass an examination. In some instances, certain requirements may be waived.

Secretaries and administrative assistants generally advance by being promoted to other administrative positions with more responsibilities. Qualified administrative assistants who broaden their knowledge of a company's operations and enhance their skills may be promoted to senior or executive secretary or administrative assistant, clerical supervisor, or office manager. Secretaries with word-processing or data entry experience can advance to jobs as word-processing or data entry trainers, supervisors, or managers

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Secretaries and administrative assistants	43-6000	4,241,000	4,603,000	362,000	9
Executive secretaries and administrative assistants	43-6011	1,618,000	1,857,000	239,000	15
Legal secretaries	43-6012	275,000	308,000	32,000	12
Medical secretaries	43-6013	408,000	477,000	68,000	17
Secretaries, except legal, medical, and executive	43-6014	1,940,000	1,962,000	22,000	1

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

within their own firms or in a secretarial, word-processing, or data entry service bureau. Secretarial and administrative support experience also can lead to jobs such as instructor or sales representative with manufacturers of software or computer equipment. With additional training, many legal secretaries become paralegals.

Employment

Secretaries and administrative assistants held more than 4.2 million jobs in 2006, ranking it among the largest occupations in the U.S. economy. The following tabulation shows the distribution of employment by secretarial specialty:

Secretaries, except legal, medical, and executive	1,940,000
Executive secretaries and administrative assistants	1,618,000
Medical secretaries	408,000
Legal secretaries	275,000

Secretaries and administrative assistants are employed in organizations of every type. Around 9 out of 10 secretaries and administrative assistants are employed in service providing industries, ranging from education and health care to government and retail trade. Most of the rest work for firms engaged in manufacturing or construction.

Job Outlook

Employment of secretaries and administrative assistants is expected to grow about as fast as average for all occupations. Secretaries and administrative assistants will have among the largest numbers of new jobs arise, about 362,000 over the 2006–2016 period. Additional opportunities will result from the need to replace workers who transfer to other occupations or leave this occupation.

Employment change. Employment of secretaries and administrative assistants is expected to increase about 9 percent, which is about as fast as average for all occupations, between 2006 and 2016. Projected employment varies by occupational specialty. Above average employment growth in the health care and social assistance industry should lead to faster than average growth for medical secretaries, while moderate growth in legal services is projected to lead to average growth in employment of legal secretaries. Employment of executive secretaries and administrative assistants is projected to grow faster than average for all occupations. Growing industries—such as administrative and support services; health care and social assistance; and professional, scientific, and technical services—will continue to generate the most new jobs. Little or no change in employment is expected for secretaries, except legal, medical, or executive, who account for about 46 percent of all secretaries and administrative assistants.

Increasing office automation and organizational restructuring will continue to make secretaries and administrative assistants more productive in coming years. Computers, e-mail, scanners, and voice message systems will allow secretaries and administrative assistants to accomplish more in the same amount of time. The use of automated equipment also is changing the distribution of work in many offices. In some cases, traditional secretarial duties as typing, filing, photocopying, and bookkeeping are being done by clerks in other departments or by the professionals themselves. For example, professionals and managers increasingly do their own word processing and data entry, and handle much of their own correspondence. Also, in some law and medical offices, paralegals and medical assistants are assuming some tasks formerly done by secretaries.

Developments in office technology are certain to continue. However, many secretarial and administrative duties are of a personal, interactive nature and, therefore, are not easily automated. Responsibilities such as planning conferences, working with clients, and instructing staff require tact and communication skills. Because technology cannot substitute for these personal skills, secretaries and administrative assistants will continue to play a key role in most organizations.

As paralegals and medical assistants assume more of the duties traditionally assigned to secretaries, there is a trend in many offices for professionals and managers to replace the traditional arrangement of one secretary per manager with secretaries and administrative assistants who support the work of systems, departments, or units. This approach often means that secretaries and administrative assistants assume added responsibilities and are seen as valuable members of a team.

Job prospects. In addition to jobs created from growth, numerous job opportunities will arise from the need to replace secretaries and administrative assistants who transfer to other occupations, especially exceptionally skilled executive secretaries and administrative assistants who often move into professional occupations. Job opportunities should be best for applicants with extensive knowledge of software applications and for experienced secretaries and administrative assistants. Opportunities also should be very good for those with advanced communication and computer skills. Applicants with a bachelor's degree will be in great demand to act more as managerial assistants and to perform more complex tasks.

Earnings

Median annual earnings of secretaries, except legal, medical, and executive, were $27,450 in May 2006. The middle 50 percent earned between $21,830 and $34,250. The lowest 10 percent earned less than $17,560, and the highest 10 percent earned more than $41,550. Median annual earnings in the industries employing the largest numbers of secretaries, except legal, medical, and executive in May 2006 were:

Local government	$30,350
General medical and surgical hospitals	28,810
Colleges, universities, and professional schools	28,700
Elementary and secondary schools	28,120
Employment services	26,810

Median annual earnings of executive secretaries and administrative assistants were $37,240 in May 2006. The middle 50 percent earned between $30,240 and $46,160. The lowest 10 percent earned less than $25,190, and the highest 10 percent earned more than $56,740. Median annual earnings in the industries employing the largest numbers of executive secretaries and administrative assistants in May 2006 were:

Management of companies and enterprises	$41,570
Local government	38,670
Colleges, universities, and professional schools	36,510
State government	35,830
Employment services	31,600

Median annual earnings of legal secretaries were $38,190 in May 2006. The middle 50 percent earned between $29,650 and $48,520. The lowest 10 percent earned less than $23,870, and the highest 10 percent earned more than $58,770. Medical secretaries earned a median annual salary of $28,090 in May 2006. The middle 50 percent earned between $23,250 and $34,210. The lowest 10 percent earned less than $19,750, and the highest 10 percent earned more than $40,870.

Salaries vary a great deal, however, reflecting differences in skill, experience, and level of responsibility. Certification in this field may be rewarded by a higher salary.

Related Occupations

Workers in a number of other occupations also type, record information, and process paperwork. Among them are bookkeeping, accounting, and auditing clerks; receptionists and information clerks; communications equipment operators; court reporters; human resources assistants, except payroll and timekeeping; computer operators; data entry and information processing workers; paralegals and legal assistants; medical assistants; and medical records and health information technicians. A growing number of secretaries and administrative assistants share in managerial and human resource responsibilities. Occupations requiring these skills include office and administrative support worker supervisors and managers; computer and information systems managers; administrative services managers; and human resources, training, and labor relations managers and specialists.

Sources of Additional Information

State employment offices provide information about job openings for secretaries and administrative assistants.

Agricultural Workers

(O*NET 45-2011.00, 45-2021.00, 45-2041.00, 45-2091.00, 45-2092.00, 45-2092.01, 45-2092.02, 45-2093.00, and 45-2099.99)

Significant Points

- Duties vary widely, from raising plants and livestock to inspecting agricultural products at border crossings.
- Farmworkers learn their jobs through short-term on-the-job training; agricultural inspectors and animal breeders require more work experience or a college degree.
- Most farmworkers receive relatively low pay and do strenuous work in all kinds of weather, but many enjoy the rural lifestyle.
- Job openings are expected to be numerous for some types of work.

Nature of the Work

Agricultural workers play a large role in getting food, plants, and other agricultural products to market. Working mostly on farms or ranches, but also in nurseries, slaughterhouses, and even ports of entry, these workers have numerous and diverse duties. Among their activities are planting and harvesting crops, installing irrigation, delivering animals, and inspecting our food for safety. While most agricultural workers have relatively few technical skills, some have college degrees that train them to breed animals with specific traits or to inspect food, protecting us from harmful bacteria.

More than 80 percent of agricultural workers are farmworkers and laborers. *Crop, nursery, and greenhouse farmworkers and laborers* perform numerous activities related to growing and harvesting grains, fruits, vegetables, nuts, fiber, trees, shrubs, and other crops. They plant and seed, prune, irrigate, harvest, and pack and load crops for shipment. Farmworkers also apply pesticides, herbicides, and fertilizers to crops and repair fences and some farm equipment. Nursery and greenhouse workers prepare land or greenhouse beds for growing horticultural products, such as trees, plants, flowers, and sod. Their duties include planting, watering, pruning, weeding, and spraying the plants. They may cut, roll, and stack sod; stake trees; tie, wrap, and pack plants to fill orders; and dig up or move field-grown and containerized shrubs and trees.

Farm and ranch animal farmworkers care for live farm, ranch, or water animals that may include cattle, sheep, swine, goats, horses, poultry, finfish, shellfish, and bees. The animals are usually raised to supply meat, fur, skins, feathers, eggs, milk, or honey. Duties may include feeding, watering, herding, grazing, castrating, branding, debeaking, weighing, catching, and loading animals. On dairy farms, farmworkers operate milking machines; they also may maintain records on animals, examine animals to detect diseases and injuries, assist in delivering animals at their birth, and administer medications, vaccinations, or insecticides. Many workers clean and maintain animal housing areas every day.

Other agricultural workers known as *agricultural equipment operators* use a variety of farm equipment to plow, sow seeds, and maintain and harvest crops. Equipment may include tractors, fertilizer spreaders, haybines, raking equipment, balers, combines, threshers, and trucks. These workers also operate machines, such as conveyor belts, loading machines, separators, cleaners, and dryers, used in moving and treating crops after their harvest. As part of the job, workers may make adjustments and minor repairs to equipment.

Agricultural inspectors, another type of agricultural worker, are employed by federal and state governments to ensure compliance with laws and regulations governing the health, safety, and quality of agricultural commodities. Inspectors also make sure that the facilities and equipment used in processing the commodities meet legal standards. Meat safety is a prime responsibility. Inspectors work to ensure that meat is free of harmful ingredients or bacteria. In meat-processing facilities, inspectors may collect samples of meat suspected to be diseased or contaminated and send them to a laboratory for identification and analysis. They also may inspect livestock to help determine the effectiveness of medication and feeding programs. Some inspectors are stationed at export and import sites to weigh and inspect agricultural shipments leaving and entering the country to ensure the quality and quantity of the shipments. A few work at logging sites, making sure that safety regulations are enforced.

Graders and sorters of agricultural products examine agricultural commodities being prepared for market, classifying them according to quality or size: they grade, sort, or classify unprocessed food and other agricultural products by size, weight, color, or condition and discard inferior or defective products. For example, graders sort

Agricultural workers tend to flowers or crops in nurseries and greenhouses.

eggs by color and size and also examine the fat content; others examine the marbling of beef, classifying the meat as "Prime," "Choice," or a lower grade, as appropriate. The grade assigned determines the meat's price.

Animal breeders select and breed animals using their knowledge of genetics and animal science to produce offspring with desired traits and characteristics, such as chickens that lay more eggs, pigs that produce leaner meat, and sheep with more desirable wool. Some animal breeders also breed and raise cats, dogs, and other household pets. Larger and more expensive animals, such as horses and cattle, are usually bred through artificial insemination, which requires the taking of semen from the male and then inseminating the female. This process ensures better results than conventional mating and also enables one prized male to sire many more offspring. To know which animals to breed and when, animal breeders keep detailed records, including the health of the animals, their size and weight, and the amount and quality of the product produced by them. They also keep track of the traits of the offspring. Some animal breeders work as consultants for a number of farmers, but others breed and raise their own animals for sale or future breeding. For those who raise animals, tasks might include fixing and cleaning animal shelters, feeding and watering the animals, and overseeing animals' health. Some breeders supervise others who perform these tasks. Animal breeders also read journals and newsletters to learn the latest information on breeding and veterinary practices.

Work environment. Working conditions for agricultural workers vary widely. Much of the work of farmworkers and laborers on farms and ranches is physically strenuous and takes place outdoors in all kinds of weather. Harvesting fruits and vegetables, for example, may require much bending, stooping, and lifting. Workers may have limited access to sanitation facilities while working in the field and drinking water may also be limited. Nevertheless, some agricultural workers enjoy the variety of their work, the rural setting, the satisfaction of working the land, and raising animals.

Farm work does not lend itself to a regular 40-hour workweek. Work cannot be delayed when crops must be planted or harvested or when animals must be sheltered and fed. Long hours and weekend work is common in these jobs. For example, farmworkers and agricultural equipment operators may work six or seven days a week during planting and harvesting seasons. Some graders and sorters may work evenings or weekends because of the perishable nature of the products they inspect. Agricultural inspectors may also work long and irregular schedules.

Many agricultural worker jobs are seasonal in nature, so some workers also do other jobs during slow seasons. Migrant farmworkers, who move from location to location as crops ripen, live an unsettled lifestyle, which can be stressful. Work also is seasonal for farmworkers in nurseries; spring and summer are the busiest times of the year. Greenhouse workers enjoy relatively comfortable working conditions while tending to plants indoors. However, during the busy seasons, when landscape contractors need plants, work schedules may be more demanding, requiring weekend work. Moreover, the transition from warm weather to cold weather means that nursery workers might have to work overtime with little notice given in order to move plants indoors to protect them from a frost. Farmworkers who work with animals usually have a more regular schedule; their work is steadier and year round, but they sometimes must come to work on short notice to help handle emergencies.

Farmworkers risk exposure to pesticides and other hazardous chemicals sprayed on crops or plants. However, exposure can be minimal if safety procedures are followed. Those who work on mechanized farms must take precautions to avoid injury when working with tools and heavy equipment. Those who work directly with animals risk being bitten or kicked.

Federal meat inspectors may work in highly mechanized plants or with poultry or livestock in confined areas with extremely cold temperatures and slippery floors. Inspectors' jobs often require working with sharp knives, moderate lifting, and walking or standing for long periods. Inspectors may find themselves in adversarial roles when the organization or individual being inspected objects to the inspection or its potential consequences. Some inspectors travel frequently to visit farms and processing facilities. Others work at ports, inspecting cargo on the docks or on boats.

Graders and sorters may work with similar products for an entire shift, or they may be assigned a variety of items. They may be on their feet all day and may have to lift heavy objects, but others may sit during most of their shift and do little strenuous work. Some graders work in clean, air-conditioned environments, suitable for carrying out controlled tests.

Animal breeders spend most of their time outdoors around animals but can also work in offices or laboratories. Breeders who consult may travel from farm to farm. If they need to sell offspring, breeders may travel to attend shows and meet potential buyers. While tending to the animals, breeders may be bitten or kicked.

Training, Other Qualifications, and Advancement

The majority of agricultural workers learn their skills on the job in less than a month. Some occupations, however, require more work experience or formal education.

Education and training. Most farmworkers learn their jobs quickly as they work; many do not have a high school diploma. People without a high school diploma are particularly common in the crop production sector, which is more labor-intensive and employs more migrant farmworkers. Other agricultural workers require a month to a year of training on the job and, maybe, coursework in related subjects. For graders and sorters, training requirements vary on the basis of their responsibilities. For those who perform tests on agricultural products, a high school diploma is preferred and may be required. Simple jobs requiring mostly visual inspection might be filled by those without a high school diploma.

The education and training requirements for animal breeders vary with the type of breeding they do. For those who breed livestock and other large or expensive animals, a bachelor's or graduate degree in animal science is recommended. Courses include genetics, animal breeding, and animal physiology. For those with experience raising animals or who are breeding their own animals, a bachelor's degree often is not needed, but an associate degree or other training in animal breeding is recommended.

Agricultural inspector jobs require relevant work experience or some college coursework in biology, agricultural science, or a related subject. Inspectors also must be trained in the applicable laws and regulations governing inspection before they can start their jobs.

Other qualifications. Experience working on a farm or around animals is helpful but not necessary to qualify for many jobs. For those who operate equipment on the road or drive a truck as part their job, a driver's license or commercial driver's license is required.

Nursery workers who deal directly with customers must be friendly and tactful. Employers also look for responsible, self-motivated individuals because nursery workers sometimes work with little supervision. People who want to become agricultural inspectors should be responsible, able to communicate well, and like detailed work.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Agricultural workers	45-2000	859,000	838,000	-21,000	-2
Agricultural inspectors	45-2011	16,000	16,000	-200	-1
Animal breeders	45-2021	11,000	11,000	500	4
Graders and sorters, agricultural products	45-2041	42,000	41,000	-800	-2
Miscellaneous agricultural workers	45-2090	790,000	769,000	-20,000	-3
Agricultural equipment operators	45-2091	59,000	56,000	-3,000	-5
Farmworkers and laborers, crop, nursery, and greenhouse	45-2092	603,000	583,000	-20,000	-3
Farmworkers, farm and ranch animals	45-2093	107,000	110,000	2,900	3
Agricultural workers, all other	45-2099	20,000	20,000	0	0

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Advancement. Farmworkers who work hard and quickly, have good communication skills, and take an interest in the business may advance to crew leader or other supervisory positions. The ability to speak both English and Spanish is quite helpful in supervisory work as well.

Some agricultural workers aspire to become farm, ranch, or other agricultural managers, or own farms or ranches themselves. (Farmers, ranchers, and agricultural managers are discussed elsewhere in the *Handbook*.) In addition, their knowledge of raising and harvesting produce may provide an excellent background for becoming purchasing agents and buyers of farm products. Knowledge of working a farm as a business can also help agricultural workers become farm and home management advisors. Those who earn a college degree in agricultural science could become agricultural and food scientists.

Federal government inspectors whose job performance is satisfactory advance through a career ladder to a specified level. Positions above this level are usually supervisory, and advancement to them is competitive and based on agency needs and individual merit. Advancement opportunities in state and local governments and in the private sector often are similar to those in the federal government.

Employment

Agricultural workers held about 859,000 jobs in 2006. More than 68 percent of all agricultural workers worked for crop and livestock producers, while about 5 percent worked for agricultural service providers, mostly farm labor contractors. Agricultural inspectors are employed mainly by federal, state, and local governments.

By far, the state with the largest employment of farmworkers is California, followed by Oregon and Washington. Though these states produce a multitude of agricultural products, they are particularly known for raising grapes, potatoes, tomatoes, lettuce, apples, citrus, and nursery and greenhouse products.

Job Outlook

Job opportunities for agricultural workers occupations should be abundant because large numbers of workers leave these jobs due to their low wages and physical demands. Overall employment of agricultural workers is projected to undergo little or no change over the 2006–2016 decade, reflecting in large part the outlook for farmworkers in crops, nurseries, and greenhouses, who make up the large majority of all agricultural workers.

Employment change. Overall employment of agricultural workers is expected to decline about 2 percent, which is considered little or no change. Employment of farmworkers who work in crops, nurseries, or greenhouses and those who work with farm and ranch animals are projected to decline moderately, about 3 percent. Fewer farmworkers will be needed overall because of continued consolidation of farms and technological advancements in farm equipment that make existing farmworkers more efficient. Farmworkers will increasingly work for farm labor contractors rather than being hired directly by a farm. The agriculture industry also is expected to face increased competition from foreign countries and rising imports, particularly from Central America and China because of free trade agreements with those regions. Nursery and greenhouse workers should experience some job growth in this period, reflecting the increasing demand for landscaping plants.

Employment of agricultural inspectors is expected show little or no change. Governments at all levels are not expected to hire significant numbers of new inspectors, and instead to leave more of the routine inspections to businesses. Little or no change in employment is also expected for graders and sorters. Employment of agricultural equipment operators is expected to decline moderately, reflecting the agriculture industry's continuing ability to produce more with fewer workers overall. Consolidation is resulting in fewer small farmers and greater need to hire equipment operators, but on a temporary basis. Animal breeders will grow more slowly than average, around 4 percent over the 2006–2016 period, as large commercial farmers continue to try to improve their animals. However, because the occupation is so small, few new jobs are expected.

Job prospects. Job openings should be plentiful because of relatively large numbers of workers who leave these jobs for other occupations. This is especially true for jobs as agricultural inspectors, graders and sorters, agricultural equipment operators, and crop, greenhouse, and nursery farmworkers. Job prospects will not be as good for animal breeders and ranch and animal farmworkers because fewer workers leave these jobs. Those who work with animals tend to have a more settled lifestyle, as the work does not require them to follow crops for harvest.

Earnings

Agricultural workers had the following median hourly earnings in May 2006:

Agricultural inspectors	$18.32
Animal breeders	13.02
Agricultural equipment operators	9.72
Farmworkers, farm and ranch animals	9.17
Graders and sorters, agricultural products	8.27
Farmworkers and laborers, crop, nursery, and greenhouse	7.95

Farmworkers in crop production often are paid piece rates, with earnings based on how much they do instead of how many hours they work. Farmworkers tend to receive fewer benefits than those in

many other occupations. Some employers supply seasonal workers with room and board. Agricultural inspectors employed by state and federal governments tend to have very good benefits.

Related Occupations

The duties of farmworkers who perform outdoor labor are similar to the duties of grounds maintenance workers; fishers and fishing vessel operators; and forest, conservation, and logging workers. Farmworkers who work with farm and ranch animals perform tasks similar to those of animal care and service workers. Animal breeders may perform some work similar to those of veterinary technologists or veterinarians.

Information on agricultural worker jobs is available from

➤ National FFA Organization, The National FFA Center, Attn.: Career Information Requests, P.O. Box 68690, Indianapolis, IN 46268-0960. Internet: http://www.ffa.org

Information on obtaining positions as an agricultural inspector with the federal government is available from the Office of Personnel Management through USAJOBS, the federal government's official employment information system. This resource for locating and applying for job opportunities can be accessed through the Internet at http://www.usajobs.opm.gov or through an interactive voice response telephone system at (703) 724-1850 or TDD (978) 461-8404. These numbers are not toll free, and charges may result.

Fishers and Fishing Vessel Operators

(O*NET 45-3011.00)

Significant Points

- This occupation is characterized by strenuous work, long hours, seasonal employment, and some of the most hazardous conditions.
- About two out of three fishers are self-employed, among the highest proportion in the workforce.
- Fishers usually acquire their occupational skills on the job.
- Employment is projected to decline rapidly.

Nature of the Work

Fishers and fishing vessel operators catch and trap various types of marine life for human consumption, animal feed, bait, and other uses. (Aquaculture—the raising and harvesting, under controlled conditions, of fish and other aquatic life in ponds or confined bodies of water—is covered in the *Handbook* statement on farmers, ranchers, and agricultural managers.)

Fishing hundreds of miles from shore with commercial fishing vessels—large boats capable of hauling a catch of tens of thousands of pounds of fish—requires a crew that includes a captain, or skipper, a first mate and sometimes a second mate, a boatswain (called a *deckboss* on some smaller boats), and deckhands with specialized skills.

The *fishing boat captain* plans and oversees the fishing operation, the fish to be sought, the location of the best fishing grounds, the method of capture, the duration of the trip, and the sale of the catch.

The captain ensures that the fishing vessel is seaworthy; oversees the purchase of supplies, gear, and equipment, such as fuel, netting, and cables; obtains the required fishing permits and licenses; and hires qualified crew members and assigns their duties. The captain plots the vessel's course using compasses, charts, and electronic navigational equipment, such as loran systems or GPS navigation systems. Ships also use radar and sonar to avoid obstacles above and below the water and to detect fish. Sophisticated tracking technology allows captains to better locate and analyze schools of fish. The captain directs the fishing operation through the officers' actions and records daily activities in the ship's log. In port, the captain sells the catch to wholesalers, food processors, or through a fish auction and ensures that each crew member receives the prearranged portion of the proceeds. Captains increasingly use the Internet to bypass processors and sell fish directly to consumers, grocery stores, and restaurants often even before they return to port.

Fishers often work near the coast.

The *first mate* is the captain's assistant and assumes control of the vessel when the captain is off duty. Duty shifts, called watches, usually last 6 hours. In this role, the first mate must be familiar with navigation requirements and the operation of all electronic equipment. The mate's regular duty though, with the help of the boatswain and under the captain's oversight, is to direct the fishing operations and sailing responsibilities of the deckhands, including the operation, maintenance, and repair of the vessel and the gathering, preservation, stowing, and unloading of the catch.

The *boatswain*, a highly experienced deckhand with supervisory responsibilities, directs the *deckhands* as they carry out the sailing and fishing operations. Before departure, the deckhands load equipment and supplies. When necessary, boatswains repair fishing gear, equipment, nets, and accessories. They operate the fishing gear, letting out and pulling in nets and lines, and extract the catch, such as cod, flounder, and tuna, from the nets or the lines' hooks. Deckhands use dip nets to prevent the escape of small fish and gaffs to facilitate the landing of large fish. They then wash, salt, ice, and stow away the catch. Deckhands also must ensure that decks are clear and clean at all times and that the vessel's engines and equipment are kept in good working order. Unless "lumpers" (laborers or longshore workers) are hired, the deckhands unload the catch.

Large fishing vessels that operate in deep water generally have technologically advanced equipment, and some may have facilities on board where the fish are processed and prepared for sale. Such vessels are equipped for long stays at sea and can perform the work of several smaller boats.

Some fishers work on small boats in relatively shallow waters, often in sight of land. Navigation and communication needs are vital and constant for almost all types of boats. On these small boats crews usually are small, often only one or two, who work on all aspects of the fishing operation. Their work might include placing

gill nets across the mouths of rivers or inlets, entrapment nets in bays and lakes, or pots and traps for fish or shellfish such as lobsters and crabs. Dredges and scrapes are sometimes used to gather shellfish such as oysters and scallops. A very small proportion of commercial fishing is conducted as diving operations. Depending upon the water's depth, divers wearing regulation diving suits with an umbilical (air line) or a scuba outfit and equipment use spears to catch fish and use nets and other equipment to gather shellfish, coral, sea urchins, abalone, and sponges. In very shallow waters, fish are caught from small boats with an outboard motor, from rowboats, or by wading from shore. Fishers use a wide variety of hand-operated equipment, for example, nets, tongs, rakes, hoes, hooks, and shovels, to gather fish and shellfish; catch amphibians and reptiles such as frogs and turtles; and harvest marine vegetation such as Irish moss and kelp.

Although most fishers are involved in commercial fishing, some captains and deckhands use their expertise in fishing for sport or recreational purposes. For this type of fishing, a group of people charter a fishing vessel with a captain, and possibly several deckhands, for periods ranging from several hours to a number of days and embark upon sportfishing, socializing, and relaxation.

Work environment. Fishing operations are conducted under various environmental conditions, depending on the region of the country and the kind of species sought. Storms, fog, and wind may hamper fishing vessels or cause them to suspend fishing operations and return to port. In relatively busy fisheries, boats have to take care to avoid collisions.

Fishers and fishing vessel operators work under some of the most hazardous conditions of any occupation, and transportation to a hospital or doctor is often not readily available when injuries occur. The crew must be on guard against the danger of injury from malfunctioning fishing gear, entanglement in fishing nets and gear, slippery decks, ice formation in the winter, or being swept overboard by a wave. Malfunctioning navigation or communication equipment may lead to collisions or shipwrecks.

Fishers and fishing vessel operators face strenuous outdoor work and long hours. Commercial fishing trips may require a stay of several weeks or even months hundreds of miles away from one's home port. The pace of work may vary, but even during travel between the home port and the fishing grounds, deckhands on smaller boats try to finish their cleaning and maintenance duties so that there are no chores remaining to be done at port. However, lookout watches are a regular responsibility, and crew members must be prepared to stand watch at prearranged times of the day or night. Although fishing gear has improved, and operations have become more mechanized, netting and processing fish are strenuous activities. Newer vessels have improved living quarters and amenities such as television and shower stalls, but crews still experience the aggravations of confined quarters, continuous close personal contact, and the absence of family.

Training, Other Qualifications, and Advancement

Fishers usually acquire their occupational skills on the job. There are no formal academic training requirements.

Education and training. Most fishers begin as deckhands and learn their trade on the job. Deckhands normally start by finding work through family, friends, or simply walking around the docks and asking for employment. Some larger trawlers and processing ships are run by larger companies. New workers can apply through the companies' human resources department. Operators of large commercial fishing vessels are required to complete a Coast Guard–approved training course. Students can expedite their entrance into these occupations by enrolling in two-year vocational-technical programs offered by secondary schools. In addition, some community colleges and universities offer fishery technology and related programs that include courses in seamanship, vessel operations, marine safety, navigation, vessel repair and maintenance, health emergencies, and fishing gear technology. Courses include hands-on experience. Secondary and postsecondary programs are normally offered in or near coastal areas.

Experienced fishers may find short-term workshops especially useful. These generally are offered through various postsecondary institutions and provide a good working knowledge of electronic equipment used in navigation and communication and offer information on the latest improvements in fishing gear.

Licensure. Captains and mates on large fishing vessels of at least 200 gross tons must be licensed. Captains of sportfishing boats used for charter, regardless of the boats' size, must also be licensed. Crew members on certain fish-processing vessels may need a merchant mariner's document. The U.S. Coast Guard issues these documents and licenses to individuals who meet the stipulated health, physical, and academic requirements. States set licensing requirements for boats operating in state waters, defined as inland waters and waters within 3 miles of the coast.

Fishers need a permit to fish in almost any water. Permits are distributed by states for state waters and by regional fishing councils for federal waters. The permits specify the season when fishing is allowed, the type of fish that may be caught, and sometimes the type of fishing gear that is permissible. (For information about merchant marine occupations, see the section on water transportation occupations elsewhere in the *Handbook*.)

Other qualifications. Fishers must be in good health and possess physical strength. Good coordination, mechanical aptitude, and the ability to work under difficult or dangerous conditions are necessary to operate, maintain, and repair equipment and fishing gear. Fishers need stamina to work long hours at sea, often under difficult conditions. On large vessels, they must be able to work as members of a team. Fishers must be patient, yet always alert, to overcome the boredom of long watches when they are not engaged in fishing operations. The ability to assume any deckhand's functions on short notice is important. As supervisors, mates must be able to assume all duties, including the captain's, when necessary. The captain must be highly experienced, mature, and decisive and also must possess the business skills needed to run business operations.

Advancement. On fishing vessels, most fishers begin as deckhands. Experienced, reliable deckhands who display supervisory qualities may become boatswains, who, in turn, may become second mates, first mates, and, finally, captains. Deckhands who acquire experience and whose interests are in ship engineering—the maintenance and repair of ship engines and equipment—can eventually become licensed chief engineers on large commercial vessels after meeting the Coast Guard's experience, physical, and academic requirements. Almost all captains become self-employed, and the overwhelming majority eventually own, or have an interest in, one or more fishing ships. Some may choose to run a sport or recreational fishing operation.

Employment

Fishers and fishing vessel operators held an estimated 38,000 jobs in 2006. About two out of three were self-employed. Most fishing takes place off the coasts, particularly off Alaska, the Gulf Coast, Virginia, California, and New England. Alaska ranks the highest in total volume of fish caught, according to the National Marine Fisheries Service. Many fishers are seasonal workers and positions are usually filled by people who work primarily in other occupations, such as teachers, or by students. For example, salmon season causes

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Fishers and related fishing workers	45-3011	38,000	32,000	-6,200	-16

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

employment of fishers in Alaska to more than double during the summer. Because fishing is quite seasonal and workers are often self-employed, measuring total employment is quite difficult.

Job Outlook

Employment of fishers and fishing vessel operators is projected to decline rapidly as regulations relating to the replenishment of fish stocks reduce allowable fishing.

Employment change. Employment of fishers and fishing vessel operators is expected to decline rapidly by 16 percent through the year 2016. Fishers and fishing vessel operators depend on the natural ability of fish stocks to replenish themselves through growth and reproduction, as well as on governmental regulation to promote replenishment of fisheries. As the use of sophisticated electronic equipment for navigation, communication, and locating fish has raised the efficiency of finding fish stocks, the need for setting limits to catches has also risen. Additionally, improvements in fishing gear and the use of highly automated floating processors, where the catch is processed aboard the vessel, have greatly increased fish hauls.

Fisheries councils issue various types of restrictions to prevent over-harvesting and to allow stocks of fish and shellfish to naturally replenish. Fishing councils are shifting to an individual quota system that tends to reduce employment. However, such a system is beneficial for those who remain in the industry because it allows for longer fishing seasons, better investment returns, and steadier employment.

In addition, rising seafood imports and increasing competition from farm-raised fish are adversely affecting fishing income and is also causing some fishers to leave the industry. However, competition from farm-raised and imported seafood tends to be concentrated in specific species and should have more of an impact in some regions than others.

Governmental efforts to replenish stocks are having some positive results, which should increase the stock of fish in the future. Furthermore, efforts by private fishers' associations on the West Coast to increase government monitoring of the fisheries may help to prevent the type of decline in fish stocks found in waters off the East Coast. Nevertheless, fewer fishers and fishing vessel operators are expected to make their living from the nation's waters in the years ahead.

Job prospects. Many fishers and fishing vessel operators leave the occupation because of the strenuous and hazardous nature of the job and the lack of steady, year-round income. Thus, some job openings will arise from the need to replace workers who leave the occupation or retire. Sportfishing boats will also continue to provide some job opportunities.

Earnings

In May 2006, median annual earnings of wage-and-salary fishers were $27,250. The bottom 10 percent earned less than $15,280, while the top 10 percent earned more than $45,480. Earnings of fishers and fishing vessel operators normally are highest in the summer and fall when demand for their catch and environmental conditions are favorable and lowest during the winter. Many full-time and most part-time workers supplement their income by working in other activities during the off-season.

Earnings of fishers vary widely, depending upon their position, their ownership percentage of the vessel, the size of their ship, and the amount and value of the catch. The costs of the fishing operation such as fuel, repair and maintenance of gear and equipment, and the crew's supplies are deducted from the sale of the catch. Net proceeds are distributed among the crew members in accordance with a prearranged percentage. Generally, the ship's owner, usually its captain, receives half of the net proceeds. From this amount, the owner pays for depreciation, maintenance and repair, and replacement and insurance costs of the ship and its equipment; the money that remains is the owner's profit.

Related Occupations

Other occupations that involve outdoor work with fish and watercraft include water transportation occupations and fish and game wardens. Many ships not only catch the fish but also cut, trim, and preserve it. Seafood processing work done on land is performed by meat, poultry, and fish cutters and trimmers.

Sources of Additional Information

Information on licensing of fishing vessel captains and mates and on requirements for merchant mariner documentation is available from the U.S. Coast Guard Marine Inspection Office or Marine Safety Office in your state, or contact either of the following agencies:

Forest, Conservation, and Logging Workers

(O*NET 45-4011.00, 45-4021.00, 45-4022.00, 45-4023.00, and 45-4029.99)

Significant Points

- Workers spend all their time outdoors, sometimes in poor weather and often in isolated areas.
- Most jobs are physically demanding and can be hazardous.
- Little to no change in overall employment is expected.

Nature of the Work

The nation's forests are a rich natural resource, providing beauty and tranquility, varied recreational benefits, and wood for commercial use. Managing and harvesting the forests and woodlands require many different kinds of workers. Forest and conservation workers help develop, maintain, and protect the forests by growing and planting new seedlings, fighting insects and diseases that attack trees, and helping to control soil erosion. Timber-cutting and logging workers harvest thousands of acres of forests each year for the timber that provides the raw material for countless consumer and industrial products.

Logging workers use increasingly productive machinery to harvest logs.

Forest and conservation workers perform a variety of tasks to reforest and conserve timberlands and to maintain forest facilities, such as roads and campsites. Some forest workers, called tree planters, use digging and planting tools called "dibble bars" and "hoedads" to plant seedlings in reforesting timberland areas. Forest workers also remove diseased or undesirable trees with power saws or handsaws, spray trees with insecticides and fungicides to kill insects and to protect against disease, and apply herbicides on undesirable brush to reduce competing vegetation. In private industry, forest workers usually working under the direction of professional foresters, paint boundary lines, assist with controlled burning, aid in marking and measuring trees, and keep tallies of trees examined and counted. Those who work for state and local governments or who are under contract with them also clear away brush and debris from camp trails, roadsides, and camping areas. Some forest workers clean kitchens and rest rooms at recreational facilities and campgrounds.

Other forest and conservation workers work in forest nurseries, sorting out tree seedlings and discarding those not meeting standards of root formation, stem development, and condition of foliage.

Some forest workers are employed on tree farms, where they plant, cultivate, and harvest many different kinds of trees. Their duties vary with the type of farm. Those who work on specialty farms, such as farms growing Christmas or ornamental trees for nurseries, are responsible for shearing treetops and limbs to control the growth of the trees under their care, to increase the density of limbs, and to improve the shapes of the trees. In addition, these workers' duties include planting the seedlings, spraying to control surrounding weed growth and insects, and harvesting the trees.

Other forest workers gather, by hand or with the use of hand tools, products from the woodlands, such as decorative greens, tree cones and barks, moss, and other wild plant life. Still others tap trees for sap to make syrup or chemicals.

Logging workers are responsible for cutting and hauling trees in large quantities. The timber-cutting and logging process is carried out by a logging crew. A typical crew might consist of one or two tree fallers or one tree harvesting machine operator to cut down trees, one bucker to cut logs, two logging skidder operators to drag cut trees to the loading deck, and one equipment operator to load the logs onto trucks.

Specifically, *fallers,* commonly known as *tree fallers,* cut down trees with hand-held power chain saws or mobile felling machines. Usually using gas-powered chain saws, *buckers* trim off the tops and branches and buck (cut) the resulting logs into specified lengths. *Choke setters* fasten chokers (steel cables or chains) around logs to be skidded (dragged) by tractors or forwarded by the cable-yarding system to the landing or deck area, where the logs are separated by species and type of product, such as pulpwood, saw logs, or veneer logs, and loaded onto trucks. *Rigging slingers* and *chasers* set up and dismantle the cables and guy wires of the yarding system. *Log sorters*, *markers*, *movers*, and *chippers* sort, mark, and move logs, based on species, size, and ownership, and tend machines that chip up logs.

Logging equipment operators use tree harvesters to fell the trees, shear the limbs off, and then cut the logs into desired lengths. They drive tractors mounted on crawler tracks and operate self-propelled machines called skidders or forwarders, which drag or transport logs from the felling site in the woods to the log landing area for loading. They also operate grapple loaders, which lift and load logs into trucks. Some logging equipment operators, usually at a sawmill or a pulp-mill woodyard, use a tracked or wheeled machine similar to a forklift to unload logs and pulpwood off of trucks or gondola railroad cars. Some newer, more efficient logging equipment has state-of-the-art computer technology, requiring skilled operators with more training.

Log graders and *scalers* inspect logs for defects, measure logs to determine their volume, and estimate the marketable content or value of logs or pulpwood. These workers often use hand-held data collection devices to enter data about individual trees; later, the data can be downloaded or sent from the scaling area to a central computer via modem.

Other timber-cutting and logging workers have a variety of responsibilities. Some hike through forests to assess logging conditions. Some clear areas of brush and other growth to prepare for logging activities or to promote the growth of desirable species of trees.

Most crews work for self-employed logging contractors who have substantial logging experience, the capital to purchase equipment, and the skills needed to run a small business successfully. Many contractors work alongside their crews as supervisors and often operate one of the logging machines, such as the grapple loader or the tree harvester. Some manage more than one crew and function as owner-supervisors.

Although timber-cutting and logging equipment has greatly improved and operations are becoming increasingly mechanized, many logging jobs still are dangerous and very labor intensive. These jobs require various levels of skill, ranging from the unskilled task of manually moving logs, branches, and equipment to skillfully using chain saws to fell trees, and heavy equipment to skid and load logs onto trucks. To keep costs down, many timber-cutting and logging workers maintain and repair the equipment they use. A skillful, experienced logging worker is expected to handle a variety of logging operations.

Work environment. Forestry and logging jobs are physically demanding. Workers spend all their time outdoors, sometimes in poor weather and often in isolated areas. The increased use of enclosed machines has decreased some of the discomforts caused by inclement weather and has generally made tasks much safer. Workers in some sparsely populated western states, as well as northern Maine, commute long distances between their homes and logging sites. A few logging camps in Alaska and Maine house workers in bunkhouses. In the more densely populated eastern and southern states, commuting distances are shorter.

Most logging occupations involve lifting, climbing, and other strenuous activities, although machinery has eliminated some heavy labor. Loggers work under unusually hazardous conditions. Falling branches, vines, and rough terrain are constant hazards, as are the dangers associated with tree-felling and log-handling operations.

Special care must be taken during strong winds, which can even halt logging operations. Slippery or muddy ground, hidden roots, or vines not only reduce efficiency, but also present a constant danger, especially in the presence of moving vehicles and machinery. Poisonous plants, brambles, insects, snakes, heat, humidity, and extreme cold are everyday occurrences where loggers work. The use of hearing protection devices is required on logging operations because the high noise level of felling and skidding operations over long periods may impair one's hearing. Workers must be careful and use proper safety measures and equipment such as hardhats, eye and ear protection, safety clothing, and boots to reduce the risk of injury.

The jobs of forest and conservation workers generally are much less hazardous than those of loggers. It may be necessary for some forestry aides or forest workers to walk long distances through densely wooded areas to accomplish their work tasks.

Training, Other Qualifications, and Advancement

Most forest, conservation, and logging workers develop skills through on-the-job training, learning from experienced workers.

Education and training. Generally, a high school diploma is sufficient for most forest, conservation, and logging occupations. Many forest worker jobs offer only seasonal employment during warm-weather months, so many students are hired to perform short-term, labor-intensive tasks, such as planting tree seedlings or conducting precommercial tree thinning.

Through on-the-job training, logging workers become familiar with the character and dangers of the forest environment and the operation of logging machinery and equipment. Safety training is a vital and required part of the instruction of all logging workers. Many state forestry or logging associations provide training sessions for tree fallers, whose job duties require more skill and experience than do other positions on the logging team. Sessions may take place in the field, where trainees, under the supervision of an experienced logger, have the opportunity to practice various felling techniques. Fallers learn how to manually cut down extremely large or expensive trees safely and with minimal damage to the felled or surrounding trees.

Training programs for loggers and foresters are common in many states. These training programs also include sessions on encouraging the health and productivity of the nation's forests through the forest product industry's Sustainable Forest Initiative program. Logger training programs vary by state but generally include classroom or field training in a number of areas, including best management practices, environmental compliance, wetlands, safety, endangered species, reforestation, and business management. Some programs lead to logger certification.

Logging companies and trade associations, such as the Northeastern Loggers Association, the American Loggers Council, and the Forest Resources Association, Inc. also offer training programs for workers who operate large, expensive machinery and equipment. Often, a representative of the equipment manufacturer spends several days in the field explaining and overseeing the operation of newly purchased machinery.

Some vocational and technical schools and community colleges offer courses leading to a two-year technical degree in forestry, wildlife management, conservation, and forest harvesting, all of which are helpful in obtaining a job. A curriculum that includes field trips to observe or participate in forestry or logging activities provides a particularly good background. Additionally, a few community colleges offer training for equipment operators.

Other qualifications. Forest, conservation, and logging workers must be in good health and able to work outdoors every day. They also must be able to work as part of a team. Many logging occupations require physical strength and stamina. Maturity and good judgment are important in making quick, intelligent decisions when hazards arise. Mechanical aptitude and coordination are necessary for operators of machinery and equipment, who often are responsible for repair and maintenance. Self-employed loggers need initiative and managerial and business skills to be successful as logging contractors.

Advancement. Logging workers generally advance from tasks requiring a lot of manual labor to those involving the operation of expensive, sometimes complicated logging equipment. Inexperienced entrants usually begin as laborers, carrying tools and equipment, clearing brush, performing equipment maintenance, and loading and unloading logs and brush. For some, familiarization with logging operations may lead to jobs such as log-handling equipment operator. Further experience may lead to jobs involving the operation of more complicated machinery and yarding towers to transport, load, and unload logs. Those who have the motor skills required for the efficient use of power saws and other equipment may become fallers and buckers.

Some experienced logging workers start their own logging contractor businesses, but to do so they also need some basic business skills, which are essential in today's tight business climate.

Employment

Forest, conservation, and logging workers held about 88,000 jobs in 2006 in the following occupations:

Logging equipment operators	40,000
Forest and conservation workers	20,000
Fallers	13,000
Log graders and scalers	7,100
Logging workers, all others	8,000

About 34 percent of all forest and conservation workers work for government, primarily at the state and local level. About 33 percent are employed by companies that operate timber tracts, tree farms, or forest nurseries, or for contractors that supply services to agriculture and forestry industries. Some of those employed in forestry services work on a contract basis for the U.S. Department of Agriculture's Forest Service. Self-employed forest and conservation workers make up nearly 15 percent of the occupation.

Although forest and conservation workers are located in every state, employment is concentrated in the West and Southeast, where many national and private forests and parks are located. Seasonal demand for forest, conservation, and logging workers can vary by region and time of year. For northern states in particular, winter weather can interrupt forestry and logging operations, although some logging can be done in winter.

More than half of all logging workers work for the logging industry. Another 28 percent are self-employed, who mostly work under contract to landowners and the logging industry. About 10 percent work for sawmills and other businesses in the wood product manufacturing industry.

Job Outlook

Overall employment of forest, conservation, and logging workers is expected to experience little or no change through the year 2016. Most job openings will result from replacement needs because some forestry workers are young people who are not committed to the occupation on a long-term basis.

Employment change. Employment of forest, conservation, and logging workers overall is expected to decline slightly by 1 percent over the 2006–2016 decade. Forest and conservation workers is the only occupation in this group that is expected to have job growth, increasing 6 percent over the 10 years. Demand for forest and con-

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16 Number	Change, 2006-16 Percent
Forest, conservation, and logging workers	45-4000	88,000	87,000	-1,200	-1
Forest and conservation workers	45-4011	20,000	21,000	1,100	6
Logging workers	45-4020	69,000	66,000	-2,300	-3
Fallers	45-4021	13,000	12,000	-1,000	-7
Logging equipment operators	45-4022	40,000	40,000	-500	-1
Log graders and scalers	45-4023	7,100	6,700	-400	-5
Logging workers, all other	45-4029	7,900	7,500	-500	-6

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

servation workers will increase as more land is set aside to protect natural resources or wildlife habitats. In addition, more jobs may be created by recent federal legislation designed to prevent destructive wildfires by thinning the forests and setting controlled burns in dry regions susceptible to forest fires.

Logging workers are expected to decline by 3 percent from 2006 to 2016. New policies allowing some access to federal timberland may create some logging jobs, and job opportunities also will arise from timber sales of owners of privately owned forests and tree farms. Nevertheless, domestic timber producers continue to face increasing competition from foreign producers, who can harvest the same amount of timber at lower cost. As competition increases, the logging industry is expected to continue to consolidate in order to reduce costs, eliminating some jobs.

Increased mechanization of logging operations and improvements in logging equipment will continue to depress demand for many manual timber-cutting and logging workers. Employment of fallers, buckers, choke setters, and other workers whose jobs are labor intensive should decline as more laborsaving equipment is used. Employment of machinery and equipment operators, such as tree harvesting, skidding, and log-handling equipment operators, will be less adversely affected and should rise slightly as logging companies switch away from manual tree felling.

Job prospects. Despite the projection for little to no change in overall employment, prospects for forest and conservation workers should be good. Job openings will come from the large numbers of workers who leave these jobs on a seasonal basis and from an increase in retirements expected over the next decade. Also, many logging workers will transfer to other jobs that are less physically demanding, dangerous, and prone to layoffs.

But employment of forest, conservation, and logging workers can sometimes be unsteady. Weather can curtail the work of forest and conservation workers during the muddy spring season and the cold winter months, depending on the geographic region. Changes in the level of construction, particularly residential construction, also cause slowdowns in logging activities in the short term. In addition, logging operations must be relocated when timber in a particular area has been harvested. During prolonged periods of inactivity, some workers may stay on the job to maintain or repair logging machinery and equipment, but others are laid off or forced to find jobs in other occupations.

Earnings

Earnings vary with the particular forestry or logging occupation and with experience. Many beginning or inexperienced workers earn the federal minimum wage of $5.85 an hour, but many states set minimum wages higher than the federal minimum. Under federal law, this wage will increase to $6.55 in the summer of 2008 and to $7.25 in the summer of 2009. Earnings range from the minimum wage in some beginning forestry and conservation positions to over $26.00 an hour for the most experienced fallers.

Median hourly earnings in 2006 for forest, conservation, and logging occupations were as follows:

Logging equipment operators	$14.28
Log graders and scalers	14.06
Fallers	13.80
Forest and conservation workers	10.01

Earnings of logging workers vary by size of establishment and by geographic area. Workers in the largest establishments earn more than those in the smallest ones. Workers in Alaska and the Northwest earn more than those in the South, where the cost of living is generally lower.

Forest and conservation workers who work for state and local governments or for large, private firms generally enjoy more generous benefits than do workers in smaller firms. Small logging contractor firms generally offer timber-cutting and logging workers few benefits beyond vacation days. However, some employers offer full-time workers basic benefits, such as medical coverage, and provide safety apparel and equipment.

Related Occupations

Other occupations concerned with the care of trees and their environment include conservation scientists and foresters, forest and conservation technicians, and grounds maintenance workers. Logging equipment operators have skills similar to material moving occupations and construction equipment operators.

Boilermakers

(O*NET 47-2011.00)

Significant Points

- Boilermakers use potentially dangerous equipment and the work is physically demanding.
- Most boilermakers learn through a formal apprenticeship; people with a welding certification or other welding training get priority in selection to apprenticeship programs.
- Excellent employment opportunities are expected.

Nature of the Work

Boilermakers and *boilermaker mechanics* make, install, and repair boilers, closed vats, and other large vessels or containers that hold liquids and gases. Boilers heat water or other fluids under extreme pressure for use in generating electric power and to provide heat and power in buildings, factories, and ships. Chemicals, oil, beer, and hundreds of other products are processed and stored in the tanks and vats made by the nation's boilermakers.

In addition to installing and maintaining boilers and other vessels, boilermakers also help erect and repair air pollution equipment, blast furnaces, water treatment plants, storage and process tanks, and smoke stacks. Boilermakers also install refractory brick and other heat-resistant materials in fireboxes or pressure vessels. Some install and maintain the huge pipes used in dams to send water to and from hydroelectric power generation turbines.

Electric power plants harness highly pressurized steam in a boiler to spin the blades of a turbine, which is attached to an electric generator. In most plants, coal burned in a firebox is the dominant fuel used to generate steam in the boiler.

Because boilers last a long time—sometimes 50 years or more—boilermakers regularly maintain them and upgrade components, such as boiler tubes, heating elements, and ductwork, to increase efficiency. They regularly inspect fittings, feed pumps, safety and check valves, water and pressure gauges, boiler controls, and auxiliary machinery. For closed vats and other large vessels, boilermakers clean or supervise cleaning using scrapers, wire brushes, and cleaning solvents. They repair or replace defective parts using hand and power tools, gas torches, and welding equipment, and may operate metalworking machinery to repair or make parts. They also dismantle leaky boilers, patch weak spots with metal stock, replace defective sections, and strengthen joints.

Many boilermakers learn their trade through a formal apprenticeship.

Boilers and other high-pressure vessels used to hold liquids and gases usually are made in sections by casting each piece out of steel, iron, copper, or stainless steel. Manufacturers are increasingly automating this process to improve the quality of these vessels. Boiler sections are then welded together, often using robotic welding systems or automated orbital welding machines, which make more consistent welds than are possible by hand and eliminates some of the monotony of the task. Small boilers may be assembled in the manufacturing plant; larger boilers usually are prefabricated in numerous pieces and assembled on site, although they may be temporarily assembled in a fabrication shop to ensure a proper fit before final assembly on the permanent site.

Before making or repairing a fabricated metal product, a boilermaker studies design drawings and creates full size patterns or templates, using straightedges, squares, transits, and tape measures. After the various sized shapes and pieces are marked out on metal, boilermakers use hand and power tools or flame cutting torches to make the cuts. The sections of metal are then bent into shape and accurately lined up before they are welded together. If the plate sections are very large, heavy cranes are used to lift the parts into place. Boilermakers align sections using plumb bobs, levels, wedges, and turnbuckles. They use hammers, files, grinders, and cutting torches to remove irregular edges so that metal pieces fit together properly. They then join them by bolting, welding, or riveting. Boilermakers also align and attach water tubes, stacks and liners, safety and check valves, water and pressure gauges, and other parts and test complete vessels for leaks or other defects.

Work environment. Boilermakers often use potentially dangerous equipment, such as acetylene torches and power grinders; handle heavy parts and tools; and work on ladders or on top of large vessels. Dams, boilers, storage tanks, and pressure vessels are usually of substantial size, thus a major portion of boilermaker work is performed at great heights, sometimes hundreds of feet above the ground in the case of dams. The work is physically demanding and may be done in cramped quarters inside boilers, vats, or tanks that are often dark, damp, and poorly ventilated. Field construction work is performed outside so exposure to all types of weather conditions, including extreme heat and cold, is common. To reduce the chance of injuries, boilermakers often wear hardhats, harnesses, protective clothing, ear plugs, safety glasses and shoes, and respirators.

Boilermakers may experience extended periods of overtime when equipment is shut down for maintenance. Overtime work also may be necessary to meet construction or production deadlines. However, since most field construction and repair work is contract work, there may be periods of unemployment when a contract is complete. Many boilermakers must travel to a project and live away from home for long periods of time.

Training, Other Qualifications, and Advancement

Most boilermakers learn this trade through a formal apprenticeship. A few become boilermakers through a combination of trade or technical school training and employer-provided training.

Education and training. Most boilermakers train in both boilermaking and structural fabrication. Apprenticeship programs usually

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Boilermakers	47-2011	18,000	20,000	2,500	14

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

consist of 6,000 hours or 4 years of paid on-the-job training, supplemented by a minimum of 144 hours of classroom instruction each year in subjects such as set-up and assembly rigging, plate and pressure welding, blueprint reading, and layout. Those who finish registered apprenticeships are certified as fully qualified journey-workers.

Most apprentices must be high school graduates or have a GED or its equivalent. Those with welding training or a welding certification will have priority in applying for apprenticeship programs. Experienced boilermakers often attend apprenticeship classes or seminars to learn about new equipment, procedures, and technology. When an apprenticeship becomes available, the local union publicizes the opportunity by notifying local vocational schools and high school vocational programs.

Other qualifications. The work of boilermakers requires a high degree of technical skill, knowledge, and dedication. Because the tools and equipment used by boilermakers are typically heavier and more cumbersome than those in other construction trades, having physical strength and stamina is important. Good manual dexterity is also important. Most apprentices must be at least 18 years old.

Advancement. Some boilermakers advance to supervisory positions. Because of their extensive training, those trained through apprenticeships usually have an advantage in getting promoted over those who have not gone through the full program.

Employment

Boilermakers held about 18,000 jobs in 2006. About 63 percent worked in the construction industry, assembling and erecting boilers and other vessels. Around 18 percent worked in manufacturing, primarily in boiler manufacturing shops, iron and steel plants, petroleum refineries, chemical plants, and shipyards. Some also worked for boiler repair firms or railroads.

Job Outlook

Employment of boilermakers is expected to grow faster than average. Excellent employment opportunities are expected.

Employment change. Overall employment of boilermakers is expected to grow by 14 percent between 2006 and 2016, faster than the average for all occupations. Growth will be driven by the need to maintain and upgrade, rather than replace, the many existing boilers that are getting older, and by the need to meet the growing population's demand for electric power. While boilers historically have lasted over 50 years, the need to replace components, such as boiler tubes, heating elements, and ductwork, is an ongoing process that will continue to spur demand for boilermakers. To meet the requirements of the Clean Air Act, utility companies also will need to upgrade many of their boiler systems in the next few years.

The Energy Policy Act of 2005 is expected to lead to the construction of many new clean-burning coal power plants, spurring demand for boilermakers. The law, designed to promote conservation and use of cleaner technologies in energy production through tax credits and higher efficiency standards, is expected to positively affect the occupation and the energy industry throughout the 2006–2016 projection period.

Installation of new boilers and pressure vessels, air pollution equipment, blast furnaces, water treatment plants, storage and process tanks, electric static precipitators, and stacks and liners, will further drive growth of boilermakers, although to a slightly lesser extent than repairs will.

Job prospects. Job prospects should be excellent because of job growth and because the work of a boilermaker remains hazardous and physically demanding, leading some new apprentices to seek other types of work. An even greater number of openings will arise from the numerous boilermakers expected to retire over the projection decade.

People who have welding training or a welding certificate should have the best opportunities for being selected for boilermaker apprenticeship programs.

Most industries that purchase boilers are sensitive to economic conditions. Therefore, during economic downturns, boilermakers in the construction industry may be laid off. However, maintenance and repairs of boilers must continue even during economic downturns so boilermaker mechanics in manufacturing and other industries generally have more stable employment.

Earnings

In May 2006, the median annual earnings of wage and salary boilermakers were about $46,960. The middle 50 percent earned between $37,300 and $59,710. The lowest 10 percent earned less than $30,410, and the highest 10 percent earned more than $71,170. Apprentices generally start at about half of journey-level wages, with wages gradually increasing to the journey wage as workers gain skills.

Many boilermakers belong to labor unions, most to the International Brotherhood of Boilermakers. Other boilermakers are members of the International Association of machinists, the United Automobile Workers, or the United Steelworkers of America.

Related Occupations

Workers in a number of other occupations assemble, install, or repair metal equipment or machines. These occupations include assemblers and fabricators; machinists; industrial machinery mechanics and maintenance workers; millwrights; pipelayers, plumbers, pipefitters, and steamfitters; sheet metal workers; tool and die makers; and welding, soldering, and brazing workers.

Sources of Additional Information

For more information about boilermaking apprenticeships or other training opportunities, contact local offices of the unions previously mentioned, local construction companies and boiler manufacturers, or the local office of your state employment service. You can also find information on the registered apprenticeships together with links to state apprenticeship programs on the U.S. Department of Labor's Web site: http://www.doleta.gov/atels_bat. Apprenticeship information is also available from the U.S. Department of Labor's toll free helpline: (877) 872-5627.

For information on apprenticeships and the boilermaking occupation, contact

➤ International Brotherhood of Boilermakers, Iron Ship Builders, Blacksmiths, Forgers, and Helpers, 753 State Ave., Suite 570, Kansas City, KS 66101. Internet: http://www.boilermakers.org

For general information on apprenticeships and how to get them, see the *Occupational Outlook Quarterly* article "Apprenticeships: Career training, credentials—and a paycheck in your pocket," online at http://www.bls.gov/opub/ooq/2002/summer/art01.pdf and in print at many libraries and career centers.

Brickmasons, Blockmasons, and Stonemasons

(O*NET 47-2021.00 and 47-2022.00)

Significant Points

- Job prospects are expected to be very good, especially for workers with restoration skills.
- Most entrants learn informally on the job, but apprenticeship programs provide the most thorough training.
- The work is usually outdoors and involves lifting heavy materials and working on scaffolds.
- About 24 percent are self-employed.

Nature of the Work

Brickmasons, blockmasons, and stonemasons create attractive, durable surfaces and structures. For thousands of years, these workers have built buildings, fences, roads, walkways, and walls using bricks, concrete blocks, and natural stone. The structures that they build will continue to be in demand for years to come.

The work varies in complexity, from laying a simple masonry walkway to installing an ornate exterior on a high-rise building. Workers cut or break the materials used to create walls, floors, and other structures. Once their building materials are properly sized, they are laid with or without a binding material. These workers use their own perceptions and a variety of tools to ensure that the structure meets the desired standards. After finishing laying the bricks, blocks, or stone, these workers clean the finished product with a variety of cleaning agents.

Brickmasons and *blockmasons*—who often are called simply *bricklayers*—build and repair walls, floors, partitions, fireplaces, chimneys, and other structures with brick, precast masonry panels, concrete block, and other masonry materials. Some brickmasons specialize in installing firebrick linings in industrial furnaces.

When building a structure, brickmasons use one of two methods, either the corner lead or the corner pole. Using the corner lead method, they begin by constructing a pyramid of bricks at each corner—called a lead. After the corner leads are complete, less experienced brickmasons fill in the wall between the corners using a line from corner to corner to guide each course, or layer, of brick. Due to the precision needed, corner leads are time-consuming to erect and require the skills of experienced bricklayers.

Because of the expense associated with building corner leads, some brickmasons use corner poles, also called masonry guides, which enable them to build an entire wall at the same time. They fasten the corner poles (posts) in a plumb position to define the wall line and stretch a line between them. This line serves as a guide for each course of brick. Brickmasons then spread a bed of mortar (a cement, lime, sand, and water mixture) with a trowel (a flat, bladed metal tool with a handle), place the brick on the mortar bed, and press and tap the brick into place. Depending on blueprint specifications, brickmasons either cut bricks with a hammer and chisel or saw them to fit around windows, doors, and other openings. Mortar joints are then finished with jointing tools for a sealed, neat, uniform appearance. Although brickmasons typically use steel supports, or lintels, at window and door openings, they sometimes build brick arches, which support and enhance the beauty of the brickwork.

Brickmasons, blockmasons, and stonemasons usually work outdoors.

Refractory masons are brickmasons who specialize in installing firebrick and refractory tile in high-temperature boilers, furnaces, cupolas, ladles, and soaking pits in industrial establishments. Most of these workers are employed in steel mills, where molten materials flow on refractory beds from furnaces to rolling machines. They also are employed at oil refineries, glass furnaces, incinerators, and other locations requiring high temperatures during the manufacturing process.

After a structure is completed there is still work that often needs to be done. *Pointing, cleaning, and caulking* workers can be the final workers on a job or the primary workers on a restoration project. These workers use chemicals to clean the laid materials to give the structure a finished appearance. Older structures also need to be refurbished as the mortar or binding agents break down. In many cases a grinder or blade is used to carefully remove the old mortar. Special care is taken to not damage the main structural integrity or the bricks, blocks, or stone. New mortar is then inserted. Depending on how much mortar is being replaced and how, it may take several applications to allow the new mortar to cure properly. These same

masons replace and repair damaged masonry materials as part of the building's restoration process.

Stonemasons build stone walls, as well as set stone exteriors and floors. They work with two types of stone—natural cut stone, such as marble, granite, and limestone and artificial stone made from concrete, marble chips, or other masonry materials. Stonemasons usually work on nonresidential structures, such as houses of worship, hotels, and office buildings, but they also work on residences.

Stonemasons often work from a set of drawings, in which each stone has been numbered for identification. Helpers may locate and carry these prenumbered stones to the masons. A derrick operator using a hoist may be needed to lift large stone pieces into place.

When building a stone wall, masons set the first course of stones into a shallow bed of mortar. They then align the stones with wedges, plumb lines, and levels, and work them into position with various tools. Masons continue to build the wall by alternating layers of mortar and courses of stone. As the work progresses, masons remove the wedges, fill the joints between stones, and use a pointed metal tool, called a tuck pointer, to smooth the mortar to an attractive finish. To hold large stones in place, stonemasons attach brackets to the stone and weld or bolt these brackets to anchors in the wall. Finally, masons wash the stone with a cleansing solution to remove stains and dry mortar.

When setting stone floors, which often consist of large and heavy pieces of stone, masons first use a trowel to spread a layer of damp mortar over the surface to be covered. Using crowbars and hard rubber mallets for aligning and leveling, they then set the stone in the mortar bed. To finish, workers fill the joints and clean the stone slabs.

Masons use a special hammer and chisel to cut stone. They cut stone along the grain to make various shapes and sizes, and valuable pieces often are cut with a saw that has a diamond blade. Some masons specialize in setting marble which, in many respects, is similar to setting large pieces of stone. Brickmasons and stonemasons also repair imperfections and cracks, and replace broken or missing masonry units in walls and floors.

Most nonresidential buildings now are built with walls made of concrete block, brick veneer, stone, granite, marble, tile, or glass. In the past, masons doing nonresidential interior work mainly built block partition walls and elevator shafts, but because many types of masonry and stone are used in the interiors of today's nonresidential structures, these workers now must be more versatile. For example, some brickmasons and blockmasons now install structural insulated concrete units and wall panels. They also install a variety of masonry anchors and other masonry-associated accessories used in many high-rise buildings.

Work environment. Brickmasons, blockmasons, and stonemasons usually work outdoors, but in contrast to the past when work slowed down in the winter months, new processes and materials are allowing these masons to work in a greater variety of weather conditions. Masons stand, kneel, and bend for long periods and often have to lift heavy materials. Common hazards include injuries from tools and falls from scaffolds, but these can often be avoided when proper safety equipment is used and safety practices are followed.

Most workers work a standard 40-hour week. Earnings for workers in these trades can be reduced on occasion because poor weather and slowdowns in construction activity limit the time they can work.

Training, Other Qualifications, and Advancement

Most brickmasons, blockmasons, and stonemasons pick up their skills informally, observing and learning from experienced workers. Many others receive initial training in vocational education schools or from industry-based programs common throughout the country. Others complete an apprenticeship, which generally provides the most thorough training.

Education and training. Individuals who learn the trade on the job usually start as helpers, laborers, or mason tenders. These workers carry materials, move or assemble scaffolds, and mix mortar. When the opportunity arises, they learn from experienced craftworkers how to mix and spread mortar, lay brick and block, or set stone. They also may learn restoration skills such as cleaning, pointing, and repointing. As they gain experience, they learn more difficult tasks and make the transition to full-fledged craftworkers. The learning period on the job may last longer than if trained in an apprenticeship program. Industry-based training programs offered through construction companies usually last between 2 and 4 years.

Apprenticeships for brickmasons, blockmasons, and stonemasons usually are sponsored by local contractors, trade associations, or local union-management committees. Apprenticeship programs usually require 3 years of on-the-job training, in addition to a minimum of 144 hours of classroom instruction each year in blueprint reading, mathematics, layout work, sketching, and other subjects. Applicants for apprenticeships must be at least 17 years old and in good physical condition. A high school education is preferable with courses in mathematics, mechanical drawing, and general shop.

Apprentices often start by working with laborers, carrying materials, mixing mortar, and building scaffolds for about a month. Next, apprentices learn to lay, align, and join brick and block. They may also learn on the job to work with stone and concrete, which enables them to work with more than one masonry material.

Bricklayers who work in nonresidential construction usually work for large contractors and receive well-rounded training—normally through apprenticeship in all phases of brick or stone work. Those who work in residential construction usually work primarily for small contractors and specialize in only one or two aspects of the job.

Some workers learn at technical schools that offer masonry courses. Entrance requirements and fees vary depending on the school and who is funding the program. Some people take courses before being hired, and some take them later as part of the on-the-job training.

Other qualifications. The most desired quality in workers is dependability and a strong work ethic. Knowledge of basic math including measurement, volume, mixing proportions, algebra, plane geometry, and mechanical drawing are important in this trade.

Advancement. With additional training and experience, brickmasons, blockmasons, and stonemasons may become supervisors for masonry contractors. Some eventually become owners of businesses employing many workers and may spend most of their time as managers. Others move into closely related areas such as construction management or building inspection. Many unionized Joint Apprenticeship and Training Committees offer continual "life long learning" through continuing education courses that help those members who want to advance their technical knowledge and their careers.

Employment

Brickmasons, blockmasons, and stonemasons held 182,000 jobs in 2006. The vast majority were brickmasons. Workers in these crafts are employed primarily by building, specialty trade, or general contractors.

About 24 percent of brickmasons, blockmasons, and stonemasons were self-employed. Many of the self-employed are contractors who work on small jobs, such as patios, walkways, and fireplaces.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Brickmasons, blockmasons, and stonemasons	47-2020	182,000	200,000	18,000	10
Brickmasons and blockmasons	47-2021	158,000	174,000	15,000	10
Stonemasons	47-2022	24,000	26,000	2,400	10

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Job Outlook

Average employment growth is expected. Job prospects should be very good, especially for workers with restoration skills.

Employment change. Jobs for brickmasons, blockmasons, and stonemasons are expected to increase 10 percent over the 2006–2016 decade, about as fast as the average for all occupations, as population and business growth create a need for new houses, industrial facilities, schools, hospitals, offices, and other structures. Also stimulating demand for workers will be the need to restore a growing number of old brick buildings. Moreover, the use of brick and stone for decorative work on building fronts, sidewalks, and in lobbies and foyers is increasing. Brick exteriors should remain very popular, reflecting a growing preference for durable exterior materials requiring little maintenance. Increased construction on hillsides also will spur the demand for new masons as designers create attractive areas that need retaining walls to hold soil in place. There is also an increased demand for durable homes that incorporate brick or stone in hurricane-prone areas.

Job prospects. Job opportunities for brickmasons, blockmasons, and stonemasons are expected to be very good through 2016. A large number of masons are expected to retire over the next decade. The large number of aging masonry buildings will increase opportunities for workers with restoration skills. Also, workers able to install new synthetic materials will have improved opportunities. Applicants who take masonry-related courses at technical schools will have better opportunities than those without these courses.

Employment of brickmasons, blockmasons, and stonemasons, like that of many other construction workers, is sensitive to changes in the economy. When the level of construction activity falls, workers in these trades can experience periods of unemployment. On the other hand, shortages of these workers may occur in some areas during peak periods of building activity.

Earnings

Median hourly earnings of wage and salary brickmasons and blockmasons in May 2006 were $20.66. The middle 50 percent earned between $15.96 and $26.26. The lowest 10 percent earned less than $12.24, and the highest 10 percent earned more than $32.43. Median hourly earnings in the two industries employing the largest number of brickmasons in May 2006 were $20.57 in the foundation, structure, and building exterior contractors industry and $20.67 in the masonry contractors industry.

Median hourly earnings of wage and salary stonemasons in May 2006 were $17.29. The middle 50 percent earned between $13.12 and $22.04. The lowest 10 percent earned less than $10.36, and the highest 10 percent earned more than $28.46.

Apprentices or helpers usually start at about 50 percent of the wage rate paid to experienced workers. Pay increases as apprentices gain experience and learn new skills. Employers usually increase apprentices' wages about every 6 months based on specific advancement criteria.

Some brickmasons, blockmasons, and stonemasons are members of the International Union of Bricklayers and Allied Craftsworkers.

Related Occupations

Brickmasons, blockmasons, and stonemasons combine a thorough knowledge of brick, concrete block, stone, and marble with manual skill to erect attractive, yet highly durable, structures. Workers in other occupations with similar skills include carpet, floor, and tile installers and finishers; cement masons, concrete finishers, segmental pavers, and terrazzo workers; and plasterers and stucco masons.

Sources of Additional Information

For details about apprenticeships or other work opportunities in these trades, contact local bricklaying, stonemasonry, or marble-setting contractors; the Associated Builders and Contractors; a local office of the International Union of Bricklayers and Allied Craftsworkers; a local joint union-management apprenticeship committee; or the nearest office of the state employment service or apprenticeship agency. Apprenticeship information is also available from the U.S. Department of Labor's toll-free helpline: (877) 872-5627 and online at http://www.doleta.gov/atels_bat.

For general information on apprenticeships and how to get them, see the *Occupational Outlook Quarterly* article "Apprenticeships: Career training, credentials—and a paycheck in your pocket," online at http://www.bls.gov/opub/ooq/2002/summer/art01.pdf and in print in many libraries and career centers.

Carpenters

(O*NET 47-2031.00, 47-2031.01, and 47-2031.02)

Significant Points

- About 32 percent of all carpenters—the largest construction trade—are self-employed.
- Job opportunities should be best for those with the most training and skills.
- Between 3 and 4 years of both on-the-job training and classroom instruction usually is needed to become a skilled carpenter.

Nature of the Work

Carpenters are involved in many different kinds of construction, from the building of highways and bridges to the installation of kitchen cabinets. Carpenters construct, erect, install, and repair structures and fixtures made from wood and other materials.

Each carpentry task is somewhat different, but most involve the same basic steps. Working from blueprints or instructions from supervisors, carpenters first do the layout—measuring, marking, and arranging materials—in accordance with local building codes. They cut and shape wood, plastic, fiberglass, or drywall using hand and power tools, such as chisels, planes, saws, drills, and sanders. They then join the materials with nails, screws, staples, or adhesives. In the last step, carpenters do a final check of the accuracy of their work with levels, rules, plumb bobs, framing squares, and surveying equipment, and make any necessary adjustments.

When working with prefabricated components, such as stairs or wall panels, the carpenter's task is somewhat simpler because it does not require as much layout work or the cutting and assembly of as many pieces. Prefabricated components are designed for easy and fast installation and generally can be installed in a single operation.

Some carpenters do many different carpentry tasks, while others specialize in one or two. Carpenters who remodel homes and other structures, for example, need a broad range of carpentry skills. As part of a single job, for example, they might frame walls and partitions, put in doors and windows, build stairs, install cabinets and molding, and complete many other tasks. Because these carpenters are so well-trained, they often can switch from residential building to commercial construction or remodeling work, depending on which offers the best work opportunities.

Carpenters who work for large construction contractors or specialty contractors may perform only a few regular tasks, such as constructing wooden forms for pouring concrete, or erecting scaffolding. Some carpenters build tunnel bracing, or brattices, in underground passageways and mines to control the circulation of air through the passageways and to worksites. Others build concrete forms for tunnel, bridge, or sewer construction projects.

Carpenters employed outside the construction industry perform a variety of installation and maintenance work. They may replace panes of glass, ceiling tiles, and doors, as well as repair desks, cabinets, and other furniture. Depending on the employer, carpenters install partitions, doors, and windows; change locks; and repair broken furniture. In manufacturing firms, carpenters may assist in moving or installing machinery. (For more information on workers who install machinery, see the discussion of millwrights as well as industrial machinery mechanics and maintenance workers elsewhere in the *Handbook*.)

Carpenters cut and shape wood, plastic, fiberglass, or drywall using hand and power tools.

Work environment. As is true of other building trades, carpentry work is sometimes strenuous. Prolonged standing, climbing, bending, and kneeling often are necessary. Carpenters risk injury working with sharp or rough materials, using sharp tools and power equipment, and working in situations where they might slip or fall. Although many carpenters work indoors, those that work outdoors are subject to variable weather conditions.

Most carpenters work a standard 40 hour week. Hours may be longer during busy periods.

Training, Other Qualifications, and Advancement

Carpenters learn their trade through formal and informal training programs. Between 3 and 4 years of both on-the-job training and classroom instruction usually is needed to become a skilled carpenter. There are a number of ways to train, but a more formal training program often improves job opportunities.

Education and training. Learning to be a carpenter can start in high school. Classes in English, algebra, geometry, physics, mechanical drawing, blueprint reading, and general shop will prepare students for the further training they will need.

After high school, there are a number of different ways to obtain the necessary training. Some people get a job as a carpenter's helper, assisting more experienced workers. At the same time, the helper might attend a trade or vocational school, or community college to receive further trade-related training and eventually become a carpenter.

Some employers offer employees formal apprenticeships. These programs combine on-the-job training with related classroom instruction. Apprentices usually must be at least 18 years old and meet local requirements. Apprenticeship programs usually last 3 to 4 years, but length varies with the apprentice's skill.

On the job, apprentices learn elementary structural design and become familiar with common carpentry jobs, such as layout, form building, rough framing, and outside and inside finishing. They also learn to use the tools, machines, equipment, and materials of the trade. In the classroom, apprentices learn safety, first aid, blueprint reading, freehand sketching, basic mathematics, and various carpentry techniques. Both in the classroom and on the job, they learn the relationship between carpentry and the other building trades.

The number of apprenticeship programs is limited, however, so only a small proportion of carpenters learn their trade through these programs. Most apprenticeships are offered by commercial and industrial building contractors with union membership.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Carpenters	47-2031	1,462,000	1,612,000	150,000	10

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Some people who are interested in carpentry careers choose to get their classroom training before seeking a job. There are a number of public and private vocational-technical schools and training academies affiliated with unions and contractors that offer training to become a carpenter. Employers often look favorably upon these students and usually start them at a higher level than those without the training.

Other qualifications. Carpenters need manual dexterity, eye-hand coordination, physical fitness, and a good sense of balance. The ability to solve arithmetic problems quickly and accurately also is required. In addition, military service or a good work history is viewed favorably by employers.

Certification and advancement. Carpenters who complete formal apprenticeship programs receive certification as journeypersons. Some carpenters earn other certifications in scaffold building, high torque bolting, or pump work. These certifications prove that carpenters are able to perform these tasks, which can lead to additional responsibilities.

Carpenters usually have more opportunities than most other construction workers to become general construction supervisors because carpenters are exposed to the entire construction process. For those who would like to advance, it is increasingly important to be able to communicate in both English and Spanish in order to relay instructions and safety precautions to workers; Spanish-speaking workers make up a large part of the construction workforce in many areas. Carpenters may advance to carpentry supervisor or general construction supervisor positions. Others may become independent contractors. Supervisors and contractors need good communication skills to deal with clients and subcontractors. They should be able to identify and estimate the quantity of materials needed to complete a job and accurately estimate how long a job will take to complete and what it will cost.

Employment

Carpenters are employed throughout the country in almost every community and make up the largest building trades occupation. They held about 1.5 million jobs in 2006.

About 32 percent worked in construction of buildings and about 23 percent worked for specialty trade contractors. Most of the rest of the wage and salary workers worked for manufacturing firms, government agencies, retail establishments, and a wide variety of other industries. About 32 percent of all carpenters were self-employed. Some carpenters change employers each time they finish a construction job. Others alternate between working for a contractor and working as contractors themselves on small jobs, depending on where the work is available.

Job Outlook

Average job growth, coupled with replacement needs, create a large number of openings each year. Job opportunities should be best for those with the most training and skills.

Employment change. Employment of carpenters is expected to increase by 10 percent during the 2006–2016 decade, about as fast as the average for all occupations. The need for carpenters should grow as construction activity increases in response to demand for new housing and office and retail space, and for modernizing and expanding schools and industrial plants. A strong home remodeling market also will create demand for carpenters. Moreover, construction of roads and bridges as well as restaurants, hotels, and other businesses will increase the demand for carpenters in the coming decade.

Some of the demand for carpenters, however, will be offset by expected productivity gains resulting from the increasing use of prefabricated components and improved fasteners and tools. Prefabricated wall panels, roof assemblies, and stairs, as well as prehung doors and windows can be installed very quickly. Instead of having to be built on the worksite, prefabricated walls, partitions, and stairs can be lifted into place in one operation; beams and, in some cases, entire roof assemblies, are lifted into place using a crane. As prefabricated components become more standardized, builders will use them more often. In addition, improved adhesives are reducing the time needed to join materials, and lightweight, cordless, and pneumatic tools—such as nailers and drills—will all continue to make carpenters more productive. New and improved tools, equipment, techniques, and materials also have made carpenters more versatile, allowing them to perform more carpentry tasks.

Job prospects. Job opportunities should be best for those with the most training and skills. Job growth and replacement needs for those who leave the occupation create a large number of openings each year. Many people with limited skills take jobs as carpenters but eventually leave the occupation because they dislike the work or cannot find steady employment.

Carpenters with all-around skills will have better opportunities for steady work than carpenters who can perform only a few relatively simple, routine tasks. Carpenters can experience periods of unemployment because of the short-term nature of many construction projects, winter slowdowns in construction activity in northern areas, and the cyclical nature of the construction industry.

Employment of carpenters, like that of many other construction workers, is sensitive to the fluctuations of the economy. Workers in these trades may experience periods of unemployment when the overall level of construction falls. On the other hand, shortages of these workers may occur in some areas during peak periods of building activity.

Job opportunities for carpenters also vary by geographic area. Construction activity parallels the movement of people and businesses and reflects differences in local economic conditions. The areas with the largest population increases will also provide the best opportunities for jobs as carpenters and for apprenticeships for people seeking to become carpenters.

Earnings

In May 2006, median hourly earnings of wage and salary carpenters were $17.57. The middle 50 percent earned between $13.55 and $23.85. The lowest 10 percent earned less than $10.87, and the highest 10 percent earned more than $30.45. Median hourly earnings in the industries employing the largest numbers of carpenters were as follows:

Residential building construction	$17.39
Foundation, structure, and building exterior contractors	17.03
Nonresidential building construction	15.12
Building finishing contractors	13.76
Employment services	10.88

Earnings can be reduced on occasion, because carpenters lose work time in bad weather and during recessions when jobs are unavailable. Earnings may be increased by overtime during busy periods.

Some carpenters are members of the United Brotherhood of Carpenters and Joiners of America.

Related Occupations

Carpenters are skilled construction workers. Other skilled construction occupations include brickmasons, blockmasons, and stonemasons; cement masons, concrete finishers, segmental pavers, and terrazzo workers; drywall installers, ceiling tile installers, and tapers; electricians; pipelayers, plumbers, pipefitters, and steamfitters; and plasterers and stucco masons.

Sources of Additional Information

For information about carpentry apprenticeships or other work opportunities in this trade, contact local carpentry contractors, locals of the union mentioned earlier, local joint union-contractor apprenticeship committees, or the nearest office of the state employment service or apprenticeship agency. You can also find information on the registered apprenticeship system with links to state apprenticeship programs on the U.S. Department of Labor's Web site: http://www.doleta.gov/atels_bat. Apprenticeship information is also available from the U.S. Department of Labor's toll-free helpline: (877) 872-5627.

Carpet, Floor, and Tile Installers and Finishers

(O*NET 47-2041.00, 47-2042.00, 47-2043.00, and 47-2044.00)

Significant Points

- About 42 percent of carpet, floor, and tile installers and finishers are self-employed.
- Most workers learn on the job.
- Projected job growth varies by specialty; for example, tile and marble setters will have faster-than-average job growth, while little change is expected in the employment of carpet installers.
- Employment is less sensitive to fluctuations in construction activity than other construction trades workers.

Nature of the Work

Carpet, tile, and other types of floor coverings not only serve an important basic function in buildings, but their decorative qualities also contribute to the appeal of the buildings. Carpet, floor, and tile installers and finishers lay floor coverings in homes, offices, hospitals, stores, restaurants, and many other types of buildings. Tile also may be installed on walls and ceilings.

Before installing carpet, *carpet installers* first inspect the surface to be covered to determine its condition and, if necessary, correct any imperfections that could show through the carpet or cause the carpet to wear unevenly. They measure the area to be carpeted and plan the layout, keeping in mind expected traffic patterns and placement of seams for best appearance and maximum wear.

When installing wall-to-wall carpet without tacks, installers first fasten a tackless strip to the floor, next to the wall. They then install the padded cushion or underlay. Next, they roll out, measure, mark, and cut the carpet, allowing for 2 to 3 inches of extra carpet for the final fitting. Using a device called a "knee kicker," they position the carpet, stretching it to fit evenly on the floor and snugly against each wall and door threshold. They then cut off the excess carpet. Finally, using a power stretcher, they stretch the carpet, hooking it to the tackless strip to hold it in place. The installers then finish the edges using a wall trimmer.

Because most carpet comes in 12-foot widths, wall-to-wall installations require installers to join carpet sections together for large rooms. The installers join the sections using heat-taped seams—seams held together by a special plastic tape that is activated by heat.

On special upholstery work, such as stairs, carpet may be held in place with staples. Also, in commercial installations, carpet often is glued directly to the floor or to padding that has been glued to the floor.

Carpet installers use hand tools such as hammers, drills, staple guns, carpet knives, and rubber mallets. They also may use carpet-laying tools, such as carpet shears, knee kickers, wall trimmers, loop pile cutters, heat irons, and power stretchers.

Floor installers and floor layers lay floor coverings such as laminate, linoleum, vinyl, cork, and rubber for decorative purposes, or to deaden sounds, absorb shocks, or create air-tight environments. Although they also may install carpet, wood or tile, that is not their main job. Before installing the floor, floor layers inspect the surface to be covered and, if necessary, correct any deficiencies, such as a rotted or unleveled sub-floor, in order to start with a sturdy, smooth, clean foundation. They measure and cut floor covering materials. When installing linoleum or vinyl, they may use an adhesive to cement the material directly to the floor. For laminate floor installation, workers may unroll and install a polyethylene film which acts as a moisture barrier, along with a thicker, padded underlayer which helps reduce noise. Cork and rubber floors often can be installed directly on top of the sub-floor without any underlayer. Finally, floor layers install the floor covering to form a tight fit.

After a carpenter installs a new hardwood floor or when a customer wants to refinish an old wood floor, *floor sanders and finishers* are called in to smooth any imperfections in the wood and apply finish coats of varnish or polyurethane. To remove imperfections and smooth the surface, they will scrape and sand wooden floors

Prior to installing tile, tilesetters use measuring devices and levels to ensure that the tile is placed in a consistent manner.

using floor sanding machines. They then inspect the floor and remove excess glue from joints using a knife or wood chisel and may further sand the wood surfaces by hand, using sandpaper. Finally, they apply sealant using brushes or rollers, often applying multiple coats.

Tile installers, *tilesetters*, and *marble setters* apply hard tile and marble to floors, walls, ceilings, countertops, patios, and roof decks. Tile and marble are durable, impervious to water, and easy to clean, making them a popular building material in bathrooms, kitchens, hospitals, and commercial buildings.

Prior to installation, tilesetters use measuring devices and levels to ensure that the tile is placed in a consistent manner. Tile varies in color, shape, and size, ranging in size from 1 inch to 24 or more inches on a side, so tilesetters sometimes prearrange tiles on a dry floor according to the intended design. This allows them to examine the pattern, check that they have enough of each type of tile, and determine where they will have to cut tiles to fit the design in the available space. To cover all exposed areas, including corners and around pipes, tubs, and wash basins, tilesetters cut tiles to fit with a machine saw or a special cutting tool. To set tile on a flat, solid surface such as drywall, concrete, plaster, or wood, tilesetters first use a tooth-edged trowel to spread a "thin set," or thin layer of cement adhesive or "mastic," a very sticky paste. They then properly position the tile and gently tap the surface with their trowel handle, rubber mallet, or a small block of wood to set the tile evenly and firmly. Spacers are used to maintain exact distance between tiles, and any excess thin set is wiped off the tile immediately after placement.

To apply tile to an area that lacks a solid surface, tilesetters nail a support of metal mesh or tile backer board to the wall or ceiling to be tiled. They use a trowel to apply a cement mortar—called a "scratch coat"—onto the metal screen, and scratch the surface of the soft mortar with a small tool similar to a rake. After the scratch coat has dried, tilesetters apply a brown coat of mortar to level the surface, and then apply mortar to the brown coat and place tile onto the surface. Hard backer board also is used in areas where there is excess moisture, such as a shower stall.

When the cement or mastic has set, tilesetters fill the joints with "grout," which is very fine cement and includes sand for joints 1/8th of an inch and larger. They then apply the grout to the surface with a rubber-edged device called a grout float or a grouting trowel to fill the joints and remove excess grout. Before the grout sets, they wipe the tiles and finish the joints with a damp sponge for a uniform appearance.

Marble setters cut and set marble slabs in floors and walls of buildings. They trim and cut marble to specified sizes using a power wet saw, other cutting equipment, or hand tools. After setting the marble in place, they polish the marble to high luster using power tools or by hand.

Work environment. Carpet, floor, and tile installers and finishers usually work indoors and have regular daytime hours. However, when floor covering installers need to work in occupied stores or offices, they may work evenings and weekends to avoid disturbing customers or employees. By the time workers install carpets, flooring, or tile in a new structure, most construction has been completed and the work area is relatively clean and uncluttered. Installing these materials is labor intensive; workers spend much of their time bending, kneeling, and reaching—activities that require endurance. The work can be very hard on workers' knees and back. Carpet installers frequently lift heavy rolls of carpet and may move heavy furniture, which requires strength and can be physically exhausting. Safety regulations may require that they wear kneepads or safety goggles when using certain tools. Carpet and floor layers may be exposed to fumes from various kinds of glue and to fibers of certain types of carpet.

Although workers are subject to cuts from tools or materials, falls from ladders, and strained muscles, the occupation is not as hazardous as some other construction occupations.

Training, Other Qualifications, and Advancement

The vast majority of carpet, floor, and tile installers and finishers learn their trade informally on the job. A few, mostly tile setters, learn through formal apprenticeship programs, which include classroom instruction and paid on-the-job training.

Education and training. Informal training for carpet installers often is sponsored by individual contractors. Workers start as helpers, and begin with simple assignments, such as installing stripping and padding, or helping to stretch newly installed carpet. With experience, helpers take on more difficult assignments, such as measuring, cutting, and fitting.

Tile and marble setters also learn their craft mostly through on-the-job training. They start by helping carry materials and learning about the tools of the trade. They then learn to prepare the subsurface for tile or marble. As they progress, they learn to cut the tile and marble to fit the job. They also learn to apply grout and sealants used in finishing the materials to give it its final appearance. Apprenticeship programs and some contractor-sponsored programs provide comprehensive training in all phases of the tilesetting and floor layer trades.

Other floor layers also learn on the job and begin by learning how to use the tools of the trade. They next learn to prepare surfaces to receive flooring. As they progress, they learn to cut and install the various floor coverings.

Other qualifications. Some skills needed to become carpet, floor, and tile installers and finishers include manual dexterity, eye-hand coordination, physical fitness, and a good sense of balance and color. The ability to solve basic arithmetic problems quickly and accurately also is required. In addition, reliability and a good work history are viewed favorably by contractors.

Advancement. Carpet, floor, and tile installers and finishers sometimes advance to become supervisors, salespersons, or estimators. In these positions, they must be able to estimate the time, money, and quantity of materials needed to complete a job.

Some carpet installers may become managers for large installation firms. Many carpet, floor, and tile installers and finishers who begin working for someone else eventually go into business for themselves as independent subcontractors.

For those who would like to advance, it is increasingly important to be able to communicate in both English and Spanish to relay instructions and safety precautions to workers with limited understanding of English; Spanish-speaking workers make up a large part of the construction workforce in many areas. Workers who want to advance to supervisor jobs or become contractors also need good English skills to deal with clients and subcontractors.

Employment

Carpet, floor, and tile installers and finishers held about 196,000 jobs in 2006. About 42 percent of all carpet, floor, and tile installers and finishers were self-employed, compared with 20 percent of all construction trades and related workers. The following tabulation shows 2006 wage-and-salary employment by specialty:

Tile and marble setters	79,000
Carpet installers	73,000
Floor layers, except carpet, wood, and hard tiles	29,000
Floor sanders and finishers	14,000

Many carpet installers work for flooring contractors or floor covering retailers. Most salaried tilesetters are employed by tilesetting contractors who work mainly on nonresidential construction projects, such as schools, hospitals, and office buildings. Most self-employed tilesetters work on residential projects.

Although carpet, floor, and tile installers and finishers are employed throughout the nation, they tend to be concentrated in populated areas where there are high levels of construction activity.

Job Outlook

Employment of carpet, floor, and tile installers and finishers is expected to grow more slowly than the average for all occupations. Job growth and opportunities, however, will differ among the individual occupations.

Employment change. Overall employment is expected to grow by 4 percent between 2006 and 2016, more slowly than the average for all occupations. Tile and marble setters, the largest specialty, will experience faster than average job growth because population and business growth will result in more construction of shopping malls, hospitals, schools, restaurants, and other structures in which tile is used extensively. Tiles, including those made of glass, slate, and mosaic, and other less traditional materials, are also becoming more popular, particularly in the growing number of more expensive homes.

Carpet installers, the second largest specialty, will have little or no job growth as residential investors and homeowners increasingly choose hardwood floors because of their durability, neutral colors, and low maintenance, and because owners feel these floors will add to the value of their homes. Carpets, on the other hand, stain and wear out faster than wood or tile, which contributes to the decreased demand for carpet installation. Nevertheless, carpet will continue to be used in nonresidential structures such as schools, offices, and hospitals. Also, many multifamily structures will require or recommend carpet because it provides sound dampening.

Workers who install other types of flooring, including laminate, cork, rubber, and vinyl, should experience rapidly declining employment because these materials are used less often and are often laid by other types of construction workers. Employment of floor sanders and finishers—a small specialty—is projected to have little or no job growth due to the increasing use of prefinished hardwood flooring and because their work is heavily concentrated in the relatively small niche market of residential remodeling. There should be some employment growth, however, resulting from restoration of damaged hardwood floors, which is typically more cost effective than installing new floors.

Job prospects. In addition to employment growth, job openings are expected for carpet, floor, and tile installers and finishers because of the need to replace workers who leave the occupation. The strenuous nature of the work leads to high replacement needs because many of these workers do not stay in the occupation long.

Few openings will arise for vinyl and linoleum floor installers because the number of these jobs is comparatively small and because homeowners can increasingly take advantage of easy application products, such as self-adhesive vinyl tiles.

Employment of carpet, floor, and tile installers and finishers is slightly less sensitive to changes in construction activity than most other construction occupations because much of the work involves replacing worn carpet and other flooring in existing buildings. However, workers in these trades may still experience periods of unemployment when the overall level of construction falls. On the other hand, shortages of these workers may occur in some areas during peak periods of building activity.

Earnings

In May 2006, the median hourly earnings of wage and salary carpet installers were $16.62. The middle 50 percent earned between $12.06 and $23.26. The lowest 10 percent earned less than $9.46, and the top 10 percent earned more than $31.11. The median hourly earnings of carpet installers working for building finishing contractors were $17.17, and $15.69 for those working in home furnishings stores. Carpet installers are paid either on an hourly basis or by the number of yards of carpet installed.

Median hourly earnings of wage and salary floor layers except carpet, wood, and hard tiles were $16.44 in May 2006. The middle 50 percent earned between $12.71 and $23.78. The lowest 10 percent

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Carpet, floor, and tile installers and finishers	47-2040	196,000	203,000	7,500	4
Carpet installers	47-2041	73,000	72,000	-900	-1
Floor layers, except carpet, wood, and hard tiles	47-2042	29,000	25,000	-3,500	-12
Floor sanders and finishers	47-2043	14,000	14,000	-300	-2
Tile and marble setters	47-2044	79,000	91,000	12,000	15

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

earned less than $9.77, and the top 10 percent earned more than $32.32.

Median hourly earnings of wage and salary floor sanders and finishers were $13.89 in May 2006. The middle 50 percent earned between $10.84 and $18.47. The lowest 10 percent earned less than $9.08, and the top 10 percent earned more than $24.21.

Median hourly earnings of wage and salary tile and marble setters were $17.59 in May 2006. The middle 50 percent earned between $13.16 and $23.50. The lowest 10 percent earned less than $10.26, and the top 10 percent earned more than $29.95.

Earnings of carpet, floor, and tile installers and finishers vary greatly by geographic location and by union membership status. Some carpet, floor, and tile installers and finishers belong to the United Brotherhood of Carpenters and Joiners of America. Some tilesetters belong to the International Union of Bricklayers and Allied Craftsmen, and some carpet installers belong to the International Brotherhood of Painters and Allied Trades.

Apprentices and other trainees usually start out earning about half of what an experienced worker earn; their wage rates increase as they advance through the training program.

Related Occupations

Carpet, floor, and tile installers and finishers measure, cut, and fit materials to cover a space. Workers in other occupations involving similar skills, but using different materials, include brickmasons, blockmasons, and stonemasons; carpenters; cement masons, concrete finishers, segmental pavers, and terrazzo workers; drywall installers, ceiling tile installers, and tapers; painters and paperhangers; roofers; and sheet metal workers.

Sources of Additional Information

For details about apprenticeships or work opportunities, contact local flooring or tilesetting contractors or retailers, locals of the unions previously mentioned, or the nearest office of the state apprenticeship agency or employment service. Apprenticeship information is also available from the U.S. Department of Labor's toll-free helpline: (877) 872-5627.

Cement Masons, Concrete Finishers, Segmental Pavers, and Terrazzo Workers

(O*NET 47-2051.00, 47-2053.00, and 47-4091.00)

Significant Points

- Job opportunities are expected to be good, especially for those with the most experience and skills.
- Most learn on the job or though a combination of classroom and on-the-job training that can take three to four years.
- Cement masons often work overtime, with premium pay, because once concrete has been placed, the job must be completed.

Nature of the Work

Cement masons, concrete finishers, and terrazzo workers all work with concrete, one of the most common and durable materials used in construction. Once set, concrete—a mixture of Portland cement, sand, gravel, and water—becomes the foundation for everything from decorative patios and floors to huge dams or miles of roadways.

Cement masons and *concrete finishers* place and finish concrete. They also may color concrete surfaces, expose aggregate (small stones) in walls and sidewalks, or fabricate concrete beams, columns, and panels. In preparing a site to place concrete, cement masons first set the forms for holding the concrete and properly align them. They then direct the casting of the concrete and supervise laborers who use shovels or special tools to spread it. Masons then guide a straightedge back and forth across the top of the forms to "screed," or level, the freshly placed concrete. Immediately after leveling the concrete, masons carefully float it—smooth the concrete surface with a "bull float," a long-handled tool about 8 by 48 inches that covers the coarser materials in the concrete and brings a rich mixture of fine cement paste to the surface.

Cement masons first set the forms for holding the concrete and properly align them.

After the concrete has been leveled and floated, concrete finishers press an edger between the forms and the concrete and guide it along the edge and the surface. This produces slightly rounded edges and helps prevent chipping or cracking. Concrete finishers use a special tool called a "groover" to make joints or grooves at specific intervals that help control cracking. Next, they smooth the surface using either a powered or hand trowel, a small, smooth, rectangular metal tool.

Sometimes, cement masons perform all the steps of laying concrete, including the finishing. As the final step, they retrowel the concrete surface back and forth with powered or hand trowels to create a smooth finish. For a coarse, nonskid finish, masons brush the surface with a broom or stiff-bristled brush. For a pebble finish, they embed small gravel chips into the surface. They then wash any excess cement from the exposed chips with a mild acid solution. For color, they use colored premixed concrete. On concrete surfaces that will remain exposed after the forms are stripped, such as columns, ceilings, and wall panels, cement masons cut away high spots and loose concrete with hammer and chisel, fill any large indentations with a Portland cement paste, and smooth the surface with a carborundum stone. Finally, they coat the exposed area with a rich Portland cement mixture, using either a special tool or a coarse cloth to rub the concrete to a uniform finish.

Throughout the entire process, cement masons must monitor how the wind, heat, or cold affects the curing of the concrete. They must have a thorough knowledge of concrete characteristics so that, by using sight and touch, they can determine what is happening to the concrete and take measures to prevent defects.

Segmental pavers lay out, cut, and install pavers—flat pieces of masonry made from compacted concrete or brick. This masonry is typically installed in patios, sidewalks, plazas, streets, crosswalks, parking lots, and driveways. Installers usually begin their work on a previously prepared base that has been graded to the proper depth, although some projects may include the base preparation. A typical segmental paver installation begins with leveling a layer of sand, followed by placement of the pavers, normally by hand but sometimes by machine. Usually the work includes constructing edges to prevent horizontal movement of the pavers. Sand is then added to fill the joints between the pavers.

Terrazzo workers create attractive walkways, floors, patios, and panels by exposing marble chips and other fine aggregates on the surface of finished concrete. Much of the preliminary work of terrazzo workers is similar to that of cement masons. There are six different types of terrazzo, but the focus of this description is on the most common standard terrazzo: Marble-chip terrazzo, which requires three layers of materials. First, cement masons or terrazzo workers build a solid, level concrete foundation that is 3 to 4 inches deep. Second, after the forms are removed from the foundation, workers add a one-inch layer of sandy concrete. Terrazzo workers partially embed, or attach with adhesive, metal divider strips in the concrete wherever there is to be a joint or change of color in the terrazzo. For the third and final layer, terrazzo workers blend and place into each of the panels a fine marble chip mixture that may be color-pigmented. While the mixture is still wet, workers add additional marble chips of various colors into each panel and roll a lightweight roller over the entire surface.

When the terrazzo is thoroughly set, helpers grind it with a terrazzo grinder, which is somewhat like a floor polisher, only much heavier. Any depressions left by the grinding are filled with a matching grout material and hand-troweled for a smooth, uniform surface. Terrazzo workers then clean, polish, and seal the dry surface for a lustrous finish.

Work environment. Concrete, segmental paving, or terrazzo work is fast-paced and strenuous, and requires continuous physical effort. Because most finishing is done at floor level, workers must bend and kneel often. Many jobs are outdoors, and work is generally halted during inclement weather. The work, either indoors or outdoors, may be in areas that are muddy, dusty, or dirty. To avoid chemical burns from uncured concrete and sore knees from frequent kneeling, many workers wear kneepads. Workers usually also wear water-repellent boots while working in wet concrete.

Most workers work 40 hours a week, although the number of hours can be increased or decreased by outside factors. Earnings for workers in these trades can be reduced on occasion because poor weather and slowdowns in construction activity limit the time they can work.

Training, Other Qualifications, and Advancement

Most cement masons, concrete finishers, segmental pavers, and terrazzo workers learn their trades through on-the-job training, either as helpers or in apprenticeship programs. Some workers also learn their jobs by attending trade or vocational-technical schools.

Education and training. Many masons and finishers first gain experience as construction laborers. (See the section on construction laborers elsewhere in the *Handbook*.) Most on-the-job training programs consist of informal instruction, in which experienced workers teach helpers to use the tools, equipment, machines, and materials of the trade. Trainees begin with tasks such as edging, jointing, and using a straightedge on freshly placed concrete. As training progresses, assignments become more complex, and trainees can usually do finishing work within a short time.

Other workers train in formal apprenticeship programs usually sponsored by local contractors, trade associations, or local union-management committees. These earn while you learn programs provide on-the-job training and the recommended minimum of 144 hours of classroom instruction each year. In the classroom, apprentices learn applied mathematics, blueprint reading, and safety. Apprentices generally receive special instruction in layout work and cost estimation. Apprenticeships may take 3 to 4 years to complete. Applying for an apprenticeship may require a written test and a physical exam.

Many states have technical schools that offer courses in masonry which improve employment and advancement opportunities. Entrance requirements and fees vary depending on the school and who is funding the program. These schools may offer courses before hiring or after hiring as part of the on-the-job training.

Other qualifications. The most important quality employers look for is dependability and a strong work ethic. When hiring helpers and apprentices, employers prefer high school graduates who are at least 18 years old, possess a driver's license, and are in good physical condition. The ability to get along with others is also important because cement masons frequently work in teams. High school courses in general science, mathematics, and vocational-technical subjects, such as blueprint reading and mechanical drawing provide a helpful background. Cement masons, concrete finishers, segmental pavers, and terrazzo workers should enjoy doing demanding work. They should take pride in craftsmanship and be able to work without close supervision.

Advancement. With additional training, cement masons, concrete finishers, segmental pavers, or terrazzo workers may become supervisors for masonry contractors or move into construction management, building inspection, or contract estimation. Some eventually become owners of businesses, where they may spend most of their time managing rather than practicing their original trade. For those

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Cement masons, concrete finishers, segmental pavers, and terrazzo workers	—	229,000	255,000	26,000	11
Cement masons, concrete finishers, and terrazzo workers	47-2050	228,000	254,000	26,000	11
Cement masons and concrete finishers	47-2051	222,000	247,000	25,000	11
Terrazzo workers and finishers	47-2053	6,800	7,500	700	11
Segmental pavers	47-4091	1,000	1,100	100	10

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

who want to own their own business, taking business classes will help them prepare.

Employment

Cement masons, concrete finishers, segmental pavers, and terrazzo workers held about 229,000 jobs in 2006; segmental pavers and terrazzo workers accounted for only a small portion of the total. Most cement masons and concrete finishers worked for specialty trade contractors, primarily foundation, structure, and building exterior contractors. They also worked for contractors in residential and nonresidential building construction and in heavy and civil engineering construction on projects such as highways; bridges; shopping malls; or large buildings such as factories, schools, and hospitals. A small number were employed by firms that manufacture concrete products. Most segmental pavers and terrazzo workers worked for specialty trade contractors who install decorative floors and wall panels.

Only about 2 percent of cement masons, concrete finishers, segmental pavers, and terrazzo workers were self-employed, a smaller proportion than in other building trades. Most self-employed masons specialized in small jobs, such as driveways, sidewalks, and patios.

Job Outlook

Average employment growth is expected, and job prospects are expected to be good, especially for those with the most experience and skills.

Employment change. Employment of cement masons, concrete finishers, segmental pavers, and terrazzo workers is expected to grow 11 percent over the 2006–2016 decade, about as fast as the average for all occupations. More workers will be needed to build new highways, bridges, factories, and other residential and nonresidential structures to meet the demands of a growing population. Additionally, cement masons will be needed to repair and renovate existing highways and bridges and other aging structures.

The use of concrete for buildings is increasing. For example, residential construction in Florida is using more concrete as building requirements are changed in reaction to the increased frequency and intensity of hurricanes. Concrete use is likely to expand into other hurricane-prone areas as the durability of the Florida homes is demonstrated.

Job prospects. Opportunities for cement masons, concrete finishers, segmental pavers, and terrazzo workers are expected to be good, particularly for those with the most experience and skills. Employers report difficulty in finding workers with the right skills, as many qualified jobseekers often prefer work that is less strenuous and has more comfortable working conditions. There are expected to be a significant number of retirements over the next decade, which will create more job openings. Applicants who take masonry-related courses at technical schools will have better opportunities than those without these courses.

Employment of cement masons, concrete finishers, segmental pavers, and terrazzo workers, like that of many other construction workers, is sensitive to the fluctuations of the economy. Workers in these trades may experience periods of unemployment when the overall level of construction falls. On the other hand, shortages of these workers may occur in some areas during peak periods of building activity.

Earnings

In May 2006, the median hourly earnings of wage and salary cement masons and concrete finishers were $15.70. The middle 50 percent earned between $12.38 and $20.70. The bottom 10 percent earned less than $10.02, and the top 10 percent earned more than $27.07. Median hourly earnings in the industries employing the largest numbers of cement masons and concrete finishers were as follows:

Masonry contractors	$17.05
Nonresidential building construction	16.34
Highway, street, and bridge construction	16.20
Other specialty trade contractors	16.15
Poured concrete foundation and structure contractors	15.38

In May 2006, the median hourly earnings of wage and salary terrazzo workers and finishers were $15.21. The middle 50 percent earned between $12.01 and $20.50. The bottom 10 percent earned less than $9.31, and the top 10 percent earned more than $27.22.

In May 2006, the median hourly earnings of wage and salary segmental pavers were $13.80. The middle 50 percent earned between $10.47 and $17.05. The bottom 10 percent earned less than $8.41, and the top 10 percent earned more than $19.11.

Like other construction trades workers, earnings of cement masons, concrete finishers, segmental pavers, and terrazzo workers may be reduced on occasion because poor weather and slowdowns in construction activity limit the amount of time they can work. Nonunion workers generally have lower wage rates than union workers. Apprentices usually start at 50 to 60 percent of the rate paid to experienced workers, and increases are generally achieved by meeting specified advancement requirements every 6 months. Cement masons often work overtime, with premium pay, because once concrete has been placed, the job must be completed.

Some cement masons, concrete finishers, segmental pavers, and terrazzo workers belong to unions, mainly the Operative Plasterers' and Cement Masons' International Association of the United States and Canada, and the International Union of Bricklayers and Allied Craftworkers. A few terrazzo workers belong to the United Brotherhood of Carpenters and Joiners of the United States.

Related Occupations

Cement masons, concrete finishers, segmental pavers, and terrazzo workers combine skill with knowledge of building materials to construct buildings, highways, and other structures. Other occupations

involving similar skills and knowledge include brickmasons, blockmasons, and stonemasons; carpet, floor, and tile installers and finishers; drywall installers, ceiling tile installers, and tapers; and plasterers and stucco masons.

Sources of Additional Information

For information about apprenticeships and work opportunities, contact local concrete or terrazzo contractors, locals of unions previously mentioned, a local joint union-management apprenticeship committee, or the nearest office of the state employment service or apprenticeship agency. Apprenticeship information is also available from the U.S. Department of Labor's toll-free helpline: (877) 872-5627. You may also check the U.S. Department of Labor's Web site for information on apprenticeships and links to state apprenticeship programs. Internet: http://www.doleta.gov/atels_bat.

For general information on apprenticeships and how to get them, see the *Occupational Outlook Quarterly* article "Apprenticeships: Career training, credentials—and a paycheck in your pocket," online at http://www.bls.gov/opub/ooq/2002/summer/art01.pdf and in print at many libraries and career centers.

Construction and Building Inspectors

(O*NET 47-4011.00)

Significant Points

- About 41 percent of inspectors work for local governments, primarily municipal or county building departments.
- Many home inspectors are self-employed.
- Opportunities should be best for experienced construction supervisors and craftworkers who have some college education, engineering or architectural training, or certification as construction inspectors or plan examiners.

Construction and building inspectors must check building measurements against construction codes.

Nature of the Work

Construction and building inspectors examine buildings, highways and streets, sewer and water systems, dams, bridges, and other structures. They ensure that their construction, alteration, or repair complies with building codes and ordinances, zoning regulations, and contract specifications. Building codes and standards are the primary means by which building construction is regulated in the United States for the health and safety of the general public. National model building and construction codes are published by the International Code Council (ICC), although many localities have additional ordinances and codes that modify or add to the national model codes. To monitor compliance with regulations, inspectors make an initial inspection during the first phase of construction and follow up with further inspections throughout the construction project. However, no inspection is ever exactly the same. In areas where certain types of severe weather or natural disasters—such as earthquakes or hurricanes—are more common, inspectors monitor compliance with additional safety regulations designed to protect structures and occupants during those events.

There are many types of inspectors. *Building inspectors* inspect the structural quality and general safety of buildings. Some specialize in for example, structural steel or reinforced-concrete structures. Before construction begins, *plan examiners* determine whether the plans for the building or other structure comply with building codes and whether they are suited to the engineering and environmental

demands of the building site. To inspect the condition of the soil and the positioning and depth of the footings, inspectors visit the worksite before the foundation is poured. Later, they return to the site to inspect the foundation after it has been completed. The size and type of structure, as well as the rate at which it proceeds toward completion, determine the number of other site visits they must make. Upon completion of the project, they make a final, comprehensive inspection.

In addition to structural characteristics, a primary concern of building inspectors is fire safety. They inspect structures' fire sprinklers, alarms, smoke control systems, and fire exits. Inspectors assess the type of construction, contents of the building, adequacy of fire protection equipment, and risks posed by adjoining buildings.

Electrical inspectors examine the installation of electrical systems and equipment to ensure that they function properly and comply with electrical codes and standards. They visit worksites to inspect new and existing sound and security systems, wiring, lighting, motors, and generating equipment. They also inspect the installation of the electrical wiring for heating and air-conditioning systems, appliances, and other components.

Elevator inspectors examine lifting and conveying devices such as elevators, escalators, moving sidewalks, lifts and hoists, inclined railways, ski lifts, and amusement rides.

For information on *fire inspectors,* see the *Handbook* statement on fire fighting occupations.

Home inspectors conduct inspections of newly built or previously owned homes, condominiums, town homes, manufactured homes, apartments, and at times commercial buildings. Home inspection has become a standard practice in the home-purchasing process. Home inspectors are most often hired by prospective home buyers to inspect and report on the condition of a home's systems, components, and structure. Although they look for and report violations of building codes, they do not have the power to enforce compliance with the codes. Typically, they are hired either immediately prior to a purchase offer on a home or as a contingency to a sales contract. In addition to examining structural quality, home inspectors inspect all home systems and features, including roofing as well as the exterior, attached garage or carport, foundation, interior, plumbing, and electrical, heating, and cooling systems. Some home inspections are done for homeowners who want an evaluation of their home's condition, for example, prior to putting the home on the market or as a way to diagnose problems.

Mechanical inspectors inspect the installation of the mechanical components of commercial kitchen appliances, heating and air-conditioning equipment, gasoline and butane tanks, gas and oil piping, and gas-fired and oil-fired appliances. Some specialize in boilers or ventilating equipment as well.

Plumbing inspectors examine plumbing systems, including private disposal systems, water supply and distribution systems, plumbing fixtures and traps, and drain, waste, and vent lines.

Public works inspectors ensure that federal, state, and local government construction of water and sewer systems, highways, streets, bridges, and dams conforms to detailed contract specifications. They inspect excavation and fill operations, the placement of forms for concrete, concrete mixing and pouring, asphalt paving, and grading operations. They record the work and materials used so that contract payments can be calculated. Public works inspectors may specialize in highways, structural steel, reinforced concrete, or ditches. Others specialize in dredging operations required for bridges and dams or for harbors.

The owner of a building or structure under construction employs *specification inspectors* to ensure that work is done according to design specifications. Specification inspectors represent the owner's interests, not those of the general public. Insurance companies and financial institutions also may use their services.

Details concerning construction projects, building and occupancy permits, and other documentation generally are stored on computers so that they can easily be retrieved and updated. For example, inspectors may use laptop computers to record their findings while inspecting a site. Most inspectors use computers to help them monitor the status of construction inspection activities and keep track of permits issued, and some can access all construction and building codes from their computers on the jobsite, decreasing the need for paper binders. However, many inspectors continue to use a paper checklist to detail their findings.

Although inspections are primarily visual, inspectors may use tape measures, survey instruments, metering devices, and equipment such as concrete strength measurers. They keep a log of their work, take photographs, and file reports. Many inspectors also use laptops or other portable electronic devices on-site to facilitate the accuracy of their written reports, as well as e-mail and fax machines to send out the results. If necessary, they act on their findings. For example, government and construction inspectors notify the construction contractor, superintendent, or supervisor when they discover a violation of a code or ordinance or something that does not comply with the contract specifications or approved plans. If the problem is not corrected within a reasonable or otherwise specified period, government inspectors have authority to issue a "stop-work" order.

Many inspectors also investigate construction or alterations being done without proper permits. Inspectors who are employees of municipalities enforce laws pertaining to the proper design, construction, and use of buildings. They direct violators of permit laws to obtain permits and to submit to inspection.

Work environment. Construction and building inspectors usually work alone. However, several may be assigned to large, complex projects, particularly because inspectors tend to specialize in different areas of construction. Although they spend considerable time inspecting construction worksites, inspectors also spend time in a field office reviewing blueprints, answering letters or telephone calls, writing reports, and scheduling inspections.

Many construction sites are dirty and may be cluttered with tools, materials, or debris. Inspectors may have to climb ladders or many flights of stairs or crawl around in tight spaces. Although their work generally is not considered hazardous, inspectors, like other construction workers, wear hardhats and adhere to other safety requirements while at a construction site.

Inspectors normally work regular hours. However, they may work additional hours during periods when a lot of construction is taking place. Also, if an accident occurs at a construction site, inspectors must respond immediately and may work additional hours to complete their report. Non-government inspectors—especially those who are self-employed—may have a varied work schedule, at times working evenings and weekends.

Training, Other Qualifications, and Advancement

Although requirements vary considerably, construction and building inspectors should have a thorough knowledge of construction materials and practices. In some states, construction and building inspectors are required to obtain a special license or certification, so it is important to check with the appropriate state agency.

Education and training. Most employers require at least a high school diploma or the equivalent, even for workers with considerable experience. More often, employers look for persons who have studied engineering or architecture or who have a degree from a community or junior college with courses in building inspection,

home inspection, construction technology, drafting, and mathematics. Many community colleges offer certificate or associate degree programs in building inspection technology. Courses in blueprint reading, algebra, geometry, and English also are useful. A growing number of construction and building inspectors are entering the occupation with a college degree, which often can substitute for previous experience. The distribution of all construction and building inspectors by their highest level of educational attainment in 2006 was:

High school graduate or less	31%
Some college, no degree	28
Associate degree	12
Bachelor's degree	26
Graduate degree	2

The level of training requirements varies by type of inspector and state. In general, construction and building inspectors receive much of their training on the job, although they must learn building codes and standards on their own. Working with an experienced inspector, they learn about inspection techniques; codes, ordinances, and regulations; contract specifications; and recordkeeping and reporting duties. Supervised on-site inspections also may be a part of the training. Other requirements can include various courses and assigned reading. Some courses and instructional material are available online as well as through formal venues.

Licensure and certification. Many states and local jurisdictions require some type of license or certification for employment as a construction and building inspector. Requirements may vary by state or local municipality. Typical requirements for licensure or certification include previous experience, a minimum educational attainment level, such as a high school diploma, and possibly the passing of a state-approved examination. Some states have individual licensing programs for inspectors, while others may require certification by such associations as the International Code Council, International Association of Plumbing and Mechanical Officials, and National Fire Protection Association.

Similarly, some states require home inspectors to obtain a state issued license or certification. Currently, 33 states have regulations affecting home inspectors. Requirements for a license or certification vary by state, but may include obtaining a minimum level of education, having a set amount of experience with inspections, purchasing liability insurance of a certain amount, and the passing of an examination. Renewal is usually every few years and annual continuing education is almost always required.

Other qualifications. Because inspectors must possess the right mix of technical knowledge, experience, and education, employers prefer applicants who have both formal training and experience. For example, many inspectors previously worked as carpenters, electricians, or plumbers. Home inspectors combine knowledge of multiple specialties, so many of them come into the occupation having a combination of certifications and previous experience in various construction trades.

Construction and building inspectors must be in good physical condition in order to walk and climb about construction and building sites. They also must have a driver's license so that they can get to scheduled appointments.

Advancement. Being a member of a nationally recognized inspection association enhances employment opportunities and may be required by some employers. Even if it is not required, certification can enhance an inspector's opportunities for employment and advancement to more responsible positions. To become certified, inspectors with substantial experience and education must pass examinations on topics including code requirements, construction techniques and materials, standards of practice, and codes of ethics. The International Code Council offers multiple voluntary certifications, as do many other professional associations. Many categories of certification are awarded for inspectors and plan examiners in a variety of specialties, including the Certified Building Official (CBO) certification, for code compliance, and the Residential Building Inspector (RBI) certification, for home inspectors. In a few cases, there are no education or experience prerequisites, and certification consists of passing an examination in a designated field either at a regional location or online. In addition, federal, state, and many local governments may require inspectors to pass a civil service exam.

Because they advise builders and the general public on building codes, construction practices, and technical developments, construction and building inspectors must keep abreast of changes in these areas. Continuing education is required by many states and certifying organizations. Numerous employers provide formal training to broaden inspectors' knowledge of construction materials, practices, and techniques. Inspectors who work for small agencies or firms that do not conduct their own training programs can expand their knowledge and upgrade their skills by attending state-sponsored training programs, by taking college or correspondence courses, or by attending seminars and conferences sponsored by various related organizations, including professional organizations. An engineering or architectural degree often is required for advancement to supervisory positions.

Employment

Construction and building inspectors held about 110,000 jobs in 2006. Local governments—primarily municipal or county building departments—employed 41 percent. Employment of local government inspectors is concentrated in cities and in suburban areas undergoing rapid growth. Local governments in larger jurisdictions may employ large inspection staffs, including many plan examiners or inspectors who specialize in structural steel, reinforced concrete, and boiler, electrical, and elevator inspection. In smaller jurisdictions, only one or a few inspectors who specialize in multiple areas may be on staff.

Another 26 percent of construction and building inspectors worked for architectural and engineering services firms, conducting inspections for a fee or on a contract basis. Many of these were home inspectors working on behalf of potential real estate purchasers. Most of the remaining inspectors were employed in other service-providing industries or by state governments. About 1 in 10 construction and building inspectors was self-employed. Since many home inspectors are self-employed, it is likely that most self-employed construction and building inspectors were home inspectors.

Job Outlook

Job opportunities in construction and building inspection should be best for highly experienced supervisors and construction craft workers who have some college education, engineering or architectural training, or certification as inspectors or plan examiners. Inspectors should experience faster than average employment growth.

Employment change. Employment of construction and building inspectors is expected to grow by 18 percent over the 2006–2016 decade, which is faster than the average for all occupations. Concern for public safety and a desire for improvement in the quality of construction should continue to stimulate demand for construction and building inspectors in government as well as in firms specializing in architectural, engineering, and related services. As the result of new technology such as building information modeling (BIM), the avail-

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Construction and building inspectors	47-4011	110,000	130,000	20,000	18

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

ability of a richer set of buildings data in a more timely and transparent manner will make it easier to conduct plan reviews. This will lead to more time and resources spent on inspections. In addition, the growing focus on natural and manmade disasters is increasing the level of interest in and need for qualified inspectors. Issues such as green and sustainable design are new areas of focus that will also drive the demand for construction and building inspectors.

The routine practice of obtaining home inspections is a relatively recent development, causing employment of home inspectors to increase rapidly. Although employment of home inspectors is expected to continue to increase, the attention given to this specialty, combined with the desire of some construction workers to move into less strenuous and potentially higher paying work, may result in reduced growth of home inspectors in some areas. In addition, increasing state regulations are starting to limit entry into the specialty only to those who have a given level of previous experience and are certified.

Job prospects. Inspectors are involved in all phases of construction, including maintenance and repair work, and are therefore less likely to lose their jobs when new construction slows during recessions. Those who are self-employed, such as home inspectors, are more likely to be affected by economic downturns or fluctuations in the real estate market. However, those with a thorough knowledge of construction practices and skills in areas such as reading and evaluating blueprints and plans will be better off. Inspectors with previous related experience in construction, a postsecondary degree, and engineering or architectural training will have the best prospects. In addition to openings stemming from the expected employment growth, some job openings will arise from the need to replace inspectors who transfer to other occupations or leave the labor force.

Earnings

Median annual earnings of wage and salary construction and building inspectors were $46,570 in May 2006. The middle 50 percent earned between $36,610 and $58,780. The lowest 10 percent earned less than $29,210, and the highest 10 percent earned more than $72,590. Median annual earnings in the industries employing the largest numbers of construction and building inspectors were:

Architectural, engineering, and related services	$46,850
Local government	46,040
State government	43,680

Building inspectors, including plan examiners, generally earn the highest salaries. Salaries in large metropolitan areas are substantially higher than those in small jurisdictions.

Benefits vary by place of employment. Those working for the government and private companies typically receive standard benefits, including health and medical insurance, a retirement plan, and paid annual leave. Those who are self-employed may have to provide their own benefits.

More than a quarter of all construction and building inspectors belonged to a union in 2006.

Related Occupations

Because construction and building inspectors are familiar with construction principles, the most closely related occupations are construction occupations, especially carpenters, plumbers, and electricians. Construction and building inspectors also combine knowledge of construction principles and law with an ability to coordinate data, diagnose problems, and communicate with people. Workers in other occupations using a similar combination of skills include architects, except landscape and naval; appraisers and assessors of real estate; construction managers; civil engineers; cost estimators; engineering technicians; and surveyors, cartographers, photogrammetrists, and surveying technicians.

Construction Equipment Operators

(O*NET 47-2071.00, 47-2072.00, and 47-2073.00)

Significant Points

- Many construction equipment operators acquire their skills on the job, but formal apprenticeship programs provide more comprehensive training.
- Job opportunities are expected to be very good.

- Hourly pay is relatively high, but operators of some types of equipment cannot work in inclement weather, so total annual earnings may be reduced.

Nature of the Work

Construction equipment operators use machinery to move construction materials, earth, and other heavy materials at construction sites and mines. They operate equipment that clears and grades land to prepare it for construction of roads, buildings, and bridges. They use machines to dig trenches to lay or repair sewer and other pipelines and hoist heavy construction materials. They may even work offshore constructing oil rigs. Construction equipment operators also operate machinery that spreads asphalt and concrete on roads and other structures.

These workers also set up and inspect the equipment, make adjustments, and perform some maintenance and minor repairs. Construction equipment operators control equipment by moving levers, foot pedals, operating switches, or joysticks. Construction equipment is more complicated to use than it was in the past. For example, Global Positioning System (GPS) technology is now being used to help with grading and leveling activities.

Included in the construction equipment operator occupation are paving, surfacing, and tamping equipment operators; piledriver operators; and operating engineers. *Paving and surfacing equipment operators* use levers and other controls to operate machines that spread and level asphalt or spread and smooth concrete for roadways or other structures. *Asphalt paving machine operators* turn valves to regulate the temperature and flow of asphalt onto the roadbed. They must take care that the machine distributes the paving material evenly and without voids, and make sure that there is a constant flow of asphalt going into the hopper. *Concrete paving machine operators* control levers and turn handwheels to move attachments that spread, vibrate, and level wet concrete in forms. They must observe the surface of concrete to identify low spots into which workers must add concrete. They use other attachments to smooth the surface of the concrete, spray on a curing compound, and cut expansion joints. *Tamping equipment operators* operate tamping machines that compact earth and other fill materials for roadbeds or other construction sites. They also may operate machines with interchangeable hammers to cut or break up old pavement and drive guardrail posts into the earth.

Piledriver operators use large machines, mounted on skids, barges, or cranes to hammer piles into the ground. Piles are long heavy beams of wood or steel driven into the ground to support retaining walls, bulkheads, bridges, piers, or building foundations. Some piledriver operators work on offshore oil rigs. Piledriver operators move hand and foot levers and turn valves to activate, position, and control the pile-driving equipment.

Operating engineers and other construction equipment operators use one or several types of power construction equipment. They may operate excavation and loading machines equipped with scoops, shovels, or buckets that dig sand, gravel, earth, or similar materials and load it into trucks or onto conveyors. In addition to the familiar bulldozers, they operate trench excavators, road graders, and similar equipment. Sometimes, they may drive and control industrial trucks or tractors equipped with forklifts or booms for lifting materials or with hitches for pulling trailers. They also may operate and maintain air compressors, pumps, and other power equipment at construction sites. Construction equipment operators who are classified as operating engineers are capable of operating several different types of construction equipment.

Piledriver operators use large machines to hammer piles into the ground.

Work environment. Construction equipment operators work outdoors, in nearly every type of climate and weather condition, although in many areas of the country, some types of construction operations must be suspended in winter. Bulldozers, scrapers, and especially tampers and piledrivers are noisy and shake or jolt the operator. Operating heavy construction equipment can be dangerous. As with most machinery, accidents generally can be avoided by observing proper operating procedures and safety practices. Construction equipment operators are cold in the winter and hot in the summer and often get dirty, greasy, muddy, or dusty. Some operators work in remote locations on large construction projects, such as highways and dams, or in factory or mining operations.

Operators may have irregular hours because work on some construction projects continues around the clock or must be performed late at night or early in the morning.

Training, Other Qualifications, and Advancement

Construction equipment operators usually learn their skills on the job, but formal apprenticeship programs provide more comprehensive training.

Education and training. Employers of construction equipment operators generally prefer to hire high school graduates, although some employers may train non-graduates to operate some types of equipment. High school courses in automobile mechanics are helpful because workers may perform maintenance on their machines. Also useful are courses in science and mechanical drawing.

On the job, workers may start by operating light equipment under the guidance of an experienced operator. Later, they may operate heavier equipment, such as bulldozers and cranes. Technologically advanced construction equipment with computerized controls and improved hydraulics and electronics requires more skill to operate. Operators of such equipment may need more training and some understanding of electronics.

It is generally accepted that formal training provides more comprehensive skills. Some construction equipment operators train in formal operating engineer apprenticeship programs administered by union-management committees of the International Union of Operating Engineers and the Associated General Contractors of America. Because apprentices learn to operate a wider variety of machines than do other beginners, they usually have better job opportunities. Apprenticeship programs consist of at least 3 years, or 6,000 hours,

of paid on-the-job training together with and 144 hours of related classroom instruction each year.

Private vocational schools offer instruction in the operation of certain types of construction equipment. Completion of such programs may help a person get a job. However, people considering such training should check the school's reputation among employers in the area and find out if the school offers the opportunity to work on actual machines in realistic situations. A large amount of information can be learned in classrooms. But to become a skilled construction equipment operator, a worker needs to actually perform the various tasks. The best training facilities have equipment on-site so that students can do the tasks that they are learning about.

Licensure. Construction equipment operators often obtain a commercial driver's license so that they can haul their equipment to the various job sites. Commercial driver's licenses are issued by states according to each state's rules and regulations. (See the statement on truck drivers and driver/sales workers elsewhere in the *Handbook* for more information on commercial driver's licenses.)

Certification and other qualifications. Mechanical aptitude and experience operating related mobile equipment, such as farm tractors or heavy equipment, in the Armed Forces or elsewhere is an asset. Operators need to be in good physical condition and have a good sense of balance, the ability to judge distance, and eye-hand-foot coordination. Some operator positions require the ability to work at heights.

Certification or training in the right school will allow a worker to have opportunities across the country. While attending some vocational schools, operators are able to qualify for or attain various certifications. These certifications prove to potential employers that an operator is able to handle specific types of equipment. Certifications last from 3 to 5 years and must be renewed.

Advancement. Construction equipment operators can advance to become supervisors. Some operators choose to teach in training facilities to pass on their knowledge. Other operators start their own contracting businesses although this may be difficult because of high start-up costs.

Employment

Construction equipment operators held about 494,000 jobs in 2006. Jobs were found in every section of the country and were distributed among various types of operators as follows:

Operating engineers and other construction equipment operators	424,000
Paving, surfacing, and tamping equipment operators	64,000
Pile-driver operators	5,600

About 63 percent of construction equipment operators worked in the construction industry. Many equipment operators worked in heavy construction, building highways, bridges, or railroads. About 17 percent of construction equipment operators worked in state and local government. Others—mostly grader, bulldozer, and scraper operators—worked in mining. Some also worked for manufacturing or utility companies. About 5 percent of construction equipment operators were self-employed.

Job Outlook

Average job growth, reflecting increased demand for their services, and the need to replace workers who leave the occupation should result in very good job opportunities for construction equipment operators.

Employment change. Employment of construction equipment operators is expected to increase 8 percent between 2006 and 2016, about as fast as the average for all occupations. Even though improvements in equipment are expected to continue to raise worker productivity and to moderate the demand for new workers somewhat, employment is expected to increase because population and business growth will create a need for new houses, industrial facilities, schools, hospitals, offices, and other structures.

Specifically, more paving, surfacing, and tamping equipment operators will be needed as a result of expected growth in highway, bridge, and street construction. There has been consistent Congressional support for road projects. Bridge construction is expected to increase most because bridges will need to be repaired or replaced before they become unsafe. In some areas, deteriorating highway conditions also will spur demand for highway maintenance and repair.

More piledriver operators will be needed as construction continues to move into areas that are challenging to build in and require the use of piles as supports. Increases in bridge construction will also create demand for piledriver operators.

Demand for operating engineers and other construction equipment operators will be driven by the demand for new construction. Increases in pipeline construction will also create demand. These operators work in all sectors of construction.

Job prospects. Job opportunities for construction equipment operators are expected to be very good. Some potential workers may choose not to enter training programs because they prefer work that has more comfortable working conditions and is less seasonal in nature. This reluctance makes it easier for willing workers to get operator jobs.

In addition, many job openings will arise from job growth and from the need to replace experienced construction equipment operators who transfer to other occupations, retire, or leave the job for other reasons. Construction equipment operators who can use a large variety of equipment will have the best prospects. Operators with pipeline experience will have especially good opportunities.

Employment of construction equipment operators, like that of many other construction workers, is sensitive to the fluctuations in the economy. Workers in these trades may experience periods of unemployment when the overall level of construction falls. On the other hand, shortages of these workers may occur in some areas during peak periods of building activity.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Construction equipment operators	47-2070	494,000	536,000	42,000	8
Paving, surfacing, and tamping equipment operators	47-2071	64,000	70,000	5,800	9
Pile-driver operators	47-2072	5,600	6,000	500	8
Operating engineers and other construction equipment operators	47-2073	424,000	460,000	35,000	8

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Earnings

Earnings for construction equipment operators vary. In May 2006, median hourly earnings of wage and salary operating engineers and other construction equipment operators were $17.74. The middle 50 percent earned between $13.89 and $23.98. The lowest 10 percent earned less than $11.54, and the highest 10 percent earned more than $30.83. Median hourly earnings in the industries employing the largest numbers of operating engineers were:

Highway, street, and bridge construction	$19.88
Utility system construction	18.62
Other specialty trade contractors	18.00
Other heavy and civil engineering construction	17.63
Local government	15.95

Median hourly earnings of wage and salary paving, surfacing, and tamping equipment operators were $15.05 in May 2006. The middle 50 percent earned between $11.98 and $19.71. The lowest 10 percent earned less than $9.97, and the highest 10 percent earned more than $25.30. Median hourly earnings in the industries employing the largest numbers of paving, surfacing, and tamping equipment operators in were as follows:

Other specialty trade contractors	$15.26
Highway, street, and bridge construction	15.11
Local government	14.86

In May 2006, median hourly earnings of wage and salary piledriver operators were $22.20. The middle 50 percent earned between $16.31 and $31.65. The lowest 10 percent earned less than $12.83, and the highest 10 percent earned more than $37.28. Median hourly earnings in the industries employing the largest numbers of pile driver operators were as follows:

Other heavy and civil engineering construction	$28.60
Highway, street, and bridge construction	22.50
Other specialty trade contractors	20.60
Utility system construction	18.62

Hourly pay is relatively high, particularly in large metropolitan areas. However, annual earnings of some workers may be lower than hourly rates would indicate because work time may be limited by bad weather. About 28 percent of construction equipment operators belong to a union.

Related Occupations

Other workers who operate mechanical equipment include agricultural equipment operators; truck drivers, heavy and tractor trailer; logging equipment operators; and a variety of material moving occupations.

Sources of Additional Information

For further information about apprenticeships or work opportunities for construction equipment operators, contact a local of the International Union of Operating Engineers, a local apprenticeship committee, or the nearest office of the state apprenticeship agency or employment service. You can also find information on the registered apprenticeship system with links to state apprenticeship programs on the U.S. Department of Labor's Web site: http://www.doleta.gov/atels_bat. Apprenticeship information is also available from the U.S. Department of Labor's toll-free helpline: (877) 872-5627.

➤ Pile Driving Contractors Association, P.O. Box 66208, Orange Park, FL 32065. Internet: http://www.piledrivers.org

For general information on apprenticeships and how to get them, see the *Occupational Outlook Quarterly* article "Apprenticeships: Career training, credentials—and a paycheck in your pocket," online at http://www.bls.gov/opub/ooq/2002/summer/art01.pdf and in print at many libraries and career centers.

Construction Laborers

(O*NET 47-2061.00)

Significant Points

- Many construction laborer jobs require a variety of basic skills, but others require specialized training and experience.
- Most construction laborers learn on the job, but formal apprenticeship programs provide the most thorough preparation.
- Job opportunities vary by locality, but in many areas there will be competition, especially for jobs requiring limited skills.
- Laborers who have specialized skills or who can relocate near new construction projects should have the best opportunities.

Nature of the Work

Construction laborers can be found on almost all construction sites performing a wide range of tasks from the very easy to the potentially hazardous. They can be found at building, highway, and heavy construction sites; residential and commercial sites; tunnel and shaft excavations; and demolition sites. Many of the jobs they perform require physical strength, training, and experience. Other jobs require little skill and can be learned in a short amount of time. While most construction laborers specialize in a type of construction, such as highway or tunnel construction, some are generalists who perform many different tasks during all stages of construction. Construction laborers, who work in underground construction, such as in tunnels, or in demolition are more likely to specialize in only those areas.

Construction laborers clean and prepare construction sites. They remove trees and debris, tend pumps, compressors and generators, and build forms for pouring concrete. They erect and disassemble scaffolding and other temporary structures. They load, unload, identify, and distribute building materials to the appropriate location according to project plans and specifications. Laborers also tend machines; for example, they may mix concrete using a portable mixer or tend a machine that pumps concrete, grout, cement, sand, plaster, or stucco through a spray gun for application to ceilings and walls. They often help other craftworkers, including carpenters, plasterers, operating engineers, and masons.

Construction laborers are responsible for oversight of the installation and maintenance of traffic control devices and patterns. At highway construction sites, this work may include clearing and preparing highway work zones and rights of way; installing traffic barricades, cones, and markers; and controlling traffic passing near,

Construction laborers remove excess materials after a job is completed.

in, and around work zones. They also dig trenches, install sewer, water, and storm drain pipes, and place concrete and asphalt on roads. Other highly specialized tasks include operating laser guidance equipment to place pipes; operating air, electric, and pneumatic drills; and transporting and setting explosives for tunnel, shaft, and road construction.

Some construction laborers help with the removal of hazardous materials, such as asbestos, lead, or chemicals. (Workers who specialize in and are certified for the removal of hazardous materials are discussed in the *Handbook* statement on hazardous materials removal workers.)

Construction laborers operate a variety of equipment including pavement breakers; jackhammers; earth tampers; concrete, mortar, and plaster mixers; electric and hydraulic boring machines; torches; small mechanical hoists; laser beam equipment; and surveying and measuring equipment. They may use computers and other high-tech input devices to control robotic pipe cutters and cleaners. To perform their jobs effectively, construction laborers must be familiar with the duties of other craftworkers and with the materials, tools, and machinery they use.

Construction laborers often work as part of a team with other skilled craftworkers, jointly carrying out assigned construction tasks. At other times, construction laborers may work alone, reading and interpreting instructions, plans, and specifications with little or no supervision.

Work environment. Most laborers do physically demanding work. They may lift and carry heavy objects, and stoop, kneel, crouch, or crawl in awkward positions. Some work at great heights, or outdoors in all weather conditions. Some jobs expose workers to harmful materials or chemicals, fumes, odors, loud noise, or dangerous machinery. Some laborers may be exposed to lead-based paint, asbestos, or other hazardous substances during their work especially when working in confined spaces. To avoid injury, workers in these jobs wear safety clothing, such as gloves, hardhats, protective chemical suits, and devices to protect their eyes, respiratory system, or hearing. While working in underground construction, construction laborers must be especially alert to safely follow procedures and must deal with a variety of hazards.

Construction laborers generally work eight-hour shifts, although longer shifts are common. Overnight work may be required when working on highways. In some parts of the country, construction laborers may work only during certain seasons. They may also experience weather-related work stoppages at any time of the year.

Training, Other Qualifications, and Advancement

Many construction laborer jobs require a variety of basic skills, but others require specialized training and experience. Most construction laborers learn on the job, but formal apprenticeship programs provide the most thorough preparation.

Education and training. While some construction laborer jobs have no specific educational qualifications or entry-level training, apprenticeships for laborers require a high school diploma or equivalent. High school classes in English, mathematics, physics, mechanical drawing, blueprint reading, welding, and general shop can be helpful.

Most workers start by getting a job with a contractor who provides on-the-job training. Increasingly, construction laborers find work through temporary help agencies that send laborers to construction sites for short-term work. Entry-level workers generally help more experienced workers. They perform routine tasks, such as cleaning and preparing the worksite and unloading materials. When the opportunity arises, they learn from experienced construction trades workers how to do more difficult tasks, such as operating tools and equipment. Construction laborers may also choose or be required to attend a trade or vocational school or community college to receive further trade-related training.

Some laborers receive more formal training. A number of employers, particularly large nonresidential construction contractors with union membership, offer employees formal apprenticeships, which provide the best preparation. These programs include between 2 and 4 years of classroom and on-the-job training. In the first 200 hours, workers learn basic construction skills such as blueprint reading, the correct use of tools and equipment, and safety and health procedures. The remainder of the curriculum consists of specialized skills training in three of the largest segments of the construction industry: building construction, heavy and highway construction, and environmental remediation, such as lead or asbestos abatement, and mold or hazardous waste remediation.

Workers who use dangerous equipment or handle toxic chemicals usually receive specialized safety training. Laborers who remove hazardous materials are required to take union or employer-sponsored Occupational Safety and Health Administration safety training.

Apprenticeship applicants usually must be at least 18 years old and meet local requirements. Because the number of apprenticeship programs is limited, however, only a small proportion of laborers learn their trade in this way.

Other qualifications. Laborers need manual dexterity, eye-hand coordination, good physical fitness, a good sense of balance, and an ability to work as a member of a team. The ability to solve arithmetic problems quickly and accurately may be required. In addition, military service or a good work history is viewed favorably by contractors.

Certification and advancement. Laborers may earn certifications in welding, scaffold erecting, and concrete finishing. These certifications help workers prove that they have the knowledge to perform more complex tasks.

Through training and experience, laborers can move into other construction occupations. Laborers may also advance to become construction supervisors or general contractors. For those who would like to advance, it is increasingly important to be able to communicate in both English and Spanish in order to relay instructions and safety precautions to workers with limited understanding of English; Spanish-speaking workers make up a large part of the construction workforce in many areas. Supervisors and contractors need good communication skills to deal with clients and subcontractors.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Construction laborers	47-2061	1,232,000	1,366,000	134,000	11

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

In addition, supervisors and contractors should be able to identify and estimate the quantity of materials needed to complete a job, and accurately estimate how long a job will take to complete and what it will cost. Computer skills also are important for advancement as construction becomes increasingly mechanized and computerized.

Employment

Construction laborers held about 1.2 million jobs in 2006. They worked throughout the country but, like the general population, were concentrated in metropolitan areas. About 67 percent of construction laborers work in the construction industry, including 30 percent who work for specialty trade contractors. About 17 percent were self-employed in 2006.

Job Outlook

Employment is expected to grow about as fast as the average. In many areas, there will be competition for jobs, especially for those requiring limited skills. Laborers who have specialized skills or who can relocate near new construction projects should have the best opportunities.

Employment change. Employment of construction laborers is expected to grow by 11 percent between 2006 and 2016, about as fast as the average for all occupations. The construction industry in general is expected to grow more slowly than it has in recent years. Due to the large variety of tasks that laborers perform, demand for laborers will mirror the level of overall construction activity.

Construction laborer jobs will be adversely affected by automation as some jobs are replaced by new machinery and equipment that improves productivity and quality. Also, laborers will be increasingly employed by staffing agencies that will contract out laborers to employers on a temporary basis, and in many areas employers will continue to rely on day laborers instead of full-time laborers on staff.

Job prospects. In many geographic areas there will be competition, especially for jobs requiring limited skills, due to a plentiful supply of workers who are willing to work as day laborers. In other areas, however, opportunities will be better. Overall opportunities will be best for those with experience and specialized skills and for those who can relocate to areas with new construction projects. Opportunities will also be better for laborers specializing in road construction.

Employment of construction laborers, like that of many other construction workers, is sensitive to the fluctuations of the economy. Workers in these trades may experience periods of unemployment when the overall level of construction falls. On the other hand, shortages of these workers may occur in some areas during peak periods of building activity.

Earnings

Median hourly earnings of wage and salary construction laborers in May 2006 were $12.66. The middle 50 percent earned between $9.95 and $17.31. The lowest 10 percent earned less than $8.16, and the highest 10 percent earned more than $24.19. Median hourly earnings in the industries employing the largest number of construction laborers were as follows:

Nonresidential building construction	$13.62
Other specialty trade contractors	12.93
Residential building construction	12.82
Foundation, structure, and building exterior contractors	12.41
Employment services	9.90

Earnings for construction laborers can be reduced by poor weather or by downturns in construction activity, which sometimes result in layoffs. Apprentices or helpers usually start out earning about 60 percent of the wage rate paid to experienced workers. Pay increases as apprentices gain experience and learn new skills. Some laborers belong to the Laborers' International Union of North America.

Related Occupations

The work of construction laborers is closely related to other construction occupations. Other workers who perform similar physical work include persons in material moving occupations; forest, conservation, and logging workers; and grounds maintenance workers.

Sources of Additional Information

For information about jobs as a construction laborer, contact local building or construction contractors, local joint labor-management apprenticeship committees, apprenticeship agencies, or the local office of your state employment service. You can also find information on the registered apprenticeships together with links to state apprenticeship programs on the U.S. Department of Labor's Web site: http://www.doleta.gov/atels_bat. Apprenticeship information is also available from the U.S. Department of Labor's toll-free helpline: (877) 872-5627. For general information on apprenticeships and how to get them, see the *Occupational Outlook Quarterly* article "Apprenticeships: Career training, credentials—and a paycheck in your pocket," online at http://www.bls.gov/opub/ooq/2002/summer/art01.pdf and in print at many libraries and career centers.

Drywall Installers, Ceiling Tile Installers, and Tapers

(O*NET 47-2081.00 and 47-2082.00)

Significant Points

- Most workers learn this trade on the job by starting as helpers to more experienced workers; additional classroom instruction may also be needed.
- Job prospects are expected to be good.

- Inclement weather seldom interrupts work, but workers may be idled when downturns in the economy slow construction activity.

Nature of the Work

Drywall consists of a thin layer of gypsum between two layers of heavy paper. It is used to make walls and ceilings in most buildings today because it is faster and cheaper to install than plaster.

There are two kinds of drywall workers—installers and tapers—although many workers do both types of work. *Installers,* also called *framers* or *hangers*, fasten drywall panels to the inside framework of houses and other buildings. *Tapers* or *finishers*, prepare these panels for painting by taping and finishing joints and imperfections. In addition to drywall workers, ceiling tile installers and lathers also help to build walls and ceilings.

Because drywall panels are manufactured in standard sizes—usually 4 feet by 8 or 12 feet—drywall installers must measure, cut, fit, and fasten them to the inside framework of buildings. Workers cut smaller pieces to go around doors and windows. Installers saw, drill, or cut holes in panels for electrical outlets, air-conditioning units, and plumbing. After making these alterations, installers may glue, nail, or screw the wallboard panels to the wood or metal framework, called studs. Because drywall is heavy and cumbersome, another worker usually helps the installer to position and secure the panel. Installers often use a lift when placing ceiling panels.

After the drywall is installed, tapers fill joints between panels with a joint compound, also called spackle or "mud." Using the wide, flat tip of a special trowel, they spread the compound into and along each side of the joint with brush-like strokes. They immediately use the trowel to press a paper tape—used to reinforce the drywall and to hide imperfections—into the wet compound and to smooth away excess material. Nail and screw depressions also are covered with this compound, as are imperfections caused by the installation of air-conditioning vents and other fixtures. On large projects, finishers may use automatic taping tools that apply the joint compound and tape in one step. Using increasingly wider trowels, tapers apply second and third coats of the compound, sanding the treated areas after each coat to make them as smooth as the rest of the wall surface. This results in a seamless and almost perfect surface. For hard to reach heights and ceilings, sanding poles are commonly used. Some tapers apply textured surfaces to walls and ceilings with trowels, brushes, or spray guns.

Ceiling tile installers, or *acoustical carpenters*, apply or mount acoustical tiles or blocks, strips, or sheets of shock-absorbing materials to ceilings and walls of buildings to reduce reflection of sound or to decorate rooms. First, they measure and mark the surface according to blueprints and drawings. Then, they nail or screw moldings to the wall to support and seal the joint between the ceiling tile and the wall. Finally, they mount the tile, either by applying a cement adhesive to the back of the tile and then pressing the tile into place, or by nailing, screwing, stapling, or wire-tying the lath directly to the structural framework.

Making walls out of plaster requires the work of lathers. Lathers apply the support base for plaster coatings, fireproofing, or acoustical materials. This support base, called lath, is put on walls, ceilings, ornamental frameworks, and partitions of buildings before plaster and other coatings are added. Lathers use hand tools and portable power tools, to nail, screw, staple, or wire-tie the lath directly to the structural framework of a building. At one time, lath was made of wooden strips, but now, it is usually made of wire, metal mesh, or gypsum, also known as rockboard. Metal lath is used when the plaster on top of it will be exposed to weather or water or when a surface is curved or irregular and not suitable for drywall.

Most beginners learn this trade on the job by helping experienced workers.

Work environment. As in many other construction trades, this work is sometimes physically strenuous. Drywall installers, ceiling tile installers, lathers, and tapers spend most of the day on their feet, either standing, bending, stretching, or kneeling. Some tapers use stilts to tape and finish ceiling and angle joints. Installers have to lift and maneuver heavy, cumbersome drywall panels. Hazards include falls from ladders and scaffolds and injuries from power tools and from working with sharp tools, such as utility knives. Because sanding a joint compound to a smooth finish creates a great deal of dust, most finishers wear masks and goggles for protection.

A 40-hour week is standard, but the workweeks often fluctuate depending on the workload. Workers who are paid hourly rates receive premium pay for overtime.

Training, Other Qualifications, and Advancement

Drywall installers, ceiling tile installers, and tapers learn their trade through formal and informal training programs. It can take 3 to 4 years of both classroom and paid on-the-job training to become a fully skilled worker, but many skills can be learned within the first year. In general, the more formal the training process, the more skilled the individual becomes, and the more in demand by employers.

Education and training. Training for this profession can begin in a high school, where classes in English, math, mechanical drawing, blueprint reading, and general shop are recommended. The most common way to get a first job is to find an employer who will provide on-the-job training. Entry-level workers generally start as helpers, assisting more experienced workers. Employers may also send new employees to a trade or vocational school or community college to receive classroom training.

Some employers, particularly large nonresidential construction contractors with union membership, offer employees formal apprenticeships. These programs combine on-the-job training with related classroom instruction—at least 144 hours of instruction each year. The length of the apprenticeship program, usually 3 to 4 years, varies with the apprentice's skill. Because the number of apprenticeship programs is limited, however, only a small proportion of drywall installers, ceiling tile installers, and tapers learn their trade this way.

Helpers and apprentices start by carrying materials, lifting and holding panels, and cleaning up debris. They also learn to use the tools, machines, equipment, and materials of the trade. Within a few weeks, they learn to measure, cut, and install materials. Eventually, they become fully experienced workers. Tapers learn their job by

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Drywall installers, ceiling tile installers, and tapers	47-2080	240,000	258,000	17,000	7
Drywall and ceiling tile installers	47-2081	186,000	199,000	14,000	7
Tapers	47-2082	54,000	58,000	3,900	7

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

taping joints and touching up nail holes, scrapes, and other imperfections. They soon learn to install corner guards and to conceal openings around pipes. At the end of their training, drywall installers, ceiling tile installers, and tapers learn to estimate the cost of installing and finishing drywall.

Other jobseekers may choose to obtain their classroom training before seeking a job. There are a number of vocational-technical schools and training academies affiliated with the unions and contractors that offer training in these occupations. Employers often look favorably upon graduates of these training programs and usually start them at a higher level than those without the training.

Other qualifications. Some skills needed to become a drywall installer, ceiling tile installer, and taper include manual dexterity, eye-hand coordination, good physical fitness, and a good sense of balance. The ability to solve basic arithmetic problems quickly and accurately also is required. In addition, a good work history or military service is viewed favorably by contractors.

Supervisors and contractors need good English skills in order to deal with clients and subcontractors. They also should be able to identify and estimate the quantity of materials needed to complete a job, and accurately estimate how long a job will take to complete and at what cost.

Apprentices usually must be at least 18 years old and have a high school diploma or GED. Those who complete apprenticeships registered with the federal or state government receive a journey worker certificate, recognized nationwide.

Advancement. Drywall installers, ceiling tile installers, and tapers may advance to carpentry supervisor or general construction supervisor positions. Others may become independent contractors. For those who would like to advance, it is increasingly important to be able to communicate in both English and Spanish in order to relay instructions and safety precautions to workers with limited understanding of English because Spanish-speaking workers make up a large part of the construction workforce in many areas. Knowing English well also makes it easier to advance.

Employment

Drywall installers, ceiling tile installers, and tapers held about 240,000 jobs in 2006. Most worked for contractors specializing in drywall and ceiling tile installation; others worked for contractors doing many kinds of construction. About 56,000 were self-employed independent contractors.

Most installers and tapers are employed in populous areas. In other areas, where there may not be enough work to keep a drywall or ceiling tile installer employed full time, carpenters and painters usually do the work.

Job Outlook

Employment is expected to increase about as fast as the average for all occupations, largely reflecting overall growth of the construction industry. Good job prospects are expected overall.

Employment change. Employment is expected to grow by 7 percent between 2006 and 2016, about as fast as the average for all occupations. Growth reflects the number of new construction and remodeling projects. New residential construction projects are expected to provide the majority of new jobs during the projection decade, but home improvement and renovation projects are also expected to create jobs because existing residential and nonresidential buildings are getting old and need repair.

Job prospects. Job opportunities for drywall installers, ceiling tile installers, and tapers are expected to be good. Many potential workers are not attracted to this occupation because they prefer work that is less strenuous and has more comfortable working conditions. Experienced workers will have especially favorable opportunities.

Besides those resulting from job growth, many jobs will open up each year because of the need to replace workers who transfer to other occupations or leave the labor force.

Despite the growing use of exterior panels, most drywall installation and finishing is done indoors. Therefore, drywall workers lose less work time because of inclement weather than do some other construction workers. Nevertheless, like many other construction workers, employment is sensitive to the fluctuations of the economy. Workers in these trades may experience periods of unemployment when the overall level of construction falls. On the other hand, shortages of these workers may occur in some areas during peak periods of building activity.

Earnings

In May 2006, the median hourly earnings of wage and salary drywall and ceiling tile installers were $17.38. The middle 50 percent earned between $13.60 and $22.58. The lowest 10 percent earned less than $10.90, and the highest 10 percent earned more than $28.85. The median hourly earnings in the industries employing the largest numbers of drywall and ceiling tile installers were as follows:

Foundation, structure, and building exterior contractors	$18.10
Drywall and insulation contractors	17.42
Nonresidential building construction	17.26
Residential building construction	17.26

In May 2006, the median hourly earnings of wage and salary tapers were $19.85. The middle 50 percent earned between $14.65 and $25.70. The lowest 10 percent earned less than $11.59, and the highest 10 percent earned more than $31.23.

Some contractors pay these workers according to the number of panels they install or finish per day; others pay an hourly rate.

Trainees usually start at about half the rate paid to experienced workers and receive wage increases as they became more skilled.

Related Occupations

Drywall installers, ceiling tile installers, and tapers combine strength and dexterity with precision and accuracy to make materials fit according to a plan. Other occupations that require similar abilities include carpenters; carpet, floor, and tile installers and finishers; insulation workers; and plasterers and stucco masons.

Sources of Additional Information

For information about work opportunities in drywall application and finishing and ceiling tile installation, contact local drywall installation and ceiling tile installation contractors, a local joint union-management apprenticeship committee, a state or local chapter of the Associated Builders and Contractors, or the nearest office of the state employment service or apprenticeship agency. You can also find information on the registered apprenticeship system with links to state apprenticeship programs on the U.S. Department of Labor's Web site: http://www.doleta.gov/atels_bat. Apprenticeship information is also available from the U.S. Department of Labor's toll-free helpline: (877) 282-5627.

Electricians

(O*NET 47-2111.00)

Significant Points

- Job opportunities should be very good, especially for those with the broadest range of skills.
- Most electricians acquire their skills by completing an apprenticeship program lasting 4 to 5 years.
- About 4 out of 5 electricians work in the construction industry or are self-employed, but there also will be opportunities for electricians in other industries.

Nature of the Work

Electricians bring electricity into homes, businesses, and factories. They install and maintain the wiring, fuses, and other components through which electricity flows. Many electricians also install and maintain electrical machines in factories.

Electricians usually start their work by reading blueprints. Blueprints are technical diagrams that show the locations of circuits, outlets, load centers, panel boards, and other equipment. To ensure public safety, electricians follow the National Electrical Code, and state and local building codes.

Electricians connect all types of wires to circuit breakers, transformers, outlets, or other components. They join the wires in boxes with various specially designed connectors. When installing wiring, electricians use hand tools such as conduit benders, screwdrivers, pliers, knives, hacksaws, and wire strippers, as well as power tools such as drills and saws. Later, they use ammeters, ohmmeters, voltmeters, oscilloscopes, and other equipment to test connections and ensure the compatibility and safety of components.

Electricians may rewire a home and replace an old fuse box with a new circuit breaker box to accommodate additional appliances.

Electricians generally focus on either construction or maintenance, although many do both. Electricians specializing in construction primarily install wiring systems into factories, businesses, and new homes. Electricians specializing in maintenance work fix and upgrade existing electrical systems and repair electrical equipment.

When electricians install wiring systems in factories and commercial settings, they first place conduit (pipe or tubing) inside partitions, walls, or other concealed areas as designated by the blueprints. They also fasten small metal or plastic boxes to the walls that will house electrical switches and outlets. They pull insulated wires or cables through the conduit to complete circuits between these boxes. The diameter and number of wires installed depends on how much power will need to run through it. The greater the diameter of the wire, the more electricity it can handle. In residential construction, electricians usually install insulated wire encased in plastic, which does not need to run through conduit.

Some electricians also install low-voltage wiring systems in addition to electrical systems, although line installers and repairers specialize in this work. Low-voltage wiring accommodates voice, data, and video equipment, such as telephones, computers, intercoms, and fire alarm and security systems. Electricians also may install coaxial or fiber optic cable for telecommunications equipment and electronic controls for industrial uses.

Maintenance electricians repair or replace electric and electronic equipment when it breaks. They make needed repairs as quickly as possible in order to minimize inconvenience. They may replace items such as circuit breakers, fuses, switches, electrical and electronic components, or wire. Electricians also periodically inspect all equipment to ensure it is operating properly and to correct problems before breakdowns occur.

Maintenance work varies greatly, depending on where an electrician works. Electricians who focus on residential work perform a wide variety of electrical work for homeowners. They may rewire a home and replace an old fuse box with a new circuit breaker box to accommodate additional appliances, or they may install new lighting and other electric household items, such as ceiling fans. These electricians might also do some construction and installation work.

Electricians in large factories usually do maintenance work that is more complex. They may repair motors, transformers, generators, and electronic controllers on machine tools and industrial robots. Electricians also advise management whether continued operation of equipment could be hazardous. When working with complex

electronic devices, they may consult with engineers, engineering technicians, line installers and repairers, or industrial machinery mechanics and maintenance workers. (Statements on these occupations appear elsewhere in the *Handbook*.)

Work environment. Electricians work indoors and out, at construction sites, in homes, and in businesses or factories. Work may be strenuous at times and may include bending conduit, lifting heavy objects, and standing, stooping, and kneeling for long periods. Electricians risk injury from electrical shock, falls, and cuts. They must follow strict safety procedures to avoid injuries. When working outdoors, they may be subject to inclement weather conditions. Some electricians may have to travel long distances to jobsites.

Most electricians work a standard 40-hour week, although overtime may be required. Those who do maintenance work may work nights or weekends and be on call to go to the worksite when needed. Electricians in industrial settings may have periodic extended overtime during scheduled maintenance or retooling periods. Companies that operate 24 hours a day may employ three shifts of electricians.

Training, Other Qualifications, and Advancement

Most electricians learn their trade through apprenticeship programs. These programs combine on-the-job training with related classroom instruction.

Education and training. Most electricians learn their trade through apprenticeship programs. These programs combine paid on-the-job training with related classroom instruction. Joint training committees made up of local unions of the International Brotherhood of Electrical Workers and local chapters of the National Electrical Contractors Association; individual electrical contracting companies; or local chapters of the Associated Builders and Contractors and the Independent Electrical Contractors Association usually sponsor apprenticeship programs.

Because of the comprehensive training received, those who complete apprenticeship programs qualify to do both maintenance and construction work. Apprenticeship programs usually last 4 years. Each year includes at least 144 hours of classroom instruction and 2,000 hours of on-the-job training. In the classroom, apprentices learn electrical theory, blueprint reading, mathematics, electrical code requirements, and safety and first aid practices. They also may receive specialized training in soldering, communications, fire alarm systems, and cranes and elevators.

On the job, apprentices work under the supervision of experienced electricians. At first, they drill holes, set anchors, and attach conduit. Later, they measure, fabricate, and install conduit and install, connect, and test wiring, outlets, and switches. They also learn to set up and draw diagrams for entire electrical systems. Eventually, they practice and master all of an electrician's main tasks.

Some people start their classroom training before seeking an apprenticeship. A number of public and private vocational-technical schools and training academies offer training to become an electrician. Employers often hire students who complete these programs and usually start them at a more advanced level than those without this training. A few people become electricians by first working as helpers—assisting electricians by setting up job sites, gathering materials, and doing other nonelectrical work—before entering an apprenticeship program. All apprentices need a high school diploma or a General Equivalency Diploma (G.E.D.). Electricians may also need classes in mathematics because they solve mathematical problems on the job.

Education can continue throughout an electrician's career. Electricians often complete regular safety programs, manufacturer-specific training, and management training courses. Classes on installing low-voltage voice, data, and video systems have recently become common as these systems become more prevalent. Other courses teach electricians how to become contractors.

Licensure. Most states and localities require electricians to be licensed. Although licensing requirements vary from state to state, electricians usually must pass an examination that tests their knowledge of electrical theory, the National Electrical Code, and local electric and building codes. Experienced electricians periodically take courses offered by their employer or union to learn about changes in the National Electrical Code.

Electrical contractors who do electrical work for the public, as opposed to electricians who work for electrical contractors, often need a special license. In some states, electrical contractors need certification as master electricians. Most states require master electricians to have at least 7 years of experience as an electrician. Some states require a bachelor's degree in electrical engineering or a related field.

Other qualifications. Applicants for apprenticeships usually must be at least 18 years old and have a high school diploma or a G.E.D. They also may have to pass a test and meet other requirements.

Other skills needed to become an electrician include manual dexterity, eye-hand coordination, physical fitness, and a good sense of balance. They also need good color vision because workers frequently must identify electrical wires by color. In addition, apprenticeship committees and employers view a good work history or military service favorably.

Advancement. Experienced electricians can advance to jobs as supervisors. In construction, they also may become project managers or construction superintendents. Those with sufficient capital and management skills can start their own contracting business, although this often requires a special electrical contractor's license. Supervisors and contractors should be able to identify and estimate costs and prices and the time and materials needed to complete a job. Many electricians also become electrical inspectors.

For those who seek to advance, it is increasingly important to be able to communicate in both English and Spanish in order to relay instructions and safety precautions to workers with limited understanding of English; Spanish-speaking workers make up a large part of the construction workforce in many areas. Spanish-speaking workers who want to advance in this occupation need very good English skills to understand electrician classes and installation instructions, which are usually written in English. and are highly technical.

Employment

Electricians held about 705,000 jobs in 2006. About 68 percent of wage-and-salary workers were employed in the construction industry and the remainder worked as maintenance electricians in other industries. In addition, about 11 percent of electricians were self-employed.

Job Outlook

Average employment growth is expected. Job prospects should be very good, particularly for workers with the widest range of skills, including voice, data, and video wiring.

Employment change. Employment of electricians should increase 7 percent between 2006 and 2016, about as fast as the average for all occupations. As the population and economy grow, more electricians will be needed to install and maintain electrical devices and wiring in homes, factories, offices, and other structures. An

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Electricians	47-2111	705,000	757,000	52,000	7

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

increase in power plant construction over the next ten years will require many additional electricians. New technologies also are expected to continue to spur demand for these workers. For example, buildings increasingly need wiring to accommodate computers and telecommunications equipment. Robots and other automated manufacturing systems in factories also will require the installation and maintenance of more complex wiring systems. As the economy rehabilitates and retrofits older structures, which usually require electrical improvements to meet modern codes, it will create additional jobs.

Job prospects. In addition to jobs created by the increased demand for electrical work, many openings are expected over the next decade as a large number of electricians retire. This will create very good job opportunities, especially for those with the widest range of skills, including voice, data, and video wiring. Job openings for electricians will vary by location and specialty, however, and will be best in the fastest growing regions of the country, especially those areas where power plants are being constructed.

Employment of electricians, like that of many other construction workers, is sensitive to the fluctuations of the economy. Workers in these trades may experience periods of unemployment when the overall level of construction falls. On the other hand, shortages of these workers may occur in some areas during peak periods of building activity.

Although employment of maintenance electricians is steadier than that of construction electricians, those working in the automotive and other manufacturing industries that are sensitive to cyclical swings in the economy may experience lay offs during recessions. In addition, opportunities for maintenance electricians may be limited in many industries by the increased contracting out for electrical services in an effort to reduce operating costs. However, increased job opportunities for electricians in electrical contracting firms should partially offset job losses in other industries.

Earnings

In May 2006, median hourly earnings of wage and salary electricians were $20.97. The middle 50 percent earned between $16.07 and $27.71. The lowest 10 percent earned less than $12.76, and the highest 10 percent earned more than $34.95. Median hourly earnings in the industries employing the largest numbers of electricians were:

Motor vehicle parts manufacturing	$31.90
Electric power generation, transmission, and distribution	26.32
Local government	23.80
Nonresidential building construction	20.58
Electrical contractors	20.47
Plumbing, heating, and air-conditioning contractors	19.56
Employment services	17.15

Apprentices usually start at between 40 and 50 percent of the rate paid to fully trained electricians, depending on experience. As apprentices become more skilled, they receive periodic pay increases throughout their training.

Some electricians are members of the International Brotherhood of Electrical Workers. Among unions representing maintenance electricians are the International Brotherhood of Electrical Workers; the International Union of Electronic, Electrical, Salaried, Machine, and Furniture Workers; the International Association of Machinists and Aerospace Workers; the International Union, United Automobile, Aircraft and Agricultural Implement Workers of America; and the United Steelworkers of America.

Related Occupations

To install and maintain electrical systems, electricians combine manual skill and knowledge of electrical materials and concepts. Workers in other occupations involving similar skills include heating, air-conditioning, and refrigeration mechanics and installers; line installers and repairers; electrical and electronics installers and repairers; electronic home entertainment equipment installers and repairers; and elevator installers and repairers.

Sources of Additional Information

For details about apprenticeships or other work opportunities in this trade, contact the offices of the state employment service, the state apprenticeship agency, local electrical contractors or firms that employ maintenance electricians, or local union-management electrician apprenticeship committees. Apprenticeship information is also available from the U.S. Department of Labor's toll-free helpline: (877) 872-5627.

Information also may be available from local chapters of the Independent Electrical Contractors, Inc.; the National Electrical Contractors Association; the Home Builders Institute; the Associated Builders and Contractors; and the International Brotherhood of Electrical Workers.

For general information on apprenticeships and how to get them, see the *Occupational Outlook Quarterly* article "Apprenticeships: Career training, credentials—and a paycheck in your pocket," online at http://www.bls.gov/opub/ooq/2002/summer/art01.pdf and in print at many libraries and career centers.

Elevator Installers and Repairers

(O*NET 47-4021.00)

Significant Points

- Most workers belong to a union and enter the occupation through a four-year apprenticeship program.
- Excellent employment opportunities are expected.
- Elevator installers and repairers are less affected by downturns in the economy and inclement weather than other construction trades workers.

Nature of the Work

Elevator installers and repairers—also called *elevator constructors* or *elevator mechanics*—assemble, install, and replace elevators, escalators, chairlifts, dumbwaiters, moving walkways, and similar equipment in new and old buildings. Once the equipment is in service, they maintain and repair it as well. They also are responsible for modernizing older equipment.

To install, repair, and maintain modern elevators, which are almost all electronically controlled, elevator installers and repairers must have a thorough knowledge of electronics, electricity, and hydraulics. Many elevators are controlled with microprocessors, which are programmed to analyze traffic conditions in order to dispatch elevators in the most efficient manner. With these controls, it is possible to get the greatest amount of service with the fewest number of cars.

Elevator installers and repairers usually specialize in installation, maintenance, or repair work. Maintenance and repair workers generally need greater knowledge of electricity and electronics than do installers because a large part of maintenance and repair work is troubleshooting.

When installing a new elevator, installers and repairers begin by studying blueprints to determine the equipment needed to install rails, machinery, car enclosures, motors, pumps, cylinders, and plunger foundations. Then, they begin equipment installation. Working on scaffolding or platforms, installers bolt or weld steel rails to the walls of the shaft to guide the elevator.

Elevator installers put in electrical wires and controls by running tubing, called conduit, along a shaft's walls from floor to floor. Once the conduit is in place, mechanics pull plastic-covered electrical wires through it. They then install electrical components and related devices required at each floor and at the main control panel in the machine room.

Repairers make sure that an elevator operates according to specifications and stops at each floor within a specified time.

Installers bolt or weld together the steel frame of an elevator car at the bottom of the shaft; install the car's platform, walls, and doors; and attach guide shoes and rollers to minimize the lateral motion of the car as it travels through the shaft. They also install the outer doors and door frames at the elevator entrances on each floor.

For cabled elevators, these workers install geared or gearless machines with a traction drive wheel that guides and moves heavy steel cables connected to the elevator car and counterweight. (The counterweight moves in the opposite direction from the car and balances most of the weight of the car to reduce the weight that the elevator's motor must lift.) Elevator installers also install elevators in which a car sits on a hydraulic plunger that is driven by a pump. The plunger pushes the elevator car up from underneath, similar to a lift in an auto service station.

Installers and repairers also install escalators. They place the steel framework, the electrically powered stairs, and the tracks and install associated motors and electrical wiring. In addition to elevators and escalators, installers and repairers also may install devices such as dumbwaiters and material lifts—which are similar to elevators in design—as well as moving walkways, stair lifts, and wheelchair lifts.

Once an elevator is operating properly, it must be maintained and serviced regularly to keep it in safe working condition. Elevator installers and repairers generally do preventive maintenance—such as oiling and greasing moving parts, replacing worn parts, testing equipment with meters and gauges, and adjusting equipment for optimal performance. They insure that the equipment and rooms are clean. They also troubleshoot and may be called to do emergency repairs. Unlike most elevator installers, those who specialize in elevator maintenance are on their own most of the day and typically service the same elevators periodically.

A service crew usually handles major repairs—for example, replacing cables, elevator doors, or machine bearings. This may require the use of cutting torches or rigging equipment—tools that an elevator repairer would not normally carry. Service crews also do major modernization and alteration work, such as moving and replacing electrical motors, hydraulic pumps, and control panels.

The most highly skilled elevator installers and repairers, called "adjusters," specialize in fine-tuning all the equipment after installation. Adjusters make sure that an elevator works according to specifications and stops correctly at each floor within a specified time. Adjusters need a thorough knowledge of electricity, electronics, and computers to ensure that newly installed elevators operate properly.

Work environment. Elevator installers lift and carry heavy equipment and parts, and they may work in cramped spaces or awkward positions. Potential hazards include falls, electrical shock, muscle strains, and other injuries related to handling heavy equipment. Most of their work is performed indoors in existing buildings or buildings under construction.

Most elevator installers and repairers work a 40-hour week. However, overtime is required when essential equipment must be repaired, and some workers are on 24-hour call. Because most of their work is performed indoors in buildings, elevator installers and repairers lose less work time due to inclement weather than do other construction trades workers.

Training, Other Qualifications, and Advancement

Most elevator installers receive their education through an apprenticeship program. High school classes in mathematics, science, and shop may help applicants compete for apprenticeship openings.

Education and training. Most elevators installers and repairers learn their trade in an apprenticeship program administered by local joint educational committees representing the employers and the union—the International Union of Elevator Constructors. In nonunion shops, workers may complete training programs sponsored by independent contractors.

Apprenticeship programs teach a range of skills, usually during a four-year period. Programs combine paid on-the-job training with classroom instruction in blueprint reading, electrical and electronic theory, mathematics, applications of physics, and safety.

Most apprentices assist experienced elevator installers and repairers. Beginners carry materials and tools, bolt rails to walls, and assemble elevator cars. Eventually, apprentices learn more difficult tasks such as wiring.

Applicants for apprenticeship positions must have a high school diploma or the equivalent. High school courses in electricity, mathematics, and physics provide a useful background. As elevators become increasingly sophisticated, workers may need to get more advanced education—for example, a certificate or associate degree in electronics. Workers with education beyond high school usually advance more quickly than their counterparts without a degree.

Many elevator installers and repairers receive additional training in their particular company's equipment.

Licensure. Most cities and states require elevator installers and repairers to pass a licensing examination. Other requirements for licensure vary.

Certification and other qualifications. Workers who also complete an apprenticeship registered by the U.S. Department of Labor or their state board earn a journeyworker certificate recognized Nationwide. Applicants for apprenticeship positions must be at least 18 years old, have a high school diploma or equivalent, and pass a drug test and an aptitude test. Good physical condition and mechanical aptitude also are important.

Jobs with many employers require membership in the union. To be considered fully qualified by the union, workers must complete an apprenticeship and pass a standard exam administered by the National Elevator Industry Educational Program.

The National Association of Elevator Contractors also offers certification as a Certified Elevator Technician or Certified Accessibility and Private Residence Lift Technician.

Advancement. Ongoing training is very important if a worker is to keep up with technological developments in elevator repair. In fact, union elevator installers and repairers typically receive training throughout their careers, through correspondence courses, seminars, or formal classes. This training greatly improves one's chances for promotion and retention.

Some installers may receive further training in specialized areas and advance to the position of mechanic-in-charge, adjuster, supervisor, or elevator inspector. Adjusters, for example, may be picked for their position because they possess particular skills or are electronically inclined. Other workers may move into management, sales, or product design jobs.

Employment

Elevator installers and repairers held about 22,000 jobs in 2006. Most were employed by specialty trades contractors, particularly elevator maintenance and repair contractors. Others were employed by field offices of elevator manufacturers, machinery wholesalers, government agencies, or businesses that do their own elevator maintenance and repair.

Job Outlook

Even with average job growth, excellent job opportunities are expected in this occupation.

Employment change. Employment of elevator installers and repairers is expected to increase 9 percent during the 2006–2016 decade, about as fast as the average for all occupations. Demand for additional elevator installers depends greatly on growth in nonresidential construction, such as commercial office buildings and stores that have elevators and escalators. This sector of the construction industry is expected to grow during the decade as the economy expands. In addition, the need to continually update and repair old equipment, provide access to the disabled, and install increasingly sophisticated equipment and controls should add to the demand for elevator installers and repairers. The demand for elevator installers and repairers will also increase as a growing number of the elderly require easier access to their homes through stair lifts and residential elevators.

Job prospects. Workers should have excellent opportunities when seeking to enter this occupation. Elevator installer and repairer jobs have relatively high earnings and good benefits. However, the dangerous and physically challenging nature of this occupation and the significant training it requires reduces the number of applicants and creates better opportunities for those who apply. Job prospects should be best for those with postsecondary education in electronics or experience in the military.

Elevators, escalators, lifts, moving walkways, and related equipment need to be kept in good working condition year round, so employment of elevator repairers is less affected by economic downturns and seasonality than other construction trades.

Earnings

Earnings of elevator installers and repairers are among the highest of all construction trades. Median hourly earnings of wage and salary elevator installers and repairers were $30.59 in May 2006. The middle 50 percent earned between $23.90 and $35.76. The lowest 10 percent earned less than $17.79, and the top 10 percent earned more than $42.14. Median hourly earnings in the building equipment contractors industry were $30.74.

Earnings for members of the International Union of Elevator Constructors vary based on the local and specialty. Check with a local in your area for exact wages.

About three out of four elevator installers and repairers were members of unions or covered by a union contract, one of the highest proportions of all occupations. The largest numbers were members of the International Union of Elevator Constructors. In addition to free continuing education, elevator installers and repairers receive basic benefits enjoyed by most other workers.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Elevator installers and repairers	47-4021	22,000	24,000	1,900	9

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Related Occupations

Elevator installers and repairers combine electrical and mechanical skills with construction skills, such as welding, rigging, measuring, and blueprint reading. Other occupations that require many of these skills are boilermakers; electricians; electrical and electronics installers and repairers; industrial machinery mechanics and maintenance workers; millwrights; sheet metal workers; and structural and reinforcing iron and metal workers.

Sources of Additional Information

For information about apprenticeships or job opportunities as an elevator mechanic, contact local contractors, a local chapter of the International Union of Elevator Constructors, a local joint union-management apprenticeship committee, or the nearest office of your state employment service or apprenticeship agency. You can also find information on the registered apprenticeship system with links to state apprenticeship programs on the U.S. Department of Labor's Web site: http://www.doleta.gov/atels_bat. Apprenticeship information is also available from the U.S. Department of Labor's toll-free helpline: (877) 872-5627.

➤ National Association of Elevator Contractors, 1298 Wellbrook Circle, Suite A, Conyers, GA 30012. Internet: http://www.naec.org

For general information on apprenticeships and how to get them, see the *Occupational Outlook Quarterly* article "Apprenticeships: Career training, credentials—and a paycheck in your pocket," online at http://www.bls.gov/opub/ooq/2002/summer/art01.pdf and in print at many libraries and career centers.

Glaziers

(O*NET 47-2121.00)

Significant Points

- Many glaziers learn the trade by helping experienced workers.
- Job opportunities are expected to be good.

Nature of the Work

Glass serves many uses in modern life. Insulated and specially treated glass keeps in warmed or cooled air and provides good condensation and sound control. Tempered and laminated glass makes doors and windows more secure. In large commercial buildings, glass panels give office buildings a distinctive look while reducing the need for artificial lighting. The creative use of large windows, glass doors, skylights, and sunroom additions makes homes bright, airy, and inviting.

Glaziers are responsible for selecting, cutting, installing, replacing, and removing all types of glass. They generally work on one of several types of projects. Residential glazing involves work such as replacing glass in home windows; installing glass mirrors, shower doors, and bathtub enclosures; and fitting glass for tabletops and display cases. On commercial interior projects, glaziers install items such as heavy, often etched, decorative room dividers or security windows. Glazing projects also may involve replacement of storefront windows for establishments such as supermarkets, auto dealerships, or banks. In the construction of large commercial buildings, glaziers build metal framework extrusions and install glass panels or curtain walls. (Workers who replace and repair glass in motor vehicles are not covered in this statement. See the statement on automotive body and related repairers elsewhere in the *Handbook*.)

Most glaziers learn their trade by helping experienced workers, sometimes with supplemental classroom training.

Besides working with glass, glaziers also may work with plastics, granite, marble, and other similar materials used as glass substitutes and with films or laminates that improve the durability or safety of the glass. They may mount steel and aluminum sashes or frames and attach locks and hinges to glass doors.

For most jobs, the glass is precut and mounted in frames at a factory or a contractor's shop. It arrives at the jobsite ready for glaziers to position and secure it in place. They may use a crane or hoist with suction cups to lift large, heavy pieces of glass. They then gently guide the glass into position by hand.

Once glaziers have the glass in place, they secure it with mastic, putty, or other paste-like cement, or with bolts, rubber gaskets, glazing compound, metal clips, or metal or wood moldings. When they secure glass using a rubber gasket—a thick, molded rubber half-tube with a split running its length—they first secure the gasket around the perimeter within the opening, then set the glass into the split side of the gasket, causing it to clamp to the edges and hold the glass firmly in place.

When they use metal clips and wood moldings, glaziers first secure the molding to the opening, place the glass in the molding, and then force springlike metal clips between the glass and the molding. The clips exert pressure and keep the glass firmly in place.

When a glazing compound is used, glaziers first spread it neatly against and around the edges of the molding on the inside of the opening. Next, they install the glass. Pressing it against the compound on the inside molding, workers screw or nail outside molding that loosely holds the glass in place. To hold it firmly, they pack the space between the molding and the glass with glazing compound and then trim any excess material with a glazing knife.

For some jobs, the glazier must cut the glass manually at the jobsite. To prepare the glass for cutting, glaziers rest it either on edge on a rack, or "A-frame," or flat against a cutting table. They then measure and mark the glass for the cut.

Glaziers cut glass with a special tool that has a small, very hard metal wheel. Using a straightedge as a guide, the glazier presses the cutter's wheel firmly on the glass, guiding and rolling it carefully to make a score just below the surface. To help the cutting tool move

smoothly across the glass, workers brush a thin layer of oil along the line of the intended cut or dip the cutting tool in oil. Immediately after cutting, the glazier presses on the shorter end of the glass to break it cleanly along the cut.

In addition to hand tools such as glasscutters, suction cups, and glazing knives, glaziers use power tools such as saws, drills, cutters, and grinders. An increasing number of glaziers use computers in the shop or at the jobsite to improve their layout work and reduce the amount of wasted glass.

Work environment. Glaziers often work outdoors, sometimes in inclement weather. Their work can, at times, result in injuries as they work with sharp tools and may need to remove broken glass. They must be prepared to lift heavy glass panels and work on scaffolding, sometimes at great heights. Glaziers do a considerable amount of bending, kneeling, lifting, and standing during the installation process.

Training, Other Qualifications, and Advancement

Most glaziers learn their trade by helping experienced workers, sometimes with supplemental classroom training. A few formal apprenticeship programs are available.

Education and training. Glaziers learn their trade through formal and informal training programs. Usually 3 years of classroom and on-the-job training are required to become a skilled glazier. There are a number of different avenues that one can take to obtain the necessary training. Most glaziers start by obtaining a job with a contractor who then provides on-the-job training. Entry-level workers generally start as helpers, assisting more experienced workers. During this time, employers may send the employee to a trade or vocational school or community college to receive further classroom training.

Some employers offer formal apprenticeships. These programs combine paid on-the-job training with related classroom instruction. Apprenticeship applicants usually must be at least 18 years old and meet local requirements. The length of the program is usually 3 years, but varies with the apprentice's skill. Because the number of apprenticeship programs is limited, however, only a small proportion of glaziers learn their trade through these programs.

On the job, apprentices or helpers often start by carrying glass and cleaning up debris in glass shops. They often practice cutting on discarded glass. Later, they are given an opportunity to cut glass for a job and assist experienced workers on simple installation jobs. By working with experienced glaziers, they eventually acquire the skills of a fully qualified glazier. On the job, they learn to use the tools and equipment of the trade; handle, measure, cut, and install glass and metal framing; cut and fit moldings; and install and balance glass doors. In the classroom, they are taught about glass and installation techniques as well as basic mathematics, blueprint reading and sketching, general construction techniques, safety practices, and first aid.

Licensure. Only the state of Connecticut currently requires glaziers to have a license. In addition to passing a test, workers need education, experience, and an apprenticeship to be licensed. There is a voluntary license in Florida. Other states may require licenses in the future.

Other qualifications. Skills needed to become a glazier include manual dexterity, eye-hand coordination, physical fitness, and a good sense of balance. The ability to solve arithmetic problems quickly and accurately also is required. In addition, a good work history or military service is viewed favorably by employers.

Certification and advancement. Glaziers who learn the trade through a formal registered apprenticeship program become certified journeyworkers. Some associations offer other certifications. The National Glass Association, for example, offers a series of written examinations that certify an individual's competency to perform glazier work at three progressively difficult levels of proficiency: Level I Glazier; Level II Commercial Interior or Residential Glazier, or Storefront or Curtainwall Glazier; and Level III Master Glazier.

Advancement for glaziers generally consists of increases in pay; some advance to glazier supervisors, general construction supervisors, independent contractors, or cost estimators. For those who would like to advance, it is increasingly important to be able to communicate in both English and Spanish in order to relay instructions and safety precautions to workers with limited understanding of English because Spanish-speaking workers make up a large part of the construction workforce in many areas. Supervisors and contractors need good communication skills to deal with clients and subcontractors and should be able to identify and estimate the quantity of materials needed to complete a job and accurately estimate how long a job will take to complete and at what cost.

Employment

Glaziers held 55,000 jobs in 2006. About 68 percent of glaziers worked for glazing contractors engaged in new construction, alteration, and repair. About 16 percent of glaziers worked in retail glass shops that install or replace glass, and for wholesale distributors of products containing glass.

Job Outlook

Average employment growth is projected. Good job opportunities are expected, especially for those with a range of skills.

Employment change. Employment is expected to grow 12 percent from 2006 to 2016, about as fast as the average for all occupations. Employment of glaziers is expected to increase as a result of growth in residential and nonresidential construction. Demand for glaziers also will be spurred by the continuing need to modernize and repair existing structures, which often involves installing new windows. Also, more homeowners now prefer rooms with more sunlight and are adding sunrooms and skylights to houses. Demand for specialized safety glass and glass coated with protective laminates is also growing in response to a higher need for security and the need to withstand hurricanes, particularly in many commercial and government buildings. Homes and buildings that have been built recently are less likely to need replacement windows than older structures.

Counteracting these factors, however, is the ability of other workers such as carpenters to install windows, which reduces employment growth for glaziers.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Glaziers	47-2121	55,000	62,000	6,600	12

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Job prospects. Job opportunities for glaziers are expected to be good. Since employers prefer workers who can do a variety of tasks, glaziers with a range of skills will have the best opportunities.

Like other construction trades workers, glaziers employed in the construction industry should expect to experience periods of unemployment because of the limited duration of construction projects and the cyclical nature of the construction industry. During downturns in the economy, job openings for glaziers are reduced as the level of construction declines. However, construction activity varies from area to area, so job openings fluctuate with local economic conditions. Employment opportunities should be greatest in metropolitan areas, where most glazing contractors and glass shops are located.

Earnings

In May 2006, median hourly earnings of wage and salary glaziers were $16.64. The middle 50 percent earned between $12.85 and $22.18. The lowest 10 percent earned less than $10.19, and the highest 10 percent earned more than $30.52. Median hourly wage-and-salary earnings in the foundation, structure, and building exterior contractors industry were $17.03. Median hourly earnings for glaziers employed by building materials and supply dealers, where most glass shops are found, were $15.51.

Glaziers covered by union contracts generally earn more than their nonunion counterparts. Apprentice wage rates usually start at 40 to 50 percent of the rate paid to experienced glaziers and increase as they gain experience. Because glaziers can lose work time due to weather conditions and fluctuations in construction activity, their overall earnings may be lower than their hourly wages suggest.

Some glaziers employed in construction are members of the International Union of Painters and Allied Trades.

Related Occupations

Glaziers use their knowledge of construction materials and techniques to install glass. Other construction workers whose jobs also involve skilled, custom work are brickmasons, blockmasons, and stonemasons; carpenters; carpet, floor, and tile installers and finishers; cement masons, concrete finishers, segmental pavers, and terrazzo workers; sheet metal workers; and painters and paperhangers. In addition, automotive body and related repairers install broken or damaged glass on the vehicles they repair.

Sources of Additional Information

For more information about glazier apprenticeships or work opportunities, contact local glazing or general contractors, a local of the International Union of Painters and Allied Trades, a local joint union-management apprenticeship agency, or the nearest office of the state employment service or state apprenticeship agency. You can also find information on the registered apprenticeships together with links to state apprenticeship programs on the U.S. Department of Labor's Web site: http://www.doleta.gov/atels_bat. Apprenticeship information is also available from the U.S. Department of Labor's toll-free helpline: (877) 872-5627.

Hazardous Materials Removal Workers

(O*NET 47-4041.00)

Significant Points

- Working conditions can be hazardous.
- Formal education beyond high school is not required, but government standards require specific types of on-the-job training.
- Good job opportunities are expected, mainly due to the need to replace workers who leave the occupation.

Nature of the Work

Increased public awareness and federal and state regulations are resulting in the removal of more hazardous materials from buildings, facilities, and the environment to prevent further contamination of natural resources and to promote public health and safety. Hazardous materials typically possess at least one of four characteristics—ignitability, corrosivity, reactivity, or toxicity. Hazardous materials removal workers identify, remove, package, transport, and dispose of various hazardous materials, including asbestos, radioactive and nuclear materials, arsenic, lead, and mercury. These workers are sometimes called abatement, remediation, or decontamination workers. Removal workers often respond to emergencies where harmful substances are present.

Hazardous materials removal workers use a variety of tools and equipment, depending on the work at hand. Equipment ranges from brooms to personal protective suits that completely isolate workers from the hazardous material. Because of the threat of contamination, workers often wear disposable or reusable coveralls, gloves, hardhats, shoe covers, safety glasses or goggles, chemical-resistant clothing, face shields, and devices to protect one's hearing. Most workers are also required to wear respirators while working, to protect them from airborne particles or noxious gases. The respirators range from simple versions that cover only the mouth and nose to self-contained suits with their own air supply.

Asbestos and lead are two of the most common contaminants that hazardous materials removal workers encounter. Through the 1970s, asbestos was used to fireproof roofing and flooring, for heat insulation, and for a variety of other purposes. It was durable, fire retardant, resisted corrosion, and insulated well, making it ideal for such applications. Embedded in materials, asbestos is fairly harmless; airborne, however, it can cause several lung diseases, including lung cancer and asbestosis. Today, asbestos is rarely used in buildings, but there are still structures that contain the material that must be remediated. Similarly, lead was a common building component found in paint and plumbing fixtures and pipes until the late 1970s. Because lead is easily absorbed into the bloodstream, often from breathing lead dust or from eating chips of paint containing lead, it can cause serious health risks, especially in children. Due to these risks, it has become necessary to remove lead-based products from buildings and structures.

Most hazardous materials removal workers are required to wear respirators to protect them from airborne particles.

Asbestos abatement workers and *lead abatement workers* remove asbestos, lead, and other materials from buildings scheduled to be renovated or demolished. Using a variety of hand and power tools, such as vacuums and scrapers, these workers remove the asbestos and lead from surfaces. A typical residential lead abatement project involves the use of a chemical to strip the lead-based paint from the walls of the home. Lead abatement workers apply the compound with a putty knife and allow it to dry. Then they scrape the hazardous material into an impregnable container for transport and storage. They also use sandblasters and high-pressure water sprayers to remove lead from large structures. The vacuums utilized by asbestos abatement workers have special, highly efficient filters designed to trap the asbestos, which later is disposed of or stored. During the abatement, special monitors measure the amount of asbestos and lead in the air, to protect the workers; in addition, lead abatement workers wear a personal air monitor that indicates the amount of lead to which a worker has been exposed. Workers also use monitoring devices to identify the asbestos, lead, and other materials that need to be removed from the surfaces of walls and structures.

Transportation of hazardous materials is safer today than it was in the past, but accidents still occur. *Emergency and disaster response workers* clean up hazardous materials after train derailments and trucking accidents. These workers also are needed when an immediate cleanup is required, as would be the case after an attack by biological or chemical weapons.

Some hazardous materials removal workers specialize in radioactive substances. These substances range from low-level contaminated protective clothing, tools, filters, and medical equipment, to highly radioactive nuclear reactor fuels used to produce electricity. *Decontamination technicians* perform duties similar to those of janitors and cleaners, but the items and areas they clean are radioactive. They use brooms, mops, and other tools to clean exposed areas and remove exposed items for decontamination or disposal. Some of these jobs are now being done by robots controlled by people away from the contamination site. Increasingly, many of these remote devices are being used to automatically monitor and survey surfaces, such as floors and walls, for contamination.

With experience, decontamination technicians can advance to *radiation-protection technician* jobs and use radiation survey meters and other remote devices to locate and evaluate materials, operate high-pressure cleaning equipment for decontamination, and package radioactive materials for transportation or disposal.

Decommissioning and decontamination workers remove and treat radioactive materials generated by nuclear facilities and power plants. With a variety of hand tools, they break down contaminated items such as "gloveboxes," which are used to process radioactive materials. At decommissioning sites, the workers clean and decontaminate the facility, as well as remove any radioactive or contaminated materials.

Treatment, storage, and disposal workers transport and prepare materials for treatment or disposal. To ensure proper treatment of the materials, laws, typically regulated by the U.S. Environmental Protection Agency (EPA) or Occupational Safety and Health Administration (OSHA), require these workers to be able to verify shipping manifests. At incinerator facilities, treatment, storage, and disposal workers transport materials from the customer or service center to the incinerator. At landfills, they follow a strict procedure for the processing and storage of hazardous materials. They organize and track the location of items in the landfill and may help change the state of a material from liquid to solid in preparation for its storage. These workers typically operate heavy machinery, such as forklifts, earthmoving machinery, and large trucks and rigs.

To help clean up the nation's hazardous waste sites, a federal program, called Superfund, was created in 1980. Under the Superfund program, abandoned, accidentally spilled, or illegally dumped hazardous waste that poses a current or future threat to human health or the environment is cleaned up. In doing so, the EPA along with potentially responsible parties, communities, local, state, and federal authorities, identify hazardous waste sites, test site conditions, formulate cleanup plans, and clean up the sites.

Mold remediation is a new aspect of some hazardous materials removal work. Some types of mold can cause allergic reactions, especially in people who are susceptible to them. Although mold is present in almost all structures and is not usually defined as a hazardous material, some mold—especially the types that cause allergic reactions—can infest a building to such a degree that extensive efforts must be taken to remove it safely. Molds are fungi that typically grow in warm, damp conditions both indoors and outdoors year round. They can be found in heating and air-conditioning ducts, within walls, and in showers, attics, and basements. Although mold remediation is often undertaken by other construction workers, large scale mold removal is usually handled by hazardous materials removal workers, who take special precautions to protect themselves and surrounding areas from being contaminated.

Hazardous materials removal workers also may be required to construct scaffolding or erect containment areas prior to abatement or decontamination. In most cases, government regulation dictates that hazardous materials removal workers be closely supervised on the worksite. The standard usually is 1 supervisor to every 10 workers. The work is highly structured, sometimes planned years in

advance, and team oriented. There is a great deal of cooperation among supervisors and workers. Because of the hazard presented by the materials being removed, work areas are restricted to licensed hazardous materials removal workers, thus minimizing exposure to the public.

Work environment. Hazardous materials removal workers function in a highly structured environment to minimize the danger they face. Each phase of an operation is planned in advance, and workers are trained to deal with safety breaches and hazardous situations. Crews and supervisors take every precaution to ensure that the worksite is safe. Whether they work with asbestos, mold, lead abatement, or in radioactive decontamination, hazardous materials removal workers must stand, stoop, and kneel for long periods. Some must wear fully enclosed personal protective suits for several hours at a time; these suits may be hot and uncomfortable and may cause some individuals to experience claustrophobia.

Hazardous materials removal workers face different working conditions, depending on their area of expertise. Although many work a standard 40-hour week, overtime and shift work are common, especially for emergency and disaster response workers. Asbestos and lead abatement workers usually work in structures such as office buildings, schools, or historic buildings under renovation. Because they are under pressure to complete their work within certain deadlines, workers may experience fatigue. Completing projects frequently requires night and weekend work, because hazardous materials removal workers often work around the schedules of others. Treatment, storage, and disposal workers are employed primarily at facilities such as landfills, incinerators, boilers, and industrial furnaces. These facilities often are located in remote areas, due to the kinds of work being done. As a result, workers employed by treatment, storage, or disposal facilities may commute long distances to their jobs.

Decommissioning and decontamination workers, decontamination technicians, and radiation protection technicians work at nuclear facilities and electric power plants. Like treatment, storage, and disposal facilities, these sites often are far from urban areas. Workers, who often perform jobs in cramped conditions, may need to use sharp tools to dismantle contaminated objects. A hazardous materials removal worker must have great self-control and a level head to cope with the daily stress associated with handling hazardous materials.

Hazardous materials removal workers may be required to travel outside their normal working areas in order to respond to emergencies, the cleanup of which sometimes take several days or weeks to complete. During the cleanup, workers may be away from home for the entire time.

Training, Other Qualifications, and Advancement

No formal education beyond a high school diploma is required for a person to become a hazardous materials removal worker. However, federal, state, and local government standards require specific types of on-the-job training. The regulations vary by specialty and sometimes by state or locality. Employers are responsible for employee training.

Education and training. Hazardous materials removal workers usually need at least 40 hours of formal on-the-job training. For most specialties, this training must meet specific requirements set by the federal government or individual states.

Licensure. Workers who treat asbestos and lead, the most common contaminants, must complete a training program through their employer that meets Occupational Safety and Health Administration (OSHA) standards. Employer-sponsored training is usually performed in-house, and the employer is responsible for covering all technical and safety subjects outlined by OSHA.

To become an emergency and disaster response worker and treatment, storage, and disposal worker, candidates must obtain a federal license as mandated by OSHA. Employers are responsible for ensuring that employees complete a formal 40-hour training program, given either in house or in OSHA-approved training centers. The program covers health hazards, personal protective equipment and clothing, site safety, recognition and identification of hazards, and decontamination.

In some cases, workers may discover one hazardous material while abating another. If they are not licensed to work with the newly discovered material, they cannot continue to work with it. Many experienced workers opt to take courses in additional types of hazardous material removal to avoid this situation. Mold removal is not regulated by OSHA, but is regulated by each state.

For decommissioning and decontamination workers employed at nuclear facilities, training is most extensive. In addition to obtaining licensure through the standard 40-hour training course in hazardous waste removal, workers must take courses dealing with regulations governing nuclear materials and radiation safety as mandated by the Nuclear Regulatory Commission. These courses add up to approximately 3 months of training, although most are not taken consecutively. Many agencies, organizations, and companies throughout the country provide training programs that are approved by the U.S. Environmental Protection Agency, the U.S. Department of Energy, and other regulatory bodies. Workers in all fields are required to take refresher courses every year to maintain their license.

Other qualifications. Workers must be able to perform basic mathematical conversions and calculations when mixing solutions that neutralize contaminants and should have good physical strength and manual dexterity. Because of the nature of the work and the time constraints sometimes involved, employers prefer people who are dependable, prompt, and detail-oriented. Because much of the work is done in buildings, a background in construction is helpful.

Employment

Hazardous materials removal workers held about 39,000 jobs in 2006. About 79 percent were employed in waste management and remediation services. Another 5 percent were employed in construction, primarily in asbestos abatement and lead abatement. A small number worked at nuclear and electric plants as decommissioning and decontamination workers and radiation safety and decontamination technicians.

Job Outlook

Employment of hazardous materials removal workers is expected to grow about as fast as average. Good job opportunities are expected because of the need to replace the large number of workers who leave the occupation each year.

Employment change. Employment of hazardous materials removal workers is expected to grow 11 percent between 2006 and 2016, about as fast as the average for all occupations. Since the 1970s, asbestos and lead-based paints and plumbing fixtures and pipes have not been used and much of the remediation stemming from those products has taken place. With the continuing decline in the number of structures that contain asbestos and lead, demand for asbestos and lead abatement workers will be somewhat limited. Some growth, however, will result from the need to abate lead and asbestos from federal and historic buildings. Mold remediation is a small and previously rapidly growing part of the occupation. However, builders have reduced the mold problem by improving the quality of construction to prevent moisture from entering buildings,

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Hazardous materials removal workers	47-4041	39,000	44,000	4,400	11

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

limiting job growth for this specialty. Also, as more workers in other occupations, such as painters and heating, ventilation, and air-conditioning workers, are able to perform mold, lead, and asbestos removal on small-scale projects, employment growth of hazardous materials removal workers will continue to be negatively impacted.

Employment of decontamination technicians, radiation safety technicians, and decommissioning and decontamination workers, however, is expected to grow in response to increased pressure for safer and cleaner nuclear and electric generation facilities. Renewed interest in nuclear power production could lead to the construction of additional facilities, resulting in the need for many new workers.

Numerous Superfund projects will require cleanup of hazardous materials waste sites, spurring demand for hazardous materials removal workers. However, employment growth will largely be determined by federal funding, which has been declining in recent years.

Job prospects. In addition to some job openings from employment growth, many openings are expected for hazardous materials removal workers because of the need to replace workers who leave the occupation, leading to good opportunities. The often dangerous aspects of the job lead to high turnover because many workers do not stay in the occupation long. Opportunities for decontamination technicians, radiation safety technicians, and decontamination workers should be particularly good as a number of new workers will be needed to replace those who retire or leave the occupation for other reasons.

Lead and asbestos workers will have some opportunities at specialty remediation companies as restoration of federal buildings and historic structures continues, although at a slower pace. The best employment opportunities for mold remediation workers will be in Southeast, and parts of the Northeast and Northwest, where mold tends to thrive.

These workers are not greatly affected by economic fluctuations because the facilities in which they work must operate, regardless of the state of the economy.

Earnings

Median hourly earnings of wage and salary hazardous materials removal workers were $17.04 in May 2006. The middle 50 percent earned between $13.31 and $22.75 per hour. The lowest 10 percent earned less than $11.02 per hour, and the highest 10 percent earned more than $28.45 per hour. The median hourly earnings in remediation and other waste management services, the largest industry employing hazardous materials removal workers, were $16.75.

Related Occupations

Asbestos abatement workers and lead abatement workers share skills with other construction trades workers, including painters and paperhangers; insulation workers; and sheet metal workers. Treatment, storage, and disposal workers, decommissioning and decontamination workers, and decontamination and radiation safety technicians work closely with plant and system operators, such as power plant operators, distributors, and dispatchers and water and liquid waste treatment plant and system operators. Police officers and firefighters also respond to emergencies and often are the first ones to respond to incidents where hazardous materials may be present.

Sources of Additional Information

For more information on hazardous materials removal workers in the construction industry, including information on training, contact

Insulation Workers

(O*NET 47-2131.00 and 47-2132.00)

Significant Points

- Workers must follow strict safety guidelines to protect themselves from insulating irritants.
- Most insulation workers learn their work informally on the job; others complete formal apprenticeship programs.
- Job opportunities are expected to be excellent.

Nature of the Work

Properly insulated buildings reduce energy consumption by keeping heat in during the winter and out in the summer. Vats, tanks, vessels, boilers, steam and hot-water pipes, and refrigerated storage rooms also are insulated to prevent the wasteful loss of heat or cold and to prevent burns. Insulation also helps to reduce the noise that passes through walls and ceilings. Insulation workers install the materials used to insulate buildings and equipment.

Insulation workers cement, staple, wire, tape, or spray insulation. When covering a steam pipe, for example, insulation workers measure and cut sections of insulation to the proper length, stretch it open along a cut that runs the length of the material, and slip it over the pipe. They fasten the insulation with adhesive, staples, tape, or wire

Insulation workers must follow strict safety guidelines to protect themselves.

bands. Sometimes, they wrap a cover of aluminum, plastic, or canvas over the insulation and cement or band the cover in place. Insulation workers may screw on sheet metal around insulated pipes to protect the insulation from weather conditions or physical abuse.

When covering a wall or other flat surface, workers may use a hose to spray foam insulation onto a wire mesh that provides a rough surface to which the foam can cling and that adds strength to the finished surface. Workers may then install drywall or apply a final coat of plaster for a finished appearance.

In attics or exterior walls, workers may blow in loose-fill insulation. A helper feeds a machine with fiberglass, cellulose, or rock-wool insulation, while another worker blows the insulation with a compressor hose into the space being filled.

In new construction or on major renovations, insulation workers staple fiberglass or rock-wool batts to exterior walls and ceilings before drywall, paneling, or plaster walls are put in place. In making major renovations to old buildings or when putting new insulation around pipes and industrial machinery, insulation workers often must first remove the old insulation. In the past, asbestos—now known to cause cancer in humans—was used extensively in walls and ceilings and to cover pipes, boilers, and various industrial equipment. Because of this danger, U.S. Environmental Protection Agency regulations require that asbestos be removed before a building undergoes major renovations or is demolished. When asbestos is present, specially trained workers must remove it before insulation workers can install the new insulating materials. (See the statement on hazardous materials removal workers elsewhere in the *Handbook*.)

Insulation workers use common hand tools, including trowels, brushes, knives, scissors, saws, pliers, and stapling guns. They may use power saws to cut insulating materials, welding machines to join sheet metal or secure clamps, and compressors to blow or spray insulation.

Work environment. Insulation workers generally work indoors in residential and industrial settings. They spend most of the workday on their feet, either standing, bending, or kneeling. They also work from ladders or in confined spaces. Their work usually requires more coordination than strength. In industrial settings, these workers often insulate pipes and vessels at temperatures that may cause burns. Minute particles from insulation materials, especially when blown, can irritate the eyes, skin, and respiratory system. Workers must follow strict safety guidelines to protect themselves. They keep work areas well ventilated; wear protective suits, masks, and respirators; and take decontamination showers when necessary. Most insulation is applied after buildings are enclosed, so weather conditions have less effect on the employment of insulation workers than some other construction workers.

Training, Other Qualifications, and Advancement

Most insulation workers learn their trade informally on the job, although some complete formal apprenticeship programs.

Education and training. Employers prefer to hire high school graduates. High school courses in blueprint reading, shop mathematics, science, sheet metal layout, woodworking, and general construction provide a helpful background.

Most new workers receive instruction and supervision from experienced insulation workers. Trainees begin with simple tasks, such as carrying insulation or holding material while it is fastened in place. On-the-job training can take up to 2 years, depending on the nature of the work, but most training is completed in 3 to 6 months. Learning to install insulation in homes generally requires less training than does learning to apply insulation in commercial and industrial settings. As they gain experience, trainees receive less supervision, more responsibility, and higher pay.

Trainees in formal apprenticeship programs receive in-depth instruction in all phases of insulation. Apprenticeships are generally offered by contractors that install and maintain industrial insulation. Apprenticeship programs may be provided by a joint committee of local insulation contractors and the local union of the International Association of Heat and Frost Insulators and Asbestos Workers, to which some insulation workers belong. Programs normally consist of 4 or 5 years of on-the-job training coupled with classroom instruction, and trainees must pass practical and written tests to demonstrate their knowledge of the trade.

Licensure. The Environmental Protection Agency offers mandatory certification for insulation workers who remove and handle asbestos.

Other qualifications. For entry-level jobs, insulation contractors prefer to hire workers who are in good physical condition and licensed to drive. Applicants seeking apprenticeship positions should have a high school diploma or its equivalent and be at least 18 years old. Supervisors and contractors, especially, need good communication skills to deal with clients and subcontractors.

Certification and advancement. A voluntary certification program has been developed by insulation contractor organizations to help workers prove their skills and knowledge of residential insulation. Certification in insulation of industrial settings is being developed. Workers need at least 6 months of experience before they can complete certification. The North American Insulation Manufacturer's Association also offers a certification for insulation energy appraisal.

Skilled insulation workers may advance to supervisor, shop superintendent, or insulation contract estimator, or they may set up their own insulation business.

For those who would like to advance, it is increasingly important to be able to relay instructions and safety precautions to workers in both English and Spanish because Spanish-speaking workers make up a large part of the construction workforce in many areas.

Employment

Insulation workers held about 61,000 jobs in 2006. The construction industry employed 91 percent of workers; 53 percent work for drywall and insulation contractors. Other insulation workers held jobs in the federal government, in wholesale trade, and in shipbuilding and other manufacturing industries that have extensive installations for power, heating, and cooling. In less populated areas, carpenters, heating and air-conditioning installers or drywall installers may do insulation work.

Job Outlook

Insulation workers should have excellent employment opportunities due to about average job growth coupled with the need to replace many workers who leave this occupation.

Employment change. Employment of insulation workers is expected to increase 8 percent during the 2006–2016 decade, about as fast as the average for all occupations. Demand for insulation workers will be spurred by the continuing need for energy efficient buildings and power plant construction, both of which will generate work in existing structures and new construction. Growth might be tempered as other workers—such as carpenters, heating and air-conditioning installers, or drywall installers—do some insulation work.

Job prospects. Job opportunities for insulation workers are expected to be excellent. In addition to opportunities created by job growth, there will be a need to replace many workers. The irritating nature of many insulation materials, combined with the often diffi-

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Insulation workers	47-2130	61,000	66,000	5,200	8
Insulation workers, floor, ceiling, and wall	47-2131	32,000	35,000	2,700	8
Insulation workers, mechanical	47-2132	28,000	31,000	2,500	9

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

cult working conditions, causes many insulation workers to leave the occupation each year. Job openings will also arise from the need to replace workers who retire or leave the labor force for other reasons.

Insulation workers in the construction industry may experience periods of unemployment because of the short duration of many construction projects and the cyclical nature of construction activity. Workers employed to perform industrial plant maintenance generally have more stable employment because maintenance and repair must be done continually.

Earnings

In May 2006, median hourly earnings of wage and salary insulation workers, floor, ceiling, and wall were $14.67. The middle 50 percent earned between $11.26 and $20.00. The lowest 10 percent earned less than $9.25, and the highest 10 percent earned more than $27.76. Median hourly earnings of insulation workers, mechanical were $17.74. The middle 50 percent earned between $13.55 and $25.12. The lowest 10 percent earned less than $10.51, and the highest 10 percent earned more than $33.39. Median hourly earnings in the industries employing the largest numbers of insulation workers were:

Insulation workers, mechanical	
Building finishing contractors	$18.69
Building equipment contractors	16.60
Insulation workers, floor, ceiling, and wall	
Building finishing contractors	$14.53

Union workers tend to earn more than nonunion workers. Apprentices start at about one-half of the journey worker's wage. Insulation workers doing commercial and industrial work earn substantially more than those working in residential construction, which does not require as much skill.

Related Occupations

Insulation workers combine their knowledge of insulation materials with the skills of cutting, fitting, and installing materials. Workers in occupations involving similar skills include carpenters; carpet, floor, and tile installers and finishers; drywall installers, ceiling tile installers, and tapers; roofers; and sheet metal workers.

Sources of Additional Information

For information about training programs or other work opportunities in this trade, contact a local insulation contractor, the nearest office of the state employment service or apprenticeship agency, or the following organization:

➤ National Insulation Association, 99 Canal Center Plaza, Suite 222, Alexandria, VA 22314. Internet: http://www.insulation.org

For more information about residential insulation, contact

➤ Insulation Contractors Association of America, 1321 Duke St., Suite 303, Alexandria, VA 22314. Internet: http://www.insulate.org

You can also find information on the registered apprenticeships together with links to state apprenticeship programs on the U.S. Department of Labor's Web site: http://www.doleta.gov/atels_bat. Apprenticeship information is also available from the U.S. Department of Labor's toll-free helpline: (877) 872-5627.

For general information on apprenticeships and how to get them, see the *Occupational Outlook Quarterly* article "Apprenticeships: Career training, credentials—and a paycheck in your pocket," online at http://www.bls.gov/opub/ooq/2002/summer/art01.pdf and in print at many libraries and career centers.

Painters and Paperhangers

(O*NET 47-2141.00 and 47-2142.00)

Significant Points

- Employment prospects for painters should be excellent due to the large numbers of workers who leave the occupation for other jobs; paperhangers will face very limited opportunities.
- Most workers learn informally on the job as helpers, but some experts recommend completion of an apprenticeship program.
- About 42 percent of painters and paperhangers are self-employed.

Nature of the Work

Paint and wall coverings make surfaces clean, attractive, and bright. In addition, paints and other sealers protect exterior surfaces from wear caused by exposure to the weather.

Painters apply paint, stain, varnish, and other finishes to buildings and other structures. They choose the right paint or finish for the surface to be covered, taking into account durability, ease of handling, method of application, and customers' wishes. Painters first prepare the surfaces to be covered, so that the paint will adhere properly. This may require removing the old coat of paint by stripping, sanding, wire brushing, burning, or water and abrasive blasting. Painters also wash walls and trim to remove dirt and grease, fill nail holes and cracks, sandpaper rough spots, and brush off dust. On new surfaces, they apply a primer or sealer to prepare the surface for the finish coat. Painters also mix paints and match colors, relying on knowledge of paint composition and color harmony. In large paint shops or hardware stores, mixing and matching are automated.

There are several ways to apply paint and similar coverings. Painters must be able to choose the right paint applicator for each job, depending on the surface to be covered, the characteristics of the finish, and other factors. Some jobs need only a good bristle brush with a soft, tapered edge; others require a dip or fountain pressure roller; still others are best done using a paint sprayer. Many jobs need several types of applicators. In fact, painters may use an assortment of brushes, edgers, and rollers for a single job. The right tools speed the painter's work and also produce the most attractive surface.

Self-employed, independent painting contractors account for two out of five painters and paperhangers.

Some painting artisans specialize in creating unique finishes by using one of many decorative techniques. These techniques often involve "broken color," a process created by applying one or more colors in broken layers over a different base coat to produce a mottled or textured effect. Often these techniques employ glazes or washes applied over a solid colored background. Glazes are made of oil-based paints and give a sleek glow to walls. Washes are made of latex-based paints that have been thinned with water and can add a greater sense of depth and texture. Other decorative painting techniques include sponging, rag-rolling, stippling, sheen striping, dragging, distressing, color blocking, marbling, and faux finishes.

Some painters specialize in painting industrial structures to prevent deterioration. One example is applying a protective coating to steel bridges to fight corrosion. The coating most commonly used is a waterborne acrylic solvent that is easy to apply and environmentally friendly, but other specialized and sometimes difficult-to-apply coatings may be used. Painters may also coat interior and exterior manufacturing facilities and equipment such as storage tanks, plant buildings, lockers, piping, structural steel, and ships.

When painting any industrial structure, workers must take necessary safety precautions depending on their project. Those who specialize in interior applications such as painting the inside of storage tanks, for example, must wear a full-body protective suit. When working on bridges, painters are often suspended by cables and may work at extreme heights. When working on tall buildings, painters erect scaffolding, including "swing stages," scaffolds suspended by ropes, or cables attached to roof hooks. When painting steeples and other conical structures, they use a bosun's chair, a swing-like device.

Paperhangers cover walls and ceilings with decorative wall coverings made of paper, vinyl, or fabric. They first prepare the surface to be covered by applying "sizing," which seals the surface and makes the covering adhere better. When redecorating, they may first remove the old covering by soaking, steaming, or applying solvents. When necessary, they patch holes and take care of other imperfections before hanging the new wall covering.

After the surface has been prepared, paperhangers must prepare the paste or other adhesive, unless they are using pretreated paper. They then measure the area to be covered, check the covering for flaws, cut the covering into strips of the proper size, and closely examine the pattern in order to match it when the strips are hung. Much of this process can now be handled by specialized equipment.

The next step is to brush or roll the adhesive onto the back of the covering, if needed, and to then place the strips on the wall or ceiling, making sure the pattern is matched, the strips are straight, and the edges are butted together to make tight, closed seams. Finally, paperhangers smooth the strips to remove bubbles and wrinkles, trim the top and bottom with a razor knife, and wipe off any excess adhesive.

Work environment. Most painters and paperhangers work 40 hours a week or less; about 24 percent have variable schedules or work part time. Painters and paperhangers must stand for long periods, often working from scaffolding and ladders. Their jobs also require a considerable amount of climbing, bending, and stretching. These workers must have stamina because much of the work is done with their arms raised overhead. Painters, especially industrial painters, often work outdoors, almost always in dry, warm weather. Those who paint bridges or building infrastructure may be exposed to extreme heights and uncomfortable positions; some painters work suspended with ropes or cables.

Some painting jobs can leave a worker covered with paint. Drywall dust created by electric sanders prior to painting requires workers to wear protective safety glasses and a dust mask. Painters and paperhangers sometimes work with materials that are hazardous or toxic, such as when they are required to remove lead-based paints. In the most dangerous situations, painters work in a sealed self-contained suit to prevent inhalation of or contact with hazardous materials. Although workers are subject to falls from ladders, the occupation is not as hazardous as some other construction occupations.

Training, Other Qualifications, and Advancement

Painting and paperhanging is learned mostly on the job, but some experts recommend completion of an apprenticeship program.

Education and training. Most painters and paperhangers learn through on-the-job training and by working as a helper to an experienced painter. However, there are a number of formal and informal training programs that provide more thorough instruction and a better career foundation. In general, the more formal the training received, the more likely the individual will enter the profession at a higher level. There are limited informal training opportunities for paperhangers because there are fewer paperhangers and helpers are usually not required.

If available, apprenticeships generally provide a mixture of classroom instruction and paid on-the-job training. Apprenticeships for painters and paperhangers consist of 2 to 4 years of on-the-job training, supplemented by a minimum of 144 hours of related classroom instruction each year. A high school education or its equivalent, with courses in mathematics, usually is required to enter an apprentice-

ship program. Apprentices receive instruction in color harmony, use and care of tools and equipment, surface preparation, application techniques, paint mixing and matching, characteristics of different finishes, blueprint reading, wood finishing, and safety.

Besides apprenticeships, some workers gain skills by attending technical schools that offer training prior to employment. These schools can take about a year to complete. Others receive training through local vocational high schools.

Whether a painter learns the trade through a formal apprenticeship or informally as a helper, on-the-job instruction covers similar skill areas. Under the direction of experienced workers, trainees carry supplies, erect scaffolds, and do simple painting and surface preparation tasks while they learn about paint and painting equipment. As they gain experience, trainees learn to prepare surfaces for painting and paperhanging, to mix paints, and to apply paint and wall coverings efficiently and neatly. Near the end of their training, they may learn decorating concepts, color coordination, and cost-estimating techniques. In addition to learning craft skills, painters must become familiar with safety and health regulations so that their work complies with the law.

Other qualifications. Painters and paperhangers should have good manual dexterity, vision, and color sense. They also need physical stamina and balance to work on ladders and platforms. Apprentices or helpers generally must be at least 18 years old and in good physical condition, in addition to the high school diploma or equivalent that most apprentices need.

Certification and advancement. Some organizations offer training and certification to enhance the skills of their members. People interested in industrial painting, for example, can earn several designations from the National Association of Corrosion Engineers in several areas of specialization, including one for coating applicators, called Protective Coating Specialist. Courses range from 1 day to several weeks depending on the certification program and specialty.

Painters and paperhangers may advance to supervisory or estimating jobs with painting and decorating contractors. Many establish their own painting and decorating businesses. For those who would like to advance, it is increasingly important to be able to communicate in both English and Spanish in order to relay instructions and safety precautions to workers with limited English skills; Spanish-speaking workers make up a large part of the construction workforce in many areas. Painting contractors need good English skills to deal with clients and subcontractors.

Employment

Painters and paperhangers held about 473,000 jobs in 2006; about 98 percent were painters. Around 38 percent of painters and paperhangers work for painting and wall covering contractors engaged in new construction, repair, restoration, or remodeling work. In addition, organizations that own or manage large buildings—such as apartment complexes—may employ painters, as do some schools, hospitals, factories, and government agencies.

Self-employed independent painting contractors accounted for 42 percent of all painters and paperhangers, significantly greater than the 20 percent of all construction trades workers combined.

Job Outlook

Employment of painters and paperhangers is expected to grow about as fast as the average for all occupations, reflecting increases in the stock of buildings and other structures that require maintenance and renovation. Excellent employment opportunities are expected for painters due to the need to replace the large number of workers who leave the occupation; paperhangers will have very limited opportunities.

Employment change. Overall employment is expected to grow by 11 percent between 2006 and 2016, about as fast as the average for all occupations. Driving employment growth will be retiring baby boomers who either purchase second homes or otherwise leave their existing homes that then require interior painting. Investors who sell properties or rent them out will also require the services of painters prior to completing a transaction. The relatively short life of exterior paints in residential homes as well as changing color and application trends will continue to support demand for painters. Painting is labor-intensive and not susceptible to technological changes that might make workers more productive and slow employment growth.

Growth of industrial painting will be driven by the need to prevent corrosion and deterioration of the many industrial structures by painting or coating them. Applying a protective coating to steel bridges, for example, is cost effective and can add years to the life expectancy of a bridge.

Employment of paperhangers should decline rapidly as many homeowners take advantage of easy application materials and resort to cheaper alternatives, such as painting.

Job prospects. Job prospects for painters should be excellent because of the need to replace workers who leave the occupation for other jobs. There are no strict training requirements for entry into these jobs, so many people with limited skills work as painters or helpers for a relatively short time and then move on to other types of work with higher pay or better working conditions.

Opportunities for industrial painters should be excellent as the positions available should be greater than the pool of qualified individuals to fill them. While industrial structures that require painting are located throughout the nation, the best employment opportunities should be in the petrochemical industry in the Gulf Coast region, where strong demand and the largest concentration of workers exists.

Very few openings will arise for paperhangers because the number of these jobs is comparatively small and cheaper, more modern decorative finishes such as faux effects and sponging have gained in popularity at the expense of paper, vinyl, or fabric wall coverings.

Jobseekers considering these occupations should expect some periods of unemployment, especially until they gain experience. Many construction projects are of short duration, and construction activity is cyclical in nature. Remodeling, restoration, and mainte-

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Painters and paperhangers	47-2140	473,000	526,000	53,000	11
Painters, construction and maintenance	47-2141	463,000	517,000	54,000	12
Paperhangers	47-2142	9,900	8,700	-1,200	-12

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

nance projects, however, should continue as homeowners undertake renovation projects and hire painters even in economic downturns. Nonetheless, workers in these trades may experience periods of unemployment when the overall level of construction falls. On the other hand, shortages of these workers may occur in some areas during peak periods of building activity.

Earnings

In May 2006, median hourly earnings of wage and salary painters, construction and maintenance, were $15.00, not including the earnings of the self-employed. The middle 50 percent earned between $12.19 and $19.51. The lowest 10 percent earned less than $9.97, and the highest 10 percent earned more than $25.62. Median hourly earnings in the industries employing the largest numbers of painters were as follows:

Local government	$20.11
Drywall and insulation contractors	16.18
Nonresidential building construction	15.68
Residential building construction	15.04
Painting and wall covering contractors	14.62

In May 2006, median earnings for wage and salary paperhangers were $16.21. The middle 50 percent earned between $13.12 and $20.62. The lowest 10 percent earned less than $10.34, and the highest 10 percent earned more than $26.77.

Earnings for painters may be reduced on occasion because of bad weather and the short-term nature of many construction jobs. Hourly wage rates for apprentices usually start at 40 to 50 percent of the rate for experienced workers and increase periodically.

Some painters and paperhangers are members of the International Brotherhood of Painters and Allied Trades. Some painters are members of other unions.

Related Occupations

Painters and paperhangers apply various coverings to decorate and protect wood, drywall, metal, and other surfaces. Other construction occupations in which workers do finishing work include carpenters; carpet, floor, and tile installers and finishers; drywall installers, ceiling tile installers, and tapers; painting and coating workers, except construction and maintenance; and plasterers and stucco masons.

Sources of Additional Information

For details about painting and paperhanging apprenticeships or work opportunities, contact local painting and decorating contractors, local trade organizations, a local of the International Union of Painters and Allied Trades, a local joint union-management apprenticeship committee, or an office of the state apprenticeship agency or employment service.

Pipelayers, Plumbers, Pipefitters, and Steamfitters

(O*NET 47-2151.00, 47-2152.00, 47-2152.01, and 47-2152.02)

Significant Points

- Job opportunities should be very good, especially for workers with welding experience.
- Pipelayers, plumbers, pipefitters, and steamfitters comprise one of the largest and highest-paid construction occupations.
- Most states and localities require plumbers to be licensed.
- Apprenticeship programs generally provide the most comprehensive training, but many workers train in career or technical schools or community colleges.

Nature of the Work

Most people are familiar with plumbers who come to their home to unclog a drain or install an appliance. In addition to these activities, however, pipelayers, plumbers, pipefitters, and steamfitters install, maintain, and repair many different types of pipe systems. For example, some systems move water to a municipal water treatment plant and then to residential, commercial, and public buildings. Other systems dispose of waste, provide gas to stoves and furnaces, or provide for heating and cooling needs. Pipe systems in powerplants carry the steam that powers huge turbines. Pipes also are used in manufacturing plants to move material through the production process. Specialized piping systems are very important in both pharmaceutical and computer-chip manufacturing.

Although pipelaying, plumbing, pipefitting, and steamfitting sometimes are considered a single trade, workers generally specialize in one of five areas. *Pipelayers* lay clay, concrete, plastic, or cast-iron pipe for drains, sewers, water mains, and oil or gas lines. Before laying the pipe, pipelayers prepare and grade the trenches either manually or with machines. After laying the pipe, they weld, glue, cement, or otherwise join the pieces together. *Plumbers* install

Pipelayers lay clay, concrete, plastic, or cast-iron pipe for drains, sewers, water mains, and oil or gas lines.

and repair the water, waste disposal, drainage, and gas systems in homes and commercial and industrial buildings. Plumbers also install plumbing fixtures—bathtubs, showers, sinks, and toilets—and appliances such as dishwashers and water heaters. *Pipefitters* install and repair both high-pressure and low-pressure pipe systems used in manufacturing, in the generation of electricity, and in the heating and cooling of buildings. They also install automatic controls that are increasingly being used to regulate these systems. Some pipefitters specialize in only one type of system. *Steamfitters* install pipe systems that move liquids or gases under high pressure. *Sprinklerfitters* install automatic fire sprinkler systems in buildings.

Pipelayers, plumbers, pipefitters, and steamfitters use many different materials and construction techniques, depending on the type of project. Residential water systems, for example, incorporate copper, steel, and plastic pipe that can be handled and installed by one or two plumbers. Municipal sewerage systems, on the other hand, are made of large cast-iron pipes; installation normally requires crews of pipefitters. Despite these differences, all pipelayers, plumbers, pipefitters, and steamfitters must be able to follow building plans or blueprints and instructions from supervisors, lay out the job, and work efficiently with the materials and tools of their trade. Computers and specialized software are used to create blueprints and plan layouts.

When construction plumbers install piping in a new house, for example, they work from blueprints or drawings that show the planned location of pipes, plumbing fixtures, and appliances. Recently, plumbers have become more involved in the design process. Their knowledge of codes and the operation of plumbing systems can cut costs. They first lay out the job to fit the piping into the structure of the house with the least waste of material. Then they measure and mark areas in which pipes will be installed and connected. Construction plumbers also check for obstructions such as electrical wiring and, if necessary, plan the pipe installation around the problem.

Sometimes, plumbers have to cut holes in walls, ceilings, and floors of a house. For some systems, they may hang steel supports from ceiling joists to hold the pipe in place. To assemble a system, plumbers—using saws, pipe cutters, and pipe-bending machines—cut and bend lengths of pipe. They connect lengths of pipe with fittings, using methods that depend on the type of pipe used. For plastic pipe, plumbers connect the sections and fittings with adhesives. For copper pipe, they slide a fitting over the end of the pipe and solder it in place with a torch.

After the piping is in place in the house, plumbers install the fixtures and appliances and connect the system to the outside water or sewer lines. Finally, using pressure gauges, they check the system to ensure that the plumbing works properly.

Work environment. Pipefitters and steamfitters most often work in industrial and power plants. Plumbers work in commercial and residential settings where water and septic systems need to be installed and maintained. Pipelayers work outdoors, sometime in remote areas, as they build the pipelines that connect sources of oil, gas, and chemicals with the users of these materials. Sprinklerfitters work in all buildings that require the use of fire sprinkler systems.

Because pipelayers, plumbers, pipefitters, and steamfitters frequently must lift heavy pipes, stand for long periods, and sometimes work in uncomfortable or cramped positions, they need physical strength and stamina. They also may have to work outdoors in inclement weather. In addition, they are subject to possible falls from ladders, cuts from sharp tools, and burns from hot pipes or soldering equipment.

Pipelayers, plumbers, pipefitters, and steamfitters engaged in construction generally work a standard 40-hour week; those involved in maintaining pipe systems, including those who provide maintenance services under contract, may have to work evening or weekend shifts and work on call. These maintenance workers may spend a lot of time traveling to and from worksites.

Training, Other Qualifications, and Advancement

Most pipelayers, plumbers, pipefitters, and steamfitters train in career or technical schools or community colleges, and on the job through apprenticeships.

Education and training. Pipelayers, plumbers, pipefitters, and steamfitters enter into the occupation in a variety of ways. Most residential and industrial plumbers get their training in career and technical schools and community colleges and from on-the-job training. Pipelayers, plumbers, pipefitters, and steamfitters who work for nonresidential enterprises are usually trained through formal apprenticeship programs.

Apprenticeship programs generally provide the most comprehensive training available for these jobs. They are administered either by union locals and their affiliated companies or by nonunion contractor organizations. Organizations that sponsor apprenticeships include: the United Association of Journeymen and Apprentices of the Plumbing and Pipefitting Industry of the United States and Canada; local employers of either the Mechanical Contractors Association of America or the National Association of Plumbing-Heating-Cooling Contractors; a union associated with a member of the National Fire Sprinkler Association; the Associated Builders and Contractors; the National Association of Plumbing-Heating-Cooling Contractors; the American Fire Sprinkler Association, or the Home Builders Institute of the National Association of Home Builders.

Apprenticeships—both union and nonunion—consist of 4 or 5 years of paid on-the-job training and at least 144 hours of related classroom instruction per year. Classroom subjects include drafting and blueprint reading, mathematics, applied physics and chemistry, safety, and local plumbing codes and regulations. On the job, apprentices first learn basic skills, such as identifying grades and types of pipe, using the tools of the trade, and safely unloading materials. As apprentices gain experience, they learn how to work with various types of pipe and how to install different piping systems and plumbing fixtures. Apprenticeship gives trainees a thorough knowledge of all aspects of the trade. Although most pipelayers, plumbers, pipefitters, and steamfitters are trained through apprenticeship, some still learn their skills informally on the job.

Licensure. Although there are no uniform national licensing requirements, most states and communities require plumbers to be licensed. Licensing requirements vary, but most localities require workers to have 2 to 5 years of experience and to pass an examination that tests their knowledge of the trade and of local plumbing codes before working independently. Several states require a special license to work on gas lines. A few states require pipe fitters to be licensed. These licenses usually require a test, experience, or both.

Other qualifications. Applicants for union or nonunion apprentice jobs must be at least 18 years old and in good physical condition. A drug test may be required. Apprenticeship committees may require applicants to have a high school diploma or its equivalent. Armed Forces training in pipelaying, plumbing, and pipefitting is considered very good preparation. In fact, people with this background may be given credit for previous experience when entering a civilian apprenticeship program. High school or postsecondary courses in shop, plumbing, general mathematics, drafting, blueprint reading, computers, and physics also are good preparation.

Advancement. With additional training, some pipelayers, plumbers, pipefitters, and steamfitters become supervisors for mechanical and plumbing contractors. Others, especially plumbers,

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16 Number	Change, 2006-16 Percent
Pipelayers, plumbers, pipefitters, and steamfitters	47-2150	569,000	628,000	59,000	10
Pipelayers	47-2151	67,000	72,000	5,800	9
Plumbers, pipefitters, and steamfitters	47-2152	502,000	555,000	53,000	11

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

go into business for themselves, often starting as a self-employed plumber working from home. Some eventually become owners of businesses employing many workers and may spend most of their time as managers rather than as plumbers. Others move into closely related areas such as construction management or building inspection.

For those who would like to advance, it is increasingly important to be able to communicate in both English and Spanish in order to relay instructions and safety precautions to workers with limited understanding of English; Spanish-speaking workers make up a large part of the construction workforce in many areas. Supervisors and contractors need good communication skills to deal with clients and subcontractors.

Employment

Pipelayers, plumbers, pipefitters, and steamfitters constitute one of the largest construction occupations, holding about 569,000 jobs in 2006. About 55 percent worked for plumbing, heating, and air-conditioning contractors engaged in new construction, repair, modernization, or maintenance work. Others did maintenance work for a variety of industrial, commercial, and government employers. For example, pipefitters were employed as maintenance personnel in the petroleum and chemical industries, both of which move liquids and gases through pipes. About 12 percent of pipelayers, plumbers, pipefitters, and steamfitters were self-employed.

Job Outlook

Average employment growth is projected. Job opportunities are expected to be very good, especially for workers with welding experience.

Employment change. Employment of pipelayers, plumbers, pipefitters, and steamfitters is expected to grow 10 percent between 2006 and 2016, about as fast as the average for all occupations. Demand for plumbers will stem from new construction and building renovation. Bath remodeling, in particular, is expected to continue to grow and create more jobs for plumbers. In addition, repair and maintenance of existing residential systems will keep plumbers employed. Demand for pipefitters and steamfitters will be driven by maintenance and construction of places such as powerplants, water and wastewater treatment plants, office buildings, and factories, with extensive pipe systems. Growth of pipelayer jobs will stem from the building of new water and sewer lines and pipelines to new oil and gas fields. Demand for sprinklerfitters will increase because of changes to state and local rules for fire protection in homes and businesses.

Job prospects. Job opportunities are expected to be very good, as demand for skilled pipelayers, plumbers, pipefitters, and steamfitters is expected to outpace the supply of workers well trained in this craft in some areas. Some employers report difficulty finding workers with the right qualifications. In addition, many people currently working in these trades are expected to retire over the next 10 years, which will create additional job openings. Workers with welding experience should have especially good opportunities.

Traditionally, many organizations with extensive pipe systems have employed their own plumbers or pipefitters to maintain equipment and keep systems running smoothly. But, to reduce labor costs, many of these firms no longer employ full-time, in-house plumbers or pipefitters. Instead, when they need a plumber, they rely on workers provided under service contracts by plumbing and pipefitting contractors.

Construction projects generally provide only temporary employment. When a project ends, some pipelayers, plumbers, pipefitters, and steamfitters may be unemployed until they can begin work on a new project, although most companies are trying to limit these periods of unemployment to retain workers. In addition, the jobs of pipelayers, plumbers, pipefitters, and steamfitters are generally less sensitive to changes in economic conditions than jobs in other construction trades. Even when construction activity declines, maintenance, rehabilitation, and replacement of existing piping systems, as well as the increasing installation of fire sprinkler systems, provide many jobs for pipelayers, plumbers, pipefitters, and steamfitters.

Earnings

Pipelayers, plumbers, pipefitters, and steamfitters are among the highest paid construction occupations. Median hourly earnings of wage and salary plumbers, pipefitters, and steamfitters were $20.56. The middle 50 percent earned between $15.62 and $27.54. The lowest 10 percent earned less than $12.30, and the highest 10 percent earned more than $34.79. Median hourly earnings in the industries employing the largest numbers of plumbers, pipefitters, and steamfitters were:

Natural gas distribution	$24.91
Nonresidential building construction	21.30
Plumbing, heating, and air-conditioning contractors	20.44
Utility system construction	19.18
Local government	17.86

In May 2006, median hourly earnings of wage and salary pipelayers were $14.58. The middle 50 percent earned between $11.75 and $19.76. The lowest 10 percent earned less than $9.73, and the highest 10 percent earned more than $25.73.

Apprentices usually begin at about 50 percent of the wage rate paid to experienced workers. Wages increase periodically as skills improve. After an initial waiting period, apprentices receive the same benefits as experienced pipelayers, plumbers, pipefitters, and steamfitters.

About 30 percent of pipelayers, plumbers, pipefitters, and steamfitters belonged to a union. Many of these workers are members of the United Association of Journeymen and Apprentices of the Plumbing and Pipefitting Industry of the United States and Canada.

Related Occupations

Other workers who install and repair mechanical systems in buildings include boilermakers; electricians; elevator installers and repairers; heating, air-conditioning, and refrigeration mechanics and installers; industrial machinery mechanics and maintenance work-

ers; millwrights; sheet metal workers; and stationary engineers and boiler operators. Other related occupations include construction managers and construction and building inspectors.

Sources of Additional Information

For information about apprenticeships or work opportunities in pipelaying, plumbing, pipefitting, and steamfitting, contact local plumbing, heating, and air-conditioning contractors; a local or state chapter of the National Association of Plumbing, Heating, and Cooling Contractors; a local chapter of the Mechanical Contractors Association; a local chapter of the United Association of Journeymen and Apprentices of the Plumbing and Pipefitting Industry of the United States and Canada; or the nearest office of your state employment service or apprenticeship agency. Apprenticeship information is also available from the U.S. Department of Labor's toll-free helpline: (877) 872-5627.

For general information on apprenticeships and how to get them, see the *Occupational Outlook Quarterly* article "Apprenticeships: Career training, credentials—and a paycheck in your pocket," online at http://www.bls.gov/opub/ooq/2002/summer/art01.pdf and in print at many libraries and career centers.

Plasterers and Stucco Masons

(O*NET 47-2161.00)

Significant Points

- Plastering is physically demanding work.
- Becoming a skilled plasterer or stucco mason generally requires 3 or 4 years of training, either informally on the job or through a formal apprenticeship.
- Good employment opportunities are expected.
- The best employment opportunities should continue to be in Florida, California, and the Southwest.

Most plasterers and stucco masons are employed in Florida, Texas, California, and the Southwest, where exterior stucco with decorative finishes is very popular.

Nature of the Work

Plastering—one of the oldest crafts in the building trades—remains popular due to the durability and relatively low cost of the material. Plasterers apply plaster to interior walls and ceilings to form fire-resistant and relatively soundproof surfaces. They also apply plaster veneer over drywall to create smooth or textured abrasion-resistant finishes. In addition, plasterers install prefabricated exterior insulation systems over existing walls—for good insulation and interesting architectural effects—and cast ornamental designs in plaster. Stucco masons apply durable plasters, such as polymer-based acrylic finishes and stucco, to exterior surfaces. Plasterers and stucco masons should not be confused with drywall installers, ceiling tile installers, and tapers—discussed elsewhere in the *Handbook*—who use drywall instead of plaster to make interior walls and ceilings.

Plasterers can plaster either solid surfaces, such as concrete block, or supportive wire mesh called lath. When plasterers work with hard interior surfaces, such as concrete block and concrete, they first apply a brown coat of gypsum plaster that provides a base, which is followed by a second, or finish coat, also called "white coat," made of a lime-based plaster. When plastering metal-mesh lath foundations, they apply a preparatory, or "scratch coat" with a trowel. They spread this rich plaster mixture into and over the metal lath. Before the plaster sets, plasterers scratch its surface with a rake-like tool to produce ridges, so that the subsequent brown coat will bond tightly. They then apply the brown coat and the finish, white coat.

Applying different types of plaster coating requires different techniques. When applying the brown coat, plasterers spray or trowel the mixture onto the surface, then finish by smoothing it to an even, level surface. Helpers usually prepare this mixture.

For the finish, or white coat, plasterers themselves usually prepare a mixture of lime, plaster of Paris, and water. They quickly apply this using a "hawk," that is a light, metal plate with a handle, along with a trowel, brush, and water. This mixture, which sets very quickly, produces a very smooth, durable finish.

Plasterers also work with a plaster material that can be finished in a single coat. This "thin-coat" or gypsum veneer plaster is made of lime and plaster of Paris and is mixed with water at the jobsite. This plaster provides a smooth, durable, abrasion-resistant finish on interior masonry surfaces, special gypsum baseboard, or drywall prepared with a bonding agent.

Plasterers create decorative interior surfaces as well. One way that they do this is by pressing a brush or trowel firmly against a wet

plaster surface and using a circular hand motion to create decorative swirls. Plasterers sometimes do more complex decorative and ornamental work that requires special skill and creativity. For example, they may mold intricate wall and ceiling designs, such as cornice pieces and chair rails. Following an architect's blueprint, plasterers pour or spray a special plaster into a mold and allow it to set. Workers then remove the molded plaster and put it in place, according to the plan.

Stucco masons usually apply stucco—a mixture of Portland cement, lime, and sand—over cement, concrete, masonry or wire lath. Stucco may also be applied directly to a wire lath with a scratch coat, followed by a brown coat, and then a finish coat. Stucco masons may also embed marble or gravel chips into the finish coat to achieve a pebblelike, decorative finish.

When required, plasterers and stucco masons apply insulation to the exteriors of new and old buildings. They cover the outer wall with rigid foam insulation board and reinforcing mesh, and then trowel on a polymer-based or polymer-modified base coat. They may apply an additional coat of this material with a decorative finish.

Work environment. Most plasters work indoors, except for the few who apply decorative exterior finishes. Stucco masons, however, work outside when applying stucco or exterior wall insulation. Plasterers and stucco masons may work on scaffolds high above the ground.

Plastering and stucco work is physically demanding, requiring considerable standing, bending, lifting, and reaching overhead, sometimes causing neck and upper back cramps. The work can also be dusty and dirty. It can irritate the skin, eyes, and lungs unless protective masks and gloves are used.

Training, Other Qualifications, and Advancement

Becoming a skilled plasterer or stucco mason generally requires 3 or 4 years of training, either informally on the job or through a formal apprenticeship.

Education and training. Preparation for a career as a plasterer or stucco mason can begin in high school, with classes in mathematics, mechanical drawing, and shop. After high school, there are many different ways to train.

The most common way is to get a job with a contractor who will provide on-the-job training. Entry-level workers usually start as helpers, assisting more experienced workers. They may start by carrying materials, setting up scaffolds, and mixing plaster. Later, they learn to apply the scratch, brown, and finish coats and may also learn to replicate plaster decorations for restoration work. Some employers enroll helpers in an employer-provided training program or send the employee to a trade or vocational school, or community college to receive further classroom training.

Depending on the region, some employers say a formal apprenticeship is the best way to learn plastering. Apprenticeship programs, sponsored by local joint committees of contractors and unions, usually include 3 or 4 years of paid on-the-job training and 160 hours of classroom instruction each of those years. In class, apprentices learn drafting, blueprint reading, and basic mathematics for layout work. They also learn how to estimate materials and costs and how to cast ornamental plaster designs.

On the job, apprentices learn about lath bases, plaster mixes, methods of plastering and safety practices. They learn how to use various tools, such as hand and powered trowels, floats, brushes, straightedges, power tools, plaster-mixing machines, and piston-type pumps. Some apprenticeship programs also allow individuals to train in related occupations, such as cement masonry and bricklaying.

Applicants for apprentice or helper jobs who have a high school education are preferred. Courses in general mathematics, mechanical drawing, and shop provide a useful background.

Other qualifications. Workers need to be in good physical condition and have good manual dexterity. Artistic creativity is helpful for those who apply decorative finishes. Applicants for apprenticeships usually must be at least 18 years old.

Certification and advancement. Some organizations related to masonry trades offer training and certification intended to enhance the skills of their members. For example, the International Union of Bricklayers and Allied Craftworkers, International Masonry Institute confers designations in several areas of specialization, including one for plastering. Candidates who complete a 12-week certification program can earn a designation as a "journey level plasterer" by passing a competency based exam. Experienced candidates can become trainers and earn a designation as "Certified Instructor of Journeyworkers and Apprentices in the Trowel Trades."

With additional training and experience, plasterers and stucco masons may advance to jobs as supervisors, superintendents, or estimators for plastering contractors. Many become self-employed contractors. Others become building inspectors.

Employment

Plasterers and stucco masons held about 61,000 jobs in 2006. Many plasterers and stucco masons are employed in Florida, Texas, California, and the Southwest, where exterior stucco with decorative finishes is very popular. Use of exterior stucco on homes in other parts of the country is gaining popularity as well.

Most plasterers and stucco masons work for independent contractors. About 16 percent of plasterers and stucco masons are self-employed.

Job Outlook

Employment of plasterers and stucco masons is expected to grow about as fast as the average for all occupations as a result of increased appreciation for the durability and attractiveness of troweled finishes. Good job prospects are expected.

Employment change. Employment is expected to grow by 8 percent between 2006 and 2016, about as fast as the average for all occupations. In recent years, there has been an increased appreciation for the attractive finishes and durability that plaster provides. Thin-coat plastering—or veneering—in particular, is gaining wide acceptance as more builders recognize its ease of application, durability, quality of finish, and sound-proofing and fire-retarding qualities, although the increased use of fire sprinklers will reduce the

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Plasterers and stucco masons	47-2161	61,000	66,000	5,000	8

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

demand for fire-resistant plaster work. Prefabricated wall systems and new polymer-based or polymer-modified acrylic exterior insulating finishes also are gaining popularity, particularly in the South and Southwest regions of the country, because of their relatively low cost. In addition, plasterers will be needed to renovate plasterwork in old structures and to create special architectural effects, such as curved surfaces, which are not practical with drywall materials.

Job prospects. Job opportunities for plasterers and stucco masons are expected to be good because many potential candidates prefer work that is less strenuous and more comfortable. Additionally, some prospects may be deterred by the lengthy apprenticeship. This creates more opportunity for people who want these jobs.

Job openings will come from employment growth and from the need to replace plasterers and stucco masons who transfer to other occupations or leave the labor force. Skilled, experienced plasterers with artistic ability should have excellent opportunities, especially with restoration projects. The best employment opportunities should continue to be in Florida, California, and the Southwest, where the use of stucco is expected to remain popular. But decorative custom finishes, expensive homes, and large-scale restoration projects will continue to drive demand for plastering in the Northeast, particularly in urban areas.

Employment of plasterers and stucco masons, like that of many other construction workers, is sensitive to the fluctuations of the economy. Workers in these trades may experience periods of unemployment when the overall level of construction activity falls. On the other hand, shortages of these workers may occur in some areas during peak periods of building activity.

Bad weather affects plastering less than other construction trades because most work is indoors. On exterior surfacing jobs, however, plasterers and stucco masons may lose time because plastering materials cannot be applied under wet or freezing conditions.

Earnings

In May 2006, median hourly earnings of wage and salary plasterers and stucco masons were $16.68. The middle 50 percent earned between $13.53 and $21.25. The lowest 10 percent earned less than $10.84, and the top 10 percent earned more than $27.31.

The median hourly earnings in the largest industries employing plasterers and stucco masons were $16.92 in drywall and insulation contractors and $15.55 in masonry contractors.

Apprentices begin by earning about half the rate paid to experienced workers. Annual earnings for plasterers and stucco masons can be less than the hourly rate suggests because poor weather and periodic declines in construction activity can limit work hours.

Related Occupations

Other construction workers who use a trowel as their primary tool include brickmasons, blockmasons, and stonemasons; cement masons, concrete finishers, segmental pavers, and terrazzo workers; and drywall installers, ceiling tile installers, and tapers.

Sources of Additional Information

For information about apprenticeships or other work opportunities, you may contact local plastering contractors, locals of the unions mentioned in this section, local joint union-management apprenticeship committees, or the nearest office of your state apprenticeship agency or employment service. You can also find information on the registered apprenticeship system with links to state apprenticeship programs on the U.S. Department of Labor's Web site: http://www.doleta.gov/atels_bat. Apprenticeship information is also available from the U.S. Department of Labor's toll-free helpline: (877) 282-5627.

Roofers

(O*NET 47-2181.00)

Significant Points

- Most roofers learn their skills informally on the job; some roofers train through three-year apprenticeships.
- Most job openings will arise from the need to replace those who leave the occupation because the work is hot, strenuous, and dirty, causing many people to switch to jobs in other construction trades.
- Demand for roofers is less susceptible to downturns in the economy than demand for other construction trades because most roofing work consists of repair and reroofing.

Nature of the Work

A leaky roof can damage ceilings, walls, and furnishings. Roofers repair and install roofs made of tar or asphalt and gravel; rubber or thermoplastic; metal; or shingles to protect buildings and their contents from water damage. Repair and reroofing—replacing old roofs on existing buildings—makes up the majority of work for roofers.

There are two types of roofs—low-slope and steep-slope. Low-slope roofs rise 4 inches per horizontal foot or less and are installed in layers. Steep-slope roofs rise more than 4 inches per horizontal foot and are usually covered in shingles. Most commercial, industrial, and apartment buildings have low-slope roofs. Most houses have steep-slope roofs. Some roofers work on both types; others specialize.

Most low-slope roofs are covered with several layers of materials. Roofers first put a layer of insulation on the roof deck. Over the insulation, they often spread a coat of molten bitumen, a tarlike substance. Next, they install partially overlapping layers of roofing felt—a fabric saturated in bitumen—over the surface. Roofers use a mop to spread hot bitumen over the felt before adding another layer of felt. This seals the seams and makes the surface watertight. Roofers repeat these steps to build up the desired number of layers, called "plies." The top layer is glazed to make a smooth finish or has gravel embedded in the hot bitumen to create a rough surface.

An increasing number of low-slope roofs are covered with a single-ply membrane of waterproof rubber or thermoplastic compounds. Roofers roll these sheets over the roof's insulation and seal

Most residential steep-slope roofs are covered with shingles.

the seams. Adhesive, mechanical fasteners, or stone ballast hold the sheets in place. Roofers must make sure the building is strong enough to hold the stone ballast.

A small but growing number of buildings now have "green" roofs that incorporate plants. A "green" roof begins with a single or multiply waterproof layer. After it is proven to be leak free, roofers put a root barrier over it, and then layers of soil, in which trees and grass are planted. Roofers are usually responsible for making sure the roof is watertight and can withstand the weight and water needs of the plants.

Most residential steep-slope roofs are covered with shingles. To apply shingles, roofers first lay, cut, and tack three-foot strips of roofing felt over the entire roof. Starting from the bottom edge, the roofer then staples or nails overlapping rows of shingles to the roof. Roofers measure and cut the felt and shingles to fit intersecting roof surfaces and to fit around vent pipes and chimneys. Wherever two roof surfaces intersect, or shingles reach a vent pipe or chimney, roofers cement or nail flashing-strips of metal or shingle over the joints to make them watertight. Finally, roofers cover exposed nailheads with roofing cement or caulking to prevent water leakage. Roofers who use tile, metal shingles, or shakes (rough wooden shingles) follow a similar process.

Roofers also install equipment that requires cutting through roofs, such as ventilation ducts and attic fans. Some roofers are expert in waterproofing; some waterproof and damp-proof masonry and concrete walls, floors, and foundations. To prepare surfaces for waterproofing, they hammer and chisel away rough spots or remove them with a rubbing brick, before applying a coat of liquid waterproofing compound. They also may paint or spray surfaces with a waterproofing material or attach waterproofing membrane to surfaces. Roofers usually spray a bitumen-based coating on interior or exterior surfaces when damp-proofing.

Work environment. Roofing work is strenuous. It involves heavy lifting, as well as climbing, bending, and kneeling. Roofers work outdoors in all types of weather, particularly when making repairs. However, they rarely work when it rains or in very cold weather as ice can be dangerous. In northern states, roofing work is generally not performed during winter months. During the summer, roofers may work overtime to complete jobs quickly, especially before forecasted rainfall.

Workers risk slips or falls from scaffolds, ladders, or roofs or burns from hot bitumen, but safety precautions, can prevent most accidents. In addition, roofs can become extremely hot during the summer, causing heat-related illnesses. In 2005, the rate of injuries for roofing contractors in construction was almost twice that of workers overall.

Training, Other Qualifications, and Advancement

Most roofers learn their skills informally by working as helpers for experienced roofers and by taking classes, including safety training, offered by their employers; some complete three-year apprenticeships.

Education and training. A high school education, or its equivalent, is helpful and so are courses in mechanical drawing and basic mathematics. Although most workers learn roofing as helpers for experienced workers, some roofers train through three-year apprenticeship programs administered by local union-management committees representing roofing contractors and locals of the United Union of Roofers, Waterproofers, and Allied Workers. Apprenticeship programs usually include at least 2,000 hours of paid on-the-job training each year, plus a minimum of 144 hours of classroom instruction a year in tools and their use, arithmetic, safety, and other topics. On-the-job training for apprentices is similar to the training given to helpers, but an apprenticeship program is more structured and comprehensive. Apprentices, for example, learn to damp-proof and waterproof walls.

Trainees start by carrying equipment and material and erecting scaffolds and hoists. Within 2 or 3 months, they are taught to measure, cut, and fit roofing materials and, later, to lay asphalt or fiberglass shingles. Because some roofing materials are used infrequently, it can take several years to get experience working on all types of roofing.

Other qualifications. Good physical condition and good balance are essential for roofers. They cannot be afraid of heights. Experience with metal-working is helpful for workers who install metal roofing. Usually, apprentices must be at least 18 years old.

Advancement. Roofers may advance to become supervisors or estimators for a roofing contractor or become contractors themselves.

Employment

Roofers held about 156,000 jobs in 2006. Almost all salaried roofers worked for roofing contractors. About 20 percent of roofers were self-employed. Many self-employed roofers specialized in residential work.

Job Outlook

Most job openings will arise from turnover, because the work is hot, strenuous, and dirty, causing many people to switch to jobs in other construction trades. Faster-than-average employment growth is expected.

Employment change. Employment of roofers is expected to grow 14 percent between 2006 and 2016, which is faster than the average for all occupations. Roofs deteriorate faster than most other parts of buildings, and they need to be repaired or replaced more often. So as the number of buildings continues to increase, demand for roofers is expected to grow. In addition to repair work, the need to install roofs on new buildings is also expected to add to the demand for roofers.

Job prospects. Job opportunities for roofers will arise primarily because of the need to replace workers who leave the occupation. The proportion of roofers who leave the occupation each year is higher than in most construction trades—roofing work is hot, strenuous, and dirty, and a significant number of workers treat roofing as a temporary job until they find other work. Some roofers leave the occupation to go into other construction trades. Jobs should be easiest to find during spring and summer.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Roofers	47-2181	156,000	179,000	22,000	14

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Employment of roofers who install new roofs, like that of many other construction workers, is sensitive to the fluctuations of the economy. Workers in these trades may experience periods of unemployment when the overall level of construction falls. On the other hand, shortages of these workers may occur in some areas during peak periods of building activity. Nevertheless, roofing is more heavily concentrated on repair and replacement rather than new installation, making demand for roofers less susceptible to the business cycle than it is for some other construction trades.

Earnings

In May 2006, median hourly earnings of wage and salary roofers were $15.51. The middle 50 percent earned between $12.12 and $20.79. The lowest 10 percent earned less than $9.81, and the highest 10 percent earned more than $26.79. The median hourly earnings of roofers in the foundation, structure, and building exterior contractors industry were $15.54. Earnings may be reduced on occasion when poor weather limits the time roofers can work.

Apprentices usually start earning about 40 percent to 50 percent of the rate paid to experienced roofers. They receive periodic raises as they master the skills of the trade.

Some roofers are members of the United Union of Roofers, Waterproofers, and Allied Workers. Hourly wages and fringe benefits are generally higher for union workers.

Related Occupations

Roofers use shingles, bitumen and gravel, single-ply plastic or rubber sheets, or other materials to waterproof building surfaces. Workers in other occupations who cover surfaces with special materials for protection and decoration include carpenters; carpet, floor, and tile installers and finishers; cement masons, concrete finishers, segmental pavers, and terrazzo workers; drywall installers, ceiling tile installers, and tapers; plasterers and stucco masons; and sheet metal workers.

Sources of Additional Information

For information about apprenticeships or job opportunities in roofing, contact local roofing contractors, a local chapter of the roofers union, a local joint union-management apprenticeship committee, or the nearest office of your state employment service or apprenticeship agency. You can also find information on the registered apprenticeship system with links to state apprenticeship programs on the U.S. Department of Labor's Web site: http://www.doleta.gov/atels_bat. Apprenticeship information is also available from the U.S. Department of Labor's toll-free helpline: (877) 872-5627.

➤ United Union of Roofers, Waterproofers, and Allied Workers, 1660 L St. NW, Suite 800, Washington, DC 20036. Internet: http://www.unionroofers.org

For general information on apprenticeships and how to get them, see the *Occupational Outlook Quarterly* article "Apprenticeships: Career training, credentials—and a paycheck in your pocket," online at http://www.bls.gov/opub/ooq/2002/summer/art01.pdf and in print at many libraries and career centers.

Sheet Metal Workers

(O*NET 47-2211.00)

Significant Points

- About 66 percent of sheet metal workers are found in the construction industry; around 21 percent are in manufacturing.
- Workers learn through informal on-the-job training or formal apprenticeship programs.
- Job opportunities in construction should be good, particularly for individuals who have apprenticeship training or who are certified welders; applicants for jobs in manufacturing may experience competition.

Nature of the Work

Sheet metal workers make, install, and maintain heating, ventilation, and air-conditioning duct systems; roofs; siding; rain gutters; downspouts; skylights; restaurant equipment; outdoor signs; railroad cars; tailgates; customized precision equipment; and many other products made from metal sheets. They also may work with fiberglass and plastic materials. Although some workers specialize in fabrication, installation, or maintenance, most do all three jobs. Sheet metal workers do both construction-related work and mass production of sheet metal products in manufacturing.

Sheet metal workers first study plans and specifications to determine the kind and quantity of materials they will need. They then measure, cut, bend, shape, and fasten pieces of sheet metal to make ductwork, countertops, and other custom products. In an increasing number of shops, sheet metal workers use computerized metalworking equipment. This enables them to perform their tasks more quickly and to experiment with different layouts to find the one that wastes the least material. They cut, drill, and form parts with computer-controlled saws, lasers, shears, and presses.

In shops without computerized equipment, and for products that cannot be made on such equipment, sheet metal workers make the required calculations and use tapes, rulers, and other measuring devices for layout work. They then cut or stamp the parts on machine tools.

Before assembling pieces, sheet metal workers check each part for accuracy using measuring instruments such as calipers and micrometers and, if necessary, finish pieces using hand, rotary, or squaring shears and hacksaws. After inspecting the pieces, workers fasten seams and joints together with welds, bolts, cement, rivets, solder, specially formed sheet metal drive clips, or other connecting devices. They then take the parts to the construction site, where they further assemble the pieces as they install them. These workers install ducts, pipes, and tubes by joining them end to end and hanging them with metal hangers secured to a ceiling or a wall. They also

Sheet metal workers often take additional training, provided by the union or by their employer, to improve their skills.

use shears, hammers, punches, and drills to make parts at the worksite or to alter parts made in the shop.

Some jobs are done completely at the jobsite. When installing a metal roof, for example, sheet metal workers usually measure and cut the roofing panels on site. They secure the first panel in place and interlock and fasten the grooved edge of the next panel into the grooved edge of the first. Then, they nail or weld the free edge of the panel to the structure. This two-step process is repeated for each additional panel. Finally, the workers fasten machine-made molding at joints, along corners, and around windows and doors for a neat, finished effect.

In addition to installation, some sheet metal workers specialize in testing, balancing, adjusting, and servicing existing air-conditioning and ventilation systems to make sure they are functioning properly and to improve their energy efficiency. Properly installed duct systems are a key component to heating, ventilation, and air-conditioning (HVAC) systems; sometimes duct installers are called *HVAC technicians*. A growing activity for sheet metal workers is building commissioning, which is a complete mechanical inspection of a building's HVAC, water, and lighting systems.

Sheet metal workers in manufacturing plants make sheet metal parts for products such as aircraft or industrial equipment. Although some of the fabrication techniques used in large-scale manufacturing are similar to those used in smaller shops, the work may be highly automated and repetitive. Sheet metal workers doing such work may be responsible for reprogramming the computer control systems of the equipment they operate.

Work environment. Sheet metal workers usually work a 40-hour week. Those who fabricate sheet metal products work in shops that are well-lighted and well-ventilated. However, they stand for long periods and lift heavy materials and finished pieces. Sheet metal workers must follow safety practices because working around high-speed machines can be dangerous. They also are subject to cuts from sharp metal, burns from soldering and welding, and falls from ladders and scaffolds. They are often required to wear safety glasses and must not wear jewelry or loose-fitting clothing that could easily be caught in a machine. They may work at a variety of different production stations to reduce the repetitiveness of the work.

Those performing installation work do considerable bending, lifting, standing, climbing, and squatting, sometimes in close quarters or awkward positions. Although duct systems and kitchen equipment are installed indoors, the installation of siding, roofs, and gutters involves much outdoor work, exposing sheet metal workers to various kinds of weather.

Training, Other Qualifications, and Advancement

Sheet metal workers learn their trade through both formal apprenticeships and informal on-the-job training programs. Formal apprenticeships are more likely to be found in construction.

Education and training. To become a skilled sheet metal construction worker usually takes between 4 and 5 years of both classroom and on-the-job training. While there are a number of different ways to obtain this training, generally the more formalized the training received by an individual, the more thoroughly skilled they become, and the more likely they are to be in demand by employers. For some, this training begins in a high school, where classes in English, algebra, geometry, physics, mechanical drawing and blueprint reading, and general shop are recommended.

After high school, there are a number of different ways to train. One way is to get a job with a contractor who will provide training on the job. Entry-level workers generally start as helpers, assisting more experienced workers. Most begin by carrying metal and cleaning up debris in a metal shop while they learn about materials and tools and their uses. Later, they learn to operate machines that bend or cut metal. In time, helpers go out on the jobsite to learn installation. Employers may send the employee to courses at a trade or vocational school or community college to receive further formal training. Helpers may be promoted to the journey level if they show the requisite knowledge and skills. Most sheet metal workers in large-scale manufacturing receive on-the-job training, with additional class work or in-house training as necessary. The training needed to become proficient in manufacturing takes less time than the training in construction.

Some employers, particularly large nonresidential construction contractors with union membership, offer formal apprenticeships. These programs combine paid on-the-job training with related classroom instruction. Usually, apprenticeship applicants must be at least 18 years old and meet local requirements. The length of the program, usually 4 to 5 years, varies with the apprentice's skill. Apprenticeship programs provide comprehensive instruction in both sheet metal fabrication and installation. They may be administered by local joint committees composed of the Sheet Metal Workers' International Association and local chapters of the Sheet Metal and Air-Conditioning Contractors National Association.

Sheet metal workers can choose one of many specialties. Workers can specialize in commercial and residential HVAC installation and maintenance, industrial welding and fabrication, exterior or architectural sheet metal installation, sign fabrication, and testing and balancing of building systems.

On the job, apprentices first receive safety training and then training in tasks that allow them to immediately begin work. They learn the basics of pattern layout and how to cut, bend, fabricate, and install sheet metal. They begin by learning to install and maintain basic ductwork and gradually advance to more difficult jobs, such as making more complex ducts, commercial kitchens, and decorative pieces. They also use materials such as fiberglass, plastics, and other nonmetallic materials. Workers often focus on a sheet metal specialty. In the classroom, apprentices learn drafting, plan and specification reading, trigonometry and geometry applicable to layout work, welding, the use of computerized equipment, and the principles of heating, air-conditioning, and ventilation systems. In addition, apprentices learn the relationship between sheet metal work and other construction work.

Other qualifications. Sheet metal workers need to be in good physical condition and have mechanical and mathematical aptitude

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Sheet metal workers	47-2211	189,000	201,000	13,000	7

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

and good reading skills. Good eye-hand coordination, spatial and form perception, and manual dexterity also are important. Courses in algebra, trigonometry, geometry, mechanical drawing, and shop provide a helpful background for learning the trade, as does related work experience obtained in the U.S. Armed Services.

It is important for experienced sheet metal workers to keep abreast of new technological developments, such as the use of computerized layout and laser-cutting machines. Workers often take additional training, provided by the union or by their employer, to improve existing skills or to acquire new ones.

Certification and advancement. Certifications in one of the specialties can be beneficial to workers. Certifications related to sheet metal specialties are offered by a wide variety of associations, some of which are listed in the Sources of Additional Information section at the end of this statement. Those that complete registered apprenticeships are certified as journey workers, which can help to prove their skills to employers.

Sheet metal workers in construction may advance to supervisory jobs. Some of these workers take additional training in welding and do more specialized work. Workers who perform building and system testing are able to move into construction and building inspection. Others go into the contracting business for themselves. Because a sheet metal contractor must have a shop with equipment to fabricate products, this type of contracting business is more expensive to start than other types of construction contracting.

Sheet metal workers in manufacturing may advance to positions as supervisors or quality inspectors. Some of these workers may move into other management positions.

Employment

Sheet metal workers held about 189,000 jobs in 2006. About 66 percent of all sheet metal workers were in the construction industry, including 45 percent who worked for plumbing, heating, and air-conditioning contractors; most of the rest in construction worked for roofing and sheet metal contractors. Some worked for other special trade contractors and for general contractors engaged in residential and commercial building.

About 21 percent of all sheet metal workers were in manufacturing industries, such as the fabricated metal products, machinery, and aerospace products and parts industries. Some sheet metal workers work for the federal government.

Compared with workers in most construction craft occupations, relatively few sheet metal workers are self-employed.

Job Outlook

Average employment growth is projected. Job opportunities in construction should be good, particularly for individuals who have apprenticeship training or who are certified welders; applicants for jobs in manufacturing may experience competition.

Employment change. Employment of sheet metal workers is expected to increase 7 percent between 2006 and 2016, about as fast as the average for all occupations. This reflects growth in the number of industrial, commercial, and residential structures being built. The need to install energy-efficient air-conditioning, heating, and ventilation systems in older buildings and to perform other types of renovation and maintenance work also should boost employment. In addition, the popularity of decorative sheet metal products and increased architectural restoration are expected to add to the demand for sheet metal workers.

Job prospects. Job opportunities are expected to be good for sheet metal workers in the construction industry, reflecting both employment growth and openings arising each year as experienced sheet metal workers leave the occupation. Opportunities should be particularly good for individuals who have apprenticeship training or who are certified welders. Applicants for jobs in manufacturing may experience competition because a number of manufacturing plants that employ sheet metal workers are moving to other countries and the plants that remain are becoming more productive.

Sheet metal workers in construction may experience periods of unemployment, particularly when construction projects end and economic conditions dampen construction activity. Nevertheless, employment of sheet metal workers is less sensitive to declines in new construction than is the employment of some other construction workers, such as carpenters. Maintenance of existing equipment—which is less affected by economic fluctuations than is new construction—makes up a large part of the work done by sheet metal workers. Installation of new air-conditioning and heating systems in existing buildings continues during construction slumps, as individuals and businesses adopt more energy-efficient equipment to cut utility bills. In addition, a large proportion of sheet metal installation and maintenance is done indoors, so sheet metal workers usually lose less work time due to bad weather than other construction workers.

Earnings

In May 2006, median hourly earnings of wage and salary sheet metal workers were $17.96. The middle 50 percent earned between $13.30 and $24.89. The lowest 10 percent of all sheet metal workers earned less than $10.36, and the highest 10 percent earned more than $32.30. The median hourly earnings of the largest industries employing sheet metal workers were:

Building finishing contractors	$18.84
Plumbing, heating, and air-conditioning contractors	18.60
Roofing contractors	17.27
Architectural and structural metals manufacturing	16.60

Apprentices normally start at about 40 to 50 percent of the rate paid to experienced workers. As apprentices acquire more skills, they receive periodic pay increases until their pay approaches that of experienced workers. In addition, union workers in some areas receive supplemental wages from the union when they are on layoff or shortened workweeks.

Related Occupations

To fabricate and install sheet metal products, sheet metal workers combine metalworking skills and knowledge of construction materials and techniques. Other occupations in which workers lay out and fabricate metal products include assemblers and fabricators;

machinists; machine setters, operators, and tenders—metal and plastic; and tool and die makers. Construction occupations requiring similar skills and knowledge include glaziers and heating, air-conditioning, and refrigeration mechanics and installers.

Sources of Additional Information

For more information about apprenticeships or other work opportunities, contact local sheet metal contractors or heating, refrigeration, and air-conditioning contractors; a local of the Sheet Metal Workers International Association; a local of the Sheet Metal and Air-Conditioning Contractors National Association; a local joint union-management apprenticeship committee; or the nearest office of your state employment service or apprenticeship agency. You can also find information on the registered apprenticeship system with links to state apprenticeship programs on the U.S. Department of Labor's Web site: http://www.doleta.gov/atels_bat. Apprenticeship information is also available from the U.S. Department of Labor's toll-free helpline: (877) 872-5627.

For general information on apprenticeships and how to get them, see the *Occupational Outlook Quarterly* article "Apprenticeships: Career training, credentials—and a paycheck in your pocket," online at http://www.bls.gov/opub/ooq/2002/summer/art01.pdf and in print at many libraries and career centers.

Structural and Reinforcing Iron and Metal Workers

(O*NET 47-2171.00 and 47-2221.00)

Significant Points

- Workers must be in good physical condition and must not fear heights.
- Most employers recommend completion of a formal three-year or four-year apprenticeship, but some workers learn on the job.
- Earnings of structural iron and steel workers are among the highest of all construction trades.
- In most areas, job opportunities should be excellent.

Nature of the Work

Structural and reinforcing iron and metal workers place and install iron or steel girders, columns, and other construction materials to form buildings, bridges, and other structures. They also position and secure steel bars or mesh in concrete forms in order to reinforce the concrete used in highways, buildings, bridges, tunnels, and other structures. In addition, they repair and renovate older buildings and structures. Even though the primary metal involved in this work is steel, these workers often are known as *ironworkers* or *erectors*.

Earnings of structural iron and steel workers are among the highest of all construction trades.

Some ironworkers make structural metal in fabricating shops, which are usually located away from the construction site. These workers are covered in the statement on assemblers and fabricators found elsewhere in the *Handbook*.

Before construction can begin, ironworkers must erect steel frames and assemble the cranes and derricks that move structural steel, reinforcing bars, buckets of concrete, lumber, and other materials and equipment around the construction site. Once this job has been completed, workers begin to connect steel columns, beams, and girders according to blueprints and instructions from supervisors and superintendents. Structural steel, reinforcing rods, and ornamental iron generally come to the construction site ready for erection—cut to the proper size, with holes drilled for bolts and numbered for assembly.

Ironworkers at the construction site unload and stack the prefabricated steel so that it can be hoisted easily when needed. To hoist the steel, ironworkers attach cables (slings) to the steel and to the crane or derrick. One worker directs the hoist operator with hand signals while another worker holds a rope (tag line) attached to the steel to prevent it from swinging. The crane or derrick hoists steel into place in the framework, whereupon two ironworkers called connectors position the steel with connecting bars and spud wrenches—a long wrench with a pointed handle. Workers using driftpins or the handle of a spud wrench align the holes in the steel with the holes in the framework. Ironworkers check vertical and horizontal alignment with plumb bobs, laser equipment, transits, or levels; then they bolt or weld the piece permanently in place.

Reinforcing iron and rebar workers, sometimes called *rod busters*, set reinforcing bars (often called rebar) in the forms that

hold concrete, following blueprints showing the location, size, and number of bars. They then fasten the bars together by tying wire around them with pliers. When reinforcing floors, ironworkers place spacers under the rebar to hold the bars off the deck. Although these materials usually arrive ready to use, ironworkers occasionally must cut bars with metal shears or acetylene torches, bend them by hand or machine, or weld them with arc-welding equipment. Some concrete is reinforced with welded wire fabric that ironworkers put into position using hooked rods. Post-tensioning is another technique used to reinforce concrete. In this technique, workers substitute cables for rebar. When the concrete is poured, the ends of the cables are left exposed. After the concrete cures, ironworkers tighten the cables with jacking equipment specially designed for the purpose. Post-tensioning allows designers to create larger open areas in a building, because supports can be placed further apart. This technique is commonly employed in parking garages and arenas.

Ornamental ironworkers install stairs, handrails, curtain walls (the nonstructural walls and window frames of many large buildings), and other miscellaneous metal after the structure of the building has been completed. As they hoist pieces into position, ornamental ironworkers make sure that the pieces are properly fitted and aligned before bolting or welding them for a secure fit.

Work environment. Structural and reinforcing iron and metal workers usually work outside in all kinds of weather. However, those who work at great heights do not work during wet, icy, or extremely windy conditions. Because the danger of injuries from falls is great, ironworkers use safety devices such as safety harnesses, scaffolding, and nets to reduce risk.

Training, Other Qualifications, and Advancement

Many workers learn to be ironworkers through formal apprenticeships, but others learn on the job less formally. Certifications in welding and rigging can increase a worker's usefulness on the job site.

Education and training. Most employers recommend a three- or four-year apprenticeship consisting of paid on-the-job training and evening classroom instruction as the best way to learn this trade. Apprenticeship programs are administered by committees made up of representatives of local unions of the International Association of Bridge, Structural, Ornamental and Reinforcing Iron Workers or the local chapters of contractors' associations.

In the classroom, apprentices study blueprint reading; mathematics, the basics of structural erecting, rigging, reinforcing, welding, assembling, and safety training. Apprentices also study the care and safe use of tools and materials. On the job, apprentices work in all aspects of the trade, such as unloading and storing materials at the job site, rigging materials for movement by crane, connecting structural steel, and welding.

Some ironworkers learn the trade informally on the job, without completing an apprenticeship. These workers generally do not receive classroom training, although some large contractors have extensive training programs. On-the-job trainees usually begin by assisting experienced ironworkers on simple jobs, such as carrying various materials. With experience, trainees perform more difficult tasks, such as cutting and fitting different parts; however, learning through work experience alone may not provide training as complete as an apprenticeship program, and it usually takes longer.

Other qualifications. Ironworkers must be at least 18 years old. A high school diploma is preferred by employers and local apprenticeship committees. High school courses in general mathematics, mechanical drawing, English, and welding are considered helpful. Because materials used in iron working are heavy and bulky, ironworkers must be in good physical condition. They also need good agility, balance, eyesight, and depth perception to work safely at great heights on narrow beams and girders. Ironworkers should not be afraid of heights or suffer from dizziness.

Certification and advancement. Ironworkers who complete apprenticeships are certified as journey workers, which often make them more competitive for jobs and promotions. Those who meet education and experience requirements can become welders certified by the American Welding Society. Apprenticeship programs often provide trainees the opportunity to become certified as part of their coursework because welding skills are useful for many ironworker tasks.

Some experienced workers are promoted to supervisor. Others may go into the contracting business for themselves. The ability to communicate in both English and Spanish will improve opportunities for advancement.

Employment

Ironworkers held about 102,000 jobs in 2006; structural iron and steel workers held about 72,000 jobs; and reinforcing iron and rebar workers held about 30,000 jobs. About 88 percent worked in construction, with 50 percent working for foundation, structure, and building exterior contractors. Most of the remaining ironworkers worked for contractors specializing in the construction of homes; factories; commercial buildings; religious structures; schools; bridges and tunnels; and water, sewer, communications, and power lines.

Structural and reinforcing iron and metal workers are employed in all parts of the country, but most work in metropolitan areas, where the bulk of commercial and industrial construction takes place.

Job Outlook

Average job growth is projected, but in most areas of the country job opportunities should be excellent.

Employment change. Employment of structural and reinforcing iron and metal workers is expected to grow 8 percent between 2006 and 2016, about as fast as the average for all occupations. Nonresidential and heavy construction is expected to increase, creating jobs. The rehabilitation, maintenance, and replacement of a growing number of older buildings, powerplants, highways, and bridges also are expected to create employment opportunities. State and federal legislatures continue to support and fund the building of roads,

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Structural and reinforcing iron and metal workers	—	102,000	110,000	7,800	8
Reinforcing iron and rebar workers	47-2171	30,000	34,000	3,500	12
Structural iron and steel workers	47-2221	72,000	76,000	4,300	6

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

which will secure jobs for the near future. However, a lack of qualified applicants may restrain employment growth in some areas.

Job prospects. In addition to new jobs from employment growth, many job openings will result from the need to replace experienced ironworkers who leave the occupation or retire. In most areas, job opportunities should be excellent, although the number of job openings can fluctuate from year to year with economic conditions and the level of construction activity. Many workers prefer to enter other occupations with better working conditions, leading to opportunities for those who wish to become structural and reinforcing iron and metal workers.

Employment of structural and reinforcing iron and metal workers, like that of many other construction workers, is sensitive to the fluctuations of the economy. Workers in these trades may experience periods of unemployment when the overall level of construction falls. On the other hand, shortages of these workers may occur in some areas during peak periods of building activity. Similarly, job opportunities for ironworkers may vary widely by geographic area. Population growth in the South and West should create more job opportunities than elsewhere as bridges, buildings, and roads are constructed. Job openings for ironworkers usually are more abundant during the spring and summer months, when the level of construction activity increases. Workers who are willing to relocate are often able to find work in another area.

Earnings

Earnings of structural iron and steel workers are among the highest of all construction trades. In May 2006, median earnings of wage and salary structural iron and steel workers in all industries were $19.46 an hour. The middle 50 percent earned between $14.11 and $27.08. The lowest 10 percent earned less than $10.94, and the highest 10 percent earned more than $34.78.

Median hourly earnings of wage and salary reinforcing iron and rebar workers in all industries were $18.38. The middle 50 percent earned between $13.15 and $27.03. The lowest 10 percent earned less than $10.25, and the highest 10 percent earned more than $34.15.

Median hourly earnings of wage and salary structural iron and steel workers in foundation, structure, and building exterior contractors were $20.54 and in nonresidential building construction, $16.76. Reinforcing iron and rebar workers earned median hourly earnings of $18.67 in foundation, structure, and building exterior contractors.

About 31 percent of the workers in this trade are union members. According to International Association of Bridge, Structural, Ornamental, and Reinforcing Iron Workers, average hourly earnings, including benefits, for structural and reinforcing metal workers who belonged to a union and worked full time were slightly higher than the hourly earnings of nonunion workers. Structural and reinforcing iron and metal workers in New York, Boston, San Francisco, Chicago, Los Angeles, Philadelphia, and other large cities received the highest wages.

Apprentices generally start at about 50 to 60 percent of the rate paid to experienced journey workers. Throughout the course of the apprenticeship program, as they acquire skills, they receive periodic increases until their pay approaches that of experienced workers.

Earnings for ironworkers may be reduced on occasion because work can be limited by bad weather, the short-term nature of construction jobs, and economic downturns.

Related Occupations

Structural and reinforcing iron and metal workers play an essential role in erecting buildings, bridges, highways, power lines, and other structures. Others who work on these construction jobs include assemblers and fabricators; boilermakers; civil engineers; cement masons, concrete finishers, segmental pavers, and terrazzo workers; construction managers; and welding, soldering, and brazing workers.

Sources of Additional Information

For more information on apprenticeships or other work opportunities, contact local general contractors; a local of the International Association of Bridge, Structural, Ornamental, and Reinforcing Iron Workers Union; a local ironworkers' joint union-management apprenticeship committee; a local or state chapter of the Associated Builders and Contractors or the Associated General Contractors; or the nearest office of your state employment service or apprenticeship agency. You can also find information on the registered apprenticeship system with links to state apprenticeship programs on the U.S. Department of Labor's Web site: http://www.doleta.gov/atels_bat. Apprenticeship information is also available from the U.S. Department of Labor's toll-free helpline: (877) 872-5627.

➤ Associated General Contractors of America, Inc., 2300 Wilson Blvd., Suite 400, Arlington, VA 22201. Internet: http://www.agc.org

For general information on apprenticeships and how to get them, see the *Occupational Outlook Quarterly* article "Apprenticeships: Career training, credentials—and a paycheck in your pocket," online at http://www.bls.gov/opub/ooq/2002/summer/art01.pdf and in print at many libraries and career centers.

Installation, Maintenance, and Repair Occupations

Electrical and Electronic Equipment Mechanics, Installers, and Repairers

Computer, Automated Teller, and Office Machine Repairers

(O*NET 49-2011.00)

Significant Points

- Workers qualify for these jobs by receiving training in electronics from associate degree programs, the military, vocational schools, equipment manufacturers, or employers.
- Employment is expected to grow more slowly than the average for all occupations.
- Job prospects will be best for applicants with knowledge of electronics, and who have formal training and repair experience.

Nature of the Work

Computer, automated teller, and office machine repairers install, fix, and maintain many of the machines that are common to businesses and households. Some repairers travel to customers' workplaces or other locations to make the necessary repairs. These workers—known as *field technicians*—often have assigned areas in which they perform preventive maintenance on a regular basis. *Bench technicians* work in repair shops located in stores, factories, or service centers. In small companies, repairers may work both in repair shops and at customer locations.

Computer repairers, also known as *computer service technicians* or *data processing equipment repairers,* service mainframe, server, and personal computers; printers; and auxiliary computer equipment. These workers primarily perform hands-on repair, maintenance, and installation of computers and related equipment. Workers who provide technical assistance, in person or by telephone, to computer system users are known as computer support specialists or computer support technicians. (See the section on computer support specialists and systems administrators elsewhere in the *Handbook.*)

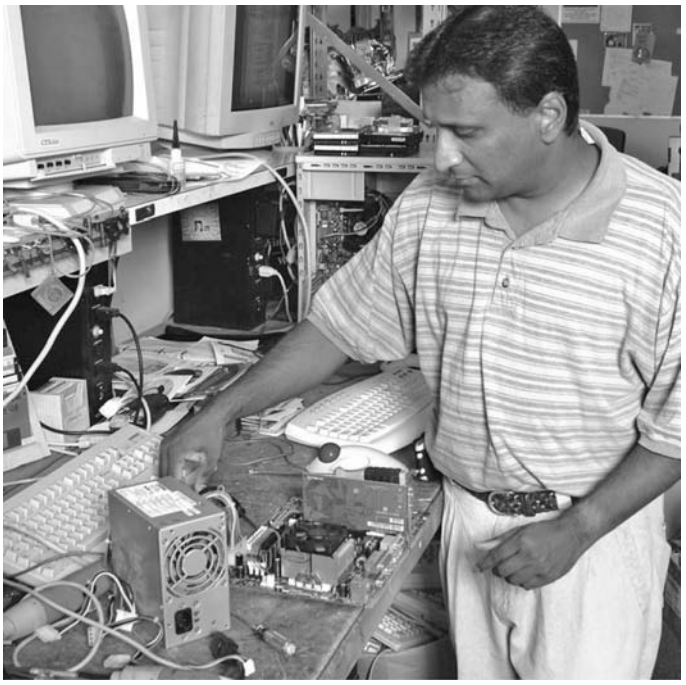
Computer repairers usually replace subsystems instead of repairing them. Replacement is common because subsystems are inexpensive and businesses are reluctant to shut down their computers for time-consuming repairs. Subsystems commonly replaced by computer repairers include video cards, which transmit signals from the computer to the monitor; hard drives, which store data; and network cards, which allow communication over the network. Defective modules may be given to bench technicians, who use software programs to diagnose the problem and who may repair the modules, if possible.

Office machine and cash register servicers work on photocopiers, cash registers, mail-processing equipment, and fax machines. Newer models of office machinery include computerized components that allow them to function more effectively than earlier models.

Office machine repairers usually work on machinery at the customer's workplace. However, if the machines are small enough, customers may bring them to a repair shop for maintenance. Common malfunctions include paper misfeeds caused by worn or dirty parts, and poor-quality copy resulting from problems with lamps, lenses, or mirrors. These malfunctions usually can be resolved simply by cleaning the relevant components. Breakdowns also may result from the failure of commonly used parts. For example, heavy use of a photocopier may wear down the printhead, which applies ink to the final copy. In such cases, the repairer usually replaces the part instead of repairing it.

Automated teller machine servicers install and repair automated teller machines (ATMs). These machines allow customers to carry out bank transactions without the assistance of a teller. ATMs also provide a growing variety of other services, including stamp, phone card, and ticket sales.

When ATMs malfunction, computer networks recognize the problem and alert repairers. Common problems include worn magnetic heads on card readers, which prevent the equipment from recognizing customers' bankcards, and "pick failures," which prevent the equipment from dispensing the correct amount of cash. Field technicians travel to the locations of ATMs and usually repair equipment by removing and replacing defective components. Broken components are taken to a repair shop, where bench technicians make the necessary repairs. Field technicians perform routine maintenance on



Computer repairers perform hands-on repair, maintenance, and installation of computers and related equipment.

a regular basis, replacing worn parts and running diagnostic tests to ensure that the equipment functions properly.

To install large equipment, such as mainframe computers and ATMs, repairers connect the equipment to power sources and communication lines that allow the transmission of information over computer networks. For example, when an ATM dispenses cash, it transmits the withdrawal information to the customer's bank. Workers also may install operating software and peripheral equipment, checking that all components are configured to function together correctly.

Computer, automated teller, and office machine repairers use a variety of tools for diagnostic tests and repair. To diagnose malfunctions, they use multimeters to measure voltage, current, resistance, and other electrical properties; signal generators to provide test signals; and oscilloscopes to monitor equipment signals. To diagnose computerized equipment, repairers use software programs. To repair or adjust equipment, workers use hand tools, such as pliers, screwdrivers, soldering irons, and wrenches.

Work environment. Repairers usually work in clean, well-lighted surroundings. Because computers and office machines are sensitive to extreme temperatures and humidity, repair shops usually are air-conditioned and well ventilated. Field repairers must travel frequently to various locations to install, maintain, or repair customers' equipment. ATM repairers may have to perform their jobs in small, confined spaces that house the equipment.

Because computers and ATMs are critical for many organizations to function efficiently, data processing equipment repairers and ATM field technicians often work around the clock. Their schedules may include evening, weekend, and holiday shifts, sometimes assigned on the basis of seniority. Office machine and cash register servicers usually work regular business hours because the equipment they repair is not as critical. Most repairers work about 40 hours per week, but about 12 percent work more than 50 hours per week.

Although their jobs are not strenuous, repairers must lift equipment and work in a variety of postures. Repairers of computer monitors need to discharge voltage from the equipment to avoid electrocution. Workers may have to wear protective goggles.

Training, Other Qualifications, and Advancement

Knowledge of electronics is required, and employers prefer workers with formal training. Office machine and ATM repairers usually have an associate degree. Certification is available for entry-level workers, as well as experienced workers seeking advancement.

Education and training. Knowledge of electronics is necessary for employment as a computer, automated teller, or office machine repairer. Employers prefer workers who are certified or who have training in electronics from an associate degree program, the military, a vocational school, or an equipment manufacturer. Employers generally provide some training to new repairers on specific equipment; however, workers are expected to arrive on the job with a basic understanding of equipment repair. Employers may send experienced workers to training sessions to keep up with changes in technology and service procedures.

Most office machine and ATM repairer positions require an associate degree in electronics. A basic understanding of mechanical equipment also is important because many of the parts that fail in office machines and ATMs, such as paper loaders, are mechanical. Entry-level employees at large companies normally receive on-the-job training lasting several months. Such training may include a week of classroom instruction, followed by a period of 2 weeks to several months assisting an experienced repairer.

Certification and other qualifications. Various organizations offer certification. Certification demonstrates a level of competency, and can make an applicant more attractive to employers.

Field technicians work closely with customers and must have good communications skills and a neat appearance. Employers may require that field technicians have a driver's license.

Certification and advancement. Newly hired computer repairers may work on personal computers or peripheral equipment. With experience, they can advance to positions maintaining more sophisticated systems, such as networking equipment and servers. Field repairers of ATMs may advance to bench technician positions responsible for more complex repairs. Experienced workers may become specialists who help other repairers diagnose difficult problems or who work with engineers in designing equipment and developing maintenance procedures. Experienced workers also may move into management positions responsible for supervising other repairers.

Because of their familiarity with equipment, experienced repairers may move into customer service or sales positions. Some experienced workers open their own repair shops or become wholesalers or retailers of electronic equipment.

Certification may also increase one's opportunities for advancement. Certification is available for workers with varying levels of skills and experience. To obtain certification, workers generally must pass an examination corresponding to their skill level.

Employment

Computer, automated teller, and office machine repairers held about 175,000 jobs in 2006. Wholesale trade establishments employed about 31 percent of the workers in this occupation; most of these establishments were wholesalers of professional and commercial equipment and supplies. Many workers also were employed in computer and software stores and office supply stores. Others worked in electronic and precision equipment repair shops and computer systems design firms. About 20 percent of computer, automated teller, and office machine repairers were self-employed, compared to 7 percent for all installation, maintenance, and repair occupations.

Job Outlook

Employment is expected to grow more slowly than the average for all occupations. Opportunities will be best for applicants with knowledge of electronics, formal training, and previous experience.

Employment change. Employment of computer, automated teller, and office machine repairers is expected to grow by 3 percent from 2006 to 2016, which is slower than the average for all occupations. Limited job growth will be driven by the increasing dependence of business and individuals on computers and other sophisticated

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Computer, automated teller, and office machine repairers.....	49-2011	175,000	180,000	5,200	3

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

office machines. The need to maintain this equipment will create new jobs for repairers.

Although computer equipment continues to become less expensive and more reliable, malfunctions still occur and can cause severe problems for users, most of whom lack the knowledge to make repairs. Computers are critical to most businesses today and will become even more so as companies increasingly engage in electronic commerce, and as individuals continue to bank, shop, and pay bills online.

People also are becoming increasingly reliant on ATMs. Besides offering bank and retail transactions, ATMs provide an increasing number of other services, such as employee information processing and distribution of government payments. The relatively slow rate at which new ATMs are installed, however, and the fact that they are becoming easier to repair, will limit demand for ATM repairers.

Conventional office machines, such as calculators, are inexpensive, and often are replaced instead of repaired. However, digital copiers and other, newer office machines are more costly and complex. This equipment often is computerized, designed to work on a network, and capable of performing multiple functions. But because this equipment is becoming more reliable, job growth in office machine repairers will be limited as well.

Job prospects. In addition to new job growth, a number of openings will result from the need to replace workers who retire or leave the occupation. Job prospects will be best for applicants with knowledge of electronics, formal training, and repair experience.

Earnings

Median hourly earnings of wage-and-salary computer, automated teller, and office machine repairers were $17.54 in May 2006. The middle 50 percent earned between $13.56 and $22.44. The lowest 10 percent earned less than $10.65, and the highest 10 percent earned more than $27.36. Median hourly earnings in the industries employing the largest numbers of computer, automated teller, and office machine repairers in May 2006 were:

Computer systems design and related services	$19.41
Professional and commercial equipment and supplies merchant wholesalers	19.09
Office supplies, stationery, and gift stores	16.64
Electronic and precision equipment repair and maintenance	15.82
Computer and software stores	15.20
Electronics and appliance stores	14.71

Related Occupations

Workers in other occupations who repair and maintain electronic equipment include electronic home entertainment equipment installers and repairers; home appliance repairers; broadcast and sound engineering technicians and radio operators; precision instrument and equipment repairers; electrical and electronics installers and repairers; electricians; radio and telecommunications equipment installers and repairers; coin, vending, and amusement machine servicers and repairers; industrial machinery mechanics and maintenance workers; and maintenance and repair workers, general.

Electrical and Electronics Installers and Repairers

(O*NET 49-2092.00, 49-2093.00, 49-2094.00, 49-2095.00, and 49-2096.00)

Significant Points

- Knowledge of electrical equipment and electronics is necessary for employment; employers often prefer applicants with an associate degree in electronics.
- Employment is projected to grow more slowly than average for all occupations.
- Job opportunities will be best for applicants with an associate degree, certification, and related experience.

Nature of the Work

Businesses and other organizations depend on complex electronic equipment for a variety of functions. Industrial controls automatically monitor and direct production processes on the factory floor. Transmitters and antennae provide communication links for many organizations. Electric power companies use electronic equipment to operate and control generating plants, substations, and monitoring equipment. The federal government uses radar and missile control systems to provide for the national defense and to direct commercial air traffic. These complex pieces of electronic equipment are installed, maintained, and repaired by electrical and electronics installers and repairers.

Installers and repairers, known as *field technicians*, often travel to factories or other locations to repair equipment. These workers usually have assigned areas in which they perform preventive maintenance on a regular basis. When equipment breaks down, field technicians go to a customer's site to repair the equipment. *Bench technicians* work in repair shops located in factories and service centers, fixing components that cannot be repaired on the factory floor.

Electrical and electronic equipment are two distinct types of industrial equipment, although much equipment contains both electrical and electronic components. In general, electrical portions provide the power for the equipment, while electronic components control the device, although many types of equipment still are controlled with electrical devices.

Some repairers install, diagnose, and repair equipment in cars and other motor vehicles.

Some industrial electronic equipment is self-monitoring and alerts repairers to malfunctions. When equipment breaks down, repairers will first check for common causes of trouble, such as loose connections or obviously defective components. If routine checks do not locate the trouble, repairers may refer to schematics and manufacturers' specifications that show connections and provide instructions on how to locate problems. Automated electronic control systems are becoming increasingly complex, making diagnosis more challenging. With these systems, repairers use software programs and testing equipment to diagnose malfunctions. Among their diagnostic tools are multimeters, which measure voltage, current, and resistance, and advanced multimeters, which measure capacitance, inductance, and current gain of transistors. Repairers also use signal generators, which provide test signals, and oscilloscopes, which display signals graphically. Finally, repairers use hand tools such as pliers, screwdrivers, soldering irons, and wrenches to replace faulty parts and adjust equipment.

Because repairing components is a complex activity and factories cannot allow production equipment to stand idle, repairers on the factory floor usually remove and replace defective units, such as circuit boards, instead of fixing them. Defective units are discarded or returned to the manufacturer or a specialized shop for repair. Bench technicians at these locations have the training, tools, and parts needed to thoroughly diagnose and repair circuit boards or other complex components. These workers also locate and repair circuit defects, such as poorly soldered joints, blown fuses, or malfunctioning transistors.

Electrical and electronics installers often fit older manufacturing equipment with new automated control devices. Older manufacturing machines are frequently in good working order but are limited by inefficient control systems for which replacement parts are no longer available. Installers replace old electronic control units with new programming logic controls (PLCs). Setting up and installing a new PLC involves connecting it to different sensors and electrically powered devices (electric motors, switches, and pumps) and writing a computer program to operate the PLC. Electronics installers coordinate their efforts with those of other workers who are installing and maintaining equipment. (See the section on industrial machinery mechanics and maintenance workers elsewhere in the *Handbook*.)

Electrical and electronics installers and repairers, transportation equipment install, adjust, or maintain mobile electronic communication equipment, including sound, sonar, security, navigation, and surveillance systems on trains, watercraft, or other vehicles. *Electrical and electronics repairers, powerhouse, substation, and relay* inspect, test, maintain, or repair electrical equipment used in generating stations, substations, and in-service relays. These workers may be known as powerhouse electricians, relay technicians, or power transformer repairers. *Electric motor, power tool, and related repairers*—such as armature winders, generator mechanics, and electric golf cart repairers—specialize in installing, maintaining, and repairing electric motors, wiring, or switches.

Electronic equipment installers and repairers, motor vehicles have a significantly different job. They install, diagnose, and repair communication, sound, security, and navigation equipment in motor vehicles. Most installation work involves either new alarm or sound systems. New sound systems vary significantly in cost and complexity of installation. Replacing a head unit (radio) with a new CD player is simple, requiring the removal of a few screws and the connection of a few wires. Installing a new sound system with a subwoofer, amplifier, and fuses is far more complicated. The installer builds a fiberglass or wood box designed to hold the subwoofer and to fit inside the unique dimensions of the automobile. Installing sound-deadening material, which often is necessary with more powerful speakers, requires an installer to remove many parts of a car (for example, seats, carpeting, or interiors of doors), add sound-absorbing material in empty spaces, and reinstall the interior parts. The installer also runs new speaker and electrical cables. The new system may require additional fuses, a new electrical line to be run from the battery through a newly drilled hole in the firewall into the interior of the vehicle, or an additional or more powerful alternator or battery. Motor vehicle installers and repairers work with an increasingly complex range of electronic equipment, including DVD players, satellite navigation equipment, passive security systems, and active security systems.

Work environment. Many electrical and electronics installers and repairers work on factory floors, where they are subject to noise, dirt, vibration, and heat. Bench technicians primarily work in repair shops, where the surroundings are relatively quiet, comfortable, and well lighted.

Installers and repairers may have to do heavy lifting and work in a variety of positions. They must follow safety guidelines and often wear protective goggles and hardhats. When working on ladders or on elevated equipment, repairers must wear harnesses to avoid falls. Before repairing a piece of machinery, these workers must follow procedures to ensure that others cannot start the equipment during the repair process. They also must take precautions against electric shock by locking off power to the unit under repair.

Motor vehicle electronic equipment installers and repairers normally work indoors in well-ventilated and well-lighted repair shops. Minor cuts and bruises are common, but serious accidents usually are avoided when safety practices are observed.

Training, Other Qualifications, and Advancement

Applicants with an associate degree in electronics are preferred, and professional certification often is required.

Education and training. Knowledge of electrical equipment and electronics is necessary for employment. Employers often prefer applicants with an associate degree from a community college or technical school, although a high school diploma may be sufficient for some jobs. Entry-level repairers may begin by working with experienced technicians who provide technical guidance, and work independently only after developing the necessary skills.

Certification and other qualifications. Many employers require applicants to be certified. Certification is available from various professional and education organizations, and usually requires applicants to pass an exam demonstrating their level of expertise.

Installers and repairers should have good eyesight and color perception to work with the intricate components used in electronic equipment. Field technicians work closely with customers and should have good communication skills and a neat appearance. Employers also may require that field technicians have a driver's license.

Certification and advancement. Certification can also serve as a form of advancement. Workers who become certified in a specialty area may gain additional responsibilities and be awarded higher pay.

Experienced repairers with advanced training may become specialists or troubleshooters who help other repairers diagnose difficult problems. Workers with leadership ability may become supervisors of other repairers. Some experienced workers open their own repair shops.

Employment

Electrical and electronics installers and repairers held about 169,000 jobs in 2006. The following tabulation breaks down their employment by occupational specialty:

Electrical and electronics repairers, commercial and industrial equipment	80,000
Electric motor, power tool, and related repairers	25,000
Electrical and electronics repairers, powerhouse, substation, and relay	22,000
Electrical and electronics installers and repairers, transportation equipment	21,000
Electronic equipment installers and repairers, motor vehicles	20,000

Many repairers worked for utilities; building equipment contractors; machinery and equipment repair shops; electrical and electronics wholesalers; electronics and appliance retailers; motor vehicle and parts dealers; manufacturers of electrical, electronic, and transportation equipment; and federal, state, and local government.

Job Outlook

Employment is expected to increase more slowly than the average through the year 2016. Job prospects should be best for applicants with an associate degree, certification, and related experience.

Employment change. Overall employment of electrical and electronics installers and repairers is expected to grow by 3 percent through the year 2016, which is slower than the average for all occupations. Growth rates will vary by occupational specialty.

Employment of electrical and electronics installers and repairers of commercial and industrial equipment is expected to grow by 7 percent, which is about as fast as the average for all occupations. This equipment will become more sophisticated and will be used more frequently as businesses strive to lower costs by increasing and improving automation. Companies will install electronic controls, robots, sensors, and other equipment to automate processes such as assembly and testing. In addition, as prices decline, this equipment will be used more frequently throughout a number of industries, including services, utilities, and construction, as well as manufacturing. Improved reliability of equipment should not constrain employment growth, however: companies increasingly will rely on repairers because malfunctions that idle commercial and industrial equipment will continue to be costly.

Employment of motor vehicle electronic equipment installers and repairers is expected to grow by 5 percent, which is slower than the average for all occupations. As motor vehicle manufacturers install more and better sound, security, entertainment, and navigation systems in new vehicles, and as newer electronic systems require progressively less maintenance, employment growth for aftermarket electronic equipment installers will be limited.

Employment of electric motor, power tool, and related repairers is expected to decline slowly, decreasing by 4 percent. Improvements in electrical and electronic equipment design, as well as the increased use of disposable tool parts should suppress job growth.

Employment of electrical and electronic installers and repairers of transportation equipment is expected to grow by 4 percent, which is slower than the average for all occupations. Declining employment in the rail transportation industry will dampen growth in this occupational specialty.

Employment of electrical and electronics installers and repairers, powerhouse, substation, and relay is expected to decline slowly, decreasing by 5 percent. Consolidation and privatization in utilities industries should improve productivity, reducing employment. Newer equipment will be more reliable and easier to repair, further limiting employment.

Job prospects. Job opportunities should be best for applicants with an associate degree in electronics, certification, and related experience. In addition to employment growth, the need to replace workers who transfer to other occupations or leave the labor force will result in some openings.

Earnings

Median hourly earnings of wage-and-salary electrical and electronics repairers, commercial and industrial equipment were $21.72 in May 2006. The middle 50 percent earned between $17.18 and $26.59. The lowest 10 percent earned less than $13.43, and the highest 10 percent earned more than $30.90. In May 2006, median hourly earnings were $23.49 in the federal government and $19.92 in building equipment contractors, the industries employing the largest numbers of electrical and electronics repairers, commercial and industrial equipment.

Median hourly earnings of wage-and-salary electric motor, power tool, and related repairers were $15.80 in May 2006. The middle 50 percent earned between $12.56 and $20.24. The lowest 10 percent earned less than $9.97, and the highest 10 percent earned more than $25.37. In May 2006, median hourly earnings were $15.32 in commercial and industrial machinery and equipment (except automotive and electronic) repair and maintenance, the industry employing the largest number of electronic motor, power tool, and related repairers.

Median hourly earnings of wage-and-salary electrical and electronics repairers, powerhouse, substation, and relay were $27.60 in May 2006. The middle 50 percent earned between $23.62 and $32.07. The lowest 10 percent earned less than $19.42, and the highest 10 percent earned more than $35.49. In May 2006, median hourly earnings were $28.30 in electric power generation, transmission, and distribution, the industry employing the largest number of these repairers.

Median hourly earnings of wage-and-salary electronics installers and repairers, motor vehicles were $13.57 in May 2006. The middle

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16 Number	Change, 2006-16 Percent
Electrical and electronics installers and repairers	—	169,000	174,000	5,200	3
Electric motor, power tool, and related repairers	49-2092	25,000	24,000	-1,100	-4
Electrical and electronics installers and repairers, transportation equipment	49-2093	21,000	22,000	900	4
Electrical and electronics repairers, commercial and industrial equipment	49-2094	80,000	86,000	5,500	7
Electrical and electronics repairers, powerhouse, substation, and relay	49-2095	22,000	21,000	-1,000	-5
Electronic equipment installers and repairers, motor vehicles	49-2096	20,000	21,000	900	5

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

50 percent earned between $10.78 and $17.41. The lowest 10 percent earned less than $9.13, and the highest 10 percent earned more than $23.45.

Median hourly earnings of wage-and-salary electrical and electronics repairers, transportation equipment were $20.72 in May 2006. The middle 50 percent earned between $16.79 and $25.10. The lowest 10 percent earned less than $13.24, and the highest 10 percent earned more than $28.78.

Related Occupations

Workers in other occupations who install and repair electronic equipment include broadcast and sound engineering technicians and radio operators; computer, automated teller, and office machine repairers; electronic home entertainment equipment installers and repairers; radio and telecommunications equipment installers and repairers; electricians; elevator installers and repairers; aircraft and avionics equipment mechanics and service technicians; coin, vending, and amusement machine servicers and repairers; and maintenance and repair workers, general. Industrial machinery mechanics and maintenance workers also install, maintain, and repair industrial machinery.

Electronic Home Entertainment Equipment Installers and Repairers

(O*NET 49-2097.00)

Significant Points

- Employers prefer applicants who have basic knowledge and skills in electronics; many applicants gain these skills at vocational training programs and community colleges.
- Employment is expected to grow more slowly than the average for all occupations because it often is cheaper to replace equipment than to repair it.
- Job opportunities will be best for applicants with knowledge of electronics, related hands-on experience, and good customer service skills.

Nature of the Work

Electronic home entertainment equipment installers and repairers—also called *service technicians*—repair a variety of equipment. They may specialize in one type of product, or may be trained in many different ones. The most common products include televisions and radios, stereo components, video and audio disc players, and video cameras. They also install and repair home security systems, intercom equipment, satellite television dishes, and home theater systems, which consist of large-screen televisions and sophisticated surround-sound audio components.

Customers usually bring small, portable equipment to repair shops for servicing. Repairers at these locations, known as *bench technicians*, are equipped with a full array of electronic tools and parts. When larger, less mobile equipment breaks down, customers may pay repairers to come to their homes. These repairers, known as *field technicians*, travel with a limited set of tools and parts, and attempt to complete the repair at the customer's location. If the job is complex, technicians may bring defective components back to the shop for diagnosis and repair.

Most home entertainment equipment installers and repairers work in electronic stores.

When equipment breaks down, repairers check for common causes of trouble, such as dirty or defective components. Many repairs consist simply of cleaning and lubricating equipment. If routine checks do not locate the trouble, repairers may refer to schematics and manufacturers' specifications that provide instructions on how to locate problems. Repairers use a variety of test equipment to diagnose and identify malfunctions. Multimeters detect short circuits, failed capacitors, and blown fuses by measuring voltage, current, and resistance. Color-bar and dot generators provide onscreen test patterns, signal generators test signals, and oscilloscopes and digital storage scopes measure complex waveforms produced by electronic equipment. Repairs may involve removing and replacing a failed capacitor, transistor, or fuse. Repairers use hand tools, such as pliers, screwdrivers, soldering irons, and wrenches, to replace faulty parts. They also make adjustments to equipment, such as focusing and converging the picture of a television set or balancing the audio on a surround-sound system.

Improvements in technology have miniaturized and digitized many audio and video recording devices. Miniaturization has made repair work significantly more difficult because both the components and the acceptable tolerances are smaller. Also, components now are mounted on the surface of circuit boards, instead of plugged into slots, requiring more precise soldering when a new part is installed. Improved technologies have lowered the price of electronic home entertainment equipment to the point where customers often replace broken equipment instead of repairing it.

Work environment. Most repairers work in well-lighted electrical repair shops. Field technicians, however, spend much time traveling in service vehicles and working in customers' residences.

Repairers may have to work in a variety of positions and carry heavy equipment. Although the work of repairers is comparatively safe, they must take precautions against minor burns and electric shock. Because television monitors carry high voltage even when they are turned off, repairers need to discharge the voltage before servicing such equipment.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Electronic home entertainment equipment installers and repairers ..	49-2097	40,000	41,000	1,200	3

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Training, Other Qualifications, and Advancement

Employers prefer applicants who have basic electronics skills, good problem-solving skills, and previous repair experience. Good customer service skills are essential for field technicians, as they spend a majority of their time working in customers' homes.

Education and training. Employers prefer applicants who have basic knowledge and skills in electronics as well as previous repair experience. Many applicants gain these skills at vocational training programs and community colleges. Training programs should include both hands-on experience and theoretical education in digital consumer electronics. Entry-level repairers may work closely with more experienced technicians, who provide technical guidance.

Other qualifications. Field technicians work closely with customers and must have good communication skills and a neat appearance. Repairers also must have good problem solving skills, as their main duty is to diagnose and solve problems. Employers also may require that field technicians have a driver's license.

Certification and advancement. Various organizations offer certification for electronic home entertainment equipment installers and repairers. Repairers may specialize in a variety of skill areas, including consumer electronics. To receive certification, repairers must pass qualifying exams corresponding to their level of training and experience.

Experienced repairers with advanced training may become specialists or troubleshooters, helping other repairers to diagnose difficult problems. Workers with leadership ability may become supervisors of other repairers. Some experienced workers open their own repair shops.

Employment

Electronic home entertainment equipment installers and repairers held about 40,000 jobs in 2006. Many repairers worked in electronics and appliance stores that sell and service electronic home entertainment products or in electronic and precision equipment repair and maintenance shops. About 12 percent of electronic home entertainment equipment installers and repairers were self-employed, compared to 7 percent for all installation, maintenance, and repair occupations.

Job Outlook

Employment is expected to increase more slowly than the average for all occupations. Job prospects will be best for applicants with knowledge of electronics, related experience, and good customer service skills.

Employment change. Employment of electronic home entertainment equipment installers and repairers is expected to grow by 3 percent from 2006 to 2016, which is slower than the average for all occupations. Demand will be driven by the rising sales of home entertainment equipment.

The need for repairers is expected to grow slowly, however, because home entertainment equipment is less expensive than in the past. As technological developments have lowered the price and improved the reliability of equipment, the demand for repair services has decreased. When a malfunction does occur, it often is cheaper for consumers to replace equipment than to pay for repairs.

Employment growth will be spurred somewhat by the introduction of sophisticated digital equipment, such as high-definition digital televisions and digital camcorders. So long as the price of such equipment remains high, purchasers will be willing to hire repairers when malfunctions occur. There also will be demand to install sophisticated home entertainment systems, such as home theaters.

Job prospects. Job openings will come about because of employment growth and from the need to replace workers who retire or who leave the occupation. Opportunities will be best for applicants with knowledge of electronics and who have related hands-on experience and good customer service skills.

Earnings

Median hourly earnings of wage-and-salary electronic home entertainment equipment installers and repairers were $14.42 in May 2006. The middle 50 percent earned between $11.52 and $18.24. The lowest 10 percent earned less than $8.96, and the highest 10 percent earned more than $22.42. In May 2006, median hourly earnings of electronic home entertainment equipment installers and repairers were $14.46 in electronics and appliance stores and $13.18 in electronic and precision equipment repair and maintenance.

Related Occupations

Other workers who install, repair, and maintain electronic equipment include computer, automated teller, and office machine repairers; electrical and electronics installers and repairers; radio and telecommunications equipment installers and repairers; precision instrument and equipment repairers; home appliance repairers; coin, vending, and amusement machine servicers and repairers; maintenance and repair workers, general; and electricians.

Radio and Telecommunications Equipment Installers and Repairers

(O*NET 49-2021.00 and 49-2022.00)

Significant Points

- Little or no change in employment is projected.
- Job opportunities vary by specialty; good opportunities are expected for central office installers and repairers, but station installers and repairers can expect keen competition.

- Applicants with computer skills and postsecondary electronics training should have the best opportunities.
- Repairers may be on-call around the clock in case of emergencies—night, weekend, and holiday hours are common.

Nature of the Work

Telephones, computers, and radios depend on a variety of equipment to transmit communications signals and connect to the Internet. From electronic and optical switches that route telephone calls and packets of data to their destinations to radio transmitters and receivers that relay signals from radios in airplanes, boats, and emergency vehicles, complex equipment is needed to keep us communicating. The workers who set up and maintain this sophisticated equipment are called radio and telecommunications equipment installers and repairers.

Telecommunications equipment installers and repairers have a range of skills and abilities, which vary by the type of work they do and where it is performed. Most work indoors. (Equipment installers who work mainly outdoors are classified as telecommunications line installers and repairers—a separate occupation discussed elsewhere in the *Handbook*.)

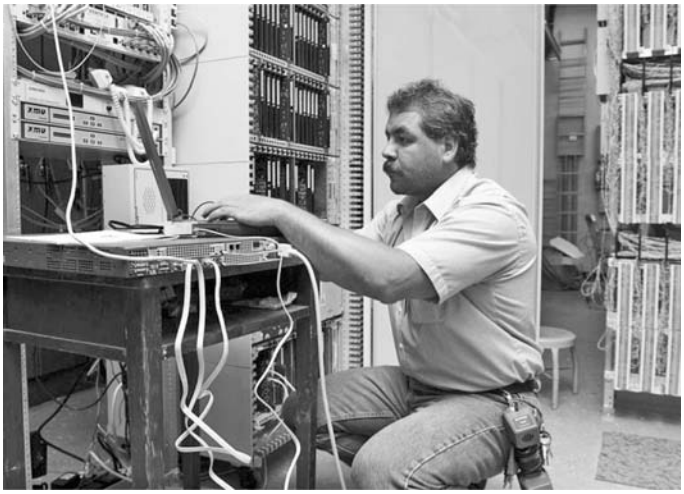
C*entral office installers and repairers*—telecommunications equipment installers and repairers who work at switching hubs called central offices—do some of the most complex work. Switching hubs contain the switches and routers that direct packets of information to their destinations. Installers and repairers set up those switches and routers as well as cables and other equipment.

Although most telephone lines connecting houses to central offices and switching stations are still copper, the lines connecting central hubs to each other are fiber optic. Fiber optic lines, along with newer packet switching equipment, have greatly increased the transmission capacity of each line, allowing an ever increasing amount of information to pass through the lines. Switches and routers are used to transmit, process, amplify, and direct a massive amount of information. Installing and maintaining this equipment requires a high level of special technical knowledge.

The increasing reliability of switches and routers has simplified maintenance, however. New self-monitoring telecommunications switches alert central office repairers to malfunctions. Some switches allow repairers to diagnose and correct problems from remote locations. When faced with a malfunction, the repairer may refer to manufacturers' manuals that provide maintenance instructions.

As cable television and telecommunications technology converge, the equipment used in both technologies is becoming more similar. The distribution centers for cable television companies, which are similar to central offices in the telecommunications sector, are called headends. *Headend technicians* perform essentially the same work as central office technicians, but they work in the cable industry.

When problems with telecommunications equipment arise, telecommunications equipment repairers diagnose the source of the problem by testing each part of the equipment. This requires understanding how the software and hardware interact. Repairers often use spectrum analyzers, network analyzers, or both to locate the problem. A network analyzer sends a signal through the equipment to detect any distortion in the signal. The nature of the signal distortion often directs the repairer to the source of the problem. To fix the equipment, repairers may use small hand tools, including pliers and screwdrivers, to remove and replace defective components such as circuit boards or wiring. Newer equipment is easier to repair because whole boards and parts are designed to be quickly removed and replaced. Repairers also may install updated software or programs that maintain existing software.



Telecommunications equipment installers make adjustments in central offices.

Another type of telecommunications installer and repairer, *PBX installers and repairers* set up private branch exchange (PBX) switchboards, which relay incoming, outgoing, and interoffice telephone calls within a single location or organization. To install switches and switchboards, installers first connect the equipment to power lines and communications cables and install frames and supports. They test the connections to ensure that adequate power is available and that the communication links work properly. They also install equipment such as power systems, alarms, and telephone sets. New switches and switchboards are computerized and workers often need to install software or program the equipment to provide specific features. Finally, the installer performs tests to verify that the newly installed equipment functions properly. If a problem arises, PBX repairers determine whether it is located within the PBX system or whether it originates in the telephone lines maintained by the local telephone company. Newer installations use voice-over Internet protocol (VoIP) systems. VoIP systems operate like a PBX system, but they use a company's computer wiring to run Internet access, network applications, and telephone communications.

Station installers and repairers, telephone—commonly known as *home installers and repairers* or *telecommunications service technicians*—install and repair telecommunications wiring and equipment in customers' home or business premises. They install telephone, VoIP, Internet, and other communications services by installing wiring inside the home or connecting existing wiring to outside service lines. Depending upon the service required, they may setup television capability or connect modems and install software on a customer's computer. To complete the connection to an outside service line, the installer may need to climb telephone poles or ladders and test the line. Later on, if a maintenance problem occurs, station repairers test the customer's lines to determine if the problem is located in the customer's premises or in the outside service lines and attempt to fix the problem if it is inside. If the problem is with the outside service lines, telecommunications line repairers are usually called to fix it.

Radio mechanics install and maintain radio transmitting and receiving equipment, excluding cellular communications systems. This includes stationary equipment mounted on transmission towers or tall buildings and mobile equipment, such as two-way radio communications systems in taxis, airplanes, ships, and emergency vehicles. Aviation and marine radio mechanics also may work on other

electronic equipment, in addition to radios. Newer radio equipment is self-monitoring and may alert mechanics to potential malfunctions. When malfunctions occur, these mechanics examine equipment for damaged components and either fix them, replace the part, or make a software modification. They may use electrical measuring instruments to monitor signal strength, transmission capacity, interference, and signal delay, as well as hand tools to replace defective components and parts and to adjust equipment so that it performs within required specifications.

Work environment. Radio and telecommunications equipment installers and repairers generally work in clean, well-lighted, air-conditioned surroundings, such as a telecommunications company's central office, a customer's location, or an electronic repair shop or service center. Traveling to the site of the installation or repair is common among station installers and repairers, PBX and VoIP installers and repairers, and radio mechanics. The installation may require access to rooftops, ladders, and telephone poles to complete the repair. Radio mechanics may need to work on transmissions towers, which may be located on top of tall buildings or mountains, as well as aboard airplanes and ships. These workers are subject to a variety of weather conditions while working outdoors.

The work of most repairers involves lifting, reaching, stooping, crouching, and crawling. Adherence to safety precautions is important in order to guard against work hazards. These hazards include falls, minor burns, electrical shock, and contact with hazardous materials.

Nearly all radio and telecommunications equipment installers and repairers work full time. Many work regular business hours to meet the demand for repair services during the workday. Schedules are more irregular at employers that provide repair services 24 hours a day, such as for police radio communications operations or where installation and maintenance must take place after normal business hours. At these locations, mechanics work a variety of shifts, including weekend and holiday hours. Repairers may be on call around the clock, in case of emergencies, and may have to work overtime.

Training, Other Qualifications, and Advancement

Postsecondary education in electronics and computer technology is increasingly required for radio and telecommunications equipment installers and repairer jobs, and a few employers even prefer people with a bachelor's degree for some of the most complex types of work. About half of all radio and telecommunications equipment installers and repairers have completed some college courses or an associate degree.

Education and training. As telecommunications technology becomes more complex, the education required for radio and telecommunications equipment installers and repairer jobs has increased. Most employers prefer applicants with postsecondary training in electronics and familiarity with computers. The education needed for these jobs may vary from a certification to work on certain equipment to a two- or four-year degree in electronics or a related subject. Sources of training include two- and four-year college programs in electronics or communications technology, military experience in radios and electronics, trade schools, and programs offered by equipment and software manufacturers. Educational requirements are higher for central office installers and repairers and for those working in nonresidential settings.

Many in the telecommunications industry work their way up into this occupation by gaining experience at less difficult jobs. Experience as a telecommunications line installer or station installer is helpful before moving up to the job of central office installer and other more complex jobs, for example. Military experience with communications equipment is also valued by many employers in both telecommunications and radio repair.

Newly hired repairers usually receive some training from their employers. This may include formal classroom training in electronics, communications systems, or software and informal hands-on training assisting an experienced repairer. Large companies may send repairers to outside training sessions to learn about new equipment and service procedures. As networks have become more sophisticated—often including equipment from a variety of companies—the knowledge needed for installation and maintenance also has increased.

Licensure. Aviation and marine radio mechanics are required to have a license from the Federal Communications Commission before they can work on these types of radios. This requires passing several exams on radio law, electronics fundamentals, and maintenance practices.

Other qualifications. Familiarity with computers, being mechanically inclined, and being able to solve problems are traits that are highly regarded by employers. Repairers must also be able to distinguish colors, because wires are color-coded. For positions that require climbing poles and towers, workers must be in good physical shape and not afraid of heights. Repairers who handle assignments alone at a customer's site must be able to work without close supervision. For workers who frequently contact customers, a pleasant personality, neat appearance, and good communications skills also are important.

Certification and advancement. This is an occupation where the technology is changing rapidly. Workers must keep abreast of the latest equipment available and know how to repair it. Telecommunications equipment installers and repairers often need to be certified to perform certain tasks or to work on specific equipment. Certification often requires taking classes. Some of certifications are needed before entering an occupation; others are meant to improve one's current abilities or to advance in the occupation.

The Society of Cable and Telecommunications Engineers and the Telecommunications Industry Association offer voluntary certifications to workers in this field. Telecommunications equipment manufacturers also provide training on specific equipment.

Experienced repairers with advanced training may become specialists or troubleshooters who help other repairers diagnose difficult problems, or may work with engineers in designing equipment and developing maintenance procedures. Home installers may advance to wiring computer networks or working as a central office installer and repairer. Because of their familiarity with equipment, repairers are particularly well qualified to become manufacturers' sales workers. Workers with leadership ability also may become maintenance supervisors or service managers. Some experienced workers open their own repair services or shops, or become wholesalers or retailers of electronic equipment.

Employment

Radio and telecommunications equipment installers and repairers held about 205,000 jobs in 2006. About 198,000 were telecommunications equipment installers and repairers, except line installers. The remaining 6,500 were radio mechanics.

Telecommunications equipment installers and repairers work mostly in the telecommunications industry. Increasingly, however, they can be found in the construction industry working as contractors to the telecommunications industry.

Radio mechanics work in the electronic and precision equipment repair and maintenance industry, the telecommunications industry, electronics and appliance stores, government, and other industries.

Job Outlook

Little or no change in employment of radio and telecommunications equipment installers and repairers is projected. Job opportunities

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Radio and telecommunications equipment installers and repairers..	49-2020	205,000	209,000	4,800	2
Radio mechanics	49-2021	6,500	6,300	-300	-4
Telecommunications equipment installers and repairers, except line installers	49-2022	198,000	203,000	5,000	3

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

vary by specialty. Job prospects are best for those with computer skills and postsecondary training in electronics.

Employment change. Employment of radio and telecommunications equipment installers and repairers is expected to increase 2 percent, reflecting little or no change, during the 2006–2016 period. Over the next decade, telecommunications companies will provide faster Internet connections, provide video-on-demand, add hundreds of television stations, and many services that haven't even been invented yet. Although building the new networks required to provide these services will create jobs, these gains will be offset by a decline in maintenance work. The new equipment requires much less maintenance work because it is newer, more reliable, easier to repair, and more resistant to damage from the elements.

The increased reliability of radio equipment and the use of self-monitoring systems also will continue to lessen the need for radio mechanics. However, technological changes are also creating new wireless applications that create jobs for radio mechanics.

Job prospects. Applicants with computer skills and postsecondary training in electronics should have the best opportunities for radio and telecommunications equipment installer and repairer jobs, but opportunities will vary by specialty. Good opportunities should be available for central office and PBX installers and repairers experienced in current technology, as the growing popularity of VoIP, expanded multimedia offerings such as video on demand, and other telecommunications services continue to place additional demand on telecommunications networks. These new services require high data transfer rates, which can be achieved only by installing new optical switching and routing equipment. Extending high-speed communications from central offices to customers also will require telecommunications equipment installers to put in place more advanced switching and routing equipment, but opportunities for repairers will be limited by the increased reliability and automation of the new switching equipment.

Station installers and repairers can expect keen competition. Prewired buildings and the increasing reliability of telephone equipment will reduce the need for installation and maintenance of customers' telephones, as will the declining number of pay telephones in operation as use of cellular telephones grows. However, some of these losses should be offset by the need to upgrade internal lines in businesses and the wiring of new homes and businesses with fiber optic lines.

Radio mechanics should find good opportunities if they have a strong background in electronics and an ability to work independently. Increasing competition from cellular services is limiting the growth of radio services, but employers report difficulty finding adequate numbers of qualified radio mechanics to perform repair work.

Earnings

In May 2006, median hourly earnings of telecommunications equipment installers and repairers, except line installers were $25.21. The middle 50 percent earned between $20.43 and $28.66. The bottom 10 percent earned less than $14.96, whereas the top 10 percent earned more than $32.84. The median hourly earnings of these workers in the wired telecommunications carriers industry were $26.25 in May 2006.

Median hourly earnings of radio mechanics in May 2006 were $18.12. The middle 50 percent earned between 14.04 and $23.02. The bottom 10 percent earned less than $10.94, whereas the top 10 percent earned more than $28.54.

About 4 percent of radio and telecommunications equipment installers and repairers were self-employed. About 26 percent of radio and telecommunication equipment installers and repairers are members of unions, such as the Communications Workers of America (CWA) and the International Brotherhood of Electrical Workers (IBEW.)

Telecommunications equipment installers and repairers employed by large telecommunications companies who also belong to unions often have very good benefits, including health, dental, vision, and life insurance. They also usually have good retirement and leave policies. Those working for small independent companies and contractors may get fewer benefits.

Radio mechanics tend to work for small electronics firms or government. Benefits vary widely depending upon the type of work and size of firm. Government jobs usually have good benefits.

Related Occupations

Related occupations that involve work with electronic equipment include broadcast and sound engineering technicians and radio operators; computer, automated teller, and office machine repairers; and electrical and electronics installers and repairers. Line installers and repairers also set up and install telecommunications equipment. Engineering technicians also may repair electronic equipment as part of their duties.

Vehicle and Mobile Equipment Mechanics, Installers, and Repairers

Aircraft and Avionics Equipment Mechanics and Service Technicians

(O*NET 49-2091.00 and 49-3011.00)

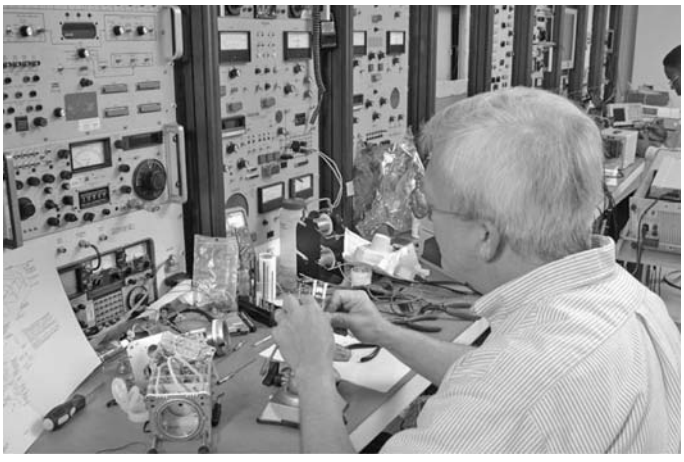
Significant Points

- Most workers learn their jobs in 1 of about 170 schools certified by the Federal Aviation Administration (FAA).
- Job opportunities should be favorable for persons who have completed an aircraft mechanic training program, but keen competition is likely for jobs at major airlines, which offer the best pay and benefits.
- Job opportunities are likely to continue to be best at small commuter and regional airlines, at FAA repair stations, and in general aviation.

Nature of the Work

To keep aircraft in peak operating condition, aircraft and avionics equipment mechanics and service technicians perform scheduled maintenance, make repairs, and complete inspections required by the Federal Aviation Administration (FAA).

Many aircraft mechanics, also called *airframe mechanics, power plant mechanics,* and *avionics technicians,* specialize in preventive maintenance. They inspect aircraft engines, landing gear, instruments, pressurized sections, accessories—brakes, valves, pumps, and air-conditioning systems, for example—and other parts of the aircraft, and do the necessary maintenance and replacement of parts. They also keep records related to the maintenance performed on the aircraft. Mechanics and technicians conduct inspections following a schedule based on the number of hours the aircraft has flown, calendar days since the last inspection, cycles of operation, or a combination of these factors. In large, sophisticated planes equipped with aircraft monitoring systems, mechanics can gather valuable diagnostic information from electronic boxes and consoles that monitor the aircraft's basic operations. In planes of all sorts, aircraft mechanics examine engines by working through specially designed openings while standing on ladders or scaffolds or by using hoists or lifts to remove the entire engine from the craft. After taking an engine apart, mechanics use precision instruments to measure parts for wear and use X-ray and magnetic inspection equipment to check for invisible cracks. They repair or replace worn or defective parts. Mechanics also may repair sheet metal or composite surfaces; measure the tension of control cables; and check for corrosion, distortion, and cracks in the fuselage, wings, and tail. After completing all repairs, they must test the equipment to ensure that it works properly.



Avionics technicians repair and maintain components used for aircraft navigation, radio communications, and weather radar systems, as well as instruments and computers that control flight, engine, and other functions.

Other mechanics specialize in repair work rather than inspection. They find and fix problems that pilot's describe. For example, during a preflight check, a pilot may discover that the aircraft's fuel gauge does not work. To solve the problem, mechanics may troubleshoot the electrical system, using electrical test equipment to make sure that no wires are broken or shorted out, and replace any defective electrical or electronic components. Mechanics work as fast as safety permits so that the aircraft can be put back into service quickly.

Some mechanics work on one or many different types of aircraft, such as jets, propeller-driven airplanes, and helicopters. Others specialize in one section of a particular type of aircraft, such as the engine, hydraulics, or electrical system. *Airframe mechanics* are authorized to work on any part of the aircraft except the instruments, power plants, and propellers. *Powerplant mechanics* are authorized to work on engines and do limited work on propellers. *Combination airframe-and-powerplant mechanics*—called *A&P mechanics*—work on all parts of the plane except the instruments. Most mechanics working on civilian aircraft today are *A&P mechanics*. In small, independent repair shops, mechanics usually inspect and repair many different types of aircraft.

Avionics systems—components used for aircraft navigation and radio communications, weather radar systems, and other instruments and computers that control flight, engine, and other primary functions—are now an integral part of aircraft design and have vastly increased aircraft capability. *Avionics technicians* repair and maintain these systems. Their duties may require additional licenses, such as a radiotelephone license issued by the U.S. Federal Communications Commission (FCC). Because of the increasing use of technology, more time is spent repairing electronic systems, such as computerized controls. Technicians also may be required to analyze and develop solutions to complex electronic problems.

Work environment. Mechanics usually work in hangars or in other indoor areas. When hangars are full or when repairs must be made quickly, they may work outdoors, sometimes in unpleasant weather. Mechanics often work under time pressure to maintain flight schedules or, in general aviation, to keep from inconveniencing customers. At the same time, mechanics have a tremendous responsibility to maintain safety standards, and this can cause the job to be stressful.

Frequently, mechanics must lift or pull objects weighing more than 70 pounds. They often stand, lie, or kneel in awkward positions and occasionally must work in precarious positions, such as on scaffolds or ladders. Noise and vibration are common when engines are being tested, so ear protection is necessary.

Aircraft mechanics usually work 40 hours a week on eight-hour shifts around the clock. Overtime and weekend work is frequent.

Training, Other Qualifications, and Advancement

Most workers learn their jobs in 1 of about 170 trade schools certified by the FAA. Most mechanics who work on civilian aircraft are certified by the FAA as an "airframe mechanic" or a "powerplant mechanic."

Education and training. Although a few people become mechanics through on-the-job training, most learn their jobs in 1 of about the 170 schools certified by the FAA. About one-third of these schools award two-year and four-year degrees in avionics, aviation technology, or aviation maintenance management.

FAA standards established by law require that certified mechanic schools offer students a minimum of 1,900 class hours. Coursework in schools normally lasts from 18 to 24 months and provides training with the tools and equipment used on the job. Aircraft trade schools are placing more emphasis on technologies such as turbine engines, composite materials—including graphite, fiberglass, and boron—and aviation electronics, which are increasingly being used in the construction of new aircraft.

Courses in mathematics, physics, chemistry, electronics, computer science, and mechanical drawing are helpful because they demonstrate many of the principles involved in the operation of aircraft, and knowledge of these principles is often necessary to make repairs. Recent technological advances in aircraft maintenance require mechanics to have an especially strong background in electronics to get or keep jobs in this field.

Courses that develop writing skills also are important because mechanics are often required to submit reports. Mechanics must be able to read, write, and understand English.

A few mechanics are trained on the job by experienced mechanics. They must be supervised by certified mechanics until they have FAA certificates.

Licensure. The FAA requires at least 18 months of work experience for an airframe or powerplant certificate, although completion of a program at an FAA-certified mechanic school can be substituted for the work experience requirement. Mechanics and technicians also must pass an exam for certification and take at least 16 hours of training every 24 months to keep their certificate current. Many mechanics take training courses offered by manufacturers or employers, usually through outside contractors.

The FAA also offers a combined certificate that allows for certification as both an airframe and a powerplant mechanic, the A&P certificate. For a combined A&P certificate, mechanics must acquire at least 30 months of experience working with both engines and airframes, or experience combined with the completion of an FAA-certified mechanic school program. FAA regulations also require current work experience to keep the A&P certificate valid. Applicants must have at least 1,000 hours of work experience in the previous 24 months or take a refresher course. Most airlines require that mechanics have a high school diploma and an A&P certificate. Applicants for all certificates must pass written and oral tests and demonstrate that they can do the work authorized by the certificate.

Avionics technicians need an FAA mechanics' certificate. They also must be trained and qualified and have the proper tools to work on avionics equipment. Many have avionics repair experience from the military or from working for avionics manufacturers.

Other qualifications. Applicants must be at least 18 years of age. Some aircraft mechanics in the Armed Forces acquire enough general experience to satisfy the work experience requirements for the FAA certificate. With additional study, they may pass the certifying exam. In general, however, jobs in the military services are too specialized to provide the broad experience required by the FAA. Most Armed Forces mechanics have to complete the entire FAA training program, although a few receive some credit for the material they learned in the service. In any case, military experience is a great advantage when seeking employment; employers consider applicants with formal training to be the most desirable applicants.

Aircraft mechanics must do careful and thorough work that requires a high degree of mechanical aptitude. Employers seek applicants who are self-motivated, hard working, enthusiastic, and able to diagnose and solve complex mechanical problems. Additionally, employers prefer mechanics who can perform a variety of tasks. Agility is important for the reaching and climbing necessary to do the job. Because they may work on the tops of wings and fuselages on large jet planes, aircraft mechanics must not be afraid of heights.

Advances in computer technology, aircraft systems, and the materials used to manufacture airplanes have made mechanics' jobs more highly technical. Aircraft mechanics must possess the skills necessary to troubleshoot and diagnose complex aircraft systems. They also must continually update their skills with and knowledge of new technology and advances in aircraft technology.

Advancement. As aircraft mechanics gain experience, they may advance to lead mechanic (or crew chief), inspector, lead inspector, or shop supervisor positions. Opportunities are best for those who have an aircraft inspector's authorization. To obtain an inspector's authorization, a mechanic must have held an A&P certificate for at least 3 years, with 24 months of hands-on experience.

In the airlines, where promotion often is determined by examination, supervisors sometimes advance to executive positions. Those with broad experience in maintenance and overhaul might become inspectors with the FAA. With additional business and management training, some open their own aircraft maintenance facilities. Mechanics with the necessary pilot licenses and flying experience may take the FAA examination for the position of flight engineer, with opportunities to become pilots.

Mechanics and technicians learn many different skills in their training that can be applied to other jobs, and some transfer to other skilled repairer occupations or electronics technician jobs. For example, some avionics technicians continue their education and become aviation engineers, electrical engineers (specializing in circuit design and testing), or communication engineers. Others become repair consultants, in-house electronics designers, or join research groups that test and develop products.

Employment

Aircraft and avionics equipment mechanics and service technicians held about 138,000 jobs in 2006; about 5 in 6 of these workers were aircraft mechanic and service technicians.

Employment of aircraft and avionics equipment mechanics and service technicians primarily is concentrated in a small number of industries. More than half of aircraft and avionics equipment mechanics and service technicians worked in air transportation and support activities for air transportation. Around 18 percent worked in aerospace product and parts manufacturing and about 16 percent worked for the federal government. Most of the rest worked for companies that operate their own planes to transport executives and cargo.

Most airline mechanics and service technicians work at major airports near large cities. Civilian mechanics employed by the U.S. Armed Forces work at military installations. Mechanics who work for aerospace manufacturing firms typically are located in California or in Washington state. Others work for the FAA, many at the facilities in Oklahoma City, Atlantic City, Wichita, or Washington,

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16 Number	Change, 2006-16 Percent
Aircraft and avionics equipment mechanics and service technicians	—	138,000	152,000	14,000	10
Avionics technicians	49-2091	16,000	17,000	1,300	8
Aircraft mechanics and service technicians	49-3011	122,000	135,000	13,000	11

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

DC. Mechanics for independent repair shops work at airports in every part of the country.

Job Outlook

Job growth for these mechanics and technicians is expected to be about as fast as the average for all occupations. Job opportunities should be favorable for people who have completed an aircraft mechanic training program, but keen competition is likely for jobs at major airlines.

Employment change. Employment is expected to increase by 10 percent during the 2006–2016 period, about as fast as the average for all occupations. Passenger traffic is expected to increase as the result of an expanding economy and a growing population, and the need for aircraft mechanics and service technicians will grow accordingly.

Job prospects. Most job openings for aircraft mechanics through the year 2016 will stem from the need to replace the many mechanics expected to retire over the next decade. In addition, some mechanics will leave to work in related fields, such as automobile repair, as their skills are largely transferable to other maintenance and repair occupations.

Also contributing to favorable future job opportunities for mechanics is the long-term trend toward fewer students entering technical schools to learn skilled maintenance and repair trades. Many of the students who have the ability and aptitude to work on planes are choosing to go to college, work in computer-related fields, or go into other repair and maintenance occupations with better working conditions. If this trend continues, the supply of trained aviation mechanics may not keep up with the needs of the air transportation industry.

Job opportunities will continue to be the best at small commuter and regional airlines, at FAA repair stations, and in general aviation. Commuter and regional airlines is the fastest growing segment of the air transportation industry, but wages in these airlines tend to be lower than those in the major airlines, so they attract fewer job applicants. Also, some jobs will become available as experienced mechanics leave for higher paying jobs with the major airlines or transfer to other occupations. At the same time, general aviation aircraft are becoming increasingly sophisticated, boosting the demand for qualified mechanics. Mechanics will face more competition for jobs with large airlines because the high wages and travel benefits that these jobs offer generally attract more qualified applicants than there are openings. Also, there is an increasing trend for large airlines to outsource aircraft and avionics equipment mechanic jobs overseas; however, most airline companies prefer that aircraft maintenance be performed in the U.S. because overseas contractors may not comply with more stringent U.S. safety regulations.

In spite of these factors, job opportunities with the airlines are expected to be better than they have been in the past. But, in general, prospects will be best for applicants with experience. Mechanics who keep abreast of technological advances in electronics, composite materials, and other areas will be in greatest demand. Also, mechanics who are mobile and willing to relocate to smaller rural areas will have better job opportunities. The number of job openings for aircraft mechanics in the federal government should decline as the Government increasingly contracts out service and repair functions to private repair companies.

Avionics technicians who do not have FAA certification, but who are prepared to master the intricacies of the aircraft while working with certified A&P mechanics, should have good opportunities. However, certified technicians who are trained to work with complex aircraft systems, performing some duties normally performed by certified A&P mechanics, should have the best job prospects. Additionally, technicians with licensing that enables them to work on the airplane, either removing or reinstalling equipment, are expected to be in especially high demand.

Earnings

Median hourly earnings of aircraft mechanics and service technicians were about $22.95 in May 2006. The middle 50 percent earned between $18.96 and $28.12. The lowest 10 percent earned less than $14.94, and the highest 10 percent earned more than $34.51. Median hourly earnings in the industries employing the largest numbers of aircraft mechanics and service technicians in May 2006 were:

Scheduled air transportation	$27.46
Nonscheduled air transportation	23.33
Federal government	23.19
Aerospace product and parts manufacturing	21.58
Support activities for air transportation	19.57

Median hourly earnings of avionics technicians were about $22.57 in May 2006. The middle 50 percent earned between $19.02 and $26.65. The lowest 10 percent earned less than $15.65, and the highest 10 percent earned more than $30.33.

Mechanics who work on jets for the major airlines generally earn more than those working on other aircraft. Those who graduate from an aviation maintenance technician school often earn higher starting salaries than individuals who receive training in the Armed Forces or on the job. Airline mechanics and their immediate families receive reduced-fare transportation on their own and most other airlines.

About 3 in 10 aircraft and avionics equipment mechanics and service technicians are members of unions or covered by union agreements. The principal unions are the International Association of Machinists and Aerospace Workers, and the Transport Workers Union of America. Some mechanics are represented by the International Brotherhood of Teamsters.

Related Occupations

Workers in some other occupations that involve similar mechanical and electrical work are electricians, electrical and electronics installers and repairers, and elevator installers and repairers.

Sources of Additional Information

Information about jobs with a particular airline can be obtained by writing to the personnel manager of the company.

For general information about aircraft and avionics equipment mechanics and service technicians, contact

➤ Professional Aviation Maintenance Association, 400 Commonwealth Dr., Warrendale, PA 15096. Internet: http://www.pama.org

For information on jobs in a particular area, contact employers at local airports or local offices of the state employment service.

Information on obtaining positions as aircraft and avionics equipment mechanics and service technicians with the federal government is available from the Office of Personnel Management through USAJOBS, the federal government's official employment information system. This resource for locating and applying for job opportunities can be accessed through the Internet at http://www.usajobs.opm.gov or through an interactive voice response telephone system at (703) 724-1850 or TDD (978) 461-8404. These numbers are not toll free, and charges may result.

Automotive Body and Related Repairers

(O*NET 49-3021.00 and 49-3022.00)

Significant Points

- To become a fully skilled automotive body repairer, formal training followed by on-the-job instruction is recommended because fixing newer automobiles requires advanced skills.
- Excellent job opportunities are projected because of the large number of older workers who are expected to retire in the next 10 to 15 years.
- Repairers need good reading ability and basic mathematics and computer skills to use print and digital technical manuals.

Nature of the Work

Most of the damage resulting from everyday vehicle collisions can be repaired, and vehicles can be refinished to look and drive like new. *Automotive body repairers*, often called *collision repair technicians,* straighten bent bodies, remove dents, and replace crumpled parts that cannot be fixed. They repair all types of vehicles, and although some work on large trucks, buses, or tractor-trailers, most work on cars and small trucks. They can work alone, with only general direction from supervisors, or as specialists on a repair team. In some shops, helpers or apprentices assist experienced repairers.

Each damaged vehicle presents different challenges for repairers. Using their broad knowledge of automotive construction and repair techniques, automotive body repairers must decide how to handle each job based on what the vehicle is made of and what needs to be fixed. They must first determine the extent of the damage and order any needed parts.

If the car is heavily damaged, an automotive body repairer might start by realigning the frame of the vehicle. Repairers chain or clamp frames and sections to alignment machines that use hydraulic pressure to align damaged components. "Unibody" vehicles—designs built without frames—must be restored to precise factory specifications for the vehicle to operate correctly. For these vehicles, repairers use benchmark systems to accurately measure how much each section is out of alignment, and hydraulic machinery to return the vehicle to its original shape.

Automotive body repairers remove, repair, and replace car and truck parts that have been damaged.

Once the frame is aligned, repairers can begin to fix or replace damaged body parts. If the vehicle or part is made of metal, body repairers will use a pneumatic metal-cutting gun or other tools to remove badly damaged sections of body panels and then weld in replacement sections. Less serious dents are pulled out with a hydraulic jack or hand prying bar or knocked out with hand tools or pneumatic hammers. Small dents and creases in the metal are smoothed by holding a small anvil against one side of the damaged area while hammering the opposite side. Repairers also remove very small pits and dimples with pick hammers and punches in a process called metal finishing. Body repairers use plastic or solder to fill small dents that cannot be worked out of plastic or metal panels. On metal panels, they file or grind the hardened filler to the original shape and clean the surface with a media blaster—similar to a sand blaster—before repainting the damaged portion of the vehicle.

Body repairers also repair or replace the plastic body parts that are increasingly used on new vehicles. They remove damaged panels and identify the type and properties of the plastic used. With most types of plastic, repairers can apply heat from a hot-air welding gun or immerse the panel in hot water and press the softened section back into shape by hand. Repairers replace plastic parts that are badly damaged or very difficult to fix. A few body repairers specialize in fixing fiberglass car bodies.

Some body repairers specialize in installing and repairing glass in automobiles and other vehicles. *Automotive glass installers and repairers* remove broken, cracked, or pitted windshields and window glass. Glass installers apply a moisture-proofing compound along the edges of the glass, place the glass in the vehicle, and install rubber strips around the sides of the windshield or window to make it secure and weatherproof.

Many large shops make repairs using an assembly-line approach where vehicles are fixed by a team of repairers who each specialize in one type of repair. One worker might straighten frames while another repairs doors and fenders, for example. In most shops, automotive painters do the painting and refinishing, but in small shops, workers often do both body repairing and painting. (Automotive painters are discussed in the section on painting and coating workers, except construction and maintenance elsewhere in the *Handbook*.)

Work environment. Repairers work indoors in body shops that are noisy with the clatter of hammers against metal and the whine of power tools. Most shops are well ventilated to disperse dust and paint fumes. Body repairers often work in awkward or cramped positions, and much of their work is strenuous and dirty. Hazards include cuts from sharp metal edges, burns from torches and heated

metal, injuries from power tools, and fumes from paint. However, serious accidents usually are avoided when the shop is kept clean and orderly and safety practices are observed. Automotive repair and maintenance shops averaged 4 cases of work-related injuries and illnesses per 100 full-time workers in 2005, compared to 4.6 per 100 workers in all private industry.

Most automotive body repairers work a standard 40-hour week. More than 40 hours a week may be required when there is a backlog of repair work to be completed. This may include working on weekends.

Training, Other Qualifications, and Advancement

Automotive technology is rapidly becoming more sophisticated, and most employers prefer applicants who have completed a formal training program in automotive body repair or refinishing. Most new repairers complete at least part of this training on the job. Many repairers, particularly in urban areas, need a national certification to advance past entry-level work.

Education and training. A high school diploma or GED is often all that is required to enter this occupation, but more specific education and training is needed to learn how to repair newer automobiles. Collision repair programs may be offered in high school or in postsecondary vocational schools and community colleges. Courses in electronics, physics, chemistry, English, computers, and mathematics provide a good background for a career as an automotive body repairer. Most training programs combine classroom instruction and hands-on practice.

Trade and technical school programs typically award certificates to graduates after 6 months to a year of collision repair study. Some community colleges offer two-year programs in collision repair. Many of these schools also offer certificates for individual courses, so that students are able to take classes incrementally or as needed.

New repairers begin by assisting experienced body repairers in tasks such as removing damaged parts, sanding body panels, and installing repaired parts. Novices learn to remove small dents and make other minor repairs. They then progress to more difficult tasks, such as straightening body parts and returning them to their correct alignment. Generally, it takes 3 to 4 years of hands-on training to become skilled in all aspects of body repair, some of which may be completed as part of a formal education program. Basic automotive glass installation and repair can be learned in as little as 6 months, but becoming fully qualified can take several years.

Continuing education and training are needed throughout a career in automotive body repair. Automotive parts, body materials, and electronics continue to change and to become more complex. To keep up with these technological advances, repairers must continue to gain new skills by reading technical manuals and furthering their education with classes and seminars. Many companies within the automotive body repair industry send employees to advanced training programs to brush up on skills or to learn new techniques.

Other qualifications. Fully skilled automotive body repairers must have good reading ability and basic mathematics and computer skills. Restoring unibody automobiles to their original form requires repairers to follow instructions and diagrams in technical manuals and to make precise three-dimensional measurements of the position of one body section relative to another. In addition, repairers should enjoy working with their hands and be able to pay attention to detail while they work.

Certification and advancement. Certification by the National Institute for Automotive Service Excellence (ASE), although voluntary, is the pervasive industry credential for non entry-level automotive body repairers. This is especially true in large, urban areas. Repairers may take up to four ASE Master Collision Repair and Refinish Exams. Repairers who pass at least one exam and have 2 years of hands-on work experience earn ASE certification. The completion of a postsecondary program in automotive body repair may be substituted for 1 year of work experience. Those who pass all four exams become ASE Master Collision Repair and Refinish Technicians. Automotive body repairers must retake the examination at least every 5 years to retain their certification. Many vehicle manufacturers and paint manufacturers also have product certification programs that can advance a repairer's career.

As beginners increase their skills, learn new techniques, earn certifications, and complete work more rapidly, their pay increases. An experienced automotive body repairer with managerial ability may advance to shop supervisor, and some workers open their own body repair shops. Other repairers become automobile damage appraisers for insurance companies.

Employment

Automotive body and related repairers held about 206,000 jobs in 2006; about 13 percent specialized in automotive glass installation and repair. Fifty-eight percent of repairers worked for automotive repair and maintenance shops in 2006, while 20 percent worked for automobile dealers. Others worked for organizations, such as trucking companies, that maintain their own motor vehicles. A small number of repairers worked for wholesalers of motor vehicles, parts, and supplies. More than 15 percent of automotive body repairers were self-employed, roughly double the number for all installation, maintenance, and repair occupations.

Job Outlook

Employment of automotive body and related repairers is expected to grow about as fast as average through the year 2016, and job opportunities are projected to be excellent due to a growing number of retirements in this occupation.

Employment change. Employment of automotive body repairers is expected to grow 12 percent over the 2006–2016 decade, as compared to 10 percent for all occupations. Demand for qualified body repairers will increase as the number of vehicles on the road continues to grow. With more motor vehicles in use, more vehicles will be damaged in accidents. In addition, new automotive designs of lighter weight are prone to greater collision damage than are older, heavier designs, so more repairs are needed. Employment growth will continue to be concentrated in automotive body, paint, interior, and glass repair shops, with little or no change in automotive dealerships.

Projections data from the National Employment Matrix

Occupational Title	SOC Code	Employment, 2006	Projected employment, 2016	Change, 2006-16	
				Number	Percent
Automotive body and related repairers	—	206,000	232,000	26,000	12
Automotive body and related repairers	49-3021	183,000	204,000	21,000	12
Automotive glass installers and repairers	49-3022	24,000	28,000	4,400	19

NOTE: Data in this table are rounded. See the discussion of the employment projections table in the *Handbook* introductory chapter on *Occupational Information Included in the Handbook*.

Despite the anticipated increase in the number of auto accidents, the increasing demand for automotive body repairers will be tempered by improvements in the quality of vehicles. Also, technological innovations that enhance safety will reduce the likelihood of accidents.

Demand for automotive body repair services will similarly be constrained as more vehicles are declared a total loss after accidents. In many such cases, the vehicles are not repaired because of the high cost of replacing the increasingly complex parts and electronic components and because of the extensive damage that results when airbags deploy. Also, higher insurance premiums and deductibles mean that minor damage is more often going unrepaired. Larger shops are instituting productivity enhancements, such as employing a team approach to repairs, which may limit employment growth by reducing the time it takes to make repairs.

Job prospects. Employment growth will create some opportunities, but the need to replace experienced repairers who transfer to other occupations or who retire or stop working for other reasons will account for the majority of job openings over the next 10 years. Opportunities will be excellent for people with formal training in automotive body repair and refinishing. Those without any training or experience in automotive body refinishing or collision repair—before or after high school—will face competition for these jobs.

Experienced body repairers are rarely laid off during a general slowdown in the economy as the automotive repair business is not very sensitive to changes in economic conditions. Although repair of minor dents and crumpled fenders is often put off when drivers have less money, major body damage must be repaired before a vehicle can be driven safely.

Earnings

Median hourly wage-and-salary earnings of automotive body and related repairers, including incentive pay, were $16.92 in May 2006. The middle 50 percent earned between $13.00 and $22.33 an hour. The lowest 10 percent earned less than $10.10, and the highest 10 percent earned more than $28.71 an hour. Median hourly earnings of automotive body and related repairers were $17.85 in automobile dealers and $16.66 in automotive repair and maintenance.

Median hourly wage-and-salary earnings of automotive glass installers and repairers, including incentive pay, were $14.77. The middle 50 percent earned between $11.44 and $18.42 an hour. The lowest 10 percent earned less than $9.19, and the highest 10 percent earned more than $22.22 an hour. Median hourly earnings in automotive repair and maintenance shops, the industry employing most automotive glass installers and repairers, were $14.80.

The majority of body repairers employed by independent repair shops and automotive dealers are paid on an incentive basis. Under this system, body repairers are paid a set amount for various tasks, and earnings depend on both the amount of work assigned and how fast it is completed. Employers frequently guarantee workers a minimum weekly salary. Body repairers who work for trucking companies, bus lines, and other organizations that maintain their own vehicles usually receive an hourly wage.

Helpers and trainees typically earn between 30 percent and 60 percent of the earnings of skilled workers. They are paid by the hour until they are skilled enough to be paid on an incentive basis.

Employee benefits vary widely from business to business. However, industry sources report that benefits such as paid leave, health insurance, and retirement assistance are increasingly common in the collision repair industry. Automotive dealerships are the most likely to offer such incentives.

Related Occupations

Repairing damaged motor vehicles often involves working on mechanical components, as well as vehicle bodies. Automotive body repairers often work closely with individuals in several related occupations, including automotive service technicians and mechanics, diesel service technicians and mechanics, auto damage appraisers, and painting and coating workers, except construction and maintenance. Automotive glass installers and repairers complete tasks very similar to those of glaziers.

Sources of Additional Information

Additional details about work opportunities may be obtained from automotive body repair shops, automobile dealers, or local offices of your state employment service. State employment service offices also are a source of information about training programs.

Automotive Service Technicians and Mechanics

(O*NET 49-3023.00, 49-3023.01, and 49-3023.02)

Significant Points

- Automotive service technicians and mechanics must continually adapt to changing technology and repair techniques as vehicle components and systems become increasingly sophisticated.
- Formal automotive technician training is the best preparation for these challenging technology-based jobs.
- Opportunities should be very good for automotive service technicians and mechanics with diagnostic and problem-solving skills, knowledge of electronics and mathematics, and mechanical aptitude.

Automotive service technicians use several types of diagnostic tools, including pressure gauges and electronic meters.

Nature of the Work

Automotive service technicians inspect, maintain, and repair automobiles and light trucks that run on gasoline, electricity, or alternative fuels such as ethanol. Automotive service technicians' and mechanics' responsibilities have evolved from simple mechanical repairs to high-level technology-related work. The increasing sophistication of automobiles requires workers who can use computerized shop equipment and work with electronic components while maintaining their skills with traditional hand tools. As a result, automotive service workers are now usually called technicians rather than mechanics. (Service technicians who work on diesel-powered trucks, buses, and equipment are discussed in the *Handbook* section on diesel service technicians and mechanics. Motorcycle technicians—who repair and service motorcycles, motor scooters, mopeds, and small all-terrain vehicles—are discussed in the *Handbook* section on small engine mechanics.)

Today, integrated electronic systems and complex computers regulate vehicles and their performance while on the road. Technicians must have an increasingly broad knowledge of how vehicles' complex components work and interact. They also must be able to work with electronic diagnostic equipment and digital manuals and reference materials.

When mechanical or electrical troubles occur, technicians first get a description of the problem from the owner or, in a large shop, from the repair service estimator or service advisor who wrote the repair order. To locate the problem, technicians use a diagnostic approach. First, they test to see whether components and systems are secure and working properly. Then, they isolate the components or systems that might be the cause of the problem. For example, if an air-conditioner malfunctions, the technician might check for a simple problem, such as a low coolant level, or a more complex issue, such as a bad drive-train connection that has shorted out the air conditioner. As part of their investigation, technicians may test drive the vehicle or use a variety of testing equipment, including onboard and handheld diagnostic computers or compression gauges. These tests may indicate whether a component is salvageable or whether a new one is required.

During routine service inspections, technicians test and lubricate engines and other major components. Sometimes technicians repair or replace worn parts before they cause breakdowns or damage the vehicle. Technicians usually follow a checklist to ensure that they examine every critical part. Belts, hoses, plugs, brake and fuel systems, and other potentially troublesome items are watched closely.

Service technicians use a variety of tools in their work. They use power tools, such as pneumatic wrenches to remove bolts quickly; machine tools like lathes and grinding machines to rebuild brakes; welding and flame-cutting equipment to remove and repair exhaust systems, and jacks and hoists to lift cars and engines. They also use common hand tools, such as screwdrivers, pliers, and wrenches, to work on small parts and in hard-to-reach places. Technicians usually provide their own hand tools, and many experienced workers have thousands of dollars invested in them. Employers furnish expensive power tools, engine analyzers, and other diagnostic equipment.

Computers are also commonplace in modern repair shops. Service technicians compare the readouts from computerized diagnostic testing devices with benchmarked standards given by the manufacturer. Deviations outside of acceptable levels tell the technician to investigate that part of the vehicle more closely. Through the Internet or from software packages, most shops receive automatic updates to technical manuals and access to manufacturers' service information, technical service bulletins, and other databases that allow technicians to keep up with common problems and learn new procedures.

High technology tools are needed to fix the computer equipment that operates everything from the engine to the radio in many cars. In fact, today most automotive systems, such as braking, transmission, and steering systems, are controlled primarily by computers and electronic components. Additionally, luxury vehicles often have integrated global positioning systems, Internet access, and other new features with which technicians will need to become familiar. Also, as more alternate-fuel vehicles are purchased, more automotive service technicians will need to learn the science behind these automobiles and how to repair them.

Automotive service technicians in large shops often specialize in certain types of repairs. For example, *transmission technicians and rebuilders* work on gear trains, couplings, hydraulic pumps, and other parts of transmissions. Extensive knowledge of computer controls, the ability to diagnose electrical and hydraulic problems, and other specialized skills are needed to work on these complex components, which employ some of the most sophisticated technology used in vehicles. *Tune-up technicians* adjust ignition timing and valves and adjust or replace spark plugs and other parts to ensure efficient engine performance. They often use electronic testing equipment to isolate and adjust malfunctions in fuel, ignition, and emissions control systems.
